Conversion is the second part of a long process, conceived in two stages. *The first step*, the introduction of electronic euro was made in January 1999, when imports and exports in and from the EU were calculated using the single currency. After 1 January 2002, consumers in 16 European countries and tourists visiting these countries stopped using the Franc, the Mark and the national Lira and began to pay for food, train tickets or consumer goods with the new banknotes of the single currency.

Moving to a single currency was not simply a matter of monetary logistics. The immediate or long-term consequences, good or bad, are enormous.

Skepticism and mistrust, this could be the position taken by the Western analysts as regards the shift to the single currency, after 1 January 2002.

• *Skepticism*, because almost 40% of the 300 million citizens of the EU member states do not realize that they do not have their national currencies anymore in their pockets. The same thing can be said also about small and medium enterprises. The managers of these companies have not tried too hard to understand the phenomenon of transition to the single currency. For them the critical moment came when they had to start paying salaries in euro.

• *Lack of confidence* comes today from gloomy forecasts regarding the economic growth, inflation and high growth of public debt ratio in GDP in the 16 Member States. A few months before "E Day" it was increasingly clear that Europe had problems. At the beginning of 2010, ECB forecasts an inflation rate of 3-4%.

In order to gain confidence in the single currency, it is important not to cause any syncope after switching from the national currencies to the euro, not to lead to delays in payments, and not be the case of temporary currency crises and to reduce the volatility of the exchange rate.

Of course, you can make a series of possible scenarios, based on the current regulations and the confidence in the single currency.

The European unification is more than an alliance or an association under the tutelage of a super-national authority. It is possible for it to exist only by self-limiting the proud movement of the national entities and by means of the conscious delegation of powers that belonged to the national entities.

Conclusions

The monetary policies are proved to be a catalyst for general economic and financial stability – regional and global. The euro zone should regain its status of reliable and stabilizing factor in international financial-monetary relations.

THE SCOPE OF GLOBALIZATION AND ITS IMPACT ON THE ECONOMIC AND FINANCIAL-BANKING SECTOR

ALEXANDRU OLTEANU*

Abstract
Currently, on the grand scene of social-human life, we may encounter all possible social players … Should we follow "movement" as a fundamental social and historical phenomenon, we shall find that the world has become, to a large extent, a single societal system, as a result of the development of interdependence connections affecting each and every one of us. The envisaged global system is not just an environment within which particular societies develop and evolve, as separate systems. Through the social, economic, financial and political ties, through the communication systems crossing interstate borders, it turns into a new system, with a trend towards materially restraining the action of its subsequent systems, decisively containing the fate of those living in each of them. The general term used to characterize this increasing interdependence of the human society is that of globalization.

Keywords: *The scope of globalization: organizing information networks; space and time compression; space and time unification; financial-banking networks; universally diversified society; opposite paradigms – financial individualization and globalization; zonal and regional blocks.*

Introduction

Globalization is not a mere process of increasing world unity. The globalization of social relations firstly requires a reassessment of time and space in social life. People's life is increasingly influenced by the events occurring far from the social context in which they are carrying out their daily activities. From this point of view, globalization is not a novelty, since it started to develop two-three centuries ago, as the scientific and technical discoveries had become more prominent on a regional and universal scale. Ever since then, from the beginnings, the globalization of social-economic and financial relations has been associated with inequalities between various parts of the world.

Nowadays, a new battle is being carried out in the competition field, namely that for mastering information.[1] A *new field* is thus *opened to financial-banking,* industrial and commercial *strategies*, but also for the military and political ones. New relations appear between state and economic institutions, between the public and the private sector, between the state and the market.

Therefore, globalization appears to be one of the most significant changes that the modern world has confronted with. Many of the current fundamental problems, such as ecological issues, avoiding world-scale conflicts, or financial crises are of international importance, as regards their purpose.

Literature Review

Despite the pronounced increase of economic, financial and cultural interdependence, the world system is characterized by inequality and divided into a "mosaic" of states, whose concerns may be common but also divergent. Currently, there is no proof, and there shall be none in the near future, of a political consensus capable to go beyond the states' conflicting interests. However, it is more than certain that eventually it shall be possible to create a world government, but it shall be the

result of a lengthy process. In many aspects, the world is becoming more united and certain sources of conflict between nation-states or regions tend to disappear.

World homogenization thus appears as a first dimension of globalization. At present, universal standards replace particular homogeneity, specific to territorial units, with slight differences. The differences between territorial units and their inner differences which were mutually exclusive, are being replaced, through expansion, by a certain level of standardization and equalization, representing the "new spatial infrastructure", accompanied by free movement of material goods, capital, people and ideas, at regional and global level.

A similar and intense process is undergoing at a more limited regional scale. European integration sought among other unifying measures, to create "Europe without borders", in removing mutual exclusivity – under the conditions where certain closed systems coexist at the level of nation-states – requiring, among others, the accomplishment of a common organizational, economic and financial culture, either as a diffusion process of such an existing culture, or as a collective participative process, meant to create a new one.

Globalization has not yet produced an international institutional entity, with a legal status, capable to efficiently control and manage the homogenization process, the existing tensions or to create a redistribution or prosperity and peace in the world.

In the attempt to identify the scope of globalization, we find that it is about to become individualized, seeking to find its way, and its means of accomplishment and consolidation. Thus, in the given conditions, globalization is mainly marked by the means of communication, via Internet, due to which the geographic distance has disappeared, being measured by entirely different criteria – technological, economic, financial, etc. - which imposes a new universal world. Cybernetics and electronics, numerical networks, and the Internet have already removed borders in certain fields, such as: transport and communication, trade and financial-banking transactions.

The world that we are living in is a world of communications – globalized communications – where information is standardized, dematerialized, symbolic, direct, without intermediation, a world where information travels with amazing intensity and velocity, sending on a long distance both positive effects and the shock of negative effects, further to the complexity, complementarity and connections in which all nation-states are engaged, be it voluntarily or otherwise.

Such an example is the appearance of electronic trade, accompanied by new electronic financial and banking instruments (payment, credit, settlement instruments and the like), fluidizing the circulation of money and commercial swaps, facilitating remote transactions, with no necessity to travel, where the demand and supply are exchanged through the Internet, thus ensuring a network system where web pages and sites provide information on stocks, varieties, prices, warehouses, conditions, etc. – through which most swaps are materialized, the market is modernized, and the capital and the goods continue to circulate. In this context, the network system raises new legal problems (access, promotion, competition, taxation, control, protection, incrimination etc.), subordinated to a new economic order. .

Life therefore imposes that the reorganization of networks at world level be founded on technical and legal norms, regulating the network usage system, the obligations, liabilities and sanctions, in other words, an international legal framework, all the more so since the organized crime phenomenon has spread on the Internet (fraud, money laundering, goods and human traffic, robberies, network hacking, etc.) which may cause the unbalance of world order, by their impact.

This aspect of globalization therefore concerns both the increase of the spatial framework of event interdependence and the intensification of extensions based on connections, on the complementarity of differences, and on the competitiveness of alternatives. More and more often, people's behavior and activities in certain areas have repercussions that go beyond local, national or regional borders, and sooner or later they reach world dimensions. In general, the broader the time framework, the greater the participation to individual and collective activities with world impact. An increased sensitivity towards world-scale differences can be detected in this process, differences that

make up the bases of competitive and complementary interaction, exceeding the level of the nation-state.

Once the "space time compression" intensifies, it becomes impossible to "solve" problems by avoiding them from a spatial point of view. Since world level interdependences increase constantly, and once the fact that there is a "single world" is acknowledged, the possibilities for isolated partial solutions is diminished both for the individual, and for the local community or the nation-state. For instance, environment protection measures become general and mandatory, independently from the available material resources coming from outside the borders. Therefore, we shall uphold the idea pursuant to which the greater the globalization level, the more limited the range of "escape alternatives".

From the aforementioned notions, another aspect of globalization arises, consisting of the *trend to unify space and time.* Such as, from the spatial point of view, globalization tends to go beyond local, particular space, to the global, unique space, we may also speak of the unification of local times into a global time, by exceeding temporal discontinuity, based on the unification of non-simultaneous rhythms of various activities, and on the inclusion thereof in the world spaces. We are considering the *services* that are currently *most integrated in the world expansionist processes* (such as banking services and stock markets), which can no longer afford the daily breaks according to the local time. In the large cities of the world, there is a number of activities and institutions working constantly according to the "global time", such as international airports or the hotel industry. Thus, once the new information, techniques and technologies have appeared, time differences no longer exclude one region or another from the global system, the trend being to ensure the active universal time synchronization.

Another aspect of globalization as a historical process consists of the fact that *it induces a new step in civilization, that of the global society, of a universally diversified society.*

Reconsidering the world market, sustained economic and financial competition, the appearance of multinational and supranational corporations, power poles, the decline of the socialist/communist alternative, and many other factors, have brought the states to the position of seriously revising the role they used to play in time.

Globalization sweeps away all adversities trying to prevent its progress. It is *developed*, in general, *independently from the will of the states, of the governments, of the markets and civilizations*, liberalizing and unifying mostly by the force of combining the scientific and technical progress, such as information networks, communication technologies, to their particular technologies, to the management of various activities. The economic frontiers have an increased mobility, determined by the increase of regional integration and cooperation processes and by globalization. Customs connections, free zones, economic, political, cultural and even political complementarities, amplify such processes and trends, simulating and imposing – in a natural manner – partnership for development and peace and the spirit of solidarity.

Therefore, globalization is not strictly limited to economy and the means of putting it into action, in a higher generalizing form. It concerns the elements of civilization in all aspects, starting from the political, management and global organization ones, going through the economic, financial and social, to the military aspect.

Globalization brings about radical changes in communications, economy and finance, in reconfiguring internal markets, in the institutional and environmental system, in distribution and redistribution, in lifestyle, in human relations and mentalities, inducing a new morale, all the above being determined by the progress to be accomplished at all levels of human activity and existence, in shaping the universal man.

In this context, there appears the paradigm of social and spatial development, with its two opposite terms: *individualization* and *globalization.* The latter has drawn great interest in recent years, while most discourses have not been focused on concept definitions, but rather on highly differentiated approaches of the phenomenon.

Globalization is a process increasing the determining frameworks of social change, at the level of the world as a whole. Thus, while social change was first approached at local and national level, the concern for globalization has increased the interest in explaining relations between territorial units and the world, as a whole, and the debates have been focused on the problems concerning the "local-global" relation, and on multilevel surveys.

Our planet is actually o diversity of a whole, a system created from subsystems with different identities.

The level of globalization may be appraised to the extent where territorial subsystems are open and allow– when they can – the access of world forces as a whole. Where territorial communities stay closed at local, national or regional level, they create a set of closed and homogenous systems, possibly on the inside. Therefore, the larger the availability and participation of the subsystems, the more they shall get closer and resemble the global system, global features replacing local ones. Potentially, we are getting closer to the situation where the world as a whole shall be mirrored in any subsystem, and at the same time, each subsystem, town, region or nation-state shall be mirrored by the whole; each component becomes singled out, becomes more similar to the whole, while the whole manifests itself increasingly at component level, and local conflicts become global social issues.

The question that stays open is the one regarding the manner in which we could go beyond the mere listing of the other indicators of globalization, such as the operations of multinational and transnational, corporations, be they economic or financial, satellite communications, the existence of a universally accepted language, the ecological problems of the modern world or the global approach to security and peace.

The world we live in is a world of zonal and regional blocks, determined by the need for capitalization and common protection of the economic, financial, and human resources, and by the more or less conscious preparation for the integration in a global world (society, market, civilization). It is a world dominated by interests and economic and social inequality, national and supranational oligopolistic concentrations, determining policies and strategies with potentially destabilizing consequences (particularly for underdeveloped countries), supranational, zonal and global, financial and banking institutions and the like, with their own policies and strategies, ignoring many times the local particularities (development level, resources, opportunities, traditions, etc.). Paradoxically or not, the existence and development of transnational societies of the large corporations, cartels and monopolies, and their mergers, are the sprouts giving birth to a large extent, to global economy, to the needs of global society, with their related institutions and mechanisms.

At the same time, state involvement in a system of networks shall generate deep changes in the configuration of nation-states, in reducing their role as regards international or interstate organizations and transnational corporations, and in redefining the power positions within the international relations system.

Conclusions

Globalization, as a process, constitutes, beyond the objectivity of the extent of communications and of the information revolution, a political issue with implications beyond all fields of activity, including the military one.

The political aspect is the one which, eventually, establishes the politics of globalization, the directions and strategies, the steps towards creating the global society. It is the one creating and undoing alliances of all types, developing, limiting and structuring the markets, causing changes of state sovereignty, troubling the existing identity structures, etc. all determined by the factor of interest, supposedly the higher human interest...

In this context, globalization appears as the greatest defiance and challenge of the century, but also as a threat. Since the "global society" or the "world system" does not appear merely based on the

interdependence and mutual connections of its parts, globalization is able to go forward either in the direction of freedom, or in the one of domination. The classic example is the relations between "centre" and "periphery" (considered at scale…).

The intensification, vastness and spatial extent of integrating processes involves the harmonization of the participating states' decisions, of the common programs and projects in promoting the most objective goals, strategies and economic, social, financial, political and military strategies and priorities for the given area. These measures and joint efforts lead to a new dimension of international cooperation, creating a new pulse, arising from the promotion of regional, community and global relations.

Under the conditions of the objectivation of this process, where economies, markets, capitals, etc. no longer have frontiers, where competitiveness, competition and efficiency become reference factors, the defining role of man, education, professionalism, pragmatism, intelligence and ingenuity, and its power to adapt to a more mobile world, are increasing as well.

Sustainable human development remains the main (human) feature, ensuring development in general, social democratization, human dignity, solidarity, participation to the decision making process, balanced distribution, natural environment protection, etc.

THE ROLE OF INFORMATION TECHNOLOGIES IN REDUCING OF SOCIAL EXCLUSION IN THE PROCESS OF KNOWLEDGE SOCIETY AND THE SAMPLE OF CALL CENTERS IN TURKEY

ORHAN KOÇAK[*]
ERSIN KAVI[**]

Abstract
The emerging of knowledge societies brought about a lot of transformations in societies in the last decades. At first, these effects have been appeared in the developed and then in the developing world not only urban area also rural. The diffusion of the technologies that is invented on the mentality of knowledge society, have been effecting all life and promising to have major changes by providing access the opportunities for training and education, media and social networks and remodeling the way we do business, the nature of work and economy. In this concept, the internet, as a tool of the knowledge society, has also been regarded an important instrument in developing the rural regions around the globe. By connecting different parts of the world, the internet and other tools of information technologies create new job opportunities for individuals and companies. There are many people who cannot have and reach to the good education as well as the job opportunities in the rural areas as much as there is in urban areas. Many state institutions and companies have easily been investing to the rural area because of information technologies' low level entry costs. Especially, many of them open new call centers in the poor areas of countries. the purpose of this paper is that the role of information technologies in the rural area is going to be evaluated on the call centers sample in Turkey. First part of the study, the literature is reviewed about knowledge society and information technologies. In the second part, the benefits of information technologies for individuals who live in the rural areas and some model applications are explained. In the final part, call centers that established by state and private companies are investigated according to their employment and training effects for the poor in the rural areas.

Keywords: *Knowledge Society, Information Technologies, Rural Development, call centers*

Introduction

Today's one of the most important problem for societies is economic stabilization including sustainable development and decreasing unemployment. This is an intertwined problem and it cannot be solved without structural changes which are the usage of high tech in industries, investment in rural area, education and training updated according to new technologies as well as information technologies, both state and private sector compatibility and legal and regulatory platform for new emerging sectors and jobs. In this paper, call center jobs, as an emerging sector and is supported information technologies, is to be investigated in the transition period. Of course, it is seen a lot opportunities and threats for the sectors by producing new jobs and employment opportunities in the sector and reducing employment in the others. Although, popular jobs require high level qualification in the knowledge society, call centers jobs are rather different in terms of workers' qualification levels, flexibility and investment. Especially, the number of call center can be increased in the short time and the required workers and qualifications can be met from local area. That is why, call centers are seen a source of employment and a dynamic element for young educated local people by state and private companies. There is a shift from developed countries to developing countries such as India, China, Malaysia and Turkey in call centers investments.

[*] PhD., Faculty of Economics and Business Administration, Department of Labour Economics, "Yalova University", (e-mail: okocak@yalova.edu.tr).
[**] PhD, Faculty of Economics and Business Administration, Department of Labour Economics, "Yalova University", (e-mail: ekavi@yalova.edu.tr).

With the stability in politics and economics in the last decade, Turkey is taking new investments in many sectors and also call centers sector both by foreign and domestic companies. On the one hand, Turkey has many advantages such as, cheap and educated labor, closeness to the developed region, high unemployment rate and young population, companies want to invest to the call center jobs. On the other hand, Turkish state offers some investment incentives for the east of Turkey in order to decrease unemployment and economic stability. In the last three years, many foreign and domestic companies established their call centers in the region in order to reduce their operation costs. Although, call centers sector is not much so big as it is in India, the sector is promising and supporting in decreasing unemployment and development of rural area in the east of Turkey. By investing and decreasing unemployment in the region, people are included in social and economic life, reached education and training opportunities and had hopes for their future.

Although the subject of call center is known in the developed world, it is not enough studied in Turkey since there is no related databases. The purpose of this paper is that the role of information technologies in the rural area is going to be evaluated on the call centers sample in Turkey. First part of the study, the literature is reviewed about knowledge society and information technologies. In the second part, the benefits of information technologies for individuals who live in the rural areas and some model applications are explained. In the final part, call centers that established by state and private companies are investigated according to their employment and training effects for the poor in the rural areas.

1. The Effects of Information Technologies in the Process of Knowledge Society

Information and communication technologies (ICTs) have become increasingly important drivers of economic growth during the last two decades. They were a major source of productivity growth during the 1990s in many developed countries. The diffusion of ICTs has been argued to permanently change the rate of sustainable economic growth, and ICTs have frequently been described as core technologies of the emerging knowledge-based economies (Tuomi, 2004, 3). Knowledge does not consist of ICT alone, without a social, political and cultural context, ICT and knowledge economy will not flourish (Evers, 2001, 17). A knowledge economy needs to be supported with an environment from legal to societal.

Information technologies is seen an important driver of economic and technologic development as well as cultural and social change. By using information technologies, reaching, using and reproducing of information bring about both new knowledge and transformational change of society. In this process, people keep new mentality in which new knowledge is used again and again to produce value added services and products. The development of the information society and the wide-spread diffusion of Information and Communication Technologies give rise to new digital skills and competences that are necessary for employment, education and training, self-development and participation in society.

Knowledge society defines a broader role for ICTs as a tool for lifelong learning for citizens, enabling knowledge workers to improve skills and their capacity to innovate by accessing knowledge via the Internet from the public domain. Individuals have more freedom and greater possibilities for self realization. Individuals can be empowered in dealing with the governments and service providers through improved channels of interactive feedback. Communities can be empowered to participate in planning processes through access to information and using the Internet for advocacy of views. Countries develop a comparative advantage that is based on application of knowledge rather than only cheap labour (Bhatnagar, 2006).

ICT-related policies are being developed to support of a wide range of important goals and aspirations associated with the development agendas of low income countries as well as developing countries (Mansel, 2009, 3). There are a lot of cases in the countries where information technologies is an engine of development in many ways (Tiwari, 2008, 448). Both ICT production and use have been associated with economic development and growth through their multifaceted impacts on

employment creation, exports, innovation, increased productivity and other 'spillover' effects. These beneficial impacts have led many transition economies to promote, to a greater or lesser extent, the production and use of this technology (Harindaranath, 2008, 34).

2. The Development Impact of Information Technologies in Rural Area

Technological innovations in the last two decades have led to a restructuring and reorganization of work. The emergence of information and technology-driven economies has expanded the service sector and redefined notions of time, space, distance, production, consumption and boundaries on the global stage. It has changed the social, economic, cultural and political environment and the nature of global interaction. New communication technologies and investment in telecommunications infrastructure have made the long-distance transfer of information realizable and inexpensive. Not only developed countries, but also developing and less developed countries reap the benefits of these opportunities have low entry barriers, provide employment and development and offer new skills as training source both in urban and poor rural area.

Emerging information technologies also changed the type of businesses and the way people do business and processes. Along with ongoing Taylorization of work processes, these changes have made possible the rapid globalization of services such that many services previously produced only locally are now outsourced or 'offshored'. These services include call centers, software development, financial services, stock market research and medical transcriptions (Abraham, 2008, 198). Call centers are representative of new service activities that have expanded in recent years, with intensified cost pressures in liberalized markets and new restructuring opportunities provided by advanced information technologies. They also have a number of characteristics that might be expected to lead to convergence on a low wage, Taylorized model of work design: low capital requirements, high mobility and often easily rationalized task content (Doellgast, 2009, 350). Call Centers are Fuelled by advances in information technology and the plummeting costs of data transmission; firms have found it cost effective to provide service and sales to customers through remote technology mediated centers (Holman, 2007, 1).

Over the past decade, call centers which is called o**utsourcing industries** often refers to the delegation of non-core operations from internal production to an external entity specializing in the management of that operation. The decision to outsource is often made in the interest of lowering firm costs, redirecting or conserving energy directed at the competencies of a particular business, or to make more efficient use of worldwide labor, capital, technology and resources have experienced phenomenal growth in virtually every country around the world (justcareers.com, 2011). The call center industry, in particular, is one of the most rapidly growing areas of work globally. It epitomizes some of the key contemporary issues concerning the shifting nature of work, labor relations, economic development and regulations (Abraham, 2008, 198).

2.1. Call Centers A New Type of The Organizations

In recent years call centers have become one of the fastest growing areas of employment in many countries. It must be noted, however, from the outset that call centers do not constitute a sector but a specific form of work organization. Customer telephone enquiries, which formerly were scattered among specialized company departments, are transferred to a centralized call-centre. The purposes of this operation are both to provide a more client-oriented service and to improve the efficiency of processing customer enquiries.

Some authors see call center jobs characterized by high degree of computerization and standardization of work. Because of these features, this type of work usually depicted as an unskilled work with high time pressure and de-humanization of work. That's why some authors describe it as an expression of "Taylorism". Consistent and tight technological surveillance and repetitive work cause stress which later result in job dissatisfaction among these employees (Yılmaz and Keser, 2008, 24). The setting up of call-centers entails a new division of labor within or between firms, one

that is frequently characterized by the standardization and fragmentation of tasks. In addition Weinkopf agree that call-centers are frequently seen as a prototype of 'neo-taylorism' in the services sector (Weinkopf, 2002, 457). In this organizations, the fatigue and stress that can result from the aggressive management of highly intense and tightly quantified call work can make groups of call centre workers mental and physical tired (Fisher, 2004, 158). Workers' work is closely monitored, tightly controlled, and highly routinized thanks to extensive reliance on highly sophisticated computer technology (D'Cruz, 2006, 342). The type of work in call centre is of itself demanding, repetitive, and often stressful. This is reflected in high levels of turnover and absenteeism (Lewig, 2003, 367).

Macro-economic and socio-political climate are driving important changes in the nature of employment and work (Rainnie, 2008,197). A call center is an example of how modern information technology has rendered it possible to create new and improved forms of communication between customers and companies including the public administration. Broadly defined, a call center is a communication platform from which firms deliver services to customers via remote, real time contact (Norling, 2001, 155). As a form of neo-taylorist work organization, call-centers go against the trend towards more cooperative forms of work found in many services (Weinkopf, 2002, 463). In this mean, the pattern shows the trinity such as person, computer and network as the new work unit. The trinity has become a kind of smallest component in the companies, a module possible to combine with other modules creating a limitless network for cooperation (Norling, 2001, 158).

With the shift towards a more competitive ICT-based services industry, call centers are fast becoming characteristic institutions of today's information economy. These novel institutions which provide enhanced services to their customers represent distant or external sites of corporate entities and respond to an increasingly sophisticated and discerning clientele. Within the 'customer services and care' industry, two simultaneous trends are apparent. The first is the establishment of call centers within countries which are key players in the digital economy; the second is the phenomenal growth of such centers in the developing world, where Information Technology Enabled Services are increasingly outsourced to low waged, multilingual countries with relatively low overhead costs (Ng and Mitter, 2005, 210).

2.2. Popular Countries in Call Center Sector

The current relocation of service sector jobs is a consequence of global business strategies as well as technological advances. The convergence of communications and networking technologies has made it possible to digitize a vast amount of information that can be transported, processed and retrieved to and from a distant location at little cost. From a technical and productivity standpoint, an information-processing worker sitting 6,000 miles away might as well be in the next cubicle and on the local area network. In this scenario, with the cost of telephony steadily falling, the advantages of relocating ICTs-related and ICTs-enabled jobs from USA or UK to India, Malaysia or Ghana are obvious (Ng and Mitter, 2005, 212).

A recent survey by the Indian National Association of Software and Service Companies (NASSCOM) found that almost two out of five *Fortune 500* companies currently outsource some of their software requirements to India. Union in the UK have predicted that up to 200,000 jobs in the finance sector would leave, mostly to India, as companies take advantage of India's cheaper labor cost. The cheaper labor cost is only one consideration for choosing India as a desired site for relocation of work. There are more IT engineers in Bangalore (150,000) than in the Silicon Valley (120,000), creating an enabling cyber culture. India now produces two million college graduates a year (a number which is expected to double by 2010), 80 percent of the graduates are English speaking (The Economist, 11 December, 2003). It would cost a company US $13,000 to hire a fresh graduate with combined information technology (IT), engineering and business skills from the Indian Institute of Management in India, while a Stanford University graduate in the US with similar qualifications will be paid about US $95,000. But the cost differentials are equally noticeable in the

relatively low skilled end of the information processing sector such as customer care services, medical transcription, processing of airline tickets, accounting and tax returns forms. The average annual wage of an employee in a call center in the UK is £12,500 compared to the £1,200 average annual wage of a similar employee in India (Ng and Mitter, 2005, 212).

The computerization of work has made it easier to connect to the capabilities that exist in countries like China, Ireland, Australia, Canada, and the Philippines, and it is accelerating the trend toward offshore outsourcing of services (Gereffi, 2004, 7). Despite the mobility of call flows and the scale economies of serving large geographic markets, most call center markets are not international: while 86% of centers serve the local, regional, or national market in their own country, only 14% serve the international market. The exceptions to this pattern are those countries that have specialized as global subcontractors India, and to a lesser extent, Ireland and Canada. In a survey examined by Holman, the proportion of call centers serving international customers is 73% in India, 37% in Ireland, and 35% in Canada. Canada is rarely noticed as a major provider of subcontracting services, but its proximity to the US and shared language, time zone, culture, government provided health care, and low exchange rate to the US dollar has made it an increasingly important locus of subcontractors for US corporations (Holman, 2007, 5).

The spread of call center services is also occurring in a way that is different from that found in manufacturing. Thus, while call centers are geographically mobile, their spread is quite uneven, shaped particularly by language and culture. Most centers providing international services follow historic patterns of linguistic ties: between France and Morocco; between Spain and Latin America; between the UK and US and other English speaking countries such as Ireland, India, Canada, and South Africa (Holman, 2007, 5).

India and the Philippines have seen a mushrooming of outsourced call centers, providing white-collar employment to many who would have found it difficult to obtain employment after secondary and tertiary education. On the other hand, in Malaysia, the contact center business is geared primarily towards the local market, but with projected regional and global ventures in the pipeline. Multinational companies have started setting up in-house call centers that serve the region, providing the much-needed push to upgrade the industry (Ng and Mitter, 2005, 211).

2.3. The Employment Opportunities of Call Centers

Call centers represent a blend of old and new employment features that are only partially grasped by existing theoretical alternatives. Labor process theory suggests that call centers are best depicted as new electronic assembly lines of fragmented, low skill service labor. Second-wave post-industrial theory represents call centers as a significant foray into the information/knowledge economy (Russell, 2002, 467). Number of employees working in call centers rapidly increasing in developed and developing countries Call center employment figures in developing countries represent a different picture. Because not only local companies establish call centers but also multinational companies prefer developing countries because of low wages and high unemployment among blue and white-collar workers (Yılmaz and Keser, 2008, 32).

Customer service is critical to the success of any organization that deals with customers, and strong customer service can build sales and visibility as companies try to distinguish themselves from competitors. In many industries, gaining a competitive edge and retaining customers will be increasingly important over the next decade. This is particularly true in industries such as financial services, communications, and utilities, which already employ numerous customer service representatives. Centralized call centers will provide an effective method for delivering a high level of customer service. Employment of customer service representatives may grow at a faster rate in call centers than in other areas. However, this growth may be tempered: a variety of factors, including technological improvements, make it increasingly feasible and cost-effective for call centers to be built or relocated outside of the Developed Countries where labor cost relatively high (McDanie, 2007, 5).

Call centre employment has been growing exponentially both domestically and globally. They are growing at an astonishing 40% per year globally. In Australia, call centre growth is forecast at around 20 –25% annually (Lewig, 2003, 367). About 160 000 workers are employed in 4000 different call centers in Australia, while employment growth is calculated to be in the order of 25 per cent per annum domestically and 40 per cent globally. Given these trends, call centre employment has become a significant factor in recent job growth. Examination of call centre work has the potential to shed further light on what is unique in the contemporary employment relationship (Russell, 2002, 468).

The globalization of services started with multinational firms in fields like accounting and consulting setting up offices in offshore locations to access new markets, followed by the movement of centralized labor-intensive functions, often referred to in services as "back-office" work (such as call centers and bill processing) to places with pools of educated, low-cost labor (Gereffi, 2004,14). According to Weinkopf, the number of call-centre jobs in 13 European countries in 2000 was 736 700, among which the United Kingdom, with 243 000 or 37%, had by far the highest number. Next came Germany with 148 000 or 17% and France with 104 900 or 14%. In fourth place came the Netherlands with 57 000 jobs, while the figures for other countries were rather low. For the year 2000 the number of call-centers in the United Kingdom was estimated at around 5 000, about twice as many as in France or Germany (each with around 2 500). Spain and Italy as fast-growing markets with respectively 5 and 4% of the European call-centre market, while the extent of call-centers in Portugal, Greece and the Scandinavian countries was estimated to be rather low, at least in 2000 (Weinkopf, 2002, 458).

As an important country, the USA has different policies in terms of call centers' diffusion and employment. Although call centers are found in all States, customer service representatives who work in call centers tend to be concentrated geographically. Four States—California, Texas, Florida, and New York—employ 30 percent of customer service representatives. Delaware, Arizona, South Dakota, and Utah, have the highest concentration of workers in this occupation, with customer service representatives comprising over 2 percent of total employment in these States. The United States has lost 250,000 call center jobs to India and the Philippines since 2001. That's part of a much larger trend. 3.3 million service industry jobs, including call centers, and $136 billion in wages, will move to countries like India, Russia, China and the Philippines (McDanie, 2007, 5).

Call centers jobs easily increase the employment since it offers flexible working opportunities from young, students to mothers. Especially, there may be many reasons for the use of college educated workers. Some call centers have specifically located near college campuses to take advantage of student labor, and at least some of these students may continue working in call centers after graduating. Some college graduates may view call center work as a temporary or transitional job before fully entering the labor market, while others may face a tight labor market and work in jobs that under utilize their skills (Holman, 2007, 13). There is an exception of some call center jobs may not be fit for student such as those providing tech services or serving large business may require relatively professional skills. Call centers are complex workplaces. They are also a huge and growing source of employment (McPhail, 2004, 77), and on-going studies into the experiences of those who work there, and into ways to improve their work-lives, will continue to be valuable in the future.

2.4. Call Center Jobs Reduce Migration

An additional benefit of call center jobs is in the reduction of migration for young and skilled workers. Call centers are attracting younger educated workers, the exact demographic group that many regions have trouble keeping. The new and dynamic information technologies jobs such as call centers could help to motivate some of them to stay, offering them better work at home than they could find through migration. This potential benefit is hard to understate because the loss of young talent is a major hurdle to countries worldwide. Making jobs come to them, rather than uprooting citizens to find jobs, is ultimately more efficient and effective for poverty alleviation and growth (Zielinski, 2005).

One of the glaring ironies of the global labor market is the number of high-skilled well educated immigrants working in menial and low-skilled positions throughout North America and Europe. It is not uncommon to find African and Asian doctors driving taxis in Washington, D.C. Communication technologies will allow specialists to practice their trade where they live rather than where the market dictates. The positive externalities associated with this change have the potential to be significant. Students would be motivated to study subjects that are now in local demand and entrepreneurs will be able to use their creative talents at home with a stable market of paid professionals. Another benefit that call centers can bring, regards the type and nature of the new jobs. Often the countries attracting this kind of employment do not have a history of service sector employment and so call center positions can stimulate the updating of skill sets (Zielinski, 2005).

3. Call Centers In Turkey

Customer relationship management is crucial for today's costumer oriented companies; because of this necessity, companies establish call centers with an increasing pace not only in developed countries but also in developing countries like Turkey ranging from financial services like banking to telecommunication sector. Multinational companies also increase the number of call centers in developing countries by outsourcing their call center work to countries with relatively low wages (Yılmaz and Keser, 2008, 23).

Turkey is one of these countries with increasing employment numbers in call centers. Turkey is getting much attractive both inside and outside since political stability in better than before, employment costs are pretty low, unemployment is high including youth educated, companies take into consideration their customer services, current legal ground is proper for subcontracting jobs which encourage the companies to outsource their services to the call centers, easy transportation possibilities in the cities of east and the call centers are supported by the state in terms of infrastructure, taxes and others.

Turkey has a lot of advantages to be a regional center in international competition and attract foreign direct investments (Call Center Association, 2009);

- Cultural closeness with Europe
- Geographical proximity to developed areas
- Young and dynamic population
- Qualified human resources
- Relatively qualified technologic infrastructure

Richardson and Belt list 7 benefits of call centers in suburb and rural area which is less developed (Richardson, 2001, 86):

— They create employment which does not displace other local work.

— Call centers are capital intensive and bring new capital and technological investment.

— Call centers have the potential to bring new types of employment to the ares.

— Call centers' employment can stimulate the updating of skill sets, including keyboard skills, customer service skills, communications skills, team-working skills, and the ability to pick up product knowledge quickly and flexibly.

— Call centers bring a new work culture to an area, which, though "not unproblematical", can play a role in modernizing the area

— Many Call centers have more commitment to training than in other office-type work (albeit relatively narrow training).

— Call centers create work for women and youth.

It is expected that there are more than 900 call centers in 12 different sectors in Turkey in 2008. The number of call centers increased about 11% according to previous year. The number is not

much but it is promising for the increasing of employment in the near future. Since youth unemployment is high in total unemployment rate, call centers is going to bring new employment opportunities for young educated generations. There is a 20% growth on employment in the call centers sector in 2008. Many companies who offers call centers services plan to enhance their services in East and Southeast cities of Turkey not in the cities such as İstanbul, Ankara and İzmir which are the third biggest cities. In this mean, poorer areas of Turkey will have more employment opportunities than rich areas (Tarakçı, 2008, 57).

Business world in Turkey is giving much importance to the customer services is an important support to the growing of call centers in the country. Call centers are increasingly growing in serving both for the Turkish companies and foreign companies. As of 2005, the call sector services companies have been getting new customers from outside of Turkey. Especially, many companies from Germany where there are lots of Turkish people started to work with Turkeys' call centers companies. The extend of the numbers of migrated people who expected to be more than 3 million from Turkey is an important factor in Germany (Tarakçı, 2008, 57).

Because of call centers' cost advantage about 30% and workforce potential, new investments will continue in the East of Turkey. The market of call center is expected to grow 12%. The current number of workers in call centers in Turkey is 35.000. The total revenue of call centers sector is about 1 billion TL. There are two trends of establishment of call centers. On the one hand, the current call centers in the West of Turkey, especially in big cities, are moving to the East of Turkey. On the other hand, new call centers companies would like to start in the East of Turkey, especially in Erzurum, Erzincan, Gümüşhane and Diyarbakır. Of course, there still are many call centers in other cities out of east side such as Yalova, Antalya, Uşak, Bursa and Kocaeli.

70% of call centers workers are woman, 65% of workers are graduated from university, 35% of the workers are high school graduate and average age of workers are between 26-28. Although the sector is 15 years old, it is pretty effective and has an expert profile and that's why it attracts attention in the region so that gets awards from Europe and the World. The call center sector is promising in Turkey by providing growth and employment, investments, supporting to regional development and private and public sector and getting an opportunity to become an important sector in international competitive arena. Its growth between 2003 and 2008 was 100%, between 2008 and 2013 15% yearly is expected and employment potential will be 65.000 in 2013(Call Center Association, 2009).

To provide the continuation of service and personal quality, it is expected that the establishment of new call centers will be supported by the state. In particular, in cities in the east where educated youth unemployment is very high and people don't have much alternatives in open jobs. Doing so, companies are going to see more stable labor and 30% lower labor cost than to the west of Turkey. Elif Gözen is a Manager in the Connect Company in the service sector, says that "unemployed people in İstanbul may choose the open jobs, but people have no alternatives to choose an open job and the people try to achieve in better manner and continue the current position in cities in the east of Turkey".

A company which offers call center services to the many companies such as Mercedes, Coca-Cola, Algida, aims to move their services to the East of Turkey. Also, many foreign companies who get their call center services from India, cancels to work with Indian companies and want to work with Turkish companies. Turkcell, is the biggest GSM cell company in Turkey, established a call center in Erzurum in the east by providing employment opportunities for region's young educated people. Today, Turkcell is the second biggest employer in the Erzurum with this investment. Avea, is the other operator in GSM cell sector, established a call center in Erzincan is a small city in the east. Avea points out that, "our call center service was in Istanbul and because of traffic every day 3-4 hours were spending on the traffic by giving rise low productivity and increase transportation costs. By moving to Erzincan, the company got rid of these kinds of extra costs as well as cheap labor prices Türk Telekom, is only service provider for land phones, established its third biggest call center

in Erzincan. Türk Telekom employs 2.700 people East and Southeast of Turkey at their call centers and 609 of them currently working in Erzincan and the number will be 1200 after 1 year (Kuvel, 2010).

In order to provide the development of call center sector and produce more value add services following items are much important (Call Center Association, 2009);

- Academic programs should be established to provide proper qualified human resources for the call center sector
- The costs of telecommunication must be much competitive to be able compete with rival countries
- The establishment and development of technoparks and infrastructure should be supported for information and communication technologies as well as broadband internet
- Increasing special investment and employment encouragements should be applied for the sector by state
- Increase transportation opportunities

Conclusions

The effect and role of information and communication technologies have been increasing on daily social, cultural and economical life, in work place and on the type we do business. Many societies benefit from the developments of these technologies both developed and developing as well as poor countries. 40 % of Turkey's population is under 22 years old which is defined pretty young. Although there is a big percentage of young population, there are no much employment opportunities for this part of society.

Turkey, as an emerging country, is becoming an attractive country by domestic and foreign investors. Consequently, this trend brought about a lot of flourishing new sectors that are supported by information and communication technologies. With the investment incentives and other opportunities such as young population and tendency the usage of ICTs in the society, especially in the poor areas of Turkey, has caused the emerging of new jobs and sectors such as call centers. During the investigation, it is seen that, Turkey faces a lot of opportunities with call centers jobs. First of all, call center jobs as a employment model, has been providing many employment opportunities for the young educated but unemployed people. It will help country's unemployment problem which is structural. Secondly, many young educated and unemployed people who feel more excluded as social and economical will be included with the call center jobs. Thirdly, unemployment is not only a structural but also a matching problem. There a lot of open jobs and job seekers but they are not matched since geographical and mobility hardships. When companies move or establish the call center companies in the east of the Turkey, the people will not search a job and migrate to the west of Turkey. Open jobs and job seekers will be matched by investing to the region. Finally, call center jobs on the one hand will attract other investments to the poor areas and on the other hand will trigger education, training and on the job development for the benefits of all society as well as young.

Because call center is a new sector, it needs to be examined more in the development process in the future. It seems the sector's size is going to grow and the growth should be supported by making new projections in education system, on transportation and urbanization, on information and communication technologies and economic incentives. By doing so, call center sector can meet the requirements of international and national companies and have a serious effect on the development process of Turkey.

THE INFLUENCE OF LENDING ACTIVITY OVER CONSUMER'S BEHAVIOR

VIORICA MIRELA STEFAN-DUICU[*]
DRIAN STEFAN-DUICU[**]

Abstract
Lending activity involves an embedding of general principles which require the analysis of risks incorporated in banking operations, both from a consumer and bank perspective.
Correlated with economic environment shifts, the consumer's definition concentrates a series of individual and group necessities with a decisive role in a possible lending decision.
As socio-economic issue, the consumer is oriented at lending when his income in order to buy goods or services is not satisfactory.
This paper aims at presenting the consumer hypostasis resulted from lending activities, identifying its purposes and risks.

Keywords*: Lending, environment shifts, lending risks, consumer's behavior, individual necessities*

Introduction

According to Michael Solomon, Gary Bamossy, Soren Askegaard, Hogg, K. Margaret, "a consumer is generally thought of as a person who identifies a need or desire, makes a purchase and then disposes of the product during the consumption process"[1].

Richard E. Beck and Susan M. Siegel highlight that "Consumer lending includes all types of credit extended to consumers, either individually or jointly, primarily for buying goods and services for their personal use"[2].

Sustaining Professor Arjun Chaudhuri, Fairfield University, Connecticut, "Consumer behavior is the study of how and why people consume products and services. All behavior can broadly be attributed to three classic influences – the particular characteristics of the individual, the environment that surrounds the individual (culture, subculture, family, friends) and the inherited genetics that constitute the biological makeup of the individual (personality, attitudes, needs)".[3]

Loan consumer rights, along with other addendums, are stipulated in GEO no. 50/2010 regarding loan contracts for consumers, published in Official Monitor, Part I no.389 per June 11th 2010.

The notion of "creditor" includes all legal entities, branches of credit institution and non-banking financial institutions that operate in Romania and grant or undertake to grant loans in its commercial of professional activity.

The consumer, represented by the individual who is acting in purposes structured outside his professional or commercial activities, enters in the lending area activity trough the loan agreement.

In terms of Richard E. Beck and Susan M. Siegel, "a consumer is a natural person who is primarily or secondarily liable on a credit contract- in other words, the individual ultimately

responsible for repaying the loan and a consumer credit is borrowed funds used for personal, family, household, or agriculture – not for commercial or business purposes."[4]

According to the law in force, the credit agreement refers to that agreement in which a creditor, in front of whom the credit consumers are protected, grant, undertake or stipulates the possibility of granting to a credit consumer, as a deferred payment, a loan or another similar financial facility, except the agreement for continuous service or good supply of similar kind, when the consumer pays for this services or goods in rates, throughout their supply period.

Conceptual framework

Coming to aid the consumers, we mention that a credit agreement can be modified according to the new law in force in two ways, namely by addendums and trough the direct effect of the law over the contract.

The first way – trough addendums, the creditor is obliged to evidence the proof that all diligences have been made in way to inform the consumer over signing this kind of addendum. If the creditor is trying to introduce a clause by which he tries to evade the legal provisions, it is considered void, whether the consumer signed it or not.

The second way – trough the direct effect of law over the contract, situation that carries the name "tacit acceptance" is when the consumer does not sign any addendums, no matter the reason or cause.

According to law, it is forbidden the creditor to unilaterally change the agreement, this law restates the "requirement of full contract" that is to include all the charges and costs and the info in respect of which the consumer has no choice, without making references to general business conditions, to general pricing and taxes lists or any other reference.

All these interdictions, addendums and determinations in the credit agreement framework represent the action of the law maker in order to protect the consumer in front of abusive behavior that can appear in banking practice.

The law in force impose and require from banks the following conditions: full and correct informing from the pre-agreement stage forward over the whole contractual agreement, compliance to honest advertising for their offer of credit product, the complete agreement rule, with no references to general business regulations, the pricing and tax list and any other fees or any other references, the interdiction to increase the fees, prices or any other costs over the full ongoing credit agreement, the inclusion of variable interest calculation in the credit agreements and prohibits the unilateral settlement of the interest over the ongoing contract, procedures for amending the credit contract addendums and the impossibility of tacit acceptance of new conditions by the consumer if they do not meet the legal provisions, meaning to provide a document attesting the closing credit-debt settlement.

The quadrant reflected in GEO no. 50/2010 is exposing, in its appendixes both the theoretical info necessary in the loaning relationship and the precise mathematical formulas for annul effective interest calculation and the fact, that for the approved loan there cannot be charged with other than certain fees: file analysis fee or account management fee (this fees cannot be simultaneously collected), compensation in case of prepayment, the insurance costs, penalties for payment delay, unique fee for services at consumer's demand.

In the legal matters it is stipulated that the information, for any customer, must be, clearly and concise over a representative example, visible and easy to read, in the same visual field and with the same character font size.

This elements are: the interest rate of the loan (fixe and/ or variable) together with the info regarding any other fees and costs included in the total cost of credit, the total credit amount, the effective annual interest rate, the duration of the loan, in case of a form of deferred payment for a

[4] Beck, E.R. Jr., Siegel, M. S., Consumer Lending, American Bankers Association, 2001, p. 3.

specific good or service, the purchase price and the amount of any payment in advance and by the case, the total amount payable by the consumer and the total amount of rates.

The creditor, and if necessary, the intermediary shall provide to the consumer, based on the terms and loan conditions offered by the creditor, and where appropriate the expressed preferences and provided elements of the customer, information that is necessary to provide the consumer the meanings for a comparison on offers in order to take an informed decision on whether to conclude a loan agreement.

The information should be provided well in advance, but not less than 15 days (this period can be reduces by written agreement of the consumer) before the consumer is to sign a credit agreement or to accept an offer: on paper copy or other sustainable support.

The information provided refers to: the type of credit, the identity and registered office address and the working point of the creditor, the total loan and conditions governing the drawdown, the duration of the loan, if a credit is given in the form of deferred payment for a specific good or service, the interest rate of the credit; conditions governing the application of the borrowing rate, the interest rate calculation formula, and deadlines, conditions and procedures for interest rate change and, if different rates apply in different circumstances, above all the applicable rates, the effective annual interest rate and total amount payable by the consumer, illustrated by a representative example which is mentioning all the assumptions used to calculate that rate, if the consumer informed the creditor of one or more components for the preferred credit, and the duration of the loan and the total loan amount, the lender must consider these components, the management fees of one or more accounts recording both payments transactions, and drawdown, unless the opening of an account is optional, along with charges for using a mean of payment for both payment and drawdown, any other costs resulting from the credit agreement together with credit conditions, can be changed; existence of taxes, fees and costs which the consumer must pay in connection with the completion, publication and / or the registration of the credit agreement and any attached documents, including notary fees.

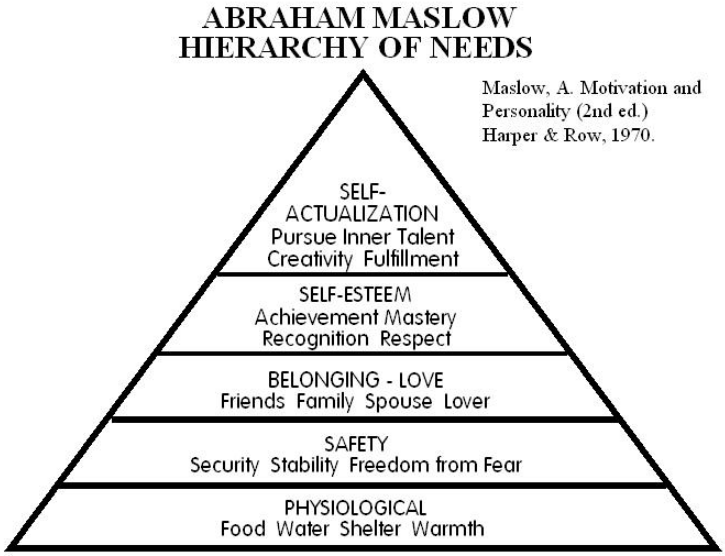
The obligation, when the case, to conclude a agreement for a credit enhancement service is mandatory in order to obtain the loan itself or in order to obtain it in accordance with terms and conditions.

The interest rate, applicable in case of late payments and measures for its adjustment and any other costs incurred by the violation of the agreement, a warning regarding the consequences of missing payments, requested guarantees, the existence or absence of withdraw right, the right of early payment and, if its applicable, the info regarding the creditor's right to compensate and the way it is going to be settled according to terms, the consumer's right to be immediately and costs free informed over the result of database search on trustworthiness, the consumer's right to request and receive a free copy of the draft credit agreement.

Social and economic approach

From a consumer's point of view, lending activity refers at the action taken to contract a loan in order to satisfy their needs or desires (loans for personal needs, loans for buying a home etc).

In order to highlight an overview for consumer behavior, we shall begin with Maslow's pyramid, which establishes the hierarchy of needs.



Professor Geoffrey P. Lantos describes Abraham Maslow`s classification of motives as a hierarchical ladder and an influential system for explaining human and consumer motivation.

Therefore, safety (security) needs involve **physiological and psychological needs** concerned with the need to establish stability and consistency of life, **social needs** (love and belonging, affection, affiliation, oriented toward loving and being loved by others, affiliation social recognition, being accepted by people, and satisfied through relationships, social groups, friends, acquaintances, advisors, **esteem needs** represented by self-worth, self-confidence, and self- respect**, self-actualization needs** related to fulfilling personal potential and devotion.[5]

The factors that influence the consumer's behavior in economic activities startup, according to Phillip Kotler's classification are the following: socio-cultural factors, psychological factors, personal factors, economical factors and demographical factors.

If we extend this factor's influence in consumer's decision assuming for a getting a loan agreement, a individualized vision of it is created.

The socio-cultural factors can be represented by family, educational level, culture, social status, reference groups, social classes.

Under economic-social aspect, the education grants a primordial role in the decision of getting a loan agreement. As a foundation of this decision, the consumer must analyze, with a high level of responsibility, every detail that comes from the consumer-bank relationship. A consumer must realize if he can afford the gradual coverage or prepayment of the loaned amount, if his own behavior or his way of life folds with the terms and requirements of bank's agreement.

Contracting a loan involves a series of steps, a stable trajectory that make the demarcation from a consumer that can assume the risks involved and another one, that will not reach the stage of primary intention, which will reach another option that will cover their needs.

The physiological factors include: motivation, beliefs, attitude, perception, learning.

The correlation between the involved risks of contracting a loan and the benefits of a good financial and banking management involves a homogenization of beliefs with perceptions, the motivation and behavior elements developed ongoing, in concordance with the saying of the American president James Abraham Garfield (1831-1881): "a right motivation is stronger than the force".

[5] Lantos, P. G., Consumer behaviour in action: real-life applications for marketing managers, Library of Congress Cataloging-in-Publication Data.

The personal factors refer to: age, incomes, way of life, sex, occupation, personality.

Earnings, as a household level, influence the loaning activity trough the coverage of default rate, of commissions and interest provided and also, the reach of its initial purpose.

The age, along with the incomes gained, are representing a condition at contracting a loan, achieving a interdependency strictly base on gaining some results that are going to place the consumer and the credit institution also, in the comfort zone granted by the trustworthiness and seriousness on both sides.

The economic factors include the specifics of the micro environment and macro environment. The great picture of the economy can evidence a crisis situation or a situation that involves the growth of the economy.

The great picture of the economy shapes the population's decision to contract a loan, trough the economical-financial evolution prism. When the growth of the economy, at the whole state level is high, the consumer is willing to contract a credit loan, while the risks are very low or even covered.

In the opposite situation of economic growth, meaning the situation of crisis, the population's decision regarding the contract of loan is subjected to a developed reasoning, with uncertain results considering the general fluctuating activity caused by globally and country changes.

Demographic factors are putting their mark over the crediting activity, evidencing the following notions: birth rate, natural growth – in terms of credit institution, they can be seen as part of a process that develops the idea of potential subject apparition: clients, loan bearers; mortality – carries out the implicit risk assumed by banks, the type of their habitat - rural or urban – the origin of households can fit the consumer both in the optimum and unanimously accepted pattern of accepted client and in the not meeting the conditions for a loan agreement. The type of habitat gains accentuated relevance when it is cumulated with the other environmental factors.

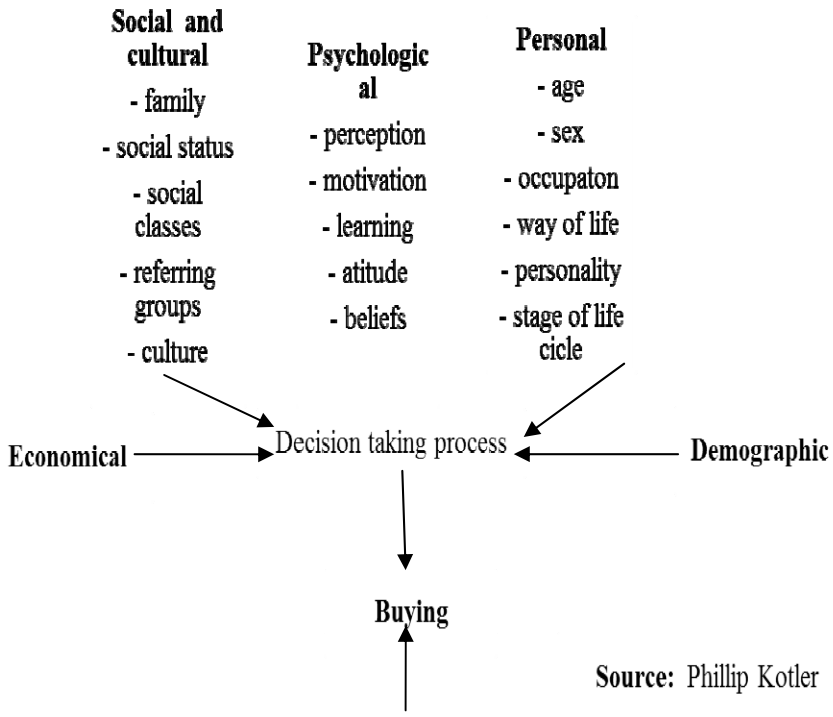


Figure no. 1. Factors that influence consumer behavior[6]

[6] Kotler, P., Armstrong G., Saunders, J., Wong, V., Principiile marketingului, Editura Teora, Bucuresti, 1999.

According to leading micro-economists Angus Deaton and John Muellbauer, "consumer behavior is frequently presented in term of preferences, on the one hand, and possibilities on the other. The emphasis in the discussions commonly placed on preferences, on the axioms of choice, on utility functions and their properties. The specification of which choices are actually available is given a secondary place and, frequently, only very simple possibilities are being considered.[7]

Conclusions

The influence of lending activity is directly proportional to the degree of the risk involved. Higher the level of risk assumed by the consumer and uncovered by financial basis, the higher the fluctuating behavior, instable, behavior that relies in the uncontrollable nature of the economical discontinuities and in the population's incapacity to maintain its solvency resulting from household income level.

Because of unforeseen situation of pseudo-forecasts unpleasant situations for both the bank and the consumer appear. Initially, the bank charges penalties and commissions depending on the contracted loan, so, scripting, the bank benefits of incomes that gradually increase as a result of accounts maintenance and other banking operations. Factual, the bank suffers because the liquidities are not cashed-in, when the person that contracted the loan is in the incapacity of payment and does not own any valuable goods from which the bank, as creditor, could cover the entire loaning structure per individual.

"Consumer behavior reflects the totality of consumer`s decisions with respect to acquisition (including leasing, trading, sharing), consumption, and disposition of goods, services, activities, experiences, people, and ideas".[8]

"Consumer behavior is a complex, dynamic, multidimensional process, and all marketing decisions are based on assumptions about consumer behavior. Consumer behavior can be defined as the decision-making process and physical activity involved in acquiring, evaluating, using and disposing of goods and services."[9]

In a world in which crediting decision is founded on material reasoning, the consumer, as in a credit requester position is assuming the active participant condition in the economical environment. The development of the crediting decision is a crucial moment which influences both the quality of life and the individualized character of the professional frame, the motive why the consumer must assure that the decision that he will take is a optimum one and it can be supported by its own activity.

By this paper, we tried to expose the influences over the consumer, both trough an economic approach and by the description of initiative generating factors which, on a evolutionary scale, mark the birth of determined crediting decisions.

ON ORTHODOX/HETERODOX AND AUTISTIC/POST AUTISTIC ECONOMICS – A VIEW FROM THE ROMANIAN ACADEMIC LANDSCAPE

RODICA IANOLE[*]
MIHAELA SANDU[**]

Abstract
The way economics is perceived nowadays seems to be going back to the old label of `dismal science`, because it has not achieved to offer consistent and valid solutions to real problems in critical moments. In a constructive defense of our profession, we need to acknowledge the existence of some oversimplified hypothesis that do not conform to the actual human behavior, and thus to turn to different branches of the discipline (from behavioral to feminist, green economics and econo-physics, just to give some examples) that try to reintegrate economic thinking in the real landscape, through different approaches. The post autistic economics represents a powerful example within this attempt of offering economics a new spirit and new insights of how it should be taught and applied.
The aim of this paper is to discuss on the multiple perspectives, orthodox and heterodox, autistic and post-autistic, and on the manner they appear to be understood, accepted and implemented in the Romanian economic higher education. We question the neoclassical paradigm in search for new insights that could lead to a possible internal reform of the field, opening it more to the opinions of the surrounding social sciences.

Keywords: *orthodox and heterodox economics, post autistic economics, Romanian economic higher education*

JEL codes: A11, A12, B50

Introduction

Labeling mainstream economics as autistic it was definitely a bold move of the French students who coined the term in 2001. „Abnormal subjectivity, acceptance of fantasy rather than reality"(PAE Newsletter), this was their more precise view on the economic science, regarding the status of teaching and relevance for practical applications and public policies.

Discovering the existence of this kind of radical perspective, as freshly young economists, is was not least of a challenge and it has lead us to extensive readings of the recent approaches on the issue and critical thinking of our own, in terms of what to believe and what paradigm to embrace.

We consider that having a broad understanding over the new theories that populate economics nowadays is essential especially for economics students and young researcher, because as Colander says „individuals are not born as economists; they are molded through formal and informal training. This training shapes the way they approach problems, process information and carry out research, which in turn influences the policies they favor and the role they play in society." (Colander 2005:175).

Under these auspices, the aim of this paper is to offer some theoretical markers about the many directions in which economics is split nowadays, with a specific focus on the latest trends, namely post autistic economics. To this framework, we have added some personal, subjective considerations on the particular situation from the Romanian economic academia.

The importance of such a topic is highlighted by the effervescence of the many relevant studies in these area (Thaler, 2000; Kirchgässner, 2005; Rubinstein, 2006), discussing the nature of

[**]Assistant, Faculty of Business and Administration, University of Bucharest, (e-mail: mihaela9sandu@ yahoo.com).

economics, compared to other sciences, and the harmony (or disharmony) between its declared scopes and the practical results.

Even if the paper does not have the ambition to be a comprehensive material in terms of modern economic doctrines, we have found necessary to start our inquiry with a chapter discussing the two distinctive schools of orthodox and, more extensively, heterodox economics, but also clarifying terms like mainstream economics or neoclassical economics. The literature review is continued through the presentation of the arguments raised by the post autistic economics, and then naturally followed by a chapter containing a conceptual analysis on how these currents were integrated in the Romanian economic academic environment, but also reflected in some public measures. We end our short demarche with a concluding section, pointing out our future research plans.

Orthodoxy and Heterodoxy in Economics

„Economics is the only field in which two people can receive a Nobel Prize for saying exactly the opposite thing". This only one of the many jokes you will find about the differences in opinion of the economists. For somebody coming from outside the field, the first impression can be that we are dealing with a very flexible and open science, thus the great number of opinions and the possibility to have such divergent views. At a closer look, the reality shows us somewhat the contrary: even if there are many interdisciplinary tendencies of questioning the problems, economics as a traditional science has some internal rules and mechanisms of high rigidity

For an accurate image, we will proceed to properly define the terms of neoclassical, mainstream, orthodox and heterodox economics, using as a starting point the excellent review of Dequech (2007).

Even if it may look simple, drawing some boundaries for neoclassical economics is quite difficult, because the concept, or the use of the label, has consistently changed over time. An important observation to be made here is that the general acceptance of what neoclassical economics means is different from the one of Adam Smith, David Ricardo, Hayek or even Keynes.

In the opinion of Dequech (2007), the three main characteristics of neoclassical economics are the emphasis on rationality, along with utility maximization as the most import criterion, the emphasis on equilibrium and the neglect of strong kinds of uncertainty. In different words, but in the same spirit, Arnsperger and Varoufakis (2005) also discuss three axioms of neoclassicism – „neoclassical meta-axioms" (p.7): methodological individualism, methodological instrumentalism and methodological equilibration. They claim that these axioms are hidden to the public eye and thus it can be explained the capacity to obtain funding and institutional prominence of the neoclassical adepts. The institutional reference leads us to our next concept, which is mainstream economics: „what is taught in the most prestigious universities and colleges, gets published in the most prestigious journals, receives funds from the most important research foundations, and wins the most prestigious awards." (Dequech 2007:281). The definition is quite precise but what needs to be added for our purpose is the intricate dynamic of what it is or not included in the mainstream. Nowadays, even if the general impression is that mainstream economics is still dominated by neoclassical approaches, it is absolutely clear that in fact mainstream is represented by a complex mixture of ideas, including heterodox ones. Just to give an example, behavioral economics has started to gain more and more power, the ultimate proof being the Nobel prize (2002) gained by Daniel Kahneman, a psychologist, for his work (in collaboration with Amos Tversky) on prospect theory. He shared the prize with Vernon Smith, a pioneer in another emergent field – experimental economics, a branch that generates distinctly non-neoclassical results.

Returning to the main intentions of this chapter, orthodoxy is next in line to be clarified. Following an analogue definition of mainstream economics, orthodox economics is represented by the dominant school of thought. In Estey words, „orthodox economics is the analysis of economic behavior under existing institutions" (Estey 1936:791). Surprisingly, or not, recent references to

orthodoxy in economics are confuse, many authors using instead, as equivalents, both neoclassical and mainstream economics. We think this is due partly to the general connotations of the term, an orthodox being a person who lives strictly by the teaching of its religion. Therefore, an orthodox economist would be an economist who analyzes and researches strictly according to the traditional dogmas, and, we imply, who rejects the new approaches. Naturally, this is a perspective to be criticized in any science and Hodgson, for example, is one of the authors that see in the non-recognition of the necessity of a large number of theoretical frameworks of understanding human behavior, a profound flaw in the methodology of the economic science (Hodgson, 1992). And this is how we have reached the last stop of this doctrinaire short journey, revealing also the nature of heterodox economics.

According to Lawson (2005), „heterodoxy serves (...) as an umbrella term to cover the coming together of, sometimes long-standing, separate heterodox projects or traditions"(Lawson, 2005:2). On a more precise basis, heterodox economics rejects the very incisive form of methodological reductionism that only accepts formal mathematical methods. The main difficulty when mapping this field consists in its heterogeneity. We are agreeing with the position that treats heterodox economics as a collection of theories (Garnett, 2005). The attention gave to methodology and to the history of economic thought point out to them as being the hallmarks of a heterodox approach. In the same time, for example, behavioral economics is principally embracing the principle that human actors are social and less than perfectly rational, driven by habits, routines, culture and tradition. Another case is for Keynesian and institutional analysis which particularly fond to the idea that while theories of the individual are useful, so are theories of aggregate or collective outcomes. Further, neither the individual nor the aggregate can be understood in isolation from the other.

Autistic and Post-Autistic Economics (PAE)

This section will follow a retrograde method of presentation, starting with the PAE movement and in relation to it, with what is understood through the attribute autistic in this case.

For a proper understanding of the issue, we need a short historical background. The intellectual revolution we are talking about was started by a group of French students, in June 2000, and it was raised against the „narrow, mathematical, nonpluralistic economic lectures they were forced, to sit through" (Lee, 2004). They demanded science than scientism, pluralism than neoclassical monotheism, empirical realism than deductive abstracts and they requested from their teachers to save economics from its irresponsible state. Also, they have claimed the need to adopt richer models of human agency and institutional change which seriously consider such factors as culture and history as significant active ingredients in any explanatory framework.

Naturally, they have attracted a lot of attention, equally supporters and critics. The metaphor of autism has especially disturbed many people, raising a natural wave of protests against the use of such a serious medical term – „a developmental disorder that is characterized by impaired development in communication, social interaction, and behavior" (Medical dictionary). Robert Solow and Olivier Blanchard, famous economists and professors at MIT, were the neoclassical voices who replied to the attack of the discipline. However, they have only marked the beginning of controversies and the debates have multiplied, and also transformed into more public and open discussions on the current state in economics, involving more and more participants and gaining more awareness.

Fulbrook (2005) argues that pluralism remains the most important element advanced by the PAE movement, and it is also the element that makes possible the existence of a body of heterogenic sub disciplines: „Out of all the approaches to economic questions that exist, generally only one is presented to us. This approach is supposed to explain everything by means of a purely axiomatic process, as if this were THE economic truth. We do not accept this dogmatism. We want a pluralism of approaches adapted to the complexity of the objects and to the uncertainty surrounding most of the

big questions in economics (unemployment, inequalities, the place of financial markets, the advantages and disadvantages of free-trade, globalization, economic development, etc.)".

From a global perspective, „the underlying critique is not new, nor unique to economic science" (Mohn, 2008:1992) and the heterodox beliefs presented in the previous section are solid proofs in this sense. The accusation of autism in economics is grounded on the reformulation of past heterodox arguments that are strikingly similar to the traits of the disease. Firstly, the missing interdisciplinary approaches are interpreted as a sign of non-sociability in terms of awareness. Stiligtz (2000) adds here the socially insensitive applications and policy. Secondly, the missing realism in many assumptions is understood as a poor communication (Thaler, 2000) with all the other stakeholders and the society. Not last, the simplified methodology is nothing else than a non-recognition of the complexity of human behavior. Thus, even if we believe that autistic is a hard label to digest, and quite inappropriate due to its primary use, we do admit the general tendencies towards it, reflected in the artificial creation of stylized facts for describe a phenomenon, for tracking it mathematically and for finding an (unique) equilibrium to the problem.

Doctrinaire Approaches within the Contemporary Romanian Economic Higher Education

To speak honestly on the contemporary state of economics in university it is necessary to asses some facts from the past, thus from the period before the 1989 revolution. One common popular memory of the old system, regarding education, was the clear focus on memorization and almost an interdiction of critical thinking outside the communist system norms (Druica, Cornescu & Ianole, 2009). Even if in reality the assertion is only partial true, the public perception has defeated the contextual and historical realities, taking it and promoting it until today, transforming it to the rank of, we dare to say, a psychological conditioning. What we mean by this is the fact that many reforms were lead in the name of this terrible threat, but almost none has solved it. At the contrary, they have just indulged this idea more deeply in the popular subconscious.

At the higher education level, in the first 10 years after the revolution, the number of universities was more than double and afterwards it has slightly diminished. In economic terms, at the beginning of the transition period we could witness an explosion on the supply side materialized through the apparition of the private universities. The market mechanism started to function and after reaching its peak it found its equilibrium at a lower number of higher education institutions.

In this context, economics was one of the sciences that started to know a widespread popularity. As statistics proves it (table 1), there were radical changes in the development of different fields of study, moving the emphasis from science and engineering towards social sciences, especially economics, commerce and business, and law.

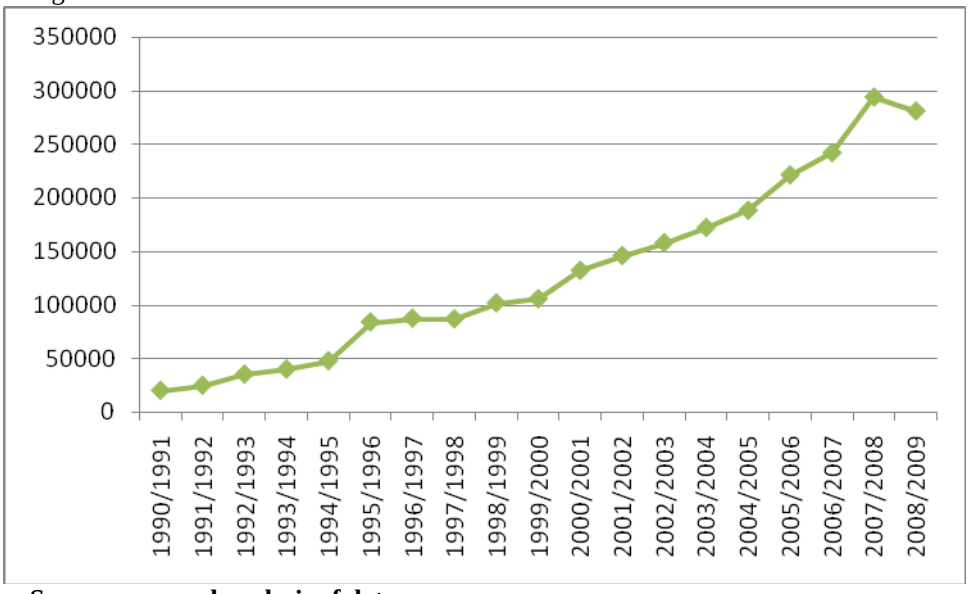
Figure 1 illustrates separately the evolution of the number of enrolled students in Economics between 1990 and 2009.

Figure 1.



Source: personal analysis of data

This un-natural growth, along with the rigid old representation on teaching and learning outcomes, has creating a new label to be applied on the economic studies and economic students, only at a national level: an easy option, a superficial faculty and a future commercial profession. Even if these are only exterior attributes, some of their features have transferred to the interior one, making Romanian economics a peculiar mix of doctrines.

On the one hand you will say it is mostly orthodox, reined by the neoclassical hypothesis. In this sense you cannot neglect the old influences of the political economy taught during the communist regime, which still reflects some inabilities to question the problems raised by the contemporary society. On the other hand, it seems to be a low interest to adhere to one specific current or to have a coherent perspective. Tiberiu Brailean is a remarkable Romanian author who subscribes to the fact the economics has become a Babel tower because of the high degree of fragmentation and specializations. Everybody is speaking a different language which is almost impossible to understand by an economist working in different area (Brailean, 2001).

With reference to the PAE claims, we will briefly discuss how we think they are perceived in our Academia.

We will start with the students, because they were the promoters of the PAE movement. Even if there any many complaints regarding the problem of excessive theory without practice (especially with the popularization of the Bologna Process) – point 1 on the PAE original petition list – Romanian economic students are lacking a coherent body of representatives to put the problem in more scientific terms, including here research and critical economical analysis skills, and not only operational competences. One possible and reasonable explanation is due to the dynamic of the labor market, dominated by multinational organizations that need graduates with very specific sets of skills. The lack of think thanks, representative research centers and institutes or other important bodies of decision is orienting students only in some very pragmatic and business related directions, and they are not to blame for this. Therefore, either the true reason behind it, students are not offered alternative approaches developed by Post-Keynesians, institutionalists, Austrians, evolutionists or behavioral economists. The even saddest part is that the problem seems to be the same elsewhere: 95 per cent of the economics taught in higher education institutions is mainstream (Mearman, 2007).

And of course, the other side of the equation is represented by the professors. Our empirical observations suggest that we face also a lack of interest for the new branches of economics, some of it due to the lack of research infrastructure. It is almost impossible to be involved in neuroeconomics if you do not have the financial resources to equip ate a laboratory with the necessary brain scan technologies. The same with experimental economics, where you need specific conditions to run an experiment. The first reaction to this is that everybody is looking for funds and grants but we actually face a vicious circle: how to firstly be interested in these emergent fields without have no local representation of what they mean.

Conclusions and further research

„The issue of interpreting economic theory is…the most serious problem now facing economic theorists…Economic theory lacks a consensus as to its purpose and interpretation. Again and again, we find ourselves asking the question ‘where does it lead? (Rubinstein, 1995:12)

Even if it may have a philosophical tent, we consider the question above to be of crucial importance and positioned at the core of the training program for students, for professors, and why not, for practitioners also. A more comprehensive and flexible understanding on economics is definitely a long and delicate process, but if we are engaged in some way with this science, it is actually an intrinsic duty to call for a greater awareness on the issue. The research initiatives in this area carry the same „stigma” of diversity, a stigma in the sense that it is almost impossible to offer a spot solution. The validity of the articulated assumptions is only arbitrated by time, maintaining still a shadow of contextual subjectivity.

With respect to the case of Romanian economics, they are many limitations, especially on a psychological level, in accepting to even explore many of the ideas discussed through the article, and still some unresolved complexes of the past paradigm. Nevertheless, we plan to elaborate on our observations and to continue the present theoretical overview through a future empirical investigation.

ECONOMETRIC ANALYSIS ON VOTE-POPULARITY FUNCTION FOR ROMANIA

NICOLAE-MARIUS JULA[*]
NICOLETA JULA[**]

Abstract
The regional analysis in Romania confirms the hypothesis of a significant correlation between the status of the economy and political behaviour of the electors. The level and the dynamic of the unemployment at regional level have an influence on vote behaviour, as stated by the partisan political business cycle theory: in the areas with a higher unemployment rate there is a voting preference (tendency) towards the political left wing. This conclusion is interesting for a political perspective. If the unemployment electors carry their votes toward left, the left wing government in office between 1992-1996 and 2000-2004 promotes an economic policy that outcomes in a diminishing the electoral support for this party: during these periods, the global unemployment rate decreased from 8.2% to 6.6% in first period (1992-1996) and from 12.3% to 6.3% in the second. Moreover, the partisan electoral behaviour hypothesis affirms that the private entrepreneurs and the self-employed vote toward right-wing parties. That means that electoral support for left party in office during the mentioned periods was also reduced by another result of the reform, namely the strong increase in the number of registered companies (large numbers of them are limited liability companies). A political analogous situation was recorded during the 1996-2000 legislatures. The global unemployment rate increased and the business environment became unfavourable, leading to a decrease of the electoral support for the right-wing governmental coalition in office.
In Romania, regarding the elections from 2008-2009, a new electoral law was introduced. The main changes concerned the election of chairpersons of county councils by uninominal voting, separating general and presidential elections and the introduction uninominal voting system for parliamentary elections, with a correction of the total number of seats with the total number of votes obtained by each party on national level.

Keywords: *Political Business Cycles, Vote Popularity Function, Partisan Behaviour, Regional Unemployment*

Introduction

In Romania, the democratic experience computes a small number of electoral moments. Therefore, it is not possible yet to build an electoral behaviour econometric model using the political time series. In these circumstances, in the following section, by the examination of the political and economic dynamics during the 1990-2008, we try only to identify some significant signals concerning the economic impact of the electoral timing. We use an econometric model to analysis the political behaviour using a regional economic and political data. The analysis is divided in two different approaches: the elections before 2008 and the elections from 2008 (when a new electoral law was introduced – mainly the impact of uninominal voting and the change in electoral preferences of the voters from local elections to parliamentary elections).

The importance of such a study is underlined also by rich international literature focused on the impact of the political behaviour on economic conditions. It is important to analyse if political factors do influence the economy not for the common wealth, but for increasing their chances of re-election.

The answer to this subject is reflected by the results presented in this study. The economic and econometric evidences are presented to support the results. There is a large specialized international

[**] Professor, Faculty of Economic Sciences, "Nicolae Titulescu University", Bucharest, Romania, (e-mail: nicoletajula@yahoo.com).

literature on political business cycles and we tested some methods and models to find out if the results for Romania are in accordance with the results obtained for other western democracies.

Political – Economic Regional Model for Romania[1]

From Romania, the democratic experience recorded a small number of electoral events. Therefore, it is not possible yet to build an electoral behaviour econometric model able to analyse the effects of population and incumbents' electoral behaviour based on the dynamics of macroeconomic and political time series. For this reason different hypotheses regarding the relationship between economic and political system were tested using the data recorded at regional level, for the electoral years 1992, 1996, 2000, 2004 and 2008.

First of all we was tested the so-called *responsive hypothesis* according to which the *electorate considers that the government is responsible for the state of the economy* and consequently, when the unemployment (and the inflation) record high values, the electoral chances of the governmental party (coalition) diminishes, and vice versa: a relatively well economic status leads to the increase of electoral chances of the party in office. From statistical point of view, the hypothesis mentioned above assumes that:

1. There is a negative correlation between the unemployment rate and the votes given to the ruling party, and
2. There is a positive correlation between the unemployment rate and the votes given to those parties (coalition) from opposition, which are considered to be an alternative at government in the electoral year.

However, the distribution of regional votes for the incumbents (parties or coalitions) in the electoral years 1992, 1996, 2000 and 2004 don't confirm hypothesis of a significant negative correlation between the unemployment rate and the electoral support. Analogously, a significant positive correlation between regional unemployment rate and electoral support of the parties situated in opposition (the challenger) cannot be observed (see Table 1). The only correct signs (in accordance with the above hypothesis) from the coefficients of correlation were recorded in 2000; as we'll show further, the values taken by the coefficient of correlation can be explained by taking into consideration of a *partisan political business cycle model*.

But these figures don't show trends according to the responsive hypothesis.

[1] In this section we use the following symbols for the Romanian political parties, political formations or their coalitions:

APR – Alliance for Romania
CDR – Democratic Convention from Romania
D.A. – Justice and Truth Alliance (National Liberal Party and Democratic Party)
FDSN – National Salvation Democratic Front
FSN – National Salvation Front
PD – Democratic Party
PD-L - Democratic-Liberal Party
PDAR – Agrarian Democratic Party of Romania
PDSR – Social Democracy Party of Romania
PNL – National Liberal Party
PNTCD – National Peasant Christian Democratic Party
PRM – Great Romania Party
PSDR – Social Democratic Party of Romania
PSD – Social Democratic Party
PSM – Labour Socialist Party
PUNR – Romanian National Unity Party
PUR – Humanist Party of Romania (which subsequently became the Conservative Party)
UDMR – Democratic Union of Hungarians in Romania
USD – Democratic Social Union

Table 1: The coefficients of correlation between the regional unemployment rates and the votes (%) carried for the Romanian political parties, political formations or their coalitions

Electoral years	Political parties, political formations or their coalitions witch form the Government	Political parties, political formations or their coalitions situated in opposition
1992	0.31 (FDSN+FSN)	-0.26 (CDR)
1996	0.33 (PDSR)	-0.17 (CDR+USD)
2000	-0.32 (PNL+PD+UDMR)	0.34 (PDSR+PRM)
2004	0.28 (PSD)	-0.14 (D.A.)

Further on, we tested for Romanian case a hypothesis formulated by Rodrik (1995) and Fidrmuc (1996) for Central and Eastern European transition countries, hypothesis regarding the political support for the economic reform.

Rodrik (1995) formulated the hypothesis that the unemployed electors cast their vote in favour of a party that realises a fast reform because they think that the rapid economic reform has as results an outcome increase and an enhance of the economic private sector. The consequence of these evolutions consists in the increasing chances for the unemployed to find a job in private sector. According to Rodrik, in the Central and East European Countries only the right-wing parties are pro-reform political formation, while left-wing parties are anti – reform. As a result, the unemployed vote for the right-wing political parties. A version of this hypothesis is given in a paper written by Fidrmuc (1996). According to Fidrmuc, the type of behaviour described by Rodrik is specific for the unemployed only in the first part of the transition, when it is expected a fast and successful reform. As far as the reform processes are developing without major results regarding the employment and the economic status of disadvantaged social categories, the unemployed become supporters of those political parties, which promote a reduction of the reform speed and maintain a high proportion of the public sector. The same as in Rodrik's model, also in Fidrmuc's model, the left-wing parties represent anti-reform political forces and for this reason, after the first transition years the political support of the disadvantaged categories (like unemployed) is straighten towards the left-wing parties.

This caricatured political system model set up for the candidate countries, with strong partisan and ideological influences (supporting the idea that the right-wing parties are pro-reform while the left-wing parties are against, that means that the last ones are anti-European), was invalidated by the political evolutions from these countries. All the candidate countries had both right and left political systems, without recording significant steps forward or backward of the reform process. There are significant differences between countries regarding the reform stage but there are not differences within the same country under different political systems. In spite of these, we have tested the Rodrik model, the same as the Fidrmuc's version of Rodrik model. The tested hypotheses are:

1.There is a positive correlation between unemployment rate and votes carried to the right-wing parties and a negative correlation between the unemployment rate and votes carried to the left-wing parties (Rodrik's hypothesis)

and

2.There is a positive correlation between the unemployment rate and votes carried to the rights-wing parties and a negative correlation between the unemployment and votes carried to the left-wing parties at the beginning of transition process, while in later reform phases the support of the disadvantaged categories is straightened towards the left (Fidrmuc's hypothesis)

The vote's distribution for the rights and left-wing parties (or coalitions) is shown in Table 2. In the Romanian case, because the fluent political environment, it is not easy to include a party in a political wing. In these circumstances, the parties are included in the right or left wing in keeping with theirs official positions.

The Rodrik's hypothesis cannot be empirically upheld, at least starting from electoral regional data. From Table 2 must be notice that always the correlation between votes from the left-wing parties and the unemployment rate is positive, while the correlation between the unemployment rate and the electoral support for right-wing parties is negative (contrary with Rodrik's hypothesis).

Table 2: The coefficients of correlation between the regional unemployment rates and the electoral behaviour

	The coefficients of correlation between the regional unemployment rates and votes carried for:	
Electoral years	Left-wing parties	Right-wing parties
1992	0.24 (FDSN+FSN+PSM)	-0.26 (CDR)
1996	0.32 (PDSR+USD)	-0.26 (CDR)
2000	0.30 (PDSR+PD)	-0.23 (PNL)
2004	0.43 (PSD+PRM)	-0.23 (D.A.+PNTCD)

The obtained results can't be a valuable argument for the Fidrmuc's version model too. The political support for the right wing is maintained relatively constant and it is negatively correlated with unemployment rate, while the political support for left increases, at least for median interval. The last result comes out from defining left-wing side. The correlation coefficient between rate employment and political support of Democratic Party (PD) is insignificant one as results from Table 3. The insertion of this party in the left political side (in 1992 through FSN – National Salvation Front and in 1996 through USD – Democratic Social Union) has an influence on global correlation coefficient. This aspect is just more evident in the case of PSM – Labour Socialist Party, which was included in the left political side in 1992; its political support was negatively correlated with unemployment rate.

Table 3: The coefficients of correlation between the regional unemployment rates and the votes for Romanian political parties

The coefficients of correlation between the regional unemployment rates votes carried for:							
Electoral years	PDSR*	PD**	PSM	CDR***	PUNR	PRM	UDMR
1992	0.33	0.07	-0.20	-0.26	-0.06	-0.14	-0.10
1996	0.33	0.08	–	-0.26	0.02	0.28	-0.13
2000	0.30	-0.03	–	-0.23	–	0.24	-0.26
2004	0.36	–	–	-0.33	–	0.30	-0.47

* For the 1992 elections – FDSN,

** For the 1992 elections – FSN, for the 1996 elections – USD

*** For the 2000 elections – PNL, for the 2004 elections – PNTCD

The relative steadfastness of the correlation coefficients recorded by the two important political parties PDSR – Social Democracy Party of Romania and CDR – Democratic Convention from Romania cannot be an argument in the favour of the Fidrmuc's hypothesis[2].

Further, we tested the hypothesis of the *partisan political behaviour*. According to this approach, *left-wing parties are relatively more concerned on unemployment* and economic growth, and relatively less interested in inflation, while right-wing parties are more concerned on inflation and less on economic growth and unemployment. *The electors' votes are straightened towards that*

[2] Even Fidrmuc gave up to this hypothesis and in his later studies he adopted a partisan hypothesis (see, Fridmuc, 2000).

party promoting a program which seen as being closer to their own expectations. As a consequence, the unemployed votes towards left wing parties.

To assess the hypothesis regarding the partisan political support we was firstly tested two following simple econometric models:

$$LEFT_{i,t} = a_0 + a_{i,1} + a_2\ RSOM_{i,t} + e_{i,t} \quad (1)$$

$$RIGHT_{i,t} = b_0 + b_{i,1} + b_2\ RSOM_{i,t} + v_{i,t} \quad (2)$$

Expected results: $a_2 > 0$, and $b_2 < 0$.

The symbols used in the models have the following meaning:

– $LEFT_{i,t}$ and $RIGHT_{i,t}$ is the share of votes received by the respective parties in county *i* (*i = 1…40*) at the elections in the electoral year *t* (*t* = 1992, 1996, 2000, 2004),

– $RSOM_{i,t}$ represents the unemployment rate recorded in county *i* in the electoral year *t*;

– $a_{i,1}$, $b_{i,1}$, are the cross-section specific coefficients and a_0, a_2, b_0, b_2 are the common coefficients in pool estimation for the models (1) and (2), and

– e_{it} and v_{it} are the error terms – random variables that respect the conditions for using the Ordinary Least Squares Method (normally and independently distributed with zero mean and constant variance).

The Romanian regional structure enclose 41 + 1 (Bucharest) = 42 counties. We used only 40 observations / year and excluded Covasna and Harghita because a large share from Covasna and Harghita counties electors are politically faithful, based on nationalist views**.** The estimation's results for 160 records (40 counties × 4 electoral events) are shown in Table 4.

Table 4: Partisan political business cycles estimation in regional data

	LEFT	RIGHT
Constant	25.01 *(2.15)*	49.68 *(2.33)*
RSOM	0.909 *(0.25)*	-2.265 *(0.27)*
Adjusted R-squared	0.64	0.44
F-statistic	8.24	4.13
Akaike info criterion	7.151	7.305
Schwarz criterion	7.939	8.093

(standard deviations are given in brackets, with *italic* fonts).

The estimators are statistically significant, with a level of significance over 99%. The probability of rejection the models (Prob (F – statistic) is smaller than 0.0001%. The estimators of the models' coefficients have correct signs (the signs anticipated for the partisan business cycle theory):

$a_2 =$ 0.909 is positive (according to the theory) and significantly different from zero with a probability over 99.99%

$b_2 =$ –2.265 is negative (according to the theory) and significantly different from zero with a probability over 99,99%

Because a share from Covasna and Harghita counties electors are politically faithful, based on nationalist views, these counties was excluded in estimation process (the proportion of the UDMR' *captive* voters affects negatively the formation up of the other parties electors).

The most important problem of these simple models is that they are able to explain only about 44% - 64% of vote behaviour setting up (R^2). For this reason we built up, in the same spirit of the partisan political business cycle theory, other econometric models, starting from the hypothesis that there are faithful electors for every party being on political market and struggle for that.

That means that, without any major political, social or economic events, the political behaviour and options of some electors remain unchanged, while economic factors explain only the

forming behaviour of the electors without long – lasting options. More exactly, there is certain inertia in the dynamic of political options, so that electors' behaviour at the moment *t* is not absolutely independent from the options expressed in the previous elections. Starting from the fact that the formation of the electors' options at the moment *t – 1* is depending on the unemployment rate and these options have a some degree of inertia, the conclusion is that the options of non-captive electorate (those electors which don't prefer almost permanently one party or an other), are formed basing on the changes in the unemployment rates between the actual electoral period (*t*) and the previous one (*t – 1*).

The literature analysis also the phenomenon of the political image eroded during the government stay in office (Nannestad and Paldam, 1994, 1997 and 1999). This effect is referred to as the *cost of ruling*, implying the incumbent governments lose support as they alienate some supporters with decisions they make while in office. The longer they stay in office and the higher their vote shares in the preceding elections the more likely it is that such losses will occur.

We have tested, in these conditions, two econometric as following:

$$LEFT_{it} = a_1 LEFT_{i, t-1} + a_2 (RSOM_{it} - RSOM_{i, t-1}) + a_3 RUL\_LEFT + e_t \quad (3)$$

$$RIGHT_{it} = b_1 RIGHT_{i, t-1} + b_2 (RSOM_{it} - RSOM_{i, t-1}) + b_3 RUL\_RIGHT + v_t \quad (4)$$

The expected results according to the theory are:

$a_1 > 0$, $b_1 > 0$, Means that every party has a faithful electors;

$a_2 > 0$, $b_2 < 0$, Means that the increase of the unemployment favours left-wing parties and disadvantage right-wing parties.

$a_3 < 0$, $b_3 < 0$, Means that it exists a *cost of ruling*.

The symbols used have the following significances:

– $LEFT_{it}$ and $RIGHT_{it}$ represents the share of votes gained by the parties in county *i* (*i = 1…41*) at the elections from moment *t* (*t* = 1992, 1996, 2000),

– $LEFT_{i, t-1}$ and $RIGHT_{i, t-1}$ are the votes (%) gained by parties in the county *i* at the previous elections (*t-1*),

– $RSOM_{it}$ and $RSOM_{i, t-1}$ are the unemployment rates registered in county *i*, in the electoral moment *t*, and at the preceding elections (*t-1*),

– RUL_LEFT is the dummy variable that capture the *cost of ruling* for left-wing parties, which takes the value 1 for 1992, 1996 and 2004, and 0 for 2000;

– RUL_RIGHT is the dummy variable that capture the *cost of ruling* for right-wing parties, which takes the value 1 for 2000, and 0 for 1992, 1996, 2004;

– a_1, a_3, a_3, b_1, b_2, b_3 are the coefficients of the models (3), respectively (4), and

– e_{it} and v_{it} are the error terms – random variables that respect the conditions for using the Ordinary Least Squares Method (normally and independently distributed with zero mean and constant variance).

In the models (3) and (4) were not used variables for counties Covasna and Harghita because the stable fidelity of electors from those regions. The results of the estimation are shown in the Table 5.

The estimators for regression equations parameters are significant different from zero with a level of significance over 99%. The models' probability of rejecting (Prob (F-statistic) is smaller than 0.00001%. The estimators of the models' coefficients have correct signs (the signs anticipated for the partisan business cycle theory) and the models (4) and (5) are better from econometric point of view than the models (2), respectively (3). The last conclusion derives both from comparison between the coefficients of determination R^2, and from the analysis of values calculated for F-criteria.

Table 5: Partisan political business cycles autoregressive model estimation

	Left wing party	Right wing party
The share of regional voting in previous elections ($LEFT_{i,t-1}$, respectively $RIGHT_{i,t-1}$)	1.169 (*0.031*)	1.225 (*0.030*)
Changes in regional unemployment rates ($RSOM_{it}$ – $RSOM_{i,t-1}$)	1.337 (*0.230*)	-1.382 (*0.175*)
Cost of ruling (RUL_LEFT, respectively RUL_RIGHT)	-4.413 (*1.364*)	-27.478 (*2.049*)
R-squared	0.91	0.84
F-statistic	590.2	311.496

(In brackets, with *italic* there are the standard deviations).

The obtained results lead to the following conclusions:

– The level and the dynamic of the unemployment rates at regional level have an influence on vote behaviour, and this effect is in accordance with the partisan political business cycle theory: in the areas with a higher unemployment rate a voting preference (tendency) towards the political left is manifest;

– Elasticity of the electoral behaviour in dependence of economic factors (unemployment rate) is rough equal (with different signs of course), in the case of the two parties[3]. This means that in the Romanian political environment the two parties have been perceived by the population as being typical for the left and respectively for the political right.

– Everyone from the two parties has faithful electors (a_1 and b_1 are positive and are significantly different from zero). The right' electors fidelity is a little bit superior comparable to the left' electors fidelity ($b_1 > a_1$); but in spite of the fact that the Romanian's political right wing has more faithful electors, this captive electorate has a small size (relative to the whole Romanian electorate).

– The *cost of ruling*, implying the incumbent governments lose support while there are in office, was much stronger in the right than in the left parties' case.

Parliamentary elections from 2008

We have analysed here the electoral behaviour from a different approach. We have studied the impact inducted by the state and dynamics of some economic variables on the change of voting intensions from the local elections from June 2008 to parliamentary elections, same year.

The results from the electoral elections from June 2008 did not obtained econometrically significant results. The vote was mainly driven by local leaders and important regional personalities.

The data are analysed in regional structures. We used a Paldam type model. In its most simple linear version the function are:

$$\Delta P_t = \{a_1 \Delta u_t + a_2 \Delta p_t + \ldots.\} + [c_1 D^1_t + c_2 D_t^2 + \ldots] + e_t \qquad (5)$$

Here Δ is used to indicate the first difference, P is either the vote or the popularity, for the political parties (%). The *a*s and *c*s are coefficients to be estimated, and the *e* is the disturbance term. The braces contain the economic variables: the e-part of the model. Two of the variables are *u* and *p*, where *u* is the rate of unemployment and *p* the rate of price rises. The next set of variables, the *d*s, are the political variables forming the p-part of the model – it is found in the square brackets[4].

Concretely, we have analysed a model like:

$$P_{ij} = \{a_0 + a_1 \cdot cj_{ij} + a_2 \cdot prescj_{ij}\} + [a_{3,i}(rs_{nov2008} - rs_{mai2008})_j] + e_{ij}, \quad (5')$$

[3] According to the Wald' test, the hypothesis of the equality (in absolute value) of the two parameters $|a_2| = |b_2|$, are accepted with a probability over 75%.

[4] *idem*, p. 14.

where P_{ij} – represents the share of votes won by the competitor *i* in county *j*, to the total number of valid votes in that county, in the Parliamentary Elections from November 2008;

cj_{ij} – represents the share of votes won by the competitor *i* in county *j*, to the total number of valid votes in that county, in the elections for the Local Councils, June 2008;

$prescj_{ij}$ – dummy variable, $prescj_{ij} = 1$, when party *i* won the Presidency of Local County *j*, Local Elections 2008 and $prescj_{ij} = 0$, otherwise;

rs_j – unemployment rate in county *j*; nov2008 = 30 November 2008, mai2008 = 31 May 2008;

a … – parameters of the model;

e_{ij} – error of regression equation, random variable.

The used data are in regional structures and refer to the first 3 parliamentary parties (PSD+PC, PD-L şi PNL). The obtained results are:

	Chamber of Deputies			Senate		
	PSD	PD-L	PNL	PSD	PD-L	PNL
Constant	6.8377 (6.94)			6.5888 (6.684)		
CJ?	0.6400 (16.684)			0.6735 (17.553)		
PRESCJ?	5.3823 (4.539)			6.1834 (5.155)		
$RS_{nov2008}$-$RS_{mai2008}$	2.1514 (1.944)	2.4978 (2.085)	-3.0629 (-2.517)	1.8465 (1.679)	2.5053 (2.009)	-3.6142 (-2.856)
R^2	0.8397			0.8548		
R^2 adjusted	0.8330			0.8487		

(in brackets, under the estimators, there are standard deviation values; the estimators have a confidence level over 90%)

The results suggest an interpretation consistent with the theory of economic voting: in the period June to November 2008, Liberal Party was the party of government. Increase of unemployment in regional structures resulted in a penalty for PNL and an increase in intentions to vote for opposition parties (PSD and PDL). Estimators are econometrically significant.

Conclusions

For Romania, the macroeconomic data suggests that is correct a hypothesis according to which a significantly connection between the political behaviour of the politicians and economic evolution exists. The intensity of the structural changes records local minimum points in electoral years. This fact could be explained by the following phenomenon: to promote economic reforms means to adopt some measures, which usually are accompanied by unpopular effects. These types of effects are not those desired by the incumbent governments, especially in election years.

At the same time, the maximum intensity of the structural changes was recorded in post – electoral years: all the political programs proposed the speeding of the economic reforms and consequently when a party or a coalition wins the political power, it tries to promote measures to speed up some economic changes process. The regional data also confirm the hypothesis of significantly connections between the state of the economy and political behaviour of the electors. The level and the dynamics of the unemployment at regional level have an influence on vote behaviour, as stated by the partisan political business cycle theory: in the areas with a higher unemployment rate the voting preference (tendency) is skewed towards the political left side. But

each of the most important Romanian political parties of the period 1992 –2004 (PDSR, CDR-D.A.) have faithful electors. The right fidelity proved to be superior to the fidelity of the left's electors: the right captive electorate has a big fidelity, but a small size (relative to total Romanian electorate)

The results obtained must be understood under the limits inner to the research method used. For example, it is likely that the bias towards left–side political spectrum observed in areas with high unemployment rates is actually explained by the behavioural specificity of the population from poor zones. Given the unavailability of credible socio-economic information regarding poverty in Romanian geographical areas over the entire 1990 – 2004 period, the above-mentioned hypothesis is not directly tested in this paper. The underlying reasoning is that the poor zones have usually high unemployment rates, and the econometric models presented here could offer, after all, arguments for two important hypotheses: (1) the electors from the poor regions vote preponderantly for left-wing political parties, and (2) the unemployment rate could be used as a *proxy* variable for poverty in the regional political behaviour models.

Regarding the economic voting for the Parliamentary elections from November 2008, the increase of unemployment in regional structures resulted in a penalty for PNL (as the party in office) and an increase in intentions to vote for opposition parties (PSD and PDL).

Further analyses would include more electoral moments, meaning that the econometric level of confidence will increase and the results should be more econometrically reliable.

CHALLENGES OF THE EUROPEAN UNION BUDGET REFORM

ELENA PĂDUREAN[*]
EMILIA CÂMPEANU[**]
ANDREEA STOIAN[***]

Abstract
At the European Union are presented some concerns regarding the need to review its policies starting with the recommendations for the budget reform and the change of the EU basic policies. Therefore, it was discussed some scenarios that involve the enlargement of the EU. However, the economic context imposes some constraint regarding this process to accept Croatia and Turkey as EU members. The aim of this paper is to present these scenarios. Taking into consideration that the empirical investigation of these scenarios are difficult to achieve based on short time series data, we propose a new set of analyze based on important macroeconomic indicators.

Keywords: *European Union; budget; reform; enlargement.*

1. Introduction

Community budget issue is far from fully clarified, neither in terms of income source or destination in terms of expenditure in line with the aims of the European construction, which is why we consider highly motivated to approach this issue based on the accuracy and impartiality of the researcher.

Since late 2005, according to the Interinstitutional Agreement, the EU launched sustained move in the sense of a fundamental review of the Community budget. European Commission and European Parliament have launched numerous invitations to researchers, academia in general, and even politicians, to bend on the issue of the EU budget reform process. We believe that the realization of such projects could lead to significant results, so as to come up with a proposal that can be reasoned and scientifically tested. Therefore, this approach is part of our work.

The methodology used in developing this research paper is: i) theoretical and logical analysis of European budget process; ii) conceptual analysis and evaluation is paramount, as compared with the methodological, instrumental or empirical analysis and evaluation; iii) is a critical research relating to the status quo of the subject matter of research

There are increasing debates who stresses the importance and usefulness of the existence of an extensive research to bring not only conceptual and methodological proposals for reforming the European budget process, as well as instrumental proposals (for example, how to identify the European tax base, respectively, how to build an European tax practice).

Taking into consideration that the empirical investigation of these scenarios are difficult to achieve based on short time series data, we propose a new set of analyze based on important macroeconomic indicators.

The paper is organized as follows: section 2 is dedicated to analyze some aspects of the EU budget reform based on the scenario that involve new EU members such as Croatia and Turkey. Section 3 presents the empirical investigation of these scenarios based on a new set of important macroeconomic indicators analyze. Section 4 is dedicated to the conclusions.

2. Scenario for the European Union budget reform[1]

Along with the decision to adopt a multiannual financial framework for 2007-2013 timeframe, the leaders of governments of the European Union members decided, during the European Council meeting in December 2005, to review the EU policies and funding costs starting with the recommendations for the budget reform and the change of the EU basic policies. Decisions adopted at that time affected the financial prospects set for 2007-2013. The changes proposed in the summit in 2005 were translated in scenarios.

One scenario involves radical reform of the EU budget, but blocks most of the actions set by the Treaty of Lisbon (needs posed by global changes made, that Member States should meet the needs arising from the EU diversity and enlargement to include new members). This process would involve the allocation of adequate resources for each instrument. Even if the CAP (Common Agricultural Policy) is limited, the current budget is inadequate compared to the needs, and review should be completed with a decision to increase the level of funds collected from the EU budget. At present there is, however, sufficient determination of the Member States to lead the discussion in this direction.

Based on the above premises in regard with the EU policies and challenges, one option would be the gradual reconsideration and reconstruction of the policies and instruments that are based on European funds so that the resources are adapted to the new needs. In this context, the Member States must deal with these given the budget constraint imposed by the size of the allocated resources, by the reluctance on its growth potential, and the position taken by the net contributor Member. The adoption of such decisions would not be possible without changing the fundamental EU policies, the acquis communautaire, and the program of the budget expenditure and revenue. This is the scenario of a progressive increase (phasing-in) of the budget so that the new activities can be financed. It may be a realistic scenario with the condition to achieve a balance between the new activities and spending.

Considering that the decision adopted at the summit in December 2005 was due to the current needs of the debate then the radical changes in the EU financing policies is not the main goal. In this situation, the most likely scenario would preserve the status quo of European budget.

The challenges of the EU budget reform focus on the reorientation of the EU expenditure program, considered a legacy of the past with significant impact on increasing the competitiveness of the EU. Making fundamental changes may prove to be difficult and, therefore, the main direction of change should aim to reduce spending for certain policies, while keeping the current level (or a very small increase) funding of existing policies. This shift in expenditure would result primarily from lower costs to agriculture and cohesion policy. Such a change would penalize new acceding countries, but would benefit taxpayers net. It would be a scenario of a progressive decrease (phasing-out) through the change in the budget for increasing the share allocated to new activities.

In terms of political it might be reconsidered the British rebate. Suspension of the exemption would lead to significant contributions to Great Britain to the European budget.

These scenarios were developed only as working hypotheses to outline the potential challenges posed by the EU enlargement. It is well known that any EU enlargement involves costs and benefits for the old states and acceding states. However, taking into account the current economic environment, the financial crisis has deepened the problems already faced by the EU Member States since the boom times, it is unlikely that the founding states of the European Union to be willing to bear the new costs of the EU enlargement. In addition, any State which becomes a member of the EU brings its own imbalances that come into contact with other economic instability of the Member States. Here's that lead to an increase of the problems already faced by the EU and

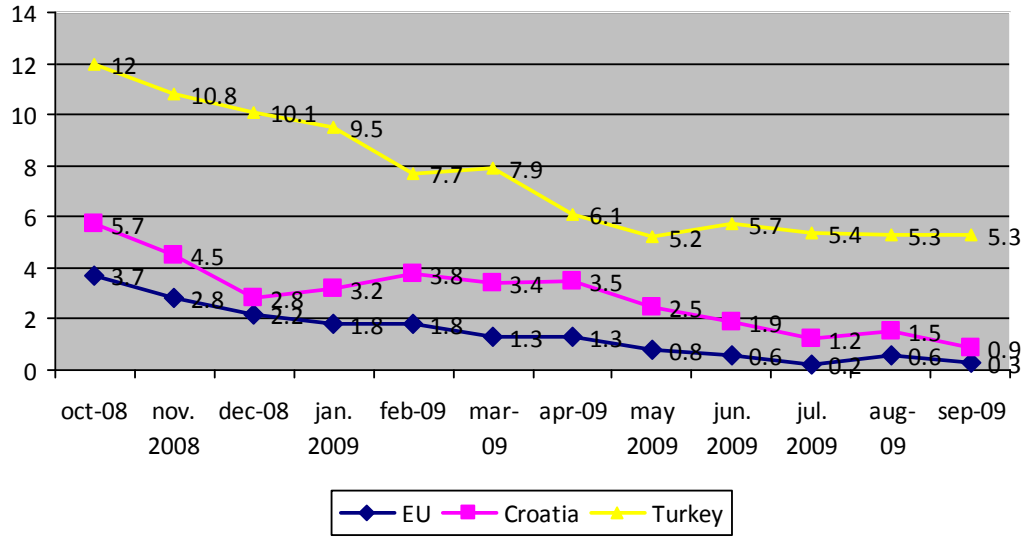
[1] This section is based on the Pietras, Jarosław, *The future of the EU budget. In search of coherence of objectives, policies and finances of the Union*, 2008, p. 60-61.

which will worsen as a result of the crisis, the failure of fiscal consolidation, and aging population effects.

3. Empirical investigation

Given the descriptive nature of these strategies it is difficult to empirically estimate the effects of EU enlargement due to insufficient statistical data. In addition, they may be a number of political and economic factors that cannot be estimated and inserted in these investigations in order to legally validate the statistical results. Considering the reasons stated above, it will try to alert the induced effects of EU enlargement in the current conditions using the key macroeconomic indicators such as inflation, unemployment, GDP per capita, budget balance, and public debt.

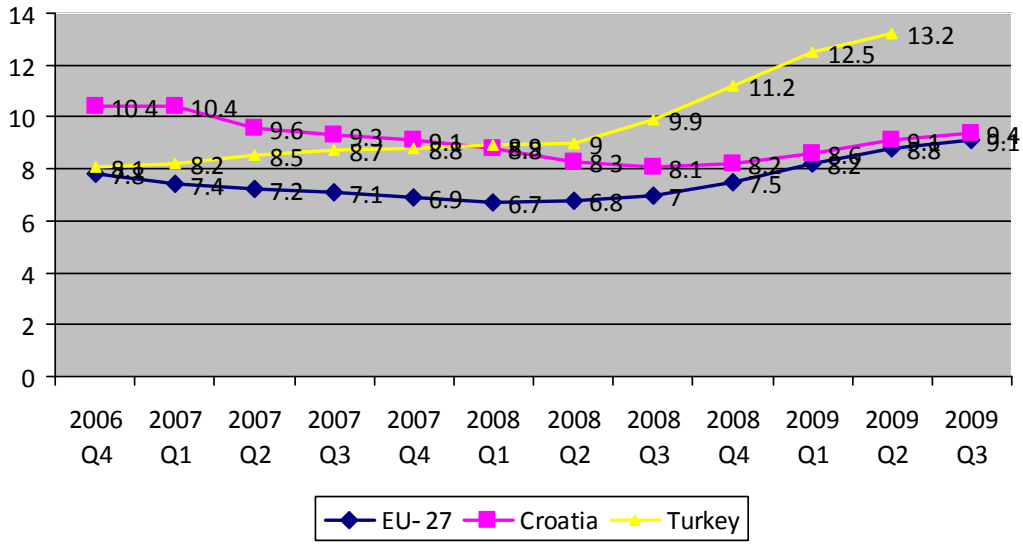
Figure 1. Inflation rate (%)



Source: own determination based on data from Eurostat yearbook 2010.

Analyzing the evolution of inflation in the EU and new EU accession countries can be observed a downward trend in Croatia and Turkey as a result of the mix of monetary and fiscal policy. However, inflation in Croatia and Turkey are above the EU average. Therefore, the inclusion of these countries under present conditions is likely to emphasize the vulnerability of the entire EU.

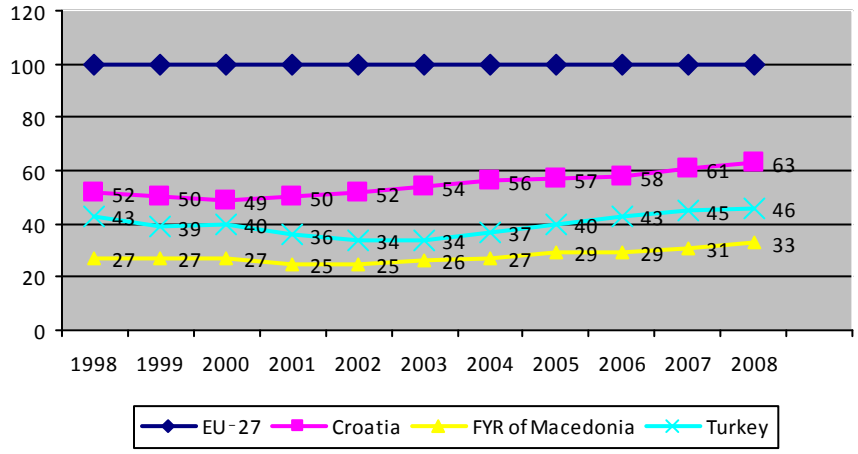
Figure 2. Unemployment rate (%)



Source: own determination based on data from Eurostat yearbook 2010.

The analyze of the unemployment rate shows that the situation is similar to that described above, in the sense that this particular indicator ahead of the EU for Turkey where there is a lag of almost 4 percentage points compared with the EU.

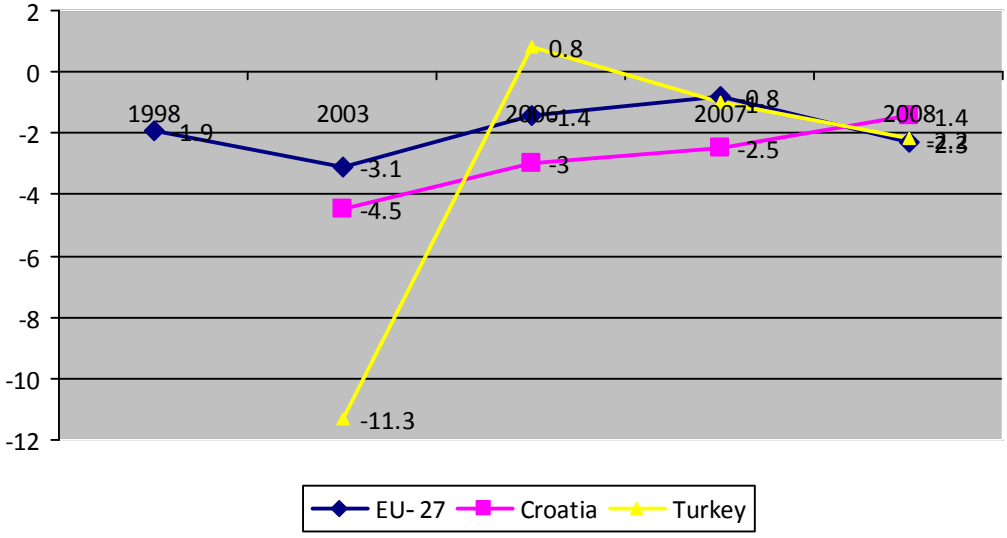
Figure 3. GDP per capita (% of GDP per capita at EU)



Source: own determination based on data from Eurostat yearbook 2010.

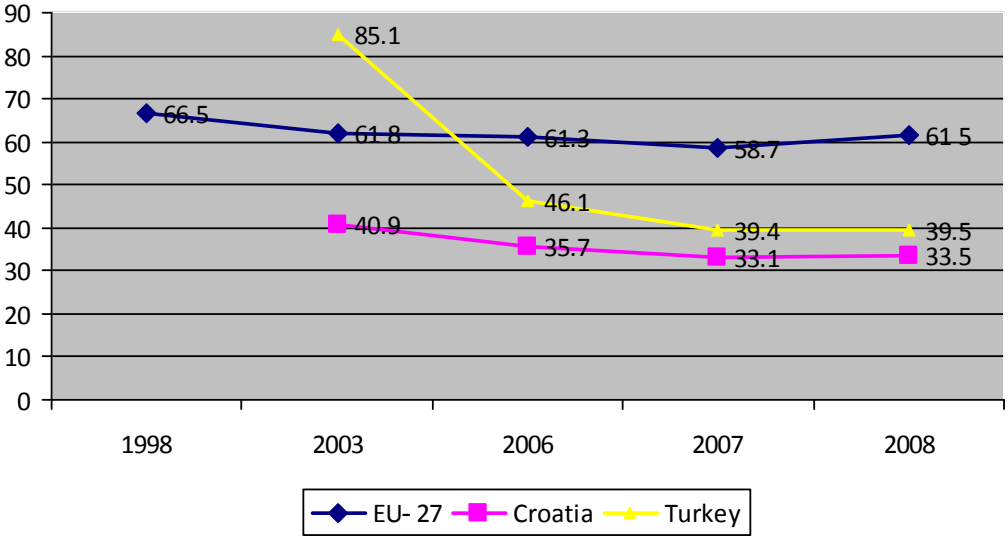
Based on GDP per capita it is identified a significant gap between its level for Croatia, Turkey and Macedonia in comparison with the EU. For example, per capita GDP of these countries to the EU average is 27.8%, in Macedonia, 39.7%, in Turkey, and 54.7%, in Croatia.

Figure 4. Budget balance (% of GDP)



Source: own determination based on data from Eurostat yearbook 2010.

Figure 5. Public debt (% of GDP)



Source: own determination based on data from Eurostat yearbook 2010.

Figures 4 and 5 indicate the evolution of fiscal indicators Croatia, Turkey in comparison with the EU. Following the graphical representation of the budget balance can be seen that these countries have the vast majority of time, lower budget deficits than the limit imposed by the Maastricht treaty. Turkey, however, had faced significant budget deficit in 1998 of 11.3% of GDP, but in 2003 the budget surplus reach 0.8% of GDP. In the same period, Turkey's public debt has been a significant

reduction of 39 percentage points of GDP as a result of massive fiscal adjustment that took place during this period. In any case, the indebtedness of Turkey and Croatia has not exceeded 60% of GDP in 1998-2008, excluding 1998 when Turkey had a debt of 85.1% of GDP.

As much as a whole is composed of more heterogeneous components it will be more difficult to manage problems that arise in all parts. Starting from this consideration it can be a generalization of this assertion and extension of it at the EU level. Above were presented the evolution of some of the macroeconomic indicators in order to highlight the important differences between the new acceding countries.

4. Conclusions

The work done in this paper is determined not only by the general case, for improvement of any tool, the EU budget having a role in the implementation of common policy objectives, but also internal and external developments, which put Union before the new challenges: geographic expansion and broadening of the subject areas of integration, the globalization and, more recently, financial and economic crisis. The intention of a deeper evaluation of the Community budget was designed not only with the involvement of EU institutions, but also with the support of wide public consultation, which shows real interest in sustainable results, acceptable, necessary to fund improvements to the design and operation of the EU budget.

It is worthwhile, given the timing generous approach coupled with the possible embed new ideas to reform the budget in future the EU's multiannual financial framework, 2013 - 2020, demonstrating the strategic vision of this reform approach.

EUROPE'S FINANCIAL AND ECONOMIC CRISIS – VALID METHODS TO PUTTING AN END TO IT

VERONICA ADRIANA POPESCU[*]
CRISTINA RALUCA POPESCU[**]
GHEORGHE N. POPESCU[***]

Abstract
Specialists believe that Europe is mired in a deep debt trap as a result of the costly measures taken to deal with the financial and economic crisis and they describe the situation as being serious, but not without hope.
The majority of the specialists believe that without the euro, Europe would be in a much worse position.
In the fallowing paper, our intention is: first to stress the key factors that have led Europe to the current crisis, second to present some possible scenarios that the crisis may generate in the near future and third to give some viable solutions that might improve Europe's nowadays economical situation and help it get out of the crisis.

Keywords: *financial crisis, economic crisis, euro crisis, valid methods, deficit, competitiveness*

Introduction

Specialists believe that Europe is mired in a deep debt trap as a result of the costly measures taken to deal with the financial and economic crisis and they describe the situation as being serious, but not without hope. The majority of the specialists also believe that without the euro, Europe would be in a much worse position.

In the fallowing paper, our intention is: first to stress the key factors that have led Europe to the current crisis, second to present some possible scenarios that the crisis may generate in the near future and third to give some viable solutions that might improve Europe's nowadays economical situation and help it get out of the crisis.

That is why our paper covers the matters that implicate the economic crisis in general, which, of course, also depend upon the financial crisis elements. The theme of the paper is extremely important nowadays, especially due to the latest events that took place not only in Europe, but all over the world.

In addition to all these important ideas, the research starts with the main factors that have led Europe to the current crisis, and that is because many specialists in the economic and financial field said, at the beginning, that the current situation was caused by the euro and the euro crisis. Other specialists have stated that it wasn't the euro and it wasn't a euro crisis that caused the current situation, bringing the arguments that the euro has worked extremely well for twelve years, and more over the last two years, when the huge crisis took place, it even has actually helped protect Europe. This last category of specialists believes that the problem was the financial policy of the countries that have it, because during the crisis most countries responded in a proper and reasonable manner, in cooperation with the European Central Bank and also in an international context, a crisis that did not start in Europe but instead had its origins in America and then came over and engulfed Europe.

After that, the research continues with the presentation of some possible scenarios that the crisis may generate in the near future, and that is because our believe is that a proper system for controlling deficits is definitely needed and that should be the lesson that we have to learn from this major economic and financial crisis.

[***] Professor Ph.D., Academy of Economic Studies, Bucharest, (e-mail: popescu_gh_cafr@yahoo.com).

In the end, as a conclusion to all the important ideas presented and debate in our paper, we try to give some viable solutions that might improve Europe's nowadays economical situation and help it get out of the crisis. Firstly, we believe that was done wrongly five, six or seven years ago needs to be rectified, at any rate, which, of course, means that we need tighter supervision of budgetary policy. Secondly, we need greater oversight by the EU Commission, which was lacking, for example, in the case of Greece. Thirdly, a country that does not abide by the rules should have its voting rights within the European Union withdrawn, particularly in the euro zone, and that is why what would be even more effective is for a country that does not abide by the rules, and fails to stick to the joint recommendations as well as its own stability program, to be denied subsidies from the European fund.

All in all, our study was also based on what is the relation between the theme chosen and the already existent specialized literature, and that is the reason why our research will include different views that specialists have expressed in time in the matter of the economic crisis. In the current environment in particular, making that sort of forecast would be especially difficult as the euro exchange rate no longer takes its cue from fundamental data alone, and of course people are worried about the future, and they ask themselves what's the safest currency to be in. We strongly believe that nowadays environment makes it difficult to arrive at a forecast, not even for us but also even for analysts and economics specialists, but what should be remember as a concrete and clear fact on long term is the fact that fundamental data will play an important role and that as a result the European currency will be in a good position only provided the Europeans stick to all the promises they've made.

1. Key factors that have led Europe to the current crisis – a short presentation

Our research starts with the main factors that have led Europe to the current crisis, and that is because many specialists in the economic and financial field said, at the beginning, that the current situation was caused by the euro and the euro crisis. Other specialists have stated that it wasn't the euro and it wasn't a euro crisis that caused the current situation, bringing the arguments that the euro has worked extremely well for twelve years, and more over the last two years, when the huge crisis took place, it even has actually helped protect Europe. This last category of specialists believes that the problem was the financial policy of the countries that have it, because during the crisis most countries responded in a proper and reasonable manner, in cooperation with the European Central Bank and also in an international context, a crisis that did not start in Europe but instead had its origins in America and then came over and engulfed Europe.

Due to all these reasons, the majority of the specialists believe that it wasn't the euro and it wasn't a euro crisis that caused the current situation, and that is because the euro has worked extremely well for twelve years, and over the last two years, as this huge crisis took place, it has actually helped protect Europe. We strongly believe that without the euro, Europe would have been a scene of currency - policy devastation, and it would look today totally fragmented, and exposed to the influence of the dollar and other currencies. So, the main conclusion is that the problem isn't the currency.

Specialists have not only once stated that the problem was in fact the financial policy of the countries that have it. Therefore, during the crisis most countries responded in a proper and reasonable manner, in cooperation with the European Central Bank and also in an international context. It is also very important to stress the fact that this particular crisis did not start in Europe but instead had its origins in America and then came over and engulfed Europe. All in all, confronted with such a terrible situation, politicians on the whole acted in the right way. Our belief is that it did take a lot of money in order to avoid the catastrophe. Like in any other critical situation, negotiations during the crisis took place within a framework consisting of the European Stabilization Fund and undertakings to reduce deficits. And at this particular point comes a very important question, which

refers to the need of a proper system for controlling deficits, its main importance and how should it be properly maintained in time.

2. Possible scenarios that the crisis might generate in the near future

After presenting the main factors that have led to the appearance of the economic and financial crisis, the research continues with the presentation of some possible scenarios that the crisis may generate in the near future, and that is because our believe is that a proper system for controlling deficits is definitely needed and that should be the lesson that we have to learn from this major economic and financial crisis.

In addition to all the points stated in the previous section, we would also like to stress that what was done wrongly five, six or seven years ago needs to be rectified, at any rate, which means, of course, that we need firstly tighter supervision of budgetary policy; secondly, we need greater oversight by the EU Commission, which, for example, was lacking in the case of Greece. If you look at Greece now, oversight by the International Monetary Fund, Commission and European Central Bank is suddenly working well and thirdly, a country that does not abide by the rules should have its voting rights within the European Union withdrawn, mainly in the euro zone. Moreover, specialists have more than once emphasized that it would be even more effective for a country that does not abide by the rules, and fails to stick to the joint recommendations as well as its own stability program, to be denied subsidies from the European fund. As a consequence to all these interventions, nowadays Greece, oversight by the International Monetary Fund, Commission and European Central Bank is suddenly working well.

We can take the example of Greece at any time, in order to make a statement regarding all that we have presented earlier. Even if budgetary consolidation plans are going according to schedule, the question is what happens when the European protective shield expires. That is why, to our mind comes the questions whether will debt increase again as a percentage of economic output or will the country be able to refinance itself on the market or has the shield simply allowed us to buy time.

In order to see which of these scenarios will be viable in time, for now it's a good thing to have bought ourselves some time and thereby restored calm, not only on currency markets but also in the countries concerned, so that they can tackle their structural problems. Our believe is that if countries are able to be successfully over the next two or three years, we will then be able to take an objective look at whether they continue to need help, or will be able to solve their problems without outside assistance. That is why, what's important now is to maintain the pressure on countries to ensure that they do not let up on the measures under any circumstances. Of course, if in two or three years' time things will evolve in an upper trend, it will be politically feasible to extend the life of this protective shield if necessary.

In the end, the idea is that if it turns out that the financial ratios for countries for which this has been done have improved decisively, that governments and people have made a huge effort and a lot of sacrifices have been made and there will also be a willingness not to let these countries down. All in all, the great success of the European Union has always lain in exporting stability, rather than importing instability. In the end, as a conclusion to all the important ideas presented and debate in our paper, we try to give some viable solutions that might improve Europe’s nowadays economical situation and help it get out of the crisis. Firstly, we believe that was done wrongly five, six or seven years ago needs to be rectified, at any rate, which, of course, means that we need tighter supervision of budgetary policy. Secondly, we need greater oversight by the EU Commission, which was lacking, for example, in the case of Greece. Thirdly, a country that does not abide by the rules should have its voting rights within the European Union withdrawn, particularly in the euro zone, and that is why what would be even more effective is for a country that does not abide by the rules, and fails to stick to the joint recommendations as well as its own stability program, to be denied subsidies from

the European fund. It is also a fact that a country is not responsible for the debts of others, and that is due to the European shield.

3. Viable solutions that might improve Europe's nowadays economical situation

After presenting the main factors that have led to the appearance of the economic and financial crisis and after emphasizing some possible scenarios that the crisis may generate in the near future, the research continues with some viable solutions that might improve Europe's nowadays economical situation and help it get out of the crisis.

Firstly, in this matter, at the begging of this part a new question is raised in regard to where specialists should expect the euro exchange rate to go in the short to medium term. It is also a fact that in the current environment in particular, making that sort of forecast would be especially difficult as the euro exchange rate no longer takes its cue from fundamental data alone. So, if people were to look at the fundamental data only, the euro zone wouldn't be in such a bad position, it would certainly be doing better than the UK, US or Japan, where debt levels have reached even greater proportions. Nowadays, in a crisis such as the one we've just experienced, the safe-haven issue also plays an important role and although economic data in America is worsening, the dollar will not necessarily weaken in such a situation. Of course, due to all the changes that occur unexpectedly today, people are worried about the future, and they want to know what the safest currency to be in is. In this matter, specialists have stated that it is still the global currency of the dollar and that makes it difficult to arrive at a forecast – even for analysts and economics specialists. Long term, we do believe fundamental data will play an important role and that as a result the European currency will be in a good position – provided the Europeans stick to all the promises they've now made. So, as a possible solution, it would be more than wise to consider as a point of reference of medium and long term the dollar as an etalon currency.

Secondly, in this matter, another question is raised in regard to where specialists should expect in the near future, and that is how likely the chances of the Americans trying in a very systematic way to inflate their way out of their debt situation can be rated. As the world's biggest debtor, they would certainly have the opportunity to do so. That is why, going back in history, one can realize that America did indeed to some extent inflate its way out of debt after the Second World War. By contrast, under Bill Clinton the US had an incredibly positive performance. Clinton had inherited a huge debt mountain from the Reagan administration. Eight years later, however, he handed over a surplus to his successor. The Clinton government was also able to achieve a superb economic performance – in which 20 to 30 million new jobs were created – through budgetary consolidation, coupled with relatively low interest rates, a flexible labor market, and a highly productive financial market. But if the Americans were now to go down a different route – in other words, inflation combined with low interest rates – this would only be possible with the cooperation of the Federal Reserve, which is nevertheless a big temptation. The US is still the world's biggest debtor. So, as a possible solution, it would be more than wise to consider as a point of reference America and the position that it takes on the market place in the near future.

Thirdly, in this matter, another question is raised in regard to where specialists should expect in the near future, and that is the one concerning USA who is heavily indebted to the Chinese, which raises the suspicion to the Americans that this dependence can be an existential threat to their country. Of course, there is indeed a dependency between America and China, but the Chinese have so far used their own currency reserves responsibly and only slowly begun to move toward allowing the renminbi to rise – and first and foremost they don't want to do that under pressure. A very important fact that must be taken into account when analyzing this delicate situation is that if the dollar were to suddenly weaken even more, America's position as a world power would also be weakened. On the surface it would perhaps bring them a bit of relief on financial policy, but on the other hand there is a risk of other countries also restructuring their currency reserves. In turn, this would be associated with a major risk to the political and economic power of the US. Even in the

most difficult of times, American presidents and finance ministers have always emphasized their wish to retain a strong currency. A weak currency is not a good advert for a world power. So, as a possible solution, it would be more than wise to consider as a point of reference the fact that America is conscious of the possible dependency and of being in a vulnerable position for the moment.

Fourthly, in this matter, another question is raised in regard to where specialists should expect in the near future, and that is the one concerning how great is the temptation for Europe to inflate. Specialists believe that the European Central Bank will not go down that road, because it is an organism committed to stability, and due to this fact its committees, presidents, vice-presidents and chief economists have demonstrated that convincingly over the last twelve years. Europe's experience in the 1960s and 70s showed that inflation is not the way to solve the existing problems. The European Central Bank is obliged by international treaty to target stability alone and that is different than in the case of the Federal Reserve, which is also required to keep a watchful eye on business activity and the economy. So, as a possible solution, it would be more than wise to consider as a point of reference the fact that Europe has a strict system of checks and balances that has proven itself, and the Europeans and European Central Bank will not depart from that.

Conclusions

In the first part of our conclusions we would like to summarize the main outcomes of our study concerning Europe's financial and economic crisis and the existing valid methods to putting an end to it.

First, the key factors that have led Europe to the current crisis are not the euro and the euro crisis, but in fact consist of the public debt that is still a big concern for Europe. While fiscal tightening can have a dampening effect on growth in some countries, it is unlikely to derail the broader European economic recovery. The example that we have shown in our study is the one of Greece. Prior to the global financial crisis, risk premia on Greek bonds versus safer European sovereign borrowers such as Germany, were very low and their yields similar. Greek government bonds were almost considered as a substitute to German bonds and that is why the implicit assumption seems to have been that if Greece or another weaker European economy is not able to pay back their debts, there will be a transfer of money from the stronger countries to the weaker ones. The European treaties do however contain a "no bail-out clause," meaning that member states are not liable for the debt of any other countries in the currency union. In this particular example, after Greece drastically revised its public deficit estimate to almost thirteen percent of gross domestic growth (GDP) last year, there were increased fears that Greece might not be able to pay back its debt and might not get support if needed, which implicated that over the past months this put pressure on other southern European sovereign issuers, as well as the euro.

Second, the possible scenarios that the crisis might generate in the near future are strongly related to the US dollar and to the USA position on the market place. On May 10, the euro zone countries and the IMF agreed to provide up to roughly 720 billion euro to countries facing financing difficulties. In technical terms there will be a special investment vehicle (SPV), which obtains funding of up to 440 billion euro through direct injection from the member states or by issuing bonds. To ensure lower financing costs, the bonds will be guaranteed by the European countries. This vehicle will then support countries in need by buying their debt and thus ensure refinancing. The IMF would provide an additional 220 billion euro and an additional 60 billion euro are available from the European Commission. The European Central Bank (ECB) is helping as well. In an unprecedented move, it announced that it will purchase government debt in order to support the functioning of markets. However, it has made it very clear that the intention of the purchases is to restore an orderly functioning of markets. The amounts purchased have initially been fairly small and the ECB is committed to absorb the created liquidity to avoid inflationary effects.

Third, as viable solutions that might improve Europe's nowadays economical situation we have mentioned: that it would be more than wise to consider as a point of reference of medium and long term the dollar as an etalon currency; it must be taken into account as a point of reference America and the position that it takes on the market place in the near future; it has to be stated that America is conscious of the possible dependency and of being in a vulnerable position for the moment; it is also good to be remarked the fact that Europe has a strict system of checks and balances that has proven itself, and the Europeans and European Central Bank will not depart from that.

Of course, we would like to mention that the implications of such outcomes must be taken into account in the near future, which also proves to be unsecure and strongly related to the position that will be played by the dollar currency and by USA. We would also have in mind as a suggestion for future researches to present in a closely manner the relation that exists between euro and the dollar and the implications of the two currencies in the world development process.

GREECE, PORTUGAL AND SPAIN - A TEST CASE FOR EUROPE IN 2011

CRISTINA RALUCA POPESCU[*]
VERONICA ADRIANA POPESCU[**]
GHEORGHE N. POPESCU[***]

Abstract
Recent statistics clearly show that Greece, Portugal, Spain and other euro zone members have massive public deficits and that is why this entire means that euro's future is extremely delicate.
Until now, politicians have not come up with a concrete plan to solve the situation. In this matter, politicians in France, Germany and elsewhere have signaled that they'll provide some kind of back-up support, but only when Greece has really taken tough measures – possibly more than they have done already – to get the deficit down. Although that may be unsettling to some investors in the very short term, it's clearly good news for the euro in the longer term.
In our paper, the intention is to present the reasons why Greece, Portugal, Spain and other euro zone members have massive public deficits and what should other countries do in order to help them in the nearby future. For us, a great concern is also the reaction of the European Central Bank and what could this institution do in the benefit of European countries in general.

Keywords: *public deficit, economic crisis, euro zone, European Central Bank, institution, competitiveness*

Introduction

The study "Greece, Portugal and Spain - A Test Case for Europe in 2011" covers complex matters such as: the data provided by recent statistics about Greece, Portugal, Spain and other euro zone members that have massive public deficits and which means that the entire euro's future is extremely delicate; aspects regarding politicians that have not come up with a concrete plan to solve the situation, and in this matter, politicians in France, Germany and elsewhere have signaled that they'll provide some kind of back-up support, but only when Greece has really taken tough measures – possibly more than they have done already – to get the deficit down; problems that may be unsettling to some investors in the very short term, but could turn out to be favorable for the euro in the longer term.

That are the main reasons why, in our paper, the intention is to present the reasons why Greece, Portugal, Spain and other euro zone members have massive public deficits and what should other countries do in order to help them in the nearby future. For us, a great concern is also the reaction of the European Central Bank and what could this institution do in the benefit of European countries in general.

We strongly believe that all the ideas that we are going to present in our paper are extremely important because they present nowadays reality and try to bring along with the specialists' ideas new ideas that might bring improvement to the situation that has been created due to the economic crisis.

In order to provide an answer to the main matters of our paper, we have analyzed the situation that exists in France, Germany and the other big countries which have to provide help to other countries in need, such as Greece, Portugal and Spain. Furthermore, we have presented the position

taken by the European Central Bank and the reasons that had lead to that position. We have considered also as being extremely important the position taken by politicians and the concrete plan that they took in order to solve the situation today. Of course, our main target was to find ways in which situations similar to the existing one can be avoided in the future. We have also mentioned which is the relation between the theme of our paper and the already existent specialized literature.

1. Greece, Portugal, Spain and other euro zone members and the massive public deficits

The first part of our study entitled "Greece, Portugal, Spain and other euro zone members and the massive public deficits" stresses the position that Greece, Portugal, Spain and other euro zone members that have great deficit problems are seen threw the yeas of other countries in the European Union or in the world. This part also highlights the main consequences of having a big financial deficit as a country that is part of the European Union and tries to emphasize the most frequent questions that the specialists have posed in regard to all these matters.

Nowadays, France, Germany and the other big countries need to provide help to other European countries that have a big public deficit. In this particular matter, France, Germany and the other big countries are going to require Greece, and any other country needing support, to put their own economy in order before receiving support from the others. It is generally known that the European Central Bank, which is technically subject to the EU treaties, is not allowed to bail out Greece, and that is the reason why the help would have to come from the other countries on a bilateral basis.

Firstly, we would like to present the situation of Greece. Of course, the problem that exists in Greece, for example, which has made investors nervous, has resulted in a safe haven flow out of Euros and into dollars. Politicians have not come up with a concrete plan to solve the situation, but they have signaled that they'll provide some kind of back-up support, but only when Greece has really taken tough measures, maybe even more than they have done already, to get the deficit down. Although that may be unsettling to some investors in the very short term, it's clearly good news for the euro in the longer term. Taking into account the situation that exists in Greece there is also a question about how high is the risk of payment default going to be. In this particular matter, specialists believe that the risk of payment default is going to be very small, though one can never say zero, because the financial markets are in continuous motion. Some analysts say that Greece is a test case for the European Union.

Secondly, our target is to present the situation of Spain. As Greece, Spain has also been facing a severe recession and major structural challenges, and that is the main reason why specialists believe that a recovery looks likely to be muted. For many years, the Spanish economy has outperformed its Euro area peers in terms of growth performance. Over the past decade, the growth of the Spain's gross domestic product (GDP) averaged 2.8 per cent compared to only 1.5 per cent in the Euro area as a whole. Even during the recent crisis, Spanish GDP has contracted somewhat less than in other Euro area countries, e.g. Italy or Germany. However, the relatively mild decline in GDP clearly masks the severity of the downturn. Domestic demand was down 12 per cent in the third quarter, compared to the third quarter in 2008. And the unemployment rate has surged from 8 per cent in 2007 to more than 19 per cent. While some of the larger Euro area economies exited recession already in the second quarter of 2009, the Spanish economy continued to contract in the third quarter. Of course, there are several reasons why the Spanish economy has been so severely affected. In this matter, specialists have stated that similar to the USA and the UK, Spain has experienced a housing boom and at the peak, 14 houses per 1000 inhabitants were built in Spain, compared to only 7 in the USA and 3 in the UK. This construction boom was financed to a significant extent by foreign borrowing. In 2007, the current account deficit to GDP ratio reached a peak of 11 per cent, which is very high by international standards and even far exceeded the US deficit. In particular, Spanish non-financial corporations' took up significant amounts of credit. And that is why, during 2007, their net borrowing (gross savings minus gross investment) reached minus 11 per cent of GDP. The debt of

households also increased markedly. The ratio of household liabilities to disposable income in Spain has become the highest among the large Euro area countries in recent years. Nowadays, Spanish households have increased their savings markedly and the savings rate has risen from around 10 per cent of disposable income at the beginning of 2008 to 18 per cent in the third quarter. Non-financial corporations have also lowered their dependency on external finance somewhat. As a result, the current account deficit has narrowed dramatically to around minus 3.5 per cent in the third quarter of 2009. At the same time, employment has been cut very sharply (minus 7.2 per cent in the third quarter of 2009, compared to the third quarter in 2008). Well known specialists believe that the extreme deterioration reflects two factors: the first one is Spain has the highest share of temporary workers in the European Union, and these can be dismissed easily and that is why the share of temporary employment has fallen from around 34 per cent in 2006 to only 26 per cent in 2009; the second one is that the downturn in the housing market has had a pronounced effect on construction employment and that is why construction employment has been falling for two years now, and accounts for around half the drop in total employment (emagazine.credit-suisse.com).

2. Possible scenarios for controlling the massive public deficits

The second part of our presentation entitled "Possible scenarios for controlling the massive public deficits" stresses the possible scenarios that one country should take into account in order to insure a better future and to avoid damage in the financial sector.

According to specialists, the current events surrounding Greece are leading to the creation of a kind of model, which will provide a broad framework in the situation in which other countries in the euro zone get into trouble. Portugal, Spain and Ireland may be affected, as well as Italy to a lesser extent, but the Greek case is very important, because it gives the possibility of creating a system offering some kind of residual support for weaker countries. In order to continue future studies, specialists must take into account that the euro encompasses strong economies like Germany and France on the one hand, and weak economies like Greece on the other and must try to balance the European Union economy. Of course, France, Germany and the stronger countries are prepared to help other countries in a deflation situation, but not inflation.

Firstly, in Greece or Spain's situation, there exist many opportunities which are both local and global: for example, locally, some investors are now looking at Greek or Spain bonds (the prices of which have fallen very sharply during the crisis) and wonder if they are now starting to offer value; for example, globally the equity prices have fallen generally during the crisis as well as the weaker euro. Of course, the worst of the crisis is now over and things will begin to stabilize, but there will be a risk of recurring bouts of instability from time to time, when some of the markets which have sold off can recover.

Secondly, taking into account Spain's situation in particular, recent figures show that unemployment is now stabilizing at a very elevated level, and we think it could start falling in coming months, business surveys have improved, but the improvement was clearly less pronounced than in other European countries, and as the process of debt reduction has further to run, we expect the road to recovery to be bumpy. The planned VAT hike from 16 per cent to 18 per cent next July and the abolition of the annual tax rebate of 400 Euro (per household) to reduce the budget deficit are the beginning of necessary fiscal restraints, which are likely to weigh on growth in coming years. Medium-term prospects do not look particularly encouraging either. A surge in the labor force driven by immigration was the major reason for the growth outperformance in recent years. From 2001 to 2008, the share of foreign workers increased from 3.6 per cent to 10.8 per cent. At the same time, productivity growth has fallen behind other large Euro area countries. Spanish competitiveness has deteriorated in recent years as unit labor costs have risen more strongly than elsewhere. A devaluation of the currency is not possible in a currency union, so competitiveness has to be regained through an increase in productivity or lower relative prices. Deflationary tendencies are becoming increasingly visible: In the producer price index, prices for consumer goods were down 0.5 per cent

in December (compared to December 2008). The prospects for Spain's housing market are also expected to be poor in the next few years. A recovery is nowhere in sight due to the challenging economic outlook, tighter credit, weak housing demand and the significant supply overhang in residential markets. The decline of housing demand in Spain started in 2007 and has intensified since then. For instance, the number of new and existing home sales is currently about 50 per cent to 70 per cent lower than their peak level. A pick-up in housing demand is unlikely in the short term given the high unemployment rate and credit constraints. During the past boom, banks have been willing and able to generate lending, which has fuelled housing demand. But the number of new mortgages on houses has dramatically fallen and hovers now around 50,000 mortgage properties per month compared to about 100,000 pre-crisis. A revitalization of mortgage credit is essential for a sustained recovery. There are some positive signs such as the pace of decline in mortgage lending abating and interest rates are at record low levels. However, for the time being, we think that mortgage credit growth is likely to remain sluggish. For example, the housing market is still highly oversupplied and the residential construction has played a major role in Spain's economic boom over the last decade, constituting around 8 per cent of output at the peak. The annual number of houses built more than trebled between 1997 and 2007 and, in 2006; Spanish housing starts were higher than in the UK and France combined. Since the beginning of the crisis in 2008, housing starts have dropped by about 70 per cent. Yet, according to estimates from R.R. de Acuña & Associados – a Spanish real estate broker – the housing supply by the end of 2008 was about 1,600,000 units. This number includes new and existing unsold houses and supply under construction. At the current sales numbers of about 400,000 units per year, it would take four years to absorb all the stock. Most of these units are located in coastal regions and satellite towns close to large cities where construction has been the most active during the housing boom. Moreover, there are some risks that this oversupply situation could worsen as Spanish saving banks have recently started selling off their property portfolios due to regulatory changes. Banks and savings banks became large real estate owners in Spain by taking over thousands of homes used as collateral on defaulted loans. Bank of Spain decided last October to increase provision requirements on real estate assets held by financial institutions for more than a year from 10 per cent to 20 per cent, which is likely to lead to the sale of some of the bank's real estate holdings. However, detailed data on the bank's real estate holdings are scarce and it is difficult to assess the importance of this effect (emagazine.credit-suisse.com).

In regard to the data that we have hereby presented, we are still optimistic regarding the economic crisis that exists today in the world, because each crisis has brought new and improved techniques to ensure a better and prosperous development to the countries.

Conclusions

All in all, specialists expect an increase in the supply/demand imbalance and further house price declines. That is why, for example, in Spain's situation, the house price index has declined by only 9.5 per cent since its peak in the first quarter of 2008, and more over, according to some indicators, such as house price to disposable income, residential properties in Spain are still substantially overvalued. In the years previous to the economic crisis, specialists will have to learn how to balance the growth in Europe and not only there, but worldwide. The consumers should make also substantial contributions to growth, as well as the corporate sector and when the economy will stabilize there will be also regions in the global economy growing far faster than Europe, so it should be able to export to these markets.

As a first conclusion, countries must find places where the demand for European exports comes from. Asia is the fastest-growing region of the global economy, and becoming a large European trading partner. Central and Eastern Europe and the US are other important trading partners.

As a second conclusion, the European countries that can outperform must be helped in the nearby future. Among these countries there is also Germany who is growing the most quickly and who has one of the most volatile economies within the euro area, and had one of the most severe recessions. The German economy is very much driven by corporate spending and exports. It is likely to grow by 3% in 2010, while France is expected to grow 2% and Italy 1%. Countries such as Spain, Ireland and Greece will probably find things much more difficult and post much lower growth rates.

As a third conclusion, this acceleration in growth mean that the European Central Bank (ECB) will start to raise its benchmark interest rate during the course of 2011, due to the already existing data on the year 2010. That is why it is possible the ECB will raise its benchmark rate to 2% by the end of 2011 from 1% today.

ON THE GASTALDI – D'URSO FUZZY LINEAR REGRESSION

DAN PETRU VASILIU[*]
MIHAELA ILIESCU[**]
DANA-FLORENTA SIMION[***]

Abstract
In the crisp regression models, the differences between observed values and calculates ones are suspected to be caused by random distributed errors, although these are due to observation errors and an unappropriate model structure.
So, the fuzzy character of model prevails.
The Fuzzy linear regression models (FLRM) are, roughly speaking, of two kinds:
Fuzzy linear programming (FLP) based methods and Fuzzy least squares (FLS) methods.
The FLP methods have been initiated by H.Tanaka (1982) and developed by H. Ishibuchi et al. The classical FLR model,

$$\mathbf{Y} = \mathbf{A}_0 + \mathbf{A}_1\mathbf{X}_1 + ... + \mathbf{A}_\mathbf{k}\mathbf{X}_\mathbf{k}$$

has a explained Fuzzy triangular variable, Y, Fuzzy triangular coefficients {Aj} and crisp explanatory variables {Xj}: the parameters {Aj} of the model are estimated by minimizing the total indetermination of the model, so each data point lies within the limits of the response variable.

In a large number of situations the prediction interval of the FLR model were much less than the interval obtained applying classical the Multiple linear regression model (see V.M. Kandala – 2002, 2003).

However, this approach is somehow heuristic; on the other side, the LP model complexity overmuch increases as the number of data points increases.

The FLS approach (P. Diamond; Miin-Shen Yang, Hsien-Hsiung Liu – 1988 et al) is an extension of the classical OLS method, using various metrics defined on the space of the fuzzy numbers.

A significant number of recent works (McCauley- Bell (1999), J. deA. Sanchez and A. T. Gomez (2003) who used FLS to estimate the term structure of interest rates) deals with models with a fuzzy output, fuzzy coefficients and a crisp input vector.

All the fuzzy components are symmetric triangular fuzzy numbers: the main idea of the method is to minimize the total support of the fuzzy coeficients. Sometimes, different restrictions occur.
In our paper, we intend to build some examples for the P. d'Urso and T. Gastaldi models, that allow a comparative study on various options.
(Pierpaolo d'Urso & Tommaso Gastaldi in: A least square approach to fuzzy linear regression, Comp. Stat. & Data Analysis 2000)

Keywords: *fuzzy linear regression; fuzzy metrics; Gastaldi - d'Urso equations; fuzzification; doubly linear adaptative fuzzy regression model.*

Introduction

The basic notion in the fuzzy theory is the fuzzy set or fuzzy number: in everyday mathematics, the corresponding notion is that of a set (or: crisp set). For a crisp set A, every element of the universe belongs or not to A, while for a fuzzy set A, every element of the subsequent universe has a degree of appurtenance to A, say, a number in the unit interval [0;1].

In this context, if an element **x** has the degree of appurtenance equal to 0, it "don't" belongs to A; if the degree of appurtenance equals to 1, then "sure" that **x** is an element of A; for the intermediate degrees of appurtenance e, say $\mu(x) = 0{,}7$ the appurtenance is 70% possible and 30% not possible (for this reason, the fuzzy theory interferes with the so – known "possibility" theory).

[***] Lecturer, Titu Maiorescu University, Bucharest. (e-mail: danaflorenta.simion@gmail.com).

For a crisp set A, belonging to an universe X, the characteristic function $\mu_A(x): X \to \{0;1\}$ is given by

$$\mu_A(x) = \begin{cases} 1, \text{if } x \in A \\ 0, \text{if } x \notin A \end{cases}$$

In the fuzzy case, the characteristic function, dubbed as *the membership function* is simply every function $\mu_A(x): X \to [0;1]$.

However, a series of special functions are routinely used, as in the following:

• **the triangular fuzzy numbers (Zimmermann)**: he's considering two continuous, decreasing shape functions, $\lambda, \rho: R^+ \to [0,1]$ with $\lambda(1)=0; \lambda(0)=1; \rho(1)=0; \rho(0)=1$; then, a triangular fuzzy number, denoted by $(m,a,b)_{\lambda\rho}$ has the membership function A(x) given by

$$A(x) = \begin{cases} \lambda\left(\dfrac{m-x}{a}\right), \text{if } x \le m \\ \rho\left(\dfrac{x-m}{b}\right), \text{if } x > m \end{cases}$$

Here, **m** is called the center of $(m,a,b)_{\lambda\rho}$, **a** is the left spread and **b** is the right spread of $(m,a,b)_{\lambda\rho}$. If **a** = **b**, then $(m,a,b)_{\lambda\rho}$ is called a ***symmetrical triangular fuzzy number*** that will be denoted simply by $(m,a)_{\lambda\rho}$.

In most applications, the shape functions **ρ, λ** are supposed to be $\rho(x)=x; \lambda(x)=x$ and consequently, the membership function becomes

$$A(x) = \begin{cases} 1-\left(\dfrac{m-x}{a}\right), \text{if } m-a \le x \le m \\ 1-\left(\dfrac{x-m}{b}\right), \text{if } m < x \le m+b \end{cases}$$

As an alternative, for an ***exponential fuzzy number***, the membership function has the shape below:

$$A(x) = \begin{cases} \exp\left[-\left(\dfrac{m-x}{\sigma}\right)^k\right], \textit{for } x \le m \\ \exp\left[-\left(\dfrac{x-m}{\sigma}\right)^k\right], \textit{for } x > m \end{cases}$$

Here, the spread is given by the positive $\sigma > 0$.

• **the trapezoidal fuzzy number (**D. Ralescu; L. A. Zadeh; Dubois), denoted by (a,b,α,β) has the membership function **A(x) :R → [0;1]** given by

$$A(x)=\begin{cases}\dfrac{x-a+\alpha}{\alpha}, & a-\alpha \le x \le a\\ 1, & a<x<b\\ \dfrac{b+\beta-x}{\beta}, & b \le x \le b+\beta\\ 0, & \text{otherwise}\end{cases}$$

• For the symmetrical triangular fuzzy numbers (TFN), an **Euclidean distance** is available: let $A=(m_1,a_1)_{\lambda\rho}$, $B=(m_2,a_2)_{\lambda\rho}$ be TFN: then, the Euclidean distance between A, B is

$$d_{AB}=\sqrt{(m_1-m_2)^2+(a_1-a_2)^2}\,.$$

If A, B are non-symmetrical, $A=(m_1,a_1,b_1)_{\lambda\rho}$, $B=(m_2,a_2,b_2)_{\lambda\rho}$ then, for $p_1,p_2,p_3>0$ suitable defined weights, $p_1+p_2+p_3=1$, the distance d_{AB} can be compute by using the next formula:

$$d_{AB}=\sqrt{p_1\cdot(m_1-m_2)^2+p_2\cdot(a_1-a_2)^2+p_3\cdot(b_1-b_2)^2}$$

PAPER CONTENT:
Fuzzy linear regression

Let's take into account the Linear Fuzzy regression model $Y = (a_0, r_0) + (a_1, r_1)X$, with:
• X – the explanatory variable, Y – the response variable
• (a_0, r_0), (a_1, r_1) the triangular symmetric fuzzy coefficients to be estimated
• X is supposed to be a crisp variable, Y = (c, s) a TSFN variable.

Remember that a triangular symmetric fuzzy number (TSFN), denoted by x = (a , r), has the membership function A(x): R → [0;1] given by

$$A(x)=\begin{cases}\dfrac{x-(a-r)}{r}, & \text{if } a-r \le x < a\\ \dfrac{(a+r)-x}{r}, & \text{if } a \le x \le a+r\\ 0, & \text{otherwise}\end{cases}$$

The spread of x is then equal to 2a: the centre of x is a.

The Tanaka approach, referred to as possibility regression, was to minimize the fuzziness of the model, represented by the total spread of the fuzzy coefficients. So, the method becomes an extension of the classical OLS method.

To illustrate this, let's consider the data in Table 1 below:

TABLE 1:

Y_i	X_i
$y_1 : (5 ; 2) = (c_1 , s_1)$	$x_1 = 1$
$y_2 : (8 ; 3) = (c_2 , s_2)$	$x_2 = 2$
$y_3 : (10 ; 2) = (c_3 , s_3)$	$x_3 = 3$

With the linear regression model: $Y = (a_0 , r_0) + (a_1 , r_1)X$

The required approximations become

$$\begin{cases} (5;2) \approx (a_0, r_0) + (a_1, r_1) \\ (8;3) \approx (a_0, r_0) + 2 \cdot (a_1, r_1) \\ (10;2) \approx (a_0, r_0) + 3 \cdot (a_1, r_1) \end{cases}$$

From here the OLS conditions are derived

- for the centers: $\min\{(a_0 + a_1 - 5)^2 + (a_0 + 2a_1 - 8)^2 + (a_0 + 3a_1 - 10)^2\}$
- for the spreads: $\min\{(r_0 + r_1 - 2)^2 + (r_0 + 2r_1 - 3)^2 + (r_0 + 3r_1 - 2)^2\}$.

The solutions are: $\begin{cases} a_0 = 8/3 \\ a_1 = 5/2 \end{cases}; \begin{cases} r_0 = 7/3 \\ r_1 = 0 \end{cases}$, so the estimated model becomes

$$Y = (2,5;0) \cdot X + (2,67;2,33) \Leftrightarrow Y = 2,5 \cdot X + (2,67;2,33)$$

Having zero spread, the X coefficient is a crisp number.

This equation allow us to perform interpolations, for example

$$x = 2,5 \rightarrow y = \frac{5}{2} \cdot 2,5 + (8/3;7/3) = (6,25;0) + (2,67;2,33) = (8,92: 2,33).$$

For a large number of explanatory variables, the matrix approach is more suitable. To illustrate this let's consider the data in TABLE 2.

TABLE 2:

sample	Y	X_1	X_2	…	X_p	the independent term
1	y_1	x_{11}	x_{12}	…	x_{1p}	1
2	y_2	x_{21}	x_{22}	…	x_{2p}	1
…	…	…	…	…	…	…
n	y_n	x_{n1}	x_{n2}	…	x_{np}	1

with: $\mathbf{y_1 = (c_1, s_1); y_2 = (c_2, s_2); \ldots; y_n = (c_n, s_n)}$ **and** $X_1, \ldots, X_n$ be crisp variables; the linear regression function will be

$$\mathbf{Y = (a_0, r_0) + (a_1, r_1)X_1 + (a_2, r_2)X_2 + \ldots + (a_p, r_p)X_p}$$

The matrix elements of the model will be the next:

- the n x (p + 1) data matrix $\mathbf{X} = \begin{pmatrix} \mathbf{x_{11}} & \mathbf{x_{12}} & \mathbf{\ldots} & \mathbf{x_{1p}} & \mathbf{1} \\ \mathbf{\ldots} & \mathbf{\ldots} & \mathbf{\ldots} & \mathbf{\ldots} & \mathbf{\ldots} \\ \mathbf{x_{n1}} & \mathbf{x_{n2}} & \mathbf{\ldots} & \mathbf{x_{np}} & \mathbf{1} \end{pmatrix}$

- the components of the TSFN Y's data:

The n x 1 centers vector, $\mathbf{C} = \begin{pmatrix} \mathbf{c_1} \\ \mathbf{c_2} \\ \mathbf{\ldots} \\ \mathbf{c_n} \end{pmatrix}$ and the n x1 spreads vector $\mathbf{S} = \begin{pmatrix} \mathbf{s_1} \\ \mathbf{s_2} \\ \mathbf{\ldots} \\ \mathbf{s_n} \end{pmatrix}$

- the (p + 1) x 1 vectors of the TSFN's coefficients,

The centers , $\hat{\mathbf{a}} = \begin{pmatrix} \mathbf{a_1} \\ \mathbf{\ldots} \\ \mathbf{a_p} \\ \mathbf{a_0} \end{pmatrix}$ and the spreads $\hat{r} = \begin{pmatrix} r_1 \\ \ldots \\ r_p \\ r_0 \end{pmatrix}$

The OLS method gives

$$\hat{\mathbf{a}} = (\mathbf{X'} \cdot \mathbf{X})^{-1} \cdot \mathbf{X'} \cdot \mathbf{C} \; ; \hat{\mathbf{r}} = (\mathbf{X'} \cdot \mathbf{X})^{-1} \cdot \mathbf{X'} \cdot \mathbf{S}$$

Let, for example, be the data in TABLE 3 below:

TABLE 3:

the sample	Y	X_1	X_2
1	(3;2)	2	1
2	(5;1)	1	3
3	(7;3)	3	2

We'll apply the regression model : $\mathbf{Y = (a_0 , r_0) + (a_1 , r_1)X_1 + (a_2 , r_2)X_2}$
According to the previous notations and formula,

$$\mathbf{X}=\begin{pmatrix}2 & 1 & 1\\ 1 & 3 & 1\\ 3 & 2 & 1\end{pmatrix};\mathbf{C}=\begin{pmatrix}3\\ 5\\ 7\end{pmatrix};\mathbf{S}=\begin{pmatrix}2\\ 1\\ 3\end{pmatrix}\Rightarrow\hat{\mathbf{a}}=\begin{pmatrix}2\\ 2\\ -3\end{pmatrix};\hat{\mathbf{r}}=\begin{pmatrix}1\\ 0\\ 0\end{pmatrix}$$

so, the estimated model will be : $\hat{\mathbf{Y}} = \mathbf{(-3 , 0) + (2 , 1)X_1 + (2 , 0)X_2}$ **or**

$\hat{\mathbf{Y}} = \mathbf{-3 + (2 , 1)X_1 + 2X_2}$.

Here, the number of parameters being equal to the number of conditions, the estimated values $\hat{\mathbf{Y}}$ are equal to the observed ones,

$$\mathbf{x_1 = 2 ; x_2 = 1} \rightarrow \hat{y}_1 = (-3;0)+(4;2)+(2;0)=(3;2)\Leftrightarrow \hat{y}_1 = y_1$$
$$\mathbf{x_1 = 1 ; x_2 = 3} \rightarrow \hat{y}_2 = (-3;0)+(2;1)+(6;0)=(5;1)\Leftrightarrow \hat{y}_2 = y_2$$
$$\mathbf{x_1 = 3 ; x_2 = 2} \rightarrow \hat{y}_3 = (-3;0)+(6;3)+(4;0)=(7;3)\Leftrightarrow \hat{y}_3 = y_3 .$$

If there are more data than model parameters, a non-zero error can occur, as shown in the example below:
Let's consider the data in TABLE 4, subject to the model

$\mathbf{Y = (a_0 , r_0) + (a_1 , r_1)X_1 + (a_2 , r_2)X_2}$

TABLE 4:

the sample	Y	X_1	X_2
1	(4;3)	2	1
2	(7;2)	3	2
3	(9;5)	2	3
4	(8;2)	4	2

The corresponding matrix elements will be

$$\mathbf{X}=\begin{pmatrix}2&1&1\\3&2&1\\2&3&1\\4&2&1\end{pmatrix};\mathbf{C}=\begin{pmatrix}4\\7\\9\\8\end{pmatrix};\mathbf{S}=\begin{pmatrix}3\\2\\5\\2\end{pmatrix}\Rightarrow$$

$$\Rightarrow\hat{\mathbf{a}}=(\mathbf{X}'\cdot\mathbf{X})^{-1}\cdot\mathbf{X}'\cdot\mathbf{C}=\begin{pmatrix}0{,}727\\2{,}5\\0\end{pmatrix};\hat{\mathbf{r}}=(\mathbf{X}'\cdot\mathbf{X})^{-1}\cdot\mathbf{X}'\cdot\mathbf{S}=\begin{pmatrix}-1{,}09\\1\\4\end{pmatrix}$$

The estimated regression function becomes $\hat{\mathbf{Y}}$ = **(0 ; 4) + (0,727 ; -1,09)X_1 + (2,5 ; 1)X_2.**

Comparing the observed values with the estimated values, we obtain

$x_1 = 2 ; x_2 = 1 \rightarrow \hat{y}_1 = (3{,}954; 2{,}82) \Leftrightarrow \hat{y}_1 \approx y_1$

$x_1 = 3 ; x_2 = 2 \rightarrow \hat{y}_2 = (7{,}181; 2{,}73) \Leftrightarrow \hat{y}_2 \approx y_2$

$x_1 = 2 ; x_2 = 3 \rightarrow \hat{y}_3 = (8{,}954; 4{,}82) \Leftrightarrow \hat{y}_3 = y_3$

$x_1 = 4 ; x_2 = 2 \rightarrow \hat{y}_4 = (7{,}91; 1{,}69) \Leftrightarrow \hat{y}_4 = y_4$

A better approach is that of Tanaka's symmetrical Doubly Linear Adaptive Fuzzy Regression Model, whose central idea is that the calculated spreads depend linearly to the calculated centers.

In this respect, for

$$\mathbf{a}=\begin{pmatrix}a_1\\\dots\\a_p\\a_0\end{pmatrix};\mathbf{C}=\begin{pmatrix}c_1\\c_2\\\dots\\c_n\end{pmatrix};\mathbf{S}=\begin{pmatrix}s_1\\s_2\\\dots\\s_n\end{pmatrix},\tilde{\mathbf{1}}=\begin{pmatrix}1\\1\\\dots\\1\end{pmatrix}$$ - "n" dimensional vector

We put

- the calculated centers: $\hat{\mathbf{C}}=\mathbf{X}\cdot\mathbf{a}$
- and, accordingly, the calculated spreads: $\hat{\mathbf{S}}=\hat{\mathbf{C}}\cdot\mathbf{b}+\tilde{\mathbf{1}}\cdot\mathbf{d}$

The optimum condition will be: **(minim)** $\left\|\mathbf{C}-\hat{\mathbf{C}}\right\|^2+\left\|\mathbf{S}-\hat{\mathbf{S}}\right\|^2$.

The next two ways to perform this:

• the "Doubly Linear" method, in which the vector **a** is estimated first using OLS method, so $\hat{\mathbf{a}} = (\mathbf{X}'\cdot\mathbf{X})^{-1}\cdot\mathbf{X}'\cdot\mathbf{C}$, the parameters of the Minimum model being the scalars b, d;

• the d'Urso and Gastaldi version, in which the unknown parameters are **a, b, d.**

As an example of applying the Doubly Linear model, let's consider the data in TABLE 5 below:

TABLE 5:

the sample	Y	X
1	(8 ; 3)	1
2	(5 ; 2)	2
3	(9 ; 4)	3

the corresponding model being the next

$\mathbf{(c_i ; s_i) = (a_0 ; r_0) + (a_1 ; r_1)x_i;\ i = 1,2,3}$

For

$$\mathbf{C}=\begin{pmatrix}8\\5\\9\end{pmatrix};\mathbf{S}=\begin{pmatrix}3\\2\\4\end{pmatrix};\mathbf{X}=\begin{pmatrix}1&1\\2&1\\3&1\end{pmatrix};\mathbf{a}=\begin{pmatrix}a_1\\a_0\end{pmatrix},$$

There arrive that

$$\hat{\mathbf{C}}=\begin{pmatrix}a_1+a_0\\2\cdot a_1+a_0\\3\cdot a_1+a_0\end{pmatrix};\hat{\mathbf{C}}-\mathbf{C}=\begin{pmatrix}a_1+a_0-8\\2\cdot a_1+a_0-5\\3\cdot a_1+a_0-9\end{pmatrix};$$

$$\hat{\mathbf{S}}=\begin{pmatrix}b\cdot(a_1+a_0)+d\\b\cdot(2\cdot a_1+a_0)+d\\b\cdot(3\cdot a_1+a_0)+d\end{pmatrix};\hat{\mathbf{S}}-\mathbf{S}=\begin{pmatrix}b\cdot(a_1+a_0)+d-3\\b\cdot(2\cdot a_1+a_0)+d-2\\b\cdot(3\cdot a_1+a_0)+d-4\end{pmatrix}$$

Putting $\hat{\mathbf{a}}=(\mathbf{X}'\cdot\mathbf{X})^{-1}\cdot\mathbf{X}'\cdot\mathbf{C}=\begin{pmatrix}0,5\\6,33\end{pmatrix}$ there obtains $\mathbf{a_1 = 0, 5;\ a_0 = 6, 33}$ and consequently

$$\hat{\mathbf{C}}=\begin{pmatrix}6,83\\7,33\\7,83\end{pmatrix}.$$

Finally, $\hat{\mathbf{S}}-\mathbf{S}=\begin{pmatrix}\mathbf{6,83\cdot b+d-3}\\ \mathbf{7,33\cdot b+d-2}\\ \mathbf{7,83\cdot b+d-4}\end{pmatrix}$.

From the condition: **(minim)** $\left\|\mathbf{S}-\hat{\mathbf{S}}\right\|^2$ there results **b = 1** and **d = -4,33 .**

Having $\hat{\mathbf{S}}-\mathbf{S}=\begin{pmatrix}\mathbf{-1/2}\\ \mathbf{1}\\ \mathbf{1/2}\end{pmatrix}$, then $\hat{\mathbf{S}}=\begin{pmatrix}\mathbf{2,5}\\ \mathbf{3}\\ \mathbf{3,5}\end{pmatrix}$ and so:

- $\hat{\mathbf{y}}_1=\mathbf{(6,83;2,5)}$ versus $\mathbf{y}_1$ = **(8 ; 3)**
- $\hat{\mathbf{y}}_2=\mathbf{(7,33;3)}$ versus $\mathbf{y}_2$ = **(5 ; 2)**
- $\hat{\mathbf{y}}_3=\mathbf{(7,83;3,5)}$ versus $\mathbf{y}_3$ = **(9 ; 4)**

For the Gastaldi – d'Urso variant, which not necessarily lead to better results, although the computations volume is incomparably greater, the parameters of the optimization problem

(minim) $\left\|\mathbf{C}-\hat{\mathbf{C}}\right\|^2+\left\|\mathbf{S}-\hat{\mathbf{S}}\right\|^2$

Will be **a, b** and **d**.

According to the results of Gastaldi – d'Urso, the solutions to this problem are given by the equations below:

$$\hat{\mathbf{C}}=\mathbf{X}\cdot(\mathbf{X}'\cdot\mathbf{X})^{-1}\cdot\mathbf{X}'\cdot\mathbf{C}\quad;\hat{\mathbf{S}}=\mathbf{X}\cdot(\mathbf{X}'\cdot\mathbf{X})^{-1}\cdot\mathbf{X}'\cdot\mathbf{S}$$

$$\bar{\mathbf{C}}=\frac{\mathbf{1}}{\mathbf{n}}\cdot\tilde{\mathbf{1}}'\cdot\mathbf{C}\quad;\bar{\mathbf{S}}=\frac{\mathbf{1}}{\mathbf{n}}\cdot\tilde{\mathbf{1}}'\cdot\mathbf{S}$$

$$\mathbf{M}_1=\mathbf{C}'\cdot\hat{\mathbf{S}}-\mathbf{n}\cdot\bar{\mathbf{C}}\cdot\bar{\mathbf{S}}\;;\mathbf{M}_2=\|\hat{\mathbf{C}}\|^2-\|\hat{\mathbf{S}}\|^2+\mathbf{n}\cdot\bar{\mathbf{S}}^2-\mathbf{n}\cdot\bar{\mathbf{C}}^2\;;\mathbf{M}_3=\mathbf{n}\cdot\bar{\mathbf{C}}\cdot\bar{\mathbf{S}}-\mathbf{S}'\cdot\hat{\mathbf{C}}$$

The appropriate value of **b**, denoted by $\hat{b}$, is derived from the equation

$$M_1 b^2 + M_2 b + M_3 = 0$$

Therefore

$$\hat{d} = \bar{S} - \hat{b} \cdot \bar{C} \quad ; \quad \hat{a} = \frac{(X' \cdot X)^{-1} \cdot X' \cdot (C + S \cdot \hat{b} - \tilde{1} \cdot \hat{b} \cdot \hat{d})}{1 + \hat{b}^2}$$

For an already presented example, namely

TABLE 6:

sample	Y	X_1	X_2	X_3
1	(3; 1)	1	2	1
2	(6; 2)	3	1	2
3	(8; 2)	2	2	3
4	(7; 4)	1	4	3
5	(10; 3)	3	2	4

From the equation: $M_1 b^2 + M_2 b + M_3 = 0$, we derive that $\hat{b}_1 = 0{,}309$, $\hat{b}_2 = -3{,}236$ and finally:

$$\hat{b}_1 = 0{,}309 \Rightarrow \hat{d}_1 = 0{,}3 \; ; \; \hat{a}_1 = \begin{pmatrix} 0{,}423 \\ 0{,}106 \\ 2{,}051 \\ 0{,}387 \end{pmatrix};$$

$$\hat{b}_2 = -3{,}236 \Rightarrow \hat{d}_2 = 224{,}4 \; ; \; \hat{a}_2 = \begin{pmatrix} -0{,}423 \\ -0{,}541 \\ 0{,}297 \\ 8{,}063 \end{pmatrix}$$

By applying the relations:

$C = X \cdot \hat{a}$; $S = \hat{C} \cdot \hat{b} + \tilde{1} \cdot \hat{d}$, we'll get

$$\mathbf{C}_1 = \begin{pmatrix} 389,7 \\ 392,5 \\ 394,2 \\ 394 \\ 396,66 \end{pmatrix} \; ; \; \mathbf{S}_1 = \begin{pmatrix} 120,71 \\ 121,58 \\ 122,11 \\ 122,05 \\ 122,88 \end{pmatrix}$$ - Obviously not convenient

$$\mathbf{C}_2 = \begin{pmatrix} 6,855 \\ 6,897 \\ 7,026 \\ 6,367 \\ 6,9 \end{pmatrix} \; ; \; \mathbf{S}_1 = \begin{pmatrix} 2,22 \\ 2,24 \\ 1,66 \\ 3,8 \\ 2,07 \end{pmatrix}$$ - This one being the feasible solution.

In the comparative TABLE 7 below, the next are presented:

- $\{\mathbf{y}_i^{\#}\}$ the values calculated using Gastaldi – d'Urso method
- $\{\hat{\mathbf{y}}_i\}$ the values calculated using the Doubly Linear method;
- $\{\tilde{\mathbf{y}}_i\}$ the values calculated using the OLS method:

TABLE 7:

$\mathbf{y}_i$	$\hat{\mathbf{y}}_i$	$\tilde{\mathbf{y}}_i$	$\mathbf{y}_i^{\#}$
(3; 1)	**(3,14 ; 1,06)**	**(3,14 ; 9,07)**	**(6,9 ; 2,2)**
(6; 2)	**(5,92 ; 1,95)**	**(5,92 ; 10,61)**	**(6,8 ; 2,24)**
(8; 2)	**(7,83 ; 1,9)**	**(7,83 ; 11,22)**	**(7,03 ; 1,66)**
(7; 4)	**(6,96 ; 3,96)**	**(6,96 ; 13,29)**	**(6,37 ; 3,8)**
(10; 3)	**(10,18 ; 3,07)**	**(10,18 ; 13,05)**	**(6,9 ; 2,07)**

Of course, not always the effectiveness of this methods is that in the Table 7: this effectiveness heavily depends on input data.

According to our information, there is no theorem stating the adequacy of each method.

Conclusion:

The basic idea of the paper is to analyze the influence of the spreads on the accuracy study.

In computing fuzzy regression – as well as other categories – there observe an automatically growing spreads with increasing number of fuzzy parameters.

Responsible for this shortcoming are the very definitions of the fuzzy operations itself. Major complications are arising when d'Urso - Gastaldi attempts to keep under control the spreads, by correlating these last with the other characteristics.

In our view, another approach consists in modifying the basic definitions as follow:

- the addition : $(a;\alpha)+(b;\beta)=(a+b;\max\{\alpha;\beta\})$
- the multiplication : $(a;\alpha)\cdot(b;\beta)=(a\cdot b;\max\{\alpha;\beta\})$

By adopting this viewpoints, we'll have the distribution,

$$(a;\alpha)\cdot[(b;\beta)+(c;\nu)]=(a;\alpha)\cdot(b;\beta)+(a;\alpha)\cdot(c;\nu)$$

thus this concept is a natural one.

On the other hand, is true that analytical optimization methods are difficult to carry out.

Our team is still trying to find solutions to these problems in occasion of studying some major economic applications.

FROM EXTERNAL DEBT TO ECONOMIC GROWTH … AND BACK

OANA SIMONA (CARAMAN) HUDEA *

Abstract

This paper is meant to trace the relationship existing between external debt and economic growth for 109 countries spread all over the world. We have resorted for this study to cross-sectional data, the economic modelling being simultaneously made for a three-year period. After having constructed four models and after having estimated them by econometric techniques, we have selected the most appropriate of them, which is in fact the version to be build upon within future personal studies. The results indicated as optimum the model including GDP in logarithm as endogenous variable and total external debt in logarithm and development level dummy as exogenous variables. The analysis revealed a positive relationship between external debt and economic growth, indicating that the threshold above which the indebting influence on the economic performance should become negative has not been reached yet. The coefficients obtained within the estimations performed, construed as elasticities, show that, while GDP is inelastic in relation with debt, the latter has a supra-unitary elasticity, therefore its modification being ampler than the GDP one.

Keywords: *economic growth, external debt, impact factors, estimates, economic modelling*

1. Introduction

This study, based on an analysis made on 109 countries, for a three year period, that is 2006, 2007 and 2008, with annual data, is meant to reveal several important issues on the economic growth phenomenon and to analyse some of its main influencing factors.

According to the economic theory, economic growth represents the increase of the real GDP from a period to another one and reflects the living standard and well being of a society. This is the reason why it is highly important to identify the key elements with major impact on economic growth and to determine the type of relationships established with each and every single such item, so as to provide accurate arguments for a ground development of a nation. The said factors cover a large range, comprising, among others, without limitation, investments, unemployment rate, budgetary deficit, exports, imports, governmental expenses, external debt or population increase. Given their significant number, we have decided to take them separately and to further render our analysis increasingly complex in subsequent studies.

Therefore, we have started, by resorting to only one item, save for GDP, meaning external debt, taken consecutively as exogenous and endogenous variable. Subsequently, we have separately added two dummies, one relating to the geographical layout and the other one to the level of development of the analysed countries. After having taken into account various facets of the issue, as seen hereinafter, the following equations have been subject to econometric estimations:

$$\log_{gdp} = \alpha + \beta * \log_{dat} + \varepsilon$$
$$\log_{dat} = \alpha + \beta * \log_{gdp} + \varepsilon$$
$$\log_{gdp} = \gamma + \delta * \log_{dat} + \theta * d_1 + \varepsilon$$
$$\log_{gdp} = \gamma + \delta * \log_{dat} + \theta * d_2 + \varepsilon$$

The relationship between the economic growth and the external debt of a country is, basically, negative, considering the opportunity cost relating to the money exit out of the country due to the debt service, this rendering non-achieved potential investments. Yet, there is an inflexion point in this

* Lecturer, "Nicolae Titulescu" University, (e-mail: caraman_simmy2005@yahoo.com).

relationship graphic, an optimum level up to which the external debt has a positive influence on economic growth by the increase of the investments funds acquired as result of the external credit contracting. In this case, it is important to see whether the investment yield is sufficient to cover the long-run debt service rate, so that the leverage should not reverse once the reimbursements begins. In order to achieve a positive impact of the external debt on growth, an efficient and comprehensive debt strategy is absolutely necessary.

In view of rendering this paper as clear as possible, we have decided to structure it into six sections, as follows: Introduction in section 1 (the current section), a brief Literature Review which appears in section 2, followed by the description of Data in section 3, the presentation of the Methodology and Empirical Results in section 4, Conclusions in section 5 and, finally, Suggestions for Further Research in section 6.

2. Literature review

The external debt – economic growth relationship has been lately focused on by many economists interested in discovering the type of correlation existing between such variables. Savvides (1992) resorted to a TSLDV method, applied on cross-sectional time series for 43 less developed countries, over a six year-period (1980-1986), in order to render the negative connection between these two variables. In his opinion, the obligation of a country to pay its foreign debt seriously affects its economic performance, as a large part of its output increase should be directed towards its debt service and creditors, the debt overhang acting as a marginal tax rate on that country and lowering its investment returns, while negatively impacting on its domestic capital formation.

A negative influence of foreign debt on growth is also rendered by Elbadawi et al.(1996) whose analysis is based on cross-section regressions for 99 developing countries spanning SSA, Latin America, Asia and Middle East. They underline the indirect effect of external debt on a country's economic performance, via the impact of the former on the public sector expenditures. While the financial standing becomes increasingly precarious, governments assist to the diminishing of their resources and, subsuquently, to the cutoff of their public expenditures, thus leading to a desrease in GDP.

Clements et al. (2003) made appeal to both fixed effects and system GMM, based on data for 55 low-income countries classified as eligible for the IMF's Poverty Reduction and Growth Facilitiy, for the period 1970–1999. Their study is directed towards the analysis of the channels via which external debt affects growth in those countries. The authors indicate that a significant decrease of the external debt of heavily indebted poor countries would directly increase per capita income growth with about 1% per year and indirectly contribute to economic growth by their effects on public investments.

Patillo et al. (2002, 2004) examined the relationship between the total external debt and the GDP growth rate for 61 developing countries, for the period 1969-1998. They found out a backward bending growth curve with a debt-growth positive relationship at low levels of national debt and negative relationship at high levels. This shows us that the effects of debt-overhang are likely to occur only after a certain threshold has been reached.

Schclarek (2004) used panel data for 59 developing countries and 24 industrial countries, with data averaged over each of the seven 5-year periods between 1970 and 2002 (1970-74; 1975-80; etc.), applying the GMM dynamic panel econometric method. The study revealed a negative and significant relationship between total external debt and economic growth for developing countries. After having divided the total external debt into public and private external debt, a negative relationship has resulted between public external debt and growth, and no significant relationship as for private external debt.

Hameed et al. (2008) studied the long-run and short-run relationships between external debt and economic growth for Pakistan, by resorting to annual data for the period 1970-2003. They

identified that the debt service ratio tends to adversely affect GDP and therefore the economic growth rate in the long-run, which, in turn, diminishes the country's capacity to service its debt. Also, the estimated error correction term indicated a significant long-run causal relationship among the said variables. As a whole, the results evidenced both a short-run and long-run causal relationship running from debt service to GDP.

An impressive analysis is made by Reinhart and Rogoff (2010) who selected 44 countries over around 200 years, collecting about 3,700 yearly observations. They found out that the relationship between government debt and real GDP growth is weak for debt-GDP ratios below a threshold of 90% of GDP, while, above 90%, median growth rates fall by 1%, and average growth falls considerably more. As regards the emerging markets, there are lower thresholds for public and private external debt: when external debt reaches 60% of GDP, annual growth decreases by about 2%; for higher levels, growth rates are roughly cut in half.

3. Data

In order to study the above mentioned phenomenon, we have selected the data described below:

- The economic performance (log_{gdp}) - expressed by GDP at PPP in USD, annual series taken over from UNO database.
- The indebting (log_{dat}) - represented by the credits contracted by the authorities and economic agents from the banks reporting to IRB, corrected by the implicit index for passing to PPP standard, for comparability. These data have been annualised (given that the external debt series is quarterly) and they have been taken from UNO and IMF databases.
- For the third model, a dummy variable (d1) has been defined, as follows:

  d1 = 2, if the country is located in Europe

  d1 = 1, if the country is located in North America or Asia

  d1 = 0, if the country is located on another continent
- For the forth model, a dummy variable (d2) has been defined, as follows:

  d2=0, if the country is less developed

  d2=2, if the country is developed.

Such classification has been made according to the data collected from the World Bank official site.

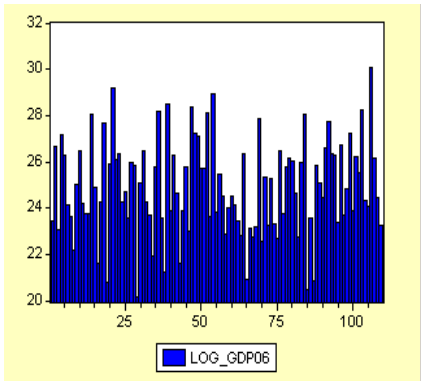
The data correspond to the years 2006, 2007 and 2008 and refer to the economic standing of 109 countries. Within the estimations performed, the series have been used in logarithm, so as to attenuate the size-related differences between the values of the variables for the selected countries.

4. Methodology and Empirical Results

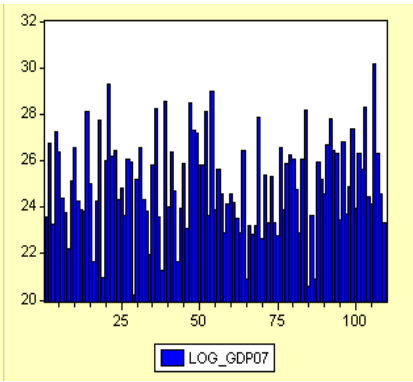
4.1. Data Descriptive Analysis

The graphic representation of the gross domestic product and of the external debt reveals the major differences between the analysed countries, even if these have been partly compensated by the logarithmic transformation performed. As for GDP, the differences indicate the distance separating the well developed countries from the poor ones.

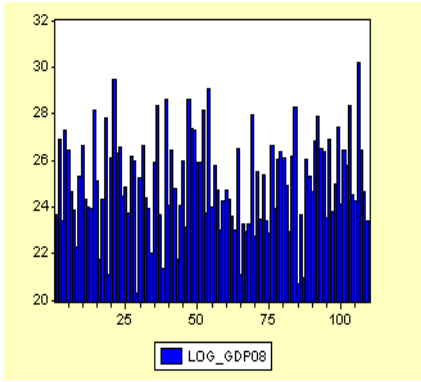
2006



2007

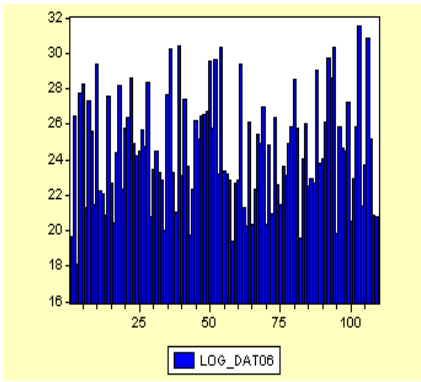


2008

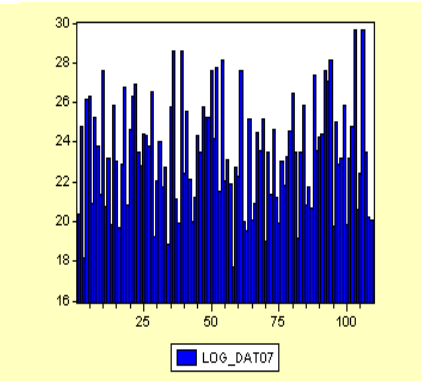


Such significant differences are also obvious in the case of the external debt series and look like remaining quite unchanged for the whole analysed period. We specify that this series is adjusted with the implicit index for passing to PPP standard and it comprises both external public debt and external private debt.

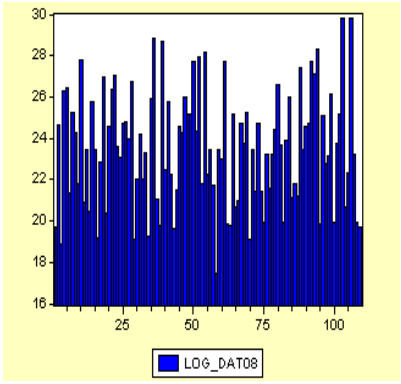
2006



2007

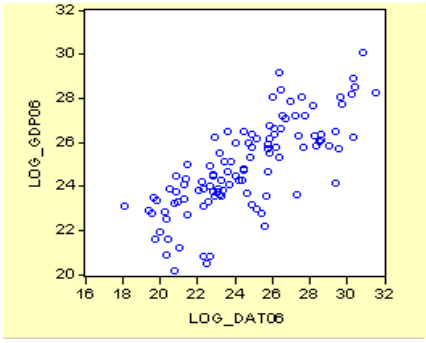


2008

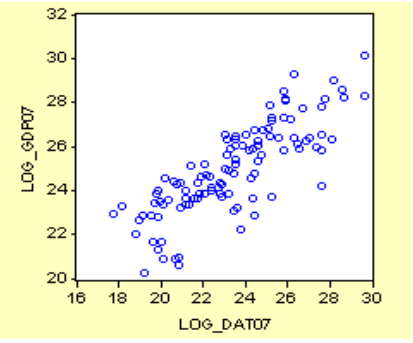


The dot plot graphic indicates a quite significant dispersing of values, but it also reveals a certain trend, a positive, stochastic relationship between the two data series to be tested by OLS method.

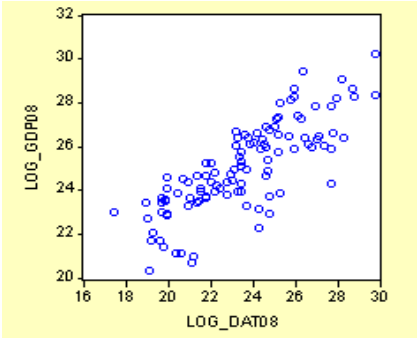
2006



2007



2008



The descriptive analysis of the two variables is separately rendered, for each of them, in Table 1.1 below:

Table 1.1 Statistic data

DEBT	2006	2007	2008	GDP	2006	2007	2008
Mean	24.55952	23.40943	23.54578	**Mean**	24.88958	24.96721	25.05848
Median	24.43337	23.46045	23.45824	**Median**	24.66615	24.75479	24.87544
Max	31.55636	29.63298	29.79000	**Max**	30.09061	30.14872	30.21124
Min	18.07819	17.72692	17.49275	**Min**	20.16988	20.23551	20.30623
Std.dev	3.097767	2.753593	2.773542	**Std.dev**	2.051020	2.051408	2.046549
Skewness	0.223488	0.172115	0.131958	**Skewness**	0.046065	0.034324	0.030269
Kurtosis	2.264114	2.289877	2.287765	**Kurtosis**	2.675430	2.680631	2.678163
Jarque-Bera	3.366811	2.828412	2.620225	**Jarque-Bera**	0.516995	0.484637	0.487066
Probability	0.185740	0.243119	0.269790	**Probability**	0.772211	0.784806	0.783854

By analysing the results obtained for the external debt, we can see that the mean increases over the three-year period, but the values remain sensitively equal. Also, the difference between the series minimum and maximum strengthens the previous statements as for the rather divergent levels between the debts of the countries considered in this study.

An interesting issue is that, in 2006, the standard deviation suddenly decreases from about 2.7 to 1.7, thus indicating a tendency of the sizes of observations to come closer to one another. The values of the skewness and kurtosis indicators have values close to the ones specific to the normal distribution.

Considering that the probability of Jarque-Bera test exceeds 5%, the null hypothesis cannot be rejected, therefore the external debt following a normal distribution. As skewness is more than zero, a slightly right deviation distribution is revealed, but its value decreases each year, thus dissipating such deviation.

As for GDP, the same increase of the mean and a significant distance between the series minimum and maximum is noticed. The standard deviation is lesser than in the previous case and it maintains all over the analysed period.

A compared to the external debt, GDP presents a positive value skewness much closer to zero, indicating an imperceptible deviation to right of the distribution graphic. The Jarque-Bera test confirms in this case too the normal distribution of the analysed series and the kurtosis values directs each year towards the normal value of 3.

4.2. Parameter Estimation

As mentioned in Introduction, we have started our study by analysing the relationship between GDP and external debt, taken successively as endogenous and exogenous variables. We have subsequently added two separate dummies, thus constructing four models to be estimated. The estimation results are rendered in brief in the tables below.

Table 1.2

$\log_{gdp} = \alpha + \beta * \log_{dat} + \varepsilon$ $\log_{dat} = \alpha + \beta * \log_{gdp} + \varepsilon$

Modelul 1	**2006**	**2007**	**2008**	**Modelul 2**	**2006**	**2007**	**2008**
Coeficient β	**0.504418***	**0.601439***	**0.588830***	**Coeficient β**	**1.150663***	**1.083645***	**1.081471***
Coeficient α	**12.50132**	**10.88788**	**11.19402**	**Coeficient α**	**-4.080010**	**-3.646159**	**-3.554232**
R-squared	0.580415	0.651746	0.636802	**R-squared**	0.580415	0.651746	0.636802
Adj R-squared	0.576494	0.648491	0.633408	**Adj R-squared**	0.576494	0.648491	0.633408
F-statistic	148.0141	200.2467	187.6053	**F-statistic**	148.0141	200.2467	187.6053
Prob F-statistic	0.0000	0.000000	0.000000	Prob F-statistic	0.0000	0.000000	0.000000
Akaike	3.433542	3.247588	3.284860	**Akaike**	4.258231	3.836349	3.892800
Schwartz	3.482925	3.296971	3.334243	**Schwartz**	4.307613	3.885732	3.942183
Durbin-Watson	2.024481	2.035982	1.987568	**Durbin-Watson**	1.985802	2.069626	1.992531

According to Table 1.2., in models 1 and 2, the independent variables are econometrically significant, the t-test having a computed value exceeding the critical one for a significance threshold of 5% for 109-2 observations. As for model 2, the intercept is significant for a significance threshold of maximum 10% in 2006 and 2008.

F statistics renders also high values, evidencing the correct specification of the said models and an adequate selection of the considered factors.

The determination ratio R^2 shows that the variance of the dependent variable is explained in a proportion of 63% by the selected explanatory variable. By comparing the two models, the adjusted R^2 is identical, as expected, but the Akaike and Schwartz tests have a lower value for the first model, indicating it as qualitatively superior.

As regards the error autocorrelation, the DW test values are located within the interval (d_2, 4-d_2), evidencing no autocorrelation for the two analysed models.

The obtained coefficients have quite similar values across the tree-year period. Considering that the used variables are in logarithm, they shall be construed as elasticities. Therefore, we could state, by interpreting the estimation results for Model 1 that GDP is inelastic in relation with the external debt, more exactly, if the external debt increases by 1%, GDP increases by only 0.58% in 2006, for instance. Model 2 indicates the elasticity of the external debt in relation with GDP, the coefficient exceeding the 1 value for the entire analysed period. The relationship would reverse once the β coefficient reaches the maximum value (t statistics value), the leverage becoming negative.

Table 1.3

$\log_{gdp} = \gamma + \delta * \log_{dat} + \theta * d_1 + \varepsilon$ $\log_{dat} = \gamma + \delta * \log_{gdp} + \theta * d_2 + \varepsilon$

Modelul 3	**2006**	**2007**	**2008**	**Modelul 4**	**2006**	**2007**	**2008**
Coeficient δ	**0.500752***	**0.621105***	**0.619299***	**Coeficient δ**	**0.581558***	**0.692501***	**0.700211***
Coeficient θ	**0.045621**	**-0.168338**	**-0.239868**	**Coeficient θ**	**-0.404404***	**-0.437195***	**-0.515113***
Coeficient γ	**12.54991***	**10.58040***	**10.69447***	**Coeficient γ**	**11.05943**	**9.245491***	**9.148010***
R-squared	0.580756	0.656104	0.645411	**R-squared**	0.605520	0.681993	0.677046
Adj R-squared	0.572846	0.649616	0.638720	**Adj R-squared**	0.598077	0.675993	0.670953
F-statistic	73.41808	101.1165	96.46866	**F-statistic**	81.35402	113.6630	111.1103
Prob F-statistic	0.0000	0.000000	0.000000	Prob F-statistic	0.0000	0.000000	0.000000
Akaike	3.451078	3.253342	3.279222	**Akaike**	3.390194	3.175077	3.185770
Schwartz	3.525152	3.327416	3.353295	**Schwartz**	3.464268	3.249150	3.259844
Durbin-Watson	2.018820	2.046178	2.003555	**Durbin-Watson**	2.026908	2.099867	2.075932

Concerning models 3 and 4 from Table 1.3., we have tried to identify the influence of the geographical layout of the analysed countries on their economic performance (for model 3) and the influence of their development level on their future economic growth (for model 4).

The dummy variable proved to be insignificant in model 3, for a significance threshold of maximum 10%; therefore we could draw the conclusion that the geographical layout does not clearly determine the economic growth of the countries in the analysed period.

In model 4, the dummy variable is significant for a significance level of at most 5% for the entire period. The sign of this coefficient is negative and sub-unitary, signalling a reverse relationship between GDP and the level of development of the countries.

By comparing this model to model 1, the first one looks like more adequate, this affirmation being strengthened by the value of the adjusted R^2 and by the Akaike and Schwartz tests.

F-test validates the model and DW test shows the absence of error autocorrelation, therefore our previous statement being reinforced. The debt coefficient remains close to the values registered for model 1, meaning positive and sub-unitary, suggesting a highly similar relationship between the two variables.

5. Conclusions

The positive relationship between external debt and GDP revealed by this study may have one of the following two explanations:

- Considering the major differences between the values of the analysed series, the negative leverage effect obtained for some of them has been compensated the positive effect of the other ones, so that, as a whole, a positive relationship emerged for the two variables of interest;
- At the world level, in average, the threshold above which the indebting influence on the economic performance should become negative has not been reached yet.

By comparing our results to those obtained by the authors of the articles considered as basic bibliographic sources, we could state that this study has revealed the same trend as that reached by Patillo et al. (2002, 2004), with the mention that the latter found a debt coefficient much closer to the inflexion value above which the leverage on GDP becomes negative.

The d1 dummy variable, dividing the countries depending on their geographical layout, proved to be insignificant, the same result being also obtained by Alfaro (2003) in his study on the influence of investments on economic growth.

Our analysis indicated that the d2 dummy variable has a strong influence on the economic growth, it being in compliance with the economic theory, according to which, as a country develops, its economic growth lowers, because the economic increase function is concave, therefore evidencing decreasing returns. On the other hand, a country in progress will develop more rapidly, as it has not reached yet the flattening level of the economic growth curve, according to Solow-Swan model.

The coefficients obtained within the estimations may be interpreted as elasticities and indicate that, while GDP is inelastic in relation with debt, the latter has a supra-unitary elasticity, so that the conclusion may be drawn that its modification is ampler than the GDP one.

Such result could be explained by stating that, if an increase of the debt determined a quicker increase of GDP, then many countries would indebt themselves until the maximum limit so as to obtain economic growth, and the debt service would be always covered by it.

The debt elasticity in relation with GDP is supra-unitary and it is confirmed for the developing and emerging countries, with significant economic growths, but highly indebted in order to reach a superior development standard, especially considering that their governments are involved in expensive development projects.

6. Suggestions for further research

In order to continue the economic growth analysis, we propose to render the model more complex, by adding, as explanatory variables, series relating to foreign direct investments, exports and imports. Such estimation results will be rendered in a future study. Also, a panel data approach could offer a larger perspective on this issue. As concerns methodology, a fixed versus random effects generalised method of moment would be an interesting alternative to the already used econometric estimation techniques.

DATA AND PROCESSING IN DEVELOPING ECCONOMIC APPLICATIONS

ADRIAN GHENCEA[*]
OANA SIMONA HUDEA[**]
DANA-FLORENTA SIMION[***]

Abstract
Economic Informatics originates in the industry economy and the electronic processing of information. A clear distinction is made between IT and economic informatics, and further between general and particular economic informatics (the particular economic informatics meaning administration, industrial informatics etc). Economic informatics is deemed to be an applicative science relating to the conception, working modality and representation of IT and communication systems, oriented towards companies which are using electronic computers.
This paper pursues to integrate applications allowing the information systems to interconnect at informational level, by information sharing, and at service level, considering the control of the related processes in real time.

Keywords*: information systems, economic applications, integration, XML, CRM (Customer Relationship Management)*

Introduction

The paper approaches a current theme that takes into account data and information processing which may lead to economic applications development using a series of latest technologies.

Technologies such as XML, HTML, CRM allow the achievement of integrated systems, giving efficiency in user's activity. The revealed text analyses a series of specialized papers, emphasizing and comparing the advantages and disadvantages of the shown systems.

The modern management of the activity of a trading company is unthinkable without being grounded on sufficient information. Obtaining timely and top quality information implies using the **e-computing technology** on a wide scale. The quality of the decisions made to ensure the proper course of the economic activity ultimately depends on the quality of the information that the upper management operates with, and on their ability to analyze it.

Paper content

We could state that, in terms of management, information is the bearer of news about the economic phenomena and processes taking place inside or outside a company, but relating to it, such information being used in business analysis and decision making.

Information is the output of an entire range of primary data processing occurring as result of the carrying out of a trading company's activity.

The processing activity turns data into a useful form, endowing them with additional knowledge. In terms of the processing cycle, **information** represents the outcome of data processing, designed to be used in the management and decision flows.

Seen as a means of knowledge, information represents a news-story, a signal reflecting the state of a system or of the environment within which it operates, and bringing added value.

As information results from data processing, we could say that it means nothing else than the final product of such process.

Picture 1 Fields of Economic Informatics

Programming languages, techniques and methods have known a tremendous boost since the appearance of computers until nowadays, due to the need to respond to the continuing increase in number and complexity of miscellaneous issues to be settled and therefore, implicitly, of the related programs. Thus, programming has evolved from the initial stage of introducing notions directly in binary code, and continued with the advent of assembling languages allowing the symbolic representation of instructions for computer.

The main issues arising in data integration process are generated by:

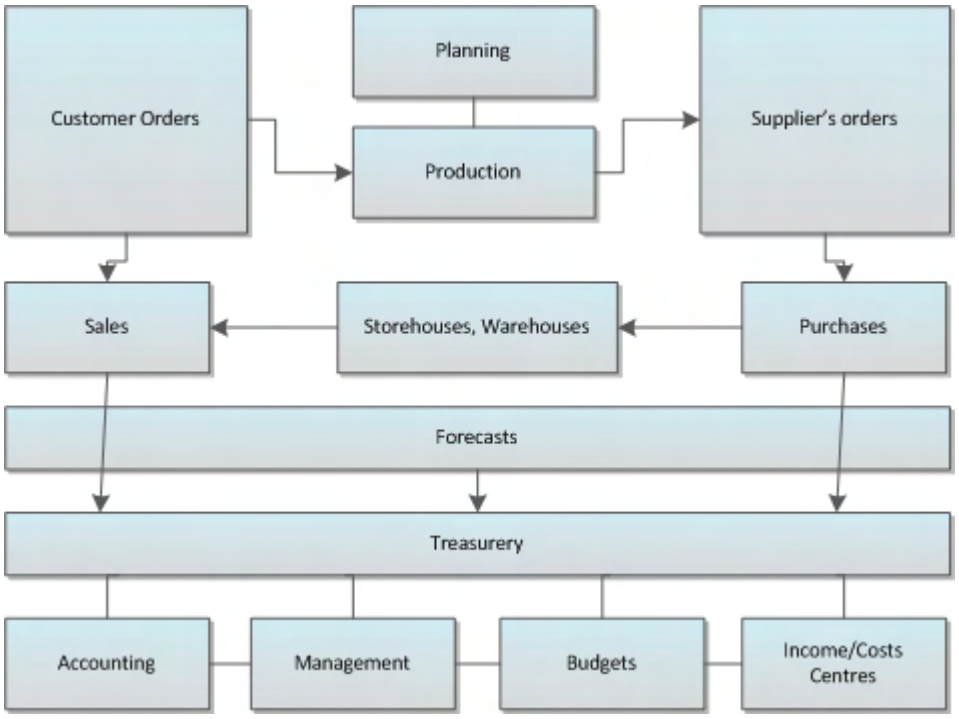
- The use of multiple data sources resorting to different versions of data representation,
- The necessity to synchronize in time the data taken over from different sources
- The use of non-conventional data,
- The ad-hoc connections to be made between different types of data or between different software applications.

Unconventional data are not standardized, semi-structured and newly defined within applications data, data with a dynamic structure or changeable in time. Given the specific characteristics of unconventional data, it is extremely difficult, and sometimes even impossible, to define general rules, universally accepted, for handling and using such types of data in software applications.

The distributed application is that application running on multiple computers simultaneously so as to improve the application performance and scalability.

The use of distributed architectures for the development of economic applications offers several advantages, namely:

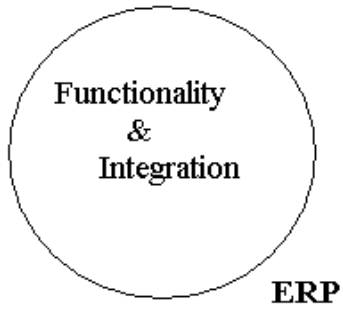
- The provision of the application with automatic scalability, by adding other computers to the system,
- The possibility to integrate applications running in different environments, on different platforms or operating systems,
- The possibility to synchronize and to allow real-time communication between multiple clients,
- The possibility to support poor computer systems in terms of technical characteristics to ensure the hardware resources required to run the related applications.



Picture 2 Flow of data exchange between a company's departments

The accelerated changes in the business environment and the increase in complexity of the activities carried out by companies impose a permanent adjustment of the effort and analysis capabilities of the human being.

Able to process a large volume of data and aggregated information in order to optimize processes and to render them more efficient, the ERP systems have been created as a solution to such challenges. The main idea relating to the development of software applications for enterprise systems consists in their evolutionary nature[1].



Picture 3 Fundamental Properties of ERP

[1] Lungu, Ion *Integrarea sistemelor informatice,(IT Systems Integration),* A.S.E. Publishing House, Bucharest, 2007.

Integration ensures the connectivity between the flows of functional economic processes. It may be construed as a communication technique. Here are some common ways in which communication takes place through and for integration: source code, extensive local networks of computers, Internet, e-mail, workflow, automated configuration tools, protocols and databases. We could state that integration is achieved through communication, and communication is achieved through integration.

The functional part of an ERP system ensures the flows of economic processes within each function. Therefore, in an ERP sequence we can find from several to tens of functional modules (general accounting, debtors, payroll, inventory, supply, production planning, logistics and sales orders).

Data integration combines the basic elements of data management systems, content management systems, data warehouses and other enterprise applications, bringing them altogether into a common platform.

Development of XML-based applications

XML is a relatively new technology. Still, this does not prevent it to impose itself almost in all branches of information technology. Obviously, since XML has become a usable component of computerization, business might also be useful.

Less than a year after its release, XML has impressed many developers and users. Currently, XML is becoming increasingly popular and irreplaceable. In 1998 the international organization W3C has strengthened the XML specification as "Extensible Markup Language (XML) 1.0. This meant green light for the development and implementation of XML.

It is clear that HTML and XML documents are based on the same structure using tags. But the functions of these two languages are quite different.

HTML	XML
Used to **display data**	Used to **carry on data**
Used to **visually define data**	Used to **describe data**
Used to show **how data are displayed**	Used to show **how data are used**

Table 1 HTML – XML Differences

The above table reveals that XML is working with data definition and transportation. An eloquent example would be the one described below, where we determine information relating to a physical entity. If we described the given information in a relational database, it would look like below:

Name	James
Surname	John
Date of Birth	07.23.1985
Height	179

The weakness of the above-described information is that it can be processed only by database management systems, which, most often, are incompatible.

From HTML to XML

The two languages have been created for different purposes:

- XML was designed to describe data and to focus on their structure;
- HTML was designed to display data and to focus on their design.

The XML Objectives are reflected by the following characteristics:

- Simple to use on Internet;
- Able to support a wide variety of applications;
- Compatible with SGML (Standard Generalized Markup Language);
- Fit for easy writing of programs processing XML documents;
- Designable quickly, formally and concisely.

The XML data can be used in HTML language and allow a rapid identification of documents via the search engines. By means of codes such as javascript, php etc., the XML files can be embedded in web pages, the most notable example being the RSS system that uses an XML file to carry on information from one web page to several web pages.

Advantages of XML:

- Extensibility (new indicators can be defined, if necessary)
- Validity (the data structural accuracy can be assessed)
- Facility for users to represent their data independently of applications
- Simple and accessible (they are text files created to structure, store and transport information)
- Easy to edit and modify (it only requires a simple text editor such as Notepad, WordPad, etc.).

XML language provides a method of inter-human communication, not of data interchangeability between machines, therefore creating relationships between the designers and the beneficiaries of their documents. XML inherits the neutrality of the platform and speech, and the liberty of the data present in SGML.

All these remarks indicate us that XML provides users with an information markup open standard, without limits in terms of annotation techniques (provided extensibility), easy to use (able to support knowledge databases) and easy to implement.

The future of XML will impact not only the IT employees, but also the political and economic world. The combination of XML with XSL could replace all current formats of text processing and publishing:

- A unique format for Web posting and printing;
- A common format for storing data in various software products;
- A single format for all languages.

The success of XML can be foreseen both as regards Web, where is allows the creation of extensible multimedia applications, and as regards the information processing in general.

Application development using the concept of CRM (Customer Relationship Management)

The CRM application is a dedicated solution for customer relationship management which offers: direct support for developing business strategies and the ability to connect front-office and back-office roles into a complete customer oriented business solution. Also, the ability to collect and analyze information, to be able to anticipate customer needs and build a profitable and long-term relationship is another important feature of this type of software solution.

The sharply increasing transition of "traditional" business towards electronic media has brought along important mutations in the crucial field of relationship administration between companies and their customers. The Customer Relationship Management (CRM) is now one of the

fashionable concepts in the new digital economy, but it is hardly an innovation of recent years. Historically, the relationship between the customer and those who provided a particular product or service has arisen since the first customer. This relationship has been managed over time in the most different ways, yet using the "traditional" methods, which implied direct contact between a company's sales representatives and its customers. As until recently a letter, a catalog sent by mail, a phone call, or an elegant restaurant were "tools" more than sufficient to maintain a close relationship of loyalty with the customer, things have changed with the appearance of the Internet. What the digital revolution brought along was an unprecedented widening of a company's customer base, and thus, almost an exponential growth of the problems involved in dealing with them.

The CRM has become a priority for the companies that have sought to have an advantage in today's stormy economy. Worse now, even if they invest hundreds and thousands, if not millions of dollars in CRM, most companies are not closer then before than when the system appeared.

The Customer Relationship Management can be defined in the following ways:

- Strategy for selecting and maintaining the customers so that their value to the firm is optimal; it involves a business philosophy that puts the customer at the center, through all the processes; the success is possible if and only if the leading team, the strategy and the organizational appropriate culture act simultaneously;

- A process of implementing a business strategy that places the customer at the center, which, in a "chain reaction" determines to redefine all the functional activities - this implies new work processes, possible only by using information technology;
- "Super-class" of business models, processes, methodologies, interactive technologies, to achieve a high retention rate of clients belonging to identifiable groups of customers with great value for business and growth potential;
- Extension of the concept of selling as an ongoing process, considered both art and science, to collect and use customer information in order to "educate" their loyalty - which is impossible without the use of appropriate technology;
- A concept of development and implementation of business strategies and related technology support, to eliminate the difference between the actual and the possible acquisition level, the development and maintenance of customer relationship - which improves the efficiency of assets;
- A timely process for enlarging and applying the knowledge (and not necessarily of data storage) on a client, leading to the individualization of acquired strategies and business to meet the personalized needs of each client;
- Specific management approach that places the customer at the center of the business processes and practices, the purpose of this approach being the increase in the profit and productivity;
- The management of all interactions with the customers, with the purpose of expanding its customer base by bringing in new customers and meeting the needs of the existing ones;
- A term specific to the information domain on potential methodologies, to the software packages offered and to the Internet, to help a company conduct customer relationships in an organized manner;
- The “overall” approach that integrates the processes of receipt of orders, sales and service, which unifies and coordinates all the channels through which the customers interact with the company, that "something" which has most to do with customer satisfaction and, in fact, has nothing in common with technology and for which technology is only a means and not an end in itself;
- A process to guide the entire company towards its outside, towards the clients, which involves understanding the customer needs and process management within the company to develop and maintain customer relations.

The information about the customers is the essence of CRM. Although the development and maintenance are important, clear and well structured data about the customers are vital. Unfortunately, many businesses do not pay enough attention to the importance of consistent and quality data. In fact a study by PriceWaterhouseCoopers showed how widespread are the data on quality problems in companies around the world.

Based on a survey of 600 mid-level companies in the U.S., Europe and Australia, the following conclusions were drawn:

- 70% of companies have recognized that insufficient data have a negative financial effect on the business. 50% added extra costs to reconcile the data.
- 30% have been forced to postpone investments in new systems because of data issues.
- A company stated that data problems have caused a loss of $ 8 million only in one fiscal year.

Many leaders have considered the subject of data management companies as boring, until they realized how much is at stake. When a critical project can not come alive because of data problems or clarity, or when they realized how much it will cost to clean the institutionalized data, the negative effect of data neglecting became clear, and the responsible persons were notified.

More than money, poor quality data means low analysis and performance indicators which makes the management take appropriate decisions to get out of this impasse. When it comes to customer information, poor data quality can lead to problems that are no less critical. Each has a story about incorrect data related to customers. But the quality of customer data is no joke, they are absolutely necessary to develop and maintain operational CRM enterprise and analytical systems. Thus consistent and quality data are critical components of the CRM system.

Customers require easy and convenient access through the channels that they choose. Creating multiple points of contact with the customer is served is a prerequisite. Unfortunately, creating multiple points of contact increases the risk of appearing inconsistent interactions. In companies where we can not reconcile information about the same customer at various points of contact, dissatisfaction shows up.

The creation of a single universal database is, unfortunately, not feasible for most large companies because of differences in portfolio applications and associated databases. However, an integrated view, and a multi-channel on the customer is feasible and represents one of the main advantages of the CRM applications. To achieve this, these applications must be integrated pragmatically, using intermediate components with intermediate applications, each dealing with a portion of data collection.

A well organized target reduces the development effort necessary to document and code the interfaces between systems, reducing duplication in technology integration, and shortening the time required to change existing applications.

Definition of customer transactions can vary widely between business-to-business (B2B) and business-to-consumer (B2C). In B2B customers are the companies and their customers, and B2C client is usually an individual, but can be a family.

The next step is to inventory the available sources of data, determining where to collect data from internal sources or whether they will be obtained from external sources. To create an analytical view, the data must be extracted from various sources, converted into consistent and usable information, and then loaded into the analytical data structures. Tools for extracting, transforming and loading (ETL) can be used for this. They are driven by data sets and have a strong support for meta-data. In addition to collecting the data from internal sources, methods to fill in the external uncovered gaps should be available.

CRM Implementation

Alone, the CRM is not a technology, but a process of collection and retention of customer information and their interactions with the company. CRM implementation tends to be a complicated and expensive test. It is estimated that during the next two years, 2,000 companies will have to spend

$ 250 million each on CRM solutions. While money is exhausted, many companies have not been able to determine what kind of return on investment they obtain in their system, beyond the obvious data.

A recent study by Andersen Consulting is seeking direct correlation between CRM and the business income. Typically a billion $ turnover could add $ 40 million profit would increase the CRM capacity by 10 percent. Besides this, the CRM increases performance and the business income.

Significantly, companies that have successfully implemented CRM solutions do not see CRM as an IT project driven away from a specific department - that is, they see CRM as a broad initiative. Most CRM implementations have been fragmented, put into operation in a department without an over viewing perspective. Similarly, the CRM software needed to be transferred to all levels throughout their organization. Marketing will be able to formulate responses and to provide the results of specific promotions or campaigns across the customer segments. The employee dealing with customer relations will be able to provide superior customer support and satisfaction services.

When talking about the technologies used to achieve the implementation of CRM system, we must first refer to the server level of the CRM. Thus the operating system on which the CRM system developed is Microsoft Windows 2000 Server and the IIS Web server is used. The application is developed in MS Visual Studio.NET Framework and the Server software is MS Framework 1.1 SDK. CRM customers that will benefit from this application should have as 2k/NT Windows operating system and IE5.

The dynamic information accessed in/through the CRM interface information will be considered as "functional" (interface elements such as labels, Message box sites, input fields sites) and "business" information (data about customers, products).

The support for the "functional" data consists in a MS SQL Server database. These data allow direct access from the interface through a ADO.net. connection. The business information is accessed through predefined Web services.

Advantages of CRM

The impact on the cost and quality data

Using data integration solutions (CDI) can produce a significant return on investment (ROI). Benefits of the CDI are:

- Better cross-selling and up-selling "(facilitated by an improvement in the modeling and better targeting of the customers)
- Improving customer retention (achieved by avoiding worn out customers)
- Improving attracting new customers

Competitive advantage through CRM

The CRM is defined as a strategy to manage customer relationship and interaction with them in the most profitable way possible for both. There are several providers of operational CRM solutions that enable traditional CRM implementation strategies. These typical strategies are supported by solutions focused on how the services, sales and marketing of more effective departments should be made, this increasing the profitability of such organizations and of their customers.

Conclusions

Web services and applications are emerging as a key technology for conducting automated interactions between distributed and heterogeneous applications and for connecting various business processes.

At software and hardware level, *technology integration* is the main phrase for the current IT products. Thus, the various existing technologies allow an interaction with outstanding results between databases and web services.

ICT infrastructures containing databases, large volumes of data, OLAP, Java turn into web platforms, therefore hardware decreasing in relevance.

A series of advantages of IT integration and interaction are outlined below:

- Diminishing of implementation, exploitation, conversion and other hidden costs;
- Increasing of data security due to the submission to common restrictions;
- Diminishing of the complexity of different technologies;
- Avoidance of scalability-related problems;
- Avoidance of issues relating to the implementation and management of different software products by using a single product;
- Obvious evolution of end users.

A VIEW ON THE NATIONAL CAPACITY OF SCIENTIFIC KNOWLEDGE ABSORPTION

STELIANA SANDU[*]
IRINA ANGHEL[**]

Abstract
The concept of the Absorptive Capacity has been approached in numerous theoretical and empirical studies during the last 20 years, covering multiple facets of the relationships between various external sources of knowledge and the capability of a firm, sectors or national economy to identify, assimilate and apply external knowledge in order to increase its economic performance.
Absorptive capacity (AC) has been extensively analyzed at the firm level, but significantly less consideration has been given to the AC at the national level. National capacity of absorption is definitely much more than the simple aggregation of the individual companies' capabilities or of the sectoral capacities, due to many systemic complex factors that may add to, or detract from the national AC: the multiplication and propagation effects, access facilities the stock of national and international knowledge, various synergetic mechanisms, knowledge spillovers etc.
Based on the literature available, the authors attempted to design a system of indicators to quantify the relative scientific knowledge absorption capacity of different European countries compared with the EU average and the EU leader. Further on, these indicators will be aggregated, providing a fundament for comparative weighted estimations of the national absorptive capacities for scientific knowledge across EU.

Keywords: *national absorptive capacity, R&D activity, National System of Innovation, system of indicators*

Introduction

The concept of "absorptive capacity" becomes more and more significant, in theory and practice, in the context of increasing innovation performance within a knowledge-based economy. Based on a detailed analysis of 285 studies on absorptive capacity, a very interesting paper published in 2006 (Lane et al, 2006) states that "absorptive capacity is one of the most important constructs to emerge in organizational research in recent decades". According to another more recent empirical assessment, the number of research papers on the "absorption capacity, published, between 2005-2009 in the top ten journals in business management, has more than doubled compared with 1990-2005" (Jimenez et al, 2010). Along the 2010 year, the literature has also been enriched with many other works on this issue.

If Cohen and Levinthal, the pioneers of "absorptive capacity" construct, defined it as "the ability of a firm to recognize the value of new, external information, assimilate it, and apply it to commercial ends" (Cohen and Levinthal, 1990), further developments of the concept extended the notional sphere, adding new dimensions, determinant factors, and applying it to other levels of aggregation as well (from firm level, to industry or national level).

Most of the work on the issue of AC is focused at the firm level, where learning processes and technological changes effectively take place and, "little research has been done to examine the determinants of a country's absorptive capacity and its relationship with national R&D activities, and the general characteristics of the international technological environment"(Criscuolo and Narula, 2002).

[**] Ph.D Candidate, research assistant in " Economics of R&D and Innovation" Department, Institute of National Economy, Romanian Academy.

It is important to understand that, while learning and absorption take place at the firm level, the success or failure of individual firms occurred in orchestration with an entire system (Narula, 2004) of interconnections and interdependences between the firms from the same sectors or from different sectors, or between firms and other non -firm institution that could facilitate or hinder knowledge absorption. On the other hand, firms are connected to the international stock of knowledge that could be assimilated only if a country has an adequate national absorptive capacity.

Based on the literature available, we designed a system of indicators for quantifying the relative national absorption capacity of different European countries compared with the EU average and the EU leader. Further on, these indicators will be aggregated, providing a fundament for comparative weighted estimations of the national absorptive capacities across EU.

1. Literature review: from micro to macro level approaches of absorption capacity

In our attempt to construct a system of indicators for assessing the relative level of the national AC of EU countries, we tried to find the valuable ideas in the literature of AC at firm level that can be extrapolated and applied at national level.

Thus, the theoretical background for our work is derived from the main thesis of some of the most visible papers on the issue of AC, regarding the conceptual evolution and its main determinants. Based on ideas from some significant works about AC at the firm level and following the model of one of few works that approached the absorption capacity topic at macro level (Narula, 2004) we tried to extrapolate the main theoretical determinants from micro to macro level

It is worthy to note, from the most cited works of Cohen and Levinthal (Cohen and Levinthal, 1990, 1994), the multidimensionality of the concept that springs out from its processual nature: the knowledge, in order to be effectively absorbed, should be firstly *acknowledged*, than *assimilated* and, at last, *converted* to commercial gain. Moreover, there is indirectly suggested a conditional correlation between the company's prior accumulated knowledge and the absorptive capacity. In other words, AC is cumulative and past dependent, and its current accruement allows for future higher increasing rates.

Cohen and Levinthal (1990) also differentiate between the absorptive capacity at individual and organizational level, stating that the last one cannot be a mere sum of the members' absorptive capacities. According to the authors, gaining absorptive capacity infers knowledge transfer processes, from the external environment to organization, as well as within the inner environment of the company. Therefore, high significance is given to the company's specific mechanisms for the stimulation of communication and interaction between its employees.

By extrapolation, we can say **that the national absorption capacity** is certainly not a simple sum of AC of national firms or industries. At macroeconomic level, there are multiple specific factors with determinant impact on the magnitude and dynamics of the AC: multiplicative effects, R&D spillovers, national potential of high educated people, development of national RD system, institutional intermediate for knowledge transfer that support interactions between the companies, as well as between the different components of the national RDI system, the effectiveness and coverage of various public supportive mechanism etc. There are "synergic effects, inter-firm and inter-industries influences, due to systemic and institutional elements that facilitate absorption" (Crisculo, Narula, 2002).

In most of the authors papers is mentioned the cumulative feature of the learning process and that the learning performance is greatest when the object of learning is related to what is already known. Diversity of knowledge plays an important role at the firm level. A diverse background provides a more robust basis for learning. **At the national level**, the assimilation of external knowledge is more difficult because the quantity, quality and diversity of knowledge are higher than at the firm level. On the other hand, the accumulation of knowledge is depending also on the stage of technological development and the distance to technological frontier. The ability of a country to assimilate knowledge spillover will be changed with his level of development and is. For a given

level of AC, the farther from the frontier a country is, the easier it would be to assimilate foreign knowledge.

A firm's ability to exploit external knowledge is often generated as a by-product of its own R&D. Through its R&D activities, a firm develops organizational knowledge about certain areas of science and technology. The extent to which it invests in absorptive capacity for a given area is a function of the relevance of that area of science or technology to the firm's strategy. **At the national level**, because external knowledge is more and more high tech, more diverse, and more scientific, the assimilation of knowledge from abroad needs an increasing financial and human R&D effort, both for creation of knowledge and for acquisition and efficient integration of external knowledge into the national production.

Criscuolo and Narula (2002) pointed out the significance of human capital, as a core determinant of absorptive capacity both, at the firms and also at the national level. But, more than at micro level, at macro level a large stock of qualified workers is not a sufficient condition for assimilate external knowledge. The institutions, the incentive mechanisms, R&D market regulations, intensity of relationship and degree of cooperation between firms and external producers of knowledge (universities, public research lab, capacity of networking) could facilitate or hinder the development of the potential absorption capacity.

An important aspect that we are having in view is the distinction between potential and realized absorption capacity made by Zahra and George (2002). The potential absorptive capacity represents the ability to identify and obtain important knowledge that is critical to its main activity field. The organizational routines and processes that allow for analyzing, processing, interpreting and understanding the acquired information smooth knowledge assimilation. The *effective* absorptive capacity refers to the transformation and effective use of the new knowledge through its integration and capitalization towards organizational objectives.

Both aspects are very important in grasping the level of a company's absorptive capacity, even if they are related to different organizational characteristics and different transmission channels. The potential AC depends on the availability of relevant knowledge sources and the type of partners the company has access to, while the realized AC is dependent on the ability to appropriate new relevant technology.

Trying to review and re-conceptualize the AC, the authors emphasized the dynamic nature of the absorptive capacity, which follows the processes and the routine of the company but also triggers change and organizational development. Therefore, the absorptive capacity is defined as a "set of organizational routines and processes whereby a company acquire, assimilate, transforms and uses knowledge in order to create a dynamic organizational capacity". The absorptive capacity represents, hence, the capacity to assimilate and manage the technological and scientific knowledge in order to improve the innovative performance and competitive advantage**.** The three processual components of the AC mentioned by Cohen and Levinthal, the authors bring in a new element, that is *knowledge transformation*. This may be considered **at the national level** as integrant to the *capitalization* stage of the process, and implies the capacity to develop and enhance the match between the prior knowledge and the newly adopted and assimilated one.

Lane, Koka and Pathak (2006, p. 856) added new aspects for a more detailed definition, such as: "absorption capacity is a firm's ability to utilize externally held knowledge through three sequential processes: (1) recognizing and understanding potentially valuable new knowledge outside the firm through **exploratory learning**, (2) assimilating valuable new knowledge through **transformative learning**, and (3) using the assimilated knowledge to create new knowledge and commercial outputs through **exploitative learning**". Each phase of this process is determined by internal and external factors. **At the national level**, the learning process is more complex, including formal education and skills formation but also many informal sources of learning.

The complexity of the absorptive capacity infers serious difficulties in defining a direct measurement system. Moreover, the few approaches to quantifying the AC and the determining factors are heterogeneous in methodology and results.

The estimation model designed and used by Tobias Schmidt (2005, 2010) provides an empirical analysis of the intensity and of the mechanisms of the impact of the most significant national AC determinants.

The author refers to three types of absorptive capacity, according to the different types of knowledge to be absorbed:

- Absorptive capacity for intra-industrial knowledge
- Absorptive capacity for inter-sectoral knowledge
- Absorptive capacity for scientific knowledge.

Therefore, AC for intra-industry knowledge is necessary for obtaining relevant knowledge from companies inside the industry; AC for inter-industries supports the absorption of knowledge generated within other activity fields; while AC for scientific knowledge attracts knowledge that becomes available to the business sector through cooperation with universities and public / private research institutions.

The results of the study indicate high correlation between the absorptive capacity of an organization and the personnel involved in intramural R&D, which seems to have an even greater impact on AC than the expenditures for research and innovation. We keep out this idea because at macro level the learning processes are more important but, also more complex and dynamic. An interesting assertion that could be extrapolated at **national level** is referring to the fact that organizational ability to assimilate and use external knowledge depends not only on the R&D expenditure level, but, also, on the stock of knowledge priory acquired and incorporated in the human capital and individual capacities. The organizational structure and managerial practices and also the type and intensity of the interactions and cooperation with external partners (other companies, universities, research institutes, etc) are often more important. A most important assertion that inspired us for this topic is the distinction between the three-mentioned types of absorption capacities. Our paper is focused on the third type, namely absorptive capacity for scientific knowledge.

All the determining factors for the level of absorptive capacity are interdependent, intercorrelated and, even, complementary: the intramural R&D activity depends on the educational level of the employees, and organizational knowledge is very tightly connected to the management strategies and methods.

2. The absorption of scientific stock of knowledge from universities and research institutes

The universities have an increasingly important mission to create and transfer knowledge through various mechanisms, through patents, licenses, and spinout or by collaborative research with industrial sector organizations. Public research institutes and universities generate scientific knowledge that is very seldom directed towards specific users. Therefore its effective value will be dependent on the capacity of the potential receptors to assess, assimilate and exploit it (Abreu et al, 2010).

Whatever the external knowledge source, the absorption and assimilation of new knowledge is contingent on the organization's effort, expertise and pro-active attitudes of the researchers from within. Thus, the absorptive capacity becomes even more important for an effective knowledge transfer from the public research sector to industry.

On the other hand, the linkages between research and industry are an important determinant of AC. Some empirical studies proved that more companies develop sustained relationships with research institutes; the more increase their absorptive capacity (Schmidt, 2005). The more intensive the connections between companies and scientists, university researchers and research institutes

personnel, the more capable will the company be to take advantage of the research results in its innovative activity. At the same time, as in a virtuous circle, high absorptive capacity improves the company's ability to exploit and turn to value new scientific *fundamental* knowledge.

The capacity to absorb research results provided by universities and research institutes is particularly dependent on the factors that are specific, intrinsic to the potential receptor. That is why, **at the national level**, the rate of tertiary education personnel, the share of employees which play the interface between the scientific knowledge source and the organization, the level of sustained involvement in own R&D activities and the stock of similar knowledge already acquired are some of the most important elements that would make the available knowledge appropriable.

It is worth mentioning that, in order to build a common platform between internal and external research, necessary for an effective knowledge transfer, the company should encourage its employees to acquire a common scientific language with knowledge providers, that would improve the ability to acknowledge, absorb and exploit the scientific research result. Higher intensity of research performed within the company is a good lever for a more effective and timely turn to profit, through innovation, of the scientific research results obtained in universities and research institutes.

In order to capitalize on scientific knowledge, the level of absorptive capacity should be higher than in case of other types of knowledge. A higher absorptive capacity is closely related to the organization's ability to use fundamental scientific knowledge provided by its external environment.

A very important element of the cooperation between the public research sector and industry, at national level is represented by the mediators, support institutions whose mission is to smooth and facilitate the connection between the knowledge creators and receptors, to encourage the business sector receptivity and absorptive efforts. This is an explanation for the numerous references in the literature on this field, on the significance of clusters, technological platforms, scientific knowledge transfer networks, partnerships between universities, public research units and potential users in the business sector (Abreu et al, 2010).

3. An attempt to design a system of indicators for evaluating the relative absorption capacity of EU countries.

Our starting point in designing the system of indicators for relative absorption capacity evaluations is the valuable ideas we have fund in literature about determinants and influencing factors of AC.

Making a deep analysis of the literature previous 2002 year, Tobias Schmidt

(2010) identified the following determinants of absorption capacity mentioned in the most of the studies:

a.**Research and development activity**, expressed by the indicators as R&D intensity, continuous R&D activity and existence of an laboratory inside a firm.

b.**Prior related knowledge.** Schmidt remarks that "the cumulative nature of absorptive capacity has not taken into account by a lot of empirical studies, despite it is extensively discussed in the literature on knowledge and spillover. In his opinion, the level of education and training of the firm emplowees express the cumulative nature of AC.

c. Organizational structure and human resources management practices

In accordance with Cohen and Levinthal, the author refers to ability of an organization as a whole, to stimulate and organize the transfer of knowledge across departments, function and individual, its tools and incentives to stimulate knowledge exchange and learning. The results of Tobias Schmidt empirical estimations prove that employees with higher education, continuous R&D activity and informal contacts have a positive influence on absorptive capacity but R&D intensity but not contributes to the building of AC but helps to develop skills and knowledge stock that contribute significantly to exploitive capacity. Broad dissemination by papers, seminars and workshops influences positively scientific knowledge absorption: "the more knowledge is translated the higher

is probability to integrate into the existing knowledge base utilized in innovation process" (T.Schmidt, 2005, p.20).

A recent paper (Murovec, Prodan, 2009) proposes a direct measure of absorptive capacity and a wide range of variables in a cross-nationally tested structural model. The results of estimations show that there exist two kinds of absorptive capacity: demand-pull and science-push. Their most important determinants proved to be internal R&D, training of personnel, innovation co-operation and attitude toward change. Both kinds of absorptive capacity are positively related to product and process innovation output.

One of few but the most relevant work focused on national absorptive capacity is that already cited, of Rajneesh Narula (2004).In his construct the national absorption capacity is more than a simple aggregation capacity of its firms or its industries, other additional multiplicative effects, which, although insignificant at the firm level, became very significant at the national level.

The national absorption capacity concept refers to "the ability to search and select the most appropriate technology to be assimilated from existing ones available, as well as the activities associated with creating new knowledge. Absorption capacity also reflects the ability of a country to integrate the existing and exploitable resources-technological opportunities-into the production chain, and the foresight to anticipate potential and relevant technological trajectories. The international technological environment therefore affects this ability (Narula, 2004).

The main sources of knowledge has to be absorbed at national level are: foreign knowledge coming from foreign suppliers and customers, foreign non- firms organizations, as universities, public research institutes, stock of knowledge in the domestic firm sector and in the MNE subsidiaries, stock of knowledge in the domestic non-firm sector. Industrial policy regime, including competition policy, governmental funding organizations, government funding for education, intellectual property regime are environmental factors that influence the transforming of potential AC into a realized, effective AC.

National absorptive capacity is taken to be a function of the distance from the technological frontier, which is defined as the difference in knowledge stock at the country level and at the frontier.

As the author conclude, his construct should be seen as a tentative that provide a basis for more accurately estimating national absorption capacity, remaining considerable lacunae which deserve further theoretical and empirical analysis.

As an answer to this provocation, we attempt to add a modest contribution to the statistical estimation of the variation among the EU member states, regarding the absorptive capacity for scientific knowledge in the business environment.

We, hereafter, propose a methodology for a statistical estimation of the variation among the EU member states, regarding the absorptive capacity for scientific knowledge in the business environment. This follows the construction and calculation of a composite indicator that would integrate and express the impact of the different categories of determinants of the absorptive capacity at the national level.

Thus, the inconvenience of using a single indicator for the absorptive capacity of R&D results would be avoided, as multicriterial synthetic indicators can express different quantitative and qualitative aspects of the analyzed issue (Mitrut et al, 2010).

The resulting index will represent only an assessment of the relative position of the level of AC of each statistical unit among the EU member states, without providing an absolute quantitative value of their absorptive capacities. Yet, it may render valuable information, as it allows for multicriterial ranking of the statistical units, as well as for quantifying the gaps among them.

The smoothness, effectiveness and intensity of the scientific knowledge absorptive process depends, largely, on the quality, time and relevance of the knowledge generated by knowledge producers (which are, mainly, the RDI institutes, university centers and, seldom, even the business sector); on the ability of potential knowledge users to understand available knowledge, to assess its economic potential, to absorb it, to transform it and turn it to commercial value; on the intensity and

functionality of the cooperation/communication network established within the National Innovation System between various actors; and, on the performance of the public support for RDI, for knowledge creation and knowledge transfer.

Choosing appropriate indicators for each factor-group (see figure 1) has proved a difficult task, as serious difficulties and limitations are imposed by data availability. As far as data source is concerned, we have drawn mainly on the Eurostat database and the Innovation Union's performance scoreboard for Research and Innovation (Innovation Union Scoreboard 2010)

The capacity of generating scientific knowledge may be expressed through input indicators – variables referring to national human and financial resources employed in R&D, such as the total R&D personnel (in full-time equivalents) as a % of total employment, total expenditures on R&D (GERD), and, through output indicators, e.g. scientific publications among the top 10% most cited publications worldwide, international scientific co-publications per million population, number of patent applications.

The effective capacity of the business sector to absorb and assimilate scientific knowledge is determined by the available and employed human and financial resources. We have chosen: business R&D expenditures as % of GDP, R&D personnel employed in the business sector (% of total employed), highly educated human resources available and effectively employed in science and technology, persons with tertiary education attainment, PhD students and graduates.

The openness of the business sector towards cooperation with knowledge providers, be they in the same or in different industries, in the universities or R&D institutes, is the main factor that stimulates and ensures good, productive linkages between scientific knowledge producers and users. The chosen indicators estimate the innovative enterprises cooperating with other actors, among which we are interested especially on cooperation with public research institutes and universities, business expenditures allotted to R&D performed in public research labs and institutes, private-public cooperation in publishing.

The public support for AC at national level, that means the legislative and financial support proves very important in ensuring a favorable environment for high-quality and relevant new scientific knowledge, for high capacity of absorption and for good cooperation relationship between knowledge creators and users. We chose to express it through various variables, such as the public expenditure assigned to R&D (GBOARD), the share of R&D performed in the private sector with public funds in total private R&D activities, % of enterprises that received any public funding, total public expenditure for tertiary education, as % of GDP.

Therefore, the level of the National AC may be expressed through a function of four groups of factors: (a) scientific knowledge creation capacity, (b) employed and available resources for scientific knowledge absorption at the company level, (c) the linkages between scientific knowledge providers and users and (d) the public support for knowledge growth.

The final composite index will aggregate the four synthetic indicators calculated for each block of indicators. At their turn, each sub-group synthetic indicator, if analyzed, may bring forth specific information on the strengths and weaknesses that may amplify or hinder the development of an economy's absorptive capacity.

Using and aggregating 22 different indicators raise the heterogeneity issue, which may be handled through normalization (min-max method). The variation range is standardized, limited to interval (0,1) no matter the nature or initial variation of the given indicators. Bringing them to a common scale may compare data on different scales.

After normalization, the readjusted values for each indicator are:

$$I_i^j = \frac{X_i^j - X_{\min}^j}{X_{\max}^j - X_{\min}^j}$$, if there is a positive correlation between the factor expressed through indicator X_i and the level of AC, and

$I_i^j = \frac{X_{\max}^j - X_i^j}{X_{\max}^j - X_{\min}^j}$, for indicators which are in inverse ratio to the absorptive capacity level,

where X_i^j is the absolute value of „j" indicator for the EU state „i", $X_{\min}^j$ and $X_{\max}^j$ represents the minimum and the maximum values of „j" indicator.

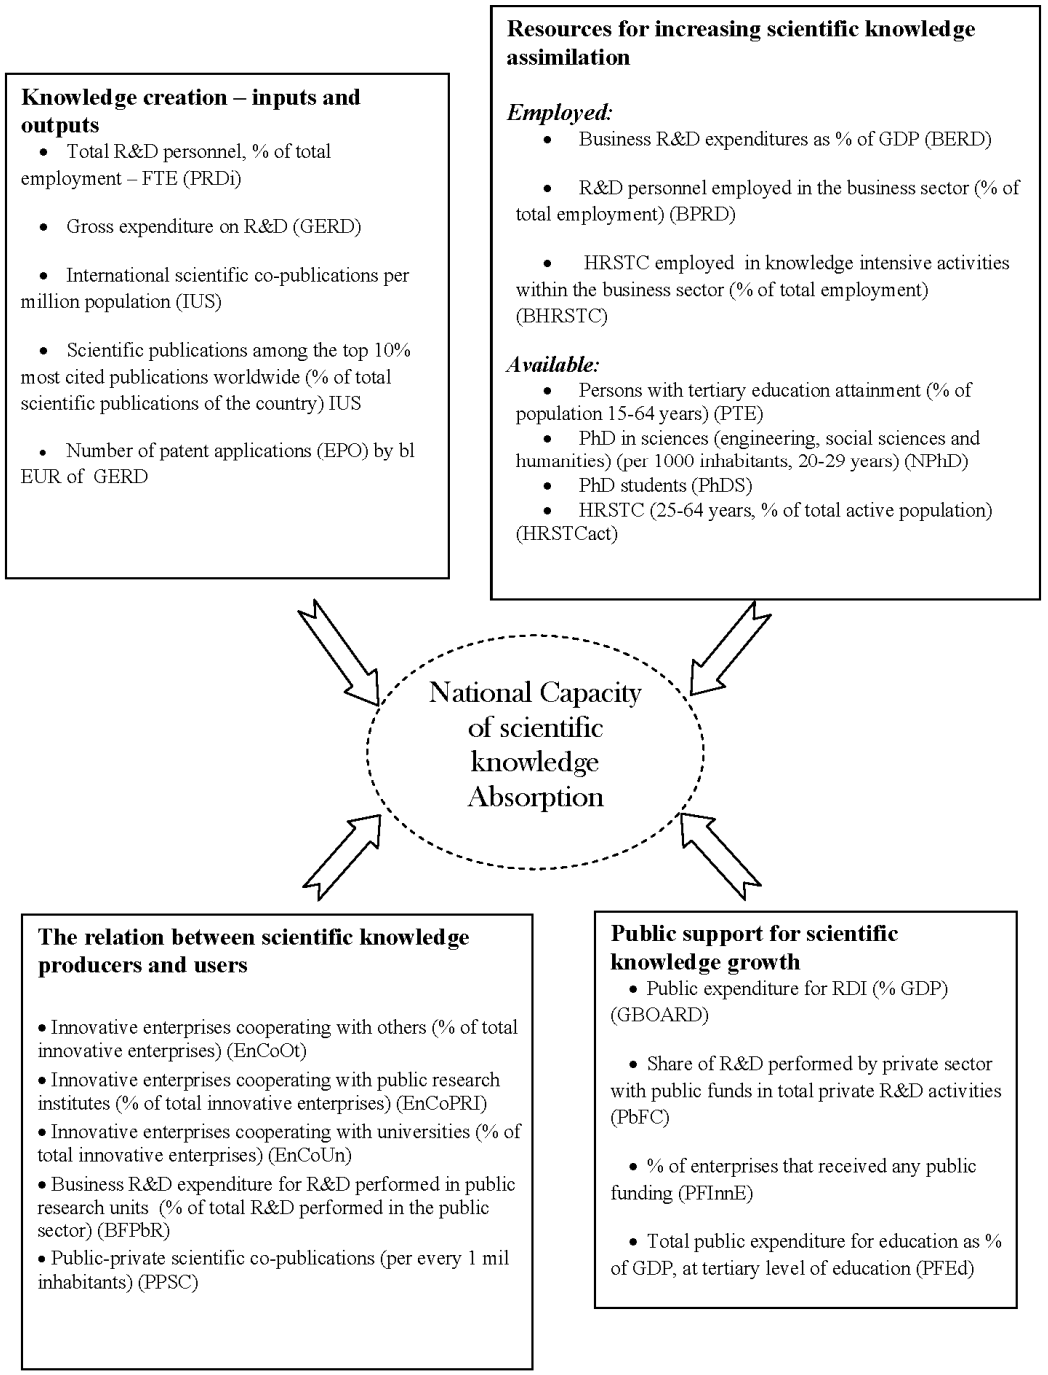
Further on, for each statistical unit „i" (EU member state) and for each indicator group („g"), a synthetic group index $\boldsymbol{I_g^i}$ will be determined as a weighted arithmetic average of the component indicators: $\overline{I_g^i} = \frac{\sum_{j=1}^{m} I_j^g \cdot p_j^g}{100}, \quad i = \overline{1,n},$ where p_j^g represents the weight of indicator „j" belonging to the factor group „g" The specific weights granted to each indicator in a sub-group shall sum up to 1.

In calculating the final composite indicator for each statistical unit „i", each group of indicators will also be given a specific weight, as their impact on the level of NAC is relative . The statistical weights sum shall equal 1, as well. ($\sum_{g=1}^{5} \boldsymbol{p_g} = 100\%$)

Therefore, the Absorptive Capacity relative composite index for the EU state „i", will eventually be calculated as $\overline{\boldsymbol{I}}_{\boldsymbol{i}} = \frac{\sum_{g=1}^{m} \boldsymbol{I_g^i} \cdot \boldsymbol{p_g}}{100}, \quad \boldsymbol{i} = \overline{\boldsymbol{1,n}}$.

The value of the composite index can be of, maximum, 1 – if the same unit scores the highest regarding all indicators and of minimum 0, if the same unit ranks the lowest for all indicators.

Figure 1. Indicators for evaluating a relative level of national AC within the EU



4. Conclusions

Indicators suggested in the figure nr.1 allow for international comparisons between the different relative national absorption capacities of scientific knowledge of the EU member states. This would provide supplementary effective tools for better assessment of national performances in innovation and competitiveness, of the gaps between countries and of the factors that may stimulate or hinder the capacity of an economy to absorb new available knowledge, to assimilate it and effectively use it towards higher competitiveness and productivity.

Our proposal of a methodology for a statistical estimation of the variation among the EU member states, regarding the absorptive capacity for scientific knowledge in the business environment is a modest contribution to the macro level literature on the absorptive capacity that has been scarcely and somehow inconsistently approached, with limited empirical, econometric applicability.

This follows the construction and calculation of a composite indicator that would integrate and express the impact of the different categories of determinants of the absorptive capacity at the national level.

Thus, the inconvenience of using a single indicator for the absorptive capacity of R&D results would be avoided, as multicriterial synthetic indicators can express different quantitative and qualitative aspects of the analyzed issue.

The papers contribute to the clear up of specific aspects of absorption capacity of scientific knowledge, constructing a system of AC components composed of four groups of indicators expressing: the capacity of generating scientific knowledge; **t**he effective capacity of the business sector to absorb and assimilate scientific knowledge; the openness of the business sector towards cooperation with knowledge providers and the public support for AC at national level.

RECENT APPROACHES IN THE OPTIMUM CURRENCY AREAS THEORY

AURA SOCOL[*]
CRISTIAN SOCOL[**]

Abstract
This study is dealing with the endogenous characteristic of the OCA criteria, starting from the idea that a higher conformity of the business cycles will result in a better timing of the economic cycles and, thus, in getting closer to the quality of an optimum currency area. Thus, if the classical theory is focused on a static approach of the problem, the new theories assert that these conditions are dynamic, and they cannot be positively affected even by the establishment of the Economic and Monetary Union. The consequences are overwhelming, as the endogenous approach shows that a monetary union can be achieved even if all the conditions mentioned in Mundell's optimum currency areas theory are not met, showing that some of them may also be met subsequent to the unification. Thus, a country joining a monetary union, althogh it does not meet the criteria for an optimum currency area, will ex post lead to the increase of the integration and business cycle correlation degree.

Keywords*: optimum currency area theory, endogeneity theory, OCA characteristics*

Introduction

Although the problem of the monetary unions is more actual than ever, both for the developed countries, which have already joined the Eurozone, and also for the less developed states, which are preparing to meet the criteria for being accepted, this topic has been put forward for a long time in the economic literature. Thus, the classical theory of the optimum currency areas has come out since 1961 in an article presented by Robert Mundell (who is considered to be the „father" of the optimum currency areas theory). The objective of this theory was to make a monetary union possible, by providing answers for the measures which should be taken for improving the situation.

The optimum currency areas theory *(OCA.)* is based on Robert Mundell's contribution (1961) which is mentioned above, although the problem has been reviewed and added by many other economists, such as Robert McKinnon (1963), Peter Kenen (1969) etc. *The theory shows that countries can obtain net benefits as a result of having a unique currency, thus being able to avoid the possible adjustment problems, as long as the member countries meet certain conditions (OCA characteristics)*

The latest researches referring to the optimum currency areas theory require the so-called theory of OCA endogeneity criteria in the economic literature. Thus, from a theoretical point of view, some authors assert that two of the optimum currency areas criteria are especially important.

Frankel and Wei (1998) propose two of the characteristics of the optimum currency areas as being fundamental in assessing the net benefits of a monetary union: *an economy's opening degree (from a commercial point of view) and the correlation degree of the business cycles* (*economic symmetry degree).* In case the classical theory is focused on a static approach of the problem, the new theories assert that these conditions are dynamic, and they can be positively affected even by the establishment of the Economic and Monetary Union. This approach represents one of the paradigms related to the optimum currency areas theory and it has overwhelming consequences. According to this approach, a higher economy opening degree will determine a convergence of the business cycles, and this will provide favorable conditions for political integration and for the creation of a currency

[**]Lecturer, PhD, The Bucharest Academy of Economic Studies, (e-mail: socol.cristian@gmail.com).

area. In such a case, the mutual commerce is stimulated, and the business cycles will get synchronized, the final effect being the regularity of the currency and the exchange arrangements.

The consequences are overwhelming due to the fact that the endogenous approach shows that a monetary union can be created *even though all the conditions* mentioned in Mundell's optimum currency areas theory *are not met*, showing that some of them may also be met subsequent to the unification. Thus, a country joining a monetary union, althogh it does not meet the criteria for an optimum currency area, will e*x post* lead to the increase of the integration and business cycle correlation degree. Actually, this fact outlines that the main objective for which a monetary union is created is to make profits on the benefits, even though they can be identified from the beginning (the ex ante variant), or if they occur after a certain period of time (the ex post variant).

The endogeneity of the optimum currency areas was defined by Jeffrey Frankel and Andrew Rose in 1998, and, subsequently, in 2007, Gayer made an important addition. The endogeneity in a currency area shows that a country's joining to a currency area results in the increase of the synchronization degree of the economic cycles, due to the increase of the commercial integration.

The Endogeneity of the Optimum Currency Area Criteria

The trade-off between *the economy's opening degree* and the correlation degree of the business cycles is described by the OCA line, in figure 1. It represents the set of combinations between symmetry and economic integration for which the costs and the benefits of joining a monetary union are equal. The OCA line has a negative slope due to the fact that the implementation of a unique currency is in a positive relation with the economy's opening degree, and also with the correlation degree between the countries' economic cycles. On the right side of the OCA line, we encounter the situation in which the benefits exceed the costs for losing the monetary independence. On the left side of the OCA line, it is more favorable for countries to keep their monetary independence and to join a monetary union (for example, a monetary union between EU, USA and China is not efficient).

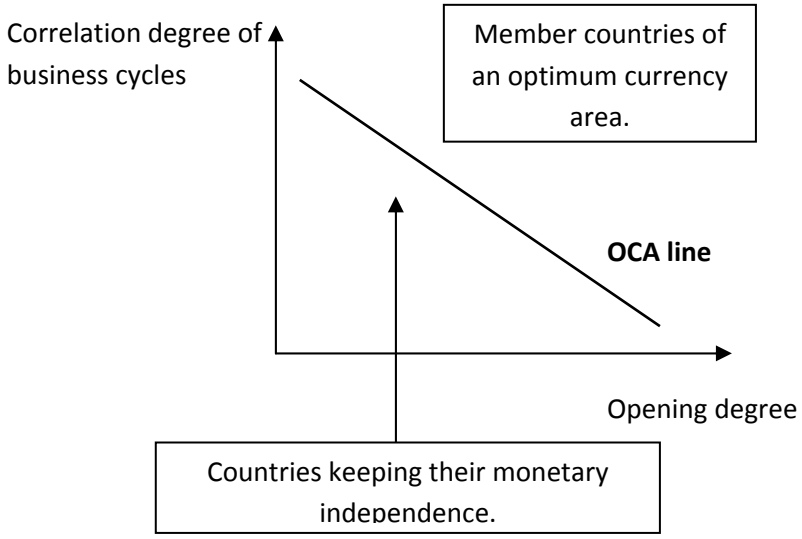

Figure 1.**The line of the optimum currency area**

Many authors agree that the development of a mutual commerce and an economy's opening degree as high as possible are benefic for each national economy. Thus, the transaction costs get

decreased, the rate of exchange is stable and the net benefits of a monetary union get increased. The empirical studies demonstrated that, after the creation of the Unique Market, the commercial relations between the European Union's members recorded a 60 percents increase (Frankel and Wei, 1998).

Rose and Frankel explained that the monetary integration may lead to a significant dependence on the mutual commerce. From this point of view, the Eurozone can be changed into an optimum currency area after initiating the monetary integration process, and this means that the countries joining the Eurozone, irrespective of their motivation, could ex-post meet the criteria required by an OCA ZMO, even though they were not able to do it ex-ante. As a consequence, the borders of a new currency area would be too large, due to the standby according to which the commerce integration and the revenues correlation will get increased when the union is created.

The effect of endogeneity of an optimum currency area is based on two main perspectives. The first perspective outlines the fact that the opening degree of the economies being taken into consideration (the mutual commerce between the members of the currency area) is expected to get increased. This perspective is generally accepted, even though there are contradictory points of view regarding the largeness of the opening, and the second perspective supposes a positive relation between the commerce integration and the revenues correlation. As a monetary union is established, even in an automatic manner, the market mechanisms begin operating, and this facilitates the various criteria proposed for testing the area's efficiency.

The differences between countries exist, but the problem is to what extent they are relevant, so that their presence could prevent the creation of a monetary union. To what extend do the *asymmetric shocks* mentioned by Mundell exist and act Î? From this point of view, there are two perspectives: an optimistic perspective and a pessimistic one.

From the optimistic point of view, the commerce within the countries which are member to the European Union is, to a large extent, an intra-industrial commerce; this commerce is based on the existence of the economies of scale. Thus, most of the demand shocks affect the countries from this economic space in the same manner. Under the terms of creating a unique market, most of the demand shocks will tend to have a symmetric effect. According to this perspective (figure 2), the increase of the integration degree will lead, to a larger extent, to making the economic structures compatible and, to a smaller extent, to the occurrence of asymmetric shocks.

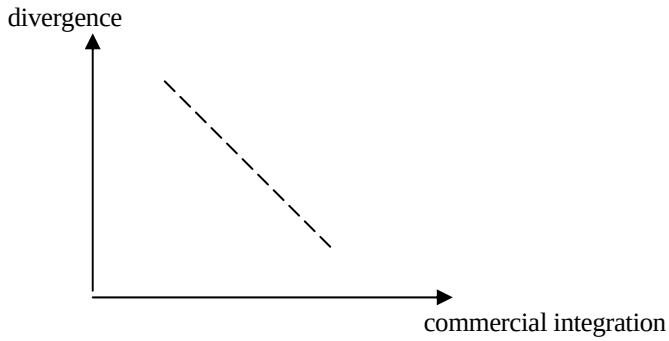

Figure 2. **The optimistic perspective**

From the optimistic point of view (figure 3), the assumption of the asymmetric shocks is not eliminated, though. According to this perspective, the economies of scale may result in the occurrence of agglomeration effects; the commerce integration which is achieved due to the economies of scale existing in the EU space leads to a regional focus of the industrial activities. Thus, the output focus effect will result in losing the advantages provided by the economies of scale. According to this approach, the commercial integration leads to the occurrence of asymmetric

shocks. The asymmetric shocks would be favored by the high focusing degree of certain industries in a country. In such a case, the countries encountering such shocks would rather use the rate of exchange for balancing economy.

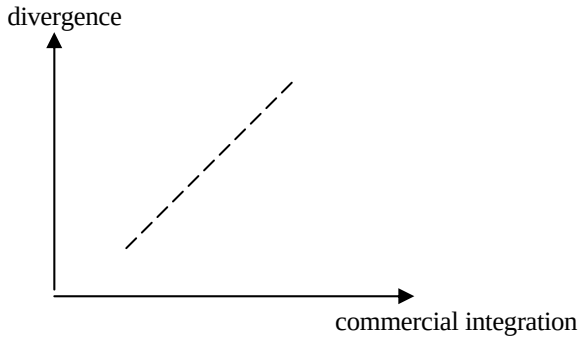

Figure 3. **The pessimistic perspective**

The intersection point of costs and benefits related to joining a monetary union (point A) determines the critical level of an economy's opening which makes a country worthy joining a monetary union together with its commercial partners. In this pattern, the form and the position of the costs curve depends, to a great extent, on the perspective considered in terms of efficiency of the exchange rate tool in adjusting the effects generated by the different evolutions of demand and costs in the countries which are involved in a monetary union. De Grauwe (2003) presents two variants of the costs-benefits correlation: *the monetarist perspective* – also accepted by the European Commission for assessing the net benefits of the Economic and Monetary Union – in which the right side of the costs is closer to the origin – and *the Keynesian perspective* which supposes a less optimistic approach of the problem (figure 4).

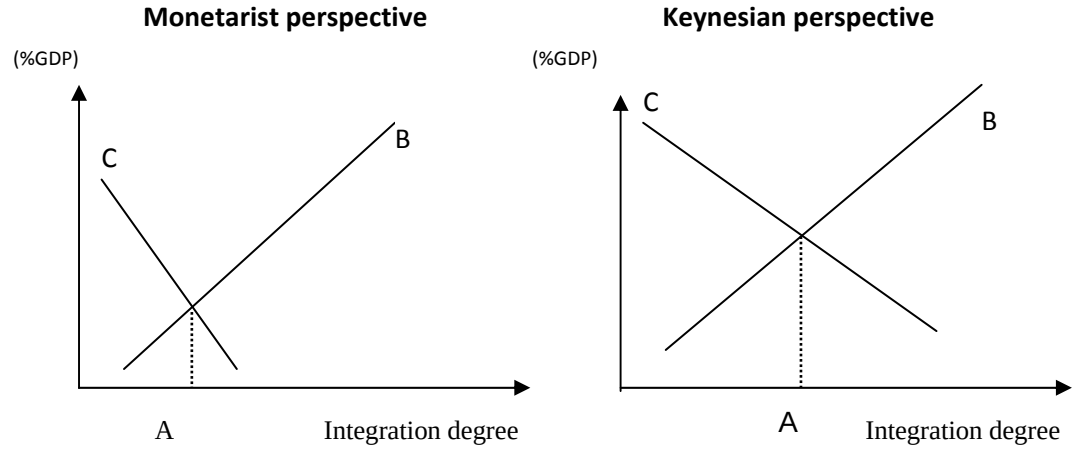

Figure 4. M**onetarist perspective versus Keynesian perspective**

In the case of the Keynesian perspective – illustrated by Mundell's model – the costs curve is placed much farther from the origin of the axes system, so that only a few countries would be favored by joining a monetary union. The national economies are characterized by structural rigidities; the rate of exchange is an essential tool for eliminating unbalances, and the curve of the costs for giving up their own currency is farther, if compared to the origin. In such a perspective, a few countries will be interested in joining a monetary union.

In the case of the monetarist perspective, the modification of the exchange rate is not efficient in adjusting the development differences between countries; thus, the curve of the costs for giving up their own currency is closer to the origin. Even in the case when the rate of exchange were an efficient tool, its use would typically generate worse results for the countries using it. Thus, the costs curve is placed very close to the origin of the axes system. The point which makes a country worthy joining a monetary union (the critical point) is close to the origin. As a consequence, several countries in the world would benefit from giving up their own currencies and from joining a monetary union. In case a decrease is recorded in the prices and wages rigidity, and the labor mobility gets increased, then the curve of the costs for giving up the national currency would move to the left, and the monetary union would become more attractive. Practically, the net benefits depend on the inclination degree of the two lines, as well as on their position in relation to the origin.

Which of the two perspectives is closer to reality? The empirical evidences of Frankel and Rose (1996) support the optimistic variant. Frankel and Rose asserted the *endogenous* characteristic of the OCA criteria, starting from the idea that the countries with the closest economic relations have the tendency to provide a higher conformity of business cycles and they asserted that the emphasis of integration due to the monetary unification will lead to a better synchronization of the economic cycles and to coming closer to the quality of an optimum currency area. The lower the correlation of the shocks, the higher the costs for a monetary union, in the absence of the economy's short-term adjustment possibilities by means of the exchange rate. The costs for a lower symmetry can be balanced by the benefits from a higher economic integration degree, and this will allow a better expenditure of resources in economy.

Frankel and Rose gave the following example. Let us consider a group of countries, which is initially placed in point 1 in figure 5, on the left of the OCA line (where it is more favorable to keep their monetary independence). If these countries create a "union" – for example, the European Union – then the correlations between the business cycles of these countries will get increased, as well as the economic integration degree. According to the endogeneity assumption, if these countries create a common market, they will gradually move towards point 2. If the group decides to also create a monetary union, then the integration degree and the correlation of the business cycles between these countries will get more increased; soon, they will move in point 3, which is placed on the right side of the OCA line, where it is more favorable for all the countries which are members to the group to adopt a common currency. Joining the monetary union will result in the increase of the economic integration degree, thus outlining the benefits of such a union.

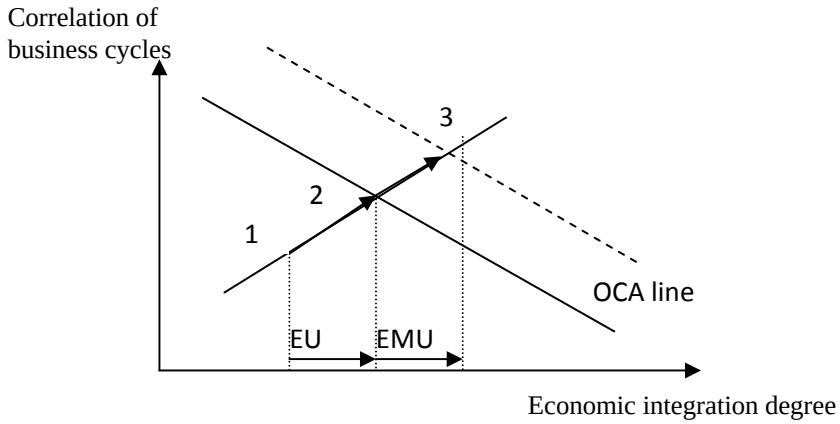

Figure 5. The Endogeneity of the Optimum Currency Area Criteria

This approach represents one of the paradigms related to the optimum currency areas theory and it has overwhelming consequences. According to this approach, a higher economic opening degree will determine a convergence of the business cycles, and this will provide favorable conditions for political integration and for the creation of a currency area. In such a case, the mutual commerce is stimulated and the business cycles will get synchronized, the final effect being the disciplining of the monetary and the exchange arrangements.

Thus, if the classical theory is focused on a static approach of the problem, the new theories assert that these conditions are dynamic, and they can be positively affected even by the creation of the Economic and Monetary Union. The consequences are overwhelming, as the endogenous approach shows that a monetary union can be created *even though all the conditions* mentioned in Mundell's optimum currency areas theory *are not met*, explaining that some of them can also be met subsequent to unification. Thus, a country's joining a monetary union, even though it does not meet the criteria of an optimum currency area, will *ex post* lead to the increase of the integration degree and to the increase of the business cycles correlation degree. Actually, the main objective for which a monetary union is created is to make profit from the benefits, even though they can be identified from the beginning (the ex ante variant), or if they occur after a period of time (the ex post variant).

Consequences of the OCA endogeneousness theory upon the economic and financial integration

The economic cycles synchronization is an extremely important element for adopting the Euro currency without costs as a result of giving up the independent monetary and exchange rate policy. On the one hand, the commercial/economic integration is one of the main economic cycles correlation mechanisms. The economic **integration is a complex and dynamic process aiming at the unification of economic areas which h**ave previously been distinct and it may become real by emphasizing the relations between them, namely by intensifying the commercial trades, the flow of goods, of persons, of capital and ideas, and also by establishing increasing interdependences between these economic areas in order to create an open system which includes various economic, politic and social fields etc.

Andrew Rose and Jeffrey Frankel were those who discovered the fact that the membership to a monetary union results in the increase of the commercial trades. The effects of the monetary integration upon commerce are also known as the "Rose effects".

Box 1. The "Rose effect" behind the economic integration endogeneity

The dilemma constituting the basis of the "Rose effect" → *Can the simple creation of a monetary union lead to intensifying commercial trades, besides the positive impact generated by the elimination of nominal exchange rate volatility?*

The researches on this topic assert contrary opinions. Thus, some of them assert that there is no significant relation between the two of them, at most a very low negative effect upon commerce may occur regarding the volatility. Other researches reflect the fact that they discovered some significant and negative effects of the exchange rate uncertainty upon commerce: on a long term, the impact could be high enough, even 10 percents. The decrease of the exchange rate may result in the increase of the commercial trades' volume in two ways: firstly, by encouraging the increase of a company's exported quantity, and secondly by increasing the number of companies which are involved in export. In order to give an exact definition for the "Rose effect", Baldwin, Skudelny and Taglioni started by noticing that Europe has several companies which do not make exports or which make very low exports. One of the factors which determine them not to make exports is the uncertainty related to commerce, thus, a decrease of uncertainty may stimulate more the companies to make exports, thus increasing the commerce volumes. While these things are important for the negative relation existing between commerce and volatility – see the broken line in the below figure – the "Rose effect" is not totally applicable, being generally perceived as the impact of a monetary union's control upon the linear commercial relations.

For a better understanding, we should explain the reason why the relation between volatility and commerce is convex. We may assume that the assertion according to which the relation between the two of them is convex is real, as the continuous curve in the chart shows.

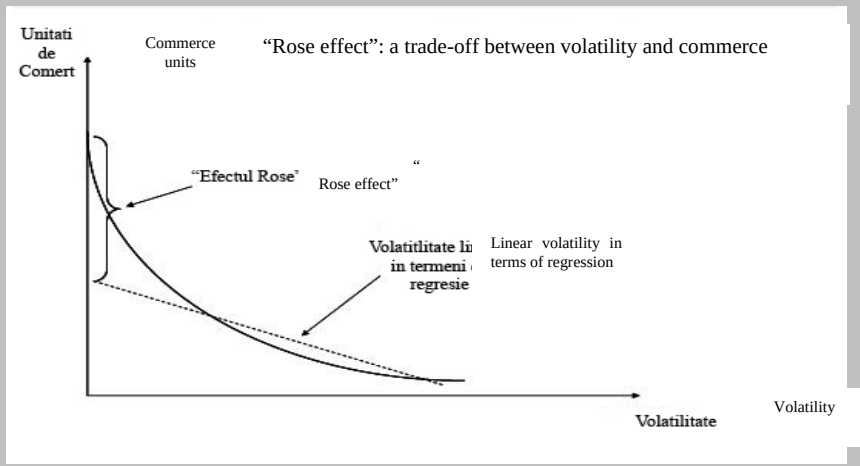

Figure 7

Baldwin assumes the existence of two sources for this convexity, as it follows:

- firstly, the volatility of the exchange rate accordingly affects small companies to a greater extent than the big ones. When the initial set of exporting companies includes more small companies, the marginal impact of a lower volatility could be higher; and
- secondly, the distribution of the European companies is very oblique in the case of the smaller companies. Thus, each decrease of distribution brings a higher and higher number of new exporters, as it is shown by the vault made by the "Rose effect" in the above figure.

As a consequence, the theory and the various economic researches have shown that the economic integration related to a monetary union may create commerce effects. The researches made for the OCA endogeneity suggest the capacity to increase the European integration subsequent to the monetary unification; along with this, the commerce is expected to increase faster. The financial European integration is a developing process, especially with reference to some market segments, namely the capital market and the retail segment of the banking market. Until now, the highest integration degree has been reached by the monetary market and the bond market. The Euro currency represents the bond which has resulted in the increase of the real unique market and which plays an important role in the well operation of the financial European market.

The financial markets integration is one of the essential factors of the optimum currency areas theory, because it results in the improvement of transmission of the unique monetary policy, it improves the assignment of resources by directing resources towards the areas with investment potential. As a consequence, the financial markets integration stimulates the economic growth and it may help in adjusting the idiosyncratic shocks. The financial markets integration is measured by means of the integration of monetary, capital and banking systems markets and by the way in which, from an institutional point of view, the conditions to equally deal with the market members are provided. Integration is institutionally provided in the new member states by adopting the community acquis. The free movement of the capital is provided by liberalizing the capital account, as a previous condition for joining the European Union.

The financial markets in the European Union's member states which are not member to the Eurozone record the highest delays in the integration process. Once these countries adopt the Euro currency and harmonize their internal financial structures with those of the Eurozone, the integration process will encounter an obvious acceleration. The experts assert that the financial integration is completely achieved when all the potential market members have the same relevant characteristics: if they face a unique set of regulations, when deciding to invest in various financial tools and/or services; if they have equal access to the above mentioned set of financial tools and/or services s; and if they are equally treated when being active on this market.

The financial integration generates a series of advantages, such as: the improvement of the capitals assignment, their efficiency increase and the increase of economic growth.

Besides all these, the financial markets can provide a significant security source against the asymmetric shocks. From a graphical point of view, the financial integration, in the presence of endogeneousness, has the effect of moving downwards the OCA line, namely the increase of net benefits for the Eurozone.

Conclusions

Even though the empirical evidences seem to validate the endogeneity theory in the case of the Eurozone, its enlargement, under the present terms of financial instability, is not efficient and it may have an unhappy end for the Euro currency, the pessimistic people assuming that it can even decompose. The uncertainty related to the future optimality of the European monetary union comes to a standstill, due to the major differences existing between the economies of the member states. Moreover, there is another assumption in the economic literature (Krugman, 1993) which is based on

the commerce theory and on the increase economies of scale, according to which the commercial and financial integration is accompanied by the member countries' specialization within an OCA, and this generates very less diversified economic structure, which is inclined to be affected by the offer shocks.

The result is that their business cycles will become less correlated. As the economy's opening degree gets increased, each country will get specialized in producing the goods and services for which they have a comparative advantage. Thus, the second paradigm of the optimum currency areas theory is supported by Paul Krugman and it attempts to demonstrate exactly the contrary (if compared to the endogeneity theory), asserting that the commercial integration may result in specialization and in a lower correlation of the economic cycles.

The empirical evidences have shown that, although with reference to industry, economic centers may occur in certain areas, it is less probable that this phenomenon brings the emphasis of asymmetries. On the one hand due to the fact that the increase of the integration degree is accompanied by the possibility of occurrence of centers in the cross-boundary areas, and on the other hand, the probability that these centers occur in the sector of services is lower. As this sector represents 60-70% of the EU member states' GDP, it will be taken into account in the costs-benefits equation maybe more than the industrial sector.

SOME SOCIO-ECONOMIC EFFECTS OF LABOR FORCE MIGRATION IN AN ENLARGED EUROPE

MARIANA BĂLAN*
VALENTINA VASILE**
LIVIU VASILE***

Abstract
The enlargement of the European Union and the liberalization of labor force movement to Europe increase greatly migration to developed countries. This phenomenon affects the economic growth both on short and long term. The ascendant trend of migration began by the mid-nineties and continued after 2000. The data between 2002 and 2009 indicate a quasi-slow down tendency. This paper intends to estimate some effects of migration flows over both origin and host countries in an enlarged Europe. Capital, financial and labor flows are the main mechanisms of European integration that should be borne in mind with respect to south-eastern enlargement, implicitly the migration from Romania which represents a sensitive subjects added to the aforementioned. The migration and emigration from and to Romania will have effects on the Romanian economy on short and long term.

Introduction

In 1849, Victor Hugo said, "*A day will come when all nations of this continent, without losing their distinctive features and their glorious individuality, will merge and form the European brotherhood. A day will come when there will be no more battlefields, others then the spiritual ones. A day will come when bullets and bombs will be replaced with votes.*" It took over a century for this utopist predictions to become reality.

The enlargement of the European Union, to 25 members - the historic step of May 1st 2004 - made a final reconciliation between history and geography, as suggested by a politician from a member state. Between 2007-2015, the EU should undergo a new enlargement: first were Romania and Bulgaria, countries accessing the European Union on January 1st 2007, and both shall be followed by Turkey and Croatia, after the latter countries will meet some of the criteria.

The enlarged EU belongs to a world in constant and quick-change process, reason for which a new stability is required. Europe is affected by the events form other continents, no matter whether it is the religious extremism of the Islamic world, the diseases form Africa, the totalitarian tendencies of Latin America, the increase of population in Asia or the global tendencies of industrial and professional reorientation. In these circumstances, Europe must focus not only on self-development, but also should/must be a part of the globalization process. Although some remarkable outcomes were obtained in commercial politics, EU has a long road ahead before it may be said that Europe has "only one voice" or that it is a powerful actor in world politics.

EU enlargement and, at the same time, free movement of labor force lead to substantial increases of migration flows. This phenomenon has effect on economic growth on long and short term.

*** PhD candidate, NICE, (e-mail: lvasile@gmail.com).

After the fall of communist regimes it was easy to notice a fast growth of work flows from Central and Eastern Europe to the West, especially for economic reasons. The new conditions allowed for workforce mobility to areas with high wages and low unemployment.

By the Amsterdam Treaty (1999) a political solution was found for continuing the progress towards the free movement area, including here The Schengen Agreement to the EU Treaty.

In "On a Community Immigration Policy" published by the European Commission in November 2000, the pressures were clearly identified about the changes which imposed the revision of immigration policies.

In this context, the specialized literature (Bauer and Zimmerman (1999), Borjas (1999b), Boeri and Brucker (2000), Fidrmuc (2002), Fidrmuc and Huber (2002), Drinkwater (2002), Kallai (2003), Hazans (2003), Huber (2003)), posed a set of questions:

- How is the mobility in the countries that joined EU15 and what kinds of geographic expansion can have mobility based on economic interest? ;
- What groups of population had the most increased mobility in the past?;
- How high can be the flows from East to West after joining the EU; which is the composition of this migration flows from the professional viewpoint?;
- What will be the effects of the post-joining migration on the labor market in the EU countries? After the new countries joined EU15, did the danger of unemployment in EU15 increase? The danger of "brains export" will increase or a labor crisis will appear in the new joined countries?

By over a decade ago, Layard and others (1992) predicted that a minimum of 3% of the Central and Eastern European countries' population will emigrate in the next 15 years after the enlargement. In 1999 Bauer and Zimmerman said that on long term, the migration rate would be 2-3% of the population of new joined countries. The expectations formed by Boeri and Brucker, in 2000, over the dimension of post-enlargement migration flows showed a number of 335000 people per year in the first stages of enlargement, dropping at 150000 in 2010. This will lead to an increase in the number of residents from Central and Eastern countries in EU15, from 850000 in 1998 to 2.9 mil around the year 2010, to 3.7 mil around 2020 and 3.9 in approximately 30 years as of the introduction of free movement. These values show that on long term, approximately 3% of Central and Eastern countries population will migrate. Each of these scenarios shows that migration can have a major impact on labor force markets in the newly joined countries but also for the EU15.

The evolution of migration flows in Central and Eastern Europe

The fall of communist regimes generated a growth of migration flows from the Central and Eastern countries to western countries, for economic reasons.

An important characteristic of Central and Eastern countries migration is the repatriation of ethnic minorities. The most important ethnic move was that of Germans from Poland, Hungary and of those from former Soviet areas to Germany.

The ethnic conflicts from various regions continue to be the source of migration for today and the near future. At the moment, most of Central and Eastern countries are regarded as stable and therefore asylum requests from this countries were rejected, a fact which meant a decrease of people migrating towards Western Europe, but which determined an increase of temporary migrations.

The Central and Eastern countries modified their national codes in order to allow to former citizens to return in their native country. The research shows that this type of migration takes place at regional level. The migration flows from Hungary, Kazakhstan, and Siberia to Poland; from the Baltic States to Russia; from Russia and Estonia to Finland, and all of them can be described as "ethnic return".

For the progressive development of an EU policy in the economic migration area, collaboration was initiated between EU organizations, member states, candidates' countries, and the civil society in order to ensure finding optimal solutions to manage migration flows taking place at EU level. As result of debates and based on the conclusions of the European Council from June

2003, the European Commission adopted, in January 2005, the Green Book regarding the administration of economic migration to EU. With this document a first step was made towards a unique legal framework at EU level in this area, starting from two new European constructions:

i) The union will develop a common immigration policy, having in mind the purpose of an efficient management of migration flows at every level;

ii) Defining a common immigration policy doesn't have to affect the right of the countries to determine the volume of entries on the workforce market of citizens from a third country.

In a first stage were identified the causes that impose a quicker approval, respectively a change, of policies promoted in this field of activity, among which:

a) The impact of demographic decline and ageing across the economy;

b) The significant demand of labor force in the EU (satisfying the national economy needs) and the impact of immigration on the entrepreneurs;

c) The creation of a legal framework for this phenomenon;

d) The necessity of a legal base for all rights and obligations for all the people working abroad;

e) Ensuring best practices for managing economic migration;

f) The realization of the necessary framework to implement the Lisbon strategy.

The next stage was substantiating the main principle about managing economic migration, in relationship with:

a) Drawing up legislation that settles some common definitions, criteria and procedures, by leaving up to the member states to answer the specific needs of their markets against setting up a quick set of common rules to allow migrants with some jobs and skills, in order to avoid competition between the member states in connection to recruiting some working categories;

b) The employment of workers from third party countries based upon the evidence that the vacant job was not taken by any worker from the internal workforce market against the employment based on quick procedure (the green card) in the case of workers with high levels of qualifications from a certain area or field were there is already a lack of workforce;

c) Choosing the national labor force market against EU labor force market;

d) Systems of admission based on existing vacant workplaces against flexible systems (green card) which allow to fill the demand on the national market on medium and long term – economic demands, the existence of a specific job – and also of a unique selection system at EU level (organizing some work fairs based on EURES services);

e) Procedures of hiring on its own, promoting some sectors of activity or establishing some accessing conditions;

f) Solving the request for work and living permit with one nation wide application which allows for combining the residency and work permits against the possibility of hand in one requests for work permits and residency in accordance with national rules;

g) Clarifying the legal situation of every migrating worker, ensuring the equality of treatment between them and the EU citizens right before obtaining the right to live and work against the clear difference of right in connection with the time duration of live and work;

h) Administrating the migration phenomenon on the integration segment or the return to the origin country by cooperation between the departure and destination country of migrating workers and also the cooperation with third party countries in order to ease the legal migration.

Regarding the free movement of workforce, EU requested all candidate countries, including Romania, a transition period of 2-7 years, after entering the Union, offering in exchange: *the member states will continue to apply the national measure for a 2 year period after joining regarding the right to work of citizens from the new member state.* This period of time can be extended with another 3 years – depending on previous evaluation – and yet with another 2 years in case of severe deviations on local market of the new member.

The EU political-social agenda bears in mind more favorable conditions for migrating workers, the European Commission talking about modifying the actual *transition periods* settled by the UE15 for the new members.

May 1st 2004, the moment when 10 new members from Central and Eastern Europe accessed EU, generated fears among the EU15, who saw a threat in a workforce exodus from these new countries. As a result, the member states announced restrictions on workforce migration from the new member states.

Since the EU enlargement, a rise was registered in connection with the numbers of *workers* from new countries into EU 15 member states. Nevertheless, despite the rise, the relative impact is quite limited if measured by the number of work permits issued in comparison with the population able to work from host countries. In the first quarter of 2005, the average population able to work from the New Member States in EU15 was low, only 0.1% in France and Netherlands, 1.4% in Austria and 2% in Ireland.

For Austria, Germany, Netherlands, Italy, and France the statistics show the fact that a significant percentage of work permits is given for short periods of time (6 month – 1 year).

The restrictive measures lead to reactions from the New Member States, which see one of their fundamental rights affected, one that came by joining the union. The New Member States aimed for complete and immediate opening of movement for workforce into EU, but a step by step mechanism was established. The member states attempted to establish bilateral relations in order to obtain advantages over this mechanism.

Romania is interested in continuing the bilateral agreements regarding the movement of workforce. Imposing a transition period to the New Member States could be an extra barrier for EU investors who desire to come to Romania. The EU enlargement will probably lead, at least in the first years after the accession, to an increase of active population looking for a workplace in more developed countries. It should be expected that the status of EU member will generate a migration flow from undeveloped countries to our country and not only. The experience of all the countries that accessed the EU in 2004 and 2007, showed that there were high values of migrating workers from Eastern Europe.

Socio-political impact of migration

Mobility/ people movement and especially of workforce movement can influence in different ways the quality of the human capital of the origin country/region, but also of the destination country.

Measuring the socio-political impact of migration in the country of origin and in the host country is a complex process which implies knowing both the costs and benefits at individual, local, national and international level for migration and to analyze the world conjuncture in which this process takes place.

For the origin country, "*the negative effect of migration/movement phenomenon"* has different dimensions and structures according to age, sex, and professional level:

i) loss of investments made in education and training for migration and emigration;

ii) losing state contributions by taxes that these categories must pay;

iii) a decrease of highly trained personnel and as result the increase of medium and low trained personal, which is not conducive to creating a strong base for a country's growth.

Regarding the *"positive effects*" of migration over the origin country, these could be:

a) reducing the unemployment rate and decreasing the pressure on work force market and social spending from the budget;

b) money transfers of migrations. These became an external source for financing the budget - it's a known fact that money or goods transfers of migrants shipped through various ways into origin countries can have various implications on the evolution of the host country. Many studies show that money transfers are used in the origin country for households' spending, for new houses

constructions and consumption. These transfers have an impact both at the micro level - households – and the macroeconomic one, affecting the macroeconomic management, workforce involvement, education and health, income distribution etc.

c) creating connections between Diasporas and the origin country. Communities outside the origin country can represent an important source and facilitating factor for research and innovation, for technology transfer and growth. To involve the diasporas in the economic growth of origin countries can be achieved by some agreements in order to allow for technology, new knowledge and know-how transfer between firms owned or managed by the diasporas in host countries and firms from the origin countries, by direct investments, the creation of scientific or professional exchanges to disseminate new research results from host countries to the origin countries, mainly through a definitive return of workers in the origin countries, etc.

The movement between the new member states and EU15 can have positive effects on the workforce market by replacement with workforce from other areas. Hence, new workplaces can be created, for instance, in constructions, in the cleaning services' sector, in catering, which otherwise could be left vacant. Highly trained workers form the New Member States can contribute to generate business and economic growth on long term, through the accumulation of human capital.

For Member States statistical and significant information is available for the main indicator - employment rate. This indicator shows the fact that citizens' form New Member States tend to have the same employment rate as the citizens of the respective country. Sometimes, these are higher than those of the respective country's citizens (in Ireland, the citizens from EU10 have a higher employment rate then the locals). So, we can say that the citizens of New Member States have an important contribution in each Member State at improving the performance on the workforce market, at the sustained economic growth and the structure of public finances.

After the EU enlargement, the employment rate of the New Member States in the EU15 grew, in certain cases, even substantially, a fact explained by:

- the EU enlargement contributed to bringing to surface a part of the black economy, made by undeclared work by workers from new members. This means, also, intensifying the movement of workforce **within the EU**, because EU enlargement can be, in reality, smaller than the data shows;
- after EU enlargement a real improvement took place for the citizens of new member countries, due to employers and their attitudes, to more opportunities for private business, a better information system and settlement.

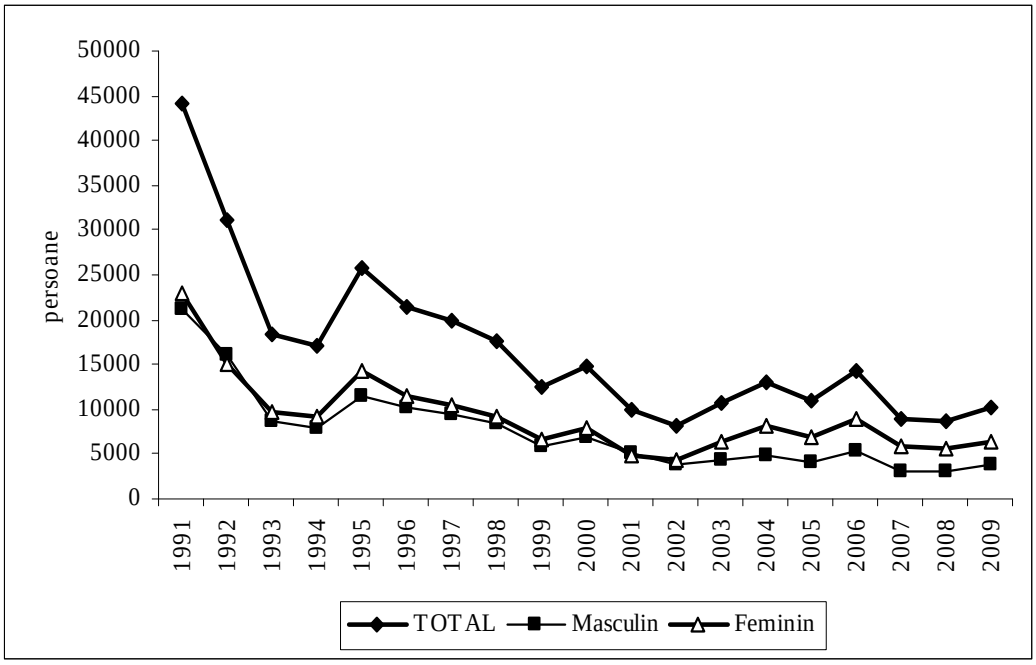
For **Romania**, the evolution of employment in different activities was conflicting, because a lot of work resources were directed to sectors with little efficiency – agriculture and industry. The most important issues regarding the workforce structure in Romania compared to EU15 or EU25 are: i) the high yet slightly decreasing employment of the population in agriculture starting with the year 2000; ii) the high but nevertheless slightly decreasing employment of the population in services, including here for agriculture (approximately half of the ones employed in this sector at EU level); iii) the decrease of population employed in industry, but still above the EU average 18.1% iv) weak movement of workforce form agriculture and industry towards the services' sector.

In Romania, the "low workforce cost" influences the position of intensive activities in their use of this production factor. The low level of high-tech within the Romanian economy leads to low work productivity for all new members, which affects some of the advantages of low wages.

The analysis of statistical data regarding the population migration from Romania shows a difficult situation. If at the beginning of 1990 the Romanian population was of 23 mil people, in the last 20 years the number dropped dramatically. The most recent statistical data shows that the number of Romanians has decreased to 21.47 millions by July 1st 2009. Between the years 2002-2009, according to NIS (Statistical Yearbook of Romanian 2010), the Romanian population dropped by approximately 211015 persons.

After the migration flow boom from 1990 the number of emigrants dropped bit by bit until it became insignificant (14197 persons in 2006 – 3 time less then 1991 – then the trend became descendant again, in 2007, 8830 persons, and ascendant until 2009- 10211 persons (figure 1)).

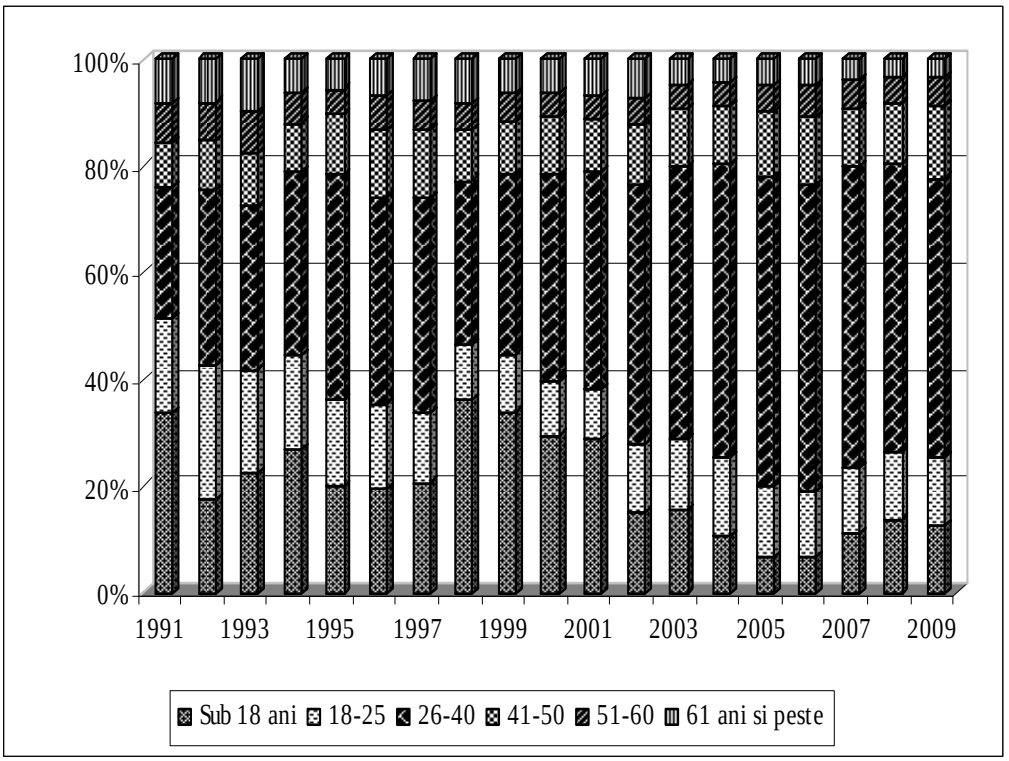
Figure 1 *The evolution of emigrants' number according to sex*



Data source: *Romanian Statistical Yearbook*, 1997-2010, (NIS)

Most of the persons that emigrated are from the able to work category, mostly young and young families, and migrations in this period had and continue to have economic motivation (figure 2).

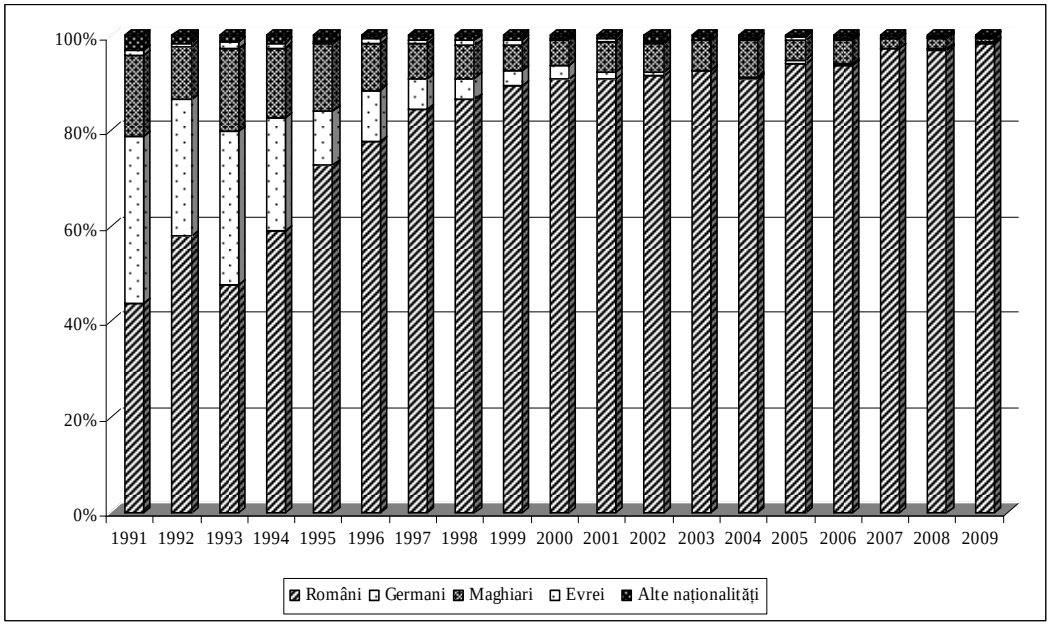
Figure 2 *The evolution of emigrants' number according to age*



Data source: *Romanian Statistical Yearbook*, 1997-20099, (NIS)

Also the numbers of ethnic minorities who left the county are significant for this period (Germans 13.5%, of which 0.015% in 2009 and Hungarians 9.8% of which 1.0% in 2009), figure 3.

Figure 3 *The evolution of emigrants' number according to nationality*



Data source: *Romanian Statistical Yearbook*, 1997-20099, (NIS)

According to WIO, a characteristic of Romanians is the fact that they have, on short term, a high tendency to travel in order to find a work place. Also the Romanians have the highest tendency to migrate for medium and long periods of time (a few years) compared to the other countries from Central and Eastern Europe. But this fact has repercussions for some national economy sectors, in which the lack of workforce is felt. For instance, in constructions, one of the most affected sectors because of work migration, the lack of trained personal, like carpenters, reinforced steel-concrete workers is worrisome; the data from NIS show that the value of constructions increases year by year, and an important part is held by new constructions. These figures prove the construction rate but also the demand for a specific workforce. Around 200,000 Romanian construction workers found a comfortable workplace in Spain and Italy, paid with 800-1000 euro, several times more than in Romania. For instance, in 2006 the number of persons working abroad, with legal forms, was above 2 mil, or more than half of workforce still in Romania – around 4.5 mil persons. This number is bigger if you add the workers without legal forms, in numbers of over 1 mil. Out of these 30% are working in constructions and forestry and 40% in textiles and confections.

Joining the EU implied for Romania the elimination of most commercial barriers, but also direct foreign investments and other forms of capital movement. Because free movement of workers is one of the four fundamental freedoms (movement of goods, services, capital and work force) stipulated in legal EU documents, joining the EU has as outcome a fundamental change of the migration regime for Romanian citizens to EU Members States (freedom of work, right of residence, equal treatment).

The analysis of *migration flows' effects from Romanian in the context of EU enlargement* means acquiring all economic dimensions of an EU member and that should be done by gaining the general equilibrium which contains the freedom of commercial, workforce, and capital flows.

In the context of enlargement the migration from Romania represents a sensitive subject, as it is, next to commercial and capital flows one of the most important mechanisms of European integration.

Migration/emigration from Romania will have effects on the national economy on short, medium and long term:

► on *short and medium term*, the emigration will affect:

i) the availability of workforce and thus will influence the wedges/wages? and employment;

ii) the workforce market through the modification of distribution at regional and sector level of workforce and the relativity of production distribution,

iii) money transfers of Romanian migrants in the country will influence the emigration regions,

iv) the decrease of financial contributions because of the decreasing number of persons from the respective community and the existence of some effects at public transfer level,

v) possible modification in the population structure and the alteration of the exchange terms because of workforce availability in Romania.

► on *long term* the emigration effects on the Romanian economy are hard to anticipate: from the neo-classic point of view, the migration can be considered just as an instrument which contributes to the convergence of integrated economies. On the other hand, migration can be regarded as a phenomenon which leads to an increase in development and growth between countries, in the way that the less developed location will lose numerous production factors.

If EU countries will continue to attract human capital from Romania, then their economy will evolve faster than the Romanian economy and the latter will be left behind. As a conclusion, on long term, the EU and Romania's economic growth will have different configuration.

The economic growth of Romania in the post-integration stage and the title of "EU member" will be influenced by migration flows through exits of human capital because the highly trained are the ones leaving (*brain migration*), and the backwards financial flows associated with migration, that is the amounts sent in Romania by the emigrants.

Regarding the *brain migration*, the analysis, conducted on the basis of data from the European Inquiry on Labor Force and Eurostat, indicates the existence of this phenomenon, but at a small level – less then 0.6%. Under the conditions of Romania's accession to the EU and of free movement, it is possible that the dimension of migration flows shall increase. Taking into account the paper of Robert E. Luca (1998), where education is considered as a determinant factor of economic growth on long run, the emigration of highly skilled persons – brain migration – has a negative impact on the origin country.

In the post-accession period it should be expected that the number of people working abroad will increase, provided that EU states shall promote an openness policy. Most member countries have promoted or would promote, probably, a selective policy, favorable to two categories of labor force: specialists/experts, with high qualifications and workers who would accept uncomely jobs, already refused by the local labor force.

Under the conditions of brain migration, it is not excluded that the professional level of the local labor force shall become inferior to the expected ones. This situation might trigger the diminishment of the creative and productive potential at national level. Thus, the Romanian capacity to overcome productivity, competitiveness and income lags against EU countries is subjected to negative influences. The external labor migration has a positive effect on the destination country, both directly (through the contribution of foreign workers) and indirectly (through the income taxes paid to host country). Also, this is one of the underlying reasons that determine a decrease of national production in the origin country. In the paper of Van der Putten (2002) it is shown that, in the context of Romania's accession to the European structures, the production decrease might by higher than 3%.

ABSORPTION OF EUROPEAN FUNDS, PRIORITY OBJECTIVE FOR LOCAL COMMUNITIES DEVELOPMENT

CONSTANTIN BRĂGARU*

Abstract
This paper analyzes the absorption capacity of structural funds in Romania in the programming period 2007-2013 and its impact on the development of local communities from the administrative point of view.
The paper also focuses on the need to invest in institutional capacity and efficiency of public administrations using the Operational Programme for Administrative Capacity Development 2007-2013 which is a part of ESF funds that have as general objective to contribute to the creation of a more efficient and effective public administration for the socio-economic benefit of local communities.
Finally, the study reveals the problems and challenges related to local administration and its limited capacity to absorb european funds wich is a sensitive issue, especially because 2011 represents the fifth year of EU assistance for Romania to reach the stage of development of other member states.

***Keywords**: Structural funds, absorption capacity, central and local authorities, local communities, local development.*

Introduction

The present paper begins with a few conceptual definitions of the notions of absorption capacity, absorption rate, administrative absorption capacity, financial absorption capacity. The next section presents the absorption capacity of Romanian central and local authorities and the main obstacles that affect the absorption processes and the local development. Chapter three focuses on the most important financial tool of EU dedicated to a major national priority "Building Effective Administrative Capacity" namely The Operational Programme for Administrative Capacity Development 2007-2013. Chapter four presents the conclusions on the actual stage of local administration capacity to implement integrated projects regarding the development of local communities and the next priority objectives that must be achieved in the next 3 years of EU financial assistance.

1. Conceptual definitions

At the beginning it is necessary to give a few conceptual definitions.

Absorption capacity expresses the degree to which a country is able to spend effectively and efficiently, the financial resources allocated through the Structural Funds. Achieving this objective depends on the one hand, on the ability of the institutional system established by that State to administer the funds in question, and on the other hand, on the beneficiaries potential to whom they are addressed, to create projects and to co-finance[1].

The ***absorption rate*** illustrates the absorption capacity and is defined as "the level of spending as a percentage of the total amount of Structural Funds available". Achieving an absorption rate of 100% or close to this level means that all funds that have been allocated to a country have been fully spent[2].

Administrative absorption capacity refers to the ability of central and local authorities to prepare plans, projects and programs in a timely manner, to organize an effective partnership, to meet the administrative obligations, to finance and supervise the implementation process, avoiding irregularities[3].

Financial absorption capacity expresses the ability of central and local authorities to co-finance EU supported programs and projects, to plan and guarantee these national contributions in multi annual budgets, and to collect these contributions from several partners, interested in a program or project[4].

2. The absorption capacity of Romanian central and local authorities

As we said before, the administrative capacity defines the ability and qualifications of central and local authorities to prepare programs and projects, to ensure coordination of partners involved, to monitory the implementation of programs and projects in order to avoid irregularities.

Seeing the last statistics regarding the stage of absorption of structural funds, we may conclude that the absorption rate is low . So, according to statistics from february 2011, Romania succeded in achieving the 9,87% from the total allocation of structural funds for 2007-2013 period.

That brings us to the conclusion that for the next 3 years of EU assistance, our public authorities ,central and local ones, must act as a responsible adminstration in order to receive the proper financial support for its actions regarding the development of local comunities .

Taking into account the importance of the above mentioned terms and the purpose of the paper which is, among other things, to analyze the main problems that affect the absorption capacity of central and local public authorities, we have to present the main obstacles affecting the absorption processes in the local communities, such as:

- lack of experience and qualifications for central and local authorities ;
- limited local budgets for public co-financing available;
- lack of funds for the initiation and completion of feasibility studies in order to access projects;
- lack of banking products for covering the private co-financing necessary for the projects budgets;
- lack of partnerships at different levels formed for financial support (public-private partnership)

It is important to note that the problems of absorption capacity depend heavily on institutional factors mostly on the administrative capacity. So, for the next period of time, in order to create an effective and efficient public administration, capable to prepare and implement good projects that can achieve the great objective, "*local development*", the central and local authorities must use one of the most important financing tool of the European Union: The Operational Programme for Administrative Capacity Development 2007-2013.

3. The Operational Programme for Administrative Capacity Development 2007-2013[5]

The initial problem analysis for the OP ACD was based on the next assessments:

- the level of public trust in public administration; the level of public trust is low and caused by: the extent and burden of regulation on the citizen, the poor timeliness in delivery of the public services, a poor motivation of civil servants, and its underlying causes in low levels of remuneration

[5] *Operational Programme* ***Administrative Capacity Development*** **2007-2013,** Ministry of Interior and Administrative Reform, September 2007.

and an unreformed civil service, the large number of laws and the need for their frequent modification;

- the problems related to reliability were grouped under three headings: political administrative, decision making, accountability and organizational effectiveness. These problems are common to both central and local levels of administration;

- the poor responsiveness of public services to the needs of citizens. This issue was used to group problems that directly affect the provision of services, including resource allocation, the need for greater attention to quality, the opportunities for process change.

In this context, The Operational Programme for Administrative Capacity Development is designed to substantially contribute to the achievement of the thematic priority "Building Effective Administrative Capacity", established in the National Strategic Reference Framework (NSRF).

Public institutions can contribute to local socio-economic development programmes through the performance of the following functions:

- improving decision making processes, including the quality of major investment choices (knowledge and human resources) and project selection (information, regulation and feed-back mechanism);
- ensuring a better implementation and enforcement of legislation;
- improving the regulation mechanism especially through setting up a standardized model for quantifying the compliance costs imposed by issued regulation;
- ensuring adequate framework for economic activities (human resources, data, legal);
- improving the public decision making processes;
- ensuring quality and efficiency in public service delivery;
- increasing the number of civil servants who hold professional qualification in HRM, finance, economics and law.

The situation analysis identified three priority sectors for support - health, education and social assistance. The basic idea is that the funds spent in these priority areas will seek to ensure that Romania has a sufficient, adequately trained, well managed work force, in good health so as to be able to develop the economy on competitiveness terms.

The OP ACD recognizes four guiding principles:

1. Participation: the OP ACD seeks to reach a higher level of trust from citizens through the impact on the functioning of institutions, improved responsiveness to public needs and thus significantly positive effects on socio-economic development.

2. Rationalization of structures: the OP ACD is expected to create new structures, to modify the existing ones, to change the relationship between central and local administration, leading to a more responsive and empowered local administration to meet the needs of citizens and to generate local development.

3. Efficiency: the OP ACD seeks a real and substantial improvement in the efficient delivery of decentralized public services at local level - a fall in consumption of resources and a qualitative and quantitative increase in output without a comparative increase in resources.

4. Sustainability: the OP ACD seeks sustainable improvement in the supported fields. This is why the interventions are based on an appropriate combination of structural, process and capacity development change.

The general objective of the OP ACD is *to contribute to the creation of a more efficient and effective public administration for the socio-economic benefit of Romanian society.*

There are also two specific objectives:

1: To achieve structural and process improvements of the public policy management cycle.

2: To improve the quality and efficiency of the delivery of public services on a decentralized basis.

The OP ACD is implemented through three Priority Axes, including a Technical Assistance Priority Axis as listed below:

Priority Axis 1: Structural and process improvements of the public policy management cycle;

Priority Axis 2: Improved quality and efficiency of the delivery of public services on a decentralized basis;

Priority Axis 3: Technical Assistance.

The first two Priority Axes complement each other, but there are relevant differences between them:

The Priority Axis 1 deals mainly with conceptual, horizontal issues in the areas of decision making system, aiming at increasing the quality of decisions within public administration by developing mechanisms for substantiating policy initiatives, increasing the effectiveness of organizational structures through better planning, and strengthening the accountability framework. Activities under Priority Axis 1 concern the system for all central and local administration, including the priority sectors (Health, Education, Social assistance, Training programs for civil servants) ;

The focus of **Priority Axis 2** is on mechanisms for the implementation of policy and the delivery of public services through fiscal and administrative decentralization from central to local administration and targeted improvements in quality, timeliness and assessment of public services.

Both Priority Axes have elements of structural and process change and involve substantial investment in training for civil servants and contractual staff.

This approach of differentiating between quality of service delivery in a decentralized way and strengthening decision making system is considered as sound basis for the development of administrative capacity.

Priority Axes 1 and 2 are supported by five key areas of intervention. These are strategic responses to the problems identified. Figure 1 will show the diagram of the overall OP objective the priority axes and key areas of intervention.

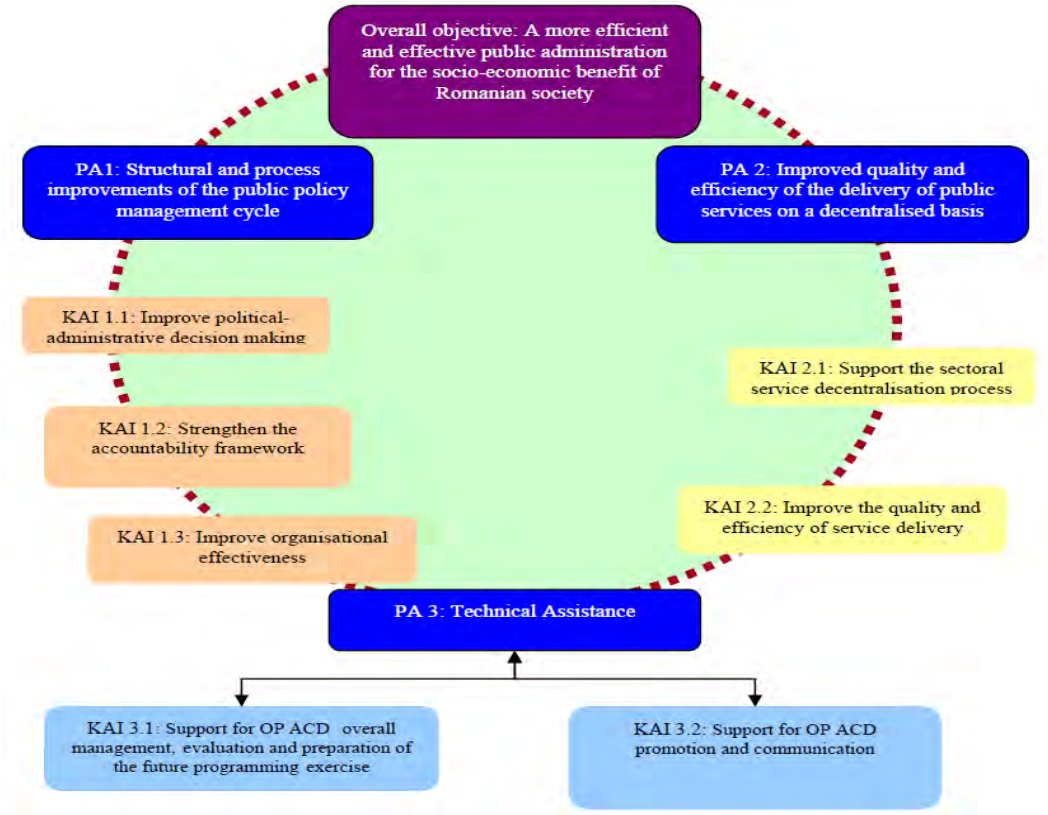

Figure 1. ***Priority Axes (PA) and Key Areas of Intervention (KAI)***

Numerous European documents, such as The Community Strategic Guidelines for Cohesion, The Lisbon Strategy , The European Commission Reports present improvement recomandations for the efficiency of local public administration and point out the need to invest in the institutional capacity of local administration in order to deal with a set of socio-economical challenges and good government, especially regarding the local development management.

Accessing OP ACD, the public administration has the opportunity to develop their capacity as good managers of their own resources and to strengthen the ability of a better representation of their communities, building strong partnerships, implementing and monitoring local policies and well based strategies for socio - economic development.

4. Conclusions

Most of the factors causing a lower absorption capacity of Romanian local and central administration, as potential beneficiaries of EU funds, can be summarized in the following lines:

- Low level of expertise and low qualifications regarding the accession and management of European funded projects;

- Low reaction regarding the process of elaboration, proposing for financing or evaluation and contracting of projects;
- Low financial and management capacity;

Since these are the main causes that threaten the successful absorption of EU funds great measures should be taken both at the level of Programme Management Authorities and at the level of the beneficiaries.

Taking into account the low absorption of EU funds, the Romanian Government had to compile a long term planning of contracting targets, terms of payments and expenditure declarations wich was presented to European Commision in order to avoid the risk of withdrawal of financial support starting with 31th of December 2011.

The action planning sent to the EC identified the same problems and obstacles as we have presented in this paper.

In order to solve these problems the Romanian Government settled semester targets regarding contracting payments and expenditure declarations for each Operation Programme.

Besides the planning mentioned before and in order to overcome the absorption problems we may also mention a few purposes to fulfil[6]:

- Regional development by creating the conditions necessary to stimulate economic growth

of less developed regions, the promotion of sustainable economic and social development. There is requirement of necessary investments in infrastructure, transport, energy, social investment (health, education), environment, tourism investments. In fulfilling of these objectives, there is ROP (Regional Operational Programme) with any destinations on the priority axes. Government must find solutions to ensure the level of public co-financing and to create conditions to attract private capital investment.

- Romania has the opportunity to decide the rate of funding per project taking into account

the balance of the all operational program in question; therefore, authorities should decide the extent of supporting projects, at 100% of Community assistance, to be taken on the sectors which have real value added in the process of economic development, or in the sectors where the potential beneficiaries have difficulty in providing their share of co financing.

- Given the difficulties of local governments to ensure necessary co-financing resources, the easiness for local governments access to financing, by taking the measure to increase the debt ceiling, would mean a concrete granted support for them, conditional on the existence of guarantees property insurance; these measure should be taken with caution, so as not to reach the situation where the government is obliged to support the effort for repayment of loans.

As a conclusion of all the aspects addressed in this paper, one may say that the financial support of EU funds is a great opportunity for central and local administration in order to develop the communities from social and economic point of view. The local public administration authorities are the main actors of local development. They are responsable for ensuring the possibility of developing the local communities in the observance of European standards.

LOCAL COMMUNITIES AND THE PROCESS OF LOCAL ECONOMIC DEVELOPMENT

CONSTANTIN BRĂGARU*

Abstract
The present paper focuses on sustainable development and the specific objectives that Romania intends to achieve in order to reach a new model of development that is capable of generating high value added, is interested in knowledge and innovation, and aims to improve the quality of life in harmony with the natural environment.
The paper also analyzes the process of local development that Romania started in 2000 with the financial support of United Nations Development Programme - "Romania within the framework of Local Agenda 21" and continued within Regional Operational Programme 2007-2013.
Finally, the study reveals the regional and local development priorities established by Romania within "The National Sustainable Development Strategy" for the next period of time – 2013-2020 -2030.

Keywords: *local communities, environment, sustainable development, European Union, Local Agenda 21, Regional Operational Programme*

Introduction

The study is structured in five chapters. The first one defines the sustainable development and presents the 2006 EU sustainable development strategy with its key objectives and guiding principles. The second chapter presents the Local Agenda 21 with its contribution to strengthening the capacity of local administrations (in the regions and localities taking part in the programme) to draft and implement concrete policies and plans aimed at promoting sustainable socio-economic development. The third chapter contains a short description of European Structural Funds for regional and local development and few detailed information on the physical and financial progress of Regional Operational Programme (ROP) implementation in our country. The fourth chapter is dedicated to regional and local development objectives for 2013, 2020, 2030 and actions to be taken in accordance with the strategic guidelines of the European Union. The paper ends with some conclusions mentioned in the fifth chapter.

1. Sustainable development. Definition. The EU Strategy for Sustainable Development (SDS)

Sustainable development has been defined in many ways, but the most frequently quoted definition is from *Our Common Future*, also known as the Brundtland Report[1]:

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts:

- *the concept of **needs**, in particular the essential needs of the world's poor, to which overriding priority should be given; and*
- *the idea of **limitations** imposed by the state of technology and social organization on the environment's ability to meet present and future needs."*

* Lecturer , PhD. , "Nicolae Titulescu" University, Bucharest, (e-mail: costin_bragaru@yahoo.com).

[1] World Commission on Environment and Development (WCED). *Our common future.* Oxford: Oxford University Press, 1987 p. 43.

As the concept of sustainable development is defined we may analyze the European Union Strategy for Sustainable Development.

The Sustainable Development Strategy of the European Union (EU SDS), as renewed in 2006, is a framework for a long-term vision of sustainability in which economic growth, social cohesion and environmental protection go hand in hand and are mutually supporting[2].

The renewed strategy sets out a single, coherent approach on how the EU will more effectively live up to its long-standing commitment to meet the challenges of sustainable development. The overall aim of the renewed EU SDS in to achieve continuous improvement of the quality of life and well-being on earth for present and future generations, through the creation of sustainable communities able to manage and use resources efficiently and to tap the ecological and social innovation potential of the economy, ensuring prosperity, environmental protection and social cohesion[3].

The document sets out key objectives and guiding principles to be achieved in the future:

1. Key objectives:

- Environmental protection,
- Social equity and cohesion,
- Economic prosperity,
- Meeting our international responsibilities.

2. Policy guiding principles:

- Promotion and protection of fundamental rights,
- Solidarity within and between generations,
- Open and democratic society,
- Involvement of citizens,
- Involvement of business and social partners,
- Policy coherence and governance,
- Policy integration,
- Use best available knowledge,
- Precautionary principle,
- Make polluters pay.

These principles correspond to the new European model of development and of course to the new model of society based on a stronger economy, a cleaner environment, a better education and health care and social protection.

Every two years the European Sustainable Development Strategy is being put to the test. With its monitoring report, the European Statistical Office Eurostat presents EU data on the development of the sustainability indicators. So, on 24th of July 2009, the Commission of the European Communities presented the 2009 Review of the European Union Strategy for Sustainable Development regarding the policy progress on the EU's sustainable development strategy. This report provides a relative assessment of whether the EU is moving in the right direction. The approach is essentially quantitative, focusing on the EU SDIs (Sustainable Development Indicators) as of October 2008.

[3] Council of the European Union, *Review of the EU sustainable development strategy*, , document 10117/06 of 9 June 2006.

Here we have indicators [4]:

SDI Indicators	Headline indicator	EU-27 evaluation of change
Socioeconomic development	Growth of Gross domestic product (GDP) per capita	clearly favourable change/on target path
Climate change and energy	Greenhouse gas emissions*	moderately unfavourable change/far from target path
	Consumption of renewables	moderately unfavourable change/far from target path
Sustainable transport	Energy consumption of transport relative to GDP	no or moderately favourable change/close to target path
Sustainable consumption and production	Resource productivity	clearly favourable change/on target path
Natural resources	Abundance of common birds**	no or moderately favourable change/close to target path
	Conservation of fish stocks***	clearly unfavourable change/moving away from target path
Public health	Healthy life years****	no or moderately favourable change/close to target path
Social inclusion	Risk of poverty****	no or moderately favourable change/close to target path
Demographic changes	Employment rate of older workers	no or moderately favourable change/close to target path
Global partnership	Official development assistance*****	clearly unfavourable change/moving away from target path
Good governance	*[No headline indicator]*	-

LEGEND:

** EU-15; ** Based on 19 Member States; ***In North East Atlantic; **** EU-25, from 2005; ***** from 2005*

The indicators presented in this report show a rather mixed picture. Policy areas where there have been favourable developments include sustainable consumption and production, in particular as regards production patterns, and global partnership. Overall, and with the exception of the headline indicators related to 'climate change and energy', little progress seems to have been made since the 2007 Monitoring Report, confirming that more efforts are necessary in the European Union to get on the pathway to sustainable development[5].

At EU level, sustainable development is primarily promoted and monitored in the context of individual EU policies, and the EU SDS itself plays a central role in promoting the overall objective of sustainable development. The EU SDS has also been instrumental in developing sustainable development strategies at national and regional levels. Today, almost all EU Member States have their own national sustainable development strategies (NSDS) in place, in line with international recommendations of best practice[6].

Romanian SDS coordinators provide a link between the EU SDS and NSDS (National Sustainable Development Strategy Romania).

[5] Idem 5.

[6] Idem 3.

Before the presentation of Romanian NSDS and its development objectives established for 2013-2020-2030, we must analyze the progress that our country succeeded in regional and local development within Local Agenda 21.

2. Implementing Local Agenda 21 in Romanian local communities

Local Agenda 21 (LA 21) was established in 1992 at the United Nations Conference on Environment and Development, also known as the Rio Earth Summit, as the blueprint for sustainability. The nations that have pledged to take part in Agenda 21 are monitored by the International Commission on Sustainable Development and are encouraged to promote Agenda 21 at the local and regional levels within their own countries. Agenda 21 addresses the development of societies and economies by focusing on the conservation and preservation of environment and natural resources.

At the Rio Earth Summit, the United Nations agreed that the best starting point for the achievement of sustainable development was at the local level. In fact, two-thirds of the 2,500 action items of Agenda 21 relate to local councils. Each local authority has to draw up its own Local Agenda 21 (LA 21) strategy following discussions with its citizens about what they think is important for the area.

Agenda 21 focuses on:

- **social and environmental problems**, including air, water and soil pollution, deforestation, biodiversity loss, health, population trends, poverty, energy consumption, waste production, and transport issues

- **sustainable development as a community issue**, involving all sections of society, community groups, businesses, and ethnic minorities.

Since the Earth Summit in Rio, successful LA21 campaigns have taken place in Bolivia, China, Sweden, United Kingdom, Turkey and Bulgaria to name a few countries committed to this concept. Romania is also regarded as a success story in the implementation of Local Agenda 21.

In Romania LA 21 was implemented in five phases till now:

1.Pilot phase – 2000-2003
2.Second phase – 2003-2004
3.Third phase – 2004-2005
4.Forth phase – 2005-2006
5.Fifth phase – 2006- 2008

It is very important to analyze the benefits of local development achieved due to the implementation of LA 21.

The pilot phase started with 9 locations (Baia Mare, Oradea, Iasi, Targu Mures, Galati, Ploiesti, Giurgiu, Ramnicu Valcea, and Miercurea Ciuc), which completed their Local Plans for Sustainable Development. One of the main goals achieved in the pilot phase was the establishment of a methodology, according to which the Local Agendas were drafted in all of the participating cities.

In the second phase, the project expanded to 13 locations, in which the local authorities agreed to draft their Local Action Plans for Sustainable Development, namely Falticeni, Vatra Dornei, Arad, Sighisoara, Medias, Sibiu, Campina, Targu Jiu, Targoviste, Pitesti, Slatina, Bolintin Vale, and Zimnicea and the third phase continued in 3 cities and 1 county**,** covering the Municipalities of Brasov, Borsec, Bistrita, and the Mures County that also prepared their Local Plans for Sustainable Development. The main innovation in that phase was the further expansion of the project to county level through cooperation with the Mureş County Prefecture.

Furthermore, the National Centre for Sustainable Development[7] added a new dimension to the project, in 2005, through its partnership with the Canadian International Development Agency (CIDA) for the purpose of introducing the Integrated Environmental Assessment (IEA) practice in Romania. The main achievements of that initiative consisted in:

- Building NCSD's capacity to provide expert advice and evaluate the environmental impact and sustainability of government and NGO programmes as well as private sector; projects.
- The beginning of IEA training provided by NCSD to 19 local NGOs and institutions.
- Enhanced cooperation with the private sector by carrying out an IEA training course for the ROMAQUA GRUP S.A. (Mineral water Company) in Borsec and other 10 private companies.

The goal of the fourth phase was to continue strengthening the institutional capacity and raise the awareness of the authorities and the public regarding the implementation of the principles of sustainable development in the local and county development strategies and action plans in another 3 cities and 1 county, namely Constanta, Medgidia, Gura Humorului, and Brasov County**.** It is important to emphasize the support rendered by UNDP and NCSD to the local authorities for the preparation of the relevant documents for the concession of the water supply/waste water treatment system in the city of Medgidia.

For the purpose of developing the institutional capacity of the selected local authorities, LA21 offices were established in each location. The participative mechanisms at the local level was accomplished by informing the local civil society about the project and organizing public debates that made it possible to finalize the three essential documents for the implementation of the LA21: the local strategy for sustainable development, the local action plan, and the portfolio of priority projects.

Continuing the established procedures for the introduction of the principles of sustainable development in the work of local municipalities, in the fifth phase, LA21 project was expanded to other 4 cities (Alba Iulia, Tulcea, Ovidiu and Babadag.), 3 counties (Alba Iulia, Neamt and Tulcea), the 2nd District of Bucharest and 2 communes in Romania (Falciu -Vaslui county and Mihail Kogalniceanu -Constanta county). The Local Strategy for Sustainable Development, the Local Action Plan and the Portfolio of priority projects were finalized in all above communities.

During the years 2009-2010, the National Centre for Sustainable Development offered consultancy to local administrations that were engaged in the implementation Local Agenda 21. The aim was to help strat the actual realisation of the priority projects that had been identified as eligible for public-private partnerships.

Localities and topics:

- Mures County Council – construction of an airport;
- Ovidiu – rehabilitation of water supply and sewerage system;
- Falciu - construction of sewerage system; rehabilitation of educational infrastructure;
- Babadag – rehabilitation of the city park; wind energy system[8].

After Romania's accession to the EU, the projects developed under LA21 became eligible for financing from the Structural Funds.

[7] The National Centre for Sustainable Development (NCSD) was established in 1997 under the aegis of the Romanian Academy. It is an independent non-governmental organization and a leading national consultant on sustainable development issues. The mandate of the NCSD is to identify the priorities for sustainable development in Romania and to address them through specific projects at national and local levels, to promote capacity building with a particular emphasis on human resources and to facilitate meaningful debates on the principles and practice of sustainable development in line with Romania's commitments as a member state of the European Union.

[8] Idem 8.

3. European Structural Funds for regional and local development. Regional Operational Programme (ROP)

Despite heavy technical assistance delivered in the past decade, local governments still lack capacity in strategic participatory planning at the local and county government level. Since presenting well- defined projects that respond to the needs of the communities is a fundamental criteria for success, this situation directly affects the ability of local governments to access structural funds. Two possible causes for this situation are:

- Insufficient and untargeted training that would support personnel in accessing and absorbing structural funds.
- An organizational culture that is unsupportive to various post-accession challenges at local and regional government level[9].

Further on we will analyze the ROP because, unlike the other operational programmes :

- It has a clear local dimension in addressing socio-economic problems from the local point of view and capitalizes on local resources and opportunities;
- It privileges Regions relatively lagging behind and less developed areas in ensuring them the existence of a minimum set of preconditions for growth but does not have redistributive purposes per se;
- ROP key areas of intervention are complementary to those of the other OPs and expected to operate in synergy with these;
- It fosters a bottom up approach to economic development;
- It takes into consideration the underdeveloped stage of local programming in the Country by envisaging broadly common-to-all thematic priority axes at the National level, namely:

Priority axis 1: Support to sustainable development of urban growth poles
Priority axis 2: Improvement of regional and local transport infrastructure
Priority axis 3: Improvement of social infrastructure
Priority axis 4: Strengthening the regional and local business environment
Priority axis 5: Sustainable development and promotion of tourism
Priority axis 6: Technical assistance [10]

So, according to the Authority for Coordination of Structural Instruments statistics regarding the contracted projects financed under operational programmes , at the end of December 2010, the rate absorption of structural funds was low. The most accessed programme is The Regional Operation Programme with a percentage of 29,79%, followed by the Operational Programme for Human Resources Development with 27,03% and Sectoral Operational Programme Increase of Economic Competitiveness with 18,58%.

Because The Ministry of Development, Public Works and Housing didn't publish yet the 2010 Annual Implementation Report we may take a look over the 2009 report in order to see how were completed all priority axes and major fields of intervention of the ROP[11].

After the presentation of Romania's achievements on regional and local development it is necessary to take a look over the main objectives and key priorities for the next period of time established within The National Sustainable Development Strategy - Romania 2013-2020-2030.

4. The National Sustainable Development Strategy - Romania 2013-2020-2030

Romania established the actions to be taken and the objectives for 2013, 2020 and 2030 in accordance with the Strategic guidelines of the European Union.

The key challenges[12] for aims at:

Climate change and clean energy

Overall Objective of the EU SDS: To limit climate change and its costs and negative effects to society and the environment

Horizon 2013. National Objective: To meet the short and medium-term energy demand and to create the prerequisites for national energy security in the long run, responding to the requirements of a modern market economy for safety and competitiveness; to fulfil the obligations under the Kyoto Protocol regarding the reduction by 8% of greenhouse gases emissions; to promote and implement measures for adjustment to the effects of climate change and to observe the principles of sustainable development.

The main strategic guidelines of the Romanian energy policy are:

- Energy security
- Sustainable development
- Competitiveness

Horizon 2020. National Objective: To ensure the efficient and safe operation of the national energy system; to attain the current average levels of energy intensity and energy efficiency of the EU; to fulfill Romania's obligations in accordance with the EU legislative package on climate change and renewable energy and with international targets following the adoption of a new global agreement on that subject; to promote and implement measures for adaptation to the effects of climate change and to observe the principles of sustainable development.

Horizon 2030. National Objective: To align Romania's performance with the EU average in terms of energy and climate change indicators; to meet Romania's commitments on reducing greenhouse gases emissions in accordance with existing international and EU agreements; to implement further measures for adjustment to the effects of climate change.

Sustainable transport

Overall Objective of the EU SDS: To ensure that transport systems meet society's economic, social and environmental needs whilst minimising their undesirable impacts on the economy, society and the environment.

Horizon 2013. National Objective: To promote in Romania a transport system that would facilitate the safe, fast and efficient movement of persons and goods nationally and internationally, in accordance with European Union standards.

Horizon 2020. National Objective: To attain the current EU average level of economic, social and environmental efficiency of transport and to achieve substantial progress in the development of transport infrastructure.

[12] The National Sustainable Development Strategy - Romania 2013-2020-2030.

Horizon 2030. National Objective: To get close to the average EU level of 2030 in relation to all the basic sustainability indicators for transport activities.

Sustainable consumption and production

Overall EU SDS objective: To promote sustainable consumption and production patterns.

Horizon 2013. National Objective: To achieve eco-efficient management of resource consumption and to maximize resource productivity by promoting a pattern of consumption and production that makes sustainable economic growth possible and brings Romania gradually closer to the average performance of the other EU countries.

Horizon 2020. National Objective: To decouple economic growth from environmental degradation by reversing the ratio between resource consumption and creation of value added; to move closer to the average performance levels of the EU in terms of sustainable consumption and production.

Horizon 2030. National Objective: To come close to the average level attained at that time by the other EU Member States in terms of sustainable production and consumption.

Conservation and management of natural resources

Overall Objective of the EU SDS: To improve management and avoid overexploitation of natural resources, recognizing the value of ecosystem services.

Horizon 2013. National Objective: To narrow the current disparities in relation to other EU Member States in terms of coverage and quality of environmental infrastructure by providing efficient public services in this domain, following the concept of sustainable development and respecting the «polluter pays» principle.

Horizon 2020. National Objective: To attain the present average EU level for the main indicators describing the responsible management of natural resources.

Horizon 2030. National Objective: To come significantly close to the environmental management performance of the other EU Member States at that time.

Public health

Overall Objective of the EU SDS: To promote equal access to high-quality health care and to improve protection against threats to health.

Horizon 2013. National Objective: To improve the structure of the health sector and the quality of medical assistance and care provided through medical services; to improve the state of public health and the performance of the healthcare system.

Horizon 2020. National Objective: To come closer to the current average public health standards and the quality of medical services provided in the other EU countries; to integrate healthcare and demographic factors in all Romanian public policies.

Horizon 2030. National Objective: To achieve full alignment with the average performance level of the other EU Member States, also with regard to healthcare financing.

Social inclusion, demography and migration

Overall EU-SDS Objective: To create a socially inclusive society by taking into account solidarity between and within generations and to secure and increase the quality of life of citizens as a precondition for lasting individual well-being.

Horizon 2013. National Objective: To create a modern legislative, institutional and participatory framework for reducing the risks of poverty and social exclusion, promoting social

cohesion, gender equality and cultural diversity, and also for the responsible management of migration and demographic change.

Horizon 2020. National Objective: To promote consistently, in accordance with the new legislative and institutional framework, the EU norms and standards regarding social inclusion, gender equality and active support to underprivileged groups; to proceed with the gradual implementation of the long-term national strategy on demographic change and migration. Horizon 2030. National Objective: To come significantly close to the average level of the other EU Member States in terms of social cohesion and quality of social services.

Global poverty and the challenges of sustainable development

Overall Objective of the EU SDS: To promote sustainable development globally, and to insure the coordination of the internal and foreign policies of the European Union with the principles of sustainable development and its related engagements.

Horizon 2013. National Objective: To implement the required legislative and institutional instruments pertaining to Romania's status as a donor of development aid according to its obligations as an EU Member State; to establish the priorities and means of action and to allocate for this purpose approximately 0.25% of the gross national income (GNI) by 2013 and 0.33% by 2015, with the intermediary target of 0.17% of GNI by 2010.

Horizon 2020. National Objective: To define the specific areas in which the expertise and resources available in Romania can serve the aims of development assistance, and to allocate for this purpose around 0.5% of gross national income.

Horizon 2030. National Objective: To fully align Romania with the policies of the European Union in the sphere of development cooperation also in terms of budget allocations as a percentage of gross national income.

5. Conclusions

The analysis presented in the previous chapters has emphasized Romania stage of development at regional and local level, the local governments implemented projects and the future development directions.

The sustainable development of the local communities is a present and future option of the national policy that seeks economic growth and quality of life's improvement.

Becoming a member state of the European Union, Romania must cope with new challenges and objectives. One of these objectives is the sustainable development of our local communities. This objective can be achieved by local governments because they represent powerful actors in their local economies. They must build and maintain infrastructure that is essential for economic activity. They must set standards, regulations, taxes, and fees that determine the parameters for economic development.

In essence, one can say that the use of European Union Funds is an opportunity for economic development in Romania, in the context in which their use can generate sustainable economic and social development.

ORGANIZATIONAL CHANGE IN KNOWLEDGE-BASED FIRM

VLADIMIR-CODRIN IONESCU[*]
VIOREL CORNESCU[**]

Abstract
For sustainable competitive advantages gain, modern organizations, knowledge-based, must promote a proactive and flexible management, permanently connected to change which occur in business environment. Contextually, the paper analyses impact factors of the environment which could determine a firm to initiate a programme strategic organizational change. Likewise, the paper identifies the main organizational variables involved in a changing process and emphasizes the essential role which managers and entrepreneurs have in substantiation, elaboration and implementation of organizational change models.

Keywords: *knowledge-based firm, organizational change, impact factors, organizational variables, competitive advantage.*

1. Introduction

In the society and knowledge-based economy context, change is by itself the essence of business development. Approach of change became a key-element of competitive advantage, because only by a coordination of employees with the purpose of the fastest implementation of change, organization may react to market pressures before a context modification. [6]

Continuous change of the organizations evolutional environment is determined by a series of factors within which we remind technological evolution, knowledge boom, a fast moral depreciation of products, work conditions and mutation in labour power character. [4]

Managers and entrepreneurs in modern firms, based on knowledge, must identify, analyze, and evaluate systematically main variables of impact on the environment inside and outside the organization. To enter the sphere of operational excellence, organizations must show flexibility, substantiate and implement proactive business strategies, which include initiation processes and periodical implementation of proper organizational changes. Viable organizational system is the flexible one, which can answer favourably to any challenge of the environment. [9]

An eloquent example on what concerns the understanding of organizational change is famous company Hewlett Packard. William Redington Hewlett, one of the co-founders of the company, states: "Above anything, consider change inevitable, do not try to oppose it. Always be ready for 180˚ turn when discover a new and promising direction".

A significant number of papers, studies and articles are found in literature, which address issues of organizational change, underlining the necessity of projecting and implementing several programmes of organizational change in modern firms, as a sine qua non condition of competiveness. [1, 3, 10]

2. Conceptual delimitation

Established on strategic diagnosis-analysis, organizational change covers a sum of activities for the firm to be prepared to gain necessary competence to implement a new business strategy. An important premise of subscribe a firm on the trajectory of economic and social efficiency is represented by the existence of an organizational infrastructure, flexible and adaptable. In the context of contemporary economic dynamics, change became necessary, for medium and long term

[**] Professor, PhD, "Nicolae Titulescu" Univeristy of Bucharest, Romania, e-mail: viorelcornescu@univnt ro

objectives are permanently reviewed and modified according to registered evolution in business environment.

Organizational change implies a change of mission and vision in organization, introducing new technologies, a modern system of performance evaluation, redesigning remuneration system, orientation towards new clients' target-groups, as well as applying several complex managerial methods such as management by objectives, management by projects, management by budgets, total quality management and so on. [11]

Organization change corresponds to new orientation, fundamental and radical, concerning ways which the organization follows to develop activity, having essential implication on the behaviour of all its members. Launching a process of change implies the awareness of change necessity, to manifest desire of change, accumulation of knowledge as well as formation of necessary ability for implementing change.

Peter. M. Senge [13], management professor at Massachusetts Institute of Technology, introduced the notion of "learning organization". In such organizations, it is are developed and grown new models of thinking, human resource are permanently stimulated in the learning process for gaining competences and every experience is considered as being an opportunity to learn.

Knowledge-based firm is, by, an organization which learns, and also a sustainable organization, an entity generating added value integrated in economic, social and ecologic environment, which, by a proactive management, flexible and innovative, creates constantly competition advantages reported to competitive firms.

For adjusting to business environment mutations, knowledge-based modern firms must be permanently connected to change. Over time were developed a series of models which support managers and entrepreneurs in the trial of understanding and implementing change. Organizational change models are based on gaining consensus between human resources of organization. One of the model's, such as Lewin's, helps managers to analyse change, to preview probable consequences and identify solutions to decrease resistance and difficulties of such step.

Lewin's model suggests that it should be accomplished a balance between change sources and resistant forces to change. Robbins appreciates a simple announcement of change and does not eliminate previous conditions and its success. For gaining a sustainable effect of change, it is necessary that managers to anticipate and to evaluate forces which are opposed to change and reduce intensity.

Beer and Eisenstat [2] believe that enterprises tend to oppose a greater resistance to change if this is not of paramount importance for their surviving. Other authors state that for reducing resistance to change, managers must induce to their employees the sense of urgency.

3. Forces of organizational change

First step in initiating organizational change represents identifying factor which greatly influenced the evolution of firm. Researches of specialists and professional consultants reveal the connection between these factors, mainly, to the firm environment, to the organizational and management structure. [15]

Of the environmental factors which could generate failure of and organization we remind new firms on the market, technological innovation of competitors, and dependence on a supplier or a single costumer and so on. On what concerns organizational structure, in most of small and medium enterprises, this is flexible and marks, usually, a potential source of success. Issues on inadequacy of any changes of the organizational structure may appear in some medium firms which develop diverse activities or are expanding, such as larger firms.

In small enterprises and many other small firms, management factors which generate failure are, in our opinion, the insufficient managerial training of entrepreneur, promoting an authoritarian managing style and inadequate coordination of developed activities within the organization. In medium and large enterprises, management factor which generate failure are, mainly, the excessive

analysis of information and the existence of some conflicts which can determine serious dysfunctions when they neither are nor well controlled. Groups in conflict reduce efficiency and often establish personal objective to prevail on those organizational. For such reason, conflict must be controlled thus to remain in accepted limits.

Modern organizations represent open economic systems to correspond more diverse consumers' demand. Firm's ability to adapt market manifestation demands depend on their flexibility. Henk Volberda considers that flexibility must represent a defining characteristic of organizations. Thus, from organizational perspective, flexibility could be defined as being the capacity of a firm to react to change. In a turbulent business environment, development strategies must be permanently filled and connected to programmes of planned strategic change. Actually, strategic organizational change includes continuous initiatives starting at entrepreneurs and manager. Management implementation of total quality is and example of organizational change within a firm.

Forces to determine an organizational change could be internal or external. Strategic orientation change of competitors, government regulation, new firms on the market technological innovation of competitors and product and services quality growth offer by these represent forces to determine a firm to resort to making some strategic organizational changes.

Organizational change could find its origin inside and enterprise – a new vision of entrepreneur or managerial team, introducing a new fabrication technology, developing a product or a service, intention to enter a new market. Change can produce reactively (as a response) or proactively (as an initiation). Otherwise, the firm either anticipates the necessity

Several authors appreciate that organizational change must be approached as a phenomenon which is the result of the interaction between economic, technological, social and political factors on the environment.

4. Variables involved in organizational change

Despite the firm's proactive or reactive approach on strategic organizational change, should be established main involved variables of changing process. As we see it, organizational change variables are strategic view, objective, organizational structure, technology, organizational culture and managerial techniques. Such variables are found either totally or partly, in different proportions, based on the firm's dimension. In small enterprises, main variables of organizational change are represented in the entrepreneur's view also by organizational culture which, at its turn, carries the imprint of his personality. In medium enterprises with productive profile or which develops more activities, as well as in large enterprises, in the process of organizational change are found, usually, all above mentioned variables.

Key-elements of organizational change, human resources – entrepreneurs, managers and employees – create and implement organizational change model, connecting mentioned variables and coordinating interaction between these. In many firms, strategic vision and system of objectives are not connected adequately. Entrepreneurs and managers must have the capacity to communicate employees their strategic vision and firm's mission. Unfulfilled objectives, inadequate communication between different hierarchical steps, lack of management involvement are obstacles in changing process. [7]

Implementing an organizational change programme implies operationalization of certain systems, methods and managerial techniques which to lead to reaching afferent objectives for new strategic orientation of the enterprise. Managerial practice targets the connection between human resources and organizational activities, as well as regulating and developing principles to govern labour process of the firm. If employees are not motivated to fulfil attributed tasks or do not understand the report between their objectives and the firm's objectives, we may find a "system incoherence" which is necessary to be analyzed and solved for the enterprise to be successful in the change initiative. [14] Rogers and Byham suggests that posts in a firm should be projected such that

subscribed tasks, competencies and responsibilities to be congruent with the new organizational strategy. [12]

Organizational change represents an integrating process in which are involved two interconnected subsystems: human resources – managers and employees – and organizational change variables – strategic vision, objectives, organizatorional structure, technologies, organizational culture, managerial methods and techniques.

Vectors which define connection between the two subsystems are orientation towards change, change resistance and organizational learning. Human resources are main actors of change. Managers and entrepreneurs have an important role by their strategic vision leads the effort of change, as well as the involved process in organizational change. Also, managers and entrepreneurs must know what are the employees' opinions and attitude towards change and to induce a feeling of mobilization for accomplishing a sustainable change. Communication between managers and employees is essential for understanding the essence of change and for implementing it successfully.

Strategy changes of competitors, technology mutations, law regulations, and new firms as well as the general trend to quality growth of products and services lead to certain organizational changes. A new strategic vision of managers, introducing new modern fabrication technologies, developing a new product or service and entering a new market implies profound change on organizational environment.

Taking into account pressures of the environment, modern firms, knowledge-based, must have flexible and adaptable infrastructures which to allow reaching high levels of performance. The greatest difficulties are not connected to technological change and managerial methods, though to human resources change.

5. Conclusion

Managers and entrepreneurs in modern firms, based on knowledge, must identify, analyze, and evaluate systematically main variables of impact on the environment inside and outside the organization. To enter the sphere of operational excellence, organizations must show flexibility, substantiate and implement proactive business strategies, which include initiation processes and periodical implementation of proper organizational changes. Viable organizational system is the flexible one, which can answer favourably to any challenge of the environment. Knowledge-based firm is an organization which learns and a sustainable organization, integrated in economic, social and ecologic environment which, by a proactive, flexible and innovative management creates constantly competitive advantages reported to competitors. Organizational change implies new competences, as a result to gathering information through continuous learning process.

Strategic orientation change of competitors, government regulation, new firms on the market, technological innovation of competitors as well as quality of products and services growth offered represent external forces that determine the firm take use of strategic organizational change. Internal forces of organizational change we remind the new vision of entrepreneur and managerial team, introducing a fabrication technology, development of a product or service, re-projecting organizational structure, operationalization of new management methods, intention to enter a new market and so on.

Organizational change represents an integrating process in which it are involved two interconnected subsystems: human resources – managers and employees – and organizational change variables – strategic vision, objectives, organizational structure, technologies, organizational culture, managerial methods and techniques.

Human resources are the main actors of change. Managers and entrepreneurs have a determinant role in transformation of firms they lead in flexible organizations, towards change, for they create and implement projects of planned strategic change, connecting involved organizational variables and coordinating interactions between these. In the society context and modern knowledge-

based economy it is necessary a new mentality of managers and entrepreneurs on what concerns change, which must be gradually induced to employees, in an adequate cultural model, thus to pass from acceptant of change to initiators.

INCREASING EFFICIENCY AND EFFECTIVENESS IN LARGE COMPANIES BY COMBINING SIX SIGMA WITH BPM

MIHAELA DUMITRASCU[*]
ROBERT SEREMETA[**]

Abstract
The paper underlines the importance in combining the Six Sigma methodology with BPM technology. Companies are just discovering the benefits of combining BPM and Six Sigma. Ideal for enhancing the long-term performance of business processes, the BPM/Six Sigma union helps companies better characterize, understand, and manage entire value chains. It also helps companies improve control and predictability of corporate business processes and generate sustainable enterprise improvements in performance levels.The study starts with the concept of Six Sigma which was powered by principles governed by continuous improvement. In pure terms, Six Sigma helps manufacturing organizations reduce the number of errors or reduce the number of defective products manufactured by them. This is achieved by a regular sharpening of the process and constant monitoring on processes and how they can be improved. This approach had been truly effective in ensuring quality in a manufacturing environment and was later adopted by the services industry during the 90s. However, as the Six Sigma framework relied heavily on the collection and analysis of data of individual processes, synchronizing them between departments was ignored. This resulted in improvement benefits being limited to specific functions only, without taking into consideration the integration with other processes. Another weakness of the Six Sigma methodology is the lack of control used to sustain improvements achieved. This stems from the fact Six Sigma utilizes manual processes to do this, an approach that lacks effectiveness. In this sense, Business Process Management (BPM) initiatives address areas that Six Sigma falls short of, in line with the purpose of achieving excellence in organizations. These two methodologies complement each other to compensate for areas of weaknesses. Although BPM addresses process enhancements and monitoring from a holistic viewpoint, it fails to address the analytical requirements to solve complex issues.

Keywords*: Six Sigma, BPM, efficiency, effectiveness, managerial tool*

1. Introduction

The managerial tools and the methodological elements used in running of complex managerial initiatives, inclusively in promoting and using them represents, with no doubt, the fundamental combination of the managerial, economical and commercial success of any organization; proper knowledge and operationalization of the most adequate systems, methods and techniques of management provide a favorable answer to the question: How do we lead?

This is why ,in the following pages ,we approach two of the most representative managerial tools Six Sigma and BPM (business process management) which combined sustain the idea that the managerial methodologization is the most facile modality of amplifying the efficiency and effectiveness of any large company.

This article focuses on answering following questions. What is BPM? .What is Six Sigma? .How can BPM and Six Sigma combined increase effectiveness and efficiency?

2. What is Six Sigma?

The concept of Six Sigma was developed at Motorola in the 1980's as they worked to improve the quality of their products and services. By implementing a systematic, rigorous routine, they were able to improve their products and increase customer satisfaction, thus increasing profits.

∗ Ph.D. candidate, Academy of Economic Studies, Bucharest (e-mail: red_mille_ro@yahoo.com).
∗∗ Ph.D. candidate, Academy of Economic Studies, Bucharest (e-mail: rseremeta@yahoo.com).

Six Sigma can be in many ways defined. It's a way to measure processes, a goal of near perfection, underlined by the 3, 4 defects / million occasions, an approach to change mentality. The best definition is by far this one: Six Sigma is a vast and comprehensive system to achieve and support efficiency, effectiveness in other words performance.

Any organization who wishes to implement Six Sigma methodology should bear in mind six vital points.

1. A real focus on costumer. The necessities of the customer should always come first

2. Managment based on facts and data, with efficient measurement systems witch follow up on results and systems outputs, but also processes, system inputs and other predictable factors.

3. Focusing on process, management and improving the process. Six Sigma keeps track of all processes through documentation, measurement indicators …

4. Proactive management. Sis Sigma anticipates problems and changes, using facts and data and always checks the hypothesis regarding organizational objectives.

5. Collaboration without limits between all actors involved in the organization (internal and external clients)

6. Impetus to perfection and yet failure tolerance. This approach offers employees freedom to test new approaches even when risk are attached to them. Only an organization who wants to seek new methods of improving is on the long term sustainable.

Six Sigma approaches business processes from a highly statistical standpoint. It incorporates three levels of activity:

- Metrics – statistical focus to make process outcomes 99.9997% defect free, otherwise expressed as 3.4 defects per million opportunities
- Methodology – structured approach to solving problems that uses specific tools and process mapping to achieve the metric goal
- Philosophy – the enterprise-wide embrace of defect reduction by making decisions based on hard data and customer focus

In short, Six Sigma allows an organization to reduce the variability in its products and services so that waste is reduced, efficiency is improved, and customer satisfaction is dramatically increased. Business problems are solved through rigorous application of data collection and analysis tools. The training that Six Sigma users receive is quite intensive, progressing through several increasingly sophisticated levels based on experience and accomplishment. Professional Six Sigma consultants and practitioners usually work to become certified at the various levels, increasing their ability to help guide development and implementation of Six Sigma methodology.

The methodology of Six Sigma is key to its success. An organization follows a five step progression that uses factual information and statistical analysis to address achievement of operational goals. There are some differences in the five steps depending on whether they are used to improve an existing process or design a new process. The end goal, though, is always to achieve the standard metric of 99.9997% defect free performance.

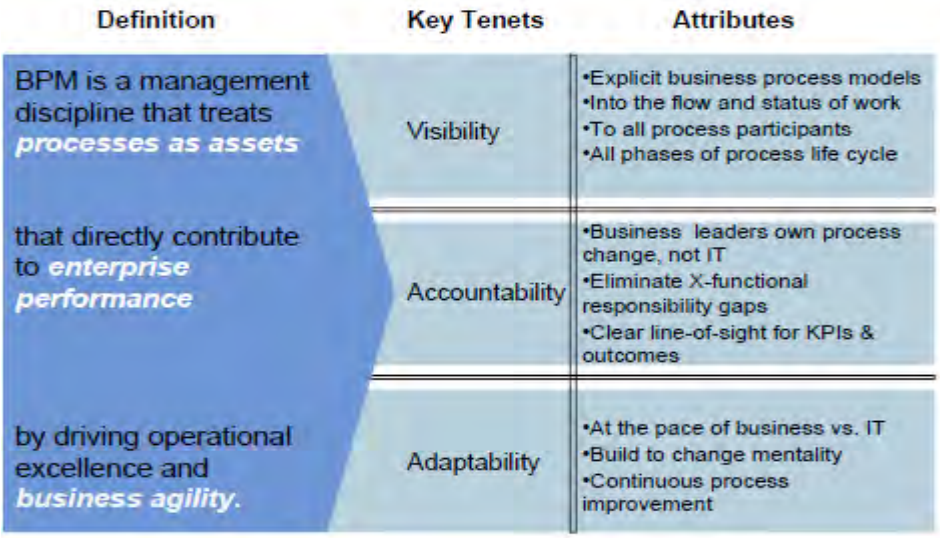
3. What is BPM?

Business Process Management (BPM) has become a top priority for companies in 2006 and 2007. A recent survey of more than 1,400 CIOs revealed that the top business priority identified by their company was business process improvement. Of course, there are many options for improving business processes – ranging from complete process re-engineering to adopting new process management methodologies, such as Six Sigma, or adding new capabilities to existing systems. An investment in BPM software, coupled with new approaches to project

implementation , enables companies to institutionalize a sustainable business process improvement program.

Business process management (BPM) is a holistic management approach focused on aligning all aspects of an organization with the wants and needs of clients. It promotes business

effectiveness , efficiency and agility while striving for innovation, flexibility, and integration with technology. BPM attempts to improve processes continuously. It can therefore be described as a "process optimization process." It is argued that BPM enables organizations to be more efficient, more effective and more capable of change than a functionally focused, traditional hierarchical management approach. Other define BP as a management discipline that treats processes as assets that directly contribute to enterprise performance by driving operational excellence and business agility.



4. How did we get to BPM?`

The managerial tools and the managerial methodological elements are in a perpetual change . From the earliest taylorist scientific management to computerized processes (JIT) to re-engineering (Six Sigma, Lean) , and currently to BPM.

- **Scientific management** was a theory of management that analyzed and synthesized workflows. Its main objective was improving economic efficiency, especially labor productivity. It was one of the earliest attempts to apply science to the engineering of processes and to management. Its development began with Frederick Winslow Taylor in the 1880s and 1890s within the manufacturing industries. Its peak of influence came in the 1910s; by the 1920s, it was still influential but had begun an era of competition and syncretism with opposing or complementary ideas. Although scientific management as a distinct theory or school of thought was obsolete by the 1930s, most of its themes are still important parts of industrial engineering and management today. These include analysis; synthesis; logic; rationality; empiricism; work ethic; efficiency and elimination of waste; standardization of best practices; disdain for tradition preserved merely for its own sake or merely to protect the social status of particular workers with particular skill sets; the transformation of craft production into mass production; and knowledge transfer between workers and from workers into tools, processes, and documentation.: While scientific management principles improved productivity and had a substantial impact on industry, they also increased the monotony of work. The core job dimensions of skill variety, task identity, task significance, autonomy, and feedback all were missing from the picture of scientific management. While in many cases the new ways of working were accepted by the workers, in some cases they were not. The use of stopwatches often was a protested issue and led to a strike at one factory where "Taylorism" was being tested. Complaints that Taylorism was dehumanizing led to an investigation by the United States Congress.

Despite its controversy, scientific management changed the way that work was done, and forms of it continue to be used today

- In the 1970s, when Japanese manufacturing companies were trying to perfect their systems, Taiichi Ohno of Toyota developed a guiding philosophy for manufacturing that minimized waste and improved quality. Called Just In Time (JIT), this philosophy advocates a lean approach to production, and uses many tools to achieve this overall goal.

When items are ready just in time, they aren't sitting idle and taking up space. This means that they aren't costing you anything to hold onto them, and they're not becoming obsolete or deteriorating. However, without the buffer of having items in stock, you must tightly control your manufacturing process so that parts are ready when you need them.

When you do (and JIT helps you do this) you can be very responsive to customer orders – after all, you have no stake in "forcing" customers to have one particular product, just because you have a warehouse full of parts that need to be used up. And you have no stake in trying to persuade customers to take an obsolete model just because it's sitting in stock.

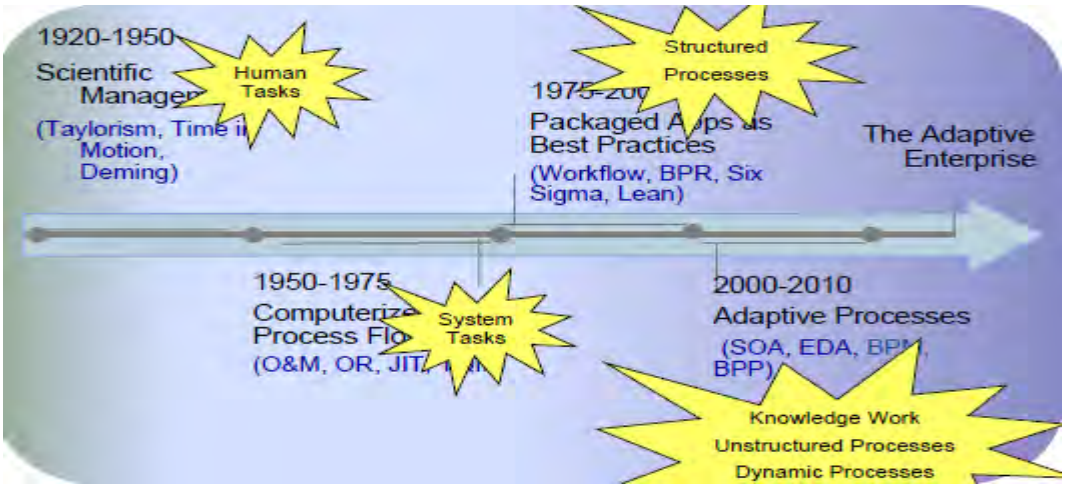
The key benefits of JIT are:

- Low inventory
- Low wastage
- High quality production
- High customer responsiveness.

A key drawback of JIT is that it only works if you can rely on your suppliers to deliver when they promise to – otherwise your whole operation may grind to a halt.

What's more, if material costs suddenly increase, then storing them at a lower rate might have been a more economic option. And JIT is also based on historical patterns of need: If orders increase sharply, adjusting to the increased need for supplies may not be easy for you or your suppliers.

- In the early 1990s strategists Hammer and Champy introduced the concept of re-engineering ,a tactic also known as business process re-engineering (BPR). The key to BPR is for firms to look at their business processes from a “clean slate” perspective and determine how they can best construct new and existing processes to improve the overall conduct of business . BPR constitutes the complete re-alignment of the firm and requires the company to be built from the bottom up . Hammer and Champy defined BPR as : “The fundamental rethinking and radical redesign of business processes to achieve dramatic improvements in critical ,contemporary measures of performance such as cost, quality ,service and speed**.** Six Sigma is probably the best method of reengineering a company . With all the positive things that people have to say about Six Sigma, there are also plenty to go around that aren't so positive. With any system that relies heavily on data and measurement like Six Sigma does, it may sometimes be difficult to gather sufficient data and this can be a big problem especially when big tactical decisions are being made based on the date collected. There are even times when a particular type of data or measurement may not even be available at all. Gathering and finding out ways to gather data when it is not available can have a very significant cost to the company in terms of time and effort. Prioritization can also become a problem when Six Sigma is being used because it so critical to the success or failure of the implementation. There are very few tools that have been developed that help make objective decisions regarding prioritization.



5. BPM basics

Let's first take a look at the basics of BPM. It uses a four step method to create better processes and improve performance. The steps are as follows:

- Map the process (whether new or existing) from start to finish, capturing each step along the way
- Execute the process by using people and automated applications, with specific assignments of responsibilities and accountabilities for each step
- Manage the process through information flow, actions and related activities Analyze process performance and metrics, using findings as the basis for continuous process improvement

BPM has a strong base in software applications to help streamline and automate processes. At the software level, BPM is commonly applied within a single department or group to improve a specific process.

From the software level, BPM expands to a suite of software applications. The suite level enables BPM to link multiple departments or groups that affect processes. It promotes information sharing and accountability through use of a work portals where multiple users can share knowledge, documentation, and process management.

At its highest level, BPM expands to an enterprise-wide system. This level combines software and IT aspects with management practices to address broad structural and systemic issues within a business or organization. Business practices and operations are examined from a holistic standpoint, paying close attention to how occurrences in any one part of the system have a ripple effect across the organization.

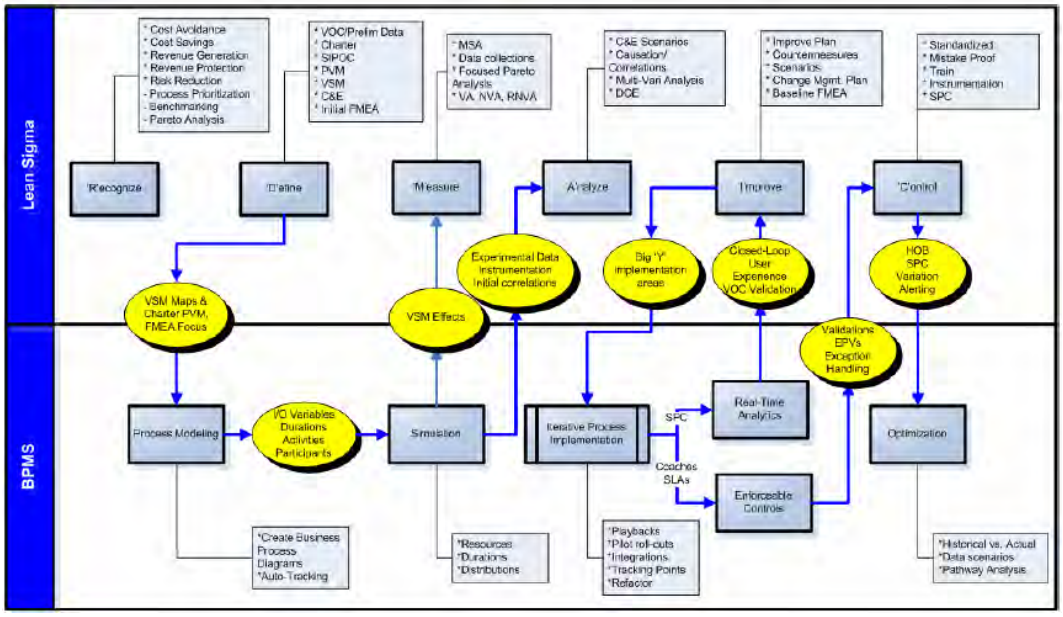
6. A Common Objective

Fortunately, both BPM and SS have a similar goal in mind – allowing companies to better manage and optimize their processes. Their approach and focus, however, is different. SS has a focus on understanding the variance in processes and how that affects the ability to achieve key objectives. One of the challenges of deploying SS across a company is that it is labor intensive to gather the data and implement the controls that are recommended by analysis. This, of course, is one of the key benefits of implementing BPM – automated controls and data gathering about the performance of the process. At the same time, many BPM teams struggle to understand which processes are the top priority for the business and which problems are the most critical to solve for any given process. SS

has much to offer BPM teams in this area – through tools like Failure Mode Effect Analysis (FMEA) and Value Stream Mapping (VSM). So, conceptually, BPM and SS should be a great fit.

Conceptually, most people will agree that connecting the data-driven focus of SS improvement with the real-time controls and automation of BPM could increase the efficiency and effectiveness of a company . The question would be, why haven't more companies succeeded at connecting the two initiatives. The problem could be the education and specific definition about points of integration. While BPM and LSS teams can tell you how their specific activities integrate and complement each other in their OWN disciplines, there is little insight into how to hand-off between the two. Lance Gibbs and Tom Shea believe there are eight basic touch points between the two initiatives. It is critical that these touch points are managed if a company is going to integrate their BPM and LSS initiatives.

7. The Eight Touch points of LSS and BPM



1. **Value Stream Maps (VSM), Charter and Failure Mode and Effects Analysis (FMEA) –**

Several of the assets created in the "Define" step of Lean Sigma are helpful to BPM teams when they start their process modeling. In particular, the VSM helps the BPM team understand the key areas of focus for their process modeling and how specific processes contribute to overall value to the company. Furthermore, FMEA provides BPM teams with insight into particular failure points that their process models must factor in and mitigate. Without these inputs from the LSS efforts, a BPM team might struggle to understand where they should truly focus their modeling efforts.

2. **I/O Variables, Durations, Activities, and Participants –** From the value stream map we can now begin to add the data that surrounds the key input and output variables. Cycle time, lead-time, and WIP as well as the human and system consumers who interact with the process – all need to be included by the BPM implementation.

3. **VSM Effects** – BPM simulation capabilities provide a strong initial baseline of data about the process. Instead of having to wait for several weeks of sampling, LSS teams can start analysis

using projected performance information provided by the BPM system. Initial multivariable studies can be run using the pathway analysis and resource thresholds generated by simulation from BPM, providing an early litmus test of the areas of opportunity for improvement.

4. **Experimental Data, Instrumentation, Initial correlations** – Simulation data generated from a BPM solution can also be leveraged to create SPC charts. This data also allows the LSS team to begin to validate process capabilities on future state. While LSS teams could gather all of this information without BPM, it would take time and effort – and they would not have key data as early. Leveraging the BPM data can remove one of the biggest bottlenecks for LSS teams.

5. **Big Y Implementation Areas** – As part of their work in the "Improve" step of an R-DMAIC approach, the LSS team will produce an Improvement Plan. This document is a great asset to the BPM team as they make the process executable – not just simulated. In the BPM world, the best practice is to implement process applications iteratively. During that implementation process, one of the biggest challenges is to keep teams focused on solving the top priority problems. Knowing the Big Y implementation areas gives the BPM team a concrete understanding of which problems to solve – without them having to go and repeatedly interview the organization to distill that information.

6. **Closed Loop User Experience** – An executing BPM solution provides control over activities and generates performance data from the process consumers that can be used for improvement base lining in LSS. Since the process that was designed is the process that runs, change is automatically enforced and failures can be identified in real-time. This automatic control and data collection greatly simplifies the workload of Black Belts and Green Belts on the LSS team who would otherwise have to enforce controls and gather data themselves.

7. **Validations, EPVs and Exception Handling** – The key exception handlers are in place for the most critical FMEA input variables that need to be closely monitored. The right information is now available to identify countermeasures as the process begins its inevitable shift from compliance to non-compliance in meeting the customer requirements. This information is fed in real-time in the right format to the LSS teams.

8. **SPC, Variation Alerting** – Today, most BPM solutions treat business event alerting in a simplistic fashion. For example, alerts are generated for late work items or when certain data conditions are met (e.g., loan application over $250,000). SPC instrumentation allows managers to understand the relevance of specific events. Variation alerting helps a process manager focus – telling them only when significant events happen. This discipline and approach must be integrated into the BPM dashboards that end users leverage to drive process performance.

8. Conclusions

BPM coupled with Six Sigma is the best investment a company can make in establishing a platform for continuous improvement and a managerial tool that can measure processes and improve them close to perfection(3.4 defect/ million occasions) .. Companies have different levels of maturity in adopting BPM and/or SS. However, those that have successfully implemented and integrated their BPM and LSS initiatives are able to answer ,"Yes," to all of the capability statements in the following list.

Capability	Yes or No?
Process Visibility from the value stream map of the business, with the processes broken down to the procedural level.	
A real-time dashboard with control charts at the procedural level, up to Executive Health of the Business gauges that can be used to monitor the whole corporation, lines of businesses, functions, or processes with full drill-down capability.	
Ability to incorporate Statistical Process Control (SPC) charts to monitor in real-time the process performance against the voice of the customer in time, quality, and delivery, and, most importantly, their "stable" processes alone.	
Simple to use Process Modeling tools for the process owners at all levels, to provide standardized process mapping and standard work documents, and simulations capability.	
Proactive: The ability to notify users immediately when out-of-control conditions occur, so process owners and process specialists can capture the root cause for corrective action or for best practices implementation.	
Relentless Voice of the Customer driven process requirements and the subsequent method to gather, prioritize, and validate compliance.	
Visibility into and accountability for process performance against voice of the customer SLAs.	
Live updating of Process Improvement Prioritization matrix, aligned with the Company Strategy, to assure that available improvement resources are assigned to the improvement activities with the most impact.	
Rapid prototyping of new products and services using process simulation (DMADV).	
An efficient workflow to implement the best "future" state process, usually yielded by Kaizen Events.	
Mining process capability against VOC for improved and new products and services.	

The challenge for many companies is justifying the BPM coupled with Six Sigma investment instead of using traditional paths for solving process problems – like buying an application or building a custom application. We feel that only BPM coupled with Six Sigma can help you're company answer "Yes" to all the above question, which automatically will increase efficiency and effectiveness .

MARKETING TECHNOLOGICAL INNOVATIONS IN BANKING PRODUCTS AND SERVICES

VALERIA ARINA BALACEANU *

Abstract
Success depends on the ability of financial institutions to assess the opportunities of new markets, attracting customers from competitors and improve the effectiveness of marketing strategies.
Marketers have to understand that the most effective approach is based on an analysis of needs of different market segments, designing the marketing mix and implementation of marketing programs targeted to selected segments.
The allocation of financial and banking institutions of important resources for new technology to replace expensive labor, led to technical progress in the field that accelerates business processes and keep control of large databases on client operations, working in worldwide.
The emphasis of the competition fund, the European single market is a challenge both in banking and for organizations involved in harmonization of standards and legislation, which is why banking institutions adapt to new technologies is very important to customers.

Keywords*: bank marketing, banking products and services, technological innovations, trends, mutations.*

1. Introduction

Developing financial markets and tradable financial innovations have led to an extensive banking disintermediation as a result of consumer preferences for other savings instruments (eg: mutual funds, pension funds, investments in investment companies etc.), and orientations consumers - the corporate capital markets in order to obtain financial resources. Banking deregulation and the emergence of the required regulatory process, as a response to conditions created new financial and banking environment.

Along with the deregulation legislation was extended and the implementation of technological innovations in retail and corporate banking business. IT applications and new communications technologies have led to reorganization and running the operations of traditional banks, but the intensifying competition and by the emergence of new financial institutions. Have emerged as new products and banking services, as well as virtual banks and internet connections.

Everything is put in a high technological breakthroughs permanent competitive banking financial institutions.

Priority and challenge for banking financial institutions still focus on implementation and optimal use of technology for a guaranteed success, in terms of a changing society, but also to increase awareness of financial education, living standards, diversification needs and desires consumers.

2. Paper content

Ability to assess new market opportunities, attract customers and competitors helps improve the effectiveness of marketing strategies to strengthen the success of financial institutions.

Marketers have realized that the most efficient approach is based on an analysis of needs of different market segments, designing the marketing mix and implementation of marketing programs directed to selected segments.

* Lecturer, PhD, Ecological University of Bucharest, (e-mail: arina.balaceanu@gmail.com)

The allocation of the financial institutions banking of significant resources for new technology to replace expensive labor, led to technical progress in the field, which accelerates business processes and keep control of large databases on client operations, working in worldwide.

Lately, technological innovations increasingly find their place in the banking business. Electronic devices, software applications, Internet, telecommunications etc., Are increasingly used in various areas of the banking industry, with major implications on the performance of its business.

Technology will always have a particularly influential role on banking products and services, such as specialized departments within the institutions and banks will have to prepare plans and strategies to meet any changes in behavior as a result of the impact of technology. Customer needs and desires to develop according to their own business so that the banks are put in a position to install systems that ensure the required level of services and products: fast and efficient. Every banking institution has different possibilities of action, but will work closely with these issues, issues that generate factors that may influence a bank's strategy, a strategy that in turn must be compatible with the external operating environment.

The banking business has an important role environmental monitoring technology for all the changes that may affect bank strategies.

In the category of outstanding technological innovation, applicable to bank finance, we can mention:

- introduction of plastic cards, which have simplified the system settlements in the economy;
- adaptation of mobile and fixed system to perform various operations (deposits, transfers, loans);
- emergence of virtual banks, the internet, which offers banking products and services through electronic media.

Technological innovations are used in the management of banking information (customers, accounts, operations etc.) risk management in facilitating the bank customer relationship (especially in distance running operations), in carrying out banking operations (bank payments, granting credit amounts of deposit, securities issues etc.). Thus, technological innovations implemented in the banking industry and are used both to base decisions, but also in manufacturing activity.

The main factors that led to the expansion and lead the implementation of technological innovations in the banking business are:

- new discoveries in the field of technological innovation;
- development of economic relations and the number of transactions;
- restructuring and modernization of banking;
- growth and diversification of customer demand, especially due to increasing awareness;
- increasing customer demands in terms of offering banking products and services;
- increasing costs for maintenance and development of traditional banking networks;
- expansion of spending on staff;
- increasing emphasis placed on resource - time.

The main role of technological innovation applied in banking is to automate the process of obtaining background information and decisions. The degree of automation of banking activity can be measured by this online banking so that it can pass through three stages:

1. online this state, namely the existence of a site and general information about the bank;
2. type interaction with the bank off line, by e-mail, some computer applications, real-time view of information etc.
3. interactive communication with the bank in real time, by conducting online transactions, internet banking etc.

The introduction and expansion of technological innovations in banking imposed, both for banks and for account holders and rationalization measures to redesign the bank documents, which leads to improvements in operational staff work from the banking institutions (activities, guidance, coordination and counseling clients).

In the contemporary economy, characterized by globalization, both the structure of financial markets, and consumer characteristics will change as a result of using new information and communication technologies, access to free, easy and real-time information of any kind and from every corner of the world. Financial institutions will form the largest trusts in transnational activities, which will provide integrated financial products and services globally. Typology and consumer behavior will turn diminishing the importance of characteristics related to their belonging to a certain nationality. Global cultural values will spread and be adopted by consumers in all countries. This will not lead to the disappearance of personal identity to consumers, but rather it will enhance and will reconfigure the access to other cultural values will be taken to the extent that they better match their personality.

Following the globalization process all elements that make up the internal environment and external financial and banking institutions will be influenced by the rapid pace of evolving information technologies and access to information from anywhere on the globe. Under these conditions, rethinking the way down the marketing strategies of bank financial institutions is becoming a necessity. Substantiation of marketing strategies in the new economy is necessary to consider the changes and evolution of all environmental factors whose action influences activity of financial institutions.

It is visible that the role of banks becomes a more consultative, and organization. Especially for large organizations to determine a change in the objective and forms bank intermediation. The bank today is not a deposit and credit, became a bank, "*financial*" to the organizations. They require more sophisticated financial innovation and support they need for banks to achieve their installation or to find a counterparty. The process leading to reorganization of banks: new directions appear on the market; new specializations occur in banking profession. Mutations continues its course: the trader to market, financial engineering and those "*back office*" which are actually the best cells are responsible for analyzing the consequences of new product development, in relation to bank and regulatory objectives in force.

In conclusion we can say that, given the emphasis of the competition, the european single market is a challenge both in banking and for organizations involved in harmonization of standards and legislation, which is why banking institutions adapt to new technologies is a very important aspect to customers.

Concerns the European Union harmonization directives on free movement of capital and services all aim to identify and eliminate existing barriers on the banking market.

The work relies heavily banks and marketing, which plays an important role in the organization. Marketing of banking services, like banking industry, marketing is a "special" you need to sell an intangible product in a tangible way. Ultimately, products and services offered by banks are essentially the same. They can be differentiated only by how they are perceived by customers.

Customer perception can be improved through effective marketing and special interests and backed by continuous quality development and meeting the needs, requirements and expectations. The client should feel important and want to remain at the bank. It is more expensive to attract new customers than retain existing ones and therefore need special efforts to retain customers, very important issues in marketing.

Ratings agencies rank banks by their financial performance. Classification of the fastest and is used depending on the size of their assets.

In conclusion, it can be said that the EU aims to create a coherent framework, and legislative and institutional banking, applying the directives in this area and non-member states (to combat and prevent money laundering, risk management, financial etc.).

The introduction of the euro has strongly influenced the economic life of the EU member states and had consequences for the national banking systems of other countries.

Bank performance are tracked and analyzed on the basis of specific indicators of the rating agencies and national financial supervisory authorities.

The EU has specific interests in the growth competitiveness by promoting quality organizations, creating legislative and institutional framework to achieve this goal, guiding it, now, to promote an ambitious policy, aiming to make it possible to substantially increase the economic competitiveness of member states.

In terms of economic development and amplification of trade, the trend of globalization and the emphasis of the competition, some of the most dynamic changes in the last decade and a half have occurred in banking. Credit institutions are, in all countries, participants in the economic life very active, dynamic, flexible and highly adaptable to market changes, being able to create demand for products and services. Assuming that credit institutions, nature activities, operates in a regulated environment, it is believed that a healthy economy is more and more efficient with how the banking system operates on principles of prudent and appropriate management of risk related. Quality management system enables continuous improvement of product quality and services provided by banks, thus increasing customer satisfaction and for the other stakeholders and, on this basis, continuous improvement in business performance of banks.

Credit institutions in Romania will face increasingly more demands of the European Union and their competitiveness in the European single market will depend largely on how they will manage to implement an effective quality management system. The problem of quality management systems effectiveness is accentuated with more insistent lately due to increased competition and market globalization.

The last decade and a half of the banking system accounted for a period of radical transformation. They were concerned not only modernize by creating appropriate legal and institutional framework and that a wide range of banking products and services, but also assimilation's acquis communautaire and aligning policies, strategies and practices of the European Union. In this context, is an essential part of the National Bank of Romania, which authorizes the operation of banks, regulate and supervise their activities for the development in healthy conditions and high caution. In recent years, banks in Romania have started to move towards the market segment represented by individuals. However, identifying customer needs (existing and potential) individuals shall be made by banks on their own or with help of specialized firms, there is the possibility of misunderstanding or misinterpretation of the results of market research. The transformation of the requirements in banking products and services for this segment of customers is difficult, especially for unusual banks have many customers, but small.

Evolution of the international environment is influenced by the development of banking systems in different countries, which, in turn, is determined by the historical, social and cultural economies. Based on these facts, and have outlined a series of functions and a way of organizing activities in the field. To be more explicit, representing banking systems still present, existing in countries with a developed economy and some aspects of their evolution.

Peculiarities of the largest global banking system

Country	**The peculiarities of the banking systems**
SUA	- The beginning of banking regulation; - Demarcation of trade and investment activities in the banking busines; - Categories of banks: commercial (deposit) and investment (credit); - The creation of bank holding company.
Marea Britanie	- Strong and stable banking system, which dominated a long period, the entire world banking system; - Strict specialization of banking activities;
Germania	- Developed banking system; - Banking activity one of the most dynamic sectors of national economy;

	- The structure of the banking system is represented by the universal banks (public institutions, cooperatives and commercial banks) and specialized; - Initiation of insurance companies.
Japonia	- The banking system is focused on holding impressive sites, including: the production unit, commercial unit and one or more banks; - Risks are high, but also are monitored and controlled by the bank; - Banks have provided the high-tech logistics; - Specialization strong banks.

Problems facing eastern european banks at present, by their nature are very varied.

First, it is necessary to adjust the cost structure of the bank margin, since the unification of banking services in EU countries and increased the absorption and merger reduced the cost of these services.

Secondly, it highlights the problem of maintaining profitability and strategy for improving the management procedure of financial, technical, human. In order to solve these problems, the FMI analysts suggest four rules banks "*gold*":

- exactly follow the bank's development strategy. Deviating from the direction of development chosen perplexities and diminish confidence finds customers and shareholders;

- deepening specialization within each activity directions of the bank;

- ensuring an adequate level of diversification of bank activities (analysis of each participating institution's directions to the profitability of banking activity);

- establish a balance between stimulating the sales of financial services and insurance cost control.

For integration into the european banking system, banks and financial companies create their universal system for selling products and services.

Study of peculiarities of development of the European banking market is a prerequisite for the banks in Romania. Regarding the Asian financial market, it includes a large number of financial centers in Tokyo, Hong Kong, Shanghai, Singapore, whose experience, especially in investment services, portfolio management services provided by a huge network of branches and agencies is of real importance for banks in Romania. Using information technologies for the development of banking is a practice used today not only the asian banking system, but also the entire global banking system.

Of particular interest to local bankers is the experience of developed countries in the sphere of communicative policy improvement, the working relationships within the group and the "behavioral approach to management." This includes system design complexities of human relationships inside the bank, between management and staff. The objective is to exclude conflict situations should be the collective incentives for staff to obtain good results of activity. Thus, the practice shows that the effectiveness of modern market economy, including banking business, is up at a rate of one third of the technical components and materials. 2/3 are determined by the intellectual potential of both managers and the employees. Many american banks, to streamline the relationships within the bank, uses the principle of feedback. Thus, the "open door", which requires that any employee can address the leaders of all ranks, organizing individual discussions, carrying out investigations with different purposes are distancing measures to prevent major bank managers collectively. Creating a favorable environment in Western banks is based on such methods as reducing the distance between client banker working process, ethics leader, the client - the most important person, removal and prevention of conflicts.

An important aspect of communicative relationships are relationships with clients and attention with which they are treated. The idea deserves to be remembered is: "*Client does not depend on us (the bank), we depend on him. We do not do favors and serving him, but he give us the*

opportunity to serve him. Our work consists in solving the problem of the client in an advantageous way for him and for the bank".

We mention that in the bank's business customers, while ensuring high quality of service process, develop informal relationships. An example may serve Bank Koelner German bank, which organizes tourism travel information clients. Client, its requirements, wishes and meeting their milestones bank marketing.

Banks should not only make financial transactions, but also to provide quality advice to their clients to explain the possibilities of making transactions, to propose optimal choices, that is to be concerned that the financial situation to be a good customer. Western banks are given public attention and involve training in business than advertising.

Most times, the supply of products and services is the main criterion for choosing a bank by a customer as an individual. Consequently, the more banking products and services offered presents several possible variants, in which only some features vary, the more customers will have a choice. The offer is applicable to understand both the rates and fees and all other aspects of banking product or service taken into account, eg deposits due to credit and interest rate, number of days until the issuance and validity of a card formalities and completed forms to obtain a loan or issuing a card etc.

Banks' ability to obtain long-term competitive advantages as a result of innovation and differentiation of products and services is limited by two things:

- banking products and services can not patent a new product being imitated by competitors within a short time;
- banking products and services are strictly regulated and supervised by the authority in the matter.

Differentiation range of banking products and services is manifested by small variations or nuances of specific items, sometimes in the details. Because differentiation is achieved through the quality that satisfies customer requirements, can be considered as a strategy to be adopted is the quality strategy. And this even more as the distribution channels are diversifying banking products and services continuously. Era in which bank customers moved to its location to find information or to request a loan or deposit a sum of money is already outdated.

Currently, today, customers have many other opportunities to meet the demands and expectations regarding products and banking services, such as: call center, ATM, Internet banking, mobile banking, co branding (cards issued together with a distributor products and services), partnerships with distributors of products (eg: consumer products).

Series of factors that led to the expansion and lead the implementation of technological innovations in the banking industry is composed of: new discoveries in terms of technological innovation, developing economic relations and the number of transactions, restructuring of banking; growth and diversification of customer demand, especially amid the rise of education degree in banking and extend more and more resources "for" increased costs for maintenance and development of traditional banking networks.

New distribution channels could be implemented due to the development of information technology. However, their expansion is limited by the need to ensure the necessary infrastructure and security operations, and customer behavior. Modern distribution methods means an increase in banks' ability to offer products and services beyond their territorial network. Deriving significant benefits:

- there is no need to go at the bank for each customer or transaction information desired;
- automatic or electronic distribution allows the advantage of standardization of products and services, leading to a continuous and homogeneous quality;
- activity is enhanced by relieving banks of any crowded desks.

It must, however, that these alternative distribution channels to benefit from increased attention from the banks to notify potential malfunctions, establish and implement corrective and

preventive measures necessary to train staff properly and meet customer reactions in parallel monitoring the life cycle of products and services.

3. Conclusions

Banking Financial Marketing is knowing and meeting customer needs and desires, their orientation towards the needs of the institution's activity, are being found both in commercials and advertising, and financial innovation in the banking, distribution services and banking products, the actual supply, adequate supply market needs and at an affordable price for both partners.

The introduction of high technology in banking activity leads to an improvement in operational staff work in banks, focusing more and more towards the work of guidance, coordination and advice to clients. Thus, visible increase customer service quality of banking services and banking.

A new era of doing business in the Internet requires a new model of strategy and marketing practice. According to a strategist*: "In light of new technologies, especially the Internet, a corporation undergoes a radical transformation that can be compared to a new industrial revolution. To survive and thrive in this century, managers will have to assimilate a new set of rules. Corporation XXI century must adapt to web management*". Another suggests that the Internet is *"revolutionizing the way we think about relationships with suppliers and customers, how to create value for them and how to make money in this process, in other words, it represents a revolutionary marketing"*.

New Economy focuses on information. The information has the advantage of being able to be arranged, divided, personalized and sent via network at incredible speeds. Due to rapid advances in Internet and other connectivity technologies, institutions have come to comprehend the gathering of data about individual customers and business partners (suppliers, distributors, sellers). In turn, they become more flexible in the individualization of products and services, messages and media.

Bank financial institutions in our country will face more and more demands imposed by the EU and their competitiveness on the European single market will be very largely dependent on how they will manage to implement an effective quality management system. The problem of quality management systems effectiveness is accentuated with more insistent lately due to increased competition and market globalization.

In conclusion, we appreciate that, given the emphasis of the competition, the European single market is a challenge both in banking and for organizations involved in harmonization of standards and legislation, which is why banking institutions adapt to new technologies is very important in front of customers.

CITY MARKETING AND ITS IMPACT OVER URBAN TOURISM – SIBIU EUROPEAN CAPITAL OF CULTURE 2007 - A SUCCESS STORY

ELENA LIDIA ALEXA[*]
CĂTĂLINA LACHE[**]

Abstract
In the past years tourism has become the fastest-growing economic sector, both in terms of turnover and the opportunity to create jobs. In this context, it begun to be one of the activities with an important potential and, in the same time, a challenge for the development of urban centers which find themselves forced to redefine their identity, due to the decrease of other types of industries under the impact of the global economic crisis and the economic reset. After analyzing the main indicators of the touristic activity in the urban area, it is noticeable that cities have an important percentage in the overall touristic circulation. The future development of this form of tourism is, however, conditioned by the assimilation in the urban management process of marketing strategies meant to allow the development of touristic functions in the main urban localities and of touristic programs designed to bring added value to the cultural attractions for large and small cities alike. Urban marketing comes, in this case, as a natural response to the requirements of the city to better answer the market's needs and to adjust to the dynamics of the tourist market. The present article aims to analyze the different urban marketing strategies used by urban centers interested in attracting important tourist flows and their impact over their future development, based on the Sibiu case after implementing the "Sibiu - European Capital of Culture" Programme in 2007.

***Keywords**: urban marketing, destination marketing, city branding, tourism, touristic attractiveness, competitiveness*

1. Introduction

The first part of the present paper analyzes the urban marketing strategies used by Sibiu municipality in 2007 when implementing "Sibiu - European Capital of Culture" Programme, in order to improve its image and to attract more tourists in the area. The second part evaluates the marketing strategies impact and the municipality ability to capitalize the advantage given by the European Programme, by examining the tourism statistics following 2007.

The importance of the study lays in drafting several marketing strategies that other cities can use outside a European Programme in order to promote their image and to attract more tourists.

The research will examine the papers submitted by Sibiu and other former European Capitals of Culture during the evaluation process, publications and online resources of European Cultural networks, documents and publications of the European Commission and local governmental documents which will describe the effectiveness of Sibiu, as European Capital of Culture in implementing and promoting its cultural programme and its impact on the long-term development of the city.

In the past years the main indicators of the touristic activity in the urban areas emphasize that cities have an important percentage in the overall touristic circulation and a recent study conducted by the European Travel Commission suggested that almost 20% of tourists who visit a European city mention culture, in the broader sense of the term, as the main reason for their visit. In these circumstances, urban tourism becomes associated naturally with cultural tourism and cities are

[*] Ph.D. candidate, "Alexandru Ioan Cuza" University Iaşi, e-mail: lidia.alexa@yahoo.com
[**] Lecturer, Ph.D., "Petre Andrei" University of Iaşi, Romania, e-mail: catalina_lache@yahoo.com

increasingly using cultural events to promote their image, encourage urban development and attract visitors and investments.

That is why the "European Capital of Culture" Programme has become appealing for different cities as their only possibility to visibly transform their cultural infrastructure, to boost the local economy, to attract tourists and to improve their image. The specialized literature treats mainly the subject of culture, as a means of promoting the cities and less the aspects regarding the European Capital of Culture Programme and subsequent impact over the cities which implemented the programme.

2. European Capital of Culture

The origins of the Cultural Capital event were put forward in 1983 by Melina Mercouri, the Greek Minister for Culture at that time. The event was designed to 'help bring the peoples of the member states closer together' through the 'expression of a culture which, in its historical emergence and contemporary development, is characterized by having both common elements and a richness born of diversity' (European Commission, 1985). In view of the fact that the proposal came from Greece, Athens was appointed the first Cultural Capital in 1985. Since then, the event has rotated around the member states of the EU, with a different city being awarded the honor every year.

The European Capital of Culture Action was introduced in 1999 by a Decision of the European Parliament and the Council1, building on the European City of Culture event that had operated annually since 1985.

This Decision created a specific Action, whose overall objective was to *"highlight the richness and diversity of European cultures and the features they share, as well as to promote the greater mutual acquaintance between European citizens"*[1].

Article 3 of the Decision stated that the "nomination of each city shall include a cultural programme of European dimension, based principally on cultural co-operation". It also set out a number of objectives that each nominated city must address, which were to:

- highlight the artistic movements and styles shared by Europeans which it has inspired or to which it has made a significant contribution;
- promote events involving people active in culture from other cities in Member States and leading to lasting cultural cooperation, and to foster their movement within the European Union;
- support and develop creative work, which is an essential element in any cultural policy;
- ensure the mobilization and participation of large sections of the population and, as a consequence, the social impact of the action and its continuity beyond the year of the events;
- encourage the reception of citizens of the Union and the widest possible dissemination of the various events by employing all forms of multimedia;
- promote dialogue between European cultures and those from other parts of the world and, in that spirit;
- optimize the opening up to, and understanding of others, which are fundamental cultural values; and
- exploit the historic heritage, urban architecture and quality of life in the city.

The list of former European Capitals of Culture:

1985: Athens	1996: Copenhagen	2003: Graz
1986: Florence	1997: Thessaloniki	2004: Genoa + Lille
1987: Amsterdam	1998: Stockholm	2005: Cork
1988: West Berlin	1999: Weimar	2006: Patras
1989: Paris	2000: Reykjavík Bergen, Helsinki,	2007: Luxembourg + Sibiu

[1] Decision No 1419/1999/EC of the European Parliament and of the Council of 25 May 1999 establishing a Community action for the European Capital of Culture event for the years 2005 to 2019

1990: Glasgow 1991: Dublin 1992: Madrid 1993: Antwerp 1994: Lisbon 1995: Luxembourg	Brussels, Prague, Krakow, Santiago de Compostela , Avignon , Bologna 2001: Rotterdam + Porto 2002: Bruges + Salamanca	2008: Liverpool + Stavanger 2009: Linz + Vilnius 2010: Essen + Pécs + Istanbul 2011: Turku + Tallinn

Although its first aim was to *"highlight the cultural wealth and diversity of the cities of Europe whilst emphasizing their shared cultural heritage and the vitality of the arts"*, it became obvious that the impact of this programme went beyond this educational level. It gave the city a marketing opportunity to improve its image on a national and European level, and represented an important regeneration instrument for the areas around which the main events occurred.

However, as the event has developed, it has been used in different ways by the cities, either to support, extend or challenge the original Cultural Capital concept. Table 1[2] illustrates the development of the event from its origins as a cultural festival to an integrated cultural capital programme, at least according to the planners of the Copenhagen event.

Table no. 1- The development of the European Capital of Culture Event

Level 1: a summer festival (Athens 1985, Florence 1986, Paris 1989)	A number of artistic events, primarily based on heritage. No international marketing. Short planning period, no long-term investment and few sponsors.
Level 2: an all-year festival (Amsterdam 1987, Dublin 1991, Madrid, 1992)	Focus still on fine arts, with national performances supplemented with a few international events. Fairly good quality, but lack of penetration because of planning gaps and lack of international marketing. Little investment, financial base primarily local.
Level 3: an art city (Berlin 1988, Antwerp 1993)	Well planned and managed international artistic programme running over a whole year. Strategies to stimulate artistic production. Professional, centralized management, with finance from the city, supplemented by substantial sponsorship.
Level 4: a cultural capital year (Glasgow 1990)	A more comprehensive programme based on a broader concept of culture. Many international highlights. Social, popular and economic structures included in the concept, with a view to creating long-lasting improvement in the image of the city. Long-term planning and management with participation of local groups. Financing from a broad spectrum of private and public sources.
Level 5: a cultural capital (Copenhagen 1996)	Development of a long-term strategy for the development of a cultural capital and improvement of the image of the city. Planning horizons extend beyond the year itself. The involvement of the local population and the business community is crucial, as is the stimulation of educational initiatives and cultural networks. The cultural capital concept involves the whole metropolitan region, with a separate environmental strategy and new infrastructure. Funding from a wide range of sources.

The cultural programme was the central element of nearly all European Capital of Culture, and represented on average 63% of the operational expenditure of European Capital of Culture. The European Capital of Culture cultural programmes are unique due to their scale, duration, scope and the range of stakeholders and partners. No other large-scale cultural events are directly comparable to

[2] Greg Richards, „The European Cultural Capital Event: Strategic Weapon in the Cultural Arms Race?", *Journal of Cultural Policy* 6(2000): 159-181.

the European Capital of Culture, and hosting the event was an unprecedented experience for most cities[3].

Communication and promotion is closely related to some of the key objectives established by the European Capital of Culture Programme, such as the enhancement of city image, attracting visitors to the city, or expanding the local audience for culture[4].

The 21 European Capitals of Culture spent in total over 105 million Euros on communication and promotion, in a range from just under 1 million to 14 million Euros, which represented between 7 and 24% of the total operating expenditure of the European Capital of Culture organization. However these figures should be treated with caution, as most European Capitals of Culture benefited from significant additional promotional expenditure by tourist boards, media and travel sponsors, cultural institutions and other partners.

The number of staff directly employed on communication and promotion varied from one to forty, however most European Capitals of Culture contracted elements out to public or private organizations, with tourist boards and municipalities often assuming responsibility for tourism marketing.

The most frequently used media by the European Capitals of Culture were print and broadcasting, while new technologies (internet, SMS) were comprehensively exploited by several recent European Capitals of Culture. Almost all used special events to promote the year, and a smaller number made significant efforts using merchandise as a communication tool.

3. Sibiu - Urban Marketing Strategies

Sibiu was the first European Capital of Culture (ECOC) to be staged in one of the post-2004 EU accession Countries and even if it was a risky bet at first, due to lack of experience in managing large scale cultural projects, to insufficient funding, or the fact that Romania was just joining the European Union, in the end it proved to be a success story.

The main aims of the event were[5]:

- Raising the international profile of Sibiu;
- Long term cultural development;
- Attracting international visitors;
- Enhancing feelings of pride and self-confidence;
- Growing and expanding the local audience for culture;
- Improving social cohesion and creating an economic downstream;
- Improving cultural and non cultural infrastructure;
- Developing relationships with other European cities/regions and promoting European cultural cooperation;
- Promoting creativity and innovation.

In addition there were a number of specific aims in the area of communications and promotion:

- Raising the international profile of the city;
- Changing the image of the city;
- Increasing foreign and domestic tourism;

[3] Palmer/Rae Associates, „European Cities and Capitals of Culture", Study Prepared for the European Commission, Brussels, 2004.

[4] Palmer/Rae Associates,„European Cities and Capitals of Culture", Study Prepared for the European Commission, Brussels, 2004.

[5] Sibiu European Capital of Culture 2007 website, accessed January 29, 2010, http://www.sibiu2007 ro/ en3/strategia htm

- Broadening audiences for culture;
- Improving the availability and dissemination of information about the programme is a major task, now under the process of construction.

The key objectives for 2007 CCE Programme in terms of communications and promotion are:

- Raising the international profile of the city;
- Changing the image of the city;
- Increasing foreign and domestic tourism;
- Broadening audiences for culture;
- Improving the availability and dissemination of information about the programme is a major task, now under the process of construction.

Sibiu 2007 CCE Programme has several communications priorities:

- Promoting the profile of the city;
- Promoting the brand/image of the Capital of Culture;
- Promoting the cultural programme of the Capital of Culture.

Table no. 2 – The target audiences of the communication strategies

Audience 1 – potential visitors	• Citizens from Sibiu and Romania, a national audience estimated at 5-5.5 million persons, focusing on the mobile categories, interested in cultural events and cultural tourism; • Citizens from EU and other European countries, from USA, Canada, Israel, accentuating the traditional areas generating tourist flows for Romania. The European targeted audience was estimated around 40-45 million people, focusing on the mobile categories, interested in cultural events and cultural tourism; • Organizations of Romanians from abroad.
Audience 2 – information multipliers	• Journalists and opinion-formers from Romania and abroad; • Tourism operators; • Business communities and lobby groups; • European and international organizations (UE, Unesco, EC).

In order to better implement the programme the representatives of the local stakeholders from Sibiu decided to create an NGO which would be entrusted with the organization of Sibiu – European Capital of Culture Programme: The Association Sibiu/Hermannstadt European Capital of Culture 2007.

The Coordination Office Sibiu European Capital of Culture 2007 represented the Association's executive board and had the following responsibilities:

- General coordination for Sibiu 2007 Programme;
- Thorough look into the objectives and artistic concepts of the Cultural Programme;
- Selection of the projects in the preliminary stages;
- Coordination and consultation with the Luxembourgian partners;
- Implementation of the Cultural Programme;
- Implementation of the communication and marketing strategy;
- Administrative and financial management for the Programme.

The Association has been the main stakeholder during the Sibiu 2007 Programme managing the marketing strategy alongside with the advertising company and the partners involved in the programme. When implementing a large scale project like this it is essential to have a clear and unique message communicated and so, the Association created the Visual Identity Guidelines which described the elements to be used by the different cultural partners in order to promote the visual

identity of Sibiu 2007 Programme within the context of its own event and the rules and limitations for using these elements.

The logo was divided in **(a)** text; **(b)** logos of financing institutions and of institutional partners, **(c)** logos of official partners, **(d)** logos of media partners.

Table no. 3 – The elements of the logo

The whole text was:

"Sibiu European Capital of Culture 2007 program is under the high patronage of the President of Romania. The program is developed by Sibiu European Capital of Culture 2007 Association in cooperation with Sibiu City Hall, the Ministry of Culture and Religious Affairs and Sibiu County Council, with the support of the Prime-Minister of Romania and of the European Commission."

The promotion campaign for Sibiu – European Capital of Culture 2007 was carried out with the support of GAV Scholtz & Friends, the company which won the auction. The program was promoted both at national and international level using different instruments of promotional mix: TV and Internet campaign, PR campaign, outdoor campaign, radio spots, and presentation films.

The Sibiu 2007 Programme logo was the following[6]:

[6] Visual Identity Guidelines, Coordination Office for Sibiu European Capital of Culture 2007 Program

The slogan, "City of Culture City of Cultures" was meant to underline the main characteristic of the city which is multiculturalism. The motto: "Sibiu - Young since 1191" emphasized the long cultural heritage of the city and also the modern context of its citizen's evolution, aiming at the same time to a different target for cultural tourism: young people.

The main communication vehicle used during 2007 event was the Programme website: www.sibiu2007.ro which was in Romanian, English and German so both national and international tourists could find useful information.

The outcomes of the campaign were[7]:

- Integrated communication campaign: TV (three spots, outdoor, PR campaign, radio campaign);
- International TV campaign: three international TV channels (EuroNews, Travel Channel, National Geographic), 1460 spots aired over a period of three months: 50 % to National Geographic, 30 % to EuroNews and 20 % to Travel Channel;
- more than 55 million people targeted in Great Britain, Austria, Belgium , Denmark, Finland, France, Germany, Ireland, Italy, Holland, Norway, Portugal, Spain, Switzerland, Bulgaria, Croatia;
- National TV campaign: four national TV stations (TVR 1, TVR 2, TVR Cultural, TVR Internațional), over 1600 spots aired, out of which 457 on TVR 1 and TVR 2, with an estimated target audience of 7 million people;
- Two outdoor campaigns (spring and summer-autumn) with over 3900 square meters of outdoor advertising displayed for 150 days in 48 central locations in Bucharest, Brasov, Targu Mures, Arad and Sibiu;
- Internet campaign with banners and pop-ups on three European websites for a period of 8 to 12 weeks: www.euronews net, www.travelchannel.com, www nationalgeographic.com.
- 2808 articles about Sibiu 2007 in the national press (October 2006 – December 2007), an average of 8 articles per day;
- 2386 minutes in the news on national TV stations (January – December 2007), an average of 7 minutes aired daily on national news programmes.
- 457 minutes of news on national radio stations (October 2006- December 2007);
- The general attitude of the articles toward the programme: negative – 5%, neutral – 25%, positive – 70%.

Besides the contracts financed by The Ministry of Culture and implemented through GAV Scholz & Friends, Realitatea TV station signed a partnership with Sibiu CCE 2007 Association to promote the event.

The partnership consisted in:

- Daily airing an one minute reports, in the evening news about Sibiu – European Capital of Culture, named "The number of the day in Sibiu";
- The show "EU, Romania" was dedicated, twice a month to Sibiu – European Capital of Culture;
- Another series of materials on Sibiu – European Capital of Culture were broadcasted once a week on Sunday in the afternoon news under the name "Eurocapitala" with an average duration of 8 minutes;
- Another series of materials labeled "Sibiu week at the Money Channel" were broadcasted during the daily show "Today's agenda" on The Money Channel TV Station.

The urban marketing strategy is strengthening by the touristic infrastructure developed in 2007: Sibiu has currently 15 active tourist information centers and the fact that the municipality continues to participate every year at the international tourism fairs and exhibitions around Europe.

[7] Sergiu Nistor, "Sibiu, Capitală Cultural Europeană – Raport sinteză, Bucureşti, Martie 2008

Another important aspect is that Sibiu continues to host every year cultural events with international impact: The International Theatre Festival, The International Jazz Festival.

The Development strategy of Sibiu County for 2010-2013 mentions as a priority of the tourism sector the development and communication of Sibiu Brand. The strategy aims to capitalize the positive image acquired throughout the European Capital of Culture Programme[8].

4. Tourism Development Effects

The Sibiu European Capital of Culture aimed to develop a „new tourism concept" in 2007, with the following aims:

- Promoting high-quality, ecologically sound, tourist experiences in Sibiu and the surrounding region.
- Providing satisfaction. Tourists must enjoy their stay here; they must be so satisfied with their experience that they will be willing to tell others about the city. The programme aims to integrate the tourism industry into an all-embracing concept, and connect it to a regional services network which operates at high standards.
- Intensifying the tourism marketing. In this regard, the activities will include:

- the promotion of the historical city centre;
- easy access to the sights and monuments in the region;
- the promotion and reintegration of the tourism market of the mountain resort at Paltinis (situated in the close proximity to the city);
- planning and organizing local, regional, inter-regional, national and international events;
- developing a gastronomic and hotel industry of high quality, enhanced by an attractive calendar of cultural and artistic events;
- developing new forms of tourism: religious, scientific and cultural, which can make better use of the local and regional conditions.

The results of visitor research conducted by ATLAS in 2007 indicated that the new tourism concept was largely successful, both in terms of the visitor profile and in terms of high levels of satisfaction[9].

It is rather difficult to separate the impacts of the European Capital of Culture Programme itself from the general growth in tourism supply in Sibiu, which would probably have shown some growth without the European Capital of Culture as well. However, looking at the pace of growth, it is clear that the period after 2007 has seen a substantial increase in the supply of hotels and other accommodation facilities.

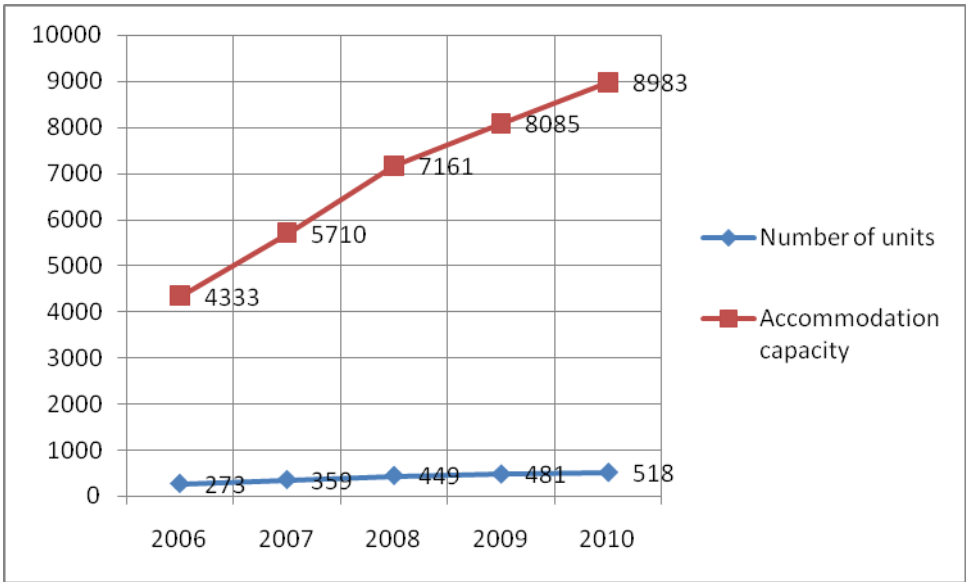
Table no. 4 - The evolution of the accommodation capacity in Sibiu County 2005– 2010

Year	Number of units	Accommodation capacity	Accommodation capacity Newly classified structures
2006	273	4333	-421
2007	359	5710	1377
2008	449	7161	1451
2009	481	8085	924
2010	518	8983	898

Source: compilation between INSSE statistical data, Masterplan for Tourism in Sibiu County, Sibiu County Tourism Association – Annual Report 2009

[8] Strategia de dezvoltare a județului Sibiu pentru perioada 2010 – 2013 și direcțiile de dezvoltare ale județului pentru perioada 2014 – 2020, Sibiu, 2010

[9] Richards, Greg nad Rotariu, Ilie, The *Impact of the 2007 European Cultural Capital in Sibiu: A long term perspective*, Sibiu, Editura Universității „ Lucian Blaga" din Sibiu, 2010.



As we can see from the table above 2007 has been an important year in the touristic development of Sibiu, from the number of touristic units and accommodation capacity, point of view. The overall result has been a doubling of total accommodation supply since 2006 and a continuous positive trend. It is also relevant that several large commercial hotels development accommodation facilities mainly in Sibiu, but also in the surrounding area.

The predicted increasing of tourists attracted many investments in hotel industry. The total amount spent for refreshing accommodation establishments was 60 million Euros[10]. Many existing hotels were renovated and some of them were reclassified to an upper category.

Ramada Hotel which is an international brand also opened a location in Sibiu. This expansion put Sibiu in top 5 Romanian destinations considering the number of hotels. An interesting aspect is the development of medium and large hotels with more than 70 rooms.

Due to the fact that many of the hotel projects related to the European Capital of Culture were not actually operational until 2007 or even in 2008, the biggest effects of hotel development were actually felt the year after the European Capital of Culture Programme. By 2009 Sibiu had an additional six four or five star hotels compared with 2006. This way, not only did tourism increase, but visitors also stayed in higher grade accommodation and therefore paid higher average room rates.

Table no. 5 - Tourist arrivals and overnights in Sibiu County 2006-2010[11]

Year	Arrivals (thousands)	Overnights (thousands)
2006	252.7	434.5
2007	327.9	530.1
2008	287.1	459.3
2009	240.1	375.9
2010*	196.1	345.6

*****statistics available until November 2010

[10] Smaranda Cosma, Adina Negrusa and Cristina Popovici, "Impact of Sibiu European Capital of Culture 2007 event on country tourism", *Proceedings of the 2nd WSEAS International Conference on CULTURAL HERITAGE and TOURISM.*

[11] www.sibiu.insse ro, National Institute of Statistics, Sibiu County Department, accessed January 29, 2010..

The tourism statistics show a clear boost both in terms of arrivals and bednights during the European Capital of Culture Programme in 2007. The fact that, starting with the following year, the number of tourists decreases is rather normal considering the global economic crisis, which had an important impact over the touristic activity. However, we need to take into consideration the fact that the decline was framed in the general national trends and that almost a third of overnight visitors stated that they stayed with friends and relatives when visiting Sibiu in 2007, so the decrease showed by the official statistics may not be entirely accurate.

Table no. 6 - Tourist arrivals and overnights in Sibiu City 2006-2009[12]

Year	Arrivals (thousands)	Overnights (thousands)
2006	150	235
2007	178.5	280.9
2008	147	204
2009	120.3	164.2

The data for 2008 and 2009 show a decline in tourist arrivals and overnights, which is also probably related in 2008 to post-ECOC decline and in 2009 to the economic crisis. It is also clear that the decline in arrivals and overnights follows national and regional trends. Compared to other cities in Transylvania, for example, the decline in arrivals in 2009 has been lower in Sibiu than in any other city except those of Mures County.

An important aspect in interpreting the statistics is the fact that almost a third of the people visiting Sibiu stated that they stay with friends and relatives, so, these are also tourists not included in the official statistics. Another issue is represented by the different accommodation units which are not registered, but still practice tourism.

Trends in the economic impact of tourism are also evident from the data on tourism tax revenues. These show clearly that 2007 marked a giant leap forward in terms of the development of the tourism economy of the city and the contribution of tourism to civic finances.

Tourism tax revenues grew by over 70% between 2006 and 2007, and have remained at these high levels in 2008 and 2009. In spite of the general downturn in tourism in Romania, tax revenues were still 70% higher in the first half of 2009 than they were in 2006. This shows that the European Capital of Culture Programme was successful in stimulating a qualitative change in the development of the tourism industry in the city[13].

5. Conclusions

In conclusion, the statistics show that Sibiu - European Capital of Culture Programme has had a strong impact on accommodation development both in terms of quantity and quality, not only in the city itself but also in the surrounding area. The marketing investments from 2007 proved to have an important impact on the overall touristic activity, but the fact that the municipality decided to capitalize the brand attributes acquired during the programme by including it as a major priority in the Development Strategy, demonstrated that Sibiu can stay on the European cultural tourism map for a long time from now on.

The fact that Sibiu continues to participate at the international tourism fairs and exhibitions around Europe, that, it hosts every year cultural events with international impact such as the

ORGANIC FOOD LABELING AND CERTIFICATION

NICOLETA-ANDREEA NEACŞU[*]
ANCA MADAR[**]

Abstract
In the rush to produce more and more crops to satisfy growing demand producers have had to resort to using a lethal cocktail of pesticides to control disease and insect attack. This has lead to numerous international debates about unhealthy food, the effects of it and the measures that must be taken in order to avoid the harmful effects of genetically modified food consumption demonstrated by specialists. These debates evolve around the benefits of the organic products versus the pure trade trick outlined by some. The organic food movement has earned its well deserved place in many markets around the world. Its prestige is lately being widespread to vast parts of Eastern-Europe as well. Based on data collected from specialized reports and articles on organic products, the aim of this paper is to present the importance of organic products, the regulations on organic food and different labels used around the world in order to certify the organic food products.

Keywords*: certification, food, labels, organic food, products.*

1. Introduction

Based on data collected from specialized reports and articles on organic products, the aim of this paper is to present the importance of organic products, the regulations on organic food and different labels used around the world in order to certify the organic food products.

Organic foods are made according to certain production standards. For the vast majority of human history, agriculture can be described as organic; only during the 20th century was a large supply of new synthetic chemicals introduced to the food supply. This more recent style of production is referred to as "conventional." Under organic production, the use of conventional non-organic pesticides, insecticides and herbicides is greatly restricted and saved as a last resort.

However, contrary to popular belief, certain non-organic fertilizers are still used. If livestock are involved, they must be reared without the routine use of antibiotics and without the use of growth hormones, and generally fed a healthy diet. In most countries, organic products may not be genetically modified. It has been suggested that the application of nanotechnology to food and agriculture is a further technology that needs to be excluded from certified organic food. The Soil Association (UK) has been the first organic certifier to implement a nano-exclusion.

Organic food production is a heavily regulated industry, distinct from private gardening. Currently, the European Union, the United States, Canada, Japan and many other countries require producers to obtain special certification in order to market food as "organic" within their borders. Most certifications allow some chemicals and pesticides to be used, so consumers should be aware of the standards for qualifying as "organic" in their respective locales.

2. Organic Food

Historically, organic farms have been relatively small family-run operations, which is why organic food was once only available in small stores or farmers' markets. However, since the early 1990's organic food production has had growth rates of around 20% a year, far ahead of the rest of

[*] Lecturer, Ph.D. candidate, Faculty of Economic Sciences and Business Administration, "Transilvania" University, Brasov (e-mail: deea_neacsu@yahoo.com).

[**] Lecturer, Ph.D., Faculty of Economic Sciences and Business Administration, "Transilvania" University, Brasov (e-mail: ancamadar@yahoo.com).

the food industry, in both developed and developing nations. As of April 2008, organic food accounts for 1–2% of food sales worldwide.

Processed organic food usually contains only organic ingredients. If non-organic ingredients are present, at least a certain percentage of the food's total plant and animal ingredients must be organic and any non-organically produced ingredients are subject to various agricultural requirements. Foods claiming to be organic must be free of artificial food additives, and are often processed with fewer artificial methods, materials and conditions, such as chemical ripening, food irradiation, and genetically modified ingredients. Pesticides are allowed so long as they are not synthetic.

The following chart shows the size of organic farmlands (in ha) in different countries from Europe.

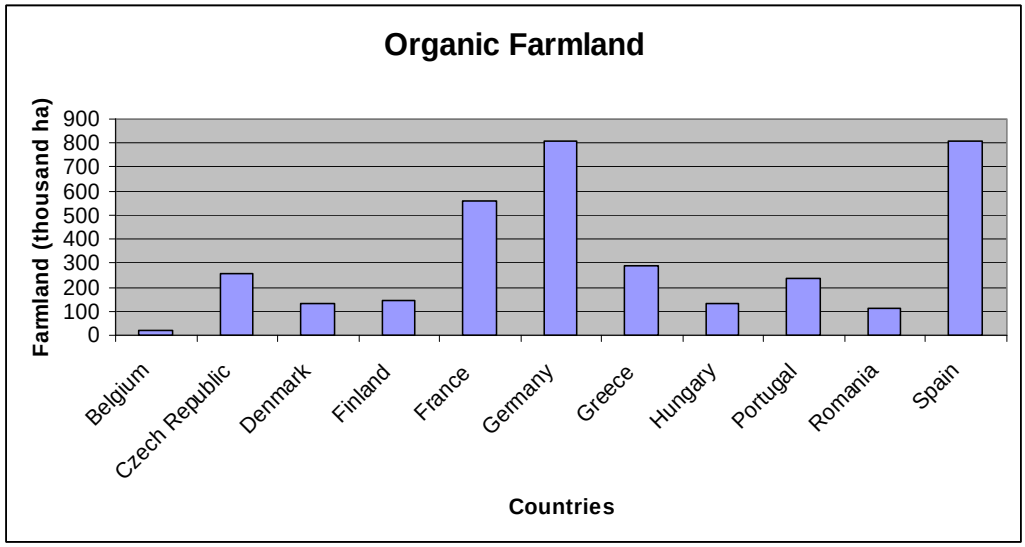

Chart 1.1: Organic Farmland in different European Countries, in thousands of hectares
Source: www.organic-europe.net

However, it must be taken into consideration the total area of these countries. It is logic that bigger countries have a larger farmland.

Early consumers interested in organic food would look for non-chemically treated, fresh or minimally processed food. They mostly had to buy directly from growers: "Know your farmer, know your food" was the motto. Small farms grew vegetables (and raised livestock) using organic farming practices, with or without certification, and the individual consumer monitored. As demand for organic foods continued to increase, high volume sales through mass outlets such as supermarkets rapidly replaced the direct farmer connection. Today there is no limit to organic farm sizes and many large corporate farms currently have an organic division. However, for supermarket consumers, food production is not easily observable, and product labeling, like "certified organic", is relied on. Government regulations and third-party inspectors are looked to for assurance. A *"certified organic"* label is usually the only way for consumers to know that a processed product is "organic".

The ecological aliments are diversified, healthy, and free of diseases and pets, deprived of noxious residuum, with a balanced content of bioactive substances and minerals.

Advantages of ecological products consumption are:

- to their production are not used herbicides, pesticides, hormones;
- they don’t contain additives or other chemical substances;

- they are not genetically modified;
- animal origin products don't contain antibiotics;
- they are healthy products, deprived of noxious residuum;
- they have a balanced content of bioactive substances and minerals;
- their impact of environment is minimal.

The disadvantages of ecological aliments are firstly represented by higher price and limited range. The higher prices are a consequence of lower productivity, because of non using additives, fertilizers and other chemical substances that have the role to increase the production.

Ecological products obtain their status only after the product unity is verified and certified. These products must have a quality certificate and the sigle of Certification Institute.

The label of an ecological product must contain: producer's name and address, the product name, the ecological production method used, the name and sigle of Institute which certify the product.

The traders of products containing 95% organic ingredients must use a EU special logo and a label indicating the product origin. Underneath will be another label indicating the organic ingredients type. This measure will permit to the consumers to easy recognize the ecological products from EU and to know exactly what they are buying. The label can be accompanied by national or private logos, depending of each member state.

The catering companies are excepted from these rules, but states can introduce national rules in that field.

Now, EU has 2 categories of labels:

- gold standard for final products containing minimum 95% of organic ingredients
- emphasized labeling for products with at least 70% organic content.

3. Organic Food in the Czech Republic

The Czech organic food market is developing rapidly. In 2005 the turnover grew by 30% and reached 350 million Czech crowns (ca. €12.5 million). The main reason for this growth is demand from Czech consumers; however, this is predominantly satisfied by increased imports from abroad.

In the retail market there is an ongoing lack of certain basic commodities of organic quality, for instance eggs, certain types of meat (above all poultry), fruit, vegetables, and milk and dairy products, especially butter and cheeses.

In general, organic food in supermarket chain stores is offered under the labels of the producer organizations. Nonetheless, the first organic labels of the retail chains are starting to appear. Super- and hypermarkets are the largest distribution networks for meat (beef from Biopark; pork from Delvita) and dairy products (Olma, Valašská Dairy, Polabské Dairies). Delvita, Tesco and Hypernova offer a limited range of fruit and vegetables (supplied by Ekofarma Deblín).

In 2005 the BIO logo of organic food in CR was transferred from private hands into the state's possession. The state support allocated to organic food producers was renewed in 1998, determining the development of this field. The support given by the state varies according to the type of food product.

The main regulation, which was changed as beginning with 2005, is Act. No. 553/2005 which amends Act. No. 242/2000, came into force as of 30.12.2005. The purpose of this amendment was to omit all the regulations from Act. No. 242/2000, which are duplicated in the European legislation. This lead to a simplification of the legislation.

4. Organic Certification

Organic certification is a certification process for producers of organic food and other organic agricultural products. In general, any business directly involved in food production can be certified, including seed suppliers, farmers, food processors, retailers and restaurants. Requirements generally

involve a set of production standards for growing, storage, processing, packaging and shipping that include:

- avoidance of most synthetic chemical inputs (e.g. fertilizer, pesticides, antibiotics, food additives, etc), genetically modified organisms, irradiation, and the use of sewage sludge;
- use of farmland that has been free from chemicals for a number of years (often, three or more);
- keeping detailed written production and sales records (audit trail);
- maintaining strict physical separation of organic products from non-certified products;
- undergoing periodic on-site inspections.

Organic certification addresses a growing worldwide demand for organic food. It is intended to assure quality and prevent fraud, and to promote commerce. For organic producers, certification identifies suppliers of products approved for use in certified operations. For consumers, "certified organic" serves as a product assurance, similar to "low fat", "100% whole wheat", or "no artificial preservatives".

Certification is essentially aimed at regulating and facilitating the sale of organic products to consumers. Individual certification bodies have their own service marks, which can act as branding to consumers; a certifier may promote the high consumer recognition value of its logo as a marketing advantage to producers.

5. Organic Food Labeling

In some countries, organic standards are formulated and overseen by the government. The United States, the European Union and Japan have comprehensive organic legislation, and the term "organic" may be used only by certified producers. Being able to put the word "organic" on a food product is a valuable marketing advantage in today's consumer market, but does not guarantee the product is legitimately organic.

In the US, federal organic legislation defines three levels of organics:

1.Labeled "100% organic" - products made entirely with certified organic ingredients and methods

2."Organic" – word can be used for products with at least 95% organic ingredients

3."Made with organic ingredients" – is a label for products containing a minimum of 70% organic ingredients.

In addition, products may also display the logo of the certification body that approved them. Products made with less than 70% organic ingredients can not advertise this information to consumers and can only mention this fact in the product's ingredient statement.

The following picture presents the logo of organic products in the United States:

Picture 1.1.: The official seal found on USDA certified organic foods
Source: www.organic-world.net

EU countries acquired comprehensive organic legislation with the implementation of the *EU-Eco-regulation 1992*. Supervision of certification bodies is handled on the national level.

In March 2002 the European Commission issued a European wide label for organic food however for most of the countries it was not able to replace existing national product labels. It was re-launched in 2009 with a design competition for a new logo to be used throughout the EU from July 2010. The new logo for European Union member states can be seen below:

Picture 1.2: The new official seal for EU organic products
Source: www.organic-world.net

In **France**, organic certification was introduced in 1985. It has established a green-white logo of "AB - agriculture biologique", seen in picture 1.3. The certification for the AB label fulfills the EU regulations for organic food.

Picture 1.3: Organic seal in France
Source: www.organic-world.net

In **Japan**, the Japanese Agricultural Standard (JAS) was fully implemented as law in April, 2001. This was revised in November 2005 and all JAS certifiers were required to be re-accredited by the Ministry of Agriculture.

The seal pf JAS can be seen on the picture below:

Picture 1.4: JAS www.organic-world.net
Source: www.organic-world.net

In **Australia**, the Australian Quarantine and Inspection Service (AQIS) is the controlling body for organic certification because there are no domestic standards for organic produce within Australia. Currently the government only becomes involved with organic certification at export, meaning AQIS is the default certification agency. The largest certifier of organic products is Australian Certified Organic (logo seen in picture 2.5), which is a subsidiary of Biological Farmers Australia, the largest organic farmers' collective in the country.

6. Organic Food in Romania

In Romania, organic food and beverages account for a mere one percent of total food sales, according to Agriculture ministry. "Romanians were fascinated by McDonalds and Coca-Cola after the 1989 Revolution, but today people think more about their health and are starting slowly to come to organic food," said Marian Cioceanu, president of NGO Bio Romania.

The fact that the organic products have an outlet in Romania is proved by imports, which are doubled each year. In 2007, the market of organic products was estimated at 2.5 million EUR, by 1 million EUR more than in 2006. The table below shows the evolution of organic food production in Romania (in tons and hl):

As in the case of land areas and livestock, productions continuously increased in the investigated period. Although the production levels are much higher than those obtained 5-6 years ago, the domestic supply cannot totally meet the demand yet, which makes it possible for the imported organic products to penetrate the Romanian market.

The organic products are found both in the large store network and in the small specialized shops. At the beginning of the year 2007, only two shop networks were registered at MAPDR: the shop "BIOCOOP" (Sibiu) and the shop Naturalia (www naturalia.ro), with units both in Bucharest and in the county Ilfov (Voluntari).

The sale on the domestic market is through the wholesale networks Metro, Selgros mainly by retail shops. The main stores that introduced organic products in their assortment of goods are: Carrefour, Cora, Gima, La Fourmi, Mega Image, Nic, Primavera, OK.

Picture 3.1: Organic products' logo
Source: www.organic-world.net

EU provides support for the promotion of organic products, through co-financing programs, with a 50% funding from the European Commission, 20% from professional organization, and 30% from the state budget, in conformity with the procedure of the Commission Regulation (EC) no. 1071/2005.

The governmental policy is elaborated and coordinated by Ministry of Agriculture, Forestry and Rural Development (MAPDR), under which the Office of the National Authority for Organic Products (ANPE) is operating, which is the authority in charge of the organic farming sector.

7. Official Control of Aliments

For assuring a consumer proper protection, by Government Order nr 1196/2002 from 12.14.2002, was approved the general Norms regarding food official control.

The Norms establish the general principles for execution the official control of aliments addressed to internal market trade or export, as well as aliments offered for free by economic agents, associations or foundations.

Official control of aliments represents the inspection made by authorities about aliments, additives, vitamins, mineral salts, as well as materials and objects who came in contact with aliments, for checking legal dispositions regarding risks prevention for public health, guarantying proper commercial transactions, protecting the consumer interests and informing them.

The control is made periodically (as a rule without warning) or any time when an illegality is suspected.

The control is done by using aim adequate ways and can target all cycle stages that include the manufacture, import, deposit, delivery and trade.

Executed control includes one or more of next operations:

a) inspection;
b) assay and examine samples, tests;
c) control of personnel hygiene;
d) documents examination;
e) examine all the checking systems established by economic agent and obtained results.

During the inspection is checked the following:

- the way of use and the status of terrain, construction and installations, offices and other spaces, neighboring, ways of transport, machines and equipment used;
- raw materials, ingredients, auxiliary technological materials and other products used for food production and preparation;
- the half-finished products;
- the finished products;
- the materials and objects that came in contact with aliments;
- the products and procedures for cleaning and maintaining;
- the procedures used for aliments manufacturing and processing;
- the aliments labeling and presentation;
- the preserving ways.

Through Phare RO 9704 – 02 Project, EU supported Romania food industry companies regarding to products standards harmonization. This project includes activities grouped in two domains: 1. consultant and managerial training for alimentary products suppliers; 2. informing the business environment from alimentary sector regarding products quality.

For aligning to EU norms in products quality domain, Romania took over all ISO 9000 standards appeared by now at world level, being RS (Romanian standard) or EN (EU standard) encoded.

EU 93/43 Directive regarding alimentary products –hygienic requirements- refers to a quality management system implementation, conform standards series ISO 9000, in those organizations that

manufacture and process aliments. Also, the Directive refers to the possibility of using HACCP (*Hazard Analysis Critical Control Points*) as part of a quality management system.

8. Conclusions

The word organic is central to the certification (and organic food marketing) process, and this is also questioned by some. Where organic laws exist, producers cannot use the term legally without certification. To bypass this legal requirement for certification, various alternative certification approaches, using currently undefined terms like "authentic" and "natural" instead of "organic", are emerging. Consumers have to be informed about real organic products and laws must always be adopted in order to certify these products and to regalement their production processes.

As seen from the information presented in this paper, various labels serve the purpose of guiding consumers. They have to pay attention and to closely analyze the available organic products.

From the tables and chart it can be deduced the increasing trend of organic food. In the same time it must be taken into consideration that the certification holds drawbacks as well. It could be seen as a barrier to entry for small producers and an unnecessary bureaucracy.

Taking into consideration all the aspects of this topic the first and most important issue is to be aware of tricks and to know as well as possible the consumer protection regulations that might come in handy if bumping into a false organic product.

MANAGERIAL FORMATION, LIFESTYLE AND PERFORMANCE

CĂTĂLINA BONCIU[*]
CRISTIAN SIMA[**]

Abstract
The definitive characteristics of companies' management and background have offered more or less convincing explanations for the fundamentals of their performances and competiveness. It was long studied the ability of managers and management teams of drawing "strategic lines" at national, regional, EU and world level. The future, instead, is at stake because of the crisis. All big companies experienced new managerial methods and models, more or less strategic, for the past two years. The present shows that those companies which resisted in front of the present realities of the market do not fit in the general strategic management. Already, often, the strategy does not excel one year. What preoccupies the specialists in human resources lately is the existent disequilibrium on the labor market and the crisis at all levels: moral crisis – spiritual crisis – financial crisis – economic crisis – social crisis, and on the needs to reduce costs with the human factor. Very few will be interested in indentifying their employees' labor aspects. They examine human personality, with the purpose of completing their employees' professional training and improvement, their performances and behavior at work, their individual results and those of the organization compared to competition… That seems to be enough, right?! But who is still interested in investigating the relation between the work results and the quality of life, the lifestyle, the personal satisfactions?

Keywords: *evaluation of management quality, lifestyle, quality, crisis.*

1. Introduction

The manifestation of the human factor in social and economic activities, involves not only the existence of a numerical quantity of it, but especially a certain level of training, of professional qualification. In simple words, the quantitative aspect is relatively easy to solve, each company draws from the labor market the respective necessary employees (calculated according to the objectives established and the interest to maximize profits). Qualitatively, the problem is more complex. The qualitative side, in the case of the labor factor, refers to the professional training, qualification, level of qualification and to the continuous formation, therefore to learning throughout life.

Until three or four years ago, when mankind was living in a time of intense expansion of technics and modern technology, the continuous improvement of workers within each company was producing significant changes in the character and content of work. This required workers with a high professional training, with a wide horizon of culture, able to master modern means of production. In real terms, on the labor market one could feel the companies' concern to improve, on one hand, the quality of labor resources, and on the other hand, the use of labor resources available in each company.

In the Romanian economy of the recent years, the relationship between the level of training and performance is impossible to separate from that of quality – quality of life, quality of work, quality of work life and why not, primarily, employees' human quality, not only their professional and managerial training.

[*] Professor, Ph.D., Faculty of Administration and Business, University of Bucharest (e-mail: catalina.bonciu@yahoo.com).

[**] Researcher, Centre for Industrial Economics and Services, National Institute of Economic Research (e-mail: sima60cristian@yahoo.com).

Even the meanings of "performance" experienced somewhat different approaches from those already established. Cases of perpetual crisis, recession, déjà vu in solving the crisis, marked the reevaluation of the turnover values, the profits, the exports, the employees that were not laid off, taking extreme measures in order to keep the organization at functional parameters.

That is performance, to prevent bankruptcy and not to lay off workers!

Sad, but terribly true.

2. Literature review

Normally, the bond between training – management training – quality / lifestyle – performance is represented by the ability to understand the content of each of the concepts mentioned especially the interdependencies between them, as well as the consequences of the individual and combined actions.

The economic publications have made available thousands of pages on managers, their training in making businesses efficient and maximize the profits by developing and generalizing performance - A. Chandler, P. Drucker, O. Gélinier, as well as Eugen Burdus, Viorel Cornescu, Gheorghita Caprarescu, Ovidiu Nicolescu, Ion Verboncu, Tiberiu Zorlentan...

Regarding the standard of living, lifestyle or the quality of life, we can say that managers have not shown sufficient concern to study the organizational context in order to identify the dependences and interdependencies with the work results. We know of research conducted over decades by Annas, Bowling, Cella, Cherin, Evans, Farquhar, Veenhoven, Sergiu Baltatescu, Ion Marginean, Lazar Vlasceanu, Catalin şi Elena Zamfir ...

3. Theoretical background

Mankind was witness over the years to an accelerated evolution of the individual, from the child in school, student in university amphitheatres, to the specialist engaged in a continuous self-improvement of his/her own professional, managerial knowledge. Perhaps the time has come to a slowdown of the process, for a deep, serious and sincere reflection about the way of understanding the complexity of present reality, of planning the personal/professional and managerial evolution, and most of all, of putting into practice in an efficient way the work of the people so formed.

Experts say that humanity is still struggling with an unprecedented crisis. The methods known and applied do not seem to help. As regards the human factor, the classical patterns of education and personality formation, they do not prove sufficient. The current financial and economic crisis, without precedent in the heyday of educational management/academic or human resources management, combined with the identity crisis of the human factor. The present shows, first of all, a human crisis: identity, physical, understanding, behavior... So, where should we look for the answers to the needs of restructuring the society [1]?

Hard to understand is that the wise men with decision power, both in the education system and in the ministries with impact on the professional development of people, are not inert, but destructive. They seem not to be aware of that fact that the work results are in direct proportion with the way in which the employed person is valued (by others, but also by his/her own standards), of the issuance of a certificate attesting a competence or more competences, of the collective or individual awareness of the personal value, of understanding the necessity of familiarize with the proactive thinking and the application examples [2]...

Study hypothesis

- Training, especially training in management, is a constant of the economic activity, just that the present situation requires changes in the approach, variation in the training programs not being enough.

• Obtaining performance is not only conditioned by the managerial training, but also by the quality of life, including the work life of all workers.

4. Possible arguments

Training is a complex and lengthy process [3]. It is materialized for each individual in its qualification for a certain profession out of the wide range of professions in a society. Qualification can be seen as acquiring all the basic scientific, technical and special knowledge, as well as all the necessary skills for carrying a profession under certain economic, technical and organizational conditions. Taking into account the opportunities, skills and aspirations of each individual, the concept of qualification becomes even wider, richer. Especially under the present conditions of technical progress, when more and more professions require a certain type of skills, the qualification of each person has to start from their identification, continuing with their development thorough professional training. Taking this into account, we consider that the professional training groups two different major processes [4], namely: the professional education (which highlights the abilities of each person and, in the same time, that person is oriented towards one of the professions appropriate for the respective abilities) and the professional formation (the process though which, effectively, the preparation of each person for the job they choose is accomplished, by using all the methods and forms existent at a certain moment for acquiring scientific, technical, general and special knowledge and working skills).

In other words, the professional formation has to be the perfect combination between the process of education and work, evolving in two directions, namely [5]:

• Ensuring for each person a volume of general and special knowledge, and particularly, superior managerial knowledge. This is achieved by means of school preparation, but also of some special forms of training within the company, by this the employee acquires more competences.

• Formation of practical working skills. Practical learning in shops and enterprises under specialized guiding. The content of the work competences acquired is formed by the existence of certain methods of action practiced through exercise, i.e. continuous repetition in executing specific operations or works. As these exercises increase, the inherent clumsiness of the beginning disappears, the individual is becoming more and more familiar with the content of the activities required, the nervous tension fades, and the effort per time unit decreases continuously. The skills' training process appears like a process of work experience accumulation, each repetition leads to better skills, work experience and enhances performance [6].

Generally accepted

The theory states a person's managerial skills, pointing out that their existence does not necessarily lead to success in the act of leading. More often they accept the idea that managers are formed through formal education, but also in practice, but this is not enough. Even today, there are very few accepting that a valuable manager is born for that particular profession. In other words, native qualities are the basis for the completion of the acquired skills.

Along with the professional skills, primarily, or with the general knowledge and qualities, the abilities, talent, experience or even gender, secondly, come together to form an efficient manager. The managerial training results in a set of ten competences [7]:

• Establish a clear direction for action;

• Achieve a system of open and intense communication with all workers, regardless of their hierarchical position in the organization;

• Train and support the others;

• Recognize objectively the subordinates' performances;

• Efficiently equilibrate control and trust (knowing that their sum is a constant in management);

- Correctly know the persons to lead the organization;
- Correctly evaluate the financial consequences of the decision process;
- React positively, openly to new ideas;
- Send clear messages and clearly communicate decisions;
- Have an ethical integrity and be an example for the others.

Most of the theorists believe that managers are those who meet two categories of requirements [8]:

- Requirements related to personality, defined by: the subject's constitution and temperament; the physical environment (or climate); social environment (land, family, education); habits, skills in everyday life...
- Requirements related to intellectual abilities: intelligence; openness to new ideas; memory; rational, clear and straightforward thinking, both in term of theorization, generalization and abstraction, but also in solving everyday problems...

However, the manager's skills always appreciated are grouped into four categories:

- Cognitive skills – serving managers in collecting and summarizing information required, as well as to expose them in an accessible manner, easily understood by others;
- Interpersonal skills – enabling managers to master human resources under their leadership by precisely awarding each team member the most appropriate role in the company;
- Communication skills – easily solve existing problems, as well as managing, formally or informally, exceptional problems that may appear;
- Motivational skills – enable managers to establish clear, deeply determined and ranked objectives.

Some also believe that the qualities, skills and competences are not the only defining elements of a manager. There have to be added some technical (tasks or works) activities, analytic, conceptual, decisional activities, in the field of human relations, communication, computers....

The fact is that regardless of the interpretation, approach, grouping or denomination, the managerial training results in a series of characteristics, competences, abilities, aptitudes, talents, vocations... subordinated to a single purpose: to lead people in order to lead processes.

The managerial training completes the special formation, is continued with managerial training, various other trainings, formations and any other ways by which managers can broaden their knowledge and skills [9]. The managers' professionalism is subject to the quality of the management training, determined, on its turn, by the complexity of the training, its pragmatism, the measure in which the knowledge and skills are updated, as well as by the measure in which new attitudes and behaviors are shaped in accordance with the recent trends. Specifically we are talking about:

- **Special training (basic formation).** The importance of the basic formation (engineer, economist, lawyer etc.) within the managerial training decreases proportionally with the position occupied by the manager on the career ladder within the company. For the average levels and especially the low leading positions, which are closer to the places where work is being carried out, the importance of the basic formation is clear, because managers have to face directly with problems regarding the respective activities, therefore it is compulsory that he/she be familiar with all the aspects of those problems. At the company's management level, especially in big companies, the basic formation of the managers significantly loses importance, since the nature of the problems faced by managers at this level and, therefore, the managerial approach, is of a superior persuasion, which requires creativity, strategic vision, foreknowledge and the ability to coordinate different activities etc., which have far less to do with the basic formation. Thus, achieving performance depends on:
  - specialized training profile;
  - its congruency with the management activity;
  - its relevance in relation to the manager's hierarchic level.

• **MA formation.** Application at European level of the Declaration of Bologna, has given increased importance to the MA (considered a superior form of training which leads to a more concise answer to the real qualification needs on the labor market). The added knowledge and specialized skills achieved through MA training is reflected on the managerial performance according to:

- MA training profile;
- Its congruency with the management activity;
- A plus of knowledge and skills which the now manager acquired in the MA training.

• **Ph.D. formation.** The higher form of high scientific qualification, after finishing the university studies, PhD involves the materialization in a scientific paper of an idea, a project, a deep approach of a certain specialized problem. PhD holds a paramount importance for the scientific careers (in fundamental and applied research) and university careers. For management positions, PhDs in technical sciences are significantly less relevant than those in social sciences related to the management or connected areas (marketing, forecasting, finance, operational research, organizational psycho-sociology etc.), because the latter, through considerable efforts of documentation and experimentation, considerably broadens the horizon of knowledge and the consolidation of certain skills directly related to the management practices.

• **Management training through university classes** (specialization – Management). This basic training is of vital importance for creating a professional manager. During the year of study with specialization Management, the graduate acquires a considerable amount of knowledge, a wide range of skills specific to that of a manager, basic rules essential for a quality management (attitudes and behaviors), in accordance with the latest elements and trends in the managerial science and practice. The effectiveness of managerial knowledge and know how within university classes is conditioned by their applicative, pragmatic character, as well as by the intensity with which they are used in interactive, participatory methods, focused on developing the base understanding of problems and on creativity. The intense presence in the university curricula of participatory methods (panel, incident, sensitivity training, solving correspondence, case study, entrepreneurial game, or in the Romanian variant, the economic project) in the past decades, is a convincing confirmation of their effectiveness in the training process, in the sense that they ensure the acquisition of conceptual, decisional and action skills that will allow the future managers to successfully face the real problems. Among graduates with specialization Management, only some will come to hold managerial positions, others will sure their knowledge and skills as specialists in activities related to the managerial practice (strategic planning, operational research, organizational development, project management, staff training etc.). The performance of a company where such graduate is working, depends on:

- the quality of the university classes completed, assessed by the reputation of the high education institution attended;
- graduation degree;
- contingent exceptional achievements of the manager during his university training (specialization in famous universities abroad, excellence awards etc.).

• **Post-university managerial training.** The requirement of continuous training is greatest for those who hold managerial positions. The answer to this requirement implies, for managers, the regular participation, usually at every 2-3 years, in management training programs, which provide an update for knowledge. To this end, training programs must cover a wide range of topics on innovations in methods, techniques and management tools, in primary and secondary legislations, in government policies, global trends in the economic and managerial fields. Subsequently, the level of performance at work is influenced by:

- the quality of the post-university classes completed, assessed by the reputation of the institution organizing them;

- the connection between the theme of the graduation paper and the problems the manager is to face;
- contingent exceptional achievements of the manager during his post-university training (an excellent graduation paper, widely applicable in the respective field, winning excellence awards etc.).

• **Further training.** The training manager have in other fields closely connected to management or which provide knowledge that can be used within the managerial activity, should also be taken into account when assessing the general training for managers. Among these classes and programs are those whose object, for example, is energy efficiency, environmental protection, investment in human capital, protection of intellectual property, sustainable development, labor market, capital flows, banking system, exchange mechanisms, trade policy, energy infrastructure, transportation and telecommunications, liberalization of industrial public services, regional development and inter-regional disparities, EU institutional context, EU policies, alignment of the Romanian legislation to the EU acquis, the benefits and costs of full integration in the EU, globalization, etc. Again, the level of performance in an organization depends on several aspects:

- number of company managers who have participated in specialized classes and programs;
- how often managers participate at such classes and programs;
- the visible effects on manager's actions, after participating at such classes and programs.

• **Specializations in the country.** This form of improving the training involves conducting training courses of varying duration, from 2-3 weeks to several months in important companies in the field, in research institutes and centers of scientific and technological development, universities and specialized government bodies (agencies, offices etc.), in consultancy companies etc.. This form of training enables new and different approach to problems of interest to the beneficiary of the specialization, provides the acquisition of knowledge and new practices, as well as the capacity to adapt to new conditions and functions, and normally requires playing an active role in the respective unit. Performance achieved in the employing company is a variable dependent on:

- profile and level of specialization;
- period of specialization;
- the form in which it is completed;
- the degree of connection with the managerial field.

• **Specializations abroad.** It, obviously, presents the same characteristics as those made in the country. However, the selection of beneficiaries of specialization abroad is significantly more demanding and rigorous than the one made in the country; specialization is made in prestigious foreign institutions, which provides the premise of a very consistent transfer of knowledge and practices. The level of performance is influenced by:

- specialization profile;
- specialization period;
- the degree of correspondence with the managerial field and with the problems the respective manager has to face.

Accepted, but with pro and con commentaries

As many specialists put it, managerial performance is what mostly defines the manager's quality, its capacity to convert, with a certain degree of efficiency, knowledge, experience and skills into decisions and actions that ensure the achievement of such performance. It is enough to mention the neoclassical school of management (which includes famous names such as A. Chandler, P. Drucker, O. Gélinier), which considers profit the most direct expression of a company's capacity and implicitly, its management, to adapt, maintain and develop, by proposing a system of precise indicators to measure profit [10].

Appraising the managerial performances, and hence the quality of managers, only through the profit achieved or, on a larger scare, in terms of economic and financial performances of the company, is to embrace an exclusive and simplistic vision, which does not take into account the many internal and external elements defining the company's management. We must not forget that the company's profit, more accurately, its rate, is determined, most of the time, by factors beyond the management practice quality, such as special situations, consistent governmental support, significant changes to regulations directly related to the company's activity etc.

Consequently, management performances have to be considered in a broader dimension that includes, in addition to the financial and economic performance, other relevant aspects. Unfortunately, today's employees put the equal mark between the level of performance and the rewards. Although not the only, nor the most important motivator, reward is one of the oldest, most visible, direct and fastest tool to gather all efforts in achieving performance [11].

Recognized as having instrumental value even at the dawn of civilization, as being the foundation of various cultures and religions, reward always had the gift to influence mentalities, behaviors and attitudes at individual and society level. In organizations, the reward evolution was linked of that of the human resources. If the reward was initially positive (money and praise) and negative (punishment and blame), and the maximum valorization was material and financial, reward became only positive, widening its scope with moral and spiritual elements which are becoming increasingly popular, especially since they became, in fact, inexhaustible, as shape, volume and means of expression.

The term reward is relatively new in the management practice in Romania. Before 1990 the concept of retribution was used as a reward for the work. Taken from the Anglo-Saxon literature – "compensation" – the term can be translated into organizational context through compensation, payment, reward, indemnity, salary [12]. If the common meaning of the compensation concept is to complete, to replace something insufficient with something else, to correct something wrong by means of something good [13], the payment concept leads to the meaning of transaction, while reward as premium for a certain recognized effort is considered by most authors as the most appropriate and comprehensive.

From the organizational point of view, rewards include all existent or future nominal earnings, facilities and advantages by which the professional status, value and contribution of an employee to the company's success is recognized. Rewards are influenced and influence on their turn, directly or indirectly, all the activities that from the Human Resources Management. Therefore, they should be seen as an open system, which interacts with the company's environment, but also with its external environment. *The reward system is composed of components, policies, strategies and processes by which the organization evaluates and rewards its human resources according to skills, competences and results, as well as to their value on the labor market.* The reward system is designed and operates as a part of the company's global strategy, reflecting the philosophy of management, which can be found, explicitly and implicitly, in the assumed mission of the organization.

In the present context, there is no pleasure in presenting the reward structure neither in the public institutions nor in the private companies. Often, it is no longer the incentive to creativity, productivity or performance. However, perhaps those who have decision power will take into account the theoretical element of the system and will no longer object in putting in into practice:

❖ **INPUTS**

1. Company's human resources in the number and structure presented in the organization chart, in the operational recruitment and selection plans;

2. Awards, classified on their nature:

A. Direct financial rewards:

a) salary – the basic element of the reward system;

b) minimum bonuses, granted under the Collective Labor Agreement (of which they are already talking at the past tense, wanting to transform it in a memory): *special working conditions, hard, dangerous or embarrassing; harmful working conditions; extra hours and hours worked on national holidays and legal holidays; seniority.*

c) awards;

d) incentives, especially in public institutions to increase motivation at work – in term of theory, the reality is quite different;

e) allowance – fixed sums paid for outstanding performance, depending on individual, group or organization results;

f) commission – a special form of reward given, with preference, to employees as a percentage of the sales or as a percentage of the total value of the sales;

g) participation to profit – share of profit distributed to employees, up to 10% for commercial companies and 5% for autonomous.

B. Indirect financial rewards: the amounts received for the employee quality, both for during employment as well as after it, including: paid vacation, sick pay, maternity leave pay, insurance premiums: medical, life, accident, work incapacity, unemployment, pensions, dividends.

C. Facilities – refer to facilities granted to employees during the period of employment with the respective company. This category includes: housing, company car, financial support for house construction or purchase of durable goods, discounts on purchase of company products, company phone, vouchers, providing legal and financial advice, use of rest houses and sports facilities, receiving paid holidays and business trips.

D. Benefits refer to the direct and indirect, immediate and future interests that the company provides for each employee; training courses for career development, team-building and friendship opportunities, career opportunities, skills developments, quality of working life, reserved parking, and special facilities at work.

3. Information in labor legislation, the levels and types of remuneration, the evolution of supply and demand of work force for the respective market, nationally as well as on European level, the level of individual and group performances at company level, individual aspirations and motivations.

❖ **REWARDING PROCESSES**

Inputs on the reward system, their level and way of combination in a special compensation policy of the respective company regard primarily the motivational processes and only afterwards the level of performance. Analyzed in conjunction with the types of motivation it was proven that, while direct financial rewards are extrinsic motivation factors, the indirect rewards, facilities and benefits are intrinsic motivation factors. Combining inputs through motivational process must take into account:

- *The utility the employee seeks* – regarding intrinsic motivation, satisfaction and interest towards the work content, the sense of professional accomplishment, merit and contributions recognition, personal development and self-esteem;
- *The cost the company seeks* – found in the extrinsic motivation, related to the official recognition of the activity and the employee's contribution.

The rewarding processes within a company are influenced by:

a) internal environmental factors:

➢ *Management vision on human resources.* The mentality of the senior manager on human resources is directly reflected on the size and structure of rewards. Thus:

- *the classic vision of* ***„labor" or of „work force"*** implies a strict judgment on the economic level: the emphasis falls on direct rewards, namely, the basic salary and certain allowances provided by law, and their value is, as much as possible, minimized in favor of profit growth; often, important components of direct rewards (bonuses provided by law) are ignored; awards are granted on a preferential system, depending on mood, sympathy, existing even the possibility of intentionally

omitting persons or situations employees are facing. Facilities exist only for certain people in the top management, the benefits for regular workers are consider extravagant spending. The formula „I am everything, you are merely a few pieces on the chessboard which can anytime by replaced" expresses the infatuation as fundament for the whole management philosophy. Contempt for people is express in the most obvious ways: from the form of addressing them to attitudes that leave no room for interpretation regarding the person/s holding the power, to the working hours that infringe on the legal legislation, as well as the lack of attention for days such as 1st or 8th of March, 1st of June etc. – or different occasions in employee's personal life. The staff's state of satisfaction or dissatisfaction is of no interest, only the obligation and responsibilities at work are. Only the present is important, usually strategies are inexistent, and the rewarding policies include restrictions, sanctions, threats. This vision is very common in the twenty-first century Romania, especially in private companies led by gerontocrats, the newly rich in the transition period, people whose entrepreneurial spirit is synonymous with the ability to circumvent the law, where performance is not a must.

- *The globalizing vision of "**personnel**"* - is characterized by a tendency of leveling rewards and strictly aligning to the legal provisions. There is no differences and contribution, effort and individual aspirations do not count. It is characteristic for the public organizations and public institutions with obvious signs of bureaucracy and too little performance.
- *"**Human resources**" vision* allows intellectual capital and human capital to be appreciated and valued, treated differently depending on skills, performance and attitudes. As a result, the rewards are fulfilling their role as motivational factors and the way the reward system is designed and applied is based on human capital appreciation through investment in organizational learning. Relations to employees are addressed in a unitary manner (employees and employers have common interests) not pluralist manner (employee's and employer's interests are different and contradictory).

➢ *Reward policy and strategy.* The reward policy can work informally, by rules, group norms, traditions and habits, reflecting the management vision. Reward strategy, since it is designed as a component of human resources strategy must reflect and support the objectives and the strategic options of the global strategy. Thus, a development strategy with options to enter new markets and product innovation will determine not only a policy of recruitment from sales and research and design, but also a strategy to reward performance in those areas.

➢ *Work conditions.* This factor is included in two factor theory of Herzberg, in the category hygiene factors, whose presence does not necessarily lead to satisfaction, while their absence causes dissatisfaction.

Here is where the quality of working life, the quality of life and that of the lifestyle appears.

The standard of living is based on aspirations and initiatives (subjective component) and living conditions (objective component) [14]. They depend on the natural economic, social, cultural, personal resources... manifested in the natural, socio-cultural, collective and individual frame. If we consider all biological, social, economic, educational, cultural activities and evaluate the level of health, leisure and free time we define the standard of living [15]. It is obvious the relationship between the amount of reward and the quality in the way of life. A high income brings access to a well-placed individual status in the social hierarchy, greater satisfaction of needs [16]. And by good health, a sustained interest of raising the education level, the individual consolidates their rise on the career ladder in parallel with raising the standard of living. In terms of efficiency, this translates into performance, both in life and in the organization in which they operate.

Managers have to pay special attention to the quality of life of their subordinates if they are not indifferent to the business they lead. The individual and the organization as well depend of the health level and quality of life of the employee. Even if, in the manager's opinion, individuals have no value except through what they achieve within the organization, there must still be concern to improve the work and life conditions of employees [17].

In order to make the business efficient, each manager should consider that the individual at work is a complex object of study, especially those who still reject the idea of taking into account the

psychological and sociological concepts within the organization. There is – not enough though – concern for employees' collective behavior. In the case of well thought leaderships, there is interest in achieving performance, but only by fully motivating their employees.

The Romanians' incomes are generally below their needs and hence employees cannot only be motivated through this material aspect. In this situation, workers choose their own work as a motivational retreat, by its content and dimensions. Surprisingly, they also become productive.

People are different, they react differently in similar situations, and therefore, observing and analyzing them and use their lucrative potential, does not have to follow rules applicable to everyone. The value of a manager is given by the way in which he/she knows and is able to recognize each personality in his/her vicinity, and through managerial levers to achieve the most efficient combination of interests at organizational level: orienting the individuals' activities towards achieving common objectives and meeting performance and, as it is possible, to meet the employees' needs. The manager's role is even more important if he knows how to use everything that is visible for everyone, but unreadable for the eyes of many.

b) external environmental factors. In this category:

- *Demographic factors.* Their evolution influences the demand for employment. Thus, a negative population, even though it is immediately charged as pozitive effect (by decreasing payment or maternity and child-rearing) has efects for the future (aging population), and the number of indirect awards (pensions, sick leaves) increases.
- *Nationwide labor market evolution.* The evolution of demand and supply on certain segments of the labor market can produce substantial reward variations. The example of the recent years Romania is clear: certain occupations – computer scientists, financial analysts, auditors, accountants – for which demand is greater than supply, caused not only an increase in direct and indirect rewards but, most of all, the occurence of certain facilities and benefits practically unknown before 1995-1997.
- *Labor price at international level.* This factor appeared as a result of the human resources' mobility, the globalization. Salaries are subject to inevitable comparizons in the case of labor force migration. It is the case of workers in construction, agriculture, IT and doctors whose salaries in the other EU countries are compared to those earned in Romania. Lower rewards determine the massive exodus of these categories, so, in order to stabilize this situations, those remaining in the country should be offered comparable rewards.

❖ **OUTPUTS**

The most obvious outputs in the rewards system are:

- *Professional performances.* Performance-reward relation remains one of the central issues of management. Although it is discussed since the time of the classics of management (F. W. Taylor shows in his works the importance of this relation, primarily, for the employer's benefit) we cannot say that there is a perfect solution in practice, or that it is an exhausted subject in theory. Beyond measuring results and comparing them with the standards, the professional performance is subject to a numerous physiological aspects, often ignored. Therefore, so that the relation professional performance – rewards be better understood, a series of conditions, mentioned in the specialized literature [18] should be taken into account.

Table no.1 : Premises of determining the correct relation between performance and reward

No.	Premise	Effects on manager's behavior	Effect on employee's behavior
1.	Employees' trust in managers	The manager who is respected by the employees may decide to grant rewards depending on performances; the contested	Employees accept the differences in rewards without clamoring against the manager whose authority they recognize; in the case of the incompetent manager

		manager will level all rewards.	the differences will be contested as being subjective and unprofessional.
2.	Performance freedom	The manager has to stimulate performance in all employees	Employees must know that there are no restrictions in achieving performance and that, once achieved, they will be properly rewarded.
3.	Competent managers	The competent manager can correctly evaluate employees' performances	Employees are convinced of the usefulness and correctness of coordination in achieving performance.
4.	The correctness of the evaluation system	The manager shall periodically review the level of performance and will periodically adapt and communicate it to employees	An incorrect assessment will generate inequity, frustration and lack of motivation.
5.	Real financial potential	The manager shall not make promises of rewards that cannot be granted	The lack of financial resources, the reduction or even elimination of certain rewards will decrease the employees' confidence and level of motivation.
6.	Way of expressing performance	The performance level has to be clearly expressed for each job	Knowing and understanding performances can enable action to achieve it.
7.	Clarity and awareness of the reward structure	The components of the rewards system and the conditions for obtaining them have to be presented to employees from employment and announced of any modification thereto	Direct motivation for employees will be increased if they can act on those aspects of work to bring them higher rewards.

- *Professional competence*. A reward system properly designed which operates efficiently, stimulates performance and recognizes professional skills, employees' efforts in professional training and development.
- *Organizational behavior*. It is found in the attitude towards the organization, the management and, last but not least, towards work, and by default performance.
- *Employee's health.* Directly affects productivity, performance and job satisfaction.

The way in which it is designed, implemented, monitored, the reward system based on the socio-economic realities of the organization and the respective area, in accordance with the specific objectives and principles, is crucial for achieving business performance, but also for the human capital's satisfaction, career and appreciation.

5. Conclusions

As times passes by, everyone can become wiser due to accumulation of information and life experience. Or so it should be. Assuming that there are no serious reasons to deny evolution in human life, at adulthood individuals can appreciate the value acquired through study, practice and put it forward through performance... For those with a deep sense of knowledge, but particularly of self-discovery, analysis is made with a high degree of objectivity and is based not only on the absorption capacity and ownership of everything that appears as new for the topics in discussions. An important factor in the analysis report is given by the relation moral motivation/material motivation; remains negligible the amount of money received by the individual for his/her work, as well as the standard of living.

The job may provide an individual with a source of revenue for a given standard of living; physical and intellectual efforts orientation towards a certain type of job; the social and material

status, implicitly recognition from others; integration in a competitive circle, where working for the benefit of others is a purpose in life and a considerable motivation to permanently overcome personal limits. However, it is not a necessary and sufficient condition for the transformation of the human factor in human capital, in discovering all human resources' abilities, talents, and vocations and transforming them into competences recognized on the labor market.

We live troubled, confusing times, almost empty of remarkable content, precisely because perennial values are denied, and non-values are promoted [19]. Slowly but surely, imposture becomes a virtue. All kind of sand castles are build and they collapse with the first wave. The principles on which our ancestors have built our society are now denied. We suffocate it – more or less consciously – not only by polluting the environment, but also by awarding incompetence with diplomas, certificates and licenses. The original fault is that there are always leaders (whatever the level) that do not know how to direct their subordinates towards progress.

Some are well intentioned, but easy to manipulate and do not realize that they are only puppets in the hands of some other more experienced puppets. Some even know their limits of competence, but mark their spiritual poverty with sick domination ambitions based on split – *divide et impera*. Those of good faith, devoted to creative, noble ideals, who know that they definitively compromise in a world of appearance, of forms without substance, of superficiality, keep fighting with the windmills until they get tired and abandon the "elitist" platoon.

Spirituality is out of place in the kingdom of materialism. Development of human personality is not desired in a world dominated by money (either by their presence, or the willing to have them) and power (through politics, family relations or economic interests).

Democracy waved in front of credulous people proves to be the symbol of uniformity. Why advocating for the individual, for the belief in one's self, who can continuously accumulate knowledge and dedicate to others?! Why should it be interesting to invest in the human being, as a specimen capable of evolution, when it is infinitely more efficient to dominate it?! When the wealth poles change, when the power spheres are reestablished, when the interest areas are reconfigured, who is interested in the number and quality of the human resources?!

Natural selection is valid also on the labor market, not only in the environment. In times of crisis only those who have days to live survive. When we will appreciate the banality of everyday life as a wonderful gift and we will stop wishing for material things or socio-professional development just because others did so, then maybe there is still hope for salvation. Reality shows that the unhealthy times we are living contain less and less moments of reflection on our own destinies: the everyday automaticity hinders us from seeing the essential in life. In fact, planning a career or professional development is, for each individual, an issue for many persons. The present economic context requires, all the more, alternatives for the permanent education and continuous formation, most of the times on our own, outside any formal structures.

There are numerous young people who are not satisfied with a slow and less significant development in the active life. All the more decided are those who already understood the difference between a satisfying job to ensure the daily income and the job which provides the individual with a wide range of challenges and multiple satisfactions. With relatively little money, for certain categories of individuals, a costly training, conducted either by the employer or another certified trainer may be replaced. If it were to encourage the acquisition of competences horizontally and transversally, by self-education or by non-formal or informal education/formation, people would be more interested in develop their hidden and undeveloped skills. It is true that such training cannot be handy to everyone, because there are not too many those who know themselves and objectively self-evaluate themselves, who are able to overcome the so considered normal or average dimension in this point of human development, and implicitly society development.

In the spirit of human resources management science, human's inexhaustible potential must be known and developed. In other words, the individual construction is subject to social construction.

Those who build explore do not fight, they create and not fight, they leave something for their descendents they do not fight. Therefore, do not kill and destroy!

The study has exceeded its original area of interest. During the research many more directions of investigation have been indentified than what it was expected. The concept of quality of life and that of quality of work life bring to focus other evolution variants of the human factor quality, namely the quality in human resources management. Upgrading human capital, with the help of managers, even in the context of such a crisis which seem not to end, contributes to the continuous development of the performance level, regardless of its manifestation.

CLASSICAL STRATEGIES OF TRANSNATIONAL COMPANIES FROM EMERGING COUNTRIES

SERGHEI MĂRGULESCU[*]
ELENA MĂRGULESCU[**]

Abstract
The analysis of strategies adopted in the last 10-15 years by companies in emerging countries that have managed to reach the status of global companies, enables us to appreciate that, in a first stage, emerging companies have followed the "normal" principles of corporate strategies that have lead Western companies to a multinational or a transnational status. But more important is what happened in the second stage, namely that many emerging companies were able to overcome the classical principles and strategies and to develop new business models, such as the integration of "functions" resulted from the global value chain restructuring, based on the new "functional" specialization in manufacturing and services, the building up of global networks of suppliers or the reverse outsourcing. However, the range of strategies implemented by emerging companies in their efforts to become global players comprise also "classical" strategies such as the global brand development, the global development and supply of niche products, the non-organic growth or the strategy of geographical adjustment of business flows on South-South and South-North directions.

Keywords: *emerging countries, emerging companies, classical strategies, modern strategies*

1. Introduction

One cannot talk about globalization without taking into account the economic momentum of emerging countries, their development in rates two times higher than in developed countries and projections that indicate that the cumulative Gross Domestic Product will be at a higher level within 25-30 years. The BRIC countries (Brazil, Russia, India and China) will surpass the G7 countries from this point of view, and the first 15 emergent countries will surpass the G7 after 2030.

Table 1
The rise of emerging countries
- Trillion $ –

	G7	Developed countries	BRIC	The next 11 emerging countries	All emerging countries
2005	27,3	32,4	4,2	2,9	8,9
2015	33,0	39,6	10,2	5,6	19,0
2030	43,0	51,6	28,2	12,5	46,8
2050	64,2	77,0	90,0	35,5	138,0

Source Table 1: Antoine van Agtmael, in "The Emerging Markets Century", Free Press, New York, 2007, based on Goldman Sachs estimates for BRIC and another 11 emerging countries and JPMorgan for another countries.

Before, however, the years will validate or not this scenario, we can see the nowadays realities in the world. A study undertaken by Boston Consulting Group (BCG) has recorded impressive economic concentrations that exist in emerging countries. In 2006, a total of 100

[*] Ph. D. University "Nicolae Titulescu" Bucharest, margulescu@univnt ro
[**] Ph. D. University "Nicolae Titulescu" Bucharest, margulescu@univnt ro.

companies in these countries have assets of 520 billion USD, this means more than the top 20 global automobile manufacturers.

UNCTAD inventoried until 2004 a total of five companies from emerging Asia, which were among the top 100 transnational companies regarding the size and another 10 external assets, which could be included among the first 200 companies.

In 2006, FDI from the emerging economies (including mergers and acquisitions) reached the level of 174 billion in the USA, 14% of world total, up from 5% in 1990. Their share in world FDI stock was 13%, representing $ 1600 billion in US (compared to 8% in 1990).

Investment flows take place increasingly SN and SS relations as emerging economies invest both in developed and in the less developed countries.

2. Tipology of strategies implemented by emerging companies

According to Antoine van Agtmael, one can see three historical steps (the author calls them „waves") that define the commercial relationships between industrial and Third World countries during the last century:

- First wave defined by FDI in production facilities overseas;
- Second wave dedined by outsourcing and offshoring;
- The third wave defined by competition between transnational companies from developed countries and strong global companies in emerging countries;

Today, we stand in the early stage of the third „wave".

Rise of a growing number of companies from emerging countries to the status of global companies is obvious. From the methodological point of view, we accept the criteria the author proposes to trace the entrance of a company in the selected category of global companies, as following:

1.to be the world leader in the industry;

2.to have a global presence in exports and even production;

3.to have one of the top three market share position as a sufficient number of countries in order to be considered a global player;

4.to be globally competitive, not only in Chapter price, but also in quality, technology and design;

5.To refer to the biggest and the best companies in the world.

The ways of achieving these performances, the strategy adopted, there has never been a single abstract step, but a succession of steps. These attempts have however one common denominator: the courage of strategic management decisions, allowing faster browsing of those steps, getting out of the classic pattern of organic development that the Western occidental companies have run across.

Analysis of strategies adopted in the last 10-15 years by companies in emerging countries that have managed to reach the status of global companies, enables us to appreciate that, in a first stage, emerging companies have followed the principles of "normal" corporate strategies that lead Western companies to multinational or transnational status, as following:

- Focus on activities or core competencies and outsource other;
- Accession to the status of market leader in key markets around the world;
- Keeping costs at a low level and quality high level;
- Impeccable customer service;
- R & D investment;
- Hiring the best specialists and their corresponding reasons;
- Building a strong brand;
- Motivating employees through options and other incentives.

But more important is what happened in the second stage, namely that many emerging companies were able to overcome the conceptual principles and strategies to develop classical and new business models.

Currently, we cross a time when we try, by specialists and researchers, to "unveil the mystery" of how many emerging companies were able to achieve this unexpected success. For example, Boston Consulting Group concludes that there are five types of strategy determinants, namely:

1.Growth of local brands globally (eg.: Hisense in China for consumer electronics, Bajaj Auto in India for two or three wheeled vehicles, Tata Motors of India for cars);

2.Transforming engineering excellence in innovation globally (eg.: Embraer of Brazil for the production of regional jets);

3.Acceding to the status of a global leader in a niche product (eg.: BYD in China which produces batteries, Johnson Electric in Hong Kong that produces electric motors and video cameras for cars);

4.Widening ownership advantage of natural resources by implementing new ways of marketing and distribution (eg.: Sadie and Brazilian companies in international distribution Perdigao cereal, chicken and pork, Brazilian Vale Company in world exports of iron ore);

5.Implementing new models for business performance or new types of market penetration (eg.: Mexican company Cemex in cement and construction materials).

Certainly, the list of examples of each type of strategy presented above can be extended enough to validate these trends.

In the following, we want to systematize in our own way the range of the main strategies implemented by emerging companies until now, facing their efforts to become global players in an increasingly globalized world.

We believe that the most remarkable and ongoing process developed in the last 10-15 years, and its effects will increase in the following decades, in a manner which cannot be said to have been predicted the "functional" specialization of companies affects the strategies of emerging companies. We call them "modern strategies."

They join to a category of strategies that have direct link with the new division (national and international) of labor specialization based on "functions". We name them classical strategies, and based on these we refer to those who have provided the greatest success in recent years as emerging companies in their globalization plans.

We believe that the following structure of strategies practiced by emerging companies to accede to the status of global companies can be enlightening for today:

- **Classical strategies,** which:
- The strategy of global brand development;
- The strategy of development and global supply of niche products;
- The strategy of non-organic growth;
- The strategy of geographical adjustment of business flows on South-South and South-North directions;
- **Modern strategies,** which:

• The strategy of integration of "functions" resulted from the global value chain restructuring, based on the new "functional" specialization in manufacturing and services, completed by the strategy of “steps getting on” on the overall chain of the "product" value;

• Strategy based on organizing global networks of suppliers;

• Reverse outsourcing strategy on South-North direction;

3. Classical strategies implemented by emerging companies

3.1. Global brand development strategy

The building of single product brands and, more than that, of a company brand, is a desirable strategy for any company. Logistic and financial effort to achieve this goal is huge, but further benefits are essential to the company. As a result, this strategy was adopted by a number of

corporations from emerging countries, and the overcoming of this challenge finally led to their success and competitivity on the global stage. A number of companies took the road of systematic construction, like Samsung, BenQ, Grupo Modelo, while others tried to make their effort easier through acquisitions and mergers, like Lenovo and Haier.

Samsung Case

Samsung General Stores Company was founded in 1938 as a Korean company exporting fish, vegetables and fruits to China. In the 1990s, Samsung Group had become the most influential Korean conglomerate with activities in various fields, from consumer electronics to insurance, petro chemistry and shipbuilding.

If we consider only consumer electronics industry, Samsung has managed to blow away the competition of Japanese firms, so that, according to the Interbrand's classification of brand value, Samsung has been ranked as one of the fastest-driven companies on the list, surpassing even Sony (see Table 2).

Table 2

Samsung's Competition in 2005

	market capitalization ($billion)	sales volume ($ billion)
Samsung	107,0	56,7
Intel	147,7	38,8
Nokia	76,3	42,5
Philips	15,2	9,8
Sony	46,4	66,0
Motorola	56,5	36,8
Matsushita	49,2	78,6
LG Electronics	12,6	43,4

Source: Antoine van Agtmael – "The Emerging Markets Century" Free Press, 2007.

Among the factors that led to the success of Samsung in the global marketplace we have to mention the specific organizational culture, access to the best technology and highly skilled workforce, the early government support, the restless search for excellence in all areas. Of particular importance was the focus on exports, on research-development as well as on brand building and promotion.

The marketing campaign sustained in a totally unconventional way has achieved the main four important goals, namely:

- led the company's brand to international recognition,
- succeded in a subtle and original use of the design of brand, in the shape of the shell, in a world where imitation exceeds inspiration
- showed incredible growth of the company's global power
- has reiterated that, according to a study conducted by Interbrand-Business Week on top global brands, Samsung steped on the 20th place, for the first time surpassing Sony, ranked 28th on a list of competitivity driven by the value of the company's brand.

Interbrand's ranking was a confirmation that Samsung is not only the first brand of emerging markets, increasing in recent years it's value faster than any other brand in the world, but succeeded in the fight for brand value, to outperform a series of symbols of the global market, such as Pepsi, Nike, Budweiser, The Gap, Ikea, Starbucks and Harley-Davidson.

All this significant evolution took place after the monetary and financial crisis of 1997-1998, when Samsung, on the verge of huge losses, was forced to prove a large market discipline and apply a real shock treatment. It took into account a total transformation of the activity by removing the low-

value consumer electronics and memory chips (DRAM) and embedded approach to high value products such as multifunction mobile phones, flat panel displays for electronic equipment, multimedia equipment, specialized chips for digital cameras, iPods, etc.. In this way, Samsung has managed not only to capture a large share of the consumer electronics market, but has become the most profitable multifunctional mobile phone maker in the world.

The company consolidated its corporate brand by significant amounts invested in promotional activities (more than $ 10 billion, which represents the maximum amount for this purpose dedicated in emerging markets) and sponsorships awarded at the Sydney, Seoul and Beijing Olympic Games.

Finally, we can estimate that the success of Samsung's efforts in establishing a brand of worldwide reputation was due not only to global marketing and advertising campaign, but also to the huge success won by the distinctive shell-shaped style of its mobile multifunctional phones. Thus, in 2005, Samsung was ranked 3rd on the production of mobile phones (over 100 million pieces), approaching Nokia and Motorola. The high value design of Samsung's products has transformed the company from a second hand maker of electronics, into a world-renowned brand, which had also the inspiration to:

- set strategic steps that seemed completely out of scale at that time
- keep their obsession for quality in execution
- combine technology, global distribution and design
- invest large sums in research and development.

Concha Y Toro Case

Concha y Toro was founded as a winery producing wines since 1875, becoming a globally active Chilean company until the economic policy of this country in the 80es forced it to change its owners. Since 2004, however, the company sells wine in 110 countries, and in 1994 became the first wine producing company listed on the New York Stock Exchange, considered the largest vineyard in Chile and Argentina. With a turnover exceeding $ 300 million, Concha y Toro is the undisputed leader of wine producers in South America, is among the top 20 companies in this category in the world and ranks 2nd in U.S. imports.

When traditional wine producers such as France, Italy, Spain lost ground latelly infront of the new production methods in the U.S., the global wine industry has moved the center of interest from northern areas to those in the south, Australia, Chile and South Africa becoming the main suppliers. Chilean exports grew from $ 10 million in 1985 to $ 835 million (60% of production) in 2004, Chile reaching the 5th place in the top of world wine exporters.

Concha y Toro has built a successful business based on exports, the modernization of wine producing processes, an aggressive distribution and a global brand promotion. The company tries to find a balance between affordable wine production, competing with other global brands of wine and delivering very high value (eg. Don Melchor) to customers with a very good knowledge of wines.

In this regard, the company turned to a successful brand strategy, whereby a major brand launches a subbrand, targeted at customers with a very good knowledge of wines, so that the master-brand could be raised in association with the subbrand. Therefore, the company produces large

amounts of wine with very attractive prices, along with some elite brands that can be appreciated only by knowledgeable specialists in the field.

As a global exporter, the company has always tried to tailor the wines to the tastes and trends of various markets. Thus, for example, most popular on the Chilean market are the oldest and sweet wines, the American consumers want especially fruity and fresh wines, the British prefer wines with more complex flavors.

Since 1980, Concha y Toro has doubled its vineyard area, employing in the same time, one expert for each of them, in order to achieve a severe quality control, and since 1990 it has invested heavyly in vineyards in Argentina, becaming a big exporter of this country too.

It achievedbalso a special location for the production of special wines for the UK and in cooperation with Philippe de Rothschild Bordeaux vineyard, focused on achieving the first "Grand Cru Classe" in Latin America.

Factors that have contributed to the international success of the company were:

- understanding the need to achieve substantial exports of wines
- a focus on quality
- addressing marketing techniques and strong distribution
- focusing obtaining important positions in the rankings made by prestigious publications in this field.

3.2. The strategy of development and global supply of niche products

The strategy of development and supply of niche products for which demand is uncovered globally, can be considered one of the main successful ways that a company can follow, showing thus such innovative qualities, which involve a well-organized business and marketing strategy, and also a special attention given to the research and development department.

Risks assumed by companies in this case are quite high, the market should be well prepared to absorb as quickly as possible the products offered, but finally the obtained advantages by implanting on such market segments are rewarding. As examples, in this case, companies like Concha y Toro and Haier could be mentioned.

Haier case

In 1984, Haier began its major restructuring through which, in one year it managed to become profitable, in 1991 started exports, in 1993 was listed on Shanghai Stock Exchange and in 2004 had a turnover of about $ 2 billion.

Haier is considered the undisputed leader in the Chinese market of household appliances, with a market share of 34%. Its products can be obtained not only through Wal-Mart network, but also through a number of other chain stores in many countries. Haier has achieved significant growth in exports, having production facilities in 22 countries, starting with Italy and the U.S. and going to the Philippines and Iran, 18 international design institutes and 30,000 employees worldwide.

It currently produces more than 6 million refrigerators, as well as air conditioners, TVsets, washing machines, microwave ovens, mobile phones, etc.. Its main competitors in the field of home appliances are Whirlpool, Electrolux and Bosch-Siemens, Haier being on the fourth place (third in refrigerators), with a global market share of 3%.

Table 4

Haier's Competition in 2005

	market capitalization ($billion)	sales volume ($ billion)
Haier	0,5	0,6
Whirlpool	5,7	14,3
Electrolux	11,0	16,4

Source: Antoine van Agtmael – "The Emerging Markets Century" Free Press, 2007.

Company's management realized early that only by improving product quality (although this was a major requirement) a world-class status can be reached. "The making of a global brand can be achieved only by testing the company's competitiveness on the global market and this is the only way Haier can demonstrate that it has become an international class company " said one of the managers of Haier.

Thus, in 1999, Haier has launched a campaign of expansion, opening its first U.S. production capacity, worth $ 30 million, aware that, by direct production in the U.S.it can get rid of the cheap label of the image of "Made in China". On this occasion, Haier has identified a niche hitherto unexplored by any company producing household appliances, namely: minifriges for college rooms and hotel mini-bars. In this way, taking over 30% of this growing niche, Wal-Mart began to sell Haier branded refrigerators in different sizes, while Haier began to build a solid reputation in the production of mini-electric refrigeration cellars, washing machines, dishwashing machines, etc..

Through the strategy approached by Haier, it has gained a competitive advantage over its competitors, not only by increasing quality and reducing production costs, but also by identifying market niches and innovation of original products, this being the safest way to build a brand and enter new foreign markets.

3.3. The strategy of non-organic growth

The non-organic growth of multinational companies involved carrying out mergers and acquisitions of companies, this strategy being increasingly important especially in emerging markets which in past years have seen fast economic growth, particularly in Eastern Europe and Asia (China, India, Russia, etc..).

Examples of that kind are companies such as China National Petroleum Corporation which has acquired PetroKazakhstan in 2005, Mittal Steel which has acquired Arcelor Group in 2006 (considered the largest transaction that year - $ 32 billion), Tata Group which has acquired British - Dutch company Corus Group, etc..

We can also mention CEMEX (global Mexican company producing cement), and Tenaris (producing steel pipes for petroleum industry, created by the merger made by Argentine company producing stainless steel pipes for oil and gas industry SIDERCA with Techint's subsidiaries in Mexico, Brazil, Europe and Japan).

CEMEX Case

Company was founded in Mexico in 1906 under the name Cementos Hidalgo, with an accelerated growth rate during the 1960s by building new factories and acquisitions across the country. In 1976, CEMEX acquired Cementos Guadalajara, the main local competitor, thus becoming the largest cement producer in Mexico.

In 1989, it consolidated its position in the Mexican market through the acquisition of the second largest producer, Cementos Tolteca, and since 1990, it began to jump on a global producer status due to international acquisitions that followed . Thus, in 1992, CEMEX has bought two cement manufacturing companies in Spain, a market which until that time was dominated by an European group of companies active in this field.

Anti-dumping measures taken by the U.S. meanwhile, by charging 58% on cement imports, have forced the company to continue its global procurement strategy in Latin America, Asia, USA and Europe, maintaining its dominance status on the cement market in Mexico. His latest acquisition, the RMC company, almost doubled its turnover, has dramatically expanded its product line and drove CEMEX at number one on the U.S. market and number two in the UK.

Currently, as a strategy, CEMEX is recognized internationally for its strong centralized management, development and focus on IT activities and highly integrated teams built after the acquisitions made. Company's declared mission is to transform cement from a commodity, into a branded product.

The factors that determined the company's international success, were:

- the dominance of the Mexican market, from which the company began the global development
- global competitiveness
- the permanent strategy of foreign acquisitions
- effective integration of post - acquisition integration
- the assumed position of industry leader in using IT.

Siam Cement	7,1	5,4

Source: Antoine van Agtmael – "The Emerging Markets Century" Free Press, 2007.

3.4. The strategy of geographical adjustment of business flows on South-South and South-North directions

The increase of the competitiveness of companies from emerging countries has made it possible to adapt the strategy of their geographical expansion from the South-South direction to the South-North direction. We are refering not to the conquest of market segments by increasing sales volume, but to the implantation of "functions" of the value chain in the field of production of goods or business services.

Examples of such companies can be:

- Indian generic drug maker, Ranbaxy, which, by virtue of a high concentration in terms of global development, strengthened its manufacturing facilities in seven countries, selling its products in 100 countries. In 2005, three quarters of the sales volume were realized internationally, 36% in the U.S., and with a major presence also in emerging markets.
- Brazilian company Embraer, manufacturer of regional aircrafts with a capacity of 50-110 seats, for buyers like US Air, Let Blue, Cross Air and even Chinese Southern Airlines.
- Hyundai Heavy Industries (HHI) of Korea, the largest sea-going vessels producer in the world, which is building tankers, bulk cargo ships and container ships, chemical hi-tech carriers, etc.., as well as marine Diesel engines and construction equipment (excavators, loaders, etc..), electrical equipment, etc.., performs deliveries in both developing countries (South-South flows) and the highly industrialized states (South-North flows).
- CEMEX SA, the Mexican cement company , which has acquired two Spanish companies in 1992 and subsequently continued this strategy by acquiring companies in U.S., Latin America and Europe, becoming one of the leading cement producers globally.
- Chinese firm Haier which became one of the most renowned global manufacturer of electronics manufactured in production facilities in 22 countries (Italy, USA, Philippines, Iran, etc..) and which has 18 international design centers and 30,000 employees worldwide.

It had become noticeable latelly also the growing number of jobs created by multinational companies from emerging countries, which have invested directly in industrialized economies, such as Samsung, Hyundai, CEMEX, Tenaris, etc..

Thus, Samsung, Hyundai, Sasol, TSMC, Haier and other companies are major employers in the U.S., with more than 30,000 employees. It is considered that, in 2003 in the U.S. there were a total of 160,000 employment made by emerging multinationals ("Survey of Annual Business", August, 2005, Bureau of Economic Analysis, USDepartment of Commerce), which further quickly

increased. In addition to these we must taken into consideration all other connections created, activities such as design, marketing, supply of equipment and materials, dealers, etc.., which also involve indirect hired personnel.

4. Conclusions

The analysis of strategies adopted in the last 10-15 years by companies in emerging countries that have managed to reach the status of global companies, shows that, as a first step, they followed the principles of "normal" corporate strategies that have led Western companies to the multinational or transnational status.

In the second stage, however, many emerging companies have managed to overcome the classical principles and strategies and to develop new business models. Some of these new business models are directly related to the development of the "functional" specialization of companies.

They come together, however, with a class of strategies that do not have direct link with the new division of labor based on the "functional" specialization. We named them classical strategies and we made reference to those who have largely ensured recently the success of the emerging companies in their efforts to accede to the status of global companies, namely: the strategy of global brand development, the strategy of development and global supply of niche products, the strategy of non-organic growth and the strategy of geographical adjustment of business flows on South-South and South-North directions.

TEAM CONSOLIDATION BY DEVELOPING WELFARE AT WORK

CATALINA BONCIU[*]
HORATIU BLIDARU[**]

Abstract
The development of welfare at work should contribute not only to strengthen the company's position on the market. Maybe before measuring the economical results we should first analyze the social consequences of a microeconomic policy supportive of all the elements of good practice conducive to employees. Environmental aspects (inside or outside the company), which affect the workers' current behavior, should be interpreted. It is the case of the actual conditions on the world market, as well as the state of things among employees' needs: job security, new aspirations for wage and personal development; professional entourage: complexity, uncertainty, lack of flexibility, fluctuation…The most pressing element of the employees' welfare is the research of: the work psychopathology; the psychoactive substances at work; the stress causes and manifestations, exhaustion, sleep disorders, but also behavioral; strikes, conflicts, crises, bullying and violence, harassment and sexism…To opt for a leadership where understanding and helping employees is a must also means having an interest in generalizing the state of health among employees, and this is reflected in their high quality of life.

Keywords: *welfare at work, employees' behavior in team*

1. Introduction

The Romanian economy in recent years faces many situations where specialists leave their jobs, either because of low wages or for better working and life conditions. If their movement would be made towards companies that recognize their skills and performance, it would not be a loss for the economy. Unfortunately, they migrate. They cannot be blamed, because everyone has a life and is bound to live it in the best way possible for themselves. But, for the society, the investment made in educating and training them is not recovered. This phenomenon is not peculiar to our country, but the Romanians who live and work within our national borders should be concerned of this fact for many reasons, with short, medium and most of all long term consequences.

In the recent years, international migration flows have increased significantly worldwide due to globalization. A significant percentage of the total number of migrants is composed of highly skilled workers. Although the studies for this type of migration date from the 1970s, the concept of "highly skilled migrant" remains hazy, difficult to define. The 2005 Report of the Global Commission on International Migration concluded that even the traditional distinctions between skilled and unskilled workers is, in some respects, of no utility, proposing the term "essential workers" [1]. At international level, skill levels can be defined either by the level of education or through the occupational level. The main classification systems used are the International Standard Classification of Education (ISCED) adopted by the United Nations Educational, Scientific and Cultural Organization [2], respectively the International Standard Classification of Occupation (ISCO), adopted by the International Labour Organization [3].

To assess the level of qualification, at the European Union the recommendations in the Canberra Manual are applied, a manual developed by the Organization for Economic Cooperation and Development (OECD) in 1995, which combines the education and the occupational skills. The

[*] Professor, Ph.D., University of Bucharest, Faculty of Administration and Business, Romania, catalina.bonciu@yahoo.com
[**] Lecturer, Ph.D., Faculty of Political Sciences, „Dimitrie Cantemir" Christian University, Bucharest, Romania, horatiu.blidaru@yahoo.com.

term used to describe highly skilled persons is that of "human resources in science and technology", agreed also by Eurostat, which uses it in comparative analysis [4]. This category includes people who have completed education at tertiary level for a particular specialization which leads to obtaining a university/post-university degree or equivalent, and even though they do not hold the above mentioned qualifications, they have a job that normally requires them. The concept of science and technology is broad and includes, in addition to the natural sciences, engineering and technology also medical, social and human sciences. Migration of highly skilled labor is inextricably linked to the level of technological and economic development policies.

Macroeconomic concerns are more or less saving. What happens in Romania is not conducive to retention of workers, on the contrary. If guidance from the highest ranking officials was to be followed, people should leave the local labor market as soon as possible. However, there are entrepreneurs who are keen not to close down businesses. Certainly many were bankrupt, some reoriented, bankrupting their own businesses and committing themselves to other employees. Regarding the public system, let us not remember the iniquities "implemented."

The analysis of the study focuses on an economy with logic functionality, regardless of difficulties, but in any case, within the normal and natural rules of common sense, based on knowledge, competence of the decision factor, accordance with the international or community laws etc. In the system of competitive economy, any valuable manager, aiming at high performance levels, is forming a well qualified team, being constantly concerned to motivate, retain, train not only in the actual activity, but also in the decision making – on different hierarchies. Perhaps most important, is to really know it, understand it, support it and to contribute to its development, not only of the business. Therefore, the human being is seen as a complex entity, bio-psycho-physiological being, involved in collective work, where it communicates, gets stressed, enters into conflicts, has a standard of living and working, with needs and aspirations... Quantify them, as restrictions on the results, strengthen the team, orienting it towards performance.

2. Literature review

The collocation "brain drain" defines the "loss of intellectual and technical labour force through the movement of such labour force to different and more favorable geographical, economic and professional environments" [5]. In Anglo-Saxon terminology the collocation means "the migration of educated people or specialists from a country, economic sector or fields to another, for better remuneration or living conditions" [6].

The word "brain" represents in general, any qualification, competence or superior intellectual quality, while "drain" suggests that the output rate is higher than desired. In the special literature also other types of migration flows are described, implying the highly skilled labour force, which differs from the "brain drain" phenomenon, respectively "brain over flow", "brain export" and "brain exchange." The "brain over flow" may be determined by the over production of highly skilled labour force, the low employment rate of those who make up this category of labour, lack of adequate jobs etc. On this background, highly qualified persons migrate, being absorbed by the external labour market.

The operation of an educational system uncorrelated with the labour market, where the necessary qualified labour force is not adequately planned, results in a surplus of skilled labour that cannot be absorbed. High percentages of unemployment among people with higher education are recorded in many countries: Columbia, China, South Korea, Philippines, India, Iran, Nigeria, Pakistan [7].

The "brain export" refers to those situations where the countries of origin invest in those segments of highly qualified labour force by the export of which the gains can outweigh the costs. The market price of high-skilled labour generally covers the private costs of education, but not the social ones. Usually, the "brain export" is mutually beneficial for the country of origin and that of

destination. Some states, that cannot absorb their own human capital (such as Barbados or the Philippines), deliberately prepare highly qualified labour force for export.

The "brain exchange" is a form of "brain drain" in which are made mutual transfers of researchers, students or other types of highly skilled persons, in order to achieve mutual benefits in terms of knowledge, expertise, training. In this case, migrations are a temporary phenomenon, and "brain loss" is offset by "brain gain." [8]. Connected to the concept of "brain drain" is that of "brain waste", used to describe highly skilled labour force wasted in case these migrate to countries of destination where their qualifications and previous experience cannot be used. [9]

Recent studies have introduced specialized language term "brain circulation", which describes the cycle of movements abroad for studies, occupying a job position in the same country where they graduated and return to their country of origin, at least with the same social status to be waived at [10]. "Brain circulation" is a positive form of migration of highly qualified people, as it promotes the spread of knowledge.

The concept of "brain return" refers to those situations in which highly qualified people studying/working in another country, return in the country of origin after longer or shorter periods of time.

In what concerns the opposite process, of attracting and retaining the human element in the organization, as a capital, possibly intelligent capital [11], the special literature has developed welfare to work [12], favorable to stimulating the individual to over exceed himself in creative actions [13]. Sociologists have long before economists agreed that the standard of living leaves its mark on employment outcomes and quality of life is conditioned and conditions on its turn, individual's state of health and its ability to work to its full potential – Baltatescu, S., Marginean, I., Vlasceanu, L., Zamfir, C., and E.

3. Theoretical background

3.1. Brain migration

a. Preliminary considerations

Migration is considered one of the defining global issues of the beginning of the millennium, due to the fact that today the phenomenon affect more people than at any other time in human history. Migration is an inevitable component of vital importance to economic and social life of each state. Complex social phenomenon, international migration affects every country in the world, in their quality of state of origin, transition and/or destination.

Among the contemporary global trends with impact on migration are: demographic evolutions; economic disparities between developing and developed countries; trade liberalization, which requires a more flexible labour force; communications networks, linking all regions of the planet; the economic downturn (temporary recession).

The dimensions of the phenomenon of migration are impressive and growing. According to data from the International Organization for Migration, at word level there are 192 million people living outside their country of origin, representing 3% of world population. Basically, one of 35 persons is a migrant [14]. If they live in one place, migrants would be the fifth country in the world taking into account the total population.

While between 1965 and 1990 the number of migrants increased by 45 million (annual growth rate of 2.1%), annual growth rate today is 2.9%. Analysis of the phenomenon is hampered by the fact that migration statistics are not regulated internationally. At EU level, for example, it is governed by a series of voluntary agreements between Eurostat and specialized institutes of the member states. In the summer of 2007, the European Parliament and the Council adopted Regulation 862, as a step toward achieving accurate and harmonized data on migration. In terms of net migration in EU – 27, it ranged from 2002 to 2007 between 1.64 and 2.03 million annually. Expressed as a

percentage of the total population in 2007, immigration has provided 0.39% of the total population of the member states [15].

According to a study conducted in 2000, of a total of 59 million migrants in OECD member states, 20 million were highly skilled. Demographic analysis showed that between 1990 and 2000 the growth rate of the level of skilled migrants in the countries concerned, has been uneven, skilled immigrants were 2.3 times more numerous than those unskilled. One of the few studies analyzing the evolution of long-term international migration between 1975 and 1995, showed that highly skilled emigrants from 223 nations had as countries of destinations Canada, USA, UK, Germany and France. Basically, almost 85% of skilled immigrants live now in the six countries mentioned above. If in 1990 the total number of immigrants with tertiary education registered in developed countries was of approximately 9.4 million (representing 41% of the total immigrants) in 2000 there were 14.7 million immigrants in this category (representing 44% of total). The most significant increase of highly skilled migrants were registered in states located in some of the poorest regions of the worlds: Latin America and the Caribbean (97%), Asia (84%), Oceania (69%) and Africa (113%) [16].

The term "brain drain" was first used in a Report of the Royal Society in London, made in 1963. The researchers of the renowned scientific fellowship surveyed more than 500 heads of higher education departments concerned about the emigration from Britain of a significant number of scientists in a period of only five years (1959-1963), including nine members of the Royal Society. The responses showed the permanent migration of approximately 60 scholars a year, a significantly high percentage being registered in the case of Ph.D. in the five years period (140 per year, representing 12% of the those acquiring this title) [17]

The emigration of intellectuals, especially from Europe to the United States of America, was thereafter the subject of several investigations that will lead to the establishment of "brain drain" in academic language. In what concerns the reverse phenomenon, namely immigration, in the United Kingdom this shall be done also though a report of the same scientific fellowship entitled "Migration of scientists to and from Great Britain", published in 1987 [18]. Study, conducted both in universities and research institutions and industry on a 10-year interval, identified an annual average of 74 emigrants in the university sector, while the number of immigrants was of 556 academic, during the same analysis, of which 140 were British. At that time it was concluded that the "brain drain" phenomenon, although it had low proportions, was continuing to pose a concern. A third study, conducted in 1993 by the Royal Society, entitled "Migration of scientists and engineers in 1984-1992", confirmed, to a larger extent, the conclusions of the previous study. [19]

More recent studies conducted in Great Britain revealed that between 1995-2006 immigrant flows predominantly academic have exceeded those of migrants, registering a 1.4 input to one output, with a fall in the trend in the last part of the period. In recent decades, in the special literature the subject was analyzed in terms of the negative impact on the countries of origin of the highly skilled migrants.

Statistics for the years 1960s-1970s showed a consistent flow of highly skilled migrants from developing countries to the developed ones, due to rising demand for migrants in this category, coupled with the decreasing availability of those on the labour market. Migration trends have been considered a serious treat to the economic development of poor countries, bodies such as the United Nations Conference on Trade and Development (UNCTAD).

Economic and political changes of the 1990s have induced significant effects in terms of migration flows of highly skilled people. On this background, there will be a considerable increase in highly skilled labour migration from Eastern Europe to the United States of America, Canada and countries in the Western Europe.

Although incomplete, the statistics give a relevant image of the phenomenon. Only in 1990, approximately 40,000 people with higher education emigrated from Yugoslavia (nearly 10% of all migrants). In 1991 at least a million polish people, especially youngsters with higher education have migrated to Western Europe (with favorite destinations UK and Ireland). The same countries of

destination were chosen by highly qualified emigrants from Lithuania, after joining the European Union.

The biggest losses caused by the "brain drain" were recorded by Albania, estimating that 40% of the intellectuals of the country before 1990 opted for emigration.

There were also situations of control of the phenomenon, the best policies of preservation and significant return of intellectuals being applied by Croatia, by strengthening the university system and granting consistent scholarships. After joining the European Union, Serbia invested considerable resources in restructuring the higher education, significantly reducing migration of highly skilled labour force.

b. Causes and determinants

One of the most common explanatory theoretical models of migration is the push-pull theory of Lee Everett (1940), according to which migration is determined by the action of certain economic, social, political, cultural, environmental etc. factors, which carries on the migrant rejection (push factors, pertaining to the country of origin) and attraction (pull factors pertaining to the country of destination). In the first category are: insufficient jobs, lack of opportunities, "primitive" living conditions, political/religious constraints, diseases, natural disasters, threat of death, slavery, pollution, lack of housing conditions, unable to find a life partner. The second category can include: job opportunities, better living conditions, political/religious freedom, education opportunities, better medical conditions, personal security, family ties, increased chances of finding a life partner.

Push-pull approach can be used to analyze factors that determine the phenomenon of "brain drain." This, the rejecting category includes underemployment, economic underdevelopment, low incomes, political instability, overproduction, little utilization of highly skilled persons, low opportunities for scientific research, discrimination in professional promotion, unfavorable working conditions, the desire for superior qualification and its recognition, high expectations in terms of career. Pull factor include: better economic prospects, higher income, increased living conditions, facilities for research, efficient education system, prestige conferred by training made abroad, better working conditions, increased employment opportunities, incentives etc.

b. 1. Economic factors

In general, in the special literature two economic factors involved in the decision to emigrate are described. The first is the remuneration gap, in real terms, between the country of origin and that of destination. The existence of such significant differences in labour remuneration for comparable activities in terms of job content and training is regarded as one of the key drivers of migration motivation. The second factor is the degree of probability of finding a job in the country of destination, within a reasonable time horizon.

The majority of those with high qualification opt for practicing abroad because that will bring significantly higher revenue compared to what they would receive in their country of origin. Generally, between the level of education and that of incomes there is a substantial correlation. Although there are individuals with a high level of education with low earnings, as well as persons with a lower education level with higher incomes, the overall level of education and income are highly connected.

The difference between the wages in the country of origin and destination correlates usually with the real GDP per capita, indicator considered a determinant variable of international migration in Europe, especially for highly skilled labour force [20]. In the case of the "brain drain" from the underdeveloped countries to developed ones, an important role is held by the uneven development patterns and the disequilibrium between demand and supply of labour force. In the developed countries the population growth rate is low, education is more expensive and the technological development requires a highly skilled workforce, for which demand is often greater than what is available.

Even if it has a special importance in the decision of migration, economic factors do not cover all possible reasons of the phenomenon.

b. 2. Socio-professional factors

Some authors have stressed the fact that dynamics of highly skilled migration varies by occupation. Pull factors and rejections causing migration are different depending on the migrant's occupation: manager, engineer, technician, scientist, entrepreneur or student. Thus, while a scientist may wish to migrate to fulfill its scientific curiosities or to receive the financing required by the respective research, an engineer may be motivated primarily by wage conditions on the labour market [21].

Similar research has shown that in the case of scientists and researchers, the decision to migrate is determined by factors such as overall structure of national systems of innovation, the quality of the research infrastructure, financial support for academic research, the prestige of universities and research institutes, employment opportunities in innovative sectors, the perspective to have a successful scientific career, access to advanced scientific equipment [22].

b. 3. Political factors

Educational policies of the countries of origin have an influence on the brain drain. Subsidization by state of tertiary education is leading either to a considerable increase in the number of graduates, over the capacity of the labour market, or to a decrease in the education quality, where the financial resources allocated by the government are insufficient. Both situations encourage the best graduates of higher education to migrate abroad in order to benefit from training opportunities qualitatively superior or from jobs according to their formation. The experience of being a student abroad increases the likelihood of later becoming a skilled migrant.

Migration of highly qualified individuals is influenced to a high extent also by the migration policies of the countries of destination. In countries like USA, UK or Canada, the absorption of highly skilled labour force through migration is an integral part of the effort aimed at maintaining the economies' global competitiveness.

Since 2002, the British government initiated a set of measures designed to determine the highly qualified people to immigrate to this country, the Highly Skilled Migrant Programme, one of the most accessible immigration programs in Europe. From 30 June 2008 it was replaced by Tier 1 visa program (General), which allows highly skilled individuals who meet a minimum score (75 points) given for a set of specific criteria to immigrate to the UK without any sponsorship from an employer. This category includes physicians, scientists, engineers and other university graduates. The criteria considered are: qualification)degree 30 points Masters – 35 points PhD – 50 points), previous income (score may vary from 5 points to annual incomes between 25,000 and 29,999 pounds to 75 points for income over 150,000 pounds), age (under 30 years – 20 points, 30 to 34 years – 10 points, 35 to 39 years – five points, over 40 – 0 points), experience in the destination country (obtaining income or previous qualification in the UK – 5 points), use of English skills (proof of a standard level of knowledge required – 10 points), the capacity of upkeeping (keeping a minimum amount in a bank account a period of three months before application, to prove ability to support the applicant/any people dependent on it, respectively 800 pounds for applicants from inside the UK and 2800 pounds for those outside the UK territory – 10 points) [23].

In Canada operates a similar system, Canada Skilled Worker Immigration. The minimum score of 75 points was reduced to 67 points from September 18th, 2003, in order to increase the applicants' chances of being accepted as immigrants. Visa criteria are: education (university studies – between 15 and 25 points, certificates/non-university diplomas – between 5 and 22 points); ability to use French and English (maximum 24 points possible, depending on the performance of speaking/listening/reading/writing, of which 18 for the first official language and 8 for the second); work experience (maximum 21 points possible – 15 points are granted for one year of experience in a

skilled profession and 2 points for each additional year); age (maximum possible 10 points awarded for category 21-49 years); adaptability (maximum 10 points). As with Great Britain, to the mentioned criteria an additional requirement is needed, that of a minimum amount for upkeeping, which varies from $ 10,168 for a single person to $ 26,910 for a family of seven people [24].

As for the United States of America, they represent the main pole of attraction for highly skilled labour. Approximately 40% of the adult population born abroad has a tertiary education level. Since 1952 U.S. authorities granted temporary visas for highly qualified people. The 1990 Immigration Act defined the categories of highly qualified people and set several distinct categories of visas that may be granted to them. Since the early 1990s, over 900,000 highly qualified people, mostly IT professionals from India, China, Russia and some OECD countries (including Canada, Britain and Germany) have migrated to this country under H-1B visa program, aimed at researchers, specialists in information technology, social, natural and exact sciences. Number of visas in this category has increased gradually, with now 195,000 annually [25].

c. Romania's situation

Although there are no official statistics to reflect the exact number of Romanians working abroad, the approximate number (2 million) leads sociologists to speak of a national phenomenon by size, implications and the geography of the flow origin. The first estimations of the emigration of Romanians have been made in the early 2000s.

The problem of immigration ("euro-commuters") is complex. Since 1989 over one third of households (two million and a half) had at least one member abroad. 10% of the Romanians aged between 18 and 59 years old have worked abroad during the transition [26]. In the first stage (1990-1995) the main countries of destination for Romanians were Israel, Turkey, Italy, Hungary and Germany. In the second stage (1996-2001) Canada, Spain and the USA were added. After 2002, with free circulation within the Schengen area, the Romanians concentrated on Italy (50% of all immigrants) and Spain (25%).

In 2008, one of six Italian immigrants came from Romania (1 million). In Spain, in 2008, the Romanian immigrants ranked first as number out of the total of 5.2 million, they were 730,000, a quarter of which in the Madrid region.

Studies on "brain migration" in our country are extremely rare. Data provided by specialized publications issued by the National Institute of Statistics provides information on the structure of migrants by level of education, correlated with other socio-demographic indicators, allowing some conclusions about the migrations of highly qualified people.

In the net migration between the two censuses (1992, 2002), the balance was inclined toward the people having the most fertile age, between 20 and 40 years old (62%) and people already formed, with a working potential and innovation higher than that of other age groups.

Higher education graduates, considered "brain drain", represent between 10 and 12% of the total migrants. Their decision to migrate is determined by the difficulties on the labour market in finding an adequately paid job, as well as the increased mobility of this category, whose elements see in emigration an option to succeed [27].

Between 1990 and 2000, from Romania emigrated a total of 36,117 highly educated people, of which 19,012 women and 17,015 men.

Regarding the distribution of migrants with higher education by age, in the same period, 57.4% were aged between 26 and 40 years, 17.5% between 41 and 50 years, 11.6% from 51 and 60 years, and 16.6% for people over 60 years.

Destinations of Romanian immigrants with higher education between 1990 and 2000 were Canada (54.4%), USA (15.95%), Germany (5.3%), Hungary (4.7%), Italy (3%), France (2.6%), Israel (2.3%).

Distribution of occupational categories of migrants between 1990 and 2000 is as follows: engineers and architects - 19.122, physicians, doctors and pharmacists - 4466, economists - 4937, other professions - 7592.

Among the few groups of occupations for which statistics are available, the most noticeable increases were recorded between 1995 and 2004 among engineers and architects (from approx. 8-9% to 12-14%), teachers and economists (3-5% at the end of the period), technicians, doctors and pharmacists (3-4%) [28].

The latest figures from the National Institute of Statistics on temporary external migration in 2008 indicate a total of 8739 migrants, slightly down from the previous year (8830). In terms of education, 33.2% had higher education and 41.2% secondary and post-secondary studies.

Most immigrants with higher education chose as countries of destination, in 2008, Germany, Canada, USA and Italy.

Age distribution of migrants with higher education is as follows: 914, between 30 and 34 years, 618 between 35 and 39 years, 471 between 25 and 29 years, 380 between 40 and 44 years, 189 between 45 and 49 years.

Among male migrants with higher education, the majority were aged between 30 and 34 years (332) and 35-39 years (242). A similar distribution was recorded in terms of female migrants (582 in the first age group and 376 in the second) [29].

Migration on age structure shows considerably more pronounced tendency to leave of the working-age people, who enjoy increased opportunities for professional development.

The highly skilled labour force involved in the migration movement includes, therefore, mainly, persons aged between 25 and 40 years old, with skills in science and technology and to a lesser extent in education and health [30].

Without minimizing the role played by the economic motivations in the decision to migrate, ultimately it depends on each individual's system of value, ideas, preferences, expectations and available resources, i.e. its financial, educational, professional and cultural capital.

Apparently, the following question emerges: And what does brain migration has to do with welfare at work, which strengthens the team? The short answer is causality – if the collective welfare in an organization is not reached through internal efforts or national regulations for all organizations, people emigrate.

3.2. Welfare at work

For every employee, welfare translates in [31]:

- An environment of functionality, a harmonious relationship within the organizational structure (both horizontally and vertically), more autonomy in carrying out the working activities, a moderate level of pressure and stress, and interesting and challenging work content;
- A constant desire to better balance the personal life and the professional one, by reducing the working time in favor of the free time, in order to rebalance the lifestyle;
- An efficient use of the skills, which allows prospects of a career, material and moral recognition of efforts and work effects.

In general, welfare at work is conditioned by the education and training level of the individual, but also by the remunerations he/she receives. We do not intent to show here the anomalies in the Romanian organizations – private, but most of all public ones. However, work duration leaves a mark on the fexicurity degree of the employee (it is again necessary to remind the need to present things as they are normal, and not as they are in our country).

The concept of welfare is closely related to the quality of life. The standard of living [32] is based on the living conditions, but also on personal aspirations. If the manager understands where the team members are positioned and knows how to provide for them natural, human, social, cultural and educational environments, but also the proper resources, then he/she will be able to mobilize the team

towards efficient activities, which, at individual level to materialize in a better life style. Specifically, we speak about the subjective and objective methods of assessment of the living standard. The individual, subjectively, is concerned about a rise in one's career, which will ensure a growth of income, working time, prestige, quality of life through access to other type of services, of a higher level. And the society, objectively, requires education, training, wishes to meet, namely mobilization to create.

Welfare at work is protected [33] by the legislation regarding the occupational safety and health. Personal hygiene, leisure, dining first aid and others no longer represent union claims. Group welfare protection services usually are in the form of access to the canteen, sports clubs or social clubs, as well as the organization of activities such as rituals and traditions.

There are also benefits offered, voluntarily, under the specific activity of the organization, but in order to maintain the employees' wellbeing – providing periodical free dental checks, medical check-ups beyond what the occupational medicine services offer, cosmetics, manicure, hairdresser.... Regarding the employees' safely, health and welfare within the organization, most elementary rules are laid down in legal regulations, at a minimal level; managers can extend these facilities, as seen before, if they take into consideration the employees' psychological comfort.

But most visibly, for the workers, is welfare through the pay system or contractual provisions for exceptional cases of family or job problems, illness or death.

Is it much? Is it little? It is enough, if it meets the people's needs. Money invested in their welfare is multiplied within the work results.

4. Managing discomfort at the workplace.

Basically, discomfort is not determined so much by crisis and conflicts, as it is by stress. Without discussing in more detail the elements which define and generate discomfort in the team, we should try to establish a change in the ways to overcome such situations.

What it is done in the management of discomfort? In practice, very little.

Crises and conflicts are apparently solved, because regardless of the communication and negotiation skills, words and deeds already done cannot be simply deleted. The play on words between "forget" and "forgive" is a trick – I forget, but I don't forgive or I forgive, but I don't forget. In reality, it is neither forgiven, nor forgotten. And stress, once installed it permanently changes the neurological structure of the person in question.

- **What to do, then?**

It is for the manager to carefully monitor the interdisciplinary relations among team members, providing them permanently with the right assessment tools, trainings, leaderships profiles, job rotation, transfer between countries for certain level managers...

- **What else could be done?**

Essentially, fighting discomfort at the workplace [34] is the preservation of health. "Health is a fully favorable condition physically, mentally and socially and not merely the absence of diseases or infirmities" (OMS, 1945). Subsequently it was added "the capacity of having a social and economic productive life."

In a holistic approach, reducing discomfort is adopting a healthy lifestyle, maintaining a balance between work and life conditions though:

1.1 **education** (strengthening self-esteem, positive thinking...). Family education is completed in any of the formal, in school, informal and non-formal environments.

1.2 **energetic recovery** (healthy diet, exposure to natural lights and fresh air; outdoor exercise; self-impose and respect a rest through sleep program...)in fact, almost everyone has heard or learned once, but fail to remember:

a) A work-appropriate nutrition is provided by:

- Substances necessary to daily consumption (50-55%), protein (15-20%), unsaturated fats, fibers, vitamins, minerals and plenty of water (2l/day) – precisely because of its properties and features [35] ("water is life," part of the body; structural role and water balance; lubricant and emollient; thermo regulator, washing agent, tempering, transport; role in digestion; prophylactic and curative factor through hydrotherapy);
- Vegetables, fruits and cereals (60% of the daily menu);
- As much fresh food as possible, without additives and preservatives.

b) Exposure to natural light and fresh air [36]:

b. 1. **Light** has been defined over time though photons, a wave-like flow, a complex of electromagnetic radiations, UV radiation (A – long, B – middle, C –short), visible (40% of those reach the earth's surface) and infrared (calorific value), cosmic rays, Y rays, X rays etc. Light effects are multiple: photochemical and photosensitive (sunburn, hives...); bactericides; antirachitic; physiological and psychological characteristics of colors; biochemical and metabolic; on blood components, circulatory, biochemical and metabolic apparatus; on the endocrine glands and nervous system as well as on the skin.

b. 2. **Clean air** is invisible, necessary to life; it presents negative ions recommended in aerotherapy and so necessary in case of pollution.

c) Outdoor exercise through: walking daily and jogging as much as possible; giving up the comfort of the elevator, the car (in exchange for the bicycle, for example), the conveyor...; walk in lunch breaks or between activities; rediscovering sports in parks or in special equipped gyms; dance classes; hiking; or any other physical activity.

d) Self-impose and respect a rest though sleep program – 8 hours work + 8 hours other activities + 8 hours sleep. Even in the case of insomnia the body should be provided with an horizontal position on the bed, eyes closed, unless there is a possibility of having a who hours sleep or rest in the afternoon...

d. 1. Rest, as the existence's universal force, essential health factor with extended utility, is opposed to fatigue caused by prolonged work or exercise (hypotonic fatigue), labor or intellectual effort (hypertonic fatigue) or insufficient sleep.

d. 2. Sleep, as a restorative period for the body, characterized by the suspension of waking, can be slow – up to 80 minutes, paradox – of approx. 10 minutes (REM – rapid eye movement), insomnia (symptom and disease) or dream.

1.3 **Adopting preventive behavior**, such as: diminish/eliminate smoking; reduce/eliminate alcohol consumption; avoid crowded public places or with a high risk; use of safety belt in car, motorbike helmet, knee protection, armrests and other protection equipment.

Of course, one can draw a "map of the mind", by which to diagnose what is healthy and recommended to be kept (raw food and less processed, water consumption, time for oneself and self-respect, happiness and passions in life...), what is harmful and desirable to be removed (alcohol, tobacco, drugs of any kind, plants, coffee – in excess...); what is better to adopt if not yet in one's behavior.

The incredible body regenerative capacity can fulfill its function though a series of complementary therapies [37]:

- To improve lifestyle: naturopathy, relaxation, visualization, meditation.
- For a state of wellness: Alexander technique, Tai Chi, Chi King.
- Natural: homeopathy, herbal medicine.
- Touch: massage, Shiatsu, aromatherapy, reflexology.
- Yoga.

- Through arts: dance, painting, music, sculpture.
- Through manipulation: osteopathy.
- Mental: healing, psychotherapy, hypnotherapy,
- Oriental: Ayurveda, Chinese traditional medicine, acupuncture.

Conclusions

A somewhat detached analysis, or at least unbiased, of the homogeneous compositions of the performance of a team cannot be carried out strictly from the economic or sociological point of view. A wide range of psycho-physiological determinants have already been discussed in detail or only mentioned. Maybe we should start from a new vision, another understanding of reality:

- Nothing, except laws, is mandatory, but advisable.
- "You don't have to, is good to"....
- Life lived intensely, fast-paced, with concerns, shortcomings and worries stops people from thinking about themselves, about their needs, their pleasures, their aspirations, their ideals...
- Forgetting one's self leads to fatigue, illness or extra pounds, motivation disappears, as well as the energy and joy of living.

We can no longer afford not to understand the need to encourage the change in the existential paradigm, by adopting a different approach to causation and effects of phenomena, especially by simplifying our existence – for instance, reducing the daily number of needs (from the 11,000 the modern man has).

Regardless of their professional profile, any person should know, not just a good manager, that adopting a healthy lifestyle in harmony with nature, can influence genetically a person. "Living healthier, eating healthier, exercise and love stimulates the development of brain cells, disabling the disease-generating genes, turning them into beneficial ones" (dr. Dean Ornish, president and founder of the Preventive Medicine Research Institute of Sausalito, California, in a recent TED conference in Monterey).

THE CONTRIBUTION OF THE EMOTIONAL INTELLIGENCE ON LEADERSHIP FROM ORGANIZATIONAL PSYCHOLOGY PERSPECTIVE

GABRIELA MIRONOV [*]
ECATERINA NECSULESCU [**]
MIHAIL – SILVIU POCORA [***]

Abstract
Talking about intelligence as a complex system of operations which conditioning the general approach and solving different problematic situations and tasks, we have insight operations and abilities such as: adaptation to the new situations, the deduction and generalization, the correlation and integration into a unified whole of rather disparate parties, the consequences and anticipation of the outcome, the qiuck comparing of actionable variants and retaining the best alternative, the correct and accurate solutions of some problems with increasing degrees of difficulty. All these skills and operations reveals at least three fundamental characteristics of intelligence: the ability to solve the new situations, quickness, mobility, adaptability, the suitable and efficient flexibility to the circumstances.The intelligence appears as a quality that whole mental activities, as expression of higher organization of all mental processes, including the emotional - motivational. According as forming and developing the mechanisms and operations of whole mental functions, we encounter a flexible and supple intelligence. At present, is still continue in psychology the question if the intelligence is the capacity to acquire knowledge, to reason and solve problems, or it involves different types of skills. The majority is choose the first assumption. The new research made by cognitive psychology perspective and neuropsychology, which connects the intelligent behavior of neurological efficiency, brings valuable clarification in this regard. The study is approaches the complexity of this side of personality, which arising from the approach advocated in the history of philosophy and psychology. The opinions considering to the intelligence have ranged from acceptance and highlighting its role in knowledge, to the decrease its significance or even to eliminate it from human existence.

Keywords*: emotional intelligence, leadership, emotional management, general intelligence.*

1. Introduction

This paper aims to show that emotional intelligence and leadership are intrinsically linked to specific. Emotional intelligence provides spiritual component, the instinctive leadership, acting in conjunction with cognitive skills, technical competence and strategic thinking. An emotional dominated leadership behavior is beneficial, whether they apply to a large mass of people, a team or even ourselves mice, but low levels of emotional intelligence are extremely harmful to leadership in any situation.

Intelligence emerges as a stable system features its own individual and the human subject is manifested as intellectual activity centered thinking. Central process of thinking is closely linked, even combined with all other organic. Moreover, the psychology of thinking, various distinctions were made between analytic and synthetic, pragmatic and theoretical, reproductive and productive, crystallized and fluid, etc. convergent and divergent. In connection with lateralized brain, considering that the left hemisphere specializes in verbal and semantic order and the right hemisphere has features for handling spatial relationships and the configuration of images, will probably shape the intelligence to research options logico-semantic dominant or spatial imaging.

Considering that intelligence as an instrumental structure, its own individual personality, we must show that the very experience of life and especially education and professional experience a highlight, and to assess them. Empirically, intelligence can be assessed after learning efficiency, as the ease and depth of understanding and by the difficulty and novelty of problems which the subject is able to solve them.

2. Emotional intelligence vs. general intelligence (IQ)

Although this paper seeks to explain the advantages of emotional intelligence should not be overlooked general intelligence as measured by IQ. In fact many psychologists still believes that IQ is only that can guarantee success. If you are a smart, if you have a high IQ if you graduated from a recognized university, or a higher qualification, you can not worry about. IQ is very important, but to increase your competitiveness, you need to build your future development plans Encompassing own emotional intelligence. Based on the adaptive role of emotionality was found that people who have an IQ (IQ - an index of development level of intelligence, mental age determined by reference to chronological age) or high academic intelligence is doing very well developed, much less everyday life, while another group of subjects, but have a lower IQ compared with the first, had good results in practice.

Where did the question: "How do they manage to have success in critical situations, to cope with life circumstances at any time?". asked people on the streets to demonstrate what they understand by an intelligent person. Following analysis of responses to the survey concluded that they have a different skill than academic intelligence, able to overcome obstacles which makes everyday life (Goleman D, R., Boyatzis 2005). This ability was originally reported to social intelligence, which refers to the ability to understand and establish relationships with people. Unlike IQ, which changes very little after adolescence, emotional intelligence appears to be largely learned and continue to develop as we go through life and learn from experience. Our expertise in this area can continue to grow, and for this there is a popular word: maturity.

Unlike IQ, emotional intelligence (EI) has proved to be a more reliable predictor of success in personal and professional life. IQ and not IE opposing powers, but rather separate, yet one can not operate at its maximum potential without the second. It is useful to note that there are often differences between the innate potential of a person's emotional intelligence and its development potential throughout life. Each child is born with a potential for emotional sensitivity, emotional memory, emotional control, with a potential ability of emotional learning.

This innate intelligence can be developed or altered by life experiences, especially emotional lessons given by parents, teachers, professors, family, etc.. during childhood or adolescence. These lessons can have a positive or negative, unhealthy on the evolution of innate emotional intelligence. It is possible for a child to start life with a high level of innate intelligence, then heads to unhealthy emotional habits from living together in family abuse. Such a child will be when it grows, a much lower level of emotional intelligence than the level it was at birth, because lived experiences during childhood . On the other hand, it is also possible that a person has a low level of emotional intelligence at birth, but received a positive emotional growth and modeling in childhood, it will increase its level of emotional intelligence. However, the child's emotional intelligence is more easily altered than developed, following the principle that it is much easier to destroy than to build.

Currently, models including the model of emotional intelligence Mayer / Solovey / Caruso combines variables measuring innate emotional (emotional sensitivity, emotional memory, emotional control, emotional learning ability) with the same environmental variables influenced.

3. Emotional intelligence in business romanian

3.1. Why is emotional intelligence so important at work?

For years, trainers, professionals in human resources, teachers, recruiting teams, managers and other people have found out what is that differentiates the normal workers from those who are

rendering themselves evident in the crowd. It is not about technical skills – these are relatively easy to learn, and is easy to determine if a person has this kind of skills or not. It is not necessarily the intelligence either. It is about something else, something you know that exists only when you see it but that is difficult to define clearly. It is about personal abilities (R.Carusso 1999).

After many years of discussions regarding personal abilities, the people working in training, management and employment fields have finally let themselves convinced. The discovery of the essence of what makes people evident at work brought this discussion in front. Starting from now on, we can replace the subjective term "personal abilities" with a more objective and exact one – "emotional intelligence". Those who never appreciated the ability of "reading" or understanding the people, or understand their feelings because they were too "soft" and couldn't be measured, will have a very accurate measuring instrument. And this is because the emotional intelligence is an intelligence form or a set of skills.

3.2. IE enter the market of training and recruitment.

Romanian market are already several companies using the concept of IE or in their work or giving presentations or training. Those who drive them have in common revelation made by finding the concept and usefulness IE passion for this area and wish to share with others what they learned.

Not incidentally, is among those companies and Korn / Ferry International, the American firm recruitment and management consulting and leadership in over 40 countries, the market leader for leadership development. Effectiveness of training on IE is best evidenced in the case of companies that have direct relationships with customers and especially for financial professionals who are often in a position to help customers achieve their personal and professional goals.

3.3. What is the role of feelings at work?

Let's consider, for example, feelings like fear, anxiety or concerns. Assume a car factory whose management decided to increase the productivity. The workers will have to work faster then before and, yet, to maintain the same product quality. If the speed imposed is still at a reasonable level, people can mobilize and they will become aware of the fact that they have to be more attentive and to work harder. But if the rhythm increases to a level where the workers feel they cannot resist, they will start to worry. They will worry about not making mistakes and not harming themselves. They can also ignore those feelings and continue to work. If they ignore their feelings, all could be normal or, on the contrary, many errors may occur and people might lose their jobs.

Worries, fear and anxiety are feelings that may mean that something is not going well. Worries can give an alarm about future dangers. When concerns regarding the increase of production rhythm occur, they may be used in a constructive way. For example, they can increase the sleeping time so that they are more refreshed at work. Or the breaks between the different sets of operations can be shortened. Or, the management can be told that the more products produced the more defects. All feelings are extremely important at work, not only fear or concerns. Satisfaction, for example, is a sign that the works are going well. A feeling of pleasure at work may signify a thing well done. It is important to know that feelings comprise critical information that we have to take into consideration if we want to be efficient.

3.4. Where does emotional intelligence intervene in work's success?

Emotional intelligence cannot predict for itself the work success, a satisfying career or an efficient leadership. It is only one of the components which are important.

The quality of being a good user of emotional intelligence also comprises the understanding of the fact that it is not and it shouldn't be thought of as a replacement or subtitute of abilities, knowledge or skills obtained in time (I 2000). The emotional intelligence increases the chances of success but it does not guarantee the success in the absence of the necessary knowledge. The

emotional intelligence is always helping the individual. It is a good thing for it to exist. But also the other abilities and competences are important.

Use emotional intelligence at work (Goleman 2001, p.88)

Some ways in which emotional intelligence may help in the day by day activity are presented below.

Identification of emotions

• One should be aware of the own feelings and emotions so that not to be "blind" by feelings;

• One should be aware of the feelings of the others as this is a key point when working with people.

Use the emotions

• Creativity may come from the ability of generating a certain state or a proper feeling;

• To feel "for" the others, to be able to be emphatic, may come from the ability of generating a feeling that the other persons perceive.

Understanding the feelings

• To know what motivates the people;

• To understand the point of view of other people;

• To understand and to manage with the interaction within the group.

Emotions control

• All the time to be aware of your own emotions which contain valuable information and use this information to resolve your problems;

• Whenever you are sad, find out the root cause for your frustration, why have you been disappointed, and solve the problem;

• When you are upset, find out the reason why you are frustrated and solve the problem;

• When you are anxious, find out the reason of your worries and solve the problem;

• When you are pleased, find out the root cause for your happiness and repeat it.

4. Specific applications of emotional intelligence at work

4.1. Considerations regarding the intelligence concept in the companie's operations

The Companie's operation may be defined as the assembly of homogenous and/ or complementary activities performed by the working personnel having a certain qualification and specialization that use certain specific methods and techniques in order to achieve the objectives of the company (Dănăiață I., A.Nicolae, Predișcan M. 2002, p.95).

According to the author's approach, the main activity fields, functions respectively within a company are the following:

1.The research – development function

2.The production or operational function

3.The commercial function

4.Financial – account function

5.The function of personnel (human resources)

Taking into account the fact that the functions of an economical company are generally the same, this meaning that they do not differ from one branch of the economy to the other depending on the object of the activity performed, a general theory of the involvement of the intelligence concept at the organization level may be developed.

Starting from the model of Multiple Intelligence made by Howard Gardner (Gardner 1993, p.104), the following question may rise: which of the seven types of intelligence mentioned by the author has a more important role in making more efficient and for a good development of each of the functions of the company?

According to the multiple intelligence theory, not only that individuals posess numerous mental representations and languages of the intellect but the individuals differ one from another by the form of these representations, of their size or the easy ways in which they are used and also the way in which these representations can be changed.

As regards the **function of research - development**, it comprises all the activities in a company oriented towards the achievement of the objectives in the field of generating new ideas that should materialize in products, useful services (elaboration of product development strategies, of technologies and development of the activity). The main characteristic of this function is its innovative character that assures the adaptation of the company to the needs of the consumers, and clients, as well as to the evolution of science and technique.

We may say that in order to be successful in this kind of activities, a high level of intelligence type visual-spatial, visual-liguistics, logical-mathematical is more than necessary. We define the visual-spatial intelligence as the "ability to perceive visually what is around us", a determining factor when elaborating some research-development activities in the light of the need to identify the necessity upon which the specialists will concentrate their efforts (Slater 2009).

Next to this type of intelligence, we define "the ability to use reason, logic and numbers", this meaning the logical-mathematical intelligence, this representing maybe the main characteristics taken into consideration when developing some research activities, mainly in the technical domain.We cannot neglect the fact that, generally, the research-development activities are performed within teams, and rarely these responsibilities are being delegated or assigned to individual level. In this way, types of intelligence such as the verbal-linguistics and inter-personal intelligence (the ability to use words and to speak, as well as the ability to understand and interact with the others) are needed for establishing an open cooperation and understanding atmosphere within the group.

The production or operational function is defined as the assembly of basic activities of the company/organization through which the work objects are being transformed into products, finite services meant for selling towards customers (Adriana 2005).

The experience of some visits to big companies in Timişoara or in the country have strengthened my opinion that in the case of individuals directly involved in this kind of activities, the visual-spatial intelligence, the logical-mathematical intelligence as well as the kinaesthetic intelligence (the ability to control the body movements and of dexterity in working with different objects) are essential for the success of the activities undertaken. We have to remind once again that many of the activities included in the production function need team work, thing for which the inter-personal intelligence is playing an important role in reaching the common group objectives.

The following activities are being taken into consideration:

a)Technical-material provisioning;

b) Storage, preservation and management of fuels, materials and raw materials stocks;

c)Transportation outside the economical unit;

In the case of the first three activities, it is obvious that types of intelligence such as: visual-spatial intelligence, logical-mathematical intelligence and kinaesthetic intelligence are necessary attributes to the directly involved persons. Besides the intellectual effort, the transportation, preservation or management of raw materials and of materials, also imply the usage of kinaesthetic or dexterity abilities.

As regards the **commercial function**, (Robert 2001) which includes the sales and marketing activities, competencies as the verbal-linguistic, musical, inter and intra personal ones (the ability of self-reflection and awareness of the own ego) have a significant importance if we think of individual's abilities such as creativity, persuasion, ambition, negotiation ability etc. Therefore, the **commercial function** includes all types of intelligence mentioned by Howard Gardner, and one of the conclusions might be that the group of individuals directly involved in the component activities of this function reunites the whole palette of the above mentioned abilities and competences.

The financial – accountant function comprises the assembly of the following activities: financial planning and execution, accountancy, costs and price calculation, economical-financial analysis. These activites have a strong synthesis character (Nicolescu 2006), highlighting, in monetary expression, the economical aspects of the activity of the entire company.

By the self nature of these activities, it is obvious the fact that the dominant feature that has to be taken into consideration in the case of this function, is the logical-mathematic intelligence, this meaning the ability to use reason, logics and numbers.

Gardner sustains the fact that any person has a certain coefficient of each of these intelligence types (visual-spatial, vizual-linguistic, logical-mathematic, kinaesthetic, musical, inter-personal, intra-personal), the only thing that makes the difference being the way in which they vary or combine with one another.

The components of the **personnel function** are very complex because each person is a unicate (Dănăiață I., A.Nicolae, Predişcan M. 2002). The activities included in this function are determination of the personnel needed, personnel recruiting, personnel evidence, appreciation and promotion, rewarding and punishing the employees, training and perfecting, protection and work hygiene, as well as administrative activities.The most of those who studied emotional intelligence consider that it can be applied in all domains of life as knowing to work and to communicate with people is an ability that no one can live without. In the conditions of quick changes within organizations, the high level of emotional intelligence has become an important factor of success, which sometimes exceeds the technical professional competence.

In fact, it is a reality that, at present, people are being employed based on an interview whose purpose is to appreciate the emotional abilities of the individual. It goes even further in the way that promotions and dismissals are the result of this interview.

Activities included in the personnel function as well as the considerations regarding the role of emotional intelligence concept upon them can be found in the next section, but what we have to keep in mind up to now is the following: the emotional intelligence finds its importance in each of the functions of the company, by its components also shown by Howard Gardner in the Multiple Intelligence model: verbal-linguistic intelligence, musical intelligence, inter-personal and intra-personal intelligence.

According to Daniel Goleman, for an organization to work well is necessary to pay attention to the emotional abilities of its members, assuring compatibility between them, in emotional-affective terms. In the past ten years, a new type of management has shaped, namely the emotional intelligence management within an organization. The organizational psychology researches led to the conclusion that managers (starting with the team leaders or the working team and up to the general manager), as well as the employees having a higher emotional coefficient are more successful than those who only have a good professional qualification. They are better seen in the organizations, are more cooperant, stronger motivated intrinsicly and more optimistic.

5. Conclusions

The conclusion that can be withdrawn from all these studies is that besides the "professional" intelligence or the high level of professional abilities, the capability of an individual of being "intelligent emotionally" brings that plus of value which transforms a simple employee in a formal or informal leader within the organization to which he/she belongs. We conclude by saying that now and in future should be kept a model for applying emotional intelligence to improve their adaptation in tensoinate situations that may arise in the evolution of a company. Identify situations associated emotions is useful and necessary because it encourages leaders to take an active attitude and to develop an effective plan.

MARKETING STRATEGIES IN PUBLIC INSTITUTIONS – FASHION OR NECESSITY?

SICA STANCIU[*]

Abstract
The marketing strategy, as core of the marketing policy, in the contemporary society and in the public institution, becomes a necessity not just a fashion. We undertake to reinforce this statement by arguments and to outline the specificity of the marketing strategy in the public institution of the modern society. Although public institutions are created and supported only if there is a large amount of social needs to be met during a certain period of time, the adoption of adequate marketing strategies and tactics is a must in order to achieve their efficiency.

Keywords: *marketing strategies, marketing policies, marketing tactics, marketing mix, public institutions*

1. Introduction

The society we are living in at the beginning of this millennium reveals a surprisingly rapid evolution due to the technical and scientific progress and to the ways it opens for its application in the social and economic practice. Therefore, we assist to an exponential evolution of the society needs in general and of the social needs in particular. This imperiously imposes for the marketing research in the contemporary society to represent a priority not only in the economic field, but also in the social and political field and particularly in the public field. Thus, the public sector should know and foresee the society needs, to analyse, systematise and hierarchically classify them in order to be able to clearly and rationally select those needs reflecting the general interest and to define them as *social needs* of public interest, on short, medium and long term.

Marketing, a science largely recognised in the post-war period, represents today the main instrument of the society as a whole, of any economic, public or non-profit organisation, allowing them to become acquainted with the social needs and their quantitative, qualitative and structural evolution. Therefore, the adoption of marketing strategies by any public institution cannot be perceived any longer as fashion but as a imperious necessity.

In this paper, we undertake to prove that the implementation of marketing strategies by the public institution is not only possible, but absolutely necessary under the specific conditions of its operation. This allows us to outline the particularities of the strategic marketing in the field of public services, as well as the concrete modality of achievement of marketing studies and marketing planning activities in the public sector.

The importance of studying this issue resides in the fact that, nowadays, no public institution, in order to carry out an efficient activity, able to promptly and favourably satisfy as many citizens' needs as possible, can ignore any longer the use of marketing methods and techniques providing it with a large range of information based on which it can adopt a corresponding strategy beneficial for its evolution in society.

In our recently published studies, we have brought, in our opinion, sufficient arguments supporting the necessity and opportunity of applying the marketing principles, methods and techniques also in public institutions. But the implementation of marketing in the public sector implies a specific attitude to be adopted by the related public institutions, the delimitation of the

[*] Professor, Ph.D, Faculty of Social and Administrative Sciences, „Nicolae Titulescu" University, sica@univnt ro

strategic directions and of the practical modalities of their accomplishment, concretised in the marketing policy essence.

The specific literature concerning the public sector marketing is at an incipient stage, the new marketing specialisation being subject to a crystallisation process. Most of the references may be found in the papers dedicated to the New Public Management or to the Services Marketing. The most consistent work dedicated to this specialisation of marketing belongs to the well-known American specialist Ph. Kotler, who published in 2007, with Nancy Lee, the paper entitled "Marketing in the Public Sector: A Roadmap for Improved Performance". This work has been already translated into Romanian in 2008, thus providing the theoreticians and especially the practitioners with the possibility to understand how to use the marketing instruments to attract the citizens' support in order to allow the settlement with maximum efficiency of their problems by the public institution.

We hope to offer support to practitioners, by the ideas rendered hereinafter, in carrying out a much more efficient activity in the public institutions, so that the citizens' and the public institutions' interests might be satisfied as quickly and favourably as possible, both quantitatively and especially qualitatively .

2. The marketing Strategy – Essence of the Marketing Policy

The public institution of the contemporary society is involved in the achievement of welfare, meaning the well being of citizens, of the natural environment and of the public administration, as expressly underlined by Ph. Kotler and Nancy Lee. This involves the assimilation of a new philosophy regarding the satisfaction of the society needs, based on the orientation towards citizens as unique beneficiaries. The marketing philosophy o the public institution aims at satisfying the "welfare" with its triple dimension: social, economic and ecological, by the combination of which to ensure the highest welfare possible of as many people as possible".

The implementation of the marketing philosophy in the public institution activity is achieved by its marketing policy which represents an important component of the general policy adopted by the public institution.

The marketing policy expresses the philosophy of the organisation regarding its existence and evolution, the directions towards which it is oriented and the concrete modalities of achievement of the objectives undertaken by it depending on the available resources at a given period of time. The adoption of the marketing policy outlines, on one hand, the overall conception and options of the public institution and, on the other hand, the principles and norms it complies with and the actions by which the undertaken objectives are fulfilled. This involves the unity of the strategy by which it delimitates the objectives and tactics by which it determines the adequate modalities for reaching the said objectives concretised in programmes of actions specific to the established time interval. The success of a unitary and coherent marketing policy resides in the harmonious combination of the marketing strategy, expressing the purposes pursued, with the marketing tactics, reflected in a set of actions that render into practice the strategic options, on the moment when these ones should be implemented by the persons in charge.

The marketing strategy has a central role within the marketing policy, as it derives from the organisation purposes and indicates the activity directions, but the marketing tactics should be synchronised with the former. Basically, the strategy is the theoretical side, relatively abstract, which may be achieved only by adequate practice, by concrete modalities of fulfilment of the established goals, in compliance with the citizens' needs, but also with the possibilities of the public institution. Therefore, tactics will be permanently subordinated to strategy, the latter remaining relatively stable for a given time interval. The tactics is the one to be permanently changed in order to adapt to the changes occurring in the social, political and economic environment. It has to generate a perfect concordance with the strategy and hence, it has to be anticipative, active and adaptive, so as to provide the adequate positioning at a given time, in order to create the adequate framework for the evolution of the public institution.

An efficient marketing tactics consists in the assembly of variables controllable by an organisation, combined in such a manner allowing them to get the desired reaction of the target market. The elements it can use to influence the demand manifested on the market are: the rendered public services, representing its product, the tariffs at which it provides such services, representing the price, the concrete manner of provision of public services, meaning the distribution of its supply, and the promotion of the public services it supplies to its citizens with whom it has to communicate as efficiently as possible. This set of variables controllable by the organisation, combined, designed and integrated in different proportions into a marketing programme, form the classical marketing mix, meant to detail the marketing strategies and to influence the market so as to provide the maximum possible efficiency of the activity carried out by the public institution. Certainly, when establishing an optimum marketing mix – as main instrument of the marketing tactics in any organisation – at the public institution level, other variables should be also considered: population, public institution's personnel, team, physical support, public service achievement process etc. By the harmonious combination of these ingredients and the adequate dosing of the available resources, the public institution can act in order to obtain the maximum impact on the citizen consuming public services.

3. Importance of adopting a marketing strategy in the public institution

The marketing strategy defines the attitude and behaviour of the public institution, the missions and aims to consider, the directions to follow in order to fulfil its established goals. It expresses the tendencies and exigencies imposed in order to obtained adequate performances. A successful strategy indicates what is essentially pursued in a given period of time, the modality of achievement of the related objectives and the answers to the fundamental questions of any supplier of public products and services:

- what services should be currently provided and what services shall be provided in the future
- which is the market share to be approached – the target market
- which is the maximum level of the tariff perceived for the said service
- what should be communicated to the potential consumers
- how to better provide the said service to the consumer

The modality of answering these questions reflects the concrete forms combined by the market strategy and the marketing mix strategy, meaning the product (service) strategy, the price (tariff) strategy, the distribution strategy and the promotion (communication) strategy which encompasses all the marketing functions.

If for theoreticians, the adoption of a marketing strategy by the public institution is nowadays a necessity, for practitioners, the most frequently, it is perceived as a fashion coming and going, mainly determined by the currently use by mass-media of terms such as: publicity, promotional price, brand, mix, public relations etc. belonging to marketing. Even certain specialists sustain that the use of marketing in public institutions has become "an officially approved fashion", especially if we analyse from the perspective of "promoting consumers' interests" which starts becoming a preoccupation of governors. They expressly require the managers of public institutions to pay an increased attention to the consuming citizens' desires, as they might frequently find alternatives to meet many of their requests in the non-profit and even in the private sector. This will lead to the decrease of the citizen's interest in relation to the public institution's supply and, in consequence, to the lowering in importance and opportunities of some public institutions, with unfavourable consequences for their employees.

For now, the social practice reveals that the promotion of the citizens' interests is made only theoretically, by words instead of facts and concrete actions, just because this is required by the central public authority and has to be ticked, so that the public institution's managers have the

possibility justify themselves before their hierarchical superiors and before citizens when the electoral campaign approaches.

Even if the consuming citizen's power started to increase as for the adoption of important decisions by the provider of public services, yet there is a power disequilibrium between the supplier of public services and consumers, in favour of the former, the user having finally just the alternative of not buying or of selecting from the existing rage of options, as the case may be. As such options usually do not exist, the provider being in a position of monopole, and if the consumer's need is urgent, the latter will accept the provided product or service and, in such circumstances, there is no interest for the supplier to promote the marketing principles, methods and techniques, unless it intends to promote its image and, considering the "trendy character" of the marketing techniques, it will use them in order to outline the openness to new in the knowledge era.

The beneficiary of the public service is traditionally called "public service user". Lately, we remark that increasingly more public institutions, especially those providing public services paid by consumers, use the term "customer" with multiple dimensions, inclusively representing the legal relationship between citizens and administration, beside terms such as "market", "transaction" etc., frequently encountered, deemed as trendy.

It has become "fashionable" to speak about the efficiency and efficacy of the activities carried out in public institutions, about the rationality of distributing the available resources so as to satisfy some social and collective needs. Any manager of a public institution justifies his failures, the inadequate quality of the public services provided, by the requirements of using with maximum efficiency the resources, especially the material and financial ones, according to the normative deeds.

The use of marketing in public institutions has become a fashion also due to the marketing opportunities, to its openness to multiple types of socio-humanist activities, to its universality having imposed it as a special way to draw the public's attention and to create human relationships. This openness of both citizens and employees of public institutions to marketing, even if just for its trendy tendency, has to be used in order to render into practice the marketing principles, methods, techniques and requirements, by the adoption and implementation of marketing strategies and adequate tactics finally leading to maximum results with minimum expenses, so that more and more social needs might be satisfied as quick as possible.

Passing from a superficial vision, according to which marketing is just a fashion, to a realistic and rational vision, imposing the use of marketing strategies as urgent necessity also by public institutions, becomes an increasingly important issue within the current international context. The dynamism of the contemporary society has lead to an unexpected quantitative, qualitative and structural acceleration of the society needs, but also of the necessity and possibility to meet them to a larger extent. As such, for any type of organisation: economic, non-profit or public, it becomes impetuously necessary to become conscious of such needs and of their evolution, so as to be able to settle realistic goals, achieving, by their fulfilment favourable circumstances for existence, subsistence and development.

The delimitation in each stage of social needs, reflecting the public interest, is highly important for the evolution of the public sector, and of the public institutions it represents. The modification of the social needs structure leads to the diversification of the activity carried out in public institutions and to its restructuring. It determines, on one hand, the establishment of new public institutions (as those emerged as result of the integration into the European Union, charged with the management of the European funds, the protection of human rights, immigration etc.) and, on the other hand, the dissolution or reduction of others' activity. For instance, as the individual resources of the society members increase, certain needs initially deemed to be of public interest may become simple individual needs or needs belonging to small communities, which may be successfully met by individuals or non-profit organisations, at local level.

The end of the first millennium revealed a modification of the vision regarding the evolution of society as for the ratio between three sectors: private, institutional (governmental) and non-profit.

Therefore, we ascertain an incredible development of the third sector, namely the non-profit sector which disputes with the institutional sector the opportunity to meet the social needs characterised by increasingly more dynamism, diversity and sophistication.

The non-profit sector turns into a serious competitor for the institutional one as concerns the provision of resources and the prompt involvement in the satisfaction of the ever evolving social needs.

Especially at the level of more developed economies, where by taxes and fees the public institutions mobilise significant financial resources, the marketing strategy becomes an essential component of their power-related policies, as they provide them with the chance to quickly discover and foresee the social needs generated by the technical and scientific progress. The community takes part in and supports public institutions in meeting the existing social needs to the extent they provide it in a more efficient and prompt manner than the non-profit organisations. Therefore, the community will focus its interest on those organisations most appropriately answering to its requirements.

Even if at first sight, the three sectors developed in the contemporary society have established direct competitive relations with one another, each of them having in view to extend the borders relating to the satisfaction of the needs of the society's members by means of the other one, in fact, they are obligated to cooperate so as to obtain optimum conditions for achieving the established goals. The public sector is the one who can and must ensure a favourable environment, but it depends to a larger extent of the resources obtained from the private sector. Mutually advantageous relationships may be achieved based on the partnerships concluded between the public and private sectors, between public institutions and between them and the non-profit organisations, by which financial resources as well as the support of those initiatives allowing the satisfaction of social needs might be provided. Such partnerships offer a very good opportunity to turn a possibility into reality, "to transform something good into something very good" as Ph. Kotler used to say. Under these circumstances, the eradication of the harmful phenomena manifested at the society level or the diminishing of some of their negative effects becomes possible. An adequate marketing strategy creates the premises for establishing partnerships that contribute to the improvement of the citizens' and communities' living standards.

A marketing strategy is necessary also in order to improve the image of the public sector, which is frequently negative, distorted and fragile, incorrect and incomplete. This unfavourable image of the public sector as a whole is deemed to be also the result of the objectives and subjective arguments formulated by the other sectors (private and non-profit) so as to justify the necessity to amplify their role and to gain as many supporters as possible.

It is important for each public institution to contribute to the perception changing and this may be done by implementing an adequate marketing strategy.

Implementing the New Public Management as an efficient modality of organisation and operation of the institutional system as a whole and of each component involves the use of marketing as main instrument. The marketing strategy allows the manager to clearly establish the vision (where he undertakes to achieve), the fundamental goal (what he wants to obtain), but also the primary and secondary goals which are sometimes controversial and not fully shared by the society or community.

4. Significance of the Marketing Strategy in Public Institutions

The marketing strategy of public institutions consists in a set of decisions acting as laws, regarding the target market, the positioning of public services and the level of marketing expenses. It has as purpose the optimum finality of the public institution activity within a certain period of time, clearly formulating the stage objectives towards which the efforts to be mobilised are directed. It is the result of a mix between managers' experience, intuition and hope as well as between their knowledge and skills.

The drawing up, implementation and assessment of the management strategy of public institutions is based on the same principles (rules) as in the economic organisation, but it deals with a series of *particularities* originating in the nature of the public institution's activity, the customers' components, the modalities of manifestation of the market mechanism etc., namely:

- the "product" supplied by the public institution is not a good with certain concrete characteristics, with attributes conferring it an obvious utility making it fit for sale, but it is a public service, the utility of which could be found in the dark corner of abstraction. In other words, something is offered, its value not being intrinsically useful but rather indirectly tangible or more exactly intangible but having to be subject to assessment.
- the large range of public services are increasingly diversified and are used simultaneously with their "production" by direct contact between providers (public institutions) and users (citizens).
- certain public services are rationalised and they are distributed based on a public will act. It is not supplied on demand, but according to the existing needs.
- other public services are provided for free in order to allow the access of all people needing them.
- there are also public services paid by users at a tariff equalling the production costs.
- in some cases, the customers entitled to use a public service are designated by political decision.
- as the facets of the term "customer" are various, it is necessary, in order to draw up a marketing strategy, to delimitate the types of customer to which the said public services are addressed. Even if in the public field the consumer of public services is not treated as a "king" as in the economic area, he or she is appreciated and deemed to be a "voice" among others to be heard.
- if, within the economic organisation, the market share to which the product is addressed is delimitated, the intention of the public institution is to simultaneously satisfy different target groups, thus determining changes in the process of implementation of the marketing strategy.

All these issues relating to the public sector should be considered within the activity of drawing up and implementation of the marketing strategy which should lead to the obtaining of the performances concerned.

The marketing strategy of public institutions represents an ample and permanent process of information, analysis and decision, a process of research of optimum solutions relating to the settlement of some clearly defined problems. The concrete formulation of the related goals shall be synthetically expressed in the strategic plan representing, beside the tactic plan, the essential instruments for directing and coordinating the organisation's marketing efforts and for orienting its activity in the future.

The marketing plan may concern a certain programme, service, area, share or even entity, in other words it may be partial or general, total (for the institution as a whole). The most frequently, the reference period ranges from one to three years, this also imposing adequate updating if domestic or foreign factors bring changes to the internal or external environment where the public institution carries out its activity. It should be drawn up by a team usually including a programme manager, a specialist in communication, in the financial field, a representative of the partnership, as the case may be, etc. Thus, a system, method, agenda and budget allowing the assessment of the marketing activity are provided. A practical model of a marketing plan in a public institution should include the following chapters:

- analysis of the existing standing meant to outline the strengths and weaknesses, opportunities and threats (SWOT analysis), as well as the direct and indirect competitors and therefore to provide the general information in order to define the goals pursued;
- general and concrete objectives (fundamental and derived – primary, secondary and individual);
- target public;
- positioning;

▪ classical marketing mix: service (product), tariff (price), distribution, promotion and/or other modern components;
▪ assessment;
▪ budget;
▪ implementation plan.

Such a plan based on a strategic conception will reflect the type of marketing strategy adopted by the public institution at a given moment, within the activities it undertakes to achieve.

Even if theoretically there is a large variety of marketing strategies to be used, due to the multiple issues to be considered, in practice, the public institution might resort to several strategies in the field of public services, types delimited based on a series of criteria (V. Olteanu, 2006):

1. the modality of occurrence:
- deliberated strategy – that consciously pursue and execute the established goals by the organisation development plan;
- emergency strategy – meant to settle unexpected issues.
2. the diversification level:
- common strategy;
- differentiated strategy.
3. the demand-supply relationship:
- concentrated strategy (on a single market share);
- differentiated strategy
- non-differentiated strategy
- inefficiently differentiated strategy
4. the nature of the relationships with environment:
- strategies promoting the partnership-related relationships that may be:
❖ preferential relationships
❖ tolerance relationships
❖ cooperation relationships
- traditional competitive-type strategies that may be:
❖ differentiation strategies
❖ alignment strategies
❖ strategies of : - customers' attraction
- customers' maintenance
- customers' regaining
5. the dynamics of the services market:
- strategies for market penetration
- strategies for developing services
- strategies for developing markets

Each type of strategy expresses just a part of the whole image. The selection of a successful strategy depends to a larger extent on the ability, knowledge and skills of the marketing manager and of the managerial team of the public institution in interpreting the environment and in organising themselves in such a manner allowing them to take maximum advantage from the occurring opportunities, in order to carry out an efficient social and economic activity.

5. Conclusions

Although several years ago (10-15 years), the implementation of marketing and especially of the marketing strategy in public institutions was perceived just as fashion (considering many of the new things as fashion has become a characteristic of the end of millennium), nowadays, without any doubt, it has become an imperious decision of the normal evolution of the society we are living in,

which is obligated to meet a series of general and collective needs, often with more and more limited resources.

The new philosophy of the contemporary world regarding the satisfaction of the society needs imposed a new relationship between the existing sectors: the private sector where the quasi-totality of available resources is created, the institutional sector that should provide the general framework relating to the carrying out of activities and the non-profit sector which takes over the tasks regarding the achievement of certain general and collective needs that the public sector cannot fulfill.

The marketing studies provides the public sector with the possibility to discover and assess the existing social needs and, on these grounds, to select those needs which may and must become of public interest and to satisfy them via the public institutions representing it, under the best possible circumstances.

The use of the marketing strategy in public institutions is an imperious necessity, for the following reasons:

- it allows it to precisely define its place and role in society, at present and especially in the future.

- the implementation of the New Public management grounded on two pillars: the orientation to market, towards the society requirements that can be satisfied more favorable at collective level than at individual level and the efficiency of allotting the public resources so that the expense on unit of useful effect be minimum involve the use of specific marketing instruments by which bureaucracy may be reduced.

- the non-profit sector competition becomes more and more serious and, in certain fields, it might represent a threat to a series of public institutions.

- the partnerships between public institutions, between them and private companies, between public institutions and non-profit organisations, offer a very good opportunity "to transform something good into something very good".

- the image of the public sector as a whole and of each public institution should be improved, as it is frequently negative, fragile, incorrect and incomplete.

The conception and implementation of the marketing strategy in public institutions is based on the same rules specific to economic organisations but it deals with a series of particularities determined by: the activity nature, the customers' structure, the modalities of manifestation of the market mechanism etc.

The marketing science provides the public institution with a series of types of marketing strategies from which the most adequate might be selected and implemented by strategic planning.

The diversity of the fields the public institutions operate in renders the drawing up of the related marketing strategies largely differentiated. Hence we undertake to continue our research in order to discover and formulate marketing strategies which might be implemented in fields such as: public administration, education, health, culture etc.

NEW ASPECTS OF COMPETITION IN THE CONTEXT OF THE FUNCTIONAL SPECIALIZATION

SERGHEI MĂRGULESCU[*]
ELENA MĂRGULESCU[**]

Abstract
Economists and managers should be aware today of the fact that some concepts and economic mechanisms need to be reconsidered in the context of the new aspects of globalization. There are aspects regarding: the new division of labour based on the "functional" specialization; the definition, on the basis of the new stategies of the "functions" arbitrage, of new structural and functional types of economic actors: "the globally integrated companies"; the appearance of a new type of management that we can call "the management of a globally integrated business"; the redefinition of such concepts as "the product" and "the producer"; the changes in the content of competition, etc. We want to point out some new facets regarding competition among companies in a decade when some of them engage in new structures of business like the "globally integrated business" that we have defined in a previous study. Competition among integrated companies is widened by competition with the globally integrated businesses and by competition among the globally integrated businesses, including wast supply chains.

Keywords: *competition, "functional" specialization, "globally integrated business"*

1. Introduction

The choice of writing this article originates in the findings that we are now in a period of **profound changes, even radical ones, of the content of the economic globalization process.**

This new economic globalization content is given by two major coordinates: the shifting of the gravity center from the globalization of markets, which was specific in the '80s, to the globalization of production and services in the last 10-15 years, simultaneously with **the appearance of a new type of specialization of companies**, favoured by the fantastic progress of the information and communication technologies, which we call "**functional specialization".** This specialization take place at the level of the distinctive functions involved in the processes of designing and supplying a product and originates in:

a) the modularization of the production process and

b) the global value chain reconfiguration

The modularization of production has generated an outsourcing stream, which has advanced rapidly, from phases of production, to the whole productive process, determening some transnational companies to give up production completely, this function beeing undertaken by a new category of economic agents, named "contract manufacturers".

The reconfiguration of the global value chain is based on the same functional specialization which exceeds this time the segment of the "manufacturing process" and can be found anywhere on the chain: innovation - product design and technological development - production - distribution and marketing - post-sales services. The value chain becomes more fragmented, as the functions involved in one or another business are differentiated in more and more specialized activities, up to the most narrowly specialized. This increasing modularization also generates more competition **in every point**

[*] Ph. D. University "Nicolae Titulescu" Bucharest, margulescu@univnt ro
[**] Ph. D. University "Nicolae Titulescu" Bucharest, margulescu@univnt ro.

of the value chain and for each function or mix of functions that a company keeps in its structure, it confronts rivals who focus their resources to become top performers of that function.

In this new competitive context, **there are two key issues of the corporate strategy:**

- selection of specific functions of the global value chain, meaning which ones to retain and which ones to outsource. A trend can be observed, namely that transnational companies tend to keep the less tangible functions of the value chain, those most intensive in knowledge, such as product innovation, research and development, management, marketing and brand management.

- selecting the most suitable integrators for the outsourced functions and their location.

"Globally integrated companies" have to be conceptually bounded from "global companies" which, in terms of market globalization, inply a large-scale implementation of the strategy of market aggregation.

"Globally integrated companies" reflect the integration in a certain formula of the value chain components of a "product" and the distribution of their fulfilment in at least two countries. Integration implies also, on a larger scale, the functional interdependence between at least two independent companies that together perform the global value chain of the "product" and generate through this symbiosis a **"globally integrated business".**

The transactional nature of the relationships between firms is replaced on this occasion with a symbiotic and "inter-functions" nature of these relationships.

2. The changing content of competition

"Traditional" competition between companies is replaced, in the context of the "globally integrated businesses", by new types of competition specific to the new types of structures and new management concepts, which are currently consolidated under the new division of labor. Competition between companies which include the achievement of all "functions" of the value chain is replaced, when companies have realized the tremendous potential offered by the functional specialization, by a **competition localized at the level of a certain function or a set of functions retained in a company's portfolio.**

When the manufacturing is outsourced by several companies to the same contract manufacturer, it is obvious that differences in competitiveness will result from other functions held within the company (research, design, logistics, marketing, etc..). Competition moves to the level of the "functions of excellence" retained inside the company, while competition in the outsourced functions becomes residual and results rather from the arbitrage of the advantages that the competing providers of functions can bring (when not resorting to the same provider).

A new type of competition is observed also **between the networks of suppliers**. This competition is more complex than the competition **between supply chains** and even more complicated when some members are part of several networks that may be competing themselves. In such cases, when a network intends to give a strong blow to another network competing in the same branch, it is very likely that it will be itself affected by this maneuver.

"Competition between networks means that a company that has access to the best networks will surpass rivals today, but will be able to overcome their rivals in the future as well. Such companies can create superior supply chains now, but can also project new supply chains based on the existing networks. Thus, companies have many more options to meet customer needs. **The best networks give rise to the best supply chains"**.

"Competition is no longer limited to company against company, but rather to supply chain against supply chain. Partners in the chain are the same team members who are trying to optimize value. If a chain eliminates another chain, all the members of the defeated chain fail. The better the chain members cooperate with each other, the more competitive they will be against rivals. This is a different vision of partnership and a broader vision on the company itself.

This idea changes the way the supply chain members interact with each other. In traditional supply chain (or other "value chains" that deliver products or services), suppliers were trying to

extract the best prices from buyers. Buyers sought concessions from suppliers. Each player optimized a part of the supply chain.... the overall efficiency of the chain being usually sacrificed for the optimization of the results of a single strong player.

But the success of a modern supply chain depends not just on efficiency, and an antagonistic relationship can damage a lot. Antagonistic relationships diminish supplier's creativity, reduce flexibility and weaken the chain in many ways. As flexibility is becoming increasingly important, the cost of such lack of coordination becomes increasingly higher. Collaboration, on the other hand, can improve supply chain as a whole"[1].

Synthesizing the above, we could say that in relational terms, a the supply chain may be:

a) a classic one, based on antagonistic relationships between its components, namely between firms in a position of sellers or buyers, each trying, in their bilateral relations, to maximize profits through the negotiated prices. Thus, some links are strengthened and others are weakened. The latter will later endanger the whole supply chain.

b) a modern one, based on relations of cooperation between its components, collaboration that aims to overall chain efficiency and results in its strengthening in competition with other supply chains.

On the other hand, it is useful to look at supply chain in structural terms, namely:

a) static supply chains, based on a fixed number of components, mostly invariant over long periods of time in respect of the supplying companies identity.

b) dynamic supply chains, based on networks that can reconfigure, whenever necessary, a certain supply chain, in order to optimize its overall responsiveness (an extension of the classical concept of efficiency), increasing chain flexibility and stimulating suppliers creativity.

In this point of the analysis, we can conclude that the dynamic supply chains of collaborative nature are better positioned in the competition fight.

The supply networks that generate these supply chains are also competing each other and the outcome of this competition will translate into a greater number of prestigious Western companies that will contract that network to carry out the supply chains specific functions.

A different level of the analysis of the business structures engaged today in the field of the global competition, could be that of the comparison between the matrix structures (from the functional point of view) of TNCs (with their branches system) and the matrix structures of the supply networks.

There are definitely matrix response skills to market demands in both structures, but it seems that a conclusion can be drawn is that networks have competitive advantages over TNCs, at least in the field of the manufacturing function. These advantages result, among others, from the following reasons:

a) The geographical and functional structure of a TNC is more rigid than that of the supply chain. It is fastened by its original structure, built on the strategies of market adaptation or the aggregation of similar market demands. This structure largely cancels from the start the permissiveness of a rapid implementation of a new production matrix. In a supply network such as that orchestrated by Li Fung, consisting of over 12,000 suppliers located in over 40 countries, the formulation and implementation of a new production matrix is possible immediately and with reduced operational costs.

b) The ownership structure of TNC is more rigid than that of the supply chain. While the flexibility of the first is increased through green-field investments or mergers and acquisitions, the second enjoys an incomparable flexibility both in the development stage of the existing structure, based on the adherence to the network that can leave aside ownership involvment, as well as well as

[1] Victor K.Fung, William K.Fung, Yoram (Jerry) Wind: Concurenta intr-o lume plata: cum sa construim o companie intr-o lume fara granite, Ed.Publica, 2009.

in the functional stage, when, for a similar result, a number of operational combinations (matrix) can be made readily available.

c) The strategy of the arbitrage factors that finaly define the manufacturing efficiency (seen in its entirety of the manufacturing "function") is optimized in the network because, in comparison with many TNCs, it can configure at any moment, from "n" possible variants, the matrix that optimizes coordinates like: assigned functions, costs, location, speed of execution, etc.). In this context, the arbitrage strategy applied inside its own structure of a TNC is expected to turn more extensively into a strategy arbitrage in respect of choosing the right supply network. Partnering with a supply network equates in the same time with the outsourcing of the arbitrage strategy regarding manufacturing (lately acompanied by activities of design, marketing and logistics) from a TNC to the selected supply chain. In this context we will probably witness the emergence of a new concept, that of the "outsourcing of the arbitrage strategy" from under the roof of some TNCs to some supply networks, which turned themselves also into "globally integrated businesses".

3. Other aspects of the analysis

a) The organic growth model, based on the ownership of assets, is no longer, as in the classical economic theory, the only model of enhancing the economic strength of a company.

Within the functional specialization, following the segmentation of the global value chain, a number of TNCs have outsourced the "function" of manufacturing, keeping higher value-added functions in which they focused their highest skills, that set them apart from competitors (such as research and development, planning and design, innovative marketing and distribution strategies).

The outsourcing of the manufacturing function to contract manufacturers discharged those companies of the need of managing some high-value assets that are no longer to be found in their heritage. The resources thus made available were assigned to other functions, functions that have generated a more notable increase of the company value.

If in the past, the vertical structure and the organic growth have paved the way towards profitability and reputation, now the deverticalized structures prove to be more profitable.

The fact that the property model can be successfully overcome is shown, perhaps the most eloquent, by the integrators of functions who have specialized in orchestrating vast networks of suppliers. Although their contractual commitment is to supply products manufactured products, it is possible that these integrators, owing no production facility, to report turnover of billions of dollars.

These networks consist of thousands of suppliers, some of which exceed the known concept of a supplier and provide even complex and distinct functions like the fabrication of product modules, assembly, logistics, retailers activities, etc..

The construction of this network is vertical, but not a single company's courtyard. This democratic structure consisting of "n" independent owners is made functional and effective not by property relationships (belonging to one company), but by a new type of management, innovated and perfected over the last 10-15 years by some visionary companies which early seized the new opportunities offered by the "functional" specialization and the availability of some brand companies, mainly American, to apply to the international outsourcing (offshoring) of manufacturing and services.

b) **The expanding and deepening of the interdependence relationships between independent companies, based on the "functional" dependability between them.**

This kind of dependency between the seller and the integrator of functions, pave the way merely to relationships of cooperation and to a balance of power between partners. The "functional" interdependence has already come to overshadow, through its potential, the older structures such as strategic alliances. It is also a challenge for managers of many companies that face difficulties in assimilating the new conceptual principles of networked businesses.

The symbiotic relationship between partners emerges from the fact that the seller of the production function knows and represents the market of demand, while the integrator of that function knows, organize and represent the market of the supply of production factors.

c)**In the context of the "globally integrated businesses", the pricing strategies will be shaped differently**

It is expected that traditional means of competitive struggle between transnational companies[2], including the central role of pricing strategies and the use of transfer price mechanism, to be reconsidered, especially in connection with the new matrix of the "globally integrated businesses" in which, for example, the mechanism of transfer prices is no longer operative and competitive advantages are distributed and focused on "functions".

d) The reconfiguration of competition in businesses involving functional specialization has implications for the overall competition. Analysis of changes in the competitive environment should be separated by areas, due to the particularities of the new business structures and their symbiosis with the classical ones.

In the past 20 years we can observe an almost exponential growth of the contract manufacturing, in all its forms (original technology manufacturers, original design manufacturers, global suppliers) and almost in all industrial fields. However it may be noted that in the light industry the strategic options of functions integrators were more varied than in other areas (a comparison should be made first of all with the electronics industry), because in terms of assets and functions, they could engage in more diverse forms of structuring the business (supply chains, supply networks).

There are still plenty of examples of running a successful business in property-based systems, as in the case of vertically integrated companies, and in the light industry the vertical pattern is often fulfiled, out of conjunctural or competitive reasons, by lohn contracting.

A parallel between a model of structuring a business including a supply network and a model that includes a network of manufacturers in a lohn system would certainly lead to the idea that the first is more competitive than the classical one. The main reason lies in the "offshoring" of the management of the manufacturing function from the outsourcing company to the company that manages the supply network, leading to an increased focus of the outsourcing company on the management of the relationship with the market, leading finally to the optimization of the flow from the demand study of demand to the suitability of supply.

The transition to the network model also implies a shift from the "supply chain management", which focuses on optimizing a fixed and relatively limited set of assets, to the "orchestrating or management of a network", which focuses on optimizing the response to customer needs, using the assets of a vast network of partners. Innovations in the field of network management define in fact another type of management, the dynamic management of probable structures.

The "decoupling" of the supply chain management from the management of markets, at the level of some independent companies, will generate not only a tendency to maximize the specific managerial skills, but also a competition which is not this time located at the level of vertically structured companies, but at the level of those couples formed by the outsourcing company and the company managing the supply network.

4. Conclusions

Analysis of new strategic concepts put into practice by a significant number of companies, both from developed countries, as well as from emerging ones, puts us in the position to sense also the reconfiguration of the content of economic competition.

[2] Serghei Margulescu, Elena Margulescu: Preturi si concurenta, Ed. Cartea Studenteasca, Bucuresti, 2007.

"Traditional" competition between companies is replaced, in the context of the "globally integrated businesses" and the "functional" specialization, with types of competition specific to the new structuring of companies and businesses and to the new management concepts in the process of consolidation. Competition between companies which include the achievement of all "functions" of the value chain is replaced, in the case of those companies that have realized the tremendous potential offered by the functional specialization, by a competition which is localized at the level of the function or set of functions retained in its portfolio. Competition moves to the "functions of excellence" retained intra-company or created.

A new type of competition is observed also between the networks of suppliers. This competition is more complex than the competition between supply chains and is further complicated when some members are part of several networks that may, themselves, be in competition.

The reconfiguration of competition in businesses involving functional specialization has implications for the overall competition. The "decoupling" of the supply chain management from the management of markets, at the level of some independent companies, will generate also a competition located at the level couples formed by the outsourcing company and the company managing the supply network. Traditional business models will have to adapt on the way, unless they do not restructure themselves too, to the new competitive challenges that the functional specialization of companies has brought lately in the field of international economic relations.

MARKETING MIX POLICIES IN FMCG CASE-STUDY: THE ADVERTISING STRATEGY

ANA MARIA BOBEICĂ*

Abstract
This paper explores the relationships between selected marketing mix elements in the area of FMCG. It discusses the nature and sometimes negative consequences of the dominating marketing paradigm of today, marketing mix management, and furthermore discusses how modern research into, for example in the case of FMCG Companies, the marketing policies as well as customer relationship tactics shows that another approach to marketing is required. It proposes a conceptual framework in which marketing elements are related to the dimensions of brand equity and brand awareness. It also presents a case study deriving from advertising strategies of FMCG Companies showing that the change in advertising spending is related to changes in market share, changes in product plans and changes in the number of competitors modified by the number of customers, their concentration and the size of the advertising budget.

Keywords: *marketing mix, marketing theory, FMCG, advertising*

1. Introduction

This paper is a starting point in the research project I am currently involved in, at the Doctoral School of the Academy of Economic Studies, searching on Marketing Mix Strategies.

This paper is a Research Analysis made on Marketing Mix Policies updated to the 21'st Century Marketing Research. It debates on the Advertising and Promotional importance of the advertising campaigns in the Marketing Mix policy, concerning Consumer, Retail and Fast Moving Consumer Goods Companies. It emphasizes the paradigm of 4P and marketing Mix and it also proposes a new conceptual framework regarding the marketing mix strategies. The concepts presented in this paper are labeled as a "vision driven approach" for today's management.

The results presented in the paper show that high advertising spending, high price, good store image, and high distribution intensity are related to high brand equity. This makes an important point out of the fact that corporate branding and awareness are two key factors in the right implementation of Marketing Mix Strategies.

The Case-Study presented in the Final part is made on Slovakia's FMCG market based on similarities with the Romanian one.

The Research Paper is important because it clears out the previous analysis made on fast moving consumer goods market, regarding the marketing mix strategies and results, that companies do not want to be exposed to the general public. Also, the paper is a starting point for a future analysis on the Romanian FMCG Market regarding the Advertising Efficiency and Promotional Strategies.

The existent specialized literature on Marketing Mix Strategy is long and consistent, but fewer studies have been made regarding FMCG policy in general and none regarding the Romanian Market.

The literature presented in this paper is consistent and it may be consulted in the Reference part of the Research Paper.

* Ph.D. candidate in Marketing, Academy of Economic Studies, Bucharest (email: a_bobeica@yahoo.com).

2. Marketing mix elements in FMCG

Few topics of the commercial theory have so intensively inspired as well as divided the marketing academia as the **4Ps Marketing Mix framework**, "the Rosetta stone of marketing education" according to Lauterborn (1990). The Mix has its origins in the 60's: Neil Borden (1964) identified twelve controllable marketing elements that, properly managed, would result to a "profitable business operation". Jerome McCarthy (1964) reduced Borden's factors to a **simple four-element framework: Product, Price, Promotion and Place**. Practitioners and academics alike promptly embraced the **Mix paradigm** that soon became the prevalent and indispensable element of marketing theory and operational marketing management.

The majority of marketing practitioners consider the Mix as the toolkit of transaction marketing and archetype for operational marketing planning (Grönroos 1994). While empirical evidence on the exact role and contribution of the Mix to the success of commercial organizations is very limited, several studies confirm that the 4Ps Mix is indeed the trusted conceptual platform of practitioners dealing with tactical/operational marketing issues (Sriram and Sapienza 1991; Romano and Ratnatunga 1995; Coviello et al. 2000). [1]

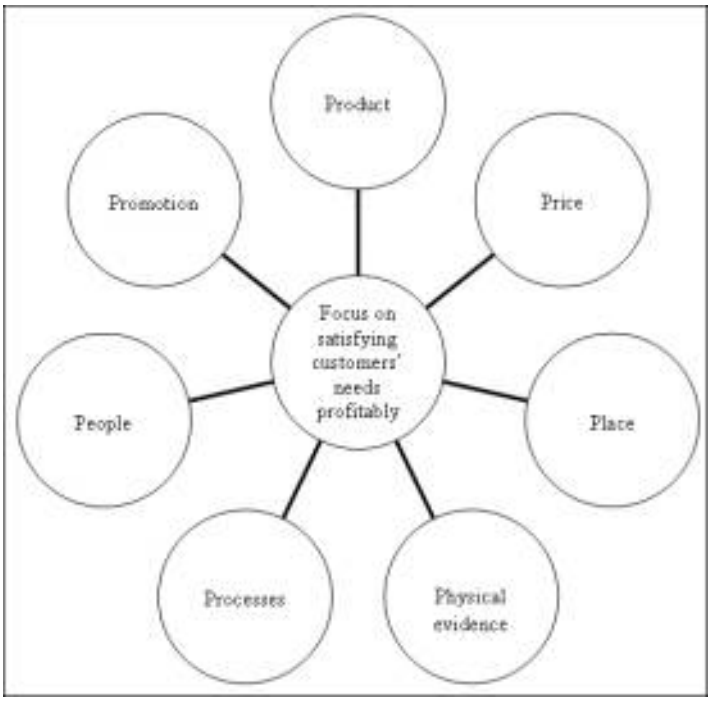
The wide acceptance of the Mix among field marketers is the result of their profound exposure to this concept during college years, since most introductory marketing manuals embrace it as "the heart of their structure" (Cowell 1984) and identify the 4Ps as the controllable parameters likely to influence the consumer buying process and decisions (Kotler 2003). An additional strong asset of the mix is the fact that it is a concept easy to memorize and apply. In the words of David Jobber (2001): "The strength of the 4Ps approach is that it represents a memorable and practical framework for marketing decision-making and has proved useful for case study analysis in business schools for many years". Enjoying large-scale endorsement, it is hardly surprising that the 4Ps became even synonymous to the very term marketing, as this was formulated by the American Marketing Association (Bennet 1995).

Next to its significance as a marketing toolkit, the Marketing Mix has played also an important role in the evolution of the marketing management science as a fundamental concept of the commercial philosophy (Rafiq and Ahmed 1995), with theoretical foundations in the optimization theory (Kotler 1967; Webster 1992). The theoretic endorsement of the Mix in its early days was underlined by the sympathy of many academics to the idea that the chances for successful marketing activities would increase if the decisions (and resource allocation) on the 4P activities were optimized; **Philip Kotler elucidated in 1967** how "mathematical programming provides an alternative framework for finding the optimal marketing mix tool that allows the optimal allocation of the marketing effort"3. **The theoretical value of the Mix** is also underlined by the widely held view that the framework constitutes one of the pillars of the influential Managerial School of Marketing along with the concepts of "Marketing Myopia", "Market Segmentation", "Product, Positioning" and "Marketing Concept" (Kotler 1967; Sheth et al. 1988).

American Marketing Association, in its most recent definition, states that "marketing is the process of planning and executing the conception, pricing, promotion and distribution of ideas, goods and services to create exchange and satisfy individual and organizational objectives"

[1] Christian Grönroos, From Marketing Mix to Relationship Marketing: Towards a Paradigm Shift in Marketing, Management Decision, Vol. 32 No. 2, 1994, pp. 4-20

Figure 1: The 4P-7P of Marketing



Adapted from: Palmer (2004)

Corporate branding

Among the changes that businesses make as they move toward globalization is a shift in marketing emphasis **from product brands to corporate branding** (e.g. Aaker, 1996; Aaker and Joachimsthaler, 2000; Balmer, 1995, 2001a; de Chernatony, 1999; Dowling, 2001, 1993; Harris and de Chernatony, 2001; Hatch and Schultz, 2001, Ind, 1997; Kapferer, 1992; Keller, 2000a, b; Knox *et al.*, 2000; Olins, 2000; Schmitt and Simonsen, 1997)[2]. This is usually ascribed to the difficulties of maintaining credible product differentiation in the face of imitation and homogenization of products and services, and the fragmentation of traditional market segments that occurs as customers become more sophisticated and markets more complex.

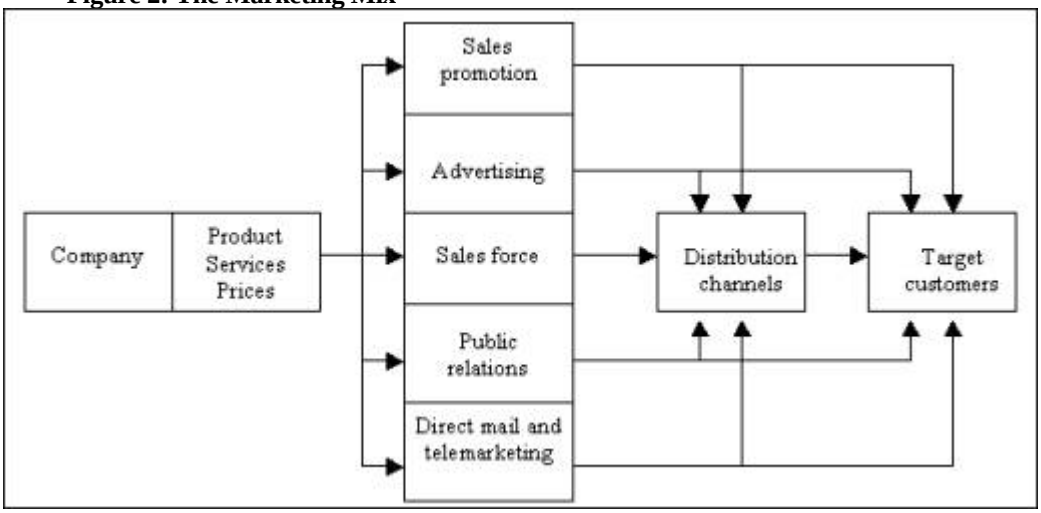
Support for the shift to corporate branding often comes from within marketing. For example, some marketing researchers have claimed that a strong corporate brand has significant impact in creating positive consume perceptions of existing products and new product extensions (e.g. Brown and Dacin, 1997; Ind, 1997). Others have addressed the special processes of creating corporate brands in the service area, **emphasizing the differences between services and fast-moving consumer goods** as foundations for corporate branding processes (McDonald *et al.*, 2001). In either case, corporate branding brings to marketing the ability to use the vision and culture of the company explicitly as part of its unique selling proposition (Ackerman, 1998; Balmer, 1995, 2001a; de Chernatony, 1999, 2001) or as suggested by Knox *et al.* (2000) and Knox and Maklan (1998), as part of its unique organizational value proposition.

[2] Mary Jo Hatch, Majken Schultz, Bringing the corporation into corporate branding, European Journal of Marketing, Vol. 37 No. 7/8, 2003, pp. 1041-1064

Parallel to this shift in the marketing area, scholars in corporate identity are moving in the direction of what Balmer and Soenen (1999) **labeled a "vision driven approach" to management.** The vision approach expands the concept of corporate identity into a much more comprehensive mix of **"mind, soul and voice".** In their review of this new approach, the authors show how identity management has been transformed from a dominating concern with visual manifestations into strategic change management (see also Balmer, 2001b). Similarly, de Chernatony (2001) argued for the importance of strategic vision to identity and branding, as a means to integrated brand building.

American corporations collectively spend hundreds of billions of dollars on **advertising and promotion**, an amount that exceeds the gross domestic product of several nations such as Singapore, Sweden and Switzerland. Even individual companies, for example, **Procter and Gamble**, spend several billion dollars on marketing activities. Consequently, the determination of the marketing budget and its allocation to several marketing activities — referred to as **"planning the marketing mix**"— is of paramount importance.

Figure 2: The Marketing Mix



Adapted from: Kotler, Ang, Leong and Tan (1999)

3. Marketing mix management – a new paradigm today

The marketing mix management paradigm has dominated marketing thought, research and practice since it was introduced **almost 40 years ago.** Today, this paradigm is beginning to lose its position. New approaches have been emerging in marketing research.

The **globalization of business** and the evolving recognition of the importance of customer retention and market economies and of **customer relationship economics**, among other trends, reinforce the change in mainstream marketing.

Relationship building and management, or what has been labeled ***relationship marketing,*** is one leading new approach to marketing which eventually has entered the marketing literature. A paradigm shift is clearly under way. In services marketing, especially in Europe and Australia but to some extent also in North America, and in industrial marketing, especially in Europe, this paradigm shift has already taken place. Books published on services marketing and on industrial marketing as well as major research reports published are based on the relationship marketing paradigm.

A major shift in the perception of the fundamentals of marketing is taking place. The shift is so dramatic that it can, no doubt, be described as a paradigm shift.

Marketing researchers have been passionately convinced about the paradigmatic nature of marketing mix management and the Four P model. To challenge marketing mix management as the basic foundation for all marketing thinking has been as *heretic* as it was for Copernicus to proclaim that the earth moved.

The Marketing Strategy Continuum

The major **problem and also a negative consequence** with the marketing mix and its Four Ps has been their position as the major and in many situations as the only, acceptable marketing paradigm. **Relationship marketing** must not become such a straitjacket.

However, developing enduring customer relationships and achieving exchanges in such relationships through a relationship marketing approach is not only another addendum to marketing mix management. Rather, it is a different approach as compared to achieving exchanges in isolated transactions through the use of the Four Ps of the marketing mix. As Reichheld observes, "building a highly loyal customer base cannot be done as an add-on. It must be integral to a company's basic business strategy"[3]. Hence, it should be useful to think about possible marketing approaches or strategies along a ***marketing strategy continuum***. **Relationship marketing is placed at one end of the continuum**. Here the general focus is on building relationships with customers (and other parties as well, although only customers are discussed in this context). **At the other end of the continuum is *transaction marketing*** where the focus of marketing is on one transaction at a time. Thus marketing revolves around creating single transactions or exchanges at a time and not around building long-term relationships.

The Paradigm Shift in Marketing

From a **management point of view** the Four Ps may have been helpful at one time, at least for marketers of consumer packaged goods. The use of various means of competition became more organized. However, the Four Ps was never applicable to all markets and to all types of marketing situations. The development of alternative marketing theories demonstrates that even from a management perspective, the marketing mix and its Four Ps became a problem.

On the other hand, marketing is more and more developing in a direction where the toolbox thinking of the marketing mix fits less well. In industrial marketing, services marketing, managing distribution channels and even **consumer packaged goods marketing itself,** a shift is clearly taking place from marketing to anonymous masses of customer to developing and managing relationships with more or less well-known or at least somehow identified customers.

Marketing mix management with its four Ps is reaching the end of the road as a universal marketing approach. Some authors now use the **7P Model** (**see Figure 1).**

However, even if marketing mix management is dying as the dominating marketing paradigm and the Four P model needs to be replaced, this does not mean that the Ps themselves, and other concepts of the managerial approach such as market segmentation and indeed the marketing concept, would be less valuable than before. Relationships do not function by themselves.

Most certainly **relationship marketing** will develop into such a new approach to managing marketing problems, to organizing the firm for marketing, and to other areas as well.

4. Review of a Marketing Management Paradigm: The Backgrounds of the Debate

Developments on the commercial landscape and changes in consumer and organizational attitudes over the last four decades, have frequently prompted marketing thinkers to explore new theoretical approaches addressing specific marketing problems and expanding the scope of the marketing management theory. The most important landmarks of the evolution of the marketing management theory include**…"the broadening of the marketing concept during the 70's, the emphasis on the exchange transaction in the 80's, the development of the Relationship**

[3] Reichheld, F. and Sasser, W. (1990), "Zero Defections: Quality Comes to Services", *Harvard Business Review*, Vol. **68,** 5 pp. 105-111 .

Marketing and Total Quality Management in the 90's" (Yudelson 1999) **and last but not least the emergence of Information and Communication Technologies as major actors of the 21st century Marketing**. At the same period the consumer behavior has also evolved; one of the noticeable changes has been the gradual evolution from the mass consumer markets of the 60's (Wolf 1998) towards increasingly global, segmented, customized or even personalized markets of today (Kotler et al. 2001) where innovation, customization, relationships building and networking have become issues of vital significance. The developments on the ground have prompted the development of new theoretical approaches dealing with specific rather than general marketing problems and situations.

In the course of these developments the **4Ps Marketing Mix framework** has been one of the subjects that frequently became the source of controversy and scientific debate (Dixon and Blois 1983; Rafiq and Ahmed 1992).

Surprisingly in a sense, this scientific debate has hardly been echoed in the practitioners' quarters. Unlike academics, practicing marketers have been reluctant to question, let alone dismiss the trusted paradigm (Sriram and Sapienza 1991; Grönroos 1994), presumably anticipating that the academic debate will yield some new, apparently better marketing methodologies and usable concepts.

Some of the criticism to the address of the 4Ps frame*work* ***has its roots in the discrepancy between the philosophy behind the Marketing Mix on one hand and the fundamentals of the Management School of Marketing on the other.*** The Management School that embraced the Mix as one of its "most important conceptual breakthroughs" (Sheth et al. 1988) has given the Mix, as already mentioned, similar status with the **Marketing Concept** and the **Market Orientation principles** (Kotler 1984). Yet the very nature of the fourP's as manageable i.e. controllable factors combined with the explicit lack of market input in the model (Kotler 2003) is in sharp contrast with the Marketing Concept and Market Orientation principles implying that marketing activities should be based on identification of customer needs and wants, typical external and therefore uncontrollable factors. This paradox has been highlighted by researchers like Dixon and Blois (1983) and Grönroos (1994).

The debate has been focused on developments of consumer and organizational behavior, the increasing complexity of the environment and the growing importance of technology as marketing enabler. (Kaufman 1995; Brown and Eisenhardt 1998; Beinhocker and Kaplan 2002).

A Disciplinary Classification of the Marketing Mix Criticism

One of the criteria for classifying the attitudes of researchers towards the 4Ps Marketing Mix framework is the disciplinary origin of the arguments, but such a classification can raise always questions; the apparent difficulty of this approach is to exactly demarcate the different marketing domains, something that underlines the complexity of the marketing environment today. A "qualitative" classification offers however a good insight to research attitudes in analyzing and modeling a changing, expanding and sometimes turbulent marketing environment.

On the basis of the disciplinary approach the theoretical status quo of the Marketing Mix will be reviewed based on publications **referring to five traditional and one emerging Marketing Management sub-disciplines: Consumer Marketing, Relationship Marketing, Services marketing, Retail Marketing, Industrial Marketing and E-Commerce.** It speaks for itself that further research in other marketing sub-disciplines is needed for drawing up final conclusions and comprehensive judgment on the question of the value of the 4Ps.

Consumer's Relationships tactics

During the last few years there has been a growing interest in studying the economics of long-lasting customer relationships. Heskett introduced the concept of *market economies*, by which he means achieving results by understanding the customers instead of by concentrating on developing scale economies. **Long-term relationships** where both parties over time learn how to best interact with each other lead to decreasing *relationship costs* for the customer as well as for the supplier or

service provider. The relationship cost theory which is based on literature on, for example, *quality costs* and *transaction costs* have been suggested by Grönroos. A **mutually satisfactory relationship** makes it possible for customers to avoid significant *transaction costs* involved in shifting supplier or service provider and for suppliers to avoid suffering unnecessary *quality costs*.

The Marketing Mix and the Consumer's Marketing

Significant cultural, social, demographic, political and economic influences during **the last decades of the 20th century,** combined with rapid technological advances have radically transformed the consumer's needs, nature and behavior. The new consumer has been described as existential, less responsive to traditional marketing stimuli and less sensitive to brands and marketing cues while the influence of family or other types of reference

The Marketing Mix Revisited groups on the new consumer's behavior is changing or diminishing

(Christopher 1989). More researchers share the view that the modern consumer is different: demanding, individualistic, involved, independent, better informed and more critical (Capon and Hulbert 2000; Lewis and Bridger 2000). A factor underlining the change is the increasing consumer power and sophistication due to wide availability of affordable personal computing power and easy access to online global commercial firms, networks, databases, communities or marketplaces. These developments have intensified the pressure on marketers to switch from mass marketing approaches towards methods allowing *personalization, interaction and sincere, direct dialog with the customer*. Such approaches allow marketers not only to improve communications with their target groups but also to identify the constantly changing and evolving customer needs, respond quickly to competitive movements and predict market trends early and accurately.

Table 1: Review of Consumer Marketing Theory Literature

Author(s)	**Arguments**	**Propositions**
Kotler 1984	External and uncontrollable environmental factors are very important elements of the marketing strategy Programs	The Marketing Mix should include: Customers Environmental variables Competitive variables Two additional Ps to the 4 traditional ones: Political power Public opinion formulation
Ohmae 1982	No strategic elements are to be found in the marketing mix. The marketing strategy is defined by three factors	Three Cs define and shape the marketing strategy: Customers Competition Corporation
Robins 1991	The 4Ps Marketing Mix is too much internally oriented	Four Cs expressing the external orientation of a Marketing Mix: Customers Competition Capabilities Company
Vignalli and Davies 1994	Marketing planning will contribute to the organizational success if it is closely related to strategy. The Marketing Mix is limited to internal and non-	The MIXMAP technique allows the exact mapping of marketing mix elements and variables, allowing the consistency between strategy and tactics.

	strategic issues	
Doyle 1994	While the 4Ps dominate the marketing Management activities most marketing practitioners would add two more elements in this mix in order to position their products and achieve the marketing objectives	Two more factors must be added to the 4P mix: Services Staff
Bennett 1997	Focused on internal variables therefore incomplete basis for marketing. Customers are disposed to buy products from the opposite direction to that suggested by the Marketing Mix	Five Vs are the criteria of customer disposition: Value Viability Variety Volume Virtue
Yudelson 1999	The 4Ps are not the proper basis of the 21st century marketing. The Marketing developments of the last 40 years require a new flexible Platform while the simplicity of the old model remains an attractive facto	4 new Ps based on exchange activities: Product -> Performance Price-> Penalty Place-> Process Promotion-> Perceptions
Schultz 2001	Marketplaces today are customer oriented. The 4Ps have less relevance today, they made sense the time they were invented	End-consumer controls the market Network systems should define the orientation of a new Marketing A new Marketing mix must be based on the Marketing Triad Marketer, Employee and Customer

Source: E. Constantinides, The Marketing Mix Revisited: Towards the 21st Century Marketing (2006)

Several shortcomings of the Marketing Mix have led the majority of the authors reviewed to suggest that the **4Ps framework should** not be considered as the foundation of Consumer Marketing management any longer. In the reviewed papers and books **the criticism is** focused on three main areas:

- **Internal Orientation:** a frequent objection underlying the Mix's explicit lack of customer orientation. Kotler (1984), Robins (1991), Vignali and Davies (1994) Bennett (1997) and Schultz (2001) are one way or another identifying this as the prime limitation of the Mix.

- **Lack of consumer interactivity**: Doyle (1994) and Yudelson (1999) argue that the Mix ignores the evolving nature of the consumer who demands not only higher value but also more control on the communication and transaction process. Allowing better interaction reduces the customer defection rates and increases customer trust.

- **Lack of strategic elements:** Ohmae (1982) Vignali and Davies (1994) argue that lack of strategic content is a major deficiency of the framework, making it unfit as planning instrument in an environment where external and uncontrollable factors define the firm's strategic opportunities and threats.

The majority of the reviewed authors propose alternative frameworks while those willing to accept a role for the 4Ps often propose modified versions, with new elements added to the traditional parameters.

Marketing Mix and the Retail Marketing

As recently as two decades ago most manufacturers of consumer products considered communication with the final customer as one of their essential marketing tasks. Being the dominant market party, producers would employ mass marketing campaigns aiming at increasing brand recognition, product awareness and mind share, as basic ingredients for stimulating product demand. **Retailers** and other intermediaries were considered as somewhat secondary actors in the marketing process, their responsibility confined in the functions of stocking and re-selling products (McCarthy 1978).[4]

Consolidation of the retailing sector, globalisation and private branding **has transformed the retailing landscape.** A significant power migration along the supply chain gave retailers gradually more control over the marketing processes and at the same time exposed them to increasing industry competition. Trying to build up strong market positions and competitive advantages, retailers were forced to adopt more professional and proactive commercial approaches, becoming gradually real marketers, rather than distributors and in-store merchandisers (Mulhern 1997). Supply chain management, efficiency, customer retention and customer lifetime value (Reichheld and Sasser 1990; Rosenberg and Czepiel 1992) form the cornerstone of many retailers' marketing strategies today. The consistent effort to build long-term relationships with the customer shifted the focus from the passive application of the 4Ps to "execution" *where retail formats, personnel, service and presentation are becoming the critical elements of retail marketing.* [5]

The retail marketing theory embraces **elements of both services marketing and relationship marketing, previously discussed.** E. Constantinides arguments against using the 4Ps as basis for services and relationship marketing can be easily expanded to retail marketing.

Yet retail marketing includes some additional, distinctive aspects that the Marketing Mix also fails to address: *physical evidence, shopping experience, atmosphere* (Mulhern 1997; Kotler 2003) *and personalized rather than mass contacts* (Wang et al. 2000). The idea is that the 4Ps do not present an adequate platform for planning of marketing activities in this domain. Most researchers suggest replacing the mix with new concepts or adding new elements to it. Personnel, Presentation and Retail Format are factors contributing to unique customer experience as basis of differentiation and retention.

5. Marketing mix and Brand equity

There are many relationships between selected marketing mix elements and the creation of brand equity.

There is a conceptual framework in which marketing elements are related to the dimensions of brand equity, that is, **perceived quality**, **brand loyalty, and brand associations** combined with **brand awareness**. These dimensions are then related to brand equity.

The practice results show now that frequent price promotions, such as **price deals,** are related to low brand equity, whereas **high advertising spending, high price, good store image,** and high distribution intensity are related to **high brand equity.**

Brand equity is the incremental utility or value added to a product by its brand name, such as Coke, Kodak, Levi's, and Nike (Farquhar, Han, and Ijiri 1991; Kamakura and Russell 1993; Park and Srinivasan 1994; Rangaswamy, Burke, and Oliva 1993).[6] Accordingly, research has suggested that brand equity can be estimated by subtracting the utility of physical attributes of the product from

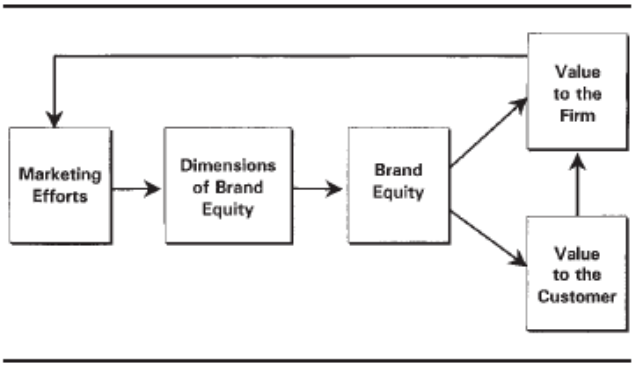
the total utility of a brand. As a substantial asset to the company, brand equity increases cash flow to the business (Simon and Sullivan 1993). From a behavioral viewpoint, brand equity is critically important to make points of differentiation that lead to competitive advantages based on non price competition (Aaker 1991).

Figure 3: A Conceptual Framework of Brand Equity



Source: Boonghee Yoo, Naveen Donthu and Sungho Lee (2000)

By strengthening the dimensions of brand equity, we can generate brand equity. Understanding the brand equity phenomenon properly requires tapping the full scope of brand equity, including **awareness, perceived quality, loyalty, and associations (**Aaker 1991).

Zeithaml (1988) defines **perceived quality** as "the consumer's [subjective] judgment about a product's overall excellence or superiority". Personal product experiences, unique needs, and consumption situations may influence the consumer's subjective judgment of quality.

High perceived quality means that, through the long-term experience related to the brand, consumers recognize the differentiation and superiority of the brand. Zeithaml identifies perceived quality as a component of brand value; therefore, high perceived quality would drive a consumer to choose the brand rather than other competing brands.

Therefore, to the degree that brand quality is perceived by consumers, brand equity will increase.

Oliver (1997) defines **brand loyalty** as "a deeply held commitment to rebuy or repatronize a preferred product or service consistently in the future, despite situational influences and marketing efforts having the potential to cause switching behavior". Loyal consumers' show more favorable responses to a brand than non loyal or switching consumers do. Brand loyalty makes consumers purchase a brand routinely and resist switching to another brand. Hence, to the extent that consumers are loyal to the brand, brand equity will increase.

Brand awareness with strong associations forms a specific brand image. Aaker (1991) defines brand associations as "anything linked in memory to a brand" and brand image as "a set of [brand] associations, usually in some meaningful way". Brand associations are complicated and connected to one another, and consist of multiple ideas, episodes, instances, and facts that establish a solid network of brand knowledge. The associations are stronger when they are based on many experiences or exposures to communications, rather than a few (Aaker 1991). Brand associations, which result in high brand awareness, are positively related to brand equity because they can be a signal of quality and commitment and they help a buyer consider the brand at the point of purchase, which leads to a favorable behavior for the brand.

Marketing Mix Elements and Brand Equity

We investigate consumers' perceptions of **five selected strategic marketing elements**: ***price, store image, distribution intensity, advertising spending, and frequency of price promotions.*** The selected factors do not embrace all types of marketing efforts but are representative enough to demonstrate the relationships between marketing efforts and the formation of brand equity.

Price. Consumers use price as an important extrinsic cue and indicator of product quality or benefits. High priced brands are often perceived to be of higher quality and less vulnerable to competitive price cuts than low priced brands (Blattberg and Winniewski 1989; Dodds, Monroe, and Grewal 1991; Kamakura and Russell 1993; Milgrom and Roberts 1986; Olson 1977). *Therefore, price is positively related to perceived quality.* Rao and Monroe (1989)[7] show that a positive relationship between price and perceived quality has been supported through previous research. By increasing perceived quality, price is related positively to brand equity.

There is not any significant relationship between price and the other brand equity dimensions, brand loyalty and brand associations. Although price implies high quality, it does not create loyalty to the brand per se. Neither loyal nor non loyal consumers use price as an evaluative criterion of the product, and they are not influenced by price considerations (Helsen and Schmittlein 1994; Meer 1995).

Brand-loyal consumers are willing to pay the full price for their favorite brand because they are less price sensitive than brand-non loyal consumers are. Thus, changing the price level alone does not affect brand loyalty. Also there is no directional relationship between price and brand associations, because both low and high prices can be equally strongly linked to the brand in memory for the benefits that each brings to consumers. A low-priced product would give transaction utility (i.e., paying less than the consumer's internal reference price), whereas a high-priced product would give high-quality image or acquisition utility, leading to reduced consumer risk. Either a low- or high-price strategy would help consumers be equally aware of the product.

Store image. The importance of channel design and management as a marketing tool of increasing brand equity is growing (see Srivastava and Shocker 1991). In a distribution channel, retailers encounter a firm's ultimate consumers. Selecting and managing retailers is therefore a firm's major marketing task in satisfying consumers' needs. In particular, distributing through good image stores signals that a brand is of good quality. Dodds et al. (1991) find significant positive effects of store image on perceived quality. The store name is a vital extrinsic cue to perceived quality. The quality of a given brand is perceived differently depending on which retailer offers it. C**ustomer traffic** will be greater in a store with a good image than in one with a bad image. Good-image stores attract more attention, contacts, and visits from potential customers. In addition, such stores provide greater consumer satisfaction and stimulate active and positive word-of-mouth communications among consumers (Zeithaml 1988). Therefore, distributing a brand through an outlet with a good image will create more positive brand associations than distributing through an outlet with a bad image.

Store image appears to have no relationship with loyalty to a specific brand. Consumers perceive good store image when their self-concept is congruent with store image (Sirgy and Samli 1985). Thus, if the store image does not match the perceived image of the product, consumers would not be impressed enough to show loyalty to the product. In other words, only when there is consistency between product and store images will consumers be loyal to the product that is available in the store.

Distribution intensity. Distribution is intensive when products are placed in a large number of stores to cover the market. To enhance a product's image and get substantial retailer support, firms

[7] Boonghee Yoo, Naveen Donthu and Sungho Lee, An Examination of Selected Marketing Mix Elements and Brand Equity, *Journal of the Academy of Marketing Science* 2000; 28; 195.

tend to distribute exclusively or selectively rather than intensively. It has also been argued that certain types of distribution fit certain types of products.

Consumers will be more satisfied, however, when a product is available in a greater number of stores because they will be offered the product where and when they want it (Ferris, Oliver, and de Kluyver 1989). Intensive distribution reduces the time consumers must spend searching the stores and traveling to and from the stores, provides convenience in purchasing, and makes it easier to get services related to the product. As distribution intensity increases, therefore, consumers have more time and place utility and perceive more value for the product. The increased value results mostly from the reduction of the sacrifices the consumer must make to acquire the product.

Such increased value leads to greater consumer satisfaction, perceived quality, and brand loyalty and consequently, greater brand equity. Accordingly, positive brand associations will increase along with a consumer's satisfaction with the product.

Advertising spending. Overwhelmingly, **advertising researchers found advertising is successful in generating brand equity, whereas sales promotion is unsuccessful** (Boulding, Lee, and Staelin 1994; Chay and Tellis 1991; Johnson 1984; Lindsay 1989; Maxwell 1989)[8]. Simon and Sullivan (1993)[9] find a **positive effect of advertising spending on brand equity**. Cobb-Walgren, Beal, and Donthu (1995)[10] find that the dollar amount spent on advertising has positive effects on brand equity and its dimensions.

Advertising is an important extrinsic cue signaling product quality (Milgrom and Roberts 1986)[11]. Heavy advertising spending shows that the firm is investing in the brand, which implies superior quality (Kirmani and Wright 1989)[12]. In addition, Archibald, Haulman, and Moody (1983)[13] find that advertising spending levels are good indicators of not only high quality but also good buys. Aaker and Jacobson (1994) also find a positive Yoo et al relationship between advertising and perceived quality.

Hence, advertising spending is positively related to perceived quality, which leads to higher brand equity.

Advertising plays a pivotal role in increasing brand awareness as well as creating strong brand associations.

Repetitive advertising schedules increase the probability that a brand will be included in the consideration set, which simplifies the consumer's brand choice, making it a habit to choose the brand (Hauser and Wernerfeldt 1990)[14].

Thus, a greater amount of advertising is related positively to brand awareness and associations, which leads to greater brand equity. In addition, according to an extended hierarchy of effects model, advertising is positively related to brand loyalty because it reinforces brand-related associations and attitudes toward the brand.

Promotions (e.g., short-term price reductions such as special sales, media-distributed coupons, package coupons, cents-off deals, rebates, and refunds), are believed to erode brand equity

over time despite immediate short-term financial gain. **Sales promotion may not be a desirable way to build brand equity because it is easily copied and counteracted** (Aaker 1991) and only enhances short-term performance by encouraging sales and momentary brand switching (Gupta 1988). In the long run, sales promotion may convey a low-quality brand image. Furthermore, frequent price promotions may jeopardize brands in the long run because they cause consumer confusion based on unanticipated differences between expected and observed prices, which results in an image of unstable quality. Consumers cannot forecast correct point of- purchase prices, and forecasting errors due to the gap between expected and observed prices negatively affect brand choice decisions as well as perceived quality, which leads to a decrease in brand equity. Also, price promotion campaigns do not last long enough to establish long-term brand associations, which can be achieved by other efforts such as advertising and sales management. Relying on sales promotion and sacrificing advertising would reduce a brand association, which leads to decreasing brand equity**.**

Price promotions do not seem to be related to brand loyalty, although they are consistently found to enhance temporary brand switching (Gupta 1988). They often fail to establish a repeat purchase pattern after an initial trial.

This is because consumers are momentarily attracted to the brand by the transaction utility that the price promotions provide, and when deals end, they lose interest in the brand. Thus, change in brand loyalty after the end of deals may not occur unless the brand is perceived to be superior to and meet consumer needs better than its competing products. Similarly, on the basis of self-perception theory, Dodson, Tybout, and Sternthal (1978)[15] find that brand switching behavior ends when it is attributable to price promotions (i.e., an external cause) rather than when it is attributable to a liking for the purchased product (i.e., an internal cause). Thus, the behavior disappears when the external cause is removed, and the loyalty level does not change.

6. Case study – The Advertising strategy

Advertising is an inevitable part of marketing activities in each business operating on consumer (B2B) markets. Behavior of customers can be very strongly influenced by advertising and therefore companies should give an appropriate attention to this issue. „Advertising is the non-personal communication of information, usually paid for and usually persuasive in nature, about products (goods and services) or ideas by identified sponsors through various media (Arens, 1996)[16]." „It is the beating heart of marketing for many organizations. Advertising is the engine that branding experts fire up whenever they want to shift awareness or attitudes (Shaw, Merrick, 2005, p. 67)[17]"

We can classify advertising forms into **six major categories: print, electronic, out-of home, direct mail, digital interactive and other** (Arens, 1996, p. 95). Advertising media include **newspaper, magazine, direct mail, radio, television, internet, inside transit, outside transit**, **outdoor** (Pride, Ferrel, 1999, p. 466). To avoid wasting the money on any activities and to know into which extend the goals (including communication goals) have been fulfilled companies should control and measure them. Control and measurement are very close interconnected. „Control is the process by which information or feedback is provided so as to keep all functions on track" (Soltani et al., 2007). Measurement is a procedure for assigning a number to an object or an event. Performance is a comparison between the outputs obtained and the set goals for outputs of a process. The most common criteria for measuring of the marketing performance are **increases in sales and market share** (Shaw, Merrick, 2005 p. 29). However we can evaluate advertising performance from two points of view: effectiveness and efficiency. Advertising effectiveness means how successful the

[15] Dodson, Joe A., Alice M. Tybout, and Brian Sternthal. 1978. "Impact of Deals and Deal Retraction on Brand Switching." *Journal of Marketing, Research* 15 (February): 72-81.

[16] Arens, W.F. 1996. Contemporary Advertising. Chicago: Irwin/ Mc Graw- Hill., ISBN 0-256-18257-4.

[17] Shaw. R., Merrick D. 2005. Marketing Payback. Harlow: Pearson Education, 2005. ISBN 0 273 688847.

advertising is in communicating the message – whether people saw it, whether they liked it etc. Necessary elements of advertising effectiveness measurement include: 1 measurement instruments, 2. benchmarks, 3. a control, 4. money and commitment, 5. a research plan, and 6. time (Bentley, 1996)[18]. Effectiveness is one of the key themes in advertising research. Advertising effectiveness can be defined as the extent to which advertising generates a certain desired communication effect (Buschken, 2007). Advertising can be evaluated before, during and after the campaign (Dibb, Simkin, Pride, Ferrel, 1997, p. 501)[19]. Evaluations performed before the campaign begins are called pre-tests. These include: concept testing, consumer juries, psychological measures, portfolio tests, readability tests, dummy advertising vehicles, theater tests and on air tests. Post-testing methods include inquiry tests, recognition tests, recall tests, day-after recall tests, test marketing, single source tracking studies and tracking print. Well known managerial expert Peter Drucker states, that effectiveness means „doing the things right". **To measure the marketing performance we can use** also ROI (Return on Investment), ROMI (Return on Marketing Investment) or ROME (Return on Marketing Expenditure). **Specifically for advertising** we can use **ROAI (Return on Advertising Investment).** These measures refer to **efficiency**.

At the beginning of the 20th century an American businessman John Wanamaker claimed that "Half the money I spend on advertising is wasted; the trouble is, I don't know which half." These words represent a basic idea what efficiency in advertising means. Efficiency means „doing the right things". **Advertising efficiency means** the financial return on the advertising expenditure. The efficiency of advertising could be measured **dividing net profits** from the campaign by the amount of the **advertising costs** (Lawless, 2007)[20]. Measurement of advertising performance can be very useful for companies. They find out whether the **main objective of the campaign has been reached**, they find out the return on advertising investments and get data for preparing the future campaigns. According to Lawles (2007) apart from that enterprises can learn the following from the campaign assessment as well: effects on customer knowledge, effects on customer attitudes, effects on customer intentions, effects on customer behavior, effects on our brand image, financial benefits stemming from the campaign, information on the campaign itself (likeability, interestingness, popularity, etc.). It's not easy to measure for a start, but that does not mean companies should not try. Up to now, **nobody has ever invented a 100% secure advertising test,** as usually the some problems occur (see **Table 2).**

Table 2 – Problems with control and measuring of advertising performance and reasons of failing to do post- campaign testing

PROBLEMS with control and measurement of advertising performance	Abstract character of the results
	Long term effects of campaigns
	Combined influence of more effects at once
	Costs of testing
	Lack of information
	Realization problems
REASONS of failing to do post-campaign testing	Lack of time
	Lack of money
	Lack of information on advertising post-testing
	Lack of human resources

Advertising performance of the fast moving consumer goods companies in Slovakia

„Fast moving consumer goods (FMCG)" also known as consumer packaged goods, are products that have a quick turnover and relatively low cost. Though the absolute profit made on FMCG products is relatively small, they generally sell in large numbers and so the cumulative profit on such products can be large. Examples of FMCG generally include a wide range of frequently purchased consumer products such as *toiletries, soap, cosmetics, teeth cleaning products, shaving products and detergents, as well as other non-durables such as glassware, bulbs, batteries and paper products. FMCG also include pharmaceuticals, food products and drinks*"(Coulthart, 2006).

In our analysis we use a case study made in Slovakia in 2010. We used this case-study for some important reasons like:

- The Slovakian FMCG market is similar to the Romanian FMCG market
- The type of FMCG Companies present in Slovakia, are similar with "brand" names present into the Romanian Market in 2010
- The Supermarket Brands in Slovakia are likely to be found also on the Romanian market: Billa, Kaufland, Lidl, Carrefour
- Slovakia is an ex communist country, now member of the European Union

The case-study deals with the measurement of advertising activities in *Slovak fast moving consumer goods companies*. The work presents results of the primary field research concerning on these issues. **The main aim of the research** *was to find out if and to what extent fast moving consumer goods companies in Slovak Republic measure results of their advertising activities, to identify the methods they know and use and to reveal the problems that companies have with evaluation of advertising effectiveness and efficiency.* The research was quantitative in nature and a method of questioning with the e-mail form questionnaire has been selected.

The research **was quantitative** in nature. For collecting of primary data the authors used questionnaires. They distributed the questionnaires through e-mails to 390 FMCG enterprises in Slovakia. An e-mail questionnaire has been sent to the persons from marketing department as they are the best specialist from companies to answer the questions. They have chosen these companies so that we went to the supermarkets **Tesco, Billa, Kaufland, Lidl and Hypernova**.They were looking there among products for names of producers and suppliers of FMCG. They received back 32 completed questionnaires. The rate of returned completed questionnaires was only 8.2%. Some companies wrote them, that they do not fill in the questionnaire, because they assume such information as internal and too private. The authors considered that *the respond rate not to be sufficient to develop general statements about all FMCG enterprises in Slovakia, but we are sure that they can reflect certain reality.*

Conclusion of the study on the Slovakian FMCG market

48.8% of the companies *do not measure their campaigns* according to their effectiveness in comparison with 51.2% companies that conduct it. More than two thirds of companies (81.0%) assess advertising campaigns *after the campaign*. Before the campaigns only 6.3% of the companies evaluate and during the campaign 12.7% of them. This percentage is not satisfying since if they conduct the measurement before and during advertising campaigns they could reveal and avoid possible problems and mistakes before they happen.

They further examined the ways in which companies evaluate their advertising performance. They wanted to know which of them companies know and use in their practice. In this question there was not limited amount of possibilities, which companies could select.

The best known from the methods of measurement of advertising effectiveness are *consumer juries* (40.6% know it and 31.3% use it). The second best known method is *Tracking print/ broadcast ads*, which is known by 37.5% companies and it is used by 21.1% companies. The next well known (34.4%) and used methods (28.1% of respondents) are *Readability tests*. The Physiological measures are known by 34, 4% companies but nobody uses them. Other methods are not very known and used. They are known maximally by 28, 1% of respondents and used maximally by 15.6% of respondents. There are many methods not known and not used.

Regarding efficiency the most of the respondents (72.2%) **know the method of Return on advertising investment.** This method is used by 50% of the companies which carry out the evaluation of their advertising campaigns. The method Increase in profit is quite a lot well known and used too. 61% companies know it and 55.6% of respondents use this method of measurement of advertising efficiency.

All companies which carry out the evaluation of advertising performance execute the evaluation themselves. The reasons for it can be that small and medium sized enterprises do not have enough financial resources to pay outsourcing companies for such services or that they do not want to pay for such services to external companies.

Control and measurement of advertising is a very important activity to ensure that the money were spent but not wasted. **Advertising should be effective and efficient**. It does not mean that efficient advertising is automatically effective or vice versa. And therefore it is not enough to evaluate only effectiveness or only efficiency; both of them should be controlled and measured. From the research only **56.3% of fast moving consumer goods enterprises control and measure their advertising performance**. This share is as very small and it has been suggested changing the current state.

Some companies do not have enough financial resources for control and measurement of advertising or they do not want to spend money on this activity. The companies which do not want to spend money on such issues should change their opinions.

The study also suggested that 43.8% of companies in the research do not assessed their advertising because of lack of information.

The major conclusion of the Slovakian study was the fact that : **advertising spending is related to changes in market share, changes in product plans and changes in the number of competitors modified by the number of customers, their concentration and the size of the advertising budget. In other words: Advertising makes Sales go up.**

7. Conclusions

The main outcomes of this Research may be found in the presentation of the marketing paradigm of today Marketing Mix Strategy and the 4Ps.

From a management point of view the Four Ps may have been helpful at one time, at least for marketers of consumer packaged goods. The use of various means of competition became more organized. However, the Four Ps was never applicable to all markets and to all types of marketing situations.

Marketing mix management with its four Ps is reaching the end of the road as a universal marketing approach. Newest studies have shown the importance of the 7Ps analysis and of the *relationship marketing* at one of the pillars of a globalized market economy and the importance of brand awareness and analysis on the corporate market that impact strategies regarding FMCG industry.

Most certainly soon the *relationship marketing* will develop into such a new approach to managing marketing problems, to organizing the firm for marketing and to other areas as well.

The research results indicate that different marketing mix elements impact also the creation of brand equity with different levels of intensity, as well as that some elements of marketing mix can negatively affect the creation of brand equity.

The case-study made on Slovakian FMCG market found similarities with the Romanian FMCG market and also showed that for the FMCG companies the Advertising Strategy occupies a key position in order to reach brand effectiveness and awareness and increase general sales.

Also, related to the way of analyzing the Slovakian market Inquiry tests can be made which are really objective and not complicated method of measurement of advertising performance.

From methods of measurement of efficiency for companies is recommended the method Return on advertising investments which is not difficult and also not very time-consuming. With change of attitude of companies to control and measurement of advertising we can expect increase of economic development of the companies.

Also, this research paper can be useful background for a future market analysis on the Romanian FMCG industry, based on questionnaires, quantitative but also qualitative methods.

QUESTIONNAIRES PRETESTING IN MARKETING RESEARCH

ALINA-MIHAELA BABONEA[*]
MIRELA-CRISTINA VOICU[**]

Abstract
Designing the perfect survey questionnaire is impossible. However, researchers can still create an effective research. To make your questionnaire effective, it is necessary to pretest it before actually using it. The following paper reveals some general guidelines on pretesting and what to do for a more effective marketing research giving the fact that the existing literature highlights the importance and indispensability of pretesting and on the other hand, does not provide sufficient information in terms of methodology about it. Also, we have tried to explain the importance of questionnaires pretesting before applying them in order to obtain the best results in marketing research and we've kept in mind that high quality in this domain means using new tools and improving the existing ones if one searches for efficient results.

Key words: *questionnaire, pretesting, focus group, cognitive interviews, behavior coding.*

1. Introduction to questionnaires pretesting

Pretesting is one of the key stages of the survey questionnaire construction process, as shown in Figure 1, a stage of undisputed importance, without which even the most experienced researchers may come to administer uncertain instruments that will lead to the accumulation of doubts about the research results[1].

A more careful examination of the literature on pretesting survey questionnaires reveals a paradox. On the one hand, pretesting is the only way to evaluate in advance whether a questionnaire poses problems for interviewers or respondents and, consequently, elementary textbooks and experienced specialists declare pretesting indispensable. On the other hand, most textbooks provide minimal, if any, guidance about pretesting methods, and survey reports usually provide no information about questionnaire pretesting, whether questionnaires were pretested, and if so, how, and with what results[2]. Moreover, until recently, there have been few methodological studies on pretesting. The universally acknowledged importance of pretesting has been, until now, honored more in theory than in practice; therefore, we know very little about the various aspects of pretesting, including the extent to which pretesting serves its intended purpose, and leads to improved questionnaires.

Pretesting is generally defined as the testing of a set of questions or a questionnaire on subjects from the target population, and dates back to the founding of the modern survey, in the mid 1930s.

We agree that designing a perfect questionnaire is impossible. Nevertheless, researchers can still conduct efficient research by designing an efficient questionnaire. In order to create such questionnaire, its pretesting is required before being actually used, activity that can help us determine the strengths and weaknesses of the survey questionnaire. Questionnaire pretesting enables us to identify inappropriate terms in question wording, an inappropriate order, errors in questionnaires

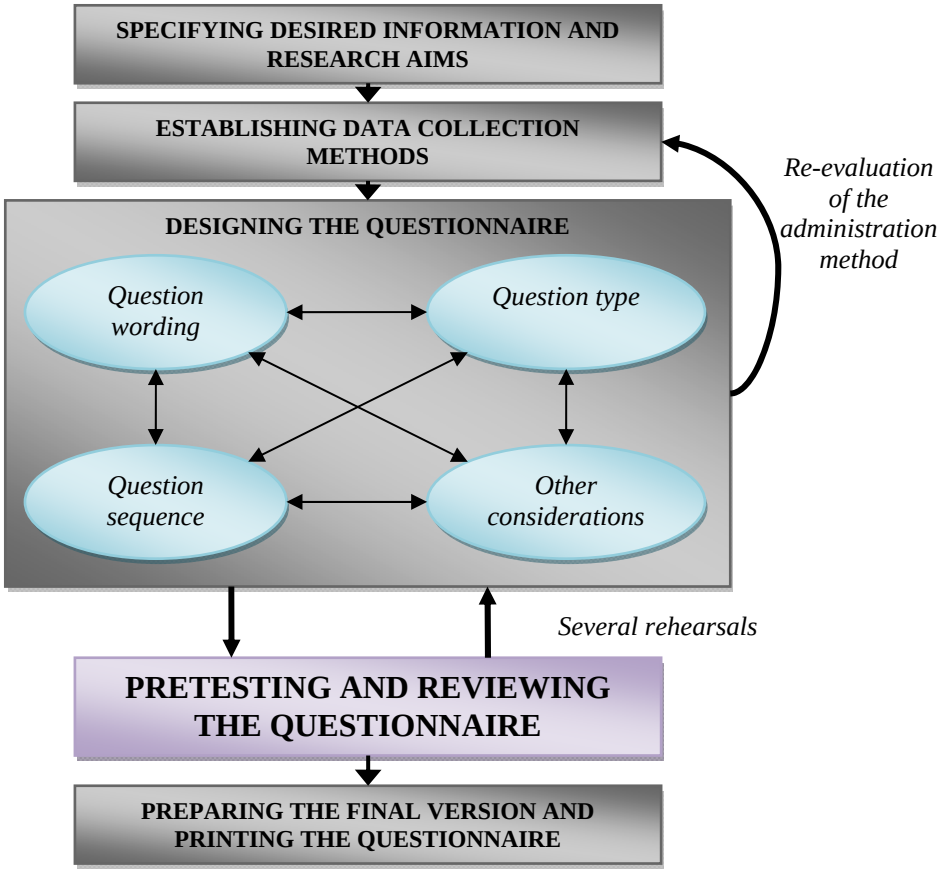
[2] Presser, S., Couper, M.P., Lessler, J.T., Martin, E., Martin, J., Rothgeb, J.M., Singer, E., „Methods for testing and evaluating survey questions", *Public Opinion Quarterly* (2004), Vol. 68, No. 1, pp. 109-130, American Association for Public Opinion Research, http://poq.oxfordjournals.org/cgi/reprint/68/1/109.pdf

related to their layout and instructions, as well as problems caused by the respondents' inability or refusal to answer certain questions.

Figure 1. *Questionnaire design stages*



Source: adaptation from Synodinos, N., „The „art" of questionnaire construction: some important considerations for manufacturing studies", *Integrated Manufacturing Systems* (2003), Vol. 14, No. 3/2003, pp. 221-237, ISSN 0957-6061; Cătoiu, I., Bălan, C., Popescu, I.C., Orzan, Gh., Vegheș, C., Dănețiu, T., Vrânceanu, D., *Marketing research*, Uranus Publishing House (2002), Bucharest, p.313

In this context, the questionnaire pretesting process must look for an answer to the following questions:

- Does every survey question measure what it should measure?
- Do respondents understand all the terms?
- Are questions interpreted in the same manner by all the respondents?
- Did closed questions provide at least one answer choice that would apply to every respondent?
- Does the questionnaire create a positive impression, thus motivating people to answer?

- Are the answer choices to be selected correct?
- Does any aspect of the questionnaire suggest any biasing attempt from the researcher?

2. Pretesting methods

Pretests can be applied in both field, and office or laboratory settings[3]. Most field pretests are conducted on the target population, using the procedures being considered for the main survey. The consensus among most researchers is that experienced interviewers should be used in the pretesting process, as they are more likely to notice errors and identify problems.

Furthermore, survey questionnaire pretests may have two forms: participating (declared) pretests, and undeclared pretests.

Participating (declared) pretests entail that the respondents are informed that this is a pretest. In this case, the idea is that instead of asking the respondents to simply fill in a questionnaire and that is all, the participants in the pretest should be involved in this activity, being asked to explain their reactions to the question format, wording and order. The respondent may also be asked to rephrase a question in his/her own words, to think aloud while trying to formulate his/her answer, or to do other things that will be briefly discussed. The goal of this pretesting method is to elicit the respondents' "immediate" thoughts and reactions to a survey question or problem, so that we can establish whether the questionnaire is understood.

On the other hand, when conducting an *undeclared pretest*, the respondents are not informed that they participate in a pretest. In this case, pretesting is conducted in a manner similar to that of the actual survey. The post-interview survey of the respondents can be carried out in connection with individual questions or replies, but the number and scope of the survey questions is much smaller and limited than in the case of a declared pretest. Its goal is to take the pulse of the dynamics of the entire interview, in other words, how well the survey questions "flow", whether the "skip" patterns work, what quantity of time is needed to conduct the interview and so on. This type of pretest enables us to verify whether our choice in respect of the analysis and standardization of the conducted survey is correct.

Specialists in the field recommend that, if the researchers have sufficient resources to carry out more than one pretest, they should first conduct a participating pretest, followed by an undeclared pretest.

According to the specialists, in recent decades, a growing awareness of the draw-backs of conventional pretesting[*] has led to changes in this field, as follows[4]:

- first, there has been a subtle shift in the goal of pretesting, from an exclusive focus on identifying and fixing the problems encountered by interviewers and respondents, to a broader concern for improving data quality so that measurements meet the survey's objectives;
- second, new testing methods have been developed or methods already in use have been adapted for other uses. These include: cognitive interviews[5] (method that has become common

[3] Czaja, R., „Questionnaire Pretesting Comes of Age", *Marketing Bulletin* (1998), No. 9, pp. 52-66, Article 5, http://marketing-bulletin massey.ac nz

[*] conventional pretesting is the process of conducting the survey on a small scale, in which the interviewer identifies problems related to the questionnaire; the specialists supporting conventional pretesting have established that conducting a survey by completing a set of 12-25 questionnaires is sufficient in order to realize the limitations and weaknesses of the questionnaire, and other specialists have established an interval of 20 to 50 questionnaires for pretesting.

[4] Presser, S., Couper, M.P., Lessler, J.T., Martin, E., Martin, J., Rothgeb, J.M., Singer, E., „Methods for testing and evaluating survey questions", *Public Opinion Quarterly* (2004), Vol. 68, No. 1, pp. 109-130, American Association for Public Opinion Research, http://poq.oxfordjournals.org/cgi/reprint/68/1/109.pdf

[5] Noël, V., Prizeman, G., "Using cognitive question testing to pretest a questionnaire for a large-scale postal survey of nonprofit organizations", *International Society for Third Sector Research/EMES* (2005), Paris, http://www.cnm.tcd.ie/publications/GP,VN%20ISTR%20EMES%20April%2005.pdf

practice in questionnaire pretesting), response latency, expert panel, behavior coding, vignette analysis, experiments, formal respondent debriefings and statistical modeling, reinterview and reconciliation method[6], Three-Step Test-Interview[7] (used to pretest self-administered questionnaires) etc.

Qualitative research is frequently used in questionnaire testing, in order to determine how respondents react to the designed questionnaire[8].

The focus group is a pretesting method that works best when applied in the first phases of questionnaire and question construction, and when a set of objectives and tasks that must be fulfilled is specified before the group meets. The focus group is the best method for determining:

- the respondents' level of understanding of key terms and concepts;
- how respondents recall the information;
- whether behavioral frequencies are numbered, estimated, or "calculated", using strategies of another nature;
- whether respondents understand the inquiry based on the current question wording;
- the frame of reference or the respondent's interpretation of the worded question.

One advantage of the focus group is the fact that its members may use other people's ideas and opinions in order to crystallize their own ideas. Moreover, the participants' observations and reactions may often provide valuable perspectives for the questionnaire and question review approaches. A very large quantity of information can be collected from a 90-minute focus group, which is audio or video recorded. The draw-backs of this method are due to the fact that it is very hard to work with its results, which are time consuming in respect of their interpretation, and that only a limited number of words, topics and problems can be discussed during a 90-minute session.

Cognitive interviews are face-to-face interviews between an interviewer and a respondent from the target population, which are usually conducted at the premises of a research organization. One of the cognitive interview techniques used is the *"think-aloud" technique,* which derives from psychological procedures described by Ericsson and Simon (1980). Consistent with this technique, respondents are instructed to think aloud or verbalize their thoughts in their attempt to understand the question, to recall relevant information and to formulate their answers. The interviewer interjects very little during the interview, except to say "tell me what you are thinking", when the subject pauses for long periods of time.

The "think-aloud" technique can be either concurrent, when probe questions are asked after the respondent answers the question, or retrospective, when probe questions are asked at the end of the interview. Interview sessions are usually taped so that non-participating staff can listen to the tapes and analyze such sessions. A major objective of this technique is to achieve a better comprehension of the cognitive processes that the interviewees go through while formulating the answer. A "think-aloud" interview does not observe the same pattern as a normal interview, and, therefore, it does not provide any indication of the existing problems in the common interview process. This happens because thinking aloud and probing for specific answers break the flow of questions, as well as the relationship between questions, thus affecting the answers given by respondents.

The main advantages of the "think-aloud" technique are due to the fact that:

▪ the interviewer contributes little other than the reading of the survey question, except to occasionally prompt the subject to state what he/she is thinking, therefore, the subject's responses are very little biased;

▪ the interviewer mainly reads survey questions, and then listens to what the interviewee has to say; therefore little training or special expertise is usually necessary;

▪ the interviewee's verbalization is guided only minimally, therefore, he or she may provide information that is unanticipated by the interviewer. Consequently, "think-aloud" interviewing is especially valuable when the subject is outgoing, articulate, and has had significant experience with the topics covered by the survey questions.

On the other hand, the "think-aloud" technique also has several disadvantages, namely[9]:

□ because thinking aloud is somewhat unusual for most people, this technique typically requires significant training of the subjects to be interviewed, in order to elicit a sufficient amount of think-aloud behavior. The subjects' preliminary training may eat into the amount of productive time that can be devoted to the interview;

□ despite all preliminary training in the activity, many individuals tend to simply answer the questions, without further elaboration, as necessary;

□ this technique places the main burden of the interview on the subject;

□ the subject controls the nature of much of the elaborative discussion. Therefore, it is very easy for an interviewee to wander off of the important topic, and to spend a significant amount of time on one question, often delving into irrelevant areas, so that the interviewer must struggle to "bring the subject back". In general, the think-aloud technique results in relatively few survey questions being tested within a particular amount of time.

□ by its nature, thinking-aloud forces subjects to invest a considerable amount of mental effort into processing the survey questions, relative to what they do when simply answering the questions. This technique entails more intensive effort, and more justification of each answer, than when one simply provides an answer such as "yes", "no" or "I agree". Therefore, it is very possible that the activities associated with this technique might contaminate the cognitive processes used in formulating the answer to the question.

The second form of cognitive interviews is *retrospective probing*, when the interviewer asks probe questions to the respondent, after the latter answers a survey question or a series of survey questions. Retrospective probing means that respondents are asked to either interpret a key phrase, or define one term used in a particular question, or justify a particular aspect of their answer, or evaluate the clarity of a phrase or a concept, or identify words or phrases that are difficult to understand. The goal of this method is to identify terms or concepts that respondents do not understand or interpret differently than what the researcher intended, and to determine whether respondents lose sight of important words or qualifiers that are part of the question.

Response latency is a less common undeclared pretesting technique, which can be used in combination with the cognitive interview method or as a method in itself, particularly in computer-assisted surveys. The time delay before a respondent starts to answer a question is most often measured with the help of computers from tapes of cognitive interviews. Unusually long delays may mean that the question is too complex, or that respondents have difficulties in recalling the information they need to formulate their answers. Otherwise, unusually quick answers may indicate that respondents did not understand the questions.

The expert panel often consists of a small group of persons (3 to 8 persons), which examines the questionnaire from various perspectives. This method makes it possible to detect problems that could not be identified through the other techniques. The main advantage of this method is that it is relatively cheap. The panel consists of experts in the field and professionals with expertise in survey

[9] Willis, G.B., *Cognitive Interviewing – A „How To" Guide*, short course presented at the 1999 Meeting of the American Statistical Association

planning, data collection, coding and data analysis. In a work session, the panel examines the questionnaire, question by question. The strength of this approach stems from the variety of expertise and interaction taking place during the panel meeting. Expert panels are often used before conducting a field pretest and, again, during the questionnaire review process carried out after field pretesting.

Behavior coding is the undeclared pretesting technique developed by Charles Cannell and his colleagues at the University of Michigan (1996), which can be used to evaluate both interviewer behavior and survey questions. This method relies on the assumption that any deviation from the ideal model, in which the interviewer reads a question exactly as written and the respondent provides a full answer, indicates that there is a problem with that question. Behavior coding involves conducting of taped interviews during an undeclared field pretest, and then coding, for each question, the frequency of occurrence of one of the following interviewer or respondent behaviors:

- The interviewer makes a minor change in wording when reading the question;
- The interviewer makes a significant change in wording when reading the question;
- The respondent interrupts the reading of the question in order to provide his/her answer;
- The respondent requests clarifications;
- The respondent's initial answer is inadequate;
- The respondent provides an "I don't know" answer;
- The respondent refuses to answer the question.

Oksenberg and his colleagues[10] (1991) suggested that, when one of the abovementioned behaviors occurs in at least 15% of the pretest interviews, it is likely that the question will pose problems during the data collection process.

Behavior coding is a simple and cheap technique designed to analyze conventional pretest interviews, and to identify problem questions. Although the most important draw-back of this technique is that it fails to indicate the source of the problem identified in the questionnaire, the research cited by Fowler and Cannell (1996) attempted to correlate various behavior codes with certain types of problems. These authors synthesized the preliminary general findings of this research, as follows:

- the questions that are not read as formulated indicate the fact that they are clumsily worded or they contain words which are difficult to pronounce;
- the questions that are misinterpreted and frequently interrupted often provide unrelated explanations at the end;
- the questions that result in clarification requests often elicit answers which do not suit the respondent's experience or frame of reference;
- the questions that require clarification are often vague or contain a badly defined term or concept;
- the questions that result in inadequate answers often request a greater level of detail than the respondent can possibly offer.

Vignette analysis. Vignettes are hypothetical scenarios used to determine whether respondents understand and apply a key concept or phrase in the manner intended by researchers. The goal of this method is to evaluate the respondent's level of understanding, especially how he/she defines and applies key phrases or terms in the process of providing answers to questions. One of the draw-backs of this method is that it requires the interviewer to be aware of the terms or expressions that are likely to present difficulties, so that appropriate vignettes can be designed in order to test alternative question wordings.

Experiments. The aforementioned pretesting methods identify questionnaire problems, and, implicitly, lead to revisions designed to address the problems. To determine whether the revisions are

[10] Oksenberg, L., Cannell, C.F., Kalton, G., „New strategies for pretesting survey questions", *Journal of Official Statistics* (1991), No.7 (3), pp. 349-365

improvements, however, there is no substitute for experimental comparisons of the original and revised survey items. Such experiments are of two kinds. First, the original and revised items can be compared using the pretesting method(s) that identified the problem(s). Thus, if cognitive interviews showed respondents had difficulty with a survey item, the item and its revision can be tested in another round of cognitive interviews in order to confirm that the revision shows fewer such problems than the original. Second, original and revised items can be tested to examine what, if any, difference they make for a survey's estimates. Fowler (2004) illustrates, in his studies, how cognitive interviews and experiments are complementary: the former identify potential problems and propose solutions, and the latter test the impact of the solutions. As he argues, experimental evidence is essential in estimating whether different question wordings affect survey results, and if so, by how much.

Statistical modeling. Questionnaire design and statistical modeling are usually thought of as worlds apart. This is unfortunate, as researchers who specialize in these two fields should work together for survey research to progress. One specific statistical modeling instrument, called "latent class analysis", is used to estimate the error associated with questions when the question has been asked of the same respondent two or more times. The specific statistical modeling methods require large numbers of cases, and thus are relatively expensive to conduct.

3. Pretesting perspectives in marketing research

The development of these methods has raised issues of how they might best be used in combination, as well as whether they in fact lead to improvements in survey measurement. The amount and type of pretesting that is necessary depends, of course, on research objectives and complexity and on the number of new questions. Specialists in the field recommend using a variety of techniques to evaluate survey instruments in various stages. In addition to informal testing of questions on colleagues, students or other persons, in the initial stages of questionnaire construction, one can use focus groups, cognitive interviews, and expert panels, and in the subsequent stages, field pretesting may include behavior coding and/or vignette analysis. The final stage should consist of a pilot study on a sample selected from the target population, and should imitate, as much as possible, the procedures that are being considered for the main survey.

In addition, the adoption of computerized questionnaire administration modes poses new challenges for pretesting, as do surveys of special populations, such as children, companies and organizations, and those requiring questionnaires in more than one language - all of which have greatly increased in recent years.

The proliferation of data collection modes has at least three implications for the evaluation and testing of survey instruments. Pretesting methods must take into consideration the question delivery mode. A second implication is that survey instruments consist of much more than words therein, e.g., their layout and design, logical structure and architecture, and the technical aspects of the hardware and software used to deliver them. All of these elements need to be tested, and their possible effects on measurement error explored. A third implication is that survey instruments are ever more complex and demand ever-expanding resources for testing. The older methods that relied on visual inspection to test flow and routing are no longer sufficient. Newer methods must be found to facilitate the testing of instrument logic, quite aside from the wording of individual questions. As Hansen and Couper (2004) argue, computerized questionnaires require interviewers to manage two interactions, one with the computer and another with the respondent, and a good questionnaire design must help interviewers manage both interactions to optimize survey data quality.

Different pretesting methods, and different ways of carrying out the same method, influence the numbers and types of problems identified in questionnaires. Consistency among currently used questionnaire pretesting methods is often low, and the reasons for this need more investigation. One perspective that should be thoroughly investigated by studies is that lack of consistency may occur because the methods used are suited for identifying different problem types. On the other hand,

inconsistencies may reflect a lack of consensus among researchers, cognitive interviewers, and coders about what is regarded as a problem with the questionnaire. The kinds and severity of problems that questionnaire pretesting aims to identify are not always clear, and this lack of specification may contribute to the inconsistencies that have been found.

4. Conclusions

This paper aims to resolve the paradox encountered in the specialized literature, namely that, on the one hand, it argues the importance and indispensability of pretesting to marketing research and, on the other hand, it fails to provide sufficient methodological information concerning pretesting.

Indeed, when summarizing the aforementioned, we, too, can draw the conclusion that questionnaire pretesting constitutes an important stage, considering that developing a perfect data collection instrument is almost impossible, and that pretesting is the only way of testing and improving the efficiency of the data collection instrument. Therefore, we have focused especially on pretesting methods that can be applied, and on aspects related to when, and how they can be used.

Theoretical and empirical research must be expanded, as specified above, to identify the most efficient pretesting modes and methods, and the new developments in survey questionnaire pretesting, which occurred as a result of the adoption of new computer-assisted survey modes and surveys of special populations.

CORPORATE REPUTATION INFLUENCES CONSUMER SATISFACTION AND LOYALTY: EVIDENCE FROM CELLULAR INDUSTRY OF PAKISTAN

IMRAN ALI[*]

Abstract
Research suggests that it takes five times more expenses to attract new customer than to retain existing consumer. The growing concern of corporations in today's competitive environment is to retain consumers. As a result, plenty of researches have been conducted to identify the approaches to satisfy and retain consumers. The current study examines the affects of corporate reputation on consumer satisfaction and consumer loyalty. The primary data has been collected from the consumers of cellular industry in Pakistan. The rationale behind selecting respondents from cellular industry is the intense competition, which is enduring in the cellular companies of Pakistan. The study used SPSS and AMOS to analyze the data. The correlation analysis, regression analysis, reliability analysis and model fit index analysis has been used to test hypotheses and interpret some interesting results. The study found significantly positive associations of corporate reputation on consumer satisfaction and consumer loyalty. The study also found strongly positive affects of consumer satisfaction on consumer loyalty for the case of cellular industry of Pakistan. The study proposes some useful recommendations for policy makers in the area.

Keywords: *Corporate reputation, consumer satisfaction, consumer loyalty, cellular industry, Pakistan.*

1. Introduction

Corporations are recognized on the basis of their worth of the in the marketplace. There is growing appreciation by the academic researchers and professional executives regarding the significance of corporate reputation for all the corporate stakeholders engaged in the legal, functional, and monetary judgments of any corporation. Corporate reputation, when understood by numerous stakeholders, is decisive as it helps to slash the operational costs, and positively affects both monetary and customer-related indicators, like consumer satisfaction, confidence and loyalty (Kreps and Wilson 1982; Shapiro 1983; Williamson 1985; Dowling 2001; Roberts and Dowling 2002; Caruana et al. 2004; Rose and Thomsen 2004). Kay (1993) recognized corporate reputation as extremely critical aspect for higher corporate performance. Many researchers, for instance Gotsi and Wilson (2001) and Groenland (2002) suggested that companies with superior reputation have distinctive lead over their contemporaries to magnetize consumer. Most past studies on corporate reputation to quote few (Doney and Cannon, 1997; Fomurun et al 2000; Davies et al. 2002; and Page and Fearn, 2005) has applied multiple stakeholder approach to corporate reputation and explored influence of customers' behavior regarding corporate reputation. Researchers considered consumers as one of the most essential stakeholder groups as they generate revenue flows for corporations. Research scholar has also emphasized on consumer satisfaction as one of the strongest determinant of consumer loyalty. Higher satisfaction level motivates consumers to adopt repetitive buying behavior and recommending others to do the same. Altogether, if corporation is having strong reputation within the consumers and they are also satisfied with the quality of services provided by the corporations, it would ultimately lead them to adopt loyal behavior to that corporation. Therefore, current study emphasizes on corporate reputation which is mainly associated with consumer behavior towards corporation. The study is conducted in the context of service industry; in service industry the

[*] Assistant Professor, Department of Management Sciences, COMSATS Institute of Information Technology Lahore, Pakistan, E-mail: imranalinim@gmail.com

strong corporate reputation and higher level of consumer satisfaction and loyalty are more important than other industries. The study has particularly focused the cellular industry of Pakistan. The cellular industry is undergoing through oligopolistic competition. There are only few cellular service providers, but they are having very extreme competition and trying to build good image in the industry as compare to their competitors. Cellular companies in Pakistan are also facing high switching costs due to rapidly changing pricing and other policies to provide customer maximum value of their money. Therefore, the main focus of corporations is to retain their existing consumers after attracting new customers. There is contest amongst cellular service provider companies for doing well e.g corporate social performance to create positive image and reputation in the industry in Pakistan. Corporations are trying to find out the social areas where they can intervene and build positive image of doing good in the society.

The objective of this study is to investigate the affects of corporate reputation on consumer satisfaction and loyalty and to examine the affects of consumer satisfaction on consumer loyalty. The following questions have been investigated in this research:

- Does corporate reputation influences consumer satisfaction in cellular industry of Pakistan?
- Does corporate reputation influence consumer loyalty in cellular industry of Pakistan?
- Does consumer satisfaction influence consumer loyalty in service industry?
- How the findings add to the knowledge regarding effects of corporate reputation on consumer behavior?

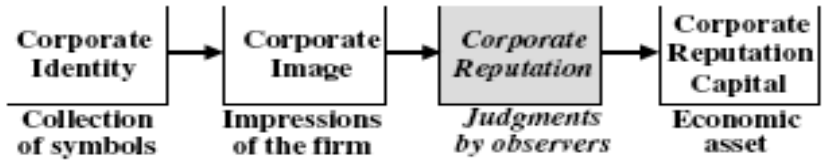
To answer these questions the paper has been structured in various sections. The following section contains theoretical discussions on the topic along with development of the hypotheses. The succeeding section contains the research methods including sample and sampling, measurement and instrumentation and data and analysis. The subsequent section includes results and discussions on the results. The final section concludes the paper with useful recommendations for policy makers.

2. Theoretical Framework and Development of Hypotheses

2.1. Corporate Reputation and Consumer Satisfaction

The concept of corporate reputation emerged from corporate image in 1950's and evolved into corporate identity in 1970's and 1980's (Bennett and Kottasz, 2000). Corporate is the general perceptions of stakeholders regarding any corporation. Corporation reputation has been defines by many authors in various ways. Fombrun (1996) stated that reputation is based on a set of collectively held beliefs about a company's ability and willingness to satisfy the interests of various stakeholders. Bromley (2002) and Sandberg (2002) viewed reputation as a socially shared impression and a consensus about how firm will behave in any given situation. These definitions denote that a reputation is the widely shared beliefs of stakeholders that the corporation will behave in the best of their interests and the future actions of corporations can also be predicted to be in favor of stakeholders. Therefore, corporations always keep perspectives of all stakeholders in the center in its decision making. Most remarkable contribution towards corporate reputation is done by Fombrun and van Riel (1997) who bridge the gap of diverse perspectives on corporate reputation and build Reputation Institute and the journal to address confusions between corporate image, corporate reputation and corporate identity. Baranett et al. (2006) also moved forward in this field and declared reputation capital; they predicted the future of reputation and anticipated that corporations with higher reputation are having higher capital enjoy more benefits than those having low reputation. Gray and Balmer (1998) stated that in today's competitive environment, the firms' ultimate survival depends upon building and maintaining a good corporate reputation. The progression from corporate identity to corporate reputation capital is presented in Figure 1 given below.

Figure 1: Disaggregating Corporate Reputation



Source: Barnett et al. (2006)

Corporate reputation conveys significantly important messages to number of stakeholders which facilitates them in decision making regarding various transactions pertaining to corporations. Numbers of studies have identified the prospects of corporate reputation in the eyes of stakeholders. These stake holders includes investors who consider investing into any corporation owing to its reputation in the market, another important stakeholder in this context is consumer who primarily takes into account corporate reputation in his purchase decision. For instance Walsh et al. (2006) found strongly significant association between corporate reputation and customer satisfaction in the context of Germany. Shapiro (1983) and Wilson (1985) and Lines (2003) declared customers as one of the main stakeholders that spread the corporate reputation in the market. Helm et al. (2010) also analyzed the relationship between corporate reputation and consumer satisfaction and declared corporate reputation as an antecedent of consumer satisfaction. The following hypothesis can be generated based on previous theoretical discussion.

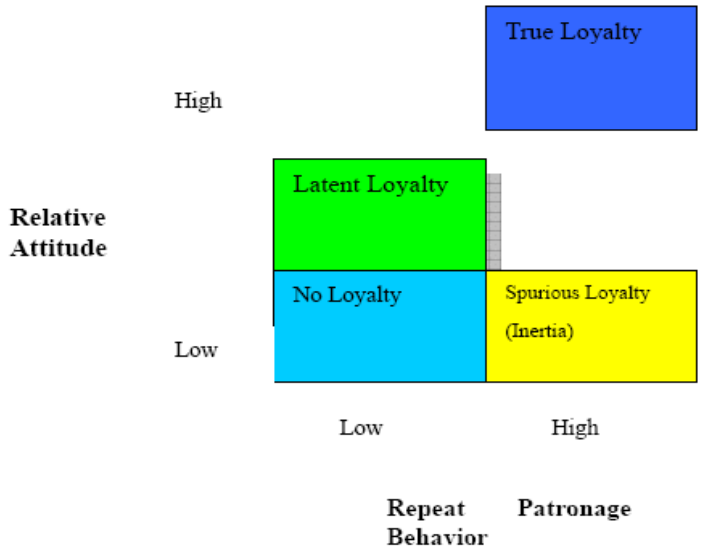
H1: Consumer satisfaction is positively influenced by higher level of corporate reputation

2.2. Consumer Satisfaction and Consumer Loyalty

Cardozo (1965) initially addressed the term customer satisfaction and stated that customer satisfaction results in enhancing the repeated buying attitude. Oliver (1981) viewed customer satisfaction as an emotional reaction resulted from any specific transaction. Both authors stressed customer's feeling about the corporation, therefore satisfaction is all about attracting and influencing customers' emotions and paving his/her attitude in favor of corporation. Several assumptions can be found in literature regarding customer satisfaction, for instance one assumption is that customer can be influenced by internally established standards for quality. Another assumption presumes that customer's future purchase behavior can be predicted by customer satisfaction level.

Consumer loyalty has been explained many researchers in marketing literature. Trucker (1964) hold that consumer's loyalty with any specific corporations can be judged by the repeated purchase of services by the consumers. Jones and Sasser (1999) stated customer loyalty as the sense of belonging and affection that customers hold towards certain firm's staff, products or services. Oliver (1999) presented more comprehensive approach to measure customer loyalty and offered four components of loyalty i.e. cognitive loyalty, affective loyalty, conative loyalty and behavioral loyalty. Number of studies have examined the predictors of consumer loyalty and majority of them have pointed consume satisfaction as basic component of consumer loyalty. Cornin et al (2000) found that service quality influences on consumer loyalty via consumer satisfaction.

Figure 2: The Loyalty Conditions



Source: Weiwei (2007)

Consumer loyalty in the service industry also referred as service loyalty means customer's faithfulness to specific brand in the service industry. Therefore customers maintains a series of loyalties to the organizations whose service they usually consumer. Their faithfulness level with corporations also determines their purchasing behavior. Researchers therefore, measure the loyalty level of consumers with organizations with their buying behavior. Controversy existed regarding consumer loyalty for a long span of time, few researchers considered loyalty as behavior whereas some also viewed consumer loyalty as attitude. Dick and Basu (1994) resolved this conspiracy by conceptualizing consumer loyalty as a composite construct. Dick and Basu (1994) defined consumer loyalty as strength of the attitude towards the target relative to available alternates and patronage behavior. Later researchers developed the metrics of loyalty and found that 'true loyalty' can only be achieved when strong positive relative attitudes are associated with high levels of repeated patronage. Different associations of loyalty conditions are explained in Figure 2.

Existing literature in marketing confirms the relationship between customer satisfaction and consumer retention. For instance Fornell (1992); Jones and Sasser (2000) found customer satisfaction as a mean to retain customer and attain sustainable growth. Brown and Gulycs (2001) hold customer satisfaction as an antecedent of customer retention. Ali et al. (2010a; 2010b) also investigated the relationship between consumer satisfaction and consumer retention in cellular industry of Pakistan. In their study Ali et al. (2010) analyzed the determinants of consumer satisfaction and retention and reported strong influence of customer satisfaction on consumer loyalty. Juan and Yan (2009) also documented association between customer satisfaction and customer loyalty in the context of China.

H2: Consumer loyalty is positively influenced by consumer satisfaction

2.3. Corporate Reputation and Consumer Loyalty

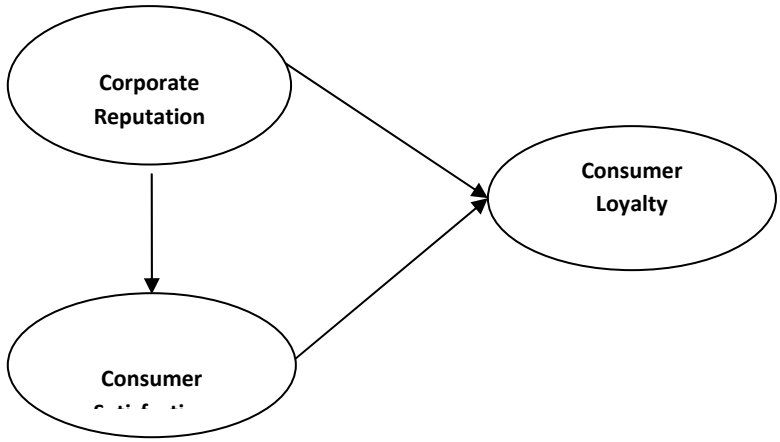
Corporate reputation is acknowledged as one of central determinants of consumer loyalty. Corporate reputation not only motivates the existing customers to adopt favorable attitude, but also to potential customers. Potential customers conceive idea about corporations from their advertisements

and from other sources for instance word of mouth from existing customers. Building strong corporate is more important in the context of service organizations who are not offering tangible products to customers. Therefore, service providing organizations uses corporate reputation as a tool to mold consumer behavior for repetitive purchases from the organizations. Tang and Weiwei (2007) stress the significance of corporate reputation for service industries more important than those providing tangible products. Corporations are increasingly working hard to build positive image and good reputation in the community. Previous researches also confirm strong relationship between positive corporate reputation and consumer loyalty. For instance Shapiro (1982) asserted that good corporate reputation results in higher market share of firms and better financial performance. Porter (1985); Yoon et al. (1993); Robertson (1993); and Andreassen and Lindestad, (1998) suggests that good reputation help firms building stronger relationships with customer. Nguyen and Leblanc (2001) hold that degree of consumer loyalty is perceived to be higher when consumer is having strong and favorable perceptions regarding corporation reputation.

H3: Consumer loyalty to corporation is positively influenced by corporate reputation

The following conceptual model can be developed on the basis of above theoretical discussion. The self-explanatory model presented in Figure 3 shows the association between corporate reputation, consumer satisfaction and consumer loyalty. In this relationship consumer loyalty is the result of higher level of corporate reputation and consumer satisfaction. Moreover, consumer satisfaction can also be increased through higher level of corporate reputation in the eyes of consumer.

Figure 3: Conceptual Model of CSR, Investor Satisfaction and Investor Loyalty



3. Research Methods

Sample and Sampling

The target population in this study is the consumers using cellular services in Pakistan. The reason behind selection of cellular industry is the intense competition enduring in the cellular companies in Pakistan. The companies are rigorously trying to develop some competitive advantage over their contemporaries. They are trying to offer products at minimum possible prices in order to

snatch existing consumers from their competitors. In this scenario corporate reputation plays an important role to retain satisfied and loyal customers. A total of 250 questionnaires were distributed in the university students in Pakistan. Student being more critical about the quality of services, corporate overall reputation makes rationale decisions to maximize its value from the cellular services. The students were given sufficient briefed to consider the case of cellular service provider companies and provide their response to the given items. A total of 243 questionnaires were found useful. The sampling technique may be attributed as convenience sampling which is quite appropriate for such research.

Measurement and Instrumentation

The study contains three variables, corporate reputation, and consumer satisfaction and consumer loyalty. The instrument to measure corporate reputation was adopted from Sabrina (2007) the instrument contained 10 items which discusses different aspects which contribute in building strong image of corporation to gauge the perceptions of the respondents regarding over reputation of corporation. The instrument measured the response of respondents on 7 points Likert scale attributing 1= a very good reputation and 7= a very bad reputation. The instrument to measure consumer satisfaction was adopted from Cornin et al. (2000) and is quite similar to Oliver (1997). The instrument contained 3 items measuring satisfaction level of consumer regarding products of corporations. Whereas, the instrument to measure consumer loyalty is adopted from Zeithaml et al (1996). The instrument consisted of 5 items explaining level of consumer loyalty with some corporation. The instruments for measuring consumer satisfaction and consumer loyalty were measured on five point Likert scale ranking from 1 for Strongly Agree to 5 for Strongly Disagree.

Data and Analysis

The data collected through self administered survey was entered in to SPSS sheet. Correlation and reliability analysis are conducted through SPSS; the correlation analysis explains the correlations between all variables whereas reliability analysis depicts the correctness of the data. Both of these analyses are useful before proceeding to final analysis. Regression analysis and model fit analysis are carried through AMOS. The structural equation model (SEM) is mainly adopted to test the hypotheses.

4. Results and Discussions

Table 1 represents the table of correlations. This table reflects variables – corporate reputation and consumer satisfaction – are positively correlated to consumer loyalty ($r = .500$, $p = .000$ and $r = .649$, $p = .000$ respectively). The magnitudes of correlations of corporate reputation and consumer satisfaction are greater than 0.3 in the absolute terms, which shows the moderate correlations between the said pair of the variables. All the correlations are statistically significant at one percent level of significant.

Table 1: Correlations

		Corporate reputation	Consumer satisfaction	Consumer loyalty
Corporate reputation	Pearson Correlation	1		
	Sig. (2-tailed)			
	N	243		
Consumer satisfaction	Pearson Correlation	.580**	1	
	Sig. (2-tailed)	.000		
	N	243	243	
Consumer loyalty	Pearson Correlation	.500**	.649**	1
	Sig. (2-tailed)	.000	.000	
	N	243	243	243

** Correlation is significant at the 0.01 level (2-tailed).

Table 2: Index of Fit of the Model

Model Summary		
Chi Square	Degree of freedom	P value
129.342	12	0.000

Table 2 depicts the index of fit for our model. The degree of freedom is (12) which meets the general standard of model fit. It apparent from our analysis that over all research model is significant (Chi= 129.342), (P<0.05).

Table 3: Hypotheses testing based on Regression Weights

Estimates	**Estimates**	**S.E.**	**Critical Ratio**	**P-value**	**Results**
CS <--- CR	.888	.125	7.089	.000	Accepted
CL <--- CR	.296	.146	2.024	.043	Accepted
CL <--- CS	.561	.095	5.883	.000	Accepted

Table 3 presents the results of the regression analysis. The results show that consumer satisfaction is significantly and positively influences by higher level of corporate reputation, therefore, we accept our H1. Ali et al. (2010) found significant association between consumer's perceptions about corporations' quality of product on consumer satisfaction in the context of cellular industry of Pakistan. Walsh et al. (2006) also found strongly significant association between corporate reputation and customer satisfaction in the context of Germany. Consumer loyalty is also significantly and positively affected by the corporate reputation as shown by the values of the

corresponding P-values (.043), we therefore accept our H2 as well. Nguyen and Leblanc (2001) found strongly favorable connection between corporate reputation and consumer loyalty. Helm et al. (2010) declared corporate reputation as antecedents of customer satisfaction and customer loyalty.

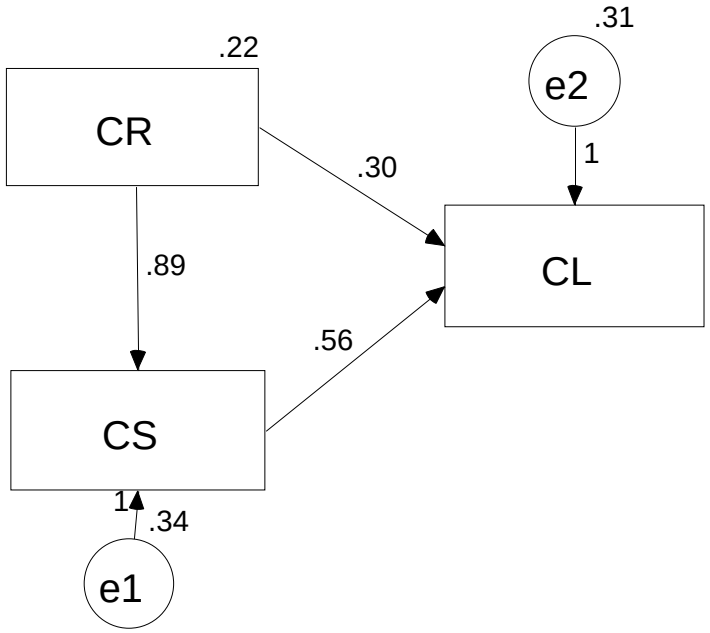
Finally, the results shows highly significant and positive association between consumer satisfaction and consumer loyalty, leaving our H3 accepted. Ali et al. (2010) also found positive relationship between consumer satisfaction and consumer retention in cellular industry of Pakistan. Juan and Yan (2009) also documented strong association between customer satisfaction and customer loyalty in the context of China. This test shows that the coefficients of all the predictors are statistically significant at less than five percent level of significance. All of the significant coefficients have the positive signs.

Table 4: Reliability Statistics

Cronbach's Alpha	N of Items
.790	3

Reliability analysis of this model is also conducted in order to check the health of collected data. Table 4 shows the reliability of data. The value of cronbach's Alpha is 0.790 which is statistically strongly reliable.

Figure 4: Structural Equation Model of CR, CS and CL



Above given Figure 4 shows the structural equation model (SEM) of this study. The SEM model displays positive associations between all three variables i.e. corporate reputation, consumer

satisfaction and consumer loyalty. The model also presents the values of error term and the nature of relationship between all variables.

5. Conclusions

This study is conducted to investigate the nature and levels of associations between corporate reputations, consumer satisfaction and consumer loyalty in the cellular industry of Pakistan. This is an important study because it provides pertinent research findings to cellular industry of Pakistan. The cellular industry is one of the leading industries amongst the growing industries in Pakistan. The cellular industry of Pakistan is also facing intense competition and cellular service providing corporations are striving hard to develop some competitive advantage over its contemporaries. They are also having the high consumer switching costs. Therefore, any research which focuses on their real world problems would be highly beneficial to them.

The study concluded that strong corporate reputation is mandatory in terms of overall quality of products, value of services which company is delivering to its customers against their money, their commitment to protect environment, offer better welfare opportunities to employees and their families, orientation towards customer, contribution towards charitable avenues, qualification of its management and above all the credibility of corporations claims in its advertising claims. Higher corporate reputation leads to higher level of satisfied customers. Therefore, if any corporation intends to develop its highly good reputation in the eyes of consumers, it must pay utmost attention to above mentioned points. Higher satisfaction level of consumers results in higher level of customer loyalty which in turn motivates consumers to purchase services of corporations again and again. Moreover, higher corporate reputation also leads to higher level of customer loyalty. The study therefore, declares corporate reputation as one of the leading indicator not only to satisfy and retain existing customers but also to attract new customers as well.

The findings of this study provide fruitful thoughts and directions for the future researchers in this field. It also provides useful recommendations for professionals and policy makers to enhance corporate performance through higher level of consumer satisfaction and consumer loyalty.

USING THE SNOWBALL METHOD IN MARKETING RESEARCH ON HIDDEN POPULATIONS

MIRELA-CRISTINA VOICU[*]
ALINA-MIHAELA BABONEA[**]

Abstract
Following the classical sampling theory, the researcher selects samples of people, businesses or others, in order to obtain the desired information. Drawing the samples is usually done by randomly selecting from a list representing the target population. In practice, this list is often not available. There are cases in which the population of interest is not fully known, not well defined and fully listed, and creating a sampling frame is difficult or impossible for the researcher.The solution to this situation comes from the snowball sampling method, the best way we can study hidden populations in marketing research. In this paper we are approaching the snowball method as a mean of accessing vulnerable and more impenetrable social groupings revealing the latest advances of this technique.

***Key words**: market research, survey, hidden population, snowball method, non-probabilistic sampling*

1. Introduction

Subject to particularities of the statistical population and the objectives of the research, a series of non-random approaches, also named rational selection techniques have been developed in marketing survey practices[1]. One of the most important non probability sampling methods used in marketing we learn about in our marketing research course is the "snowball" sampling[2]. We are also briefed during the same course on the non-probability character of this approach which does not allow prior establishment of the possibility of including each particular subject in the sample as it is done in the probability surveys, fact which prevents definition of interferences.

Also known as the referral method or network sampling, the "snowball" sampling is normally used wherever there is little knowledge on the target population, whose boundaries or number are hard to define and the development of a sampling database is difficult if not impossible to achieve by the researcher[3]. The most frequent examples of using this method are met in the surveys intended to identify sensitive information or in researches carried out on *hidden populations.*

The term hidden populations, synonymous with "very rare human populations" or "difficult to approach populations" is being used to generally designate the populations for which there is no official information or which represent less than 2% of the population. In other words, these populations are difficult to identity, approach or recruit for research purposes, more often than not because of their social stigmata, legal status as well as subsequent lack of visibility of members of

such population[4]. These categories of populations include relevant groups for public health purposes such as injectable drug consumers, relevant groups for public politics such as street youth and the homeless, as well as relevant groups in terms of art and culture, such as jazz musicians and other kinds of musicians or artists and the list remains open. Bryam (1999) used this method to create a sample consisting of British visitors of thematic Disney parks and Venter, Boshoff and Maas (2005) have also used this method to identify the owners or successors of small and average family companies in South Africa[5] to list only a few practical examples.

Inadequate public records raise difficulties in terms of sampling the developing countries which causes a significant part of the general population to qualify as "hidden" for sampling purposes. This category also includes the highly specialized target groups such as networks being formed or transformed very quickly or temporarily.

The "snowball" method also stands as an extremely valuable marketing research instrument whenever we want to access highly informed and experienced individuals in a specific field, product, production process, etc, individuals who can provide in-depth information which is not available elsewhere or in another manner[6].

2. Brief history

The "snowball" method has been developed based on the multiplicity sampling prepared by Sirken at the end of the 1960s for the sampling of rare populations[7]. In Sirkin's method the respondent is requested to indicate not only if a specific condition affects one's household but also if it affects a certain group of households such as those of children and brothers. The information concerning a phenomenon or event thus becomes available not only from the respondent's household but also from other households related to the respondent. Multiplicity is generated by the fact that the information referring to a certain event may be obtained from several sources and thus the capacity to detect rare events is significantly improved.

The approach based on multiplicity has been extended to the "snowball" sampling by Rothbart, Fine and Sudman (1982). They suggested adding to the survey a question related to the number of eligible respondents known to the respondent. The dimension of this network then offers the basis for multiplicity adjustment where the respondents are weighted with the opposite of the dimension of their network.

3. Definition and application methods

The *"snowball" method* implies the identification of an initial set of respondents who will be interviewed and who will be requested at the end of their interview to recommend potential subjects who share similar characteristics and who are relevant for the purpose of the subject survey. Request for referrals shall be initiated by the researcher by means of a phrase such as: " It was a great pleasure to meet you and I really appreciate the time you have so kindly offered. I was wondering if you happen to know other persons who share the same interest/experience as yours and who would be willing to meet me".

It is recommended to select the initial sample of respondents at random although easiness of access always dictates the initial sample in practice. The second set of respondents is interviewed and also requested to recommend names of other potential respondents for the subject survey. The process continues until the moment the researcher decides the sample is large enough to satisfy the purpose of the study or until the moment the respondents start repeating the names recommended which indicates that subsequent rounds of interviews would not bring additional relevant information[8]. There are certain specialists who consider that the satisfactory threshold is reached not by meeting a specific number enforced by statistical requirements but rather by access to a specific amount of relevant, quasi complete information on the investigated field.

Use of this method often raises the problem of defining the individuals who belong to the initial sample of respondents. The most important problems to be approached and solved to this effect are:

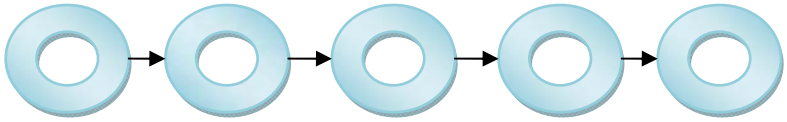
- Who holds sufficient authority to supply the opinions needed?
- How large is the hidden population?
- Can we define the limits of the hidden population?
- The manner in which we shall access the members of the hidden population;
- How can we obtain a high response rate?
- How can we measure and interpret the errors caused by non-replies?
- How can we effectively manage the interviews in a short period of time without negatively affecting their validity?

The relationship between the "snowball" sampling and the in-depth interview method is quite obvious and is established by the very definition of this sampling method[9]. Under these circumstances the quality of the process of obtaining referrals is of course related to the quality of the interaction between the respondent and interviewer – the respondent should not leave the interview with a feeling of dissatisfaction while the interviewer should gain the trust and sympathy of the respondent so as to increase his chances to her referrals from the respondent.

The main manners of using the "snowball" method are represented by:

➥ *the linear method* (see Figure 1) – which implies requesting from the first sample of initial respondents a single referral from the target population of the survey, a single referral being also requested during subsequent cycles of the survey;

Figure 1. *Graphic representation of the linear version of the "snowball" method*



➥ *non discriminative exponential method* (see Figure 2) – which implies that the interviewer asks the initial respondents to indicate all the individuals they know and who belong to

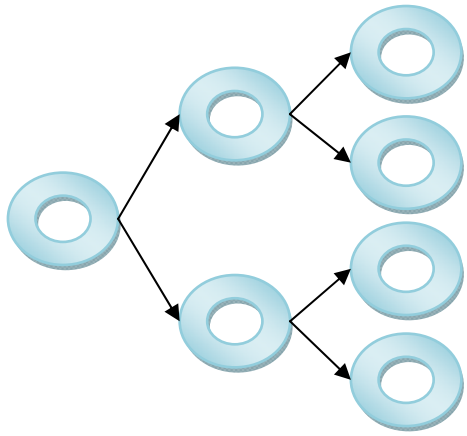
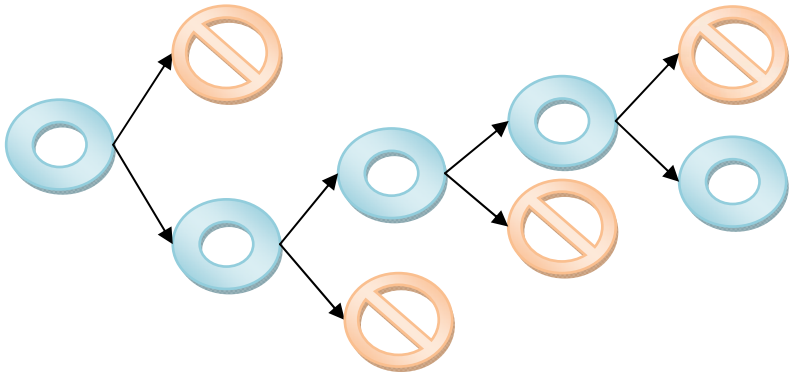
the target population of the survey, the same system being applied to the subsequent cycles of the survey, the researcher interviewing all referrals obtained;

Figure 2. *Graphic representation of the non discriminative exponential version of the "snowball" method*



➥ *discriminative exponential method* (see Figure 3) – is similar in many respects to the non discriminative exponential method in the sense that the researcher asks the respondents to name all the persons they know within the target population of the survey. The difference from the former method resides in the fact that the researcher shall randomly select a certain number of individuals from the referrals offered by each respondent.

Figura 3. *Graphic representation of the discriminative exponential version of the "snowball" method*



4. Advantages and disadvantages of using the "snowball" method

The advantages of the snowball method reside in the first place in the advantages of the non-probability sampling methods which are much faster and cost effective than the probability methods, allowing adjustment of the survey during progress thereof should the subject of the survey prove to

be "difficult"[10]. These surveys are recommended whenever it is not necessarily intended to generalize the data for the entire population, but rather to collect certain detailed informed on specific events or phenomena, whenever a list of the population being surveyed is not available or when the target population is hard to identify[11].

Use of the "snowball" method in marketing surveys brings along a series of advantages specific to this method:

- the method of referrals allows the surveyor to reach populations which are otherwise difficult to be sampled using other sampling methods;
- application of this sampling method does not require a complex planning and the staff used is considerably smaller in comparison to other sampling methods.

The major disadvantages of this method are basically related to the general disadvantages resulting from use of a non-probability sampling method[12]:

- the units being entered in the sample in an arbitrary manner, the probabilities of selecting the units in the sample can not be calculated. It is thus no longer possible to calculate variance and displacement of the estimator. Estimation of parameters by a trust interval is not allowed for this method.
- due to the selection manner of the survey units, there is no guarantee that all simple units of the population have a chance to enter the sample. As calculation of variance and displacement of estimator is not possible, the only way to evaluate the quality of data collected is to compare them to data available in an older report or in a different survey.

In addition to the limitation enforced by the non-probability character of the "snowball" method there is another series of limitations related to the specific characteristics of this method:

- the surveyor has limited control over the method. The individuals the surveyor may interview basically depend on the subject formerly interviewed;
- the surveyor is not familiar with the real distribution of the population and the sample;
- given the fact that the initial respondents tend to name the persons they know best and who share the same opinions, it is very likely that the subjects posses the same features and characteristics and thus the sample finally obtained by the surveyor represents only a small subgroup of the entire population or small target groups will pass unnoticed.

The most often errors occurring in the application of this method are caused by the following:

- interferences being obtained are only based on the initial sample of respondents as long as the subsequent respondents are not selected at random. However, as the initial sample is not selected at random in practice, interferences may not be obtained at the initial sample either;
- the samples extracted by means of this method tend to be un-representative due to the fact that the co-operant persons who agree to participate in the survey are over-represented;
- errors are also caused by the fact that part of the participants "hide" the referrals trying to protect friends or acquaintances, a problem which is difficult to solve particularly where there is a strong concern for confidentiality of data;

➥ referrals are obtained by means of the relationships between people, so that people belonging to a large social network shall be over-represented while individuals relatively isolated shall be under-represented.

Used in marketing surveys, the "snowball" sampling may be applied in the exploratory qualitative and also descriptive surveys without allowing however extrapolation of results for the target population although this method is incorrectly being used for this purpose.

5. Improvement in using "snowball" method

To improve the efficiency of the "snowball" method Frank and Snijders (1994) have created, starting from it, a method for the estimation of the hidden populations using a sample selected by the one-cycle referral method. To achieve this, they have selected a heterogeneous group of initial subjects, each of these drafting a list with all the known members of the target population. The dimension of the target population is then estimated based on the coverage rate of the members listed. In a similar manner, Klovdahl (1989) suggests the term random walk for the procedure which allows obtaining a sample of the hidden population by asking the respondents to suggest potential respondents who might possess the characteristics being studied and from which a unit is selected at random[13]. The results of this process highlight the structural characteristics of the connection network of the hidden population. In addition to this, Spreen and Zwaagstra (1994) suggest a combination between the "snowball" sampling method and the oriented sampling which uses ethnographic representation for location of the initial sample which becomes the basis for a network sampling.

Despite all these improvements and extensions of the "snowball" method, there are several problems yet to be solved to this day. The main problem in the methodological debate concerning sampling and analysis of the hidden populations is – how do we extract an (initial) sample at random?

The concentrated efforts of the specialists to improve the main disadvantage of the "snowball" method resulted in the respondent driven sampling (RDS) based on the referrals of the respondents by means of the combination between the referral method and a mathematic method which weights the sample in order to compensate its selection by a non-random method and where appropriate use of stimulants may lead to cutback of errors occurring in sampling by the referral method.

The respondent driven sampling (RDS)[14] based on the respondents' referrals basically consists in the respondents' recruiting other respondents among their acquaintances same as it is done in the "snowball" method and the surveyors' following who recruited whom, by means of the coupon[*] each respondent must offer to each acquaintance/friend/colleague[15] recruited, as well as the number of social contacts of the respondents. Then, using a mathematic model of the recruitment process, the sample is weighted to compensate for the non-random recruitment. This model is based on a synthesis and an extension of two areas of mathematics, the theory of Markov chain and the theory of the biased network, which have not been formerly used as standard instruments in the sampling theory. The statistics theory which resulted from the incorporation of these theories, named respondent driven sampling (RDS) allows the surveyors to supply both estimations on the population as well as indicators on the accuracy of these estimations.

[13] Thompson, S.K., Targeted Random Walk Designs, *Survey Methodology* (2006), June 2006, Vol. 32, No. 1, pp. 11-24, Statistics Canada, Catalogue No. 12001XIE

[14] Heckathorn, D.D., Extensions of respondent-driven sampling: analyzing continuous variables and controlling for differential recruitment, *Center for the Study of Economy and Society Working Paper Series* (2007), paper No. 38, April 2007, http://www.economyandsociety.org/publications/wp38_Heckathorn_07.pdf

[*] the coupon includes contact information on how to reach the interviewer or the location where the interview takes place and the coupon code which allows reconstruction of the network

[15] Schonlau, M., Liebau, E., *Respondent Driven Sampling*, Research Notes of the German Data Forum (RatSWD) (2010), No. 45, September 2010

The problems of the "snowball" method occurring with each use of the method are being solved in the RDS method as follows:

Table 1. *Errors occurring following use of the "snowball" method and solutions offered by the RDS method*

Characteristics of the "snowball" method	***Errors occurring following use of the "snowball" method***	***Solutions offered by the RDS method***
Respondents may recommend a countless number of persons	1. Differential recruitment: those with a large size network may recruit a larger number of persons who are likely to possess similar characteristics; 2. Clustering: leads to decrease of the effective dimension of the sample.	Restriction of recruitment by restricting the number of recruitment coupons.
Characteristics of the social network are ignored	1. Grouping of individuals based on the network characteristics can not be measured; 2. Dimensions of the social network affect the selection probability.	1. Encoded coupons allow association of the respondent with the recruiter and the enlisted subjects; 2. Weighted comparison to take into account the measurable properties of the network
The respondents offer referrals, the interviewers must determine them to respond	Members accessible to outsiders participate only	The respondents are those who recruit the referrals, which also include the capacity to also exercise a social influence wherever the interviewer does not possess any; respondents remain in their offices.
Convenience sample – analysis restricted to definition of weights in the sample; generalization is not possible.	Selection probability is unknown	Collection of data referring to dimension of network of respondents to calculate the selection probability within the network; use of network properties to take into account clustering effects.

Source: adaptation of Johnston, L.G., Sabin, K., *Sampling hard-to-reach populations with respondent driven sampling*, Methodological Innovations Online (2010), 5(2), pp.38-48, ISSN 1748-0612online

As you can notice in the table above, RDS differs from the traditional "snowball" method in several respects. First of all, while sampling using the "snowball" method usually implies use of a participation incentive, RDS implies a dual stimulant system – reward granted for having been interviewed (primary reward) plus a reward for recruitment of other members of the hidden population (secondary reward). The recruiter exerts an additional pressure to this double reward, which may lead to a smaller number of non-replies as long as those not willing to participate in the survey on financial grounds may however accept participation as a favour to a friend. Secondly, the subjects are not requested to identify and name the other known members of the hidden population to the recruiter, but are requested to recruit these persons themselves. The RDS approach thus reduces the respondents' tendency to "hide" the referrals, offering the respondents the opportunity to allow

those being recruited to decide themselves if they are willing to participate in the survey. In the third place, the referrals are limited to a number of respondents who may be recruited by means of a pre-established number of coupons (normally 3 or 4), thus minimizing the influence of initial respondents on the structure of the final sample. Such limitation of the number of persons recruited stimulates achievement of long recruiting chains thus raising the degree in which the survey may approach the most hidden areas of the target population. And last but not the least, the relationships between the recruiters and the persons being recruited are documented allowing assessment and adjustment of recruitment errors during the final stage of data analysis, and the information on the dimensions of the personal network of each respondent is collected to allow weighted comparison by post-stratification to compensate over-sampling of respondents with large social networks.

The RDS method implies the existence of four essential elements in whose absence the method may not be named RDS approach. These elements are represented by[16]:

- the documentation referring to who recruited whom being constructed by means of coupons;
- recruitment must be rationalized by means of not more than 3-4 coupons normally allocated to a single respondent;
- the information concerning dimension of network must be collected and recorded;
- the recruiters and the persons being recruited should know each other (should have a previous relationship).

The efficiency of the RDS method is based on two remarks. In the first place, in the event the referral chains are long enough, namely the process of development of referral chains consists in sufficient recruitment cycles or waves, the structure of the final sample shall become independent from the initial sample in terms of characteristics and behaviour patterned studied. After a certain number of cycles the structure of the sample becomes stable and all the members of the target population have a selection probability different from zero. Hence, an essential element in the design of the RDS method implies application of the methods which lead to increase of the referral chains. While the final structure of the RDS sample is independent from the initial sample, the process for selection of the components of the initial sample may affect the rate in which a balance is reached as well as the speed of the sample selection process. In other words, the subjects of the initial sample possess certain characteristics which are more adequate than others in that they facilitate a higher "production" of referrals.

Following requirements should be observed during the selection process of the subjects of the first sample to improve efficiency of the RDS selection process:

- respondents of the initial sample should have a great diversity in terms of factors whose impact is crucial in the development of social relationships within the population. These factors normally include basic demographic characteristics such as race, nationality, religion, caste, social standing and age.
- as most of the social relationships are based on proximity, such as subjects living in the same street or working for the same company, initial subjects should be extracted from a variety of geographical areas occupied by the target population;
- initial subjects should be individuals who maintain multiple social relationships and enjoy the appreciation of the target population. It would be much easier for such individuals to promote participation and speed up recruitment.

The second remark on which efficiency of the RDS method is based refers to the fact that the information collected during the sampling process may offer the means for calculation of the relative selection probabilities which in their turn offer the means for the calculation of both non-displaced

[16] Magnani, R., Sabin, K., Saidel, T., Heckathorn, D., Review of sampling hard-to-reach and hidden populations for HIV surveillance, *AIDS* (2005), (suppl 2): S67-S72

estimators within the population and the variation of these estimators. In case of traditional sampling methods, such as simple random sampling or the stratified sampling, the sampling framework is built as a rule before selection of the first respondent. In a simple random sample, the selection probabilities are equal, while in a stratified sample, the special interest subgroups are over-represented and the selection probabilities are therefore unequal. The selection probabilities are established in both cases before selection of the first respondent the effects of the sampling scheme being quantified at a later stage.

In case of the RDS method however, the sampling framework is developed after completion of sampling based on two types of information collected during the sampling process. First of all, each pair of recruiter-recruited person is documented, thus offering the basis required for control of errors entered by the tendency of individuals to build social relationships in a non random manner. The information concerning who recruited whom is used to quantify the sampling errors caused by the non random structure of the network offering the basis for performing the estimations. Secondly, the respondents are asked how many other members of the target population they know. On a network based sample, the selection probability of an individual depends on the number of persons within the target population the subject individual is connected with and which gives him his so called class. The recruitment process may proceed for instance as follows: a typical respondent in the RDS method, namely Mr Popescu recommends Mrs Ionescu; without knowing the names of the two respondents, the researcher will ask Mrs Ionescu to supply information on the nature of her relationship with the person who had handed her the coupon; by means of the coupon code we shall then associate her to Mr Popescu and the information supplied on the nature relationship between the two; when Mr Popescu returns to receive his reward the recruiter will also ask him as well information on the nature of his personal relationships with the individuals recommended and this information shall be associated to the network; the recruiter shall also ask Mr Popescu to indicate the number of persons he knows in the target population; if his reply is 30 the recruiter can conclude that Mrs Ionescu had a selection probability of 1 to 30.

Despite all these improvements the RDS method still presents several disadvantages:

□ despite its apparent potential for fast recruitment, the RDS sampling may result in practice in a very slow recruitment for various reasons including:

- the small dimensions of the network;
- lack of relationships between the members of the target population;
- lack of enthusiasm for participation;
- inadequate incentives;
- a high degree of stigmata.

The real disadvantage consists in fact in the unpredictable response rate.

□ there is no software developed for the analysis of data collected by means of RDS. The only software developed so far is RDSAT intended for the definition of basic statistical estimators only.

The respondent driven sampling has been recently extended to the internet, extension which offers the possibility to sample large electronically connected populations in a fast way and with the minimum resources[17].

6. Conclusions

As popularity of qualitative surveys has significantly increased in the last years, both worldwide and in our country, it is only natural to focus on the non probability methods used in the

[17] Wejnert, C., Heckathorn, D.D., Web-based network sampling: efficiency and efficacy of respondent-driven sampling for online research, *Sociological Methods and Research* (2007), May 18, 2007, http://www respondentdri vensampling.org/reports/web_rds1.pdf

marketing surveys, the theoretical and practical issues being very seldom approached in the textbooks. Such is the case of the "snowball" sampling, a method often used along the years both in exploratory and descriptive surveys, due to its capacity to discover precious information on the so called "hidden" populations.

In the paper we have presented above we have approached the "snowball" method basically in connection with the multiple advantages and also the improvements it may offer in marketing surveys. The latest and most popular improvement is named the respondent driven sampling based on the recommendations of the respondents which can be used to mitigate the non probability character of the method in order to correlate statistical interferences.

Despite the series of improvements brought to the "snowball" method, as presented above, there still are several issues which continue to raise the interest of researchers and which include:

- Identification of respondents and initiation of referral chains;
- Checking of eligibility of potential respondents;
- Employment of respondents as informal survey assistants;
- Control of types of referral chains and of the number of cases associated to each chain;
- Stimulation and monitoring of the referral chains and of quality of data collected.

LANDMARKS IN THE EVOLUTION OF THE SOCIAL RESPONSIBILITY OF ORGANIZATIONS IN THE TWENTIETH CENTURY

SORIN-GEORGE TOMA[*]
COSTEL STANCIU[**]
EUGEN IRIMIA[***]

Abstract
The social responsibility of organizations concept has become the subject of considerable researches, debates and commentaries especially in the second half of the last century. According to ethical principles organizations and individuals have the obligation to act in the benefit of society at large. Consequently, the social responsibility of a business is related to its duties and obligations directed towards the social welfare. The role of corporations in society and the issue of corporate social responsibility have been increasingly debated in the last century.
Based on a literature review our paper seeks to describe and summarize some of the main contributions to the development of the social responsibility of organizations. The aims of our paper are to explore the evolution of the social responsibility of organization concept in the last century and to emphasize its various approaches, mostly in the business field. This historical trace identifies both similarities and differences related to social responsibility themes.

Keywords*: social responsibility, corporate social responsibility, corporations, organizations, stakeholders*

1. Introduction

Since the beginning of the twentieth century scholars and researchers from different field of study (e.g. business, sociology, philosophy, theology, law, economics etc.) have become interested in the social responsibility of organizations concept. The concept has become the subject of considerable researches, debates and commentaries especially in the second half of the last century.

The roots of social responsibility emerged earlier in the history of civilization. In essence, the genesis and evolvement of social responsibility are linked to the evolution of human society. Any responsibility an individual/organization has towards the society as a whole is called social responsibility. According to ethical principles organizations and individuals have the obligation to act in the benefit of society at large. Consequently, the social responsibility of a business is related to its duties and obligations directed towards the social welfare. The role of corporations in society and the issue of corporate social responsibility (CSR) have been increasingly debated in the last century. Scholars all over the world have laid the stress on the fact there is an ethical responsibility of firms to drive their progress in the direction favorable for global society (Sady and Guja, 2010). Either passive, by avoiding engaging in harmful or destructive actions, or active, by achieving environmental and social goals or promoting an active citizenship, more and more companies have understood the need to act in a responsible manner.

In spite of the fact there is little agreement about the definition of CSR the evolution of the CSR concept suggests a multidimensional construct worthy of a multidisciplinary approach. As no universally acceptable definition of CSR exists a lack of consistency in this area has emerged (Fifka,

2009). This could be partially explained by the existence of a relatively long history of the concept. That is why it is necessary to look at the emergence and development of the concept over the course of time, especially in the twentieth century. Over the last century the concept of CSR has continued to grow in importance (Carroll and Shabana, 2010).

Based on a literature review our paper seeks to describe and summarize some of the main contributions to the development of the social responsibility of organizations. The aims of our paper are to explore the evolution of the social responsibility of organization concept in the last century and to emphasize its various approaches, mostly in the business field. This historical trace identifies both similarities and differences related to social responsibility themes.

2. A retrospective of the evolution of the social responsibility of organizations

Since the ancient time it has been a permanent concern regarding the consequences of human activities, especially economic activities, upon society. During the history people have shown a continuous interest in ensuring durable resources for the economic activities. There has always been a tension between the use of resources and the population needs.

The Hindu Vedic and Sutra, the Buddhist Jatakas and the Islamic Zakat were among the first oldest texts that included ethical admonitions on usury or wealth tax. In the "Code of Hammurabi" the king of Babylon pleaded for the protection of slaves. The Roman senators voiced many protests about the insufficient contributions of businesses to fund the military campaigns of the Roman Empire.

In the Middle Ages the landlords were preoccupied to keep in balance the exploitation of their lands, livestock and forests. The French King Louis XIV took measures for the long term safekeeping of forests. In the eighteenth century and the nineteenth century workers were subjects to systematic exploitation (e.g. unhealthy working conditions, low wages etc.). In the second half of the nineteenth century a "corporate paternalism" emerged, especially in the United States of America (USA) and Great Britain. Some of the wealthiest capitalists supported philanthropic activities.

A. Carnegie earned a fortune in the American steel industry. One of the so-called "captains of industry" he was also a large-scale philanthropist by donating most of his money to the establishment of many institutions in the USA and Great Britain (e.g. universities, schools, libraries, foundations, charities etc.). On the eve of the twentieth century Carnegie published "Wealth", an article that called both for the reconciliation of the rich and the poor, and for the spending of the great sums accumulated by the rich people for public purposes. By using his fortune to enrich the community within he acts the "man of Wealth" has to produce the most beneficial outcomes for it. According to his Dictum that illustrates once again his generous nature, the life of a wealthy industrialist should be divided in the following three periods:

- Getting all education he can.
- Making all the money he can.
- Giving the money for worthwhile causes.

On the other coast of the Atlantic Ocean the Quaker capitalism promoted the idea that wealth creation was not only for the benefit entrepreneurs but also for the benefit of employees, community and society at large. The Quaker businessmen felt that their companies existed for more reasons than just to make money and that they had a huge responsibility to give back something valuable to the community (Cadbury, 2010). Starting from its puritanical hard work ethic and sober austerity George and Richard Cadbury proved to be highly concerned with the quality of life of their employees. Therefore they decided to move the Cadbury factory from Birmingham to a country location and to build a factory town in a village, known as Bournville. A housing reformer interested in improving the living conditions of his employees, G. Cadbury envisaged Bournville as a community that served more than their employees. In a relative short period of time Bournville became the "factory in the garden" where Cadbury provided housing, gardens, football and cricket pitches, swimming pools,

shops, social clubs, schools, a concert hall and a lecture theatre. Each residence had a large garden with flower and fruit trees. As "doing good…is good for business", G. Cadbury founded the Bourneville Village Trust, a charitable trust and registered landlord, in 1900. Its mission statement has promised to:

- Promote good quality social housing which protects the environment.
- Manage all the housing and estates to the highest standards to the residents.
- Encourage residents to share in decisions affecting their communities.

The community spirit remained strong through the years and guided Cadbury's business philosophy.

On his turn, the American industrialist J. H. Patterson chose to spend a great deal of his fortune on their own employees by introducing the industrial welfare movement into factory life. The architects he engaged designed a "daylight factory" which ensured the comfort and the safety of his workers. For example, the air throughout the factory was changed every fifteen minutes and hundreds of shower baths were provided for the use of all employees. Moreover, Patterson enjoyed nature and launched the children's garden movement in an attempt to provide to all communities such gardens. Under his direction an energetic campaign of education for better government started in order to make Dayton a model city. In this respect Patterson laid the foundation of the Department of Public Welfare of Dayton and wrote the Dayton Charter. By giving expression of a new conception regarding the duty of the state to all citizens, the charter stipulated that the Director of the Public Welfare Department had to (Garland, 1916, pp. 194-195):

- Manage all charitable, correctional and reformatory institutions and agencies belonging to the city.
- Enforce all laws, ordinances and regulations relative to the preservation and promotion of the public health, the prevention and restriction of disease.
- Provide for the study of and research into causes of poverty, delinquency, crime and disease and other social problems in the community.
- Promote the education and understanding of the community in those matters which affect the public welfare.

A man of rare vision, Patterson created the Dayton Foundation aiming to strengthen the community through philanthropy and leadership. From an initial 250,000 USD donation by the Patterson family in 1921 the foundation reached 371 million USD in assets in 2010, ranked the 38th among the wealthiest community foundations in the USA. Three primary goals have been identified for the Dayton Foundation in the last decade as follows:

- Providing community leadership/impact, by working with area not-for-profit organizations in direct partnership programs or services and identifying one major community initiative.
- Increasing donor development and financial stewardship, by continuing to grow overall assets and increasing the number of funds and legacy commitments.
- Developing and strengthening the organization to be more responsive to the needs of the Foundation's donors, financial and estate planning advisors, and not-for-profit organizations.

In the early 1900s A. Heald advised the business leaders not to forget that they were trustees of the public interest. Later, the trusteeship concept of business responsibility, enunciated before by A. Carnegie, emerged in the practices of the rulers of General Electric, O. D. Young and G. Swope. They both sought to establish partnerships with government, community and labor.

One of the founders of the theory of workable competition, J. M. Clark shared his father's view, J. B. Clark, of the importance of ethical issue. He advocated both the social control of industry for the general benefit and the control of trusts as follows: "...we can make very large corporations legitimate and safely avail ourselves of their productive power. The government can use insight, discover how nature is already working, be guided to the right experiment and try it promptly. It can

liberate the competitive forces that even now, trammeled as they are, make our state endurable, and it can enable them to develop their full influence and make the condition comfortable and encouraging. It can do this while fostering and not repressing general prosperity, and while increasing and not lessening our chance of success in the fierce economic rivalries into which nations are entering." (Clark and Clark, 1914, p. 14). Emphasizing the power of corporations over the wellbeing of individuals Clark called for the implementation of an economics of responsibility, embodied in the working business ethics. In this type of economics businesses have to recognize and admit their responsibilities to act in the light of social norms. The results of businesses actions (e.g. unsafe products, pollution etc.) are "things over which someone can exercise control and that means they are things for which someone is responsible" (Clark, 1916, p. 213). He also traced one of the lines of the social responsibility of corporations (CSR) when he stated that business responsibilities have to include the known results of business dealings.

W. B. Donham showed in the late 1920s that businesses did not yet recognize the magnitude of their responsibilities for the future of the civilization. In order to identify, estimate and measure the social performance of businesses, T. J. Kreps used for the first time the term "social audit" while introducing the subject of "Business and Social Welfare" to Stanford University in 1931 (Kreps, 1962). As a tool of measurement, the social audit "is a natural evolutionary step in the concern for operationalizing corporate social responsibility and, in its essence, represents a managerial effort to develop a calculus for gauging the firm's socially oriented contributions" (Carroll and Beiler, 1975, p. 589). In his opinion the social audit is the real acid test of business and not the profit-and-loss statement. In this way Kreps developed a framework for measuring the social involvement of companies which reported on their social responsibility.

One year later, A. A. Berle and G. C. Means warned about the fact that huge American corporations had come to dominate major industries in the USA: "the economic power in the hands of the few persons who control a giant corporation is a tremendous force which can harm or benefit a multitude of individuals, affect whole districts, shift the currents of trade, bring ruin to one community and prosperity to another. The organizations which they control have passed far beyond the realm of private enterprise- they have become more nearly social institutions." (Berle and Means, 1932, p. 46). In their opinion the few wealthy people who managed the big corporations had to repay society by contributing through various programs to its benefit. In the same year E. M. Dodd affirmed that corporations served a social service, as well an economic function (e.g. profit-making).

The C. Barnard's "Functions of the Executive" of 1938 constituted "a substantial primer on leadership that resonates a profoundly humanistic ethic" (Aupperle and Dunphy, 2011, p. 156). He stated that the survival of an organization depends on its willingness to cooperate, its ability to communicate and its desire to ensure the integrity of its purpose. Starting from the structural concepts (e.g. individual, formal organization, informal organization etc.) and dynamic concepts (e.g. free will, cooperation, authority etc.) he considered the word "responsibility" as a quality that confers credibility, predictability, caution, and social responsibility as a function of the executive class. In his opinion the executive functions are different from other functions due to the fact that they impose the necessity of creating moral codes. Also, the durable organization depends on the quality of management which is based on morality. A high responsibility is necessary in any organization, either big or small, according to Barnard. His writings emphasize "competence, moral integrity, rational stewardship, and professionalism" (Mahoney, 2002, p. 162).

F. Capra, a film director at Columbia Pictures, launched the movie "Mr. Smith Goes to Washington" in 1939. Based on an explicit defense of America and its Christian values the film presents the story of a boy scout leader turned US senator who fights corruption. Capra embedded the individuals in a social matrix and demonstrated that once they became part of an artificial society they are no longer unique and irreplaceable. Fueling the theme of human alienation Capra called for the reinstallation of the individual at the center of the social reality and insisted on the fact that the social responsibility of the individual has not to be neglected or forgotten. He insisted on the idea that

each human being must take care of the people around him. In his concern about individual he proved his adoration for the Christian social ethics by taking up the theme of goodness and simplicity in a deeply selfish society.

In the 1940s P. F. Drucker, the "father of modern management", argued that every company has both economic and social purposes. In his landmark study "The Concept of the Corporation" he emphasized that any corporation should be a social institution and a community for all employees: "…the essence of the corporation is social, that is human, organization" (Drucker, 1946, p. 31).

The famous Harvard Business Review published in 1949 two distinct articles written by B. Dempsey and D. K. David. Dempsey asserted that there are four concepts of justice at the foundation of the responsibilities of businessmen:

- Exchange justice.
- Distributive justice.
- General justice.
- Social/contributive justice.

The social/contributive justice refers to the obligation of businessmen to contribute to the wellbeing of individuals and society. David also stated that one of the priorities of businesses is to be constructive namely to operate in ways that respect the communities.

Since the end of the Second World War scholars and researchers have provided a huge number of theories about CSR. Therefore the theoretical literature on CSR can be divided in different phases (Table 1).

Table 1- Phases in the evolution of the theoretical literature on CSR

No.	Authors	Phases
1.	P. Katsoulakos, M. Koutsodimou, A. Matraga, L. Williams (2004)	a) CSR initiation phase (1960-1990) b) CSR momentum building phase (1990-2000) c) Mainstreaming initiation phase (2000 onwards)
2.	M.-C. Loison, A. Pezet, C. Berrier (2009)	I. Corporate Social Responsibility (1950s-1960s) II. Corporate Social Responsiveness (1970s-1980s) III. Corporate Social Rectitude (1980s) IV. Corporate Social Performance (1990s) V. Corporate Citizenship (2000s)

In the 1950s F. W. Abrams launched the idea that the managers of corporations should voluntarily assume public responsibilities by acting as trustees of the public interest. Besides profits, companies had to take into consideration their employees, customers and the public at large. The modern era of social responsibility started when H. R. Bowen, the "father of CSR", published his book entitled "Social Responsibilities of the Businessman" in 1953. He gave the first definition of the social responsibility in business: "it refers to the obligations of businessmen to pursue those policies, to make those decisions, or to follow those lines of action which are desirable in terms of the objectives and values of our society" (Bowen, 1953, p. 6). Thus, Bowen thought about CSR as a way of integrating the societal values beyond the interests of shareholders. However, T. Levitt warned the business world about the dangers of the social responsibility. In his view social concerns were not the responsibility of business world, but of government.

The 1960s brought an effervescence of ideas related to the field of social responsibility. In 1960 K. Davis indicated that social responsibility implies businessmen's decisions and actions taken for reasons beyond the direct economical or technical concerns of the firm. W. C. Frederick affirmed that social responsibility implies a public posture of the businessmen towards society's economic and human resources. He asserted that an adequate theory of business responsibility had to meet several requirements as follows (Frederick, 1960, pp. 59-60):

- "First, its criterion of value should be drawn from our increasing awareness of the requirements of socially effective economic production and distribution, and particularly the necessities of economic growth and development on a broad social scale.
- …The second requirement of an adequate theory of business responsibility is that it be based upon the new concepts of management and administration that are now emerging.
- …Third, an adequate theory of business responsibility will recognize that the present business system is an outgrowth of history and past cultural traditions.
- …The fourth requirement of a theory of business responsibility is that it recognizes that the behavior of individual businessmen is a function of the social role they play in business and society.
- …Fifth, there should also be a recognition that socially responsible business behavior is not to be produced automatically but is rather to result from deliberate and conscious efforts of those institutional functionaries who have been given this task by society."

One year later, R. Eells and C. Walton referred to corporate social responsibilities as ethical principles that ought to govern the relationships between corporations and society. On his turn G. Goyder considered social audit as a management tool in his book "The Responsible Company". Based on the idea that with God's grace a man can do anything he wants to Goyder's business philosophy promoted efficiency and justice. He stated that the purpose of management is to create a balance among the responsibilities towards shareholders, employees, consumers and community.

Recognizing the primacy of economic interests for businesses J. W. McGuire provided a broader idea of their social responsibilities in the 1960s. He thought that corporations have not only economic and legal obligations, but also responsibilities to society. In 1970 M. Heald published a comprehensive history of the social responsibilities of business in which he analyzed the business policies and practices related to social responsibility. He focused on the ways businessmen experienced social responsibility. On his turn M. Friedman affirmed that the social responsibility of business is mainly to increase its profit. Along the same lines with A. Smith who promoted the pursuit of self-interest in a free market system, Friedman considered that enhancing profitability and shareholder value are the true responsibilities of business. One year later, the Committee for Economic Development (CED) showed that businesses functions by public consent and aims to serve the societal needs. The CED proposed a model for corporate responsibility according to its "three concentric circles" approach:

- The inner circle includes the efficient execution of the economic function.
- The intermediate circle encompasses a responsibility to exercise this economic function.
- The outer circle outlines the emerging and still amorphous responsibilities.

Also H. L. Johnson noticed that social responsibility was important since companies necessitated to achieve a balance among various interests (e.g. employees, shareholders etc.) in order to accomplish their multiple goals. S. P. Sethi launched the corporate social performance model, a major advancement in the CSR theory, which articulated the following evolutional stages (Sethi, 1975):

- Social obligation.
- Social responsibility.
- Social responsiveness.

In the late 1970s W. C. Frederick made the distinction between CSR1 (corporate social responsibility) and CSR2 (corporate social responsiveness) concepts. The former has ethical or moral threads and the latter is concerned only with the managerial processes. On the other hand, A. B. Carroll developed the "three dimensional conceptual model" of corporate performance. The social responsibilities can be divided into four main categories (Table 2), neither cumulative nor additive (Carroll, 1979).

Table 2- The four social responsibility categories according to A. Carroll

No.	Category	Characterization
1.	Economic responsibilities	The business institution is the basic economic unit in our society. It has a responsibility to produce goods and services that society wants and to sell them at a profit.
2.	Legal responsibilities	Society laid down the laws and regulations under businesses are expected to operate. Society expects companies to fulfill their economic mission within the framework of legal requirements.
3.	Ethical responsibilities	There are additional behaviors and activities that are not necessarily codified into law but nevertheless are expected of business by citizens. In sum, society has expectations of business over and above legal requirements.
4.	Discretionary/ volitional responsibilities	There are responsibilities left to individual choice and judgment. They are at business's discretion; however, societal expectations do exist for businesses to assume social roles over and above described.

In the 1980s K. E. Goodpaster and J. B. Mathews Jr. stated that a corporation can and should have a conscience. Later, R. E. Freeman introduced the stakeholder theory starting from the problem of value creation and trade. He considered that corporate management has a fiduciary responsibility to stakeholders, which are groups and individuals who have a stake in the success/failure of a company. S. L. Wartick and P. L. Cochran broadened the CSR concept to corporate social performance (CSP), based on principles, processes and policies. In their opinion the CSP represents "the underlying interaction among the principles of social responsibility, the process of social responsiveness and the policies developed to address social issues" (Wartick and Cochran, 1985, p. 758).

In the 1990s the term corporate citizenship gained visibility. Corporate citizenship (CC) designates the initiatives undertaken by companies to act responsibly in society and represents a discretionary activity, a choice for businesses to put something back into the community within they function. Also, the CC is a fruitful business practice both in terms of internal and external marketing (Maignan, Ferrell and Hult, 1999).

D. Wood provided an explanation of the socially responsible behavior of industries and firms. She also gave an explanation of how socially responsible objectives might be formulated and achieved. In her view the CSP is "a business organization's configuration of principles of social responsibility, processes of social responsiveness, and policies, programs, and observable outcomes as they relate to the firm's societal relationship" (Wood, 1991, p. 693). Close to the stakeholder theory, M. B. E. Clarkson defined CSP as the ability to manage and satisfy the different corporate stakeholders (Clarkson, 1995). On their turn, T. Donaldson and L. Preston expanded the stakeholder theory by emphasizing the moral and ethical dimension of CSR, as well as the business case for involving in such activities.

S. L. Hart tried to explain the competitive advantages starting from the environmentally responsible firms and by adapting the resource based view of the firm. J. Elkington launched the "triple bottom line" as an attempt to introduce an accounting paradigm to the social and environmental issues. Besides the responsibility of the company to generate economic welfare there are also the responsibilities to care for the society and the environment (Elkington, 1998).

At the end of the twentieth century researchers sought to demonstrate that the 21st century most successful global businesses will draw profit from their environmental and social responsibilities. They also called to learn to deal responsibly with all types of waste. This is why "a society that wastes its resources wastes its people and vice versa" (Hawken, Lovins and Lovins, 1999, p. 55).

3. Conclusions

The understanding of the historical evolution of the social responsibility of organizations is based on the view of what role they play or should play in society, especially businesses. Various definitions of social responsibility have appeared both from theoreticians and practitioners all over the world, often independently. A socially responsible organization has the duty to satisfy the needs of its stakeholders. On their turn, companies have social obligations in addition to their economic purposes. There is no social responsibility for businesses if their philosophy is separated from ethical principles. It means that they have a social responsibility towards the society within they perform.

A multifaceted concept, CSR has encouraged companies throughout the world to look at their social responsibilities as well as their usual responsibilities (e.g. economic). The dynamism of the CSR concept during the last century echoed its multidimensional nature. This means that there is an urgent need for coordinated efforts towards the study of the history of CSR based on a multidisciplinary research.

Our paper suggests that it may be useful to identify the landmarks in the evolution of the social responsibility of organizations in the last century in order to better understand this concept. It is our hope that this paper could serve as a starting point for further researches.

LEADERSHIP IMPORTANCE AND ROLE IN THE PUBLIC SECTOR - FEATURES IN THE CONTEMPORARY CONTEXT

MAGDALENA IORDACHE-PLATIS[*]
ELEONORA GABRIELA BABAN[**]

Abstract
Nowadays leadership is considered a managerial and organizational process that influences and guides the activities of the companies. As a management process, leadership can systematically influence the relationships that occur between managers and employees as a result of applying the management functions application. This study aims to highlight the main elements that designate the modern and revolutionary concept named"leadership". The main objectives of the study are: 1). explaining the importance of leadership in the contemporary context; 2). analyzing the similarities and differences between two seemingly similar concepts - "leadership" and "management"; 3). description of the main management styles; 4). analyzing the correlation between leadership and emotional intelligence; 5). explaining leadership role in the public sector in Romania. In every company leadership has a very important role in achieving performance. The leader also plays an important role in a company, because a leader is the person who influences the behavior, actions, positive or negative attitude of others who are determined to act and take decisions voluntarily without fear of being punished if they do not follow the leader. Emotional self-awareness, trust, adaptability, initiative, optimism and team spirit are the ingredients of modern management style which determines the competitiveness of an organization.

Keywords: *leadership styles, emotional intelligence, performance, and competitivness.*

1. Introduction

This study highlights the main aspects that define leadership style in the contemporary business context. The main types of leaders and the essential features of leadership in the public sector in Romania are described. In the present paper we set ourselves to present the main management styles applied by leaders at organizational level, and also to exhibit the role an efficient management style has in Romania's public sector. It is important to identify the main management styles, as managers can obtain success and performance by applying certain management styles. In literature review, the main leadership styles are closely related to leaders' personality, and they are also analyzed in the present paper. Moreover, analyzing the similarities and differences between the concepts that appear to be similar (management and leadership), as well as analyzing the relationship between leadership and emotional intelligence constitutes and highlights the important role leadership has with respect to businesses.

We have to think that leadership is an attitude of life which is required in order to obtain performance and success in everything we do. Leadership is a modern and revolutionary concept and should be adapted to the demands of a modern society which is continuously changing.

The idea that leadership should focus on individual and organizational behavior is important. The community and the organizations should learn together, should create and explore ideas that can generate the proper development of managerial activities. In order to be a successful leader some conditions must certainly be fulfilled, and these conditions are: a leader must think positive, must encourage teamwork, must promote and develop the management culture, creativity and innovation,

[*] Professor, Ph.D, Faculty of Business and Administraton, University of Bucharest.
[**] Assistant, Faculty of Business and Administraton, University of Bucharest (e-mail:baban.eleonora@ yahoo.com).

must acknowledge the value of teamwork, must have a clear vision of achieving goals, must be responsible, must assume both praise and failure, must use effective communication tools in his relationships and must facilitate the optimal work climate in the enterprise.

2. Literature review

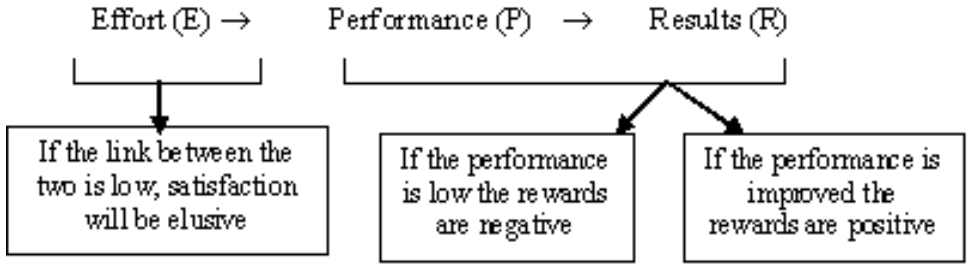
In existing studies of leadership in both private and public organizational contexts, writers have defined leadership in three ways: as a set of exemplary traits, values, and behaviors that individuals possess; the ability to influence action and motivation based on situational contexts and follower characteristics; and ascription among followers.[1] It is important the idea that leadership should focus on individual and organizational behavior. The community and organizations should learn together, should create and explore ideas that can generate the proper development of managerial activities.

People's behavior is influenced by their moods. They take into account a few principles which help them to act in a proper way.

A. Maslow's theory presents the consumers' needs on a certain scale, called "hierarchy of needs" (Maslow's pyramid).The order is as it follows [2]: physiological and safety needs – primary and inferior needs- and social, esteem and self-realization needs - secondary and higher needs. A. Maslow said that an individual makes decisions in order to satisfy his needs in optimal conditions. This is a fundamental premise. A competent leader should focus their subordinates so that they acquire that knowledge and needs that might move them to the top of the pyramid.

Starting from Maslow's hierarchy of needs, F. Herzberg broadened the area of the debate highlighting both the hygiene factors (working conditions, colleagues, salary, security, and personal life) and motivational factors (promotion, responsibility, recognition).

L. Porter and Lawler have developed Vroom's theory. According to this theory, the performances of the firm depend on certain variables: effort, expected performance and results, personality awards. Lawler's model is based on the motivational behavior which is influenced by tow types of experiences:[3]



Expectation (A) calculation model: $A = (E \rightarrow P) \times \sum [(P \rightarrow R) \times V]$, V = valence results.

Leadership is the art of expressing how to think and act according to principles, courage and discipline. Through leadership an organization can achieve its objectives that lead to obtaining the expected results and performance. Management styles are performance instruments and can affect the relations between the organization members and its customers.

[1] A Carol Rusaw, *Administrative Leadership in the Public Sector* ; Public Administration Review. Washington:May/Jun 2009. Vol. 69, Iss. 3, p. 551-553 (3 pp.)

[2] A. Maslow, *Motivation and Personality*, New York, Harper& Row, 1954.

[3] Vezi Cătălina Bonciu, *Introducere în managementul resurselor umane*, Editura Credis, Capitolul III, Bucureşti, 2008.

Two types of leadership are presented in the literature review: formal leadership and informal leadership. Formal leadership is based on the capacity of the leaders who have a superior position to influence their subordinates. Informal leadership emphasizes the leader's ability to influence an informal group with positive or negative characteristics. Thus, there are two types of leaders: formal leaders, who cannot be accepted in a group and informal leaders, who have the ability to guide and understand their subordinates.

3. Leadership versus management

This table summarizes the differences between being a leader and being a manager:

Table no.1

Subject	**Leader**	**Manager**
Essence	Change	Stability
Focus	Leading people	Managing work
Seeks	Vision	Objectives
Dynamic	Proactive	Reactive
Wants	Achievement	Results
Power	Personal charisma	Formal authority
Have	Followers	Subordinates
Horizon	Long-term	Short-term
Conflict	Uses	Avoids

Source: adapted from www.changingminds.org

There is a question regarding the difference between leadership and management, but the correct answer cannot be found at the first try. At the first sight this are two similar concepts, but in reality they are different.

Leadership reflects the human dimension of management, that side which makes it possible for a manager to influence and lead the group (…).This concerns not only an operational side, but also an emotional one, which is based on the authority of the manager and on his human qualities (...)[4]. This is leadership, a component of the management.

Management deals with an overview of the various complex issues. Is important to note that just by thinking of the main function of the management, leadership can be included in this complex process that is management.

4. The importance of management styles

The management style leaders can express the performance obtained by them and it may be the instrument through which can be identify employees' satisfaction at the individual or group.

M. Zlate makes a complex identification of the management styles and shows that this analysis is given by[5]:

-practicing a certain style of leadership which has relevant effects on the psychological climate and on the labor productivity;

[4] V. Cornescu, I. Mihăilescu, S. Stanciu, *Managementul organizaţiei*, Editura ALL BECK, Bucureşti 2003, p. 221-222

[5] vezi Mielu Zlate, *Leadership şi management*, Editura Polirom, Iaşi, 2004.

-leadership style which influences the actions of the team members;

-leadership is an organizational variable that influence the interpersonal relations in the organization and is affecting all people. Presentation of the leadership styles is complex, but in the literature review the following management styles are acknowledged and studied thoroughly:

1). Leadership styles depending on how decision are made.

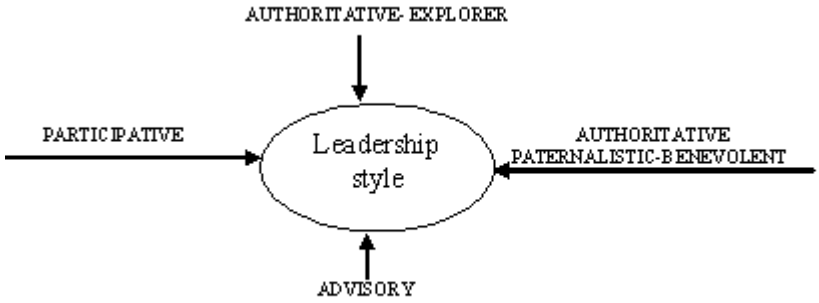
2). Leadership styles in relation to the efficiency criterion.

3). Leadership styles in relation to the values that guide the behavior of management staff for their work in an organization.

1). Leadership styles depending on how decision are made

Kurt Lewin, a renowned specialist in the field of research has identified three leadership styles[6]: authoritative leadership styles, democratic leadership styles and permissive leadership style (laisser-faire). Seeing this classification research has not stopped. These studies have been extended by R. Likert, R. Lippi, R.K White, N. Mayer, J. Brown and other researchers in the field.

In his research R. Likert [7] has identified four leadership styles:



Source: Authors

Authoritative leader does not allow to the subordinates to express freely their opinion and he is always preoccupied by the desire to occupy high positions. He also has a critical attitude regarding his behavior towards his subordinates and always creates always conflicts. These leaders are dynamic persons who have a great confidence in their forces and can appreciate their own performance because they think that only they can successfully fulfill certain responsibilities. Because of their authorative behavior most of the subordinates are discouraged and their interests regarding certain tasks are relatively low. Authoritative leaders are concerned about recognize and praise their hits instead of encourage their subordinates who carried out certain activities. In case of failure, authoritative leaders are not realistic and honest, placing the responsibility for a failure to the other team members. These leaders don't accept the idea that they may be wrong because they considered that everything they do is perfect. **Democratic leader** can obtain performance only if he involves the subordinates in establishing the organizations goals. He must ensure that the subordinates participate to the tasks distribution. This management style brings only benefits to the leaders because through it they can diminish the tensions that arise between the team members. **Permissive leader** is characterized by the expression of its disinterest in the coordination of the group. The members' teams are allowed to set the organizations goals. They are, also, let to distribute the tasks. If a leader is practicing this leadership style he cannot obtain performance. He can obtain only confusion and inefficiency.

[6] Kurt Lewin, *Psychologie dinamique*, Paris, PUF, 1967, p. 196-227.

[7] R. Likert, *New Patterns of Management*, McGraw-Hill Book Company, New york, 1961.

J. Brown has identified the following types of leadership: authoritative leader (absolute authoritative leader, benevolent authoritative leader and incompetent authoritative leader) and democratic leader (democratic advisory leader and participative democratic leader).

Absolute authoritative leader is a severe leader whose orders are followed by the subordinates. The subordinates take action like their leader does without expressing their own opinion. **Benevolent authoritative leader** involves his subordinates in setting the goals and distributing the tasks, but the major decisions belong to them.**Incompetent authoritative leader** is always insecure of his decisions.**Democratic advisory leader** takes into account the subordinates opinion when he launches an idea, but the decision belongs to them. **Participative democratic leader** involves his subordinates in making the decisions.

2). Leadership styles in relation to the efficiency criterion

The following types of leaders are emphasiyes in the literature review according with the criterion of efficiency[8].

The Organizer takes actions rationally and accurately, organizes the work of subordinates, but gives them independence to make decisions in various situations. He is a formal leader who solves the problems in a regular way.

The Participator is a leader who encourages teamwork using the communication means, direct collaboration, and who accepts criticism and suggestions of team members.

The Entrepreneur is the leader who seeks to obtain positive results and stimulates competitiveness. He is strict with his subordinates and tries to resolve conflicts openly.

The Realist is the leader who lets his subordinates to come up with proposals and solutions of specific problems which are arising in the business management and he believes that mutual respect and trust are the requirements to be met best in the relationships within the enterprise.

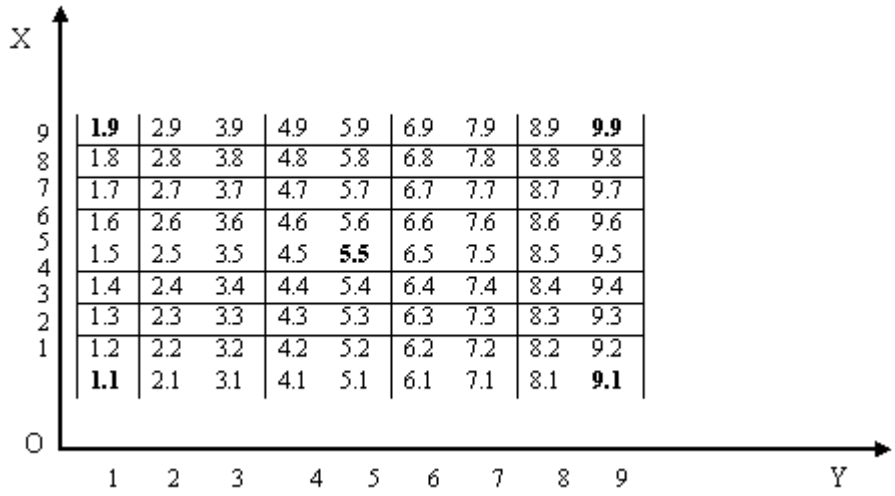
The Maximalist is a leader who wants to achieve his purpose quickly. He is rigorous with his subordinates and he gets positive results in some conflicts. **The Bureaucrat** uses his diplomas and titles to intimidate his subordinates, avoids making decisions that require a great responsibility through from his part. He doesn't encourage the communication and the views of subordinates who have special practical skills. **The Demagogue** is a leader who encourages his subordinates, team spirit leads his actions, he does not encourage fighting, and even avoids them.**The Technocrat** is a leader who has an authoritative attitude and the respect for hierarchy in the firm is a necessary prerequisite to his subordinates. The interpersonal relationships are threatened by his dictatorial attitude which creates tension. Those subordinates who did not respect his decisions are respectfully removed by him. **The Opportunist** is the leader who is attentive to obtain personal satisfaction using intrigue in his relationship with his subordinates. He is the one who uses the compromise to achieve his goal. **The Utopist** is the leader who makes decisions in hurry and is not a good organizer of the team. He spends time encouraging the discussions and so, he doesn't obtain positive results.

To be a successful leader, certainly some conditions must be fulfill in , and these are: a leader must think positive, must encourage teamwork, must promote and develop the management culture, should promote creativity and innovation, must recognize the value of the teamwork, must have a clear vision of achieving goals, must be responsible, must assume both praise and failures, must use effective communication tools in his relationships and should facilitate the optimal work climate in the enterprise.

3). Leadership styles in relation to the values that guide the behavior of management staff for their work in an organization are presented in the literature review accordance with two criteria: two-dimensional criterion and three-dimensional criterion.

Robert R. Blake and Jane S. Mouton proposed a dimensional management styles classification. According to these criteria, managers' activity is oriented towards production and towards staff[9].

[8] Vezi W. J. Reddin, *Les „ 3 dimensions du dirigeant"*, Management France, Paris, 1968.



OX→ degree of interest is oriented towards production;

OY→ degree of interest is oriented towards staff.

The authors have presented only five leadership styles:

1). **1.9 Style** is characterized by a great attention directed towards production. The interest regarding the personnel's is lower.The leaders are authoritative and the subordinates' opinions are not taken into account. The effort is small, the results are poorly and, in this case, the performance is lower.

2). **9.1 Style** is characterized by a greater attention which is oriented towards personnel, and little interest towards production. The leader motivates his subordinates and takes into account their point of views. Performance is good, but the manufacturing activity is low.

3). **1.1 Style** is characterized by a low interest regarding the production activities. Team performance is smaller and the leader is not involved in major decisions. The subordinates are those who make decisions.

4). **5.5 Style** is characterized by a moderate attention towards staff and a medium interest towards production activity. The leader, in this case, is a person who avoids conflicts, accepts some compromises and finds solutions to obtain a satisfactory performance.

5). **9.9 Style** is characterized by a great attention directed both towards production activities and towards staff. The leader who applies this leadership style makes rational decisions, achieves maximum performance, encourages power, compromise and avoids open conflict.

J. Reddin suggested a dimensional classification of the leadership styles, such as: managers' orientation towards goals or tasks, managers' orientation towards interpersonal relations and, also, the group psychology and its performance.[10]The apparent correlation of these three categories generates the following types of leaders[11]: **the negativist** whose actions are not oriented towards goals, interpersonal relations or efficiency; **the bureaucrat** whose actions are oriented towards obtaining the incentive profit; **the authoritative benevolent** whose actions are oriented towards

[9] R. R. Blake, J.S. Moutin, *Les deux dimensions du management*, Les Editions d'Organisation, Paris, 1972.

[10] W. J. Reddin, *Les 3 dimensions du dirigent*, Management France, Paris, 1968.

[11] Vezi V. Cornescu, I. Mihăilescu, S. Stanciu, *Managementul organizației*, Editura ALL BECK, București 2003, Capitolul XI.

tasks and efficiency; **the hesitator** whose actions are oriented towards tasks and interpersonal relations; **the altruist** whose actions are oriented only towards interpersonal relations; **the promoter** is that leader who stimulates human relations and whose actions are oriented towards achieving efficiency; **the creator** is the real manager who gives importance to the three dimensions.

5. An effective leadership approach and the emotional intelligence

A leader can obtain succes by practicing an effective management style. If we ask why they are so effective we think about strategy, vision and incentive ideas. But the reality is different ... true leaders are those who feel and live with those involved in the organization activity. Emotions are the source of success.

Daniel Goleman said that, no matter what leaders aim to do - to create strategy or mobilizing teams to action- their success depends on how they act. Even if they do well in all other chapters and fail in the basic task of channeling emotions in the right direction, everything they do cannot be like they wished.[12].

The prosperity of a modern organization depends on the emotional responsibility of the leader who is influencing the results obtained by the whole team. The leader is the person who influences and guides the emotions of the team. They should create a link between them and their subordinates in order to obtain positive results. But if the leader directs the emotions in a negative sense, subordinates are pessimistic, and they can not obtain good results.

Emotional intelligence is the key toleadership. Leaders who take full advantage of the benefits of leadership based on emotional intelligence, channel the emotions that guide them in the right direction[13].A company that is lead by a leader who motivates and inspires his subordinates can be considered a modern and innovative company.

The specialists believe that emotional intelligence is the competency key that can lead a company to obtain the desired performance.Emotional intelligence is the art by which leaders stimulate their subordinates, and success or failure of an organization depends on how they manage their emotions.

Emotions influence the results obtained by the leaders and their subordinates. Strong emotions generate tension between the team members.But when negative emotions, anger or anxiety, appear are seen only the negative side of the situation and all the negative things in it. Negative emotions such as anger, or feelings of uselessness, influence and distorts the work of team members.

Daniel Goleman emphasize an important issue, namely that leaders influence business climate and hence the propensity of employees to satisfy customers [14].

For example, according to a survey of 19 insurance companies, the working climate created by the leaders was the indicator of business performance throughout the organization: in 75% of cases, companies could be divided into companies with high rate and profits and companies with small profits and increase rate, only depending on the working climate[15]. So, how do people feel when they are working influencing business results.

We often think who is affecting the business climate? The answer is simple: leadership actions determine the extent of 50% -70% on how people perceive the professional climate in a company.

The leader must submit self-confidence, positive emotion, clarity, seriousness in making decisions. Effective relationships with subordinates and customers, can lead to achieving performance in a modern organization.

---

6. The role of leadership in the public sector in Romania

In our country leadership role in the public sector should be considered in connection with sudden changes occurring continuously in the business environment.

In Romania, leader's creativity and innovation should not be influenced by legal regulations which are governing the work of employees in the public institutions.Generally, in the public sector the concept of effective leadership style is confused with the notion of authoritarian leadership style, without distinguishing leadership from management. True leaders are those who encourage the team spirit, motivate subordinates, and develop creativity and innovation. Communication with their subordinates is the best solution for a leader to achieve performance. Performance is the result of communication and of a flexible management style. Only a leader who takes into account the ideas of his subordinates can achieve the organizations targets in a short time. Leaders should stimulate the competition among their employees. Those who are involved in the organization activity are always concerned about getting good results so that they can find appropriate solutions in achieving the targets. If the leader encourages and requires an appropriate working climate, the employees become receptive to his ideas. In our country, leadership development must become a priority that must take into account the creativity and innovation of those persons who work in a company.

According to John Aidair, an effective leadership is influenced by leaders who can provide an appropriate working climate to their employees.

Table no. 2:
How to apply an effective leadership

1.Do	*establish and assign the tasks to the team members;
2.Act	*be in contact with the team members and forward the tasks;
3.Check	* initiate action, make decisions, always check the work of the team;
4.Stimulate	*stimulates creativity, promotes innovation, eliminates the tension between the team members;
5.Plan	*take into account the opinion of subordinates, review their ideas and put them into practice;
6. Estimate	* evaluate the activities of team members by checking their plans and their decisions.

Source: Adapted from John Adair, Understanding Motivation, Guildford, London, 1990, p 78-79.

7. Conclusion

The implementation of an effective leadership style is conditioned by leaders' skills in finding new ideas. They should transform these ideas in realizable actions to obtain the success. Leaders are those who find many ways in leading their subordinates in order to achieve the organizational objectives.

Leadership style is also reflected by leader's behavioral features. An effective leader can lead a company and its employees to find solutions to a various problems.

Leaders are those who implement an effective strategy, but they put first the employees' needs instead their own success.

There is no leader to born with the ability of a perfect leader. This capacity is acquired and can increase if the leader interacts with his subordinates. But if the leadership style is incorrectly applied the results are inefficient and can create tensions and conflicts.

S. Certo believes that leadership influences the individuals' behavior. The management functions highlight the complex relationship that exists between leadership and management, focusing on behavioral issues. Leaders are using certain tools to stimulate and motivate their subordinates, to encourage their actions, to promote the teamwork. In this way, the subordinates are confident in their own forces and the results are positive and effective.

The effectiveness of a leader is recognized when he combines features of leadership style with a flexible cooperative behavior. The leader should be optimistic, enthusiastic and friendly with his subordinates. He should have a modern vision, should be creative and should encourage his subordinates to express their own ideas. The main qualities of an effective leader are: intuition, perseverance, self-control, modesty and responsibility.

TRANSACTIONAL ANALYSIS IN THE BUSINESS CONTEXT

MAGDALENA PLATIS[*]
ELEONORA GABRIELA BABAN[**]

Abstract
Every day people are faced with changes that are sometimes spontaneous, and that influence our state of mind, depending on the circumstances. The Transactional Analysis managed to identify these states of the Ego being at the same time an instrument of communication and interconnection in this direction. Starting a business means the entrepreneurs must stand risks and make continuous efforts. Moreover, they must face challenges and novelty that define the business environment which is continuously changing and moving. Starting and developing a business mean the entrepreneurs must make a real effort; they are always trying to develop their business in order to meet the various needs of potential customers. The study, presents the following main issues: 1).emphasizing the role of business in the current economic context; 2).presenting the economic and strategic business construction; 3).showing the main steps in developing a business; 4). identifying the role of transactional analysis and its influences in business; 5). highlighting the main principles and rules of business behavior in the contemporary context. Transactional Analysis helps businessmen adapt their future actions to concrete situations. Therefore, Transactional Analysis is a tool for analysis and action and its application allows businessmen to master more than ever the so called "rules of business".

Keywords: *competitiveness, strategy, transactional analysis, business, communication.*

1. Introduction

This study emphasizes the main aspects that define transactional analysis in the contemporary business context, and also the main elements that influence the development of a business.

The importance of this study is reflected by presenting the main elements that contribute to business success, such as business economic and strategic development, as well as identifying the main steps entrepreneurs must undertake in order to start a business. The main methods for determining the price, reflected by business economic development, are also presented in literature review. These methods are highlighted in the present study. Moreover, by presenting transactional analysis aspects, one tries to analyze the personality of businessmen, since their attitude can influence business success.

Companies must face unpredictable changes, must exploit existing advantages, must implement appropriate strategies in order to survive, and why not, even thrive. This permanent concern to adapt all actions to the business environment is the most important thing for a managerial team. The managers' attitude has a major role in achieving the company's targets.

Business ethics, principles and rules that must be followed are the components of a long and difficult process. Along this road of obtaining performance the businessman faces many obstacles, that once exceeded can complete the business success. An entrepreneur must be smart and innovative to succeed in business. Although an entrepreneur applies intelligent strategies he sometimes fails. Therefore it is very important to learn from failures, to analyze the failure's causes and to identify mistakes in order to turn failure into success.

[*] Professor, Ph.D., Faculty of Business and Administration, University of Bucharest
[**] Assistant, Faculty of Business and Administration, University of Bucharest (e-mail:baban.eleonora@ yahoo.com).

Business has an economic construction, and also a strategic one. The economic construction of the business reflects the relation between price and performance, and the other one, the strategic construction, takes into account the main steps of achieving the businessman's goals.

2. Literature review

Throughout time, businesses have had periods of development, as well as downfalls. The way they have been tackled throughout time represented their starting point.[1]

In antiquity, although there were small traders and salesmen, trade was seen as a profitable activity. In ancient Rome and in ancient Greece trade has developed, and businesses have gradually grown.

The Middle Ages was a period of stagnation in business, economic development being threatened by the feudal system. Aristocracy and clergy couldn't trade because trading was seen as a disdainful activity. However, in the last period of the Middle Ages, there had been a fundamental change in the conduct of trade in some cities in Italy.

In the ethical capitalism, the gradual development of urban planning determined the expansion of business, and the attitude regarding trade became positive.

Adam Smith in his volume "Wealth of Nations" published in 1776 laid the theoretical foundations of the capitalist development ethics. He thought economic freedom is the premise of the self-interest maximization, each person contributing to the wealth fare of society.[2]

In the contemporary period, businesses have experienced a period of expansion, innovation and technological and economic progress that contributed to their development.

The person who creates a business is called entrepreneur. In the past, in ancient times, the common entrepreneur was represented by the military and by traders. By applying successful strategies, military and traders could obtain substantial benefits.

In the middle Ages, even if the trade was considered a disdainful activity, the entrepreneur was a clergyman who got involved in huge projects (construction of castles and fortifications, public buildings, monasteries). He didn't take risks, he only found material and human resources for the project's development. However, later, it was established that an effective entrepreneur must know potential risks and must be well informed about the quality and price of the products.

In the 17th century, entrepreneurs were considered land speculators and farmers. They were sealing bargains with buyers who wanted to acquire a particular product.

In the 18th century, the entrepreneur's role was recognized and exploited for the first time. Richard Cantillon thought that the entrepreneur is someone who takes risks, buys and sells products at available and consistent prices.

In the 19th century, the entrepreneur was thought to be the business manager. He wasn't distinguished from the manager. Jean-Baptiste Say thought that an entrepreneur was the supervisor and the manager of a business, who had to possess the following qualities: perseverance, intuition, modesty, flair, tenacity.

In the 20th century the entrepreneur was acknowledged as an innovative person who used to promote change. According to J. Schumpeter he was usually a creative person. In other words, an entrepreneur was the person who used to start and develop a business. In many cases, he used to take risks in order to obtain personal or material satisfactions.[3]

Nowadays, as a consequence of technology and science progress, society is increasingly concerned about the quality of work factor, which depends a lot on a person's level of general education and vocational training. The economic development of a country is also an important element in this matter. Thus, the 21th century entrepreneur is a person with a high level of training, who provides, organizes, coordinates and controls the company activity to obtain the optimum efficiency in business.

The businessman has several qualities which are acknowledged on the business market. He is the person who: has the ability to take risks, has an innovative and creative spirit, and has experience in human relationships and management conflicts. Today, the businessman has an essential role in contemporary society. The business environment is uncertain and changeable. Entrepreneurs can obtain the incentive profit only if they take into account certain particularities of the business market. Business market should not be confused whit the consumer goods market.[4]

Business market versus consumer goods market

Is derived from the demand on the consumer goods market
Has an inelastic character, because any change of the products price from consumer goods market attracts a smaller change on the business market.
Has a variable character, because a smaller change from the consumer goods market generates a bigger change on the business market.

3. Strategic and economic construction of the business

The business is a commercial, industrial or financial activity based on speculation, and it implies the organized effort of economic agents to produce and to sell in order to obtain maximum profit, assets and services that meet the request of the citizens. In other words, the business is one's intention to develop an activity that generates profit.

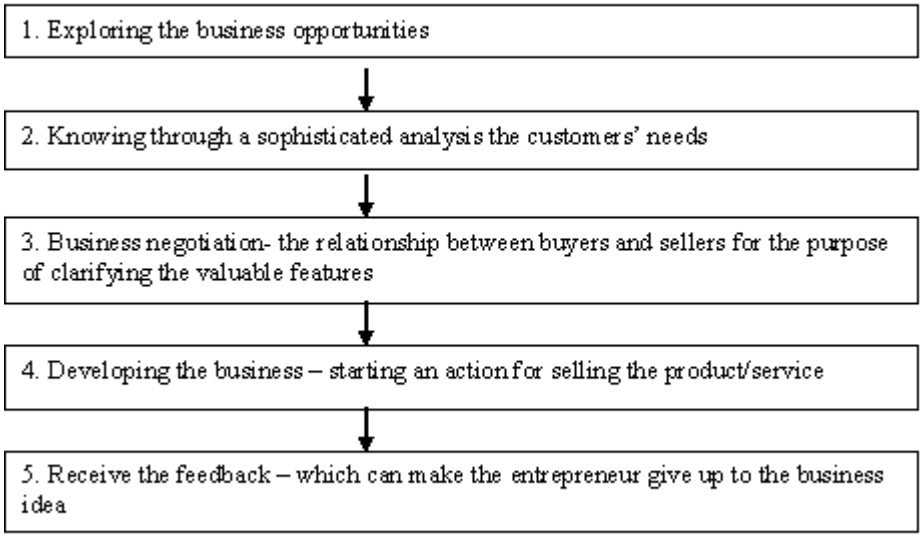
Figure no.2: Steps which must be followed in starting and developing a business



Source: Authors

In order to succeed an entrepreneur must take into account the business novelty degree (usually a relative novelty). Development of a business can be seen as an adventure because starting a business is a challenge for the business partners. Entrepreneurs must use efficient strategies because a business is characterized by complexity.

The Strategic construction of a business designates few interconnected elements which allow a selection of the business and, also, the correct positioning of the company on the business market. Thus, the following actions are necessary:

1). Choosing the proper business so it can represent an idea or an existing product in appropriate situation when the existing offer is insufficient and the supplier is able to hold a competitive advantage.

2). Understanding the goals set, in order to survive on the business market, or to obtain an incentive profit.

3). Understanding each step in business development in correlation with other stages: selection, construction, beginning and operation.

4). The need for understanding the level of price as an instrument of attraction for the consumer. New understandings of price are: a). non-monetary value (the consumer buys the product not because of the low price, but due to the intrinsic value they bring to the product); b). emotional attraction – the product attracts the consumer's attention because it has started a whole industry of sophisticated and attractive packing.

5). A business must be seen as a multidimensional activity with a legal, responsible, ethical and technically advanced economic construction.

Business strategic objectives must be appreciated in correlation with the entrepreneur's objectives. There are tactical, strategical and practical objectives.

The tactical objectives are the following: strengthening the position in correlation with competition; attracting the new customers; targeting new markets.

The strategic objectives are the following: price strategy regarding the business differentiation; price strategy regarding cost control; price strategy regarding the competitive advantage.

The strategic vision of the businessmen expressed the market orientation in the near future. The main guidelines that reflect the strategic vision are: geographic expansion, attracting new customers, diversifying the product range, business expansion through franchising, closing the business, selling the business, selling the brand, merging the business especially in air transport, vertical integration that involves opening a new business segment correlated with the first, creating strategic alliances.

4. Economic construction of the business

On the basis of business economically construction there are four levels of correlation in terms of price – performance relation:

1). Price war (it is generally considered a lose-lose strategy);

2). The level of competition through price (the price is a key element in directing strategically option);

3). Non-price competition.

Methods for determining the price reflects the economic construction of the business. These methods can be divided into three main groups:

1). Method of price formation through cost: a). cost pricing method – which consists in determining the price by adding a commercial addition to the overhead costs; b). mark-up pricing method – which express the method of determining the price by adding a higher commercial addition to variable costs (20%) or lower (10%) than average total cost.

2).Methods based on demand: a). break-even pricing method- expresses the determination of optimal price corresponding to the break-even point so that it can have an upward trend; b). experience curve pricing method – expresses the determination of prices according to the short-term dynamics of demand at the certain businesses which have started for a while their activity on the market.

3). Methods based on competition: a). price taker method – expresses the actions in buying and selling stocks of the most investors who don't have enough power to change the security of the prices; this method is opposed to the price setter method; b). method of auction price – which has two specific types: a normal variant of auction (it starts at a lower price, then price starts to rise) and the second variant, Dutch auction price variant (it starts at a higher price).

5. Transactional Analysis and business environment

Transactional Analysis was developed in 1965 when has been created "The International TA Association" (ITAA) and in 1976 the "European Association for TA" (EATA).

The definition developed by the I.T.A.A. regarding the Transactional Analysis is: *"Transactional Analysis is an explanatory theory of personality and is a psychotherapeutic system dedicated to the development and personal change"*.

Eric Berne's contributions to business are significant. He said that the businessmen' moods are the results of their spontaneous personality.

Transactional Analysis is a set of methods and techniques through which the businessmen' personality can be analyzed. This identification is based on analytical scales where the most important scale is the businessman's mood. Transactional Analysis is a practical approach that emphasizes the capacity of people regarding the communication skills.

There are various questions about how Transactional Analysis find the answers, such as: why a certain consumer systematically chooses the same product and doesn't try to buy another one which can probably satisfy his various needs – the answers are found in the analysis of their moods;

or why sometimes even if we find a solution to our everyday problems, we often face with an ability to confront reality and we get "stuck".

Transactional Analysis can be used in various domains (organizational, educational, and social) and it finds answers to the consumers' questions that need to know what the consequences of their moods are. So, the consumers' decisions are the results of their ego-states. In line with this transactional theory, **Ego-State** (Parent-Adult-Child or PAC model) represents an essential component of the human personality. Eric Berne mentioned that we shouldn't invest our energy in a single state.

The Parent ego-state is a state of the ego in which individuals barrow their parents' (or other parental figures) attitude and behavior. A businessman with this side of personality is based on some well structured information and at the same time he has the capacity to anticipate the possible risks that may affect his business. Parent ego-state can be: critical Parent ego-state and careful Parent ego-state. The Critical Parent ego-state reflects that side of the personality which is divided by rules, norms and principles. The Careful Parent ego-state provides protection, affection and caring, while the Critical Parent ego-state imposes rules and responsibilities. A businessman who is influenced by this state has the ability to see his partner in a friendly way. He tries to take into account all possible alternatives for their actions, using his skills and business flair.

The Adult ego-state is governed by the principle of rationality and clarity, and also by the safe behavior and emotional detached. The businessman is self-confident, is responsible for his actions which are based on concrete facts. He rigorously assesses his actions without taking into account the emotional implications and risks.

The Child ego-state reflects a spontaneously and creative behavior and attitude. This state of the ego is characterized by changing moods in a positive or negative ways. Three Child ego-states are presented in the literature review: Adapted Child ego-state, Creative Child ego-state, Spontaneous Child ego-state.

Adapted Child ego-state is the state of the ego in which the individual knows his own potential and tries to supplement his knowledge by accepting the influence of the others.

Creative Child ego-state expresses the individual's ability to show in a creative way his desires and expectations. The businessman, who takes into account these characteristics, chooses the matters that have a degree of absolute novelty. In this case the innovation can be expressed permanently.

Spontaneous Child ego-state expresses the unexpected behavior of the individual because sometimes he has the tendency to question the rules.

Figure 4: Perspective of the Ego-States

6. Behavior principles and rules in business

The main form of business communication is direct conversation with the customer. It is very important for the businessmen to be trained for the meeting. He must know the following information about the customer: age, sex, social status, vocational training, hobby and personality items, knowing the value and objectives of the organization, knowing the product market. He must identify the filters from the communication process. These filters should be established when the conversation starts. The filters of the conversation express some obstacles, shortcomings in the conversation between partners. There are physical filters (hearing deficiencies, sight deficiencies, speech expression deficiencies) and psychological filters (preconceived ideas, superstitions, lack of interest, dispositions).

Statistics show there are various percentages of information retention. Depending on how information is transmitted, these percentages are: 10% if the information is read, 20% if the information is written, 30% if the information is written and heard, 50% if the information is seen and heard, and 80% if the information is mixed.

Some main elements are important in business communication. These are: the volume, the articulation, the intonation, the sight, the accent, the rhythm, the mimicry, the breaks.

The following process is known in business. It is called "lobby" and refers to a small group that sometimes puts pressure on policy makers and executive groups to influence them and to promote their interests. In the field of business practice this process named "lobby" has demonstrate its influence being organized under the rule of "5 of 20%" in the following domains: 20% law, 20% politics, 20% economics, 20% diplomacy, 20% communication.[5]

For a successful business to develop an entrepreneur must apply a few rules. The businessman should take into account a few principles because in this way he can stimulate a potential customer to act on the market.

In a negotiation, the rules of communication are the following: in a negotiation you mustn't be the first to make an offer; you mustn't take the first offer; you must know when to stop; you must know both the strong and the weak point of the opponent; in order to have a successful negotiation you must be flexible.

The businessman should take into account the main principles of the collaboration with the customers. These are the following:

1. The businessman should ensure trust to his customers! In order to do so he should take into account their needs!

2. The businessman should request a feedback! In this way he can collaborate in the future with his customer or he can improve his business!

3. The businessman should promote and encourage the honest communication and business ethics!

4. The businessman should avoid conflicts and promote amiable solutions in negotiations!

5. The businessman should sell quality products that satisfy customers' sophisticated needs and ensure that the products reach the customers on time!

As a result of global competition, business integrity is an essential attribute in negotiations. Integrity and credibility are key elements that must be taking into account by the entrepreneurs when they try to start a negotiation.

[5] Popescu, D., „Conducerea afacerilor", Editura Scripta, Bucureşti, 1998, p.115.

7. Conclusions

This paper explores the current literature on transactional analysis and its importance in the contemporary business context.

Transactional Analysis is an action instrument and has the role to respond to the questions which appear during the communication process. Starting a business is a difficult process that should take into account the opportunities of the business environment. The role of the marketing mix in this process is essential and the businessman should apply efficient strategies. The businessmen must have an ethical behavior when they interact with their clients. To succeed in business, they must satisfy the most sophisticated needs of the customers. Good progress of a business and positive results are relevant aspects for any entrepreneur. Achieving the goals of the business in an efficient way is the dream of any businessman.

"Business world" is a fascinate place and is also considered "a battle field". There is a fierce competition among entrepreneurs as they are trying to attract the most important customers. They can obtain the desired success only by applying knowledge acquired through their continuous effort in achieving the business competitiveness.

Success can only be obtained by applying earned knowledge and by means of businessmen continuous effort to obtain business competitiveness. Business ethics, the principles and rules that must be complied with are the elements of a long and difficult process. On the road to success, the businessman faces various obstacles that once overcome shall only complete the performance, and so the success is well-deserved.

Business success depends on the businessman's creativity, intelligence and tenacity. Even if a businessman tries different strategies, the results are not positive. It is thus very important for a businessman to learn from his failures, to analyze the causes of the failure, to identify his mistakes in order to turn the failure into a success.

Laying down a business plan is essential in order to obtain success. The business plan is a leading instrument that the entrepreneur needs. Negotiating a business depends on the existence of a business plan. As an element that can attract potential investors, the business plan helps maintaining the business, offering efficient strategies that derive from an entrepreneur's professionalism and tenacity. Developing a business plan depends on the businessman's tenacity to take into account the profile of the business. The business negotiation depends on the existence of a business plan. The business plan must be properly realized and must provide confidence and reliability in order to start the business and ensure the success. The businessman has to identify the main economic, technical, social and ethical factors. The businessman must be an individual with social responsibility, who observes certain business communication rules and standards. The future of the business depends on this behavior. The ability to take risks and his flexibility to sudden changes in the business environment can be seen as two elements that influence performance. Businessmen's activities should be dynamic, but should at the same time support the development of the business. They must take responsibility for their enterprises.

A NONPARAMETRIC ANALYSIS OF INVESTMENT BANKS' EFFICIENCY IN THE CURRENT GLOBAL CRISIS

TEODORA CRISTINA BARBU[*]
NICOLAE DARDAC[**]
IUSTINA ALINA BOITAN[***]

Abstract
The purpose of this study is to assess to what extent the business model practiced by investment banks, before the beginning of the financial crisis, has influenced their performance indicators, and especially those who express shareholders' satisfaction. To this end, we have applied a nonparametric method, called Data Envelopment Analysis, which allows obtaining the efficiency scores for each financial institution considered. The sample included two pure investment banks, Lehman Brothers and Goldman Sachs, and seven international financial groups carrying out investment banking activities. The model tested assumed the maximization of selected output variables (ROE and the dividend distributed), by considering several input variables, meant to summarize the risk profile and costs arising from implementing a particular business model. The results obtained, in the form of high inefficiency scores, indicate that the business model of investment banks was not better performing than that applied by financial groups, because it failed to ensure a balance between ownership compensation and sustainable expansion of financial activity.
JEL classification: C14, G24

Keywords*: investment banks, business model, data envelopment analysis, efficiency score.*

Introduction

Over the last decades the field of investment banking activity has been the subject of extensive changes, especially in terms of services granted to customers. Consequently, the composition of the revenues recorded has evolved from the commissions they earned to the revenues from trading debt instruments, particularly in the OTC market and income from corporate advisory business.

According to Morrison, Wilhelm (2007), the fundamental role of investment banks consists in acting like an intermediary between those holding information and wanting to sell it and the investors and security issuers who purchase it. They argue that *investment banks exist because they maintain an information marketplace that facilitates information-sensitive security transactions* (Morrison, Wilhelm 2007, p.10).

In our paper we intended to assess to what extent the business model adopted by investment banks proves to be efficient, from the standpoint of their performance indicators. The second part of the article presents the changes recorded by the investment banking landscape, focusing on the interference between investment banks and merchant banks' activity and the pace of growth of this industry over the last ten years. In the third part we question whether the investment banks' business model is still viable, in the post-crisis period. We have discussed some trends, as a result of economic and legislative constraints, that will significantly influence the future development of this industry and will reshape investment banks' business strategies. In the fourth part we have empirically investigated whether the investment banks' business model is more efficient, in terms of maintaining

[*] Professor, Ph. D., The Academy of Economic Studies, Bucharest (e-mail: teodora_barbu@yahoo.com).

shareholders' satisfaction, than that employed by traditional banks which provide investment banking services, too. The study comprised two pure investment banks, Lehman Brothers and Goldman Sachs, and seven international financial groups carrying out investment banking activities, during an eight years period. Efficiency scores were computed for each bank in the sample, by applying the Data Envelopment Analysis non-parametric technique. The fifth part synthesizes the results obtained while the last part concludes.

1. Investment banking industry dynamics

In the framework of the financial system, although, in practice, there is a very fine demarcation line between investment banks and merchant banks, however, the two types of institutions providing financial services fulfil different functions. Traditionally, merchant banks activate in the field of securities underwriting, while investment banks participate in financing transactions.

Pure investment banks provide funds for the private businesses and governments, by issuing debt and capital securities, and selling them on the market. In addition, they facilitate mergers and acquisitions and provide financial advisory to companies (Shiller, 2009). Traditionally, they do not operate with the public.

Merchant bank institutions provide international funding, such as corporate investment, foreign real estate investment and international financial transactions. Some of these transactions involve letters of credit, funds transfer, consultancy and co-investment in projects.

Broadly speaking, investment banks focus on initial and private public offerings of shares. Merchant banks tend to operate on a smaller scale (with smaller companies) and offer creative financing options (bridge financing, mezzanine financing, corporate loans). In other words, investment banks are oriented towards big companies, while merchant banks provide services to companies that are too large for venture capital or too small for a public offering of securities.

The doctrine according to which investment banks offered prosperity for all was fully accepted by 2007, the year of the global financial crisis' onset. The specialists outlined the view that commercial banks were dealing with financial capital, while investment banks and merchant banks controlled the intellectual capital.

The economic literature claims there are three key areas of investment banking business, according to the developments of which one can evaluate the performance of this industry, namely: success in running IPO's, business consulting and involvement in mergers and acquisitions. Regarding the first element, that of conducting IPO's, we mention that the main beneficiaries of companies' transformation into public companies were the investment banks. For example, in the U.S., the peak of the IPO's launching had been reached in 2000, with over $ 100 billion. Studies on successful investment banks, in terms of launching IPO's, show a gradual increase in the cost afforded by companies seeking to benefit from an IPO: in only a few years the commission received by the underwriting syndicate (gross spreads) tripled its level to 7%, double than that practiced in Europe or Asia. According to Hansen (2001), a similar trend has been recorded by the offer price. This stood at 8% during 1978-1991, and then rose to 12% during 1991-1994. In 1995 the initial gain offered by an IPO exceeded 20%, increasing to 69% in 1999 and 56% in 2000.

The quality of consultancy provided to companies, in the form of studies, is the second area of interest when analysing investment banks' performance. Studies show that analysts' recommendations could produce abnormal returns of the market, 98% of all recommendations being of buying, which has generated more business than the recommendation to sell, because they addressed to investors who had cash and wanted to invest.

Regarding the growth recorded by this industry, we point out that in 2007 the gross incomes amounted to $ 84.3 billion, with 22% more than in 2006 and double than 2003. U.S. was the primary source of revenue for investment banks, with 53% of the total, Europe with 32% and Asia with 15%. Revenues rose with 80% in U.S., in Europe by 217% and in Asia by 250%. Investment banking

industry is concentrated in a few financial centres: London, New York, Hong Kong and Tokyo. It's an industry that must respond rapidly to major developments in financial markets, the main trends consisting of vertical integration and debt securitization.

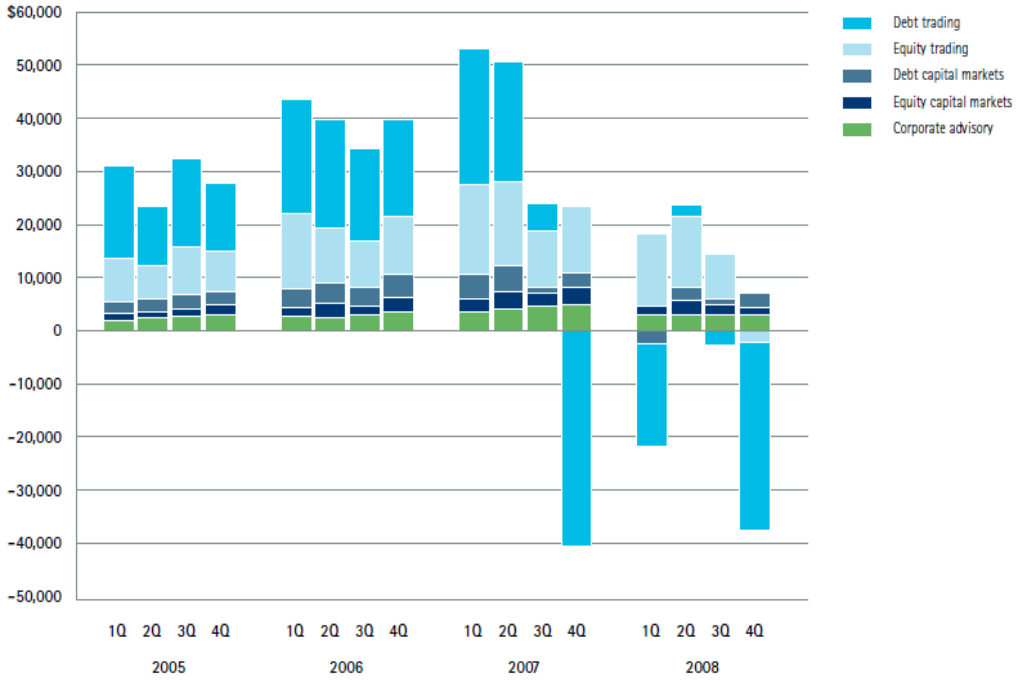
The investment banks' involvement in a broad range of activities may be associated with a conglomerate with numerous subsidiaries and with a high degree of cross risk and price transfer between lines of business. For this reason it is difficult to assess the degree of profitability for each line of business. In general, it is believed that the brokerage business is the most volatile but also the most competitive line of work.

Podolny (1993) examined the correlation between bank's profit and status, considering that the market on which they are positively correlated is more stable than the one in which status is inversely correlated with profit. The author made the assertion that investment banks have a higher status than commercial banks and can better protect the market. However, it appeared that in only 15 years their profitability has deteriorated significantly. According to Podolny (1993), the relationship between status and profitability need not be on the long run, but an effective relational mechanism. The author defines status as being represented by the performance of a bank in underwriting securities. A bank that proves a high proficiency in the underwriting process can be regarded as if it has a high status, compared to a bank that does not demonstrate such competence.

According to the Securities Industry Association, the average ROE profitability registered by investment banks in the U.S. has evolved from 48% during 1980-1984 to 22% during 1985-1989, 14% during 1990-1994, 21% during 1995 - 1999 and 30% during 2000-2004. Explanation of these increased returns, compared with other types of credit institutions, is due to financial market characteristics. If the market were efficient, then competition would lead to lower prices and commissions, lower returns recorded for the entire industry as a whole. The returns' level specified above shows that the market has not worked effectively due, primarily, to entry barriers, limiting the number of competitors and practicing strategic pricing.

Research carried out by Gach, Sproule (2009) revealed that in the economic boom years the transaction incomes held a share of 75% in total income, while income from corporate advisory business stood at 20%. The years 2008-2009 marked the orientation of investment banks to less risky lines of business, traditional business consulting revenue growth accounting for up to 40%. Analyzing the structure and evolution of revenues (Figure 1), it can be noted that the consultancy is the only line of business which has not experienced significant fluctuations. At the opposite pole lies the revenue from trading debt instruments, particularly in the OTC market.

Figure 1. Investment banking revenues in the period 2005 - 2008 ($ millions)



Source: Gach, Sproule (2009), p. 4

2. The opportunity of developing a new business model for investment banks

By 2007, there were no interrogations on investment banks' business model viability. The collapse of investment banks, began in 2007, marked the beginning of wider debate on the possibility of implementing a new business model, to save investment banks. According to the authors Gach, Sproule (2009), a new business model must be based on the concepts of transparency, liquidity and strengthening the supervision of such financial institutions.

In 2008, the Fed has adopted the measure of changing the status of investment banks, which, in turn for having access to credit facilities, were forced to convert into bank holding companies. A bank holding company is a corporation under the control of two or more parties. Becoming holding companies, investment banks can easily obtain capital and agree to be supervised by authorities. As holding companies, Morgan Stanley and Goldman Sachs will create more retail units, in order to attract deposits from customers. The decision took by Morgan Stanley and Goldman Sachs to convert into bank holding companies was considered exceptional, because they were the last independent banks. Turning into bank holding companies, they have had to reduce their leverage.

Change of status means more stability, but lower profits. Such a bank can be regarded as a more secure institution, with a cleaner balance sheet and with a variety of ways for raising funds. This institution will become more bureaucratic and more risk averse. Change of status meant for Morgan Stanley and Goldman Sachs the ability to receive deposits from customers, to receive financial facilities from the Federal Reserve, the possibility of merging with other banks. The immediate effects were the leverage reduction (and hence, lower default risk for the entire financial system) and the possibility given to the two financial institutions to survive.

According to Demirgüç-Kunt, Huizinga (2009), the U.S. went through a complete cycle in terms of regulating financial activity, from the separation of financial institutions in commercial

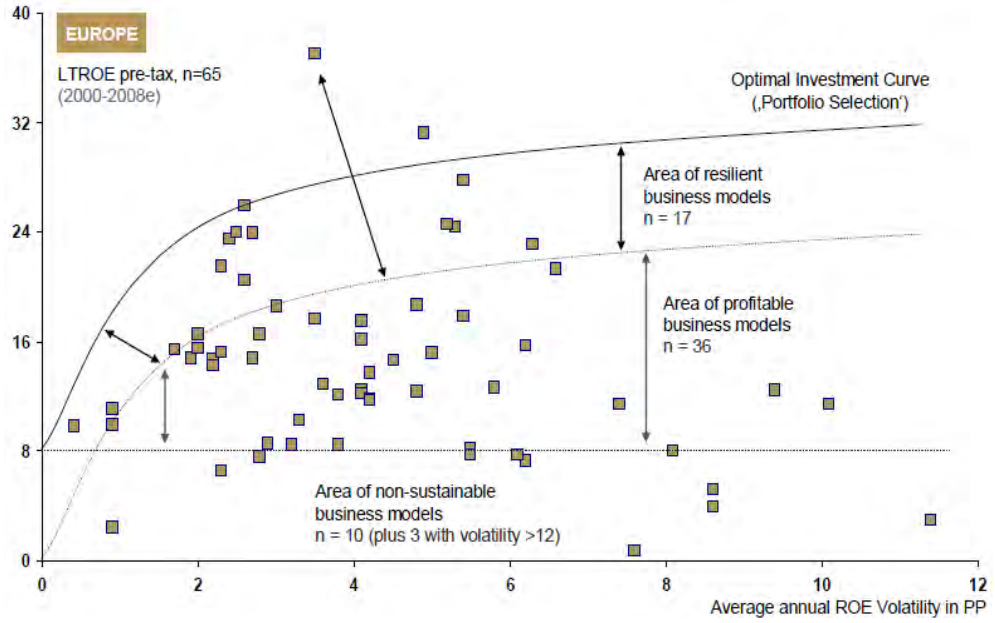
banks and investment banks (the Glass-Steagall Act in 1933), the reintroduction of universal banking (the Gramm-Leach-Bliley Act in 1999) and by the disappearance of major investment banks in 2008.

Efforts of these banks towards increasing liquidity and transparency will assume a new capital structure. In terms of liquidity risk, complex derivatives will not disappear, but their use will be translated to financial institutions that are better accommodated at managing this risk. Moreover, after 2007, the necessary liquidity for conducting operations has increased and banks' management became more conservative, being less receptive to risk taking.

New regulations, designed to improve transparency in financial markets, are similar to a new standardization in transactions, which means that liquidity providers will be encouraged to enter the market. The core element, around which investment banks' activity will articulate, will be represented by the customer-oriented financial products, which offer an attractive risk/return ratio, in terms of liquidity and increased transparency.

Fremerey and Hagen (2010) argue that long-term success of a business model is based, generally, on five key elements: the growth of business, asset mix, financial institution's size, cost/revenue and market share. The research undertaken by them on 65 banking groups in Europe, which carry out also activities in the field of investment banking, revealed that their orientation towards adopting a business model specific to investment banks hasn't brought substantial improvements in long-term profitability. The authors pointed out that truly sustainable, resilient business models, characterized by low annual volatility of ROE (below 8%) and a rate of long-term ROE of at least 8%, positioned above the Markowitz frontier, are a minority, fact that requires a recalibration of their business strategy.

Figure 2. Distribution of banking groups according to the characteristics of the business model applied



Source: Fremerey F.S., Hagen J.U. (2010) European Banks –The Way Forward Toward Resilient Business Models, p.24

A study by Boston Consulting Group (Saumya, Chandrashekhar, Morel and Grealish, 2009) signals the need for investment banks' business model reinvention, by replacing the aggressive revenue growth strategy with the management of risk-adjusted profitability, while recognizing the

importance of further financial innovation developments. According to the authors, the new generation of investment banks will adopt a business model characterized by simplification and specialization of work, in the sense of maintaining those business lines in which expertise acquired over time can generate competitive advantages. On the other hand, Nielsen and Bukh (2008) state that the concept of business models is, perhaps, the most discussed but least understood of the newer business concepts.

The future of investment banks will be marked by a series of regulations and restrictions on mitigating aggressive strategies and better risk management, mandatory establishment of reserves, a move towards derivatives trading, corporate restructuring, a lower reliance on short-term funds and leverage.

In the current crisis, investment banks show a diminished appetite for risk taking and, in the future, they must face important changes, namely:

- ✓ have the potential to invest, without reaching a high level of leverage, giving investors an attractive return, coupled with the risk embedded;
- ✓ to undertake financial innovation on a documented base, by creating financial products able to generate value added. In this regard, it is anticipated that demand for complex, illiquid, traded OTC (e.g. credit default swaps) derivatives will narrow substantially.

Economic and legislative constraints (strict regulation, less leverage, high capital cost) will have, no doubt, influence on banks' investment strategies, in the sense of rethinking the mix of business lines, the preference for risk, a better correlation between target customer needs and products/services' characteristics.

3. Study assumptions and methodology

The process of financial liberalization was one of the factors that boosted banking activity nationally and across borders. The desire for better positioning based on market share and the rapid pace diversification of banking products and services (retail banking, corporate banking, asset management, investment banking, private banking, etc.) created incentives for large financial institutions to adopt a permissive attitude towards taking excessive risks, by focusing on the volume of activities, while relaxing loan granting practices and superficially monitoring the concentration of exposures to a particular customer segment or sector. In order to reduce risk exposure, they have resorted to creating sophisticated financial instruments, the trading of which being assumed to contribute at risk dispersion to other market players.

In this study we aimed to analyze whether the business model practiced by investment banks is more efficient, in terms of maintaining shareholders' satisfaction, than that employed by traditional banks which diversified their activity and provide investment banking services, too. Therefore, we examined the extent to which diversification of financial institutions' activity was reflected in the improvement of performance indicators which are closely related to the degree of shareholders' satisfaction, namely financial return (ROE) and the amount of dividend distributed. We determined a measure of banking efficiency, from the shareholders' viewpoint, by testing, separately, two models corresponding to the two variables of interest specified above. Our analysis focused on individual performances obtained both by pure investment banks and by a number of representative international financial institutions, which have an active investment banking department. Data were taken from the annual financial statements consolidated at group level, covering the period between the years 2001 to 2008.

Efficiency scores were obtained by applying the technique Data Envelopment Analysis – DEA (see Vincova, 2005 and Barr, 2004 for details related to computational aspects). Main arguments in favor of using DEA as a tool to evaluate the performance of financial institutions are:

- ➢ allows the testing of multi-input multi-output models;
- ➢ does not require defining a functional relationship between input and output variables;

- estimates are generally not affected by the multicollinearity problem between explanatory variables;
- variables can be expressed in different measurement units;
- each institution's performance is compared with that of other institutions in the analyzed sample, allowing the estimation of relative efficiency to the group analyzed and not to a theoretical maximum;
- generates for each inefficient institution a set of benchmark institutions, called "peer group", which include only the efficient ones, which have a structure of input-output variables similar to the inefficient entity analyzed.

It is important to specify the heuristic nature of our scientific approach, which lies in the fact that there is no predetermined, generally agreed structure of the models tested through the DEA method. As a result, we have adapted the components of the model to the specific of the financial institutions considered and to the goals of this study. Also, we mention that the efficiency scores obtained are not a single, generally valid solution, but a satisfactory, credible one for the given context, having an exploratory nature, as it is intended to extract new information existing in the initial set of variables.

We opted to implement a DEA BCC model (Banker, Charnes, Cooper) as it allows the use of variable returns of scale. The mathematical model (considering the hypothesis of a model oriented to maximize results) is:

$$max\ \theta = \alpha + s + e \quad (1)$$

With restrictions:

$$\sum_k \mu_k\ y_{tk} = \alpha y_{t0} + s_t,\quad t = 1, 2, \ldots . I \quad (2)$$

$$\sum_k \beta_k\ x_{tk} = x_{j0} - e_j,\quad j = 1, 2, \ldots . J \quad (3)$$

$$s_t \geq 0,\quad t = 1, 2, \ldots . I \quad (4)$$

$$e_j \geq 0,\quad j = 1, 2, \ldots . J \quad (5)$$

$$\beta_k,\ \mu_k \geq 0,\quad k = 1, 2, \ldots . n \quad (6)$$

Notations:

$\boldsymbol{\theta}$ = the efficiency score for each financial institution considered

n = the number of financial institutions included into analysis

I = the number of output variables considered

J = the number of input variables considered

μ = the weight attributed to output variables, appropriate to each financial institution

β = the weight attributed to input variables, appropriate to each financial institution

y = the vector of output variables

x = the vector of input variables

α = a parameter reflecting the value with which the vector of output variables increases, while maintaining input variables at a relatively constant level

s = parameter that quantifies the deficiencies in obtaining the output variable *i*

e = parameter reflecting the excessive use of input *j*

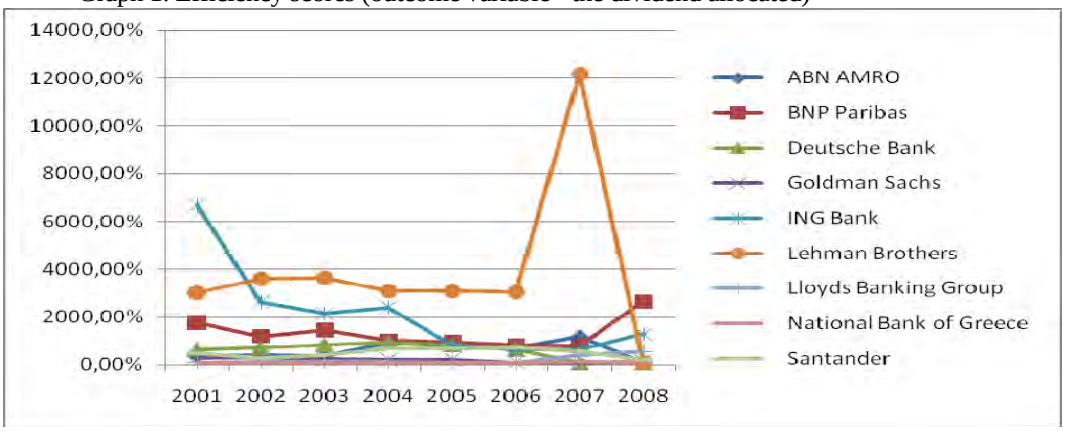
In the selection process of input variables we have applied the intermediation approach that takes into account the costs incurred in attracting financial resources (Mester, 2008). The chosen variables are: *total assets, financial assets held for trading, the cost/ income ratio* and *leverage*. Output variables are the *distributed dividend* and *net profit generated by a unit of capital invested*. The models implemented are oriented towards maximizing the results (output oriented in DEA terminology), while maintaining a relatively unchanged level of input variables. We chose this orientation because, to be competitive, a financial institution with cross-border activity must carefully manage its costs, monitor the evolution of solvency and the characteristics of assets held in portfolio.

Regarding the chosen orientation, towards maximizing outputs, it is considered that banking activity is characterized by efficiency if the input-output combination allows the achievement of a financial performance standard, whose efficiency score is equal to 100%. Scores in excess of 100% indicate inefficiency in the optimization of results.

4. The results obtained and their interpretation

In a first step, we calculated the efficiency scores for each financial institution in the sample, under the assumption that the output variable is the dividend distributed. In other words, we show to what extent the amount of dividend distributed to shareholders is justified by the quality of the financial activity undertaken. Allocation of a dividend inconsistent with the institution's financial performance will lead to a state of inefficiency, signalled by a score whose value is higher than the limit of 100%. The graph 1 depicts the time evolution of efficiency scores for the corresponding financial institutions in the sample.

Graph 1. Efficiency scores (outcome variable - the dividend allocated)



In 2008, four financial institutions (ABN Amro, Deutsche Bank, Lehman Brothers and National Bank of Greece) have proved effective in this regard, achieving a score of 100%. Most inefficient proved to be BNP Paribas, with a score of 2644.4% and ING Bank (1280.87%).

In the year 2007 only two institutions (Deutsche Bank and Goldman Sachs) had a score of 100%, which means that the dividend was properly distributed, according to annual financial results obtained by each of them. However, we noted also the highest inefficiency score recorded for the entire sample of institutions, during the period 2001-2008, of 12169.05% obtained by Lehman Brothers. If we look at the scores obtained by this financial institution we see that during the years 2001-2006 it has been constantly the most inefficient institution, recording values exceeding 3000%, which explains, among other causes, the sudden failure of this investment bank in September 2008. This permanent state of inefficiency can be argued by the aggressive growth strategy practiced on each business line (Capital Markets, Investment Banking and Investment Management). As a result, by 2007, Lehman Brothers reported net income per share and a dividend record.

In 2005 and 2006, in the top of efficient institutions were positioned just Lloyds Banking Group and National Bank of Greece. In each of the years 2004, 2003, 2002 and 2001 a single financial institution has reached a score of 100%, namely National Bank of Greece.

If we analyze the time evolution of the net dividend amount per share, we note that each financial institution considered experienced a progressive increase in the period 2001-2007, followed by an abrupt adjustment in 2008 to a value of 1 euro per share or lower. Although the stated aim of

the institutions considered was to increase the dividend distributed each year, the high scores obtained (higher than the threshold of 100%) suggest a generalized state of inefficiency. Thus, we can appreciate that the value of the dividend distributed to shareholders was not correlated with changes in financial results or there wasn't an optimal management of available capital.

In a second step, we estimated efficiency scores for each financial institution considered, under the assumption that the output variable is the most significant expression of banking profit, from the shareholders' standpoint, namely the financial return (ROE). It is the main measure of shareholder wealth, reflecting the net profits made by a monetary unit of invested capital.

Chart 2. Efficiency scores (outcome variable - ROE)

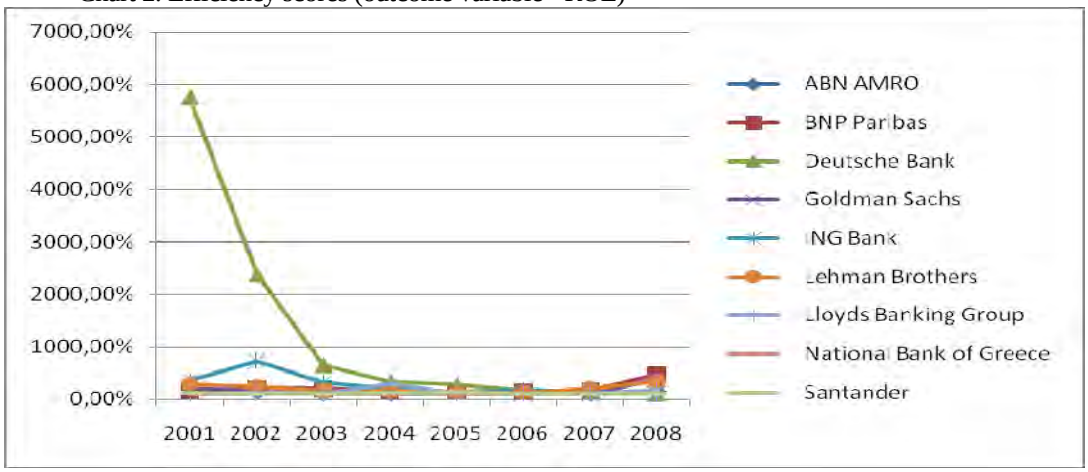


Chart 2 shows that efficiency scores for the model whose output variable is ROE, have a more uniform development in time, compared to the ones shown in chart 1, suggesting that the degree of inefficiency, seen against the net profit generated by one unit of capital invested is significantly lower.

In tables 1 and 2 we have illustrated, comparatively, the efficiency scores corresponding to the two models which evaluate, complementary, the two dimensions of shareholders' satisfaction: the return on invested capital and the dividend policy, the last row in each table summarizing the average efficiency scores for the entire eight year period.

Table 1. Efficiency scores under the assumption of distributed dividend

	ABN AMRO	BNP Paribas	Deutsche Bank	Goldman Sachs	ING Bank	Lehman Brothers	Lloyds Banking Group	National Bank of Greece	Santander
2001	376,85%	1767,25%	648,31%	276,78%	6679,52%	3006,94%	106,27%	**100,00%**	464,34%

2008	**100,00%**	2644,40%	**100,00%**	137,48%	1280,87%	**100,00%**	551,79%	**100,00%**	220,83%
average	606,89%	1329,20%	601,24%	201,68%	2159,88%	3969,43%	204,25%	106,00%	504,79%

Table 2. Efficiency scores under the assumption of ROE

	ABN AMRO	BNP Paribas	Deutsche Bank	Goldman Sachs	ING Bank	Lehman Brothers	Lloyds Banking Group	National Bank of Greece	Santander
2001	134,83%	165,67%	5762,08%	179,27%	349,19%	285,38%	**100,00%**	**100,00%**	117,43%
2002	122,85%	213,92%	2376,49%	224,07%	724,26%	248,91%	120,01%	**100,00%**	**100,00%**
2003	**100,00%**	198,65%	653,95%	172,95%	326,97%	157,84%	**100,00%**	**100,00%**	107,40%
2004	102,65%	166,28%	334,63%	146,88%	198,20%	163,87%	299,37%	**100,00%**	121,10%
2005	127,50%	150,65%	278,65%	143,85%	150,21%	136,21%	**100,00%**	**100,00%**	140,56%
2006	158,09%	143,12%	169,56%	**100,00%**	175,64%	131,16%	**100,00%**	**100,00%**	111,54%
2007	**100,00%**	156,96%	153,43%	100,41%	137,08%	198,77%	**100,00%**	**100,00%**	**100,00%**
2008	146,73%	468,64%	100,00%	379,71%	**100,00%**	345,23%	185,00%	**100,00%**	**100,00%**
average	124,08%	207,99%	1228,60%	180,89%	270,19%	208,42%	138,05%	100,00%	112,25%

For the period under review it can be observed that the National Bank of Greece's activity was characterized by a state of good performance in paying shareholders, recording a rating of 100% for both models tested in 2001, 2002, 2003, 2004, 2005, 2006 and 2008. The implementation of a strategy of rational, balanced market share growth, diversification of lending both to the public and private sector, low concentration of loans in the sectors that have been adversely affected by the global financial crisis are just some of the factors that contributed to achieving and maintaining a good financial performance, reflected in the permanence in time of the state of efficiency in rewarding shareholders.

This performance was achieved in 2005 and 2006 by the Lloyds Banking Group, in 2007 only Goldman Sachs's results were characterized by efficiency, and in 2008 Deutsche Bank has been effective in both the proposed criteria.

If we refer only to efficiency scores from table 2, we note that the number of banks located on the efficiency frontier, as they recorded a score of 100%, is significantly higher than for the model which quantifies the efficiency of the dividend allocation (see table 1). Thus, in 2008, Deutsche Bank, ING Bank, National Bank of Greece and Santander have been optimal in terms of the return on capital, according to financial results obtained. In 2007, five financial institutions have proven to be effective (ABN Amro, Goldman Sachs, Lloyds Banking Group, National Bank of Greece and Santander), three in 2006 (Goldman Sachs, Lloyds Banking Group and National Bank of Greece), two in 2005 (Lloyds Banking Group and National Bank of Greece), National Bank of Greece in 2004, three in 2003 (ABN Amro, Lloyds Banking Group and National Bank of Greece), two in 2002 (Santander and National Bank of Greece) and other two in 2001 (Lloyds Banking Group and National Bank of Greece).

If we consider the standard ROE rate of 15-20%, required by international practice, most financial institutions in the sample fall within this range, and even ahead of it. When we integrate this level of ROE in the context of the volume of activity and costs, the results indicate a state of inefficiency for most institutions considered.

This result is supported by the empirical research conducted by Fremerey, Hagen (2010), which show that the growth pace of business, combined with effective management of costs, contribute to a higher ROE.

Conclusions

Nouriel Roubini, renowned professor of economics, which accurately foresaw the magnitude of the current financial crisis, has given a prognosis: in the future, there will be only a few independent business brokers, since the main problem is short-term liquidity. Investment banks will not disappear in the future, but there will be small and specialized institutions such as merchant banks, business advisor, hedge funds, and private equity funds. Investment banks have changed the

financial world by the fact that it is the largest deployment that requires a rethinking of their values and a recalibration in terms of their structure.

As regards the empirical results obtained, comparing performance in terms of efficiency, recorded by financial institutions in the sample, we can argue that the two pure investment banks considered (Lehman Brothers and Goldman Sachs), although they were listed as key players in the financial market, which had record levels of net profit and dividend per share, have not correlated the dividend growth rate to the level of capitalization and asset portfolio structure, and hence, they received high scores of inefficiency. Consequently, investment banks have not proved superior to financial groups, which, in addition to performing traditional banking activities, have also, investment banking-type activities, because they failed to maintain a balance between shareholders' rewarding and sustainable expansion of financial activity.

APPROACHES FOR EVALUATING AND FINANCING INVESTMENT PROJECTS

MARIA-LOREDANA POPESCU*

Abstract
This article presents the financial investment approach and the investment evaluation methods, which are criteria for assessing both investment projects and their funding sources.
An important role in the analysis carried out is played by the investment decision and financing decision quality. Making an investment decision implies computing the related investment efficiency indicators. They allow the comparison of several variants of the same investment project as well as their comparison with other projects in the same industry or in other industries.
The financing decision concerns the selection between their own sources (share capital, depreciation fund, profits, reserve funds, additional capital, revenues from investments), attracted sources (domestic resource mobilization) and borrowed sources (credits).

Keywords: *financial approach, investment evaluation methods, investment decisions, profitability, funding sources.*

Introduction

Adopting an investment project involves a careful analysis of the company overall standing. Investment projects have a particular importance for developing a business as they prepare the production capacity and conditions to be achieved, therefore influencing the results and the financial balance. The project idea comes from the need to meet a current demand or from the desire to take advantage from some opportunity.

The decision regarding the project accomplishment requires that a lot of elaborated basic actions should be carried out by specialists from various fields of interest. As investments require important long-term financial resources, investment projects present significant risks, most often their launching being irreversible. Favorable financial perspectives can be obtained either by continuing the existing activities or by making investments and launching new activities. The company's financial managers must assess past investments and future investment needs. The past investments must be evaluated and the effects of the future accepted projects must be foreseen.

The term "investment" means, strictly speaking, the use of financial resources that are meant to allow the entry into the company's patrimony of fixed inputs (buildings, constructions, machinery, plants, equipment, tools, etc.) either by acquisition or by their effective creation.

In financial terms, investment means a long-term capital asset undertaking so as to achieve higher future returns.

The funding of investments covers, to a large extent, the sphere of financial requirements at company level and takes into account both the own and borrowed sources as well as the permanent and temporary sources.

The investment effect enhances the volume and quality of a company's activity.

The works carried out concern the analysis of investigations in this field, the fundamental results of such analysis, in general, and their evaluation in particular. The investigations rendered by this article are based on the works of several theorists, as follows: M. Adochiței, Vintilă Georgeta, Ilie Vasile, Ion Stancu, Mihai Toma, Felicia Alexandru, Bistriceanu Gh, Adochiței M., Negrea E.,

*Assistant, Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: maria.loredana_popescu@yahoo.com)

Dumitrescu D., Dragotă V. A. Ciobanu, V. Ilie, M. Teodorescu, V. Juravle, G. Vintilă. Such authors have mainly focused on evaluating, and also on financing investment projects.

1. Financial approach of investment projects

Defining investment and delimiting the field of investment policy can be made in various ways. In terms of accounting and legal areas, expenses are considered investment only when they result in a purchase of durable goods, as tangible, financial or intangible assets. Thereby the purchase of a building, of a land, of means of transport, of the shares or investment certificates appearing as investment operations. Any expense that has no direct patrimonial incidence is not considered an investment, even if it increases the potential and business performance. This exclusion doesn't seem to be justified because recent economic studies evaluate only about 40% of the investment property in the global effort of investment of the companies and thus emphasize the determinant role, of 60% of "immaterial" investments which are not found in simple purchases assets.[1]

While accounting and legal approach of investments highlights the nature of the items purchased by making expenditures, the psychological definition is focused on the intention of the individual or the company which invests, insisting that, in time, investment leads to the offset consumption. From this perspective, the investment is giving up immediate goods in exchange for future goods.

The monetary definition considers that investments are all costs incurred in order to obtain monetary income in the future. Any immediate payment which is capable to bring future revenue is assumed as investment policy.

The investment decision is based on complex and accurate information about need, opportunity, duration of implementation and operation investments, the expenditure volume and financial resources, the input and output flows of funds throughout the investment operation, the ensurance of profitability and liquidity, the recovery of invested capital, etc.

The investment decisions are founded on a convenience and efficiency study based on several versions of the project from which is going to be chosen the one that ensures maximum results with minimum effort.[2]

The opportunity is closely related to the need, the effectiveness and the optimal time for delivery and commissioning of the production's capacities, to the formation of financial resources and supplying and trading conditions.

Efficiency is reflected in the ratio of operating results or in the outcomes of the investment and the efforts or expenditures for the investment. The efficiency of investments depends on a number of factors, the most important being the cost of production and the sales volume. Unit production costs will be even lower, since the investments and operating costs will be distributed on some higher sales. Therefore, it is necessary for strategic analysis of markets to be made, knowing that the investment requirements and profitability will differ depending on the sellers and the degree of competition. A dominant enterprise will be more profitable than those that own small market segments.

Assessment indicators of investment efficiency should allow the comparison to other projects from the same branch, from other branches and even from across the entire economy as well as the comparison of several project variants for the same investment and choosing the best among them.

All operations that represent lasting enrollment of various capital forms (monetary, material, human) are subscribed in the area of investment policy in order to maintain or to improve business potential and performance.

In an enterprise, investments are of great diversity: technical, human, social, financial, commercial, for publicity and advertising etc.

Depending on the risk that investments involve for the enterprise's future, we can structure them in: replacement, modernization, development (expansion) and strategic investment.

Replacing investments of completely absolute equipment has a very low risk because it doesn't involve changes in the manufacturing technology, the new equipment generally have, similar characteristics to the old ones.

Modernization investments for the operational existing equipment involves a low risk as a result of a few essential changes in the manufacturing technology. These investments are intended to improve profitability and productivity, resulting in: lowering the production's costs, direct labor savings, standardization of production process.

Development investments, the expansion of some sections, plants, require a higher risk related to the enterprise growth in traditional or recent markets.

Strategic investments structurally involve the enterprise and they assume a high degree of uncertainty and considerable risk. These investments relate to automating the entire manufacturing process, the merger with another company or the setting up of foreign subsidiaries.

Financing sources for the first two categories of investments are generally long-term credits granted under advantageous conditions of payment, repayment and guarantees because profitability is safe and has low risk. The last two categories will be funded, particularly from their own sources or external sources. The latter are more difficult to obtain due to the high risk and less probability of investment's profitability.

The financial criteria for evaluating the investment projects are:

- the projects' influence on the enterprise's results and profitability;
- the influence on financial stability;
- the impact of projects on the risk borne by the enterprise.

The projects' influence on the enterprise's results and profitability. Each investment project taken under consideration or made on business's expenses needs income throughout its lifetime. The evaluation of the project contribution to the profit of the company is made through results which are determined by comparing the initially allocated funds with the future possible results. On the one hand, the project evaluation is based on accounting profits resulted from the comparison of the total revenue with the total expenditure incurred during each project, and on the other hand the assessment could be based on gross income or cash flow, the additional revenue resulting from the deduction of the additional payments of the companies' activities that are incurred by implementing the investment.

The influence on financial stability. This criterion takes into account the investment operations incidence over the enterprise solvency. The initial project funding allocation for the purchase of fixed assets questions global financing, either by purchasing additional external resources or by carrying out a sampling of the working capital and accepting a certain damage to the treasury. The investment involves over its lifelong the need for additional working capital. This corresponds to the attributable allocations to the project deemed necessarily. This can be written as:

The need for additional working capital due to an investment project = investment + Changes in inventories attributable to trade receivables - Change in liabilities to suppliers[3]

The incidence of financial investments on the financial balance results from the deduction of additional resources with additional needs which they generate:

[3] Vintilă, Georgeta, *Gestiunea financiară a întreprinderii*, Editura Didactică şi Pedagogică, Bucureşti, 2000, p. 353

Additional Needs	Additional Resources
- Initial costs (property acquisition and related expenses) - Additional working capital needs	- Additional cash flow - Recoveries of possible assignments

Source: Ilie, Vasile, *Gestiunea financiară a întreprinderii*, Editura Meteor Press, Bucureşti, 2008

The impact of projects on the risk borne by the enterprise. The investment projects taken under consideration or launched by the company affect the level of risk which the enterprise bears. Three types of risk can be identified:

- The expenses for treasury business finances which affect investment involve a risk of solvency or bankruptcy

- The uncertainty of future operations and results imply a worsening of the risk of exploitation. The specific risk is defined in relation to the variability or instability of the results and the company is, therefore doubly affected by the new investment which increases the dispersion of possible results and tends to increase the fixed costs incurred by it.

- Additional funding required to cover additional needs arising from the investment project exposes the company to financial risk whose magnitude depends on the ratio between the rate of return of invested assets, the economic profitability, and the cost of the used resources, which are mainly acquired.

2. The evaluation of investments profitability

The financial evaluation of investment projects generally aims at two objectives. It primarily aims at making comparisons between competing projects, in order to set up priorities. Secondly an assessment of the inner value of the project should be made.

The investment profitability is one of the basic criteria on which the decision of choosing a investment is made. Financial evaluation of investment projects can be done either by putting emphasis on the average profitability or through updated methods.

The methods based on the average profitability are:

- Average rate of return to service
- The term of recovery of costs

The searching methods based on measuring the size of the *average return rate* of type are the relationships between the average annual outcome and the average annual operating expenditure. Their application determines various formulations according to the indicator chosen to measure the annual results (benefit accounting, gross operating surplus) and the size chosen for the used capital.

Cost recovery period is the time for the fund investor to reconstruct the original advanced funds.[4] This is the number of years in which the initial investment is recovered, based on annual cash flow released from the project and it is a way of choosing the investment alternatives according to the duration of the initial investment recovery.

The term recovery can be determined by summing annual flows that the investment yields until the initial value is reached, without exceeding it, resulting the number of years of recovering the project. It is calculated as the ratio between the initial cost of investment and the annual cash-flow environment.

According to a variant of this method, at the end of each year we calculate the recovery period by comparing the cash flow obtained from the commissioning of the investment with the initial cost of investment.

The interest in such a method is that it takes into account the time, the duration of operation, but the methods of evaluation of the investment projects based on updating take into account time in a much more satisfactory way.

[4] Ilie, Vasile, *Gestiunea financiară a întreprinderii*, Editura Meteor Press, Bucureşti, 2008, p. 251

The methods based on updated cash flows are:

- Net Present Value (NPV)
- Profitability Index (PI)
- Internal rate of return (IRR)

The three methods are in the mean time criteria for the evaluation of investment projects.

Net Present Value (NPV) of an investment project is the difference between the total expected discounted cash flows and the initial cost of investment.

NPV criterion determines actuarial profit which is generated from the investment project as the difference between the sum of all discounted future cash flows and the initial investment.

If NPV <0 then the project is rejected because the rate of return of the investment project is less than the cost of capital.

If NPV = 0 the project can be accepted or not because the capital invested is remunerated at compound interest charged by commercial banks.

If NPV> 0 the project is accepted for the return of the investment is higher than the interest rates or the cost of capital.

Out of the projects that the company holds, by applying the NPV criterion they can identify the acceptable set of projects.

Concerning investment project that requires initial funds F_0 and determines a set of cash-flow forecast F_1, F_2, F_3, ... F_n during its lifetime, if the discount rate applied by the firm is r, NPV can be calculated as follows:

NPV(r) = - cost + initial amount predictable cash-flows discounted

$$NPV = -F_0 + \frac{F1}{1+r} + \frac{F2}{(1+r)^2} + \ldots + \frac{Fn}{(1+r)^n} \text{ or } NPV = -F_0 + \sum_{j=1}^{n} \frac{Fj}{(1+r)^j}$$

Applying NPV meets two difficulties. The first is to forecast the cash-flows that will be generated by the investment. Technical, economic and financial studies prior to the financial evaluation of the investment are needed.

The profitability index (PI) is the net return on invested monetary unit and it is the relative form of expression to net added value. This index is calculated as the ratio of future cash flows and initial expenses. The disadvantage of this indicator is that it supports projects with low initial costs and that is why the NPV indicator is used.

For each project – exclusively, the IP profitability index falls often in conflict with the NPV. In such a case the project as best shown by the NPV is selected.

Internal Rate of Return (IRR) is the discount rate that makes net present value of zero.

$$F_0 = \frac{F1}{1+r} + \frac{F2}{(1+r)^2} + \ldots + \frac{Fn}{(1+r)^n}$$

This rate corresponds to the maximum cost that the company could bear for financing the investment. IRR should be interpreted by comparing with the *weighted average cost* (WAC) of the enterprise resource. If r > WAC, the investment cost is low and allows compensation resources. Internal rate of return is an important criterion to classify the degree of potential investment return.

This involves determining the rate of profitability of the investment capital equivalent to the return that would be obtained if the investor would put the net investment value over a period of time equal to the lifetime of the project, in the system of compounded interest at a bank. Basically, this internal return of investment value is obtained by equating the sum of all future financial flows discounted at the specific rate which is generated during the lifetime of the investment.

The use of IRR criterion is limited. If the company has several projects available for investment then it will choose that internal rate project of return which is the highest. Limited nature of this criterion is that it does not give any reference if the project is accepted or not. For the acceptability of an investment project, in financial practice the NPV is used.

3. Sources of investment funding

In practice, the decision to finance and investment can not be separated. Concerning the capital, with impact over the investments, there are a number of limitations determined by the ability of the company's debt, the market conditions, etc. Such a situation requires rationalization of capital and it implies taking into account the financial factors in measuring the expenses of the investment.

As usual ways of overcoming the financial constraints, expenditure distribution with investments is used for a period of time or doing it in cooperation. In case of financial constraint the decision rule seeks to achieve maximum efficiency for the activity, taking into account the capital costs and the risk class of the project.

If self-financing capacity is insufficient, the company uses external sources of capital.[5] Financing on investment can be made through their own sources (capital fund, depreciation, profits, reserve funds, additional capital, income from investments), attracted sources (domestic resource mobilization) and borrowed funds (loans).

The social capital is the source of financing the investment by which a company is created. Its size is determined by the initiative group, which proposes to the holders of capital the development of the business that the future company is represented by. The depreciation fund aims to replace of fixed assets when they are out of service. Since creating the fund is gradually made on account of sales, the fund is available between the time of formation and the time of use, so that during this time it can be used to finance the investment.

Its destination is thus expanding the volume of additional fixed assets and, on this occasion, their technical improvement (technical progress).

Profit as a source of investment financing, aims at increasing the stock of capital (net fixed capital formation company) and as a complementary destination the replacement of fixed assets. The part of the profit used for this purpose is included within the profit it is determined annually by the Board of Directors in conjunction with the dividend policy, but also with other factors, such as investment, financing needs and other activities/operations, attracting other sources, size profit etc.

Reserve funds are made by profits, annually, through allowances provided either in legal rules (which lead to the formation of legal reserves) or in the status of the company's formation or in the decisions of the Board of Directors. In terms of balance sheet, these funds have equity scheme. The formation of these funds is the existence of additional resources which ensures their reserves of major financial risks. The continuity of collecting these funds makes their quantum important.

The investment decision to use the part of the legal reserve that exceeds the rate established by law is taken as a decision of additional social equity.

The company can earn income from investments in the form of dividends, interest and exchange differences. These revenues "round" the existing availability and can be used to finance the investments when one of the projects for expansion, modernization, renewal included in the company's long term strategy becomes useful.

Mobilizing domestic resources is another source of financing the investment. This source is temporary and it can be used for a relatively short time (three months, usually), until the possibility to establish long-term sources arises. Unlike all other sources of investment, which are recorded in separate accounts, this one doesn't appear in any account.

Domestic resources represent only a temporary release of resources resulting from changes in a given time (one month, one quarter), of the accounts balances of uses and requirements that reflect the investment business.

Loans are another important source of investment financing. The call for credits can be:

- short term (less than one year) to cover monthly or quarterly gap between the investment is borrowing requirements (planned spending is for investment or just starting current) and their sources available for such investment
- medium to long term (over one year) to supplement its own resources.

[5] Stancu, Ion, *Finanțe.Gestiunea financiară a întreprinderii*, vol. III, Editura Economică, Bucureşti, 2003, p. 329

In the second case the call credit is usually established when the investment project is made.

The repayment of loans and associated expenses is made by the company's current and future results and by the net financial flows released from the investment after its entry into service. For short-term loans, the repayment is made from their own sources, if they are available in the following period, in conformity with the existing funding schedules which are approved by the investment project. The formulas of financing the investment through loans vary a lot:

- *Issuance of single-issue bonds*
- *Issuance of convertible bonds*
- *Eurobond* issuance is usually made by banking groups, with multinational interests, in order to invest in an area of interest without having to export capital.
- *Loans from financial institutions* are based on economic resources mobilized by them as investment funds or from insurance companies.
- *Bank credit* is obtained from banks (commercial, investment, mortgage, etc..) under a loan contract credit which states the repayment terms and the guarantees that are required to be established by the debtor.
- *Credit-lease*, called lease or "creditbail", the entrepreneur is the beneficiary of the credit, the creator of the investment and life interest of the resulting object from the investment he made.

The leasing contract is concluded for a period equal to the required one for the full amortization of the investment and cannot be cancelled at the same time by either party. The object of the investment appears only in the annual balance sheet of the owner, while in the entrepreneur's balance there are included only the financial commitments assumed through the contract.

Other sources. This category includes amounts derived from the liquidation of fixed assets, asset sales and recovery of materials resulting from the preparation of the land for construction, from digging foundations or liquidation of temporary buildings on the site.

Conclusions

Given that each investor is interested in obtaining higher profits from the invested funds, considering the specific circumstances of each year and the existing market standing, it is necessary to make assessments of the project or the investment level, in other words this means making the financial analysis of the investment project.

The development of procedures for diagnosing, evaluating and investment decision–making requires a prior delimitation of the operations defined as investments. The analysis based on investment project appreciation criteria leads to the selection of the most beneficial ones.

The provision in due time of the resources needed for the financial covering of investments is a first order necessity and an objective of the company's finances. Investments involve a significant capital mobilization, which determines the need for purchasing or acquiring the related resources.

INTANGIBLE ASSETS – IMPORTANT RESOURCE FOR ENTERPRISE PERFORMANCE MANAGEMENT

ANDREEA PAULA DUMITRU[*]

Abstract

Along time, the goal of intangible assets became very important for the activity and prosperity of business. This matter is achieved as well as more and more the companies operate in a global economy which has as main base the digital revolution and information management. The increase of the immaterial investments percent requires evaluation and recognition criteria by knowledge, intelligence and human competence. But recently, the accounting standards were about to accord negligible attention or even totally ignored the appropriate modalities of report this category of assets. The accounting, obliged to bend to economic, financial and juridical logics, in a „Taylor" modality, presents an unreal image of the company economic life and particularly of investment activity. In a competitive environment, the reliability of future economic benefits, generated by investments, depends less on their material or immaterial nature and more on the characteristics of the market they operate on. These are just a few reflections which determined us to focus our attention to this thought-provoking domain of immaterial investments, appreciated as a potential for the company.

Keywords*: intangible assets; immaterial investments; competences; intelligence; knowledge; competences; potential.*

Introduction

New potent (able) that brought them "information age" led to considerable renewal of the ways in which business is carried out.

Major trends that have broad implications on the performance of firms are: economic activity will continue to internationalize, markets for consumer and intermediate goods will become more sophisticated, the pace of technological change will remain rapid.

In this context, the performance capability of a firm depends on more than one distinctive resource of any company, as an economic system, namely **knowledge.**

What differentiates one from the other is "its ability to use all types of knowledge – from the scientific and technical up to the social, economic and management"[1] to achieve something that has value market.

As an universal social resource, knowledge is not a resource of a firm. A crucial resource of any company is located outside so, as its economic results which are obtained by "exploitation of opportunities".

Deep changes taking place in today's world of business involving the movement of forces driving economic growth, from matter and energy to information and knowledge. The process of "dematerialization" of economic activity changes the source value toward design and innovation activity, knowledge management and organizational skills.

In this context, intangible investments are becoming more important than material investments, by spending more and more significant that a company engages in the design, innovation, training, organization, or exploring new market opportunities.

[*] Lecturer, Ph.D., Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: pauladumitru@univnt ro).

[1] Drucker P. – "Management strategic", Editura Teora, Bucureşti, 2001, p. 11

Business employing increasingly more spending in areas like research and development, staff training, production organization and marketing. These charges are intended to increase the competitive capacity of the company long term, creating value for shareholders.

Including all these costs in the category seems very risky investments because of uncertainty effects that entail:

- Knowledge and skills, in large part, cannot be dissociated from human or material resources (equipment) that incorporates, is hardly controllable by the enterprise;
- Irreversible nature of the expenses involved in training and research, further up the productive sphere, with lasting effects (strategic) to give them the status of invested costs, the risks of non-recovery;
- "perishability" accumulated knowledge and skills is often in a discontinuous and unpredictable world, requiring reconsideration and updating constantly.

Growing importance of intangible investments in increasing business

performance and competitiveness requires an approach and an appropriate accounting treatment for a relevant and reliable financial reporting.

1. Deficiencies of current accounting systems

Current accounting systems, whose tools and financial reporting practices are

still strongly imbued taylorism, difficulties in indentifying and measuring intangible investments.

The major difficulty comes from the absence of relationship "cause-effect" in recognition of intangible expenses such as investment and thus "activate" their balance sheet.

Balance sheet, by his role to represent the company's financial structure, offers, on the one hand, investors (or potential) ability to assess risk assessment estimated return on investment, and offers all guarantees of creditors, as legal protection, recovery amounts advanced temporarily. On the other hand, balance sheet, through the assets they represent, enables the potential capacity to provide liquidity entity.

Although dominated by conflicting demands, the accounting system should highlight the economic potential to support decision allows different categories of users.

Between the two components of financial statements there is a constant tension because they are interconnected and cannot serve different interests. The capital market is concerned primarily profit, at it is apparent from the income statement. If financial statements are primarily aimed at measuring earnings, this means that the balance will reflect "the results of the evaluation process residues"[2].

From this perspective, the accounting system pays excessive attention to short-term financial objectives, to assess business performance. The emphasis on the influence on the outcome of the exercise and financial reporting systems is justified by the speculative interests of managers. They, many times seeking to "invent" means to achieve levels of financial indicators assigned based on whether it is appreciated and the underlying activity remunerated.

The most dangerous consequence management by quantifying the financial indicators of short-term performance is encouraging that is type of behaviour to reduce the intangible investments and the precautionary principle should treat them as expenses in the period. It's vocation of the "informational asymmetry"[3], the precautionary principle may lead to harmful phenomena embellishment of images about wealth and business performance, which may represent an unfair attack on the relevance of accounting information.

[2] Epstein B., Mîrza A., - IFRS 2005 – Interpretarea şi aplicarea Standardelor Internaţionale de Contabilitate şi Raportare Financiară, Editura BMT, Publishing House, Bucureşti, 2005, p.32

[3] Feleagă N., Feleagă M – "Contabilitate financiară – o abordare europeană şi internaţională", vol.I, Editura InfoMega, Bucureşti, 2005

For short-term objectives, to maximize value creation for shareholders (by maximizing the profit or loss) is sacrificing long-term performance. Strategic abdication of responsibilities aimed at a lasting effect, increase the value of the company (through innovation, new markets and products, training and motivation, customer loyalty). Adaptability and even threaten the survival of the enterprise.

It is obvious that these charges, which produce medium and long-term effects that can be regarded is immaterial investments, must have an appropriate accounting treatment.

Forced to obey certain logic while legal, economic, financial, accounting presents a distorted picture of the economic life of the company, neglecting or ignoring for too long the appropriate methods for recognizing and reporting of these investments, assets (property) intangible. As a consequence, practice has not evolved beyond the traditional rules of historical cost.

2. Recognition and evaluation of intangible assets

After a long discussion, an international accounting referential addressed for the first time in detail the accounting for intangible assets by IAS 38 (enacted in 1998), and determining criteria for recognition, measurement bases and reporting requirements of such an assets.

Recognition of intangible assets requires compliance with the following key criteria:

- identifiable character of intangible assets;
- possibility of control over use of such property;
- their ability to generate benefits (economic benefits) of future credible assessment.

Character of an identifiable intangible assets requires it to be "distinguished from goodwill"[4]. Identification condition is satisfied if the intangible asset is separable (can sell, transfer, permit, lease or exchange and may distribute its future economic benefits, without undertaking to deprive future economic benefits from other assets used in the same activities). At the same time, intangible assets should flow from contractual or legal rights of another kind, whether those rights are transferable or separable from the entity or from other rights and obligations.

Identifiable intangible assets include patents, copyrights, licenses, software, marketing rights and know-how specialized. Feature that these elements have in common is nonexistent material substance, physical and having a useful life grater than one year, (determined or undetermined).

Certain intangible assets can be kept in or an object (support) physical: CD (in case of software), legal documentation (for a patent or a license). Clearing up confusion for their correct classification (as property, plant and equipment under IAS 16 or as an intangible asset after IAS 38) should appeal to professional reasoning to identify the relative importance or comparative basis, the most significant element.

For example, software that is part of the operating system (from a computer or computer equipment) is an essential component of that hardware and treated as tangible assets. If the software is not part of the hardware related equipment, it is treated as an intangible asset.

To ensure that only assets which are capitalized and deferred amounts recoverable in future periods is required, under international accounting referential, identification and recognition as more individualized items. This approach is useful because the residual value of acquisitions costs allocated is treated globally, in goodwill, whose impairment is less likely than an asset identified, thus providing less transparent to investors.

The ability to have control over the use of intangible assets: control involves the entity's ability to attract both benefits, future economic benefits arising from their involvement property.

Usually, the entity to obtain or protect their ability to control the legal rights as registered copyrights, patents, restrictions on trade agreements (if this is allowed) or legal coercion of employees to retain confidentiality.

[4] Standardele Internationale de Raportare Financiara, Interpretari la 1 ianuarie 2005, Editura CECCAR, 2005

In the absence of these rights, the entity cannot usually sufficient control of the economic benefits expected from teams of professionals and training programs and training and through specific technical or management skills.

Thus, considerable costs incurred for staff training, building a portfolio of customers, market share, customer or their fidelity can still be recognized as intangible assets, although these expenditures are investments in marketing and as "engines" that bring profits long-term.

"A balanced company is the research and development department and marketing at sharing responsibility to achieve a successful market-oriented innovation"[5]. In practice, however, characterized inter-relationships, often by rivalry and mutual distrust, determine missing several good opportunities.

Creating a foundation for constructive cooperation can only be in the interest of the company, but being aware that each carry a potential impact depending on customer satisfaction and thus to attract economic benefits for the firm.

Advantages (benefits) that may be associated with future economic intangible asset may take the form of revenue from selling products or services, savings, cost reductions and other economic benefits resulting from the use of intangible asset to the firm.

However, is recognition of an intangible asset conditional probability that the economic benefits attributable to it to return the entity. Evaluating the likelihood of the future economic benefits must be made on the basis of rational calculations that represent the best estimate for the set of economic conditions existing during the life of the asset.

Use reasoning to assess the safety associated with its future economic gain intangible asset is based upon the evidence available to initial recognition, giving priority to external evidence. Calling at fair value, determined primarily by reference to an active market or, failing that, using the best available information involves determining the present value of cash flow, adjusted according to the probability of its realization and the time value of money. Even at a low probability of occurrence of cash flow, fair value is considered as can be determined, and the asset will be recognized.

At the international level referential rightly converge more and more opinions to reflect the probability assessment of an asset, instead of its use as a threshold criterion of recognition, which will lead to amendment of the framework.

Credible evaluation of intangible assets is contingent on how to obtain them, such as initial assessment is done at their cost of production.

For a separately acquired intangible asset, the price paid for getting to the expectations about the probability that future economic benefits associated with immobilization purchased to return the enterprise. In other words, the effect probability is represented in the cost of immobilization. Or acquisition cost includes purchase price, including tax and excise duty stranded plus costs directly attributable to the intentional use immobilization preparations (handwork including employee benefits, arising directly from bringing the asset to its operating condition, professional fees arising from the same end, the costs of testing the proper functioning of immobilization). As in the case of tangible assets (IAS 16), capitalization of costs ceases when the intangible asset is ready for its intended use.

In many case, are internally generated intangible assets. Baseline to which they are recognized as assets is difficult to determine due to the nature of these categories of property, for which many were committed to spending at the time of their recognition as an asset.

Expenditure on intangible assets are getting treated according to the stage where they are involved in their creation or in the research phase or stage of development.

The whole reasoning is based on credible evaluation of the project concept (as a set of joint actions and schedule for a particular purpose). Capitalization of expenses incurred in obtaining an intangible asset is subject to their reliable measurement using a customized project.

[5] Kotler Ph. – Managementul marketingului, Editura Teora, Bucuresti, 2005

In the research phase of an internal project, expenditure on activities whose purpose is to obtain new knowledge, searching, delivering, evaluating and selecting alternatives. These costs are recognized as cost in the period were employed.

The development phase of an internal project involves expenses that can be capitalized of it is demonstrated the technical feasibility of completing, the intangible asset, intending to complete their ability to use or sell the restraint, the mechanism by which future benefits will likely evolve the ability to assess credible cost attributable to immobilization during its development.

In practice, the distinction between research costs and the phase of the development phase is, in many cases quite difficult.

Categories of assets that brand-names, may be difficult to estimate values that meet the criteria for their recognition as separate assets of internally generated goodwill. Not recognize them as assets is justified by the principle of prudence, capitalization of expenses involving failure to uncertainty rather than on evaluation methods with the volatile nature of their value. Hence the unequal treatment of acquired intangible assets from internally generated is not limited to their initial recognition, but it also regards their depreciation policy. The life of an intangible asset may be very long or even indefinite. Uncertainty justify caution to estimate the duration of her life, but life does not justify an unrealistically short. There may be both economic factors and legal factors that influence the life of an intangible asset. Economic factors determine the period in which the company will receive future economic benefits.

Legal factors may restrict the period in which the company controls access to those benefits. Life is the shortest of the periods determined by these factors, and the depreciated value of intangible assets will be allocated on a systematic basis over the term.

The life of an intangible asset is regarded as an undetermined time based on analysis of all factors (intended use of the asset by the enterprise, the typical life cycles, technology usage, commercial or other types of wear, stability domain, the expected actions of competitors, the costs of maintenance, control over the immobilization period, depending on the asset useful life that of another asset) there is no foreseeable limit to the period during which the asset is expected to generate net cash flows for the enterprise. In this case allegedly immobilization test for impairment under IAS 36, recoverable value comparing the carrying amount annually and whenever there is evidence that immobilization may be impaired.

Conclusions

The issue of recognition and evaluation of intangible assets, for which we tried to point out some defining elements, continues to incite controversy more so as, in a society marked by competition and change, the estimate of future benefits arising from investment depends less on the nature material or immaterial, and features more than the market within which it operates (the degree of competition, rapid technological change).

Relevance and reliability of accounting information claiming an appropriate accounting treatment, and international bodies (IASB and FASB) accounting standard – they put on their agenda a long-term joint project of accounting for intangible assets.

For now, the accounting regulations encourage (with out requiring) companies to disclose in the notes the categories of investments that have an impact on long-term performance of the company, but not above the threshold limiting their recognition as assets (IAS 38) in the balance sheet.

Accounting evolution is slow and there is always a gap between the volume of investments and intangible assets recognized immaterial, because you cannot make a reliable assessment of all components involved in the investment process.

COMPARATIVE ANALYSIS OF THE LEVEL OF TAXATION IN ROMANIA AND EUROPEAN UNION

MARIA ZENOVIA GRIGORE [*]
MARIANA GURĂU [**]

Abstract
This paper contains a statistical and economic analysis of the tax system of Romania in the last decade, as well as comparisons with the other states of the European Union.
The overall tax ratio of Romania, i.e. the sum of taxes and social security contributions in the Gross Domestic Product (GDP), is the lowest in the European Union. Considering the fact that the GDP value, that constitutes the denominator of the overall tax ratio, includes estimates of production by the informal sector (the "grey" and "black" economy), this reduction can be explained not only by tax reductions, but also by the high tax evasion.

Key words: *taxation, tax revenues, tax policy, tax system, implicit tax rates*

Introduction

Taxes bring revenues to the public budget and those who pay them are directly interested by the system and the way in which the government spends the money. Taxes are the basis of a stable and prosperous society. As a result of the global economic crisis, the collecting of taxes is more and more difficult. Although is quite obvious that governments have to increase taxes and reduce public expenses, they will have to take these measures carefully, given the fact that „too much tax kills the tax".

We shall present in this work in a concise and theoretical way the concept of tax burden (emphasizing the factors which determine its level and the consequences of the level of tax burden upon the economy of a country), then we will analyse the level of taxation in EU and Romania in the last decade, and finally we will try to identify the taken fiscal measures and the ones that should be taken by the government of Romania, and by the governments of other Member States, for answer to the present global financial crisis.

The greater part of data presented and analysed in this work are taken from the 2010 edition of the report „Taxation trends in the European Union"[1], published by Eurostat, the Statistical Office of European Union and European Commision - Taxation and Customs Union. This report presents a number of fiscal harmonized indicators, based upon The European System of Accounts (ESA95), a system which allows a fair comparison of taxation systems and fiscal policies between the Member States of EU.

The present work focuses also upon the report „Doing Business 2011"[2], realised by the World Bank (WB) in co-operation with International Financial Corporation (IFC) and upon the study „Paying taxes 2011"[3], realised by WB, IFC and PricewaterhouseCoopers (PwC). This last report looks at tax systems from the business perspective, because business plays an essential role in contributing to economic growth and prosperity by employing workers, improving the skills and

knowledge base, buying from local suppliers and providing affordable products that improve people's lives. Business also pays and generates many taxes. As well as corporate income tax on profits, these include employment taxes, social contributions, indirect taxes and property taxes. Therefore, the impact that tax systems have on business is important. The two reports of WB, IFC and PwC analyze the facility in paying taxes in 183 economies from world-wide. The indicators used measures the cost of taxes paid by a standard company, but also the administrative charges due to accomplishment of fiscal obligations. Both aspects are very important for a company. These are measured through the identification of three sub-indicators: total tax rate (cost of all paid taxes), necessary time to accomplish the fiscal obligations (income tax, social security contributions paid by the employer, property taxes, transfer of properties taxes, dividends tax, capital income tax, financial transactions tax, wastes collecting taxes, as well as motor vehicle taxes and road taxes), as well as the number of fiscal payments made by the company during a fiscal year.

1. Tax burden. Factors of influence and consequences

Tax burden shows the level of pressure of taxes or in other words, how much is the fiscal burden lying heavy on tax payers' shoulders. The most common way to measure the tax burden of a country is the overall tax ratio (OTR), i.e. the sum of taxes and social security contributions as a percentage of gross domestic product (GDP). This indicator reflects the part from revenues created at the level of real economy that is shifted to the State through the taxes and social contributions. OTR is influenced by two categories of factors: external and internal.

Through the external ones, we can mention:

- the level of development of the country, given by the GDP value per inhabitant. Usually, the tax burden is greater in the countries which have a high level of GDP per inhabitant since the capacity of fiscal contribution of inhabitants is higher in these States.

- the level of taxation from other countries. The fiscal policy of a state has to take into consideration the fiscal policies of other countries, since a high tax burden can determine a migration of money and manpower to countries with a lower taxation.

- the level and structure of public expenses. In countries where public expenses for education, culture, health, social security etc. are greater, the State can pretend higher taxes, since their degree of reversibility is substantial.

The internal factors which influence the level of taxation are:

- the type of used tax rates (generally progressive or proportional rates). In states where the progressive rates are most used, the tax burden is higher.

- the methods of valuation and determination of the used tax base. Different methods can determine an overvaluation or an undervaluation of the taxable product.

- the offered fiscal facilities (exemptions, deductions or reductions to tax payment). The higher their number, the lower the tax burden.

Knowing the level of taxation is important because its high level can have bad consequences upon the economy of a country. Among these effects, we can mention:

- effects upon the production. A high level of taxation of labour, savings and investments determines the diminution of production under two aspects: discourages the setting up of a business (diminishes the enterprising spirit) and also discourages work.

- effects upon the purchasing power. When taxes increase, companies seek to include in the sale prices of these rises, and the employees want higher salaries to compensate for the reduction of purchasing power resulted from the rise of prices. The wage rises are introduced also in the sale prices and therefore we are put face to face to a vicious circle.

- effects upon the degree of tax receipts. In the case of tax burden rise, it appears the phenomenon of tax resistance, expressed by the underground economy and international tax evasion.

2. Level of taxation in European Union

In 2008, the first year of economic and financial crisis, the overall tax ratio was of 39,3% in EU-27[4], in a slight decrease as compared to 2007, when it was situated at 39,7% **(table no. 1)**. This ratio, which was of 40,6% in 2000, decreased till 38,9% in 2004, before rising till 2007.

Table no. 1. Total tax revenue (including social security contributions) in % of GDP

Source: http://ec.europa.eu/eurostat

The total tax burden in euro area (EU-16[5]) was of 39,7% from GDP in 2008 as compared to 40,4% in 2007. From 2000, taxes in euro area had a similar tendency to EU-27, though at a slight higher level.

[4] Belgium, Bulgaria, Czech Republic, Denmark, Germany, Estonia, Ireland, Greece, Spain, France, Italy, Cyprus, Latvia, Lithuania, Luxembourg, Hungary, Malta, Netherlands, Austria, Poland, Portugal, Romania, Slovenia, Slovakia, Finland, Sweden, United Kingdom

In comparison with other countries, generally the tax burden remains high in EU-27. Thus, in 2008 OTR in EU-27 was with 13,2% higher than that registered in United States, with 11,2% higher than that from Japan and with 4,5 % higher than the average of OCDE Member States[6].

In spite of all these, the tax burden varies significantly from a Member State to another. In 2008 the most reduced levels of OTR were registered in Romania (28,0%), Latvia (28,9%), Slovakia (29,1%) and Ireland (29,3%), and the highest in Denmark (48,2%) and Sweden (47,1%).

Between 2000 and 2008, the highest reductions of OTR were registered in Slovakia (from 34,1% in 2000 to 29,1% in 2008), Sweden (from 51,8% to 47,1%) and Finland (from 47,2% to 43,1%), and the highest rises in Cyprus (from 30,0% to 39,2%) and Malta (from 28,2% to 34,5%).

In 2008, the effects of financial crisis were felt most at the level of public expenses than at the level of public revenues, because of the choosing of expenses programs meant to prevent the impact of crisis. OTR rose in nine Member States as compared to 2007.

Implicit tax rates (ITR) measure the effective average tax burden on different types of economic income or activities, i.e. on labour, consumption and capital, as the ratio between revenue from the tax type under consideration and its (maximum possible) base. The data from the **table no. 2** help us to understand how the level of taxation evolved under the aspect of these three economic incomes.

Source: http://ec.europa.eu/eurostat

The labour taxes remain the most important source of fiscal incomes, representing over 40% from total revenues in EU-27, followed by the consumption tax at about a quarter and capital tax, which represents little more than a fifth.

ITR on labour[7], which measures the degree of labour incomes taxation, remained as a matter of fact unchanged in EU-27, being situated at 34,2% in 2008 as compared to 34,3% in 2007, after has decreased from 2000, when it was of 35,8%. Among Member States, ITR on labour varied in 2008 from 20,2% in Malta, 24,5% in Cyprus and 24,6% in Ireland, to 42,8% in Italy, 42,6 % in Belgium and 42,4% in Hungary.

ITR on consumption[8], which increased in EU-27 between 2001 and 2007, it decreased from 22,2% in 2007 to 21,5% in 2008. In 2008, the lowest values of ITR on consumption were in Spain (14,1%), Greece (15,1%) and Italy (16,4%) and the highest in Denmark (32,4%), Sweden (28,4%) and Luxemburg (27,1%).

In EU-27 ITR on capital [9] was of 26,1% in 2008 as compared to 26,8% in 2007. The lowest values of the ration were registered in Estonia (10,7%), Latvia (12,4%) and Ireland (15,7%), and the highest in United Kingdom (45,9%), Denmark (43,1%) and France (38,8%).

In order to compare the maximum personal income tax rate and corporate income tax rate, we will use the data from **table no. 3**.

The maximum personal income tax rate (PIT)[10] rose in EU-27 in 2010, mostly because of an increase of 10 percentage points in United Kingdom. In 2010, the maximum personal income tax rates were highest in Sweden (56,4%), Belgium (53,7%) and Netherlands (52,0%), and the lowest in Bulgaria (10,0%) and Czech Republic (15,0%) and Lithuania (15,0%). Between 2000 and 2010, the highest diminutions were registered in Bulgaria (from 40,0% in 2000 to 10,0% in 2010), Romania (from 40,0% to 16,0%) and Slovakia (from 42,0% to 19,0%), these countries applying the single tax rate system. The highest rises of the rate in the same period were registered in United Kingdom (from 40,0% to 50,0%) and Sweden (from 51,5% to 56,4%).

[7] The ITR on labour is calculated as the ratio of taxes and social security contributions on employed labour income to total compensation of employees.

[8] The ITR on consumption is the ratio between the revenue from all consumption taxes and the final consumption expenditure of households.

[9] The ITR on capital is the ratio between taxes on capital and aggregate capital and savings income. Specifically it includes taxes levied on the income earned from savings and investments by households and corporations and taxes, related to stocks of capital stemming from savings and investment in previous periods. The denominator of the capital ITR is an approximation of world-wide capital and business income of residents for domestic tax purposes.

[10] The top statutory personal income tax rate reflects the tax rate for the highest income bracket. The rates also include surcharges, state and local taxes.

Source: http://europa.eu/

The corporate income tax (CIT)[11] rates continued to decrease in 2010 in EU-27. The highest levels of CIT in 2010 were registered in Malta (35,0%), France (34,4%) and Belgium (34,0%), and the lowest in Bulgaria (10,0%), Cyprus (10,0%) and Ireland (12,5%). Between 2000 and 2010, the highest diminutions of rate were registered in Bulgaria (from 32,5% to 10,0%), Germany (from 51,6% to 29,8%), Cyprus (from 29,0% to 10,0%) and Greece (from 40,0% to 24,0%).

According to the data from **table no. 4**, in EU-27 the VAT standard average rate rose from 19,8% in 2009 to 20,2% in 2010. As compared to 2000, in 2010 the rise of VAT average rate was of

[11] Taxation of corporate income is not only conducted through the CIT, but, in some Member States, also through surcharges or even additional taxes levied on tax bases that are similar but often not identical to the CIT. In order to take these features into account, the simple CIT rate has been adjusted for comparison purposes: notably, if several rates exist, only the 'basic' (non-targeted) top rate is presented; existing surcharges and averages of local taxes are added to the standard rate.

1%. In 2010, the VAT standard rate varies from 15,0% in Cyprus and Luxemburg, to 25,0% in Denmark, Hungary and Sweden.

Table no. 4. Standard rate of value added tax, in %

Source: http://europa.eu/

Between 2000 and 2010, the VAT rate remained unchanged in 13 Member States, rose in 12 Member States and diminished only in Slovakia (from 23,0% in 2000 to 19,0% in 2010) and Czech Republic (from 22, 0% to 20,0%). The highest rises were registered in Greece (from 18,0% to 23,0%) and Cyprus (from 10,0% to 15,0%).

The EU Commission forecasts that in 2009-2011 the overall tax ratio will remain well below 2008 levels, as governments are keen to maintain favourable conditions for business development. However, in the longer term, the accumulation of debt by Member States leads to expect that governments will try to consolidate their budgets, so that the tax cuts will be limited. In addition, EU general government expenditure has increased considerably: from 2007 to 2010 it has risen by more than five points of GDP, surpassing the 50% mark. The expenditure ratio is expected to start declining only in 2011.

3. Level of taxation in Romania

According to the data from **table no. 5**, the overall tax ratio in Romania was of 28,0% in 2008, with 9 percentage points lower than the average EU-27 (37,0%). The taxation level in Romania is the lowest from EU and significantly lower than in neighbouring countries Bulgaria (33,3%) and Hungary (40,4%).

Table no. 5. Taxation in Romania (2000-2008)

	2000	2001	2002	2003	2004	2005	2006	2007	2008	Ranking in 2008*

According to data published by the Ministry of Public Finance of Romania, in 2010 Romania registered the lowest value of the overall tax-to-GDP ratio from the last decade: 27,1%, in decrease as compared to 2009, when it was of 27,4% **(table no. 6)**.

Table no. 6. Taxation in Romania (2009-2010)

The fiscal structure from Romania points out in many respects. In Romania the indirect taxes have a very great weight, since in 2008 Romania occupied from this point of view the fourth place in EU-27 after Bulgaria, Cyprus and Malta. Indirect taxes ensure 42,7% from total fiscal revenues, as compared to 37,6% EU-27 average, while the weight of social security contributions is of 33,3% (as compared to the EU-27 average of 30,2%) and of direct taxes of only 24,0% (the average in EU-27 is of 32,4%). An important element which determined this structure is the VAT high weight in total tax (28,2% in 2008), the third biggest within EU-27. The low level of direct taxes is due mainly to low personal income taxes (only 3,4% from GDP), comprising about 42% from EU-27 average. If in 2009 the structure of revenues from the three types of taxes modified in the sense of reduction of the weight of indirect taxes to 39% and of rise of weight of social security contributions to 35,4% and of direct taxes to 25,6%, in 2010, the structure of taxes was very close to that from 2008. **(table no. 7)**

Table no. 7. Taxation in Romania (2008-2010)

Structure of revenues (% of total taxation)	2008	2009	2010
Indirect taxes	42,7	39,0	43,1
Direct taxes	24,0	25,6	24,0
Social contributions	33,0	35,4	32,9
TOTAL	**100,0**	**100,0**	**100,0**

Source:
http://discutii.mfinante.ro/static/10/Mfp/buget/executii/anexa2_bgcdec2010.pdf
http://discutii.mfinante.ro/static/10/Mfp/buget/executii/dec2008.pdf

In 2008, the weight of central government revenues is more than a half from total (62,9%), while the local government revenues are marginal, composed of only 3,2%. The weight of social contributions is of 32,9%, with almost four percentage points over EU-27 average. In spite of all these, in percentage from GDP, the revenues from social security contributions are with 1,5 percentage points under EU-27 average.

The overall tax ratio decreased continually within the period 2000-2004 with a total of three percentage points, mainly due to a reduction of revenues from social security contributions paid by employers, which diminished with more than one quarter. The rise of revenues from all three major fiscal categories, lead later on to a rise of OTR from 27,2% (in 2004) to 29,0% in 2007. In the following three years, the ratio registered again a descending trend, arriving to 28,0% in 2008, 27,4% in 2009 and 27,1% in 2010.

In order to compare the level of taxation from Romania with the one from EU-27 under the aspect of the three economic functions: consumption, labour and capital, we shall analyse the data from **table no. 5.**

The ITR on consumption is of 17,7% in 2008, with 3,8 percentage points lower than EU-27 average. As a result of the very big weight of final consumption of households in GDP, the consumption taxes as per cent of GDP are still in conformity with EU-27 average (11,2% as compared to EU-27 average of 12,0%).

The ITR on labour decreased constantly during the period 2000-2005, in total with more than five percentage points. The most significant reduction, of about a percentage point, can be noticed in 2005, the year of introduction of flat rate of personal incomes taxation (16%). Although, in 2006, ITRL increased with two percentage points and remained enough stable in 2007, but decreased in 2008 to 29,5%. ITRL was significantly below EU-27 average (34,2%), mainly as a result of low receipts from wage income tax. The cause is not only the reduced level of rate, but also the illicit work that is a common practice in Romania.

Capital taxation is one of the lowest in EU-27, obtaining only 5,2% from GDP, as compared to EU-27 average of 7,5%. This is due to reduced revenues from all categories of capital taxes. Because of the lack of data, ITR on capital is not available for Romania.

On the basis of available data, the environment taxes of 1,8% from GDP in 2008, are much below the EU-27 average (2,6%). In fact, this value is the third lowest in EU. Most of these taxes are applied to energy. Each of the other two categories of environment taxes, transport and pollution taxes, raise at least than half from EU average. The incomes from environment taxes decreased in the last years.

In **table no. 8** there are comprised the structural modifications of main taxes according to „Fiscal-Budgetary Strategy" of the Government during the period 2011-2013.

Table no. 8. The structural modifications of taxes in Romania in 2011-2013

Taxes	**% in GDP**
Personal income tax	3,3%-3,4%
Corporate income tax	2,1%
VAT	7,9-7,8%
Excise duties	3,2%-3,1%
Social security contributions	8,9-8,2%

Source: http://discutii.mfinante.ro/static/10/Mfp/strategbug/STRATEGIA_FB_27sept.pdf

For this period, there are planned the following measures in the fiscal domain:

a) Personal income tax. The rate of 16% will be maintained.

b) Corporate income tax. The rate of 16% will be maintained.

c) VAT. The standard VAT rate was increased from 19% to 24% beginning with 1st July 2010. Regarding the reduced rates, the Government's goal is to maintain the present values, respectively the 9% rate for some deliveries of goods and services stipulated by Fiscal Code and the 5% rate for delivery of dwellings as part of the social politics.

Also, the Government will follow the continuation of legislation improvement for the harmonization with the EU legislation, by transposition into national legislation of directives adopted at european level in VAT domain.

Regarding the legislative measures of reduction of fiscal fraud in VAT domain, these were concretized in:

- setting up of the Register of Intra-Community Operators, beginning with 1st July 2010, a measure introduced with the purpose of diminishing the fiscal evasion in the domain of intra-community operations.

- application of inverse taxation mechanism for deliveries of goods within the country from the following categories: cereals and technical plants, vegetables, fruits, meat, sugar, flour, bread, and bakery products, between taxable persons registered normally for VAT purposes. This measure will be applied after the obtaining by Romania of the authorization for application of derogation from provisions of art.193 from 112/2006/CE Directive regarding the common system of VAT with the ulterior modifications and completions, and it will come into force till 31st December 2011.

d) Excise duties. The Government aims at rising the excise duties in view of attaining the minimum level imposed by the community legislation in field, according to transition periods offered to Romania by European Commission, stipulated in the Adhesion Treaty and in 2010/12/CE Directive of modification of tobacco directives.

e) Social security contributions. The rates of social security contributions will be maintained on middle term.

The moderate evolution of gross average salary on middle term and gradual implementation of second pillar of pensions will lead to the diminution of weight of social security contributions in GDP till 2013 as compared to the level registered in 2008.

f) Local government taxes. We have in view the modification of fiscal legislation in the sense of granting the right to local authorities to modify the level of local rates and taxes depending on local necessities and the degree of supportability of population and through the implementation of a calculation system of the tax value of buildings and lands from built-up area by relating to their market value, where this is obviously greater than that determined through the calculus formula.

4. Fiscal reform as anti-crisis solution

According to the study „Paying taxes 2011"[12], almost 60% of the States from world-wide made legislative and procedural modifications meant to facilitate the taxes payment, despite the impact of recession and of heavy economic recovery.

The report shows the fact that in the last year, 40 States simplified the payment procedures of taxes. For countries in question, the necessary time to accomplish the tax liabilities decreased with a week on average, the cost of fiscal administration decreased with 5% on average, and the number of payments decreased with almost four. In total, 90 States reduced the corporative tax burden as compared to 2006.

According to the study, a typical company uses almost half of its profit for the payment of rates and taxes and spends seven weeks on average accomplishing the administrative charges due to tax liabilities payment, making a payment on average at each 12 days.

The report shows that the payment of taxes is easier for companies from developed economies which have the lowest costs to accomplish the tax liabilities and the most reduced bureaucracy. These economies tend to have mature fiscal systems, a much reduced administrative burden and use more the electronic means for tax payment and filling out the financial statements.

The conclusions of the study „Paying taxes 2011"regarding EU can be synthesized thus:

- Seven States from EU implemented during 2009-2010 fiscal reforms to facilitate the taxes'payment: Bulgaria, Czech Republic, Hungary, Lithuania, Netherlands, Portugal and Slovenia.

- UE situates below the global middle level as regards all the three sub-indicators. The total tax rate is of 44,2% (as compared to global average of 47,8%), the necessary time to observe the tax liabilities is of 222 hours (global average: 282), and the number of payments is 17,5 (global average: 29,9).

- The average number of taxes that the standard company must pay is of 9 at global level. The average in EU is of 10,9, varying from 5 in Sweden to 17 in Hungary, Romania and Italy.

- The taxes and contributions on wages and salaries represent the biggest part of the tax burden in EU – that is 64,3% from total tax rate in EU, as compared to global average of 33,8%.

- Many EU Member States have numerous taxes and contributions on wages, fact which increases the fiscal bureaucracy.

- The VAT rate is regulated at the community level, but the necessary time to observe the tax liabilities comprised in the VAT legislation varies depending on various administrative used practices. For example, the observance of tax liabilities regarding VAT needs 222 hours in Finland and 288 in Bulgaria.

In the analyse that gathers 183 of 191 States recognized in the world, Romania situates on the 151 place from the point of view of the facility with which taxes of a business can be paid, in a slight regress in comparison with the previous edition when it came on 147 place. This positioning is not due only to the Romanian tax system itself, but also to the tax reforms implemented in other countries.

The position of Romania in the second half of the classification is strongly influenced by the great number of payments of rates and taxes: no less than 133 payments during a year, of which 84 refer to payments of social security contributions. Romania occupies the second place at global level regarding the number of payment of taxes, being surpassed only by Ukraine (135). The biggest problem is the fact that there is no functional electronic system for payments.

The number of necessary hours for the compliance with fiscal legislation increased during last year from 202 hours to 222 hours in this year report. This is due mainly to the introduction of more difficult regulations regarding the employment contracts, as well as to the regulations regarding the profit tax payment (the minimum tax was removed since 1st October 2010).

[12] http://www.pwc.com/gx/en/paying-taxes/pdf/paying-taxes-2011.pdf

More, specialists expect that the fiscal measures taken by the Government during 2010 affect in the future the indicator regarding the tax payment. It's about the VAT increase from 19% to 24%, together with the introduction of new regulations regarding the VAT payment, an increase of local taxes (for example the motor vehicle tax, certificate issue tax, notifications and authorizations for publicity), as well as the introduction of a new system of penalty for delays in paying taxes.

The Romanian Government has also postponed the introduction of a simplified advance corporate income tax payments system (already implemented for banks), until 2012. When the system is introduced, it is expected that it will make the compliance procedure easier for the taxpayer and reduce the number of hours required.

The reduction of bureaucracy and of taxation level could have a good effect now when investors run from neighbouring countries because of the tax increases and seek new alternatives. Romania can profit by the unattractive economic policies of its neighbours to bring more foreign capital in the country.

In the last years, Hungary was a destination loved by foreign companies. The Hungarians surpass us in the classification of most propitious countries to start a business, as it results from the report „Doing Business 2011". They situate on 52 place and Romania on 54. But last year, the Government from Budapest decided the imposing of new „crisis" taxes and increase of some taxes to bring money to budget. Thus, the profit tax for earnings of over 2,5 millions dollars was increased from 16 to 19%. The energy, telecommunication and retail domains (dominated by foreign investors) must now pay additional taxes, called by economists the „Robin Hood taxes", comprised between 1,05% and 6,5%. Moreover, although approved at the end of last year, they will be applied retroactively also for 2010. Many foreign companies warned Hungarian Government that if the situation didn't change, they would relocate their operations. Romania could become a target for them, with minimum of effort.

Global crisis is only one of the causes which led to the decrease of foreign capital in Romania. Our country didn't attain its maximum potential not even in the boom period of direct foreign investments (2008). If we look at the total tax rate (**table no. 9**), Romania is more competitive than its Austrian, Slovakian, Czech, Ukrainian, Hungarian neighbours. But, we still have a lot of work. For example, we should eliminate the great number of taxes that an entrepreneur must pay in Romania.

Table no. 9. Total tax rate in states of Central and Eastern Europe

	States of Central and Eastern Europe	**Total tax rate (%)**
1.	Belarus	80,4
2.	Austria	55,5
3.	Ukraine	55,0
4.	Hungary	53,3
5.	Czech Republic	48,8
6.	Slovakia	48,7
7.	**Romania**	**44,9**
8.	Poland	42,3
9.	Albania	40,6
10.	Slovenia	35,4
11.	Serbia	34,0

13.	Moldova	30,9
14.	Bulgaria	29,0
15.	Bosnia and Herzegovina	23,0
16.	Macedonia	10,6

Source: http://www.pwc.com/gx/en/paying-taxes/pdf/paying-taxes-2011.pdf

Conclusions

As a result of the current economic crises, the focus on the role that tax can play in international development has increased. Tax revenues are a more sustainable source of financing for developing countries than debt or aid. But there are many challenges to tackle in increasing tax revenues in developing countries, including combating capital flight from these countries, reducing the size of their informal economies and helping their tax authorities to monitor compliance and collect the taxes due. The "Paying Taxes-2011" study results show that tax rates tend to be higher and the compliance burden heavier in the developing world. Reducing tax rates, broadening the tax base and making it easy to pay, can be important in encouraging local business to register and pay tax.

In the last three years, in European Union the trend was of reduction of taxation level, especially in the domain of corporate income tax. The reason is the competition between States to attract foreign investments which imply new jobs and prosperity. All the States try to create a competitive business environment, a fact proved by the reduction of total taxes ratio in the commercial profits, whose average decreased from 50,6% in 2004 to 49,8% in 2008 and 47,8% in 2010[13].

Romania can boast with the most reduced level of taxation from EU. Though, because of the bad assigned tax burden (high weight of social security contributions and of indirect taxes) and because of the bureaucracy, corruption and legislative instability, Romania is far to be a „tax haven".

The fiscal policies promoted by Romanian Governments influenced not only the structural evolution of fiscal system but also the size of taxes. The level of taxation was determined by the proportions of granted fiscal facilities (exemptions, reductions, deductions), of the level and type of rates, but also by the sensibility of taxable product. The social-economic policies promoted in economy influenced the tax burden through some factors as: degree of economic development, structure of property, structural distribution of revenues, structural evolution of global consumption etc. More, the quality of fiscal debts administration and the level of fiscal education of the population influence, through the fiscal fraud, the tax receipts and the tax burden.

Having a the reduced level of taxation, Romania can profit by the fact that the investors run from neighbouring countries because of the tax increases and seek new alternatives. We consider that the following measures in the fiscal domain could prove efficient to attract more foreign capital in the country:

- Reduction of bureaucracy. The time lost by Romanian companies to pay their taxes to the State represents a too great obstacle for potential investors. The introduction of unique printed form for payment of taxes and social security contributions is the first step to the reduction of bureaucracy.
- Tax reduction. Although if we look only at the total tax rate, Romania is doing better than other neighbours, the indirect taxes and the social security contributions remain between the highest in Europe. Their diminution will stimulate investors, stir up the labour market and finally it will be reflected in the consumption increase.
- Fiscal predictability. In the last six years, the Fiscal Code was modified of 60 times. The situation is more critical as, in many cases, the changes came into force immediately, as it happened with the increase with five percentage points of the VAT (from 19 to 24%).
- Simplification of juridical system. If the period to solve litigation is long, the investors prefer to avoid the respective State. An inefficient juridical system is one of the first things that damages to the attraction of foreign capital.

If Romania will take these measures and know to use its advantages (cheap labour, geographical position, available agricultural land, easy access to natural resources with advantageous

[13] http://www.pwc.com/gx/en/paying-taxes/pdf/paying-taxes-2011.pdf

price, potential of market growth in financial-banking, energy, telecommunications, transports, retail domains etc.) it could attract foreign investors, situation that generates many taxes.

FINANCIAL DEVELOPMENT AND ROMANIAN SMES

DANIELA-RODICA SILIVESTRU (POPESCU)*

Abstract

Research has shown that financial development accelerates economic growth but little has been discussed about the disproportionate effect a country's financial development has on the growth of its small firms. With this in mind we propose a panel data analysis of the Romanian SMEs over the period 2002-2008. The results show that financial development exerts a positive effect on small firms relative to large ones. The analysis is based on data regarding: (a) the relative size of Romanian small and medium size enterprises (SMEs) in sectors like: industry, trade and services (calculated as the share of value added by different size class SMEs in total country's value added); (b) each sector's employment share and (c) Romania's level of financial development.

Keywords: *financial development, SMEs, firm size*

Introduction

Financial development is defined *"as the factors, policies, and institutions that lead to effective financial intermediation and markets, and deep and broad access to capital and financial services"*[1]. Following this statement local financial development can be regarded as a tool in assessing a country's economic performance in terms of local market's capacity to offer a stable source of financing for the private and public sector.

The following paper aims to empirically investigate the extent to which the local level of financial development favors small and medium sized enterprises (henceforth SMEs) over large ones and in which sectors. By analyzing the impact of financial development on the distribution of Romanian SMEs by sector of activity and by size class we try to answer a simple question: which are the most favored SMEs by the Romanian financial system?

The study is important for at least two reasons:

a) Knowing which sectors are mostly sought by financial intermediaries offers a broad perspective on the allocation of financial resources on the market. In addition by examining the size class distribution we are able to identify which enterprises are more likely to benefit from financial intermediary development

b) Romanian SMEs play a less prominent role in the local economy than their counterparts do, on an average in other EU Member States. This holds true for their contribution to employment (63.6 % vs. 67.4 % in the EU) but especially for their contribution to value added (42.2 %) which is significantly below the European average (57.9 %)[2]. One of the reasons why such situation is present is the fact that Romania's financial system still lags behind in supporting SMEs growth in spite of the tremendous changes it faced during the last couple of years when considerable progress had been made in restructuring and consolidating the banking sector, liberalizing the markets and opening-up to foreign ownership[3].

To study the impact of Romania's financial development on SMEs growth by sector of activity and size class we proposed an empirical analysis which integrates data regarding SMEs value added and employment for 38 sectors during 2002 and 2008.

Based on Beck, Demirgüc-Kunt, Laeven, and Levine (2008)[4] research this paper focuses on a specific country by examining a broad cross section of economic sectors in which SMEs are present and testing whether overall financial development influences a specific size class SMEs more than the others.

The remainder of the paper is organized as follows. Section 2 presents a brief review of the literature on the issue concerning the effects of financial development on economic and firm's growth. Section 3 provides a short overview on Romanian SMEs and the local financial development. Section 4 describes the data and methodology used. Section 5 illustrates the main results and tests performed, and section 6 gives the concluding remarks.

Literature review

In the last few years several influential papers have examined the relationship between finance and growth at industry-level and firm-level in an attempt to document in greater detail the mechanisms, through which finance influences economic growth. Rajan and Zingales (1998)[5] managed to empirically prove that industrial sectors that are relatively more in need of external finance develop disproportionately faster in countries with more developed financial markets. They concluded that the level of financial development can also be seen as a factor in determining the size composition of an industry as well as its concentration.

Using Rajan and Zingales methodology, Cetorelli and Gambera (1999)[6] examined the role played by banking sector concentration on firm access to capital, showing that bank concentration promotes the growth of industries that are naturally heavy users of external finance by facilitating credit access to younger firms. In a different study Beck, Demirgüc-Kunt, and Maksimovic (2004)[7] find that small firms use less external finance than large firms (especially in terms of banks and equity finance) but benefit the most from better protection of property rights and financial intermediary development.

Guiso, Sapienza, and Zingales (2004)[8] studied the effects of differences in local financial development for Italian firms. They find that financial development enhances the probability of an individual to start his own business, favoring new firms entry, increasing competition, and promoting growth. Their results suggest that local financial development is an important determinant of the economic success of an area even in an environment where there are no frictions to capital movements.

The relationship between firm size and financial and institutional development was further investigated by Beck, Thorsten, Asli Demirgüç-Kunt, and Vojislav Maksimovic (2006)[9] who

presented empirically, by analyzing data across 44 countries, that firm size is positively related to financial intermediary development, the efficiency of the legal system and property rights protection.

Extending Rajan and Zingales approach, in a 2008 study, Beck, Demirgüc-Kunt, Laeven, and Levine[10] highlighted another channel through which finance could be linked to growth: removing impediments for small firms. Using cross-industry, cross-country data, they showed that industries which are naturally composed of small firms grow faster in financially developed economies[11]. Their results indicate that improvements in the operation of the financial system can have cross-firm distributional effects, helping small-firms more than large ones. In the light of their findings it can be said that a country's level of financial development exerts a different effect on small firms vs. large ones by removing the growth constraints on small firm industries and accelerating disproportionately the growth of industries that for technological reasons are composed of small firms[12].

Inspired by the literature approaches so far illustrated, the present paper aims to empirically investigate the extent to which the local level of financial development favors small and medium sized enterprises over large ones and in which sectors. The entire analysis is conducted taking into account the SMEs definition presented by the European Commission's in its Recommendation no. 361 from 2003. According to article 2 from the cited Recommendation, "the category of micro, small and medium-sized enterprises (SMEs) is made up of enterprises which employ fewer than 250 persons and which have an annual turnover not exceeding EUR 50 million, and/or an annual balance sheet total not exceeding EUR 43 million. The following table presents the headcount ceiling, the turnover ceiling and the balance sheet ceiling which delineate SMEs by size class[13] :

Table 1: Ceilings for differentiating SMEs by size class

Enterprise category	**Headcount**	**Turnover or Balance sheet total**
medium-sized	< 250	≤ € 50 million ≤ € 43 million
small	< 50	≤ € 10 million ≤ € 10 million
micro	< 10	≤ € 2 million ≤ € 2 million

Source: European Commission, Enterprise and Industry

Besides the staff headcount ceiling, an enterprise can be included in the SMEs category if it meets either the turnover ceiling or the balance sheet ceiling, but not necessarily both.

In caring out our empirical analysis we use the headcount ceiling to differentiate SMEs by size class.

1. Overview of Romanian SMEs and financial sector development

The transition to a market economy triggered by the late 1989 events lead to a steady and continuous transformation of Romania's ownership structure from a predominantly state owned to a predominantly private owned.

Private entities, organized mainly as limited liability companies or joint family associations were among the first to register a constant year on year growth. During 2002-2008 the number of

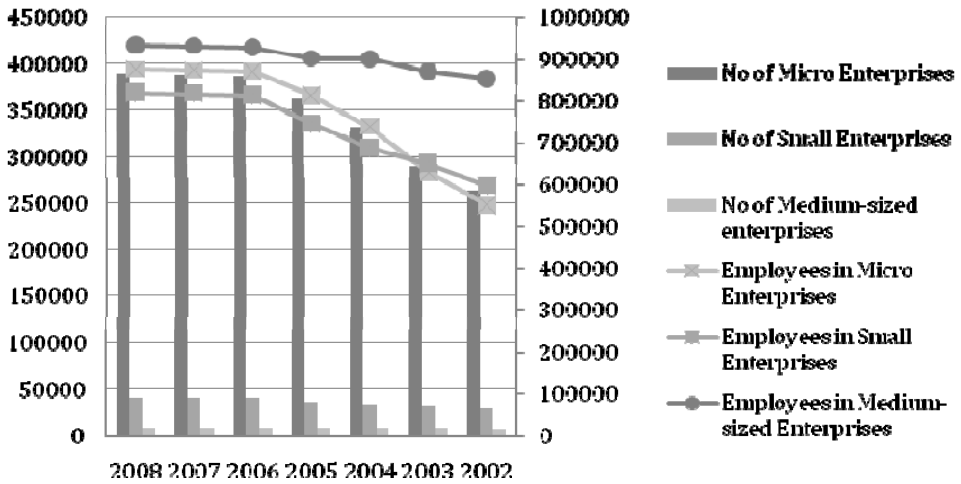
active SMEs by size class increased at a fast pace contributing to the country's employment growth rate.

Chart 1: Romanian SMEs by size class (in number of units and number of employees)

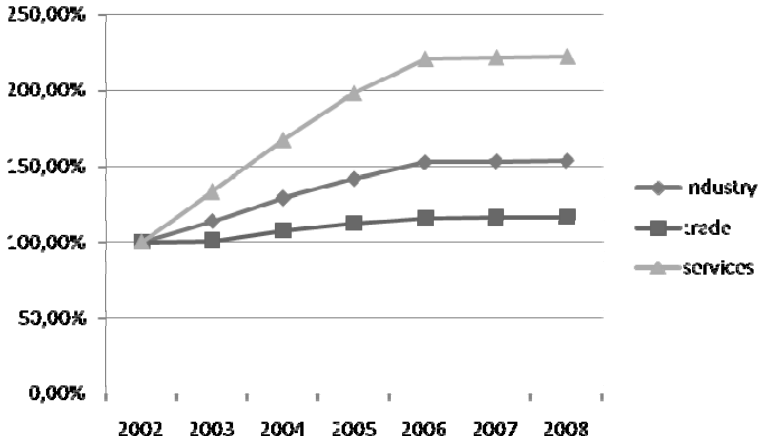


Source: data processed from European Commission, Enterprise and Industry. "Small and medium-sized enterprises (SMEs): SME Performance Review", last modified 07.01.2011, http://ec.europa.eu/enterprise/policies/sme/facts-figures-analysis/performance-review/index_en htm

By structure size Romanian SMEs are dominated by Micro Enterprises which in 2008 represented 88.48% of all SMEs in terms of number of units, a 1.09% increase from 2002. Looking at the number of persons employed it can be noticed that Medium-Sized Enterprises are the prime providers of employment, followed very closely by Micro Enterprises.

By sectors of activity, the evolution of SMEs is highlighted in the chart below.

Chart 2: Romanian SMEs sector growth index
(2002=100)



Source: data processed from European Commission, Enterprise and Industry. "Small and medium-sized enterprises (SMEs): SME Performance Review", last modified 07.01.2011, http://ec.europa.eu/enterprise/policies/sme/facts-figures-analysis/performance-review/index_en htm

The most dynamic SMEs in terms of unit growth have been those active in the service sector which registered a huge increase from 2002 to 2008 (122.20%). This is due to the fact that most service related activities require neither high investment in fixed assets nor expensive labor cost. Thus, it can be said that, overall, the entry barriers are quite low.

Regarding the evolution of industry and trade related SMEs, as can be seen; these have registered a constant growth over the analyzed period. Although their number increased in absolute terms they were heavily influenced by the structural changes that took place on the market: the decline in the share of firms active in trade and industry, in favor of companies that provide different types of services to citizens and businesses.

The high growth trend was constant for all sectors especially between 2002 and 2006. Once Romania entered European Union in 2007, SMEs growth rate in terms of units slowed down due to market openness.

Now looking at Romania's level of financial development during the studied period 2002-2008 it can be said that our country trailed behind other EU member States in the region despite the fact that during 2003-2007 the shares of credit institutions and insurance companies in total financial assets diminished, while those of leasing companies and other non-bank financial institutions widened due to looser prudential regime. This was highlighted in the Financial Stability Report conducted by the National Bank of Romania in 2007.

In 2010 our country was included for the first time in the World Economic Forum's Financial Development Report ranking 44 in the chart of the 57 most developed financial markets worldwide, with an overall score of 3.05 on a one-to-seven scale. By structure, Romania's financial development index presented itself as follows:

Table 2: Romania Financial Development Index 2010

Overall index: 3.05, rank 44			
Categories	**Pillars**	**Score**	**Rank**
Factors, policies and institutions	Institutional environment	4.47	26
	Business environment	4.74	26
	Financial stability	3.77	50
Financial intermediation	Banking financial services	2.11	56
	Non-banking financial services	1.44	53
	Financial markets	1.85	40
Financial access	Financial access	3.01	40

Source: World Economic Forum. "The Financial Development Report 2010." USA, third edition, 2010: 12-13. http://www3.weforum.org/docs/WEF_FinancialDevelopmentReport_2010.pdf

Romania received a relatively high score for the overall laws and regulations that govern the financial sector (1th pillar institutional environment) and the availability of human capital, the state of physical and technological infrastructure and costs of doing business for financial intermediaries (2 pillar: business environment). Poor results have been registered in the 3th, 4th and 5th pillar capturing some of Romania's biggest problems: financial instability, poor credit allocation and the lack of non-bank financial intermediaries—such as broker, dealers, traditional asset managers, alternative asset managers and insurance companies.

When it comes to "Financial access", Romania lags behind most countries in terms of financial market sophistication, venture capital availability, financing through local equity market and ease of access to loans. The 3.01 is an important barometer in assessing the availability of financing for enterprises in general and SMEs in particular. Research shows that SMEs are more affected by financing and other institutional obstacles than are large enterprises. From this perspective assessing the extent to which the development of Romania's financial systems has contributed to the development of SMEs by sector will help identify the flows in the allocation of financial resources on the market.

The methodology and data employed are presented below.

1. 2. Methodology and Data

In this paper we study the impact of Romania's financial development on SMEs growth by sector of activity and size class. To asses the extent to which financial development boosts the level of output accounted by small firms active in different sectors we used the following estimation equation:

$$Growth_{i,k} = \sum_{i} \alpha\, Size\ class_i + \sum_{k} \beta Sector_k + \gamma Sector\ Share_{i,k} + \delta(SMEs\ Share_{ik} \times FD_i) + \varepsilon_{i,k}$$

where:

a) $Growth_{i,k}$ is the average annual growth rate of value added, in industry k and firm size i, over the period 2002-2008 and was calculated as $[(\ln y_{ik}^{2008} - \ln y_{ik}^{2002})^{1/6} - 1]$. The data were collected from the database used by the European Commission, DG Enterprise and Industry in producing the findings of the Annual Report on European SMEs in 2009[14].

b) $Size\ class_i$ and $Sector_k$ represent size class SMEs and sector dummies, respectively

c) $Sector\ share_{i,k}$ is the value added of firms by size class and sector in total value added of the country in 2002 and is calculated as $[(\ln y_{ik}^{2002})/(\ln y^{2002})]$. The data are collected from the database used by the European Commission, DG Enterprise and Industry in producing the findings of the Annual Report on European SMEs in 2009. With this variable, we test whether Romania's level of financial development shapes the cross-sectional distribution of sectors and helps increasing the proportion of value added accounted for by different size class enterprises. While we examine *Sector Share*$_{i,k}$, we keep focusing on *Growth*$_{i,k}$ as, many theoretical models (Levine (2006)) predict that a higher level of financial development will induce a faster rate of economic growth, exerting a disproportionately positive effect on the growth rate of particular types of sectors (such as sectors naturally composed of small firms facing high informational asymmetries). The summary statistics are reported in table 3.

Table 3: Summary Statistics Sector Share$_{i,k}$

d) *SMEs Share*$_k$ is the benchmark share of employment in firms with less than 250 employees in sector *k* in UK in 2002 and is calculated as (ln*emp*$_{ik}^{2002}$)/ (ln*emp*^{2002}). We have chosen United Kingdom as benchmark economy for two reasons. Firstly because of data availability. The database used by the European Commission, DG Enterprise and Industry in producing the findings of the Annual Report on European SMEs in 2009 covers a wide variety of economic indicators for all EU countries which are presented by size class and sector. Thus by using the same database we have eliminated the errors regarding data matching in terms of the data collection methodology (sectors and firm size are comparable between countries). The second reason is the fact that United Kingdom

has been used in literature[15] as alternative benchmark in measuring an industry's technological share of small firms. Following Thorsten Beck, Asli Demirgüc-Kunt, Luc Laeven and Ross Levine (2008) methodology we measure sector-specific characteristics using data on the share of employment by size class and sector in the United Kingdom in 2002.

e) FD_i measures Romania's level of financial development. Due to the fact that there is no direct indicator to reflect the degree to which financial intermediaries support SMEs by size class, in constructing FD_i, we used the following methodology. As shown by Beck, Levine and Loayza (2000)[16], Private Credit by deposit money banks and other financial institutions to GDP (henceforth PvC) is a good proxy for financial development as it provides a broader measure of banking sector development by including all financial institutions, not only deposit money banks and excluding the credits issued by central banks. However this indicator alone cannot reflect the amount of credits channeled to SMEs by financial intermediaries. Therefore in constructing the financial development indicator we interacted PvC with the percentage of investments in tangible goods made by SMEs. The assumption was that investments made by different size class SMEs required credit taking and thus, by interacting the two indicators we could render more accurately the impact of Romania's financial system development on SMEs. In this light we can say that a higher level of FD_i indicates higher level of financial services for enterprises belonging to a certain size class category. The source of the private credit data was the World Development Indicators dataset[17]. The percentages of investments made by SMEs were calculated from the database used by the European Commission, DG Enterprise and Industry in producing the findings of the Annual Report on European SMEs in 2009. The indicator was averaged over the period 2002-2008.

f) $\varepsilon_{i,k}$ represents the error term

The regression analysis is focused on the interaction between FD_i and *SMEs Share*$_k$. To be more specific we study the δ sign. If δ enters positive and significant at 5% level of confidence we can say that financial development exerts a disproportionately positive effect on sectors dominated by small firms relative to large ones. This suggests that the level of financial development eases growth constraints on small firms more than on large firms. A negative and significant δ sign indicates the contrary: Romania's level of financial development favors sectors dominated by large firms over those dominated by small ones.

The dummy variables for sector and firm size control for specific characteristics that might determine SMEs growth patterns by sector.

We included Sector Share to control for convergence effect: sectors with a large share might grow more slowly, suggesting a negative sign on γ. United Kingdom (the benchmark country) was excluded from the regression.

We used Ordinary Least Squares (OLS), which assumes that the error term is uncorrelated across sectors and firm size.

3. Main results and tests performed

The results in figure 1 show that Romania's level of financial development favors the growth of sectors dominated by small firms. The interaction of FD_i with *SMEs Share*$_k$ enters positively and significantly at 5% level. The coefficient on *Sector Share*$_{i,k}$ enters negatively and significantly, suggesting some convergence in the economic sectors composition.

Figure 1: Fixed-effects (within regression)

***Regression includes size class and sector dummies, but these are not reported

The data were analyzed using a fixed-effects model which is focused on within-data variation.

The relationship between financial development, a sector's small firm share, and sector growth is not only statistically, but also economically large. To illustrate the effect, we compare the growth of a sector with a relatively large share of small firms and a sector with a relatively low share of small firms across two size class SMEs. The growth difference between sectors at the 25th and 75th percentiles of SMEs share and SMEs at the 25th and 75th percentiles of FD_i is 4.5%. This implies that medium enterprises (which are at 75th percentile of FD_i) operating under NACE division de22: publishing, printing, reproduction of recorded media sector (which is at 75th percentile of SMEs Share) grow 4.5% faster per annum than micro enterprises (25th percentile of FD_i) which operate under NACE division dn37: recycling (25th percentile of SMEs Share).

The panel data were submitted to several test like: heteroskedasticity (modified Wald test), autocorrelation (Wooldridge test), normality (Skewness/Kurtosis tests for residuals) and unit root tests (Im, Pesaran and Shin (2003) and Levin and Lin (1992)).

In order to ensure that statistical inference is valid, we tested our panel data for cross-sectional dependence (Pesaran test). The results rejected the null hypothesis of cross-sectional independence and thus we estimated a robust fixed-effect (within) regression with Driscoll and Kraay standard errors which results "*are well calibrated when the regression residuals are cross-sectionally dependent*"[18].

Table 4 reports the results of the test performed while figure 2 presents the regression with Driscoll-Kraay standard errors.

Table 4: Tests results

Tests	Null Hypothesis	Results
Wooldridge test for autocorrelation in panel data	H0: no first order autocorrelation	F(1, 2) = 4.504 Prob > F = 0.1678

Figure 2: Regression with Driscoll-Kraay standard errors

***Regression includes country and sector dummies, but these are not reported

As can be seen the coefficients remain strongly significant at 5% level of confidence.

Several sensitivity tests were performed by replacing either the benchmark country or the FD_i indicator. In all cases the coefficients entered significantly.

Conclusions

Romania's level of financial development has improved significantly over the last couple of years. Nevertheless SMEs continue to suffer from lack of financing due to financial intermediaries' restrictive guarantee requirements and increased commissions charges.

In this context the paper finds that during 2002-2008 Romania's level of financial development exerted a disproportionate effect on SMEs by sector and size class favoring the growth of medium sized enterprises in manufacturing related sectors. The results are consistent with some author's findings which sustain that under-developed financial systems are particularly detrimental to the growth of firms with less than 20 employees[19].

Although the overall results show that Romania's financial system favors the growth of sectors dominated by small firm looking closely we see that micro and small size enterprises (which in terms of units' number dominate the scene in most sectors) remain affected by the lack of local

financial intermediary development. The results sustain the idea that improvements in the operation of the financial system will lead to cross firm distributional effects, helping SMEs grow regardless their size class. In future work we plan to asses the impact of the instruments used by financial intermediaries to support Romanian SMEs growth by size class.

THE ANALYSIS OF COUNTRY RISK BY MEANS OF ALTERNATIVE METHODS

ROBERT-GABRIEL DINU[*]
MIHAELA PAPA[**]

Abstract
There are many situations in which the country risk must be considered. Those situations could be when one wants to make an investment in another country; when a loan is given; or, even when a stronger and a more powerful economic union is desired. There are many ways to measure the country risk. These methods are created by central banks, rating agencies and international banking institutions. There is a new method the country risk can be measured, with the help of a financial instrument, derived from lending. This paper presents the bond between country risk and credit default swap. Because of the financial-economic crisis, the values of country risk fluctuated considerably, especially in those countries with a large public debt.

Keywords: *country risk, derivative instruments, country rating, crisis, default*

Introduction

For a better understanding of the concepts, these elements must be explained: country risk, rating agencies or derivative financial instruments. First of all the country risk and its components must be explained. This type of risk is indeed a special risk.

This paper examines the impact of sovereign credit default swap's price over the deterioration or improvement of the country's rating. In the first part of the paper two key concepts are explain. Those concepts are: country risk and the financial derivative instruments known as credit default swap. The country risk is split in three components.

The fact that the global economy is going through some changes must be taken into account. These shocks are of course the effect of the global financial-economic crisis during 2008. There are countries that they manage to survive the crisis, of course with some loss. These ones are the countries with advanced economies. Some countries suffered shocks so big that their economy dropped, along with that, the macroeconomic indicators fallen also. During the actual economic crisis the classification of countries by the gross domestic product changed. And therefore, it is a good opportunity to make the country risk analysis.

In this study it will be given the values of country risk with the help of the sovereign credit default swap's market. This idea is based on the fact that the price is set free on this market, at the intersection of supply and demand. In this type of market the information reaches the recipient in a very short time. This is presented parallel with the country rating calculated by various rating agencies.

The country risk

In a broad sense, country risk is the probability of financial losses in international business, losses generated by certain macroeconomic or politic events of the considered country. Although it is unlikely that a country can go bankrupt, a country can declare its independence in any

[*] Assistant, Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: dinu robert.gabriel@gmail.com).
[**] Assistant, Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: mihaela.papa@gmail.com).

ways and a country cannot be sued in without its consent. In the ’70, during the oil crisis, the country risk played an important role. In those times, countries like Argentina and Mexico almost went into default.

The country risk can be defined in many ways, the uncertainty that arises when there are funds to be transferred abroad, the evaluation of a country’s credibility, especially in terms of external debt payment, the scenario that a country don’t want or cannot honor their commitments to foreign partners or the borrowers from a country cannot pay their debt obligations because of some factors beyond their capacity.

This type of risk could appear in other situations also, the government of a country could suspend the assets of foreign companies; the military conflict could damage the goal of investors or could stop the ongoing operations; the economic difficulties from a country may hold back the repatriation of profit into a powerful currency.

Following, it can create strong relationships between the country risk and its components: political risk, economic risk and social risk. Country risk is divided into three types of risk mentioned above.

The political risk is linked with the country's willingness to meet its external commitments. The political instability can develop certain negative situations for creditors, like the denial of loan contracts; limit or ban foreign investment; the interdiction of the transfer of capital; the cease of payments to abroad partners or the sopping of imports and exports.

The social risk is resulting from exposure to losses in terms of international flows of transactions caused due to social events. These social events could mean: strikes, civil war, conflicts of interest arising from regional political polarization.

The last component of the country risk, the economic risk is represented by the ability of a country to be able to pay its external debt. This type of risk is resulting from a country’s inability to transfer a loan obtained by a public or private entity, although the company may be solvent. The lack of foreign currency reserves is determining insolvency.

Of course, when one wants to determine the risk of a country one must take into consideration the values and the evolution of that country’s macroeconomic indicators.

The country risk analysis is not a reliable answer, the results are estimated. This happens because the measurements have a qualitative feature and they are done with the help of quantitative indicators. These types of analysis are done by specialized organizations. The entities that make the analysis regarding the country risk are divided as follows:

- International financial organizations: B.I.S., I.M.F., B.E.R.D.
- universities
- authorized commercial banks
- specialized rating agencies: Euro money, Institutional Investors, Standard and Poor, Moody’s, Fitch

Credit default swap

The credit default swap (CDS) is a financial instrument derived from lending. Its porpoise is to transfer between two parties the risk of exposure to some financial instruments with fix income (loans, bonds). In some cases, for a better understanding of this type of financial instrument, a CDS could be compared to insurance. The first bank that developed this type of derivative was JP Morgan, in the 1997. The buyer of CDS is protected against the risk of default regarding the financial instrument with fix income, while, the seller of CDS guarantees the credit worthiness of the product.

The risk of default is transferred from the holder of the fixed income security to the seller of the swap. For example, the buyer of a credit swap will be entitled to the par value of the bond by the seller of the swap, should the bond default in its coupon payments.

CDS is like insurance because it offers the buyer protection against the risk to default, downgrade or other negative event affecting the perception of the credit worthiness of the issuer (and thereby the price of bonds issued by it). The contract's seller assumes the credit's risk in exchange of a periodic payment (the spread) which is like insurance. The seller must pay the buyer only if a negative event will occur. As the CDS is not directly related to a particular asset or security, but it only refers to it, the buyer of CDS obtains protection, but also may obtain profit when the issuer does not fulfill its obligations. The payment obligations come to an end when the seller delivers the cash value of bonds or the same type of bonds if this is stipulated in the contract. If a negative event won't occur then the swap's seller will get the periodic payment and he will make a profit.

For a better understanding of this derivative financial instrument's mechanism was chosen the next example: suppose that there is a corporation with the name Corporation of Risk and a commercial bank named First Bank. The bank offers a loan of 10 million euro to the company, for a period of five years. The interest rate of this loan is not relevant with this example.

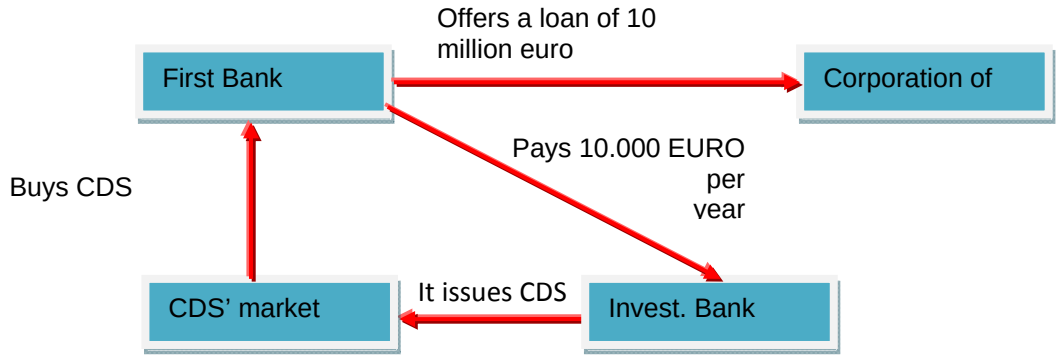

Figure 1 *– The mechanism of CDS with the exposure on a company*

It may happen that the borrower will default on the loan. So, the First Bank won't receive the total amount, the loan and the interest. In this case, a third entity could appear, an investment bank called Invest Bank. This bank issues the CDS with exposure to Corporation of Risk, with a period of five years and a price of 100. To understand better this example we will explain the meaning of the price. In fact, the price of 100 means 100 basis points or 1 per cent (1 basis point = 0.01%). Therefore, First Bank, the one that offered the loan could buy CDS with the exposure to Corporation of Risk from Invest Bank, in the amount of 10 million euro, because this is how much the loan worth. Of course that anyone who is a creditor of Corporation of Risk may buy the CDS issued by Invest Bank.

Because the First Bank acquired 10 million euro worth CDS at the price of 100 basis points, it must pay yearly:

$$0.1\ \% \times 10\ mil.EUR = 10{,}000\ EUR$$

Therefore to protect against the risk of insolvency of the debtor, the First Bank pays 10,000 euro per year. This complex mechanism is presented in Figure 1.

Of course that First Bank will include this default's risk protection cost in the interest rate. So, if a company has a higher risk of default, it must pay more for the borrowed capital.

There is a counterparty risk associated to this type of derivative instrument. The buyer assumes the seller's risk of default. The buyer loses the protection against the bankruptcy of the company if Invest Bank and Corporation of Risk default simultaneously. If the Invest Bank goes bankrupt and Corporation of Risk doesn't then the buyer must replace the previous bought CDS.

On the other hand the seller assumes the risk that the buyer couldn't compliance the contract. This way, the seller won't receive his income regarding the sales of securities. If the buyer doesn't fulfill his part, the seller can immediately sell the CDS on the market. But, it may happen that the transaction will take place at a lower price so the seller will have a loss.

Sovereign credit default swap

When referring to sovereign CDS things are similar. When the price of sovereign CDS goes up, the cost of financing is increased. Basically the more risky a country is the more expensive the cost of financing will be. The price of CDS in the derivatives' market is called spread. The sovereign CDS' spread is often used to indicate a catastrophic situation.

Here are a few countries regionally significant. The data regarding the gross domestic product was taken from annual reports of World Bank.

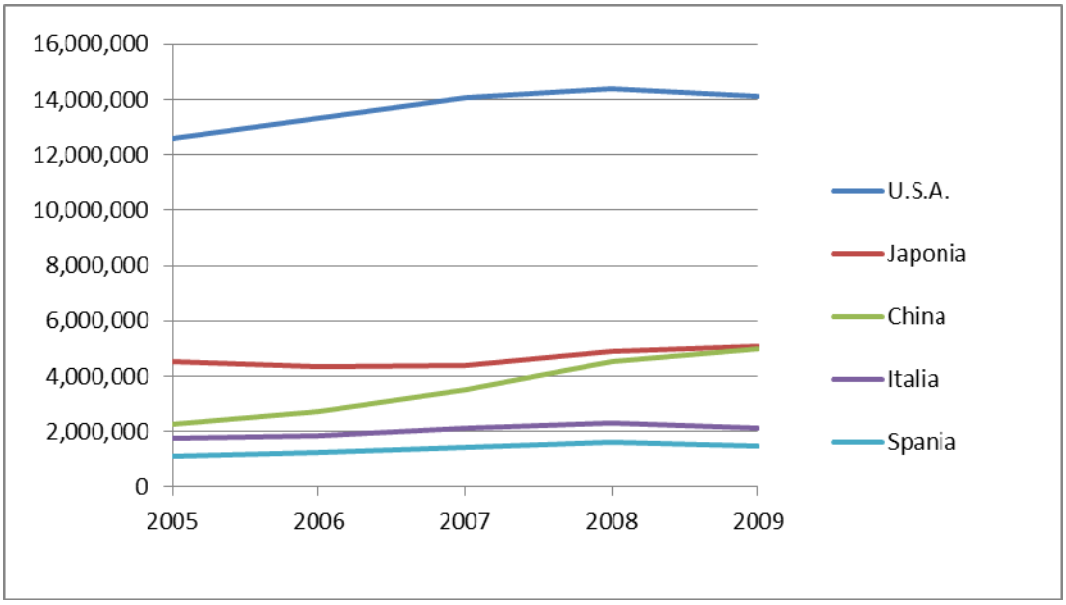

Figure 2 *– The evolution of Gross Domestic Product in previous prices in million USD.*[1]

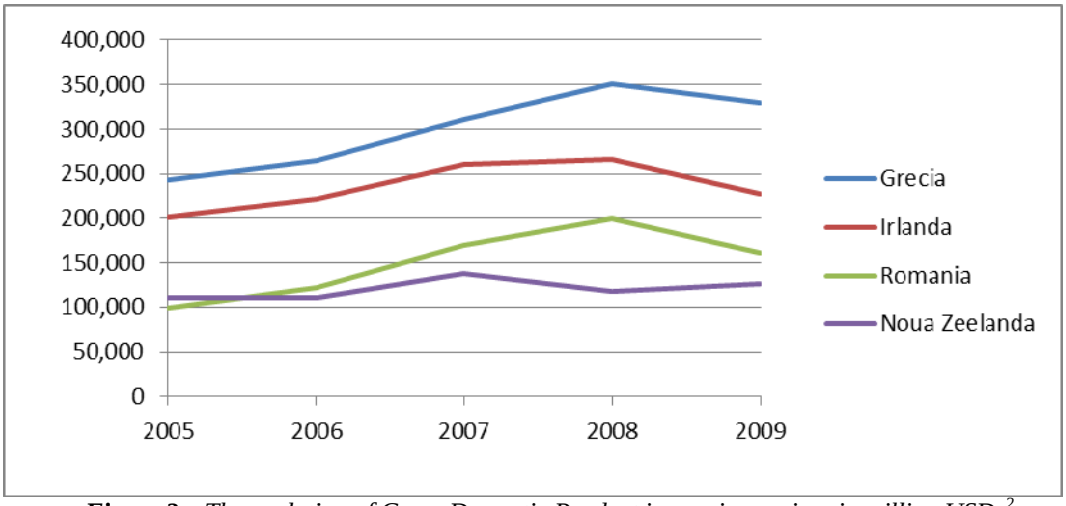

Figure 3 *– The evolution of Gross Domestic Product in previous prices in million USD.*[2]

The countries' evolution regarding the Gross Domestic Product is fully consistent with the global trend. There are countries with powerful economy like U.S.A., Japan and China. These countries had the same trend in the examined period. Most of the values had been grown until 2008, after that period the values dropped, because of the global financial crisis. From economic point of view, there are countries which seem to have benefited due to this turbulent period. Regarding this fact it could be mentioned China (Figure 2) and New Zeeland (Figure 3), first one is one of the great economic powers over the globe and the second one isn't a country of the same rank.

The public debt is another typical indicator which can be used to calculate country risk (Table 1). Due to the high degree of indebtedness of governments, public debt increased. This large public debt will transform itself in the short term into a high financing cost for the countries concerned. The country risk will appear in the price of the treasury bonds and in the spread of the CDS. An economy which has a great need for financing resources will face restricted access to primary markets and high interest rates.

	Gross public debt, percentage of GDP	External public debt, percentage of GDP	External financing rating/ outlook
U.S.A.	92,7	26,7	10/Stable
Japan	225,9	11,5	8/Negative
China	17,5[3]	-	-
Italia	118,4	55,5	7/Stable
Spain	63,5	31,1	9/Negative
Greece	130,2	94,2	0/Negative

[1] Source: World Bank
[2] Source: World Bank
[3] Source: The World Fact book , CIA

Ireland	93,6	54,9	7/Negative
Romania	16,39[4]	41,74[5]	-
New Zeeland	31,0	13,0	9/Negative

Table 1- *Indicators of vulnerability for 2010*[6]

As you can observe in the Figure 2 and Figure 3, most of the countries analyzed had a growth GDP by 2008. At the end of this year the countries had to strengthen their bank sector, due to the economic and financial crisis. This action stopped the deepening of the recession. Those are the causes that drove the rise of countries' public debt. Therefore, most of the countries with advanced economy must sustain equilibrium between fiscal consolidation, on the one hand and rolling risk on the other hand.

Below is the table with countries' ratings provided by the two rating agencies, Fitch, Standard and Poor, and their CDS' prices at the end of 2010.

	Fitch Rating	Standard and Poor Rating	CDS Spread 5 year (basis points)
U.S.A.	AAA	AAA	41
Japan	AA	AA	79
China	A+	AA-	77
Italia	AA+	A+	199
Spain	AA+	AA	301
Greece	BBB-	BB+	1022
Ireland	BBB+	A	574
Romania	BB+	BB+	290
New Zeeland	AA+	AA+	61

Table 2 *- Countries' ratings and sovereign CDS' prices at the end of 2010.*

The investors will demand a higher yield to lend to countries with economies in distress. As it can be seen in Table 2, there are countries that have the same values of rating but the sovereign CDS spread is different.

A very good example is Spain and Italy. Both countries have the same rating given by Fitch, but regarding the price of their sovereign CDS, it is a difference of 102 basis points. This means that Spain is borrowing at an interest rate with one percentage point more expensive than Italy. Although Italy has a higher public debt, than Spain calculated as a percentage of GDP.

Another relevant example is Romania and Spain. Although their country ratings are similar, the sovereign CDS' spreads are very different. The sovereign CDS of Greece have risen at a price of 1022 basis points because of two things. One of them is the massive grown of its external debt and the other is the economic issues that The Hellenic Republic has. The price of Romania's sovereign CDS is 290 basis points.

Further, there are presented a few examples of sovereign CDS' spreads and their evolution in time. The spread of sovereign CDS is a price that forms freely in the market. Like any other price, it is the point of balance between the demand and the supply in the market. We chosen a few countries

[4] Source: National Bank of Romania and National Institute of Statistics, November 2010
[5] Source: National Bank of Romania and National Institute of Statistics, November 2010
[6] Source: Global Financial Stability Report – I.M.F.

that have had economic problems; some of them still have. The evolution of countries' ratings is presented; the ratings are given by an international rating agency.

First example is the sovereign CDS of Greece. The Hellenic Republic is facing with a huge value of country risk, because the country rolled over time its own debts, with the help of derivative instruments. The country is on the age of default. At the beginning of 2009, when it was the peak of the financial and economic crisis, most of the spreads of sovereign CDS had been rising. In that period, the ones with the exposure to Greece's default grown to almost 300 basis points. As it can be seen on Table 3, Greece had an A rating with a negative outlook. On the 22th of October 2009 the rating of Greece dropped, although the value of the price of sovereign CDS was close to 100 basis points. Indeed at the beginning of 2011 the country's rating keeps peace with increased protection to insolvency of the Hellenic Republic. On the 14th January 2011 the rating of Greece dropped to BB+ and the Greece sovereign CDS spreads increased at 1022 basis points.

	Greece		
14 Jan 2011	BB+	**20 Oct 2003**	A+
21 Dec 2010	BBB-	**23 Oct 2002**	A
9 Apr 2010	BBB-	**20 Jun 2001**	A
8 Dec 2009	BBB+	**21 Sep 2000**	A-
22 Oct 2009	A-	**27 Jul 2000**	A-
12 May 2009	A	**13 Mar 2000**	BBB+
20 Oct 2008	A	**25 Oct 1999**	BBB+
5 Mar 2007	A	**10 Aug 1999**	BBB
16 Dec 2004	A	**4 Jun 1997**	BBB
28 Sep 2004	A+	**13 Nov 1995**	BBB-

Table 3 *– The evolution on long term of the Greece's rating*[7]

Regarding Ireland, the facts are the same. In the middle of September 2010 the spread of Ireland sovereign CDS have risen to 433 basis points. The cost of protection against the default of Ireland was 433,000 $ for a 10 million $ debt. The rating of the country has been unchanged until 6th of October 2010. On the 23th November 2010 the prime minister of Ireland didn't get the support of the parliament for the austerity measures. So, on account of this news, the price of Ireland sovereign CDS boosted at 555 basis points. The country's rating dropped at BBB+ on 9th December 2010.

	Ireland		
9 Dec 2010	BBB+	**21 Sep 2000**	AAA

[7] Source: Fitch Ratings

6 Oct 2010	A+	**16 Dec 1998**	AAA
4 Nov 2009	AA-	**14 Jul 1998**	AA+
8 Mar 2009	AA+	**26 Oct 1995**	AA+
6 Mar 2009	AAA	**10 Oct 1994**	AA+

Table 4 *– The evolution on long term of the Ireland's rating* [8]

Ireland reaches in the top of the most risky countries over the globe, because of the problems of the Irish banking sector. But the value of the risk is above the investment grade.

As follows, the evolution of Romania's risk is presented. In late September 2010, Romania was on the first place in the Eastern Europe's emerging economies regarding the price of sovereign CDS. The spread overtook 300 basis points, because the government didn't manage to cut back the budget deficit as mentioned in the I.M.F. stand-by agreement. From all the countries in the region of Eastern Europe the Hungary became the most risky, it overran Romania. The Hungary sovereign CDS exceeded 370 basis points.

	România		
2 Feb 2010	BB+	**14 Jun 2002**	B+
9 Nov 2008	BB+	14 Nov 2001	B
31 Jan 2008	BBB	16 Nov 2000	B
31 Aug 2006	BBB	21 Sep 2000	B-
17 Nov 2004	BBB-	24 Mar 1999	B-
23 Aug 2004	BB	23 Dec 1998	B
18 Dec 2003	BB	23 Sep 1998	BB-
24 Sep 2003	BB-	11 Sep 1997	BB-
30 Oct 2002	BB-	6 Mar 1996	BB-

Table 5 *– The evolution on long term of the Romani's rating* [9]

The Romania's rating has been below of the investment grade since the 31th January 2008. As it can be seen in Table 5 the value of the rating hasn't been changed since the 9th of November 2008. On the other hand the quality has been changed since the 2nd of February 2010, that's way the color isn't red anymore. The outlook of the country risk of Romania has changed from negative to stable.

[8] Sursa: Fitch Ratings
[9] Source: Fitch Ratings

Conclusions

The rating agencies and other international institutions always calculate country risk and they give different notes and ratings. This entities offer precise information. But, as it was demonstrated later, there is another method which indicates the country risk more rapid. This method involves using a derivative instrument. Of course, the market of those derivative financial instruments isn't regulated in all countries. There are economists who said that theses toxic derivative instruments have had an important role in the bursting of the actual financial and economic crisis.

The issue is that not everyone has access to real-time price trends of sovereign CDS, because the costs with this kind o data are expensive. With the help of the sovereign CDS' market it can be anticipated the changes of a country's rating. Although the spread of sovereign CDS was floating, the rating of the country stood still. Or even if the rating changed, that happened over a long period of time. The positive events that could influence the rating can be anticipated faster that the negative ones. When a government is engaged in a stand-by agreement with an international financial institution regarding any type of financing, this is reflected in the CDS spread.

It must be taken into account that sovereign CDS are financial derivative securities, so they can be used for speculative purposes. If panic is created among the investors, due to negative news, this thing will affect almost instantaneously the prices of sovereign CDS. Because of this, the information offered through the spread of CDS' evolution may not always reflect the reality.

We can take the example of a country with economic problems, which is part of a union, like the European Union. In these conditions, the negative events that drove the rising of the country's credit risk could affect other country members in that union. An example is Greece and Ireland.

I think that the sovereign credit default swap must be taken into account when the risk of a country is studied. The correlation must be made carefully, between this type of risk, country risk, and the financial derivative securities mentioned before. It must consider certain things that could affect immediately the price of this derivates, those things can be news, political events and rumors.

GENERAL RISKS AND UNCERTAINTIES OF REPORTING AND MANAGEMENT REPORTING RISKS

DANIELA N. SAHLIAN[*]
CAMELIA I. LUNGU[**]

Abstract
Purpose: Highlighting risks and uncertainties reporting based on a literature review research. Objectives: The delimitation of risk management models and uncertainties in fundamental research. Research method: Fundamental research study directed to identify the relevant risks' models presented in entities' financial statements. Uncertainty is one of the fundamental coordinates of our world. As showed J.K. Galbraith (1978), the world now lives under the age of uncertainty. Moreover, we can say that contemporary society development could be achieved by taking decisions under uncertainty, though, risks. Growing concern for the study of uncertainty, its effects and precautions led to the rather recent emergence of a new science, science of hazards (les cindyniques - l.fr.) (Kenvern, 1991). Current analysis of risk are dominated by Beck's (1992) notion that a risk society now exists whereby we have become more concerned about our impact upon nature than the impact of nature upon us. Clearly, risk permeates most aspects of corporate but also of regular life decision-making and few can predict with any precision the future. The risk is almost always a major variable in real-world corporate decision-making, and managers that ignore it are in a real peril. In these circumstances, a possible answer is assuming financial discipline with an appropriate system of incentives.

Keywords: *Risks, Uncertainties, Reporting, Risk Recognition, Risk Management*

Introduction

Our paper is meant to develop an analysis, based on fundamental research, regarding the impact on managerial perception of introduction the economic and financial theory of risk and uncertainties in information reporting process. It is important for economic entities to realise this impact on their day-to day activities in order to help them to progress. The connection between companies' activity and risk presentation impact is supported by managers competencies and skills in evaluateing and managing risks in order to decide the format of their presentation.

In recent years, the concepts of risk and risk management have been the subject of study for many specialists in the field of economics but also in other areas[1]. On the one hand, this may be generated by the significant risk debates taken by sociologists as Beck[2] and Douglas[3], and on the other hand, risk management standards issued by professional organizations have also determined a higher interest for risk management systems' development (for example Association of Insurance and Risk Managers).

An important aspect of the risk debates concerns the presentation of risk information by the entities to shareholders, through the annual financial statements. Schrand and Elliott (1998), at a conference sponsored by the American Accounting Association/Financial Accounting Standards Board (AAA/FASB) in 1997 drew attention to the fact that U.S. companies provided insufficient information about risks in the annual financial statements.

The Institute of Chartered Accountants in England and Wales (ICAEW) also noted, this lack of information about risks, and issued three drafts (1998, 1999 and 2002), in order to encourage directors of UK companies to report more detailed risk information.

Results of a survey of Great Britain institutional investors (Solomon et al., 2000) support the AAA / FASB and the ICAEW's view. Thus, because a significant number of respondents agreed that entities' directors first have to provide more comprehensive and detailed information about the risks and then to consider publishing risk management policy statements. Investors also approved the importance to assess the risk profile of a company; therefore, relevant and reliable information on risks must be provided[4].

Recent studies on the concept of risk are based on the idea that a risk society exists, because we become more concerned about the human actions' impact on nature than the nature's impact on us. Beck[5] refers to these risks as a "manufactured uncertainty" and notes that it is paradoxical that they appear as we search to reduce risk.

Risk can take various forms ranging from specific risks faced by individual firms (such as financial risk, or risk of a strike among the workers) through the current risks faced by certain industries (such as banking, car manufacturing, or construction) reaching more general economic risks resulting from interest rate or currency fluctuations, and last but not the least, the risk of recession. The concept of risk has often negative connotations, in terms of potential loss, but there also exists the potential for greater returns.

Clearly, the risk is involved in most decision-making aspects, whether in a company or in everyday life, and few can accurately predict future. It is almost always an important variable in the real world of corporate decision making, and managers who ignore it are in real danger.

1. Definition of risk

Etymology and geographical origin of the word risk is controversial. In French, *risque* appears in the early sixteenth century, as in German (*risiko*). *Se risquer* (French language) is attested by 1580, and *riskieren* (German language) only in the seventeenth century. In English, the script *risque* is used in 1661, and the script *risk* in 1741. In Castilian, was used *riesgo* by 1570. It is recognized that all these terms were taken directly or indirectly, from Italian *risco* (later, *rischio*). The ancient Italian certificates don't date previous of thirteenth century, and came from the uperficial Latinized forms *rischium*, *risigus*, *riscus*. They are in expressions like *rischium et fortuna, periculum et risigum* used in various contracts. The Latin's word etymology is also obscure: this may be *rixare* or *resecare* who have a similar meaning. Different from that of danger, hazard or chance, modern sense has emerged in the eighteenth century along with scientific research on risk[6].

As for the definition of risk, there is known a large number of approaches that use different keywords, as shown in the examples below.

T. Hindle et al. (1998), in the *Finance - The Economist Books proposed Guide*[7], define the risk as being the danger to record a loss. Against the risk, investors get a return. In general, the higher the risk is, more substantial the gains will be. About those who maintain the safety line (investing only in government bonds) is said to have risk aversion.

In their study, *Managerial Finances*, Halpern et al. (1998) define asset risk as being the likely variability of future profitability of the asset[8].

[8] P. Halpern et al., *Finanțe manageriale*, (Bucureşti: Economică, 1998), 22.

Dictionary of Economics defines risk as an event or process that is uncertain and likely to cause a failure, a loss in operating or economic activity[9].

Dictionary of ergonomics[10] defines risk as the possibility to occur, in the development of an action or task, less known or unknown circumstances, having adverse effects on the possible and planned outcomes arising from a future action subject to the influence of accidental factors.

Complete Dictionary of the Market Economy: A Practical Guide[11] and *Romanian Explanatory Dictionary* (2009) define risk as the possibility of reaching a danger, of having to face a trouble or to incur a loss; a potential threat.

The Investopedia Dictionary defines risk as the possibility that current investments will not achieve the expected return.

In his paper, *Three decades of risk research. Accomplishments and new challenges*, Ortwin Renn[12] identifies four general risk types:

1. Sword of Damocles - the risk is considered a threat which can strike at any moment. There is a sense of insecurity among human subjects;
2. Pandora's Box - the risk is an invisible threat to health and human welfare. It is always a bad thing;
3. Athens balance - the risk is perceived as a possible financial loss as a result of decisions taken;
4. Myth of Hercules - the risk is desired, sought, assumed, and in other words actively exploited.

William F. Sharpe[13] defines risk as the general possibility of a loss or damage.

According to *Lexique d'economie*[14] risk is a random phenomenon corresponding to a situation where the future is not predictable only with certain probability, as opposed to allowing a forecast uncertainty made.

Jaquillat and Solnik[15] in *Marchés financières: gestion de portefeuille et des risques* define the risk as:

- The sacrifice of an immediate advantage or the absence of immediate consumption in exchange of future benefits;
- The loss of a clear and immediate advantage of acquisition and possession or consumption of a real good or a service for an uncertain future advantage through investment in securities;
- The uncertainty about the financial value of assets that will occur at a future moment in time.

Economic and Financial Vocabulary[16] defines risk as a key element of uncertainty that may affect the activity of an economic agent or a transaction.

Dorfman[17] considers the risk to be a random variation of possible outcomes in relation to an event, while Mehr and Hedges[18] link the risk to the losses that can be greater than normal or regular.

The previous presentation shows that there is no single definition of risk; each activity defined its own definition of the concept of risk. However, the general idea that emerges is that risk is traditionally defined in terms mostly related to uncertainty.

In this context, to formulate the concept of risk becomes a difficult task. We support the general sense, that risk is a future and uncertain event, able to occur but whose appearance is uncertain, as:

- it is a future event because his appearance is related to a future period;
- it is uncertain because no one knows exactly when it appears, emerges or what form it will manifest in;
- its appearance can be measured by appealing to statistical analysis, the science of probability and actuarial calculations.

2. The impact of introduction of risk and uncertainty economic and financial theory

The emergence of risk and uncertainty theory is due to the need of improving models that explain the functioning of modern economies. Since the second decade of last century, we have witnessed the extinction of the certainty premise, and of the economic agents' foresight, while it gained ground the hypothesis of individuals and economic entities' actions in uncertain future conditions and risk situations.

This vision change had valuable effects on the economic research framework and on practical applications. It allowed the approach of difficult to explain phenomenon in terms of certainty, such as the fact that entrepreneurs are not always eager to maximize the profit. It also provided a better understanding of the behaviour of individuals and businesses, where chance plays a crucial role, especially in finance, related to the stock market risk or foreign exchange risk, but also in other areas as natural resource exploitation.

The economic theory of risk and uncertainty is based on a number of fundamental concepts: the utility expectation, assumptions on the attitude towards risk (risk aversion preference or indifference), or exchange rate risk. The criteria based on maximizing the expected utility has been developed by Daniel Bernoulli[19]. The expected utility is a model of behaviour under conditions of uncertainty referring to individuals' decision taken in the presence of risk in order to maximize the hope of winning, as the final function of wealth.

An individual can choose between different decisions of gaining, having uncertain consequences as to play the lottery or not, to buy shares or not, to play or not on the stock market, to ensure or not their activity etc. All these relate to the possibility of earning under uncertainty. The future is known with uncertainty, but this uncertainty is limited. There may appear only two events, opposite and incompatible: the decider either wins or loose on his actions. Such pairs of mutually exclusive events have the probability q, respectively, $1- q$, where q takes values between 0 (when the event is impossible) and 1 (when its production is safe), as the basis in probability theory application.

From each of the mentioned events derives a result which can be positive or negative and is denoted by x, respectively y. Maximizing utility expectation leads to the relation $qx + (1-q) y$. Thus, for an economic entity, if U(x) and U(y) are expected utilities, for x and y types of gains, the proposed utility indicator is $qU(x) + (1-q)U(y)$. expected utility model influences decisions under uncertainty in two ways: first, because of the so-called *St. Petersburg paradox* (a paradox of the probability theory, in which a participant will pay only a small sum of money for an infinite greater expected value as described by J. Fraysse[20] in 1994) and second because of the common sense. The result is that the decision is not determined by the mathematical gain expectation, but by the real one. The holder of a lottery ticket that gives him 50% to win 10.000 lei (meaning 5.000 lei as mathematical gain expectation) has every reason to decide to sell it for a certain amount of 4.000 lei.

[19] D. Bernoulli, "Exposé d'une nouvelle théorie de la mesure du risque," *Risques* 31 (1997): 12.
[20] J. Fraysse, "Esperance d'utilité," *Risques* 17 (1994): 69.

The expected utility model and its applicability in decision making process have their flaws and opponents. Determination of expected utility is based on objective probabilities. A number of authors have shown that individual behaviour in decision-making matters in the situation of *imperfect information*. They emphasized that, faced with the decision-making the individual manifests an *ambiguity aversion. Ellsberg's paradox*[21] show preference for those lotteries experiments in which subjects have more information on the likelihood of various results. According to Ellsberg's paradox, people prefer to bet on a box with 50 red balls and 50 blue balls than on one with 100 balls of unknown number of red or blue balls. The probability of winning is the same in both cases, but people, nevertheless, prefer to bet on a familiar scenario than on unknown one. These observations have led to some reconsideration about the expected utility model and about the alternative concept of *unexpected utility*[22]. This type of study, based on the unexpected utility model recalls the criteria of choice between prevention, self-insurance and insurance[23].

3. Risk recognition

An investigation of Stanton and Stanton's in 2002 on corporate annual reports research identifies a number of disclosure studies published in the period 1990–2000, none of which specifically examine risk disclosures. There have, however, been a number of risk-related papers published on derivative and market risk disclosures aspects. The rationale underlying the development of these studies was that disclosure of market risk information would be useful for shareholders to valuate companies' activity[24].

Linsley and Shrives also suggest that the provision of forward-looking risk information would be especially useful to investors. They refer also to Dietrich et al.'s experiments that provide support for the usefulness of releasing future risk information, concluding that overt risk disclosures lead to improved market efficiency. The two major obstacles to increased risk disclosures that Linsley and Shrives consider are the reluctance of directors to release risk information they deem too commercially sensitive and their reluctance to provide future risk information without safe harbour protection[25].

One of the most extensive risk reporting studies is Beretta and Bozzolan's (2004) analysis of the Management's Discussion and Analysis (MD&A) section of the annual report for a sample of 85 companies listed on the Italian Stock Exchange[26]. A key conclusion is that companies focus upon disclosing information on past and present risks, rather than future risks. Where future risks are disclosed, directors are reluctant to indicate whether the impact is likely to be positive or negative. Additionally, directors have a predisposition to self-justification when reporting on risk; that is they feel compelled to attribute risks with negative outcomes to external events. Ascribing the cause of negative outcomes to factors that are beyond directors' responsibilities suggests that attribution theory may be a factor in risk reporting.

Previous general and environmental disclosure studies have often found that a positive relationship exists between the size of the company and the number of disclosures. For example, Firth (1979) and Beattie et al. (2004) find that a positive size–disclosure relationship exists for

samples of UK companies and Hossain et al. (1995) find a similar relationship in non-UK company studies.

The ICAEW (1999) have argued that companies disclosing more risk information will find that the marketplace better understands the company's risk position and the company is then deemed to be less risky than before. Therefore, increased risk disclosure could impact upon the perceived level of company risk, although to what extent is unknown.

Previous studies[27] testing for a relationship between leverage, which is a possible measure of risk, and the number of disclosures, have not been decisive. Ahmed and Curtis cited Hossain et al. (1995) that found no association but, also, Malone et al. (1993) that found a positive association. It was found that there was limited reporting of future risk information based upon studies of German, UK and Italian companies, and managers expectation to provide forward-looking risk information on their own initiative and to provide such information in a sufficient and credible manner, is unrealistic in at least two reasons: first, as is shown by Ryan[28] annual reporting purposes is to perform a management function and, therefore, include historical data, and secondly this information is inherently uncertain and company directors fear that the lack of reliability may expose them to losses[29].

4. Risk management

The risk management policy is a document that must clearly provide the essential characteristics of the risks to which the company is exposed. This is how the company defines and measures its activity related risks, identifying the type and source of risks to which they are exposed as well as the exposure limit they can handle. It may be specified the desired degree of diversification as well as the concentration risk tolerance.

Risks identification. Exposure to risks can be easily ignored or forgotten in the light of their excessive familiarity, or in the light of indifference to new risks. For example, many companies do not protect their exposure to exchange rate risk because there are safe methods of assessment or risk reduction. Equally, failure to identify any new risks or unusual combinations of risk can lead to disaster.

It is therefore necessary to have reporting systems in order to identify the risks, which may include advice on:

- Separate description of each financial instrument and the associated liquidity;
- Information about the market: time series of interest rates and exchange rates, price index, historical volatility and correlation charts.

Risk assessment. Considering that risks are treating unexpected gains or losses, their evaluation is reflected in statistical models establishing a set of parameters and assumptions supported by historical events from time to time and trading strategies.

Risk assessment is based on the selection of a limited number of risk factors and a range of models to describe the uncertainty of future values of these factors and the impact on the value of individual financial instruments, and finally the portfolio.

Measuring and managing risk may be done by:

- Methodical appliance of portfolio sensitivity tests in order to estimate the possible economic losses (and their effect on capital), within chosen market conditions including atypical ones. The results of these tests should be discussed with senior managers and should direct their appetite for market risk;

[27] K. Ahmed and J. K. Courtis, "Association between corporate characteristics and disclosure levels in annual reports: A meta analysis", British Accounting Review 31 (1999): 36 – 61.

[28] S.G. Ryan, "A survey of research relating accounting numbers to systematic equity risk, with implications for risk disclosure policy and future research," *Accounting Horizons* 11 (1997): 82–95.

[29] P. Linsley and P. Shrives, "Disclosure of risk information in the banking sector," *Journal of Financial Regulation and Compliance* 13 (2005): 205–214.

- Frequency test patterns generated by the measures of risk management designed to assess their accuracy and to examine the exemption to the established confidence intervals;
- Measuring the extent to which society is exposed to various individual categories of specific risk and global risk;
- Analyzing the effect of new contracts or transactions on the current situation of market risk.

The models tested over the years include:

- Statistical models (probability) that describe the uncertainty about the future values of market factors (eg. GARCH models and stochastic volatility models);
- Pricing models that relate specific instruments to prices and market factors (eg. Black-Scholes-Merton formula);
- Aggregation of risk models that assess the corresponding uncertainty of future values of financial instruments portfolio (VaR models using simplified estimates in order to establish a probability distribution over future values of a static portfolio in a chosen period of time).

Monitoring risk. The risks themselves cannot be monitored (but can be revalued more often), instead, the results, procedures and exposure can be monitored by specialists and presented in various reports. At the company level some reports contain information and comments related to different risks faced by an entity, market development and the maximum concentration areas subunits, type of asset, etc. Others refer to the risk limits or sub-type of activities related to VaR analysis. Thus, the updating and reporting relevant information may be assured.

All these reports should be as complete as possible and should provide accurate and in time information on risks in order to ensure the opportunity of any remedial action required. Certification of the monitoring process may be done to determine its consistency with both current market conditions and risk tolerance of the company.

Risk Control. The control must be viewed in the sense of obtaining a balance between risks and benefits, given the dynamic ways to manage risks, different than some rigid templates of control. There is a general rule but the following formula may be addressed:

- Establish a structure to limit the risk by addressing the key factors of risk issuing correlated to the size and complexity of the company;
- Setting limits on gross and net positions of risk concentrations and on the maximum loss acceptable;
- Setting alert signals when the limits are exceeded, requiring review and remedial actions.

Although well understood, company's risk is still undetectable in many cases and its evaluation may be based on a number of scenarios. It relates to the less liquid assets and liabilities that cannot be assessed objectively and reasonably. Fortunately, the adoption of international financial reporting standards that favour fair values of assets, liabilities and owner's equity, without affecting the reporting of company's profit may encourage managers to pay more attention on communicating risk information.

Conclusions

Implementation of risk strategy hardly depends on business, environment, culture, organization and objectives of individual companies, the task of risk management applied to company's risk including the four well-known themes, namely: identification, assessment, monitoring and control. Qualitative conceptual understanding of this topic for discussion is essential as long as the purpose remains the strengthening of stability while maintaining a reasonably competitive environment.

However, the adoption and development of companies' improved risk policies should be an important objective beyond the requirements of authorities. Establishing a prudent goal (setting a limit to the risk of insolvency) or economic objectives such as balancing the risks with the benefits should aim to broaden the spectrum of risk management activities.

Both the accounting literature and the main international accounting organisations recognize the need to complement the information currently supplied by companies with reports on the levels of risk they assume, in order to serve the purposes of users in their decision making processes. For future research we intend to draft a formal framework, that has still not been established, within which companies can operate when it comes to deciding which risks they should report, how these risks should be quantified and where they should be presented.

THE IMPACT OF PENSIONS SAVING AND EDUCATION DEFICIT ON THE LIVING STANDARDS IN ROMANIA, IN THE POST-ACTIVITY PERIOD

SANDRA TEODORESCU *

Abstract
The present paper starts with the study on the annual pension deficit in the EU member states, elaborated by AVIVA and DELOITTE companies in 2010. The paper analyzes the impact of pensions saving and education deficit on the living standards in Romania, in the post-activity period. It comprises the following sections: an introduction to the analysis, several definitions and the calculation method employed in the above-mentioned study, comparisons between Romania and other EU members states, focusing on the pension deficit, as well as a brief overview on the pension systems in Romania.
In the end of the paper, we propose a debate on good financial planning that can make the difference between poverty and a decent standard of living at the time of retirement.

Keywords: *saving deficit, pension, private pensions, financial planning, and calculation methods.*

1. General aspects

The history of pensions begins in Germany, under the leadership of Chancellor Bismarck, more than 120 years ago. The empire centered around the Hohenzollern dynasty, strongly supported by the aristocratic and bourgeois political elites, was attempting to establish a new state. Nevertheless, the working class and its Social Democratic representatives opposed the respective initiative from the very beginning. However, the leadership brutally repressed them and banned hostile organizations, without getting the expected results. During the same period (the 1880s) a new economic crisis emerged, and the social unrest convinced Bismarck that the integration of the working class into society was the only way to overcome the respective deadlock. Therefore, *three insurance laws* were adopted, for the first time: *the sickness insurance law* – on June 15, 1883, *the accident insurance law* – on July 6, 1884, and *the insurance against old age* – on June 22, 1889. The last one is extremely interesting, because it paved the way for the current state-run pension system initially adopted by the Austro – Hungarian Empire, later – by Benelux countries and, finally, by the whole Europe. Its beneficiaries had made payments for at least 30 years, receiving their pension at the age of 65 or more. The pension fund came from taxpayers, as well as company owners and the state, the second category being also involved in the financial resource management.

Although in a Europe dominated by liberal policies, the social legislation promoted by the German Chancellor seemed to be a long term failure, it was validated and, gradually, the elites became aware of the fact that social protection was compatible with economic growth and that the integration of the working class into society could not harm capitalism.

Basically, the state-run pension system has always required contributions from a sufficient working class which paid money to the pension fund, during periods characterized by stability and economic growth. The respective system has been applied in Romania, too, especially during Communism. Even today, there are talks about the capitalization of important resources during that period, which could guarantee the long term and very long term stability of the pension fund. The respective hypothesis is not entirely correct, because we cannot consider that the economically active

* Associated Professor, Faculty of Economic Sciences, „Nicolae Titulescu" University, Bucharest (e-mail: tsandra@xnet ro).

age depositors create intangible funds, benefiting from them at the time of retirement. The pension is a property gradually built up as the main source of effective contribution. However, it does not mean that, for example, if the depositor has accumulated 300 million lei in 30 years, he or she will benefit from the same amount from the state-run pension fund, each month, for the rest of his or hers life - 5 or 10 years (taking into account the average life expectancy).

First of all, it happens because there is a history of money, specific to the respective period, during the depositor's economically active life. Let us assume, again, that we are talking about a person who has contributed to the pension fund since 1966 through 2008. During 42 years, our depositor has witnessed two political regimes, two economic regimes (a centralized economy and a market one), triggering different financial regimes, exchange rates (under Communism, the dollar exchange rate was established through state decrees), devastating inflations, not to mention the demographic growth (especially after 1966) and, later, its increasingly sharp decline, the liquidation or privatization of state properties or the significant decrease in the number of public employees and in the demographic ratio of economically active population and pensioners, subsequently reversed. In addition, many still believe that, in the 1990s, the pension fund was used for other purposes, a move with negative consequences. To conclude, no contributor can benefit from the entire amount of the deposit, which, well capitalized upon, may earn him or her at least a decent living, at the age of retirement. And that happens because the (extremely inconstant) ability of the national financial institutions to cover payments based on the available resources at the respective moment is relevant for the state-run insurance system.

Therefore, the state cannot afford to pay more than it possesses at a certain moment. As a result, it can only establish rigorous criteria to calculate pensions based on contributions and their length, hierarchizing beneficiaries, applying a very simple rule: the person who has contributed large amounts for a long period of time may enjoy more benefits than a person who has contributed smaller amounts for a short period of time.

Although since mid-1990s, there have been numerous signals about the fact that the state will no longer have the ability to pay, amid the uncontrolled increase in the number of pensioners below retirement age limit or sick and the accelerated decline in the number of economically active people. However, although thorough calculations indicated that the pension funds were no longer self-sustaining, being financed from the state budget, the political elite remained indifferent. Moreover, the leadership of law enforcement institutions (the Ministry of Interior, the Ministry of Defense, and the Ministry of Justice) promoted special laws in the Parliament, according to which their employees would receive pensions equivalent to 80% of the last salary (including abusively increased benefits). Thus, an abnormal situation was created, and people who had long been retired benefited from pensions that exceeded the highest salary earned by a public employee. During that period, many people belonging to the respective social category justified their privileged pensions invoking their former positions within law institutions (such as the judiciary, considered to be the third power) or military structures, disregarding the other professions. The decline has accelerated, as the politicians have constantly promoted the myth of increased pensions, to win the support of a major part of the electorate represented by pensioners. As a result, during the 2005-2008 boom years, the pensions were constantly increased, however justified, but without the necessary economic support, completely neglecting the fact that once increased, the new pension fund should further be financed. However, finally, the political elites could no longer deny reality, admitting that the current state-run pension system faced collapse, ratifying the private pension system and the compulsory pensions - comprehensively approached in the following section - that could improve our future.

In 2009, when Romania faced the economic crisis overnight, the only solution to balance the situation was to ask for the IMF, the EU and the WB support. The conditions imposed during the respective negotiations focused mainly on cutting the budget deficit. Thus, in order to balance it, a series of laws were adopted, including revised pension rules, taking into account the state's economic and financial situation, instead of people's needs. Thus, the solid base of the new law was established

by adjusting pensions according to the minimum average wage, contributions, and the retirement age - 63 for women and 65 for men. In addition, the incorporation and recalculation of special pensions, according to the contributions paid, has led to massive protests. However, it is obvious that further measures will be adopted, and that the reform will continue to adjust pensions, either increasing or decreasing them. Unsurprisingly, after the political leadership's announcement that Romania overcame the crisis and that the economic recovery was visible, the pensions for people working under hard labor conditions increased. However, as far as future developments are concerned, the present paper offers a potential solution, based on AVIVA and DeLoitte reports on the savings deficit in the EU member states and Romania.

2. Basic definitions and calculation methods

The above discussion was meant to prove that pension funds had always faced deficits, due to various reasons, and the respective situation would not change in the future.

The word "deficit" comes from French, being defined in the encyclopedic dictionary "Larousse" as something that lacks, triggering disequilibrium between earnings and spending; and the resulting state of affairs. The Romanian dictionary "Dex" and other dictionaries as well, including the recent Romanian illustrated dictionary [12] nuance the term, defining it as expenditures that exceed earnings or lack of money for 'inventory' or during the audit period.

I have highlighted the respective definitions in order to stress that the deficit is always identified by examination (inventory or audit), revealing events that have occurred. The present paper assesses the pension deficit nowadays (for the recent past) and for the future, through prognosis based on potential scenarios. To that end, the paper analyzes three types of deficits: *the annual retirement income gap* – denoted by X, *the capital shortfall at retirement* –Y, and *the annual pensions savings gap* - T.

The annual retirement income gap - X represents the shortfall between required income and forest income in retirement.

The capital shortfall at retirement –Y represents the capital required at retirement that, when annuitised, would produce sufficient income to close the annual retirement income gap.

The annual pensions savings gap – T represents the additional annual savings required to meet the capital shortfall at retirement.

The three definitions highlight the difference between the savings accumulated during the time when people were economically active and the spending at the age of retirement, in order to enjoy a decent living standard. In mathematical terms, the three definitions are the following:

1. We have the next formula of the *annual retirement income gap* – X:

$$X = Y - Z$$

where Y represent *required income at the age of retirement and* Z represent the forest income *at the age of retirement.*

We also have the next formula of Y:

$$Y = A \times B$$

where A represent the *salary at retirement* and B represent *the replacement rate* (for example 70%),

and the formula of Z:

$$Z = C + D + E$$

where C represent *the state pension income*, D - *the private pension income* and E – *net non-pensions income.*

2. The formula of *the capital shortfall at retirement* – W is:

$$W = X \times a$$

where *a* represent the annuity factor.

3. The formula of *the annual pensions savings gap* – T is:

$$T = f(W; p\%; n)$$

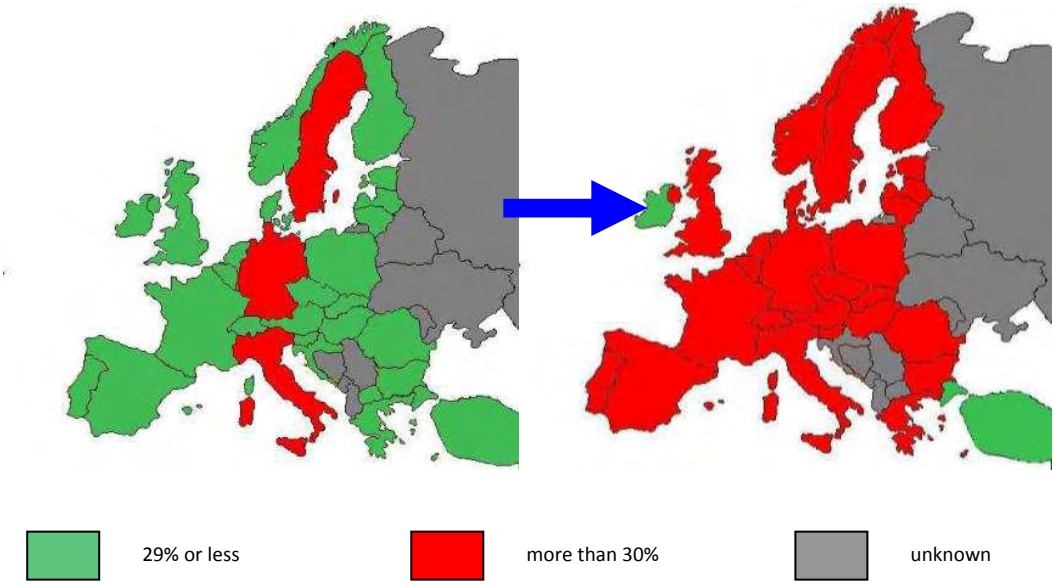
where p% represent *the interest rate* and n represent *the number of years remains until the age of retirement.*

3. Efforts to balance the savings deficit in Romania and other European countries

Providers of pension and life insurance products are increasingly aware that the pressure over the European pension system will grow, as a result of the rise in the average age of retirement and the modification of the balance between economically active and inactive persons, amid the constant growth in the number of pensioners. The graphic below clearly shows that if in 2008 pensioners accounted for 30% of the population from several geographic regions, such as Norway, Germany or Italy, in the next 40 years, the respective percentage would emerge in Western Central Europe states, such as Finland, the Baltic states, Romania, Bulgaria and Greece. After another 10 year period, the economically active population is expected to decrease by 12%, and the respective percentage of pensioners will generalize to the whole Europe.

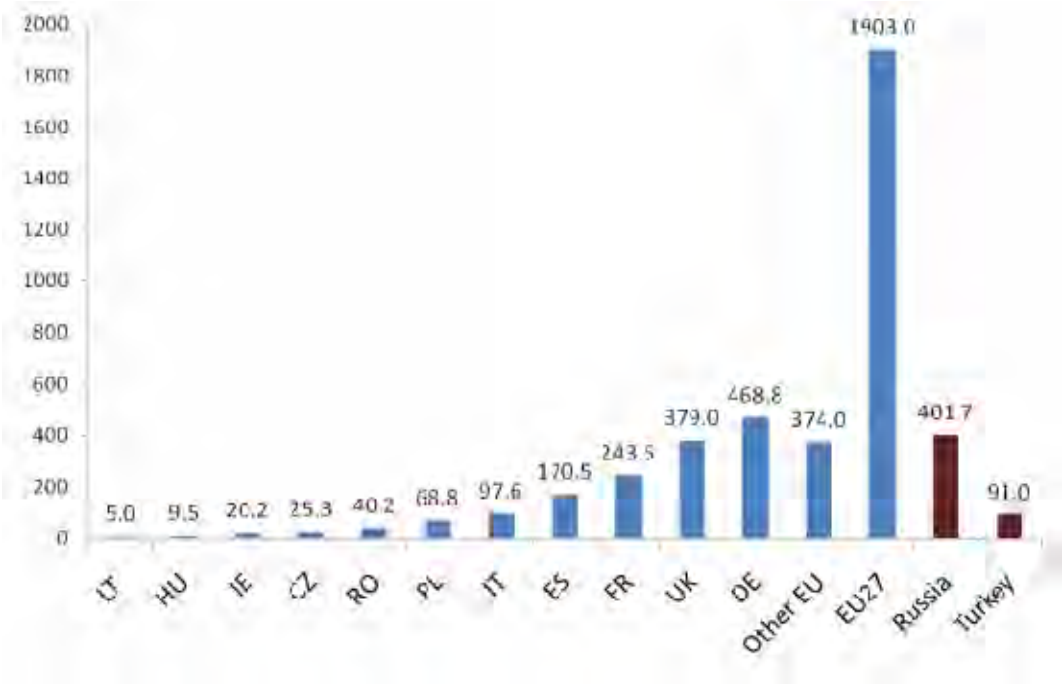
The report pensioners/total population

2008 **2050**



There are two relevant AVIVA tables. The first one illustrates the savings deficit in 11 EU member states, as well as in Russia and Turkey.

The pensions gap for different states from EU, Russia and Turkey

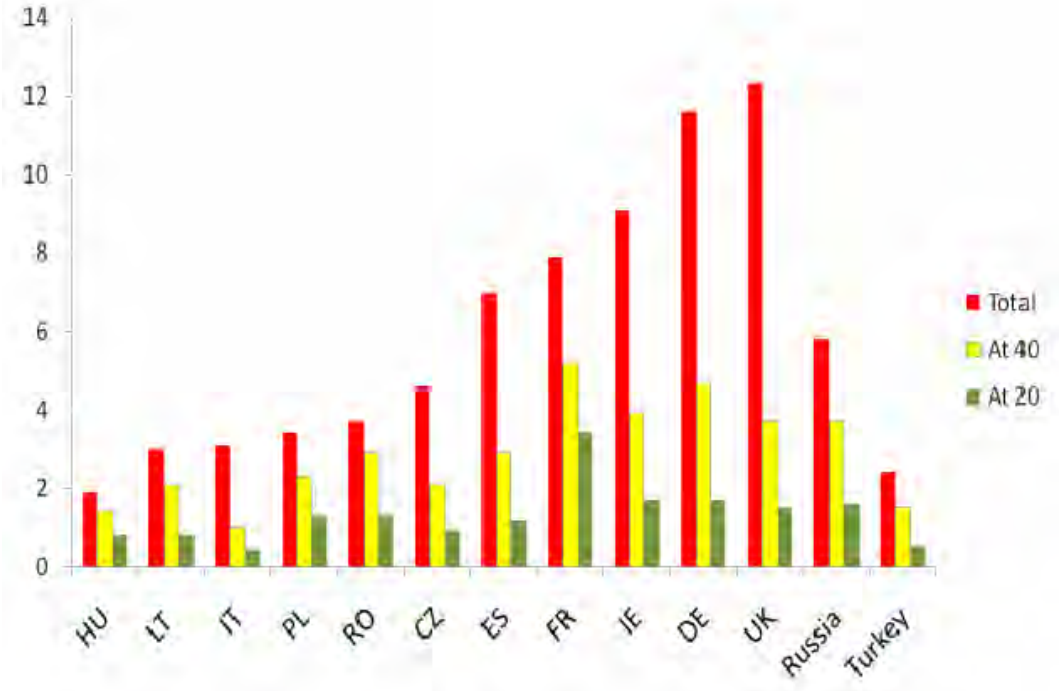


Romania should save 40.2 billion euros each year, four times more money than Hungary (9.5 million euros, and half of Romania's population) and approximately less than half of Poland's savings (68.8 million euros, and a significantly larger population). The deficit is higher in developed countries, where the population has high wages and pensions (for example 97.6 in Italy, 170.5 in Spain, 243.5 in France, and, the highest of all - 468.8, in Germany).

The total deficit reaches 1,900 billion euros in the 27 EU member states and 91 billion euros, namely twice as big as in Romania, in non-EU countries such as Turkey or Russia – 401.7, a smaller amount than in Germany. The good news is that the prediction model enables us to calculate the savings necessary to enjoy a decent living standard at the age of retirement, in the next 50 years. The bad news is that we might need more money to cover the deficit.

The second table shows the data on the savings deficit per capita, establishing the average deficit, denoted by *k euros/year*. Of course, the proportion is not different from the global one. Therefore, it is obvious that a Romanian citizen will have to save less than a Spanish resident and more than a Hungarian one, according to the average age and the demographic growth rate.

The pensions gap for individuals (k euros/year)



The table also shows the contributions paid since the age of 20 years and, respectively, 40 years, as well as the global contributions, highlighting the levels reached in Spain, which occupies the middle position. Here, the contribution should represent 1.2 K/per year for people aged 20, 2.9 k/per year for those aged 40, the global contribution reaching 7 k/per year. Thus, people could enjoy a decent living standard at the age of retirement. It is also important to mention that one should start paying the respective contribution as early as possible.

According to AVIVA report, the savings deficit should reach 1,900 billion euros, in 2011-2051, namely 40.2 billion euros in Romania, accounting for one third of our country's GDP or 3,700 euros per capita. Signaling that, „AVIVA Europe" recommends the following four measures:

1. Establishing the budget of the pension system of each country, per GDP, for each pillar. That target would encourage national governments to facilitate the development of the culture of saving.
2. Creating the European Quality Standard for Pensions, enabling thus providers to guarantee the quality of their products, increasing at the same time clients' confidence.
3. Issuing a pension declaration, encouraging consumers to consider the state-run pension system as part of the mixed strategy for providing for their future, and to act in order to obtain additional benefits.
4. Reviewing the National Plan to boost personal savings, taking into account the efficiency of the current incentive programs, their impact and visibility, as well as their ability to change consumer behavior, encouraging them to save more money.

The AVIVA report reveals that the state-run pension system still plays a vital role in the EU member states, amid the increasing presence of private pensions. Thus, the respective pension systems were introduced in 1994 in the Czech Republic, as non-compulsory pensions, in 1998 – in Hungary, and in 1999 – in Poland. The additional contributions and the compulsory pensions were introduced in Romania in 2007 and in the non-EU countries in 2001, for example in Turkey (the

additional pensions) and in Russia – in 2002, through state decree. Thus, in all European countries surveyed, the state-run pension system and different compulsory and non-compulsory pension schemes have been adopted, providing the beneficiaries the opportunity to save money and to enjoy more benefits at the age of retirement. At the same time, the coverage of private pension systems is gradually extending, tending to replace the state-run one. However, in the future, the value of state pension funds will further decrease, amid a drop in the number of economically active persons and an increase in the number of pensioners. In Romania, the respective ratio has exceeded the critical value (1). Moreover, according to forecasts, more than half of the working population will retire in the next 40 years. Unfortunately, there are fairly few global solutions: to save more money, to use non-passive assets, to retire at an older age or to accept lower living standards when retired.

There are two tables that show us the saving rate for persons aged 20-50, in 2010, and, respectively, the detailed situation, based on a scenario for the same category, briefly reviewing three types of contributions, gradually providing wage replacement rates (70%, 60%, and 50%), the savings efficiency, the 10% lower or higher state pension, the increase in the pension age limits – by 5 or 10 years, as well as the savings efficiency at the age of retirement.

	The age in 2010			
All pensioners in 2011-2051 aged up to 65 years old	50 years old	40 years old	30 years old	20 years old
3700 EUR/year	4800 EUR/year	2900 EUR/year	1700 EUR/year	1300 EUR/year

The best scenario is the following: a 20 year-old person in 2010, who will work 5 years longer than currently stipulated and who can save only 300 euros per year, and the worst scenario – a 50 year old person, in 2010-2011, who wants to benefit from 70% of his or hers wage, having thus to save 5,700 euros per year.

The average annual savings gap for pensioners in 2011-2051 according to age (thousand euros)

The scenario	The average annual savings gap for all pensioners in 2011-2051	The average annual savings gap for a 60 year-old person in 2010	The average annual savings gap for a 50 year-old person in 2010	The average annual savings gap for a 40 year-old person in 2010	The average annual savings gap for a 30 year-old person in 2010	The average annual savings gap for a 20 year-old person in 2010
The reference case	3,7	unavailable	4,8	2,9	1,7	1,3
Replacement rate 70%	4,6	unavailable	5,7	3,4	2,0	1,3
Replacement rate 60%	3,0	unavailable	4,2	2,5	1,4	1,1
Replacement rate 50%	1,5	unavailable	2,7	1,6	0,8	0,6

The interest rate 3%	4,3	unavailable	5,5	3,7	2,4	2,1
The state pension: -10%	4,2	unavailable	5,3	3,1	1,9	1,4
The state pension: +10%	3,1	unavailable	4,4	2,6	1,5	1,1
The age at retirement: +5 ani	2,8	4,4	3,1	1,6	1,2	0,9

The age at retirement: +10 ani	2,2	3,2	1,9	1,0	0,7	0,6
The interest rate 8% The age at retirement: +5 ani	2,3	4,0	2,3	1,0	0,6	0,3

The authors of the study start from the premise that in Romania, the salary will represent 80% of the average European one, by 2023. The middle class will face the most pressure on revenues, as beneficiaries have enough assets to enjoy a decent living standard at the age of retirement, while poor people are protected by the state through social protection programs.

To cover the 40.2 billion euro deficit, each category should save money. Thus, people aged 30 should save 1,300 euros each year, the segment aged 30-40 – 1,700 euros each year, and those aged 50-65 – 4,800 euros per year. That means 80 euros monthly (for the young people), 142 euros (for those aged 30-40), and 400 euros (for the third category).

However, what else can we do? First, the 20th century *mentality* should change. According to it, the state should take care of its citizens, who should not be preoccupied with their needs. As I have said, the state pensions cannot be increased, and the state will be forced to borrow more and more money to make the respective payments. Subsequently, the state will be unable to pay debts, being thus compelled to cut pensions. According to the worst scenario, in the future decades, pensions paid by state will be only 10% - 15% of the average wage, and respectively, 20% - 25%, in the developed European countries, insufficient for a decent living standard at the age of retirement.

Private pension funds (Pillar II and III) may represent a solution, being already adopted by many European countries. However, the state will temporarily nationalize them, if the budget deficit exceeds the limit (as it happened in Hungary, where a scandal has recently broken out), endangering thus the future of pension funds. Unfortunately, all those warning signs are usually neglected. It is still a hot summer day, and a bright blue sky. One could hardly spot a few clouds in the distance. Who can anticipate the looming tempest? However, despite inflation problems, the waste of public resources, the crisis and its negative impact, the state has paid pensions up to date, with sacrifices known only by the financial elite. Moreover, the political leaders competing in a never-ending election campaign, being aware of the needs of pensioners, have promised and will further promise a major increase in pensions, despite the collapsing system, endangering our country's future.

Therefore, we should learn to save money after years of wasting money, heavy consumption and destruction. Who will teach us? The young people, aged 20 – 30, are oriented towards present, instead of future. To convince them to save money in order to enjoy a decent living standard at the age of retirement, after 40 years, seems impossible. But it can be done, telling them over and over again that their contribution is small at the respective age, and that they can stop spending on expensive things, such as vacancies abroad or luxury items, to gather 1,300 euros, each year.

The age group of 30- to 40-year-olds or the 40 – 50 year-olds, is usually married, with children, having a stable job. They also got bank loans (for houses, cars and other necessary assets). Although enjoying a decent living standard, they are responsible and willing to save money in order to enjoy the same living standard at the age of retirement. Thus, they can be easily convinced to save 1,700 euros per year, with sacrifices, of course.

The other category, soon to retire, can be hardly influenced, and not only because their contribution should be greater. They are experienced enough and their personality is well-shaped. Many of them have been taught to save money and they have already done that, so, they can be easily convinced. However, others rely on state pensions, even though knowing that they may not enjoy a decent living standard at the age of retirement. Some of them believe that they could do

something else, if healthy and experienced enough to get a part-time job, in order to preserve the same living standard at the age of retirement.

What else could we do? The insurance companies strongly recommend us to make investment choices, such as bank deposits, state bounds or houses, whose value increases, as time passes. For example, they can rent one of their flats, to earn more money, exceeding sales price. Thus, efficient investments may represent a solution for you to enjoy a decent living standard at the age of retirement.

For those who cannot do it, the companies recommend measures already implemented in various European countries, such as increasing the age limit or working part-time in retirement. Although contested (for example, a new wave of pension protests has hit France, nevertheless failing to change the leadership's decision), the first solution will be gradually adopted by every country. One thing is sure: raising the state pension age by 5 years may reduce the budget deficit by one third. In the past 10 years, in Romania, the age limit was raised from 57 to 60 years for women, until 2015, and, in the next 20 years, it will probably rise to 63, until 2030.

A small change to the state pension age was also adopted for men, namely from 60 to 62 years, and later, to 65, until 2015, raising, in the next 20 years, to the same level.

For example, the new education law and the future status of teachers stipulate the same age limit for pre-university teachers (eliminating the opportunity to work for three years more, after retirement) and university professors (who could work until they were 70, if approved by the faculty leadership). But let's not deplore their fate, as their experience and expertise is still needed after retirement (they could offer consultations, teach pupils at home, getting paid by hour, publish their works abroad or in our country, attend conferences, and so on).

The same applies to experts in various fields, who can offer their services without obstructing the young people's access to top-level positions, where they are preferred, offering them instead best and valuable services, based on their expertise. For example, the Romanian-Austrian engineer Emil Prager (1888 - 1985), who built many representative buildings, such as the Royal Palace, the Ministry of Interior Palace, the Military Academy or the Elias Hospital, in Bucharest, as well as in other Romanian cities. In 1950, at the age of 62, he became advisor to the then Energy Minister. Until the age of 90, he helped the Ministry to build dams, thermal plants, hydro plants, under the Communist regime. His example has been recently vehiculated by the Romanian media outlets.

1.4. The public pension schemes in Romania

As most beneficiaries nowadays rely on state pension alone, it is important to briefly present the three-pillar architecture of our country's retirement income systems, which, altogether, could provide a decent living standard at the age of retirement.

- The first pillar (or state pension) is a distributed system, the compulsory contributions being paid each month by the employees (10.5%) and the employers (20.8% - 30.8%), in accordance with the Labor Standards Act;

- The second pillar (compulsory private pension) is financed from the contributions paid by the employees, amounting to 2%, in 2008-2009, expected to increase up to 6%, by 2016. It is mandatory for people aged under 35 to join it, while the 35-40-age segment, benefiting from state pension funds, may not;

- The third pillar (additional voluntary private pension) is based on the same principles. Contributions amount up to 15% of gross earning, paid each month by the employees or the employers (tax-free up to an amount of 400 euros), since 2009. It is not mandatory.

According to 2010 estimates, the average pension in Romania reaches 736 RON a month, namely 51% of the average wage of 1,436 RON, while in Europe the average pension reaches 85%.

The paper will present the third pillar (additional voluntary private pension), preferred by many social categories, including public employees, budgetaries, businessmen, liberal professionals and farmers.

Below, I will present two such products, namely the ING Classic and ING Optim, provided by ING. The two products have the same structure, but different deposit guarantee schemes. They are based on investment tools whose risks and opportunities are worthy of, such as bonds issued by the Romanian state or public companies, as well as by other EU or SEE countries, as Explicit Government Guarantee Bonds.

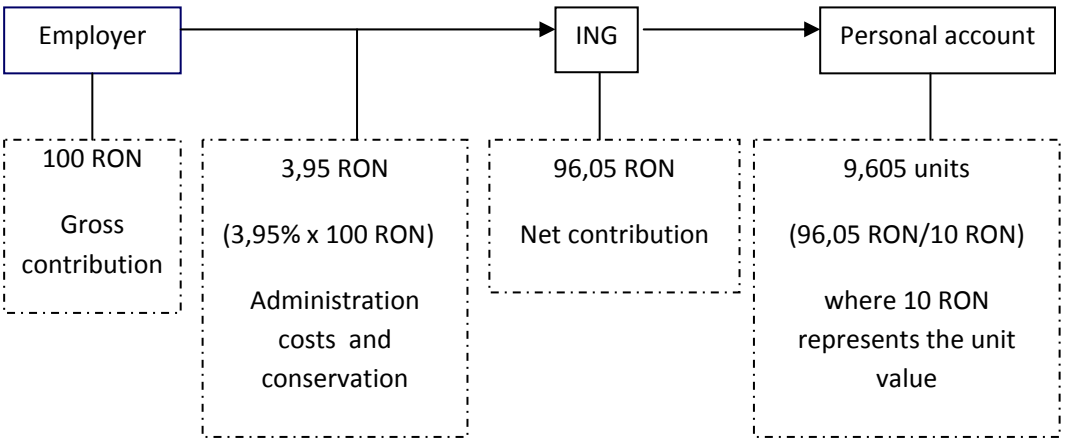
The first product offers relative guarantees on the market (achieving a greater efficiency rating than other additional pension schemes, calculated by the Private Pension System Supervisory Commission which controls the assets and transactions operated by the funds).

The second product is based on Deposit Guarantee Schemes (the payment of at least the value of gross contribution, in addition to the value of transferred assets).

The table below illustrates the tax expenditure by type and level:

	Value	**Mentions**
ING Clasic Fund		
Monthly administrative costs and conservation	3,95%	Deducted monthly from the total contribution paid Legal maximum level – 5%
Annual administrative costs and conservation	1,24%	Deducted monthly from the funds total net asset Legal maximum level – 2,4%
Transfer costs	5%	Charged when the transfer occurs within the first two years after accession No charge is made if the transfer to another ING fund
ING Optim Fund		
Monthly administrative costs and conservation	3,95%	Deducted monthly from the total contribution paid Legal maximum level – 5%
Annual administrative costs and conservation	1,36%	Deducted monthly from the funds total net asset Legal maximum level – 2,4%
Transfer costs	5%	Charged when the transfer occurs within the first two years after accession No charge is made if the transfer to another ING fund

It includes two fee adjustments for monthly administrative costs and conservation, covered by the participant and the managers of the fund, namely an adjustment from 3.95 to 4.85 (ING Classic and ING Optim), and, respectively, from 1.24 or 1.36, up to 1.95. The latter has already been approved by the Commission, entering into force since September 23, 2010.



During the contract period, the specific transactions take into account the modification of the contribution limit, the suspension, cessation or resumption of payments, the change of employer and transfers from or to other funds.

As far as benefits are concerned, they can be received by the 60 year-old beneficiary who has paid 90 monthly contributions, the value of personal assets being subsequently established. The participant will then receive the respective amount. If the two pre-conditions are not met, the amount will be paid off as a lump sum or annuity over a 5-year period. The same strategy is to be applied if the participant gets sick and is unable to hold a job. If the beneficiary dies, there are two methods: if he or she dies before submitting the necessary request, the deposit amount will be paid to his or hers heirs, under succession or, if he or she dies after submitting the written request, the amount will be paid to the designated person.

As far as deductions are concerned, the tax free employee or employer contribution is shown below.

The employee's annual contribution	Over 400 EUR	The employee pays: - CAS (9,5% + 5,5% + 1%) for this amount because it is part of salary - income tax (16%) for this amount
	400 EUR	The employee pays: - CAS (9,5% + 5,5% + 0,5%) for this amount, which is basically an amount withheld from the salary - NO income tax (16%) for this amount
The employer's annual contribution	Over 400 EUR	- The employer pays CAS (19,5%/24,5/29,5 + 5,5% + 1% + etc) for this amount - NO profit tax (16%) because this amount is considered an advantage in cash
	400 EUR	The employer does NOT pay - CAS (19,5%/24,5/29,5 + 5,5% + 1% + etc) for this amount - NO profit tax (16%) for this amount

The second table illustrates several scenarios, according to the periodic payments over a fixed period of time.

Scenarios			
Annual contribution (EUR)	Monthly contribution (EUR)	Contribution period (years)	Monthly pension (EUR)
200[1]	16,7	10	14
		30	57
400	33,4	10	27
		30	114
800	66,7	10	54
		30	228

[1] 200 euros represent the limit of the deductible amount per fiscal year

Alternative scenario:

A female person (*x* years old) contracts a voluntary private pension. For this, she contributes for *n* years (up to 63 years) with 66,7 euros/month (800 euros/year). It is considered that the interest rate paid by the credit institution (the fund's average annual interest rate) is 5% per year. To determine the monthly pension that a person will receive from the retirement age is using the formula:

$$\text{Monthly pension}=\frac{\text{Annual contribution}}{12\times(\text{life expectancy -retirement age})}\times\frac{N_x-N_{x+n}}{N_{x+r}}$$

where N_x represent a switching number and it can be found in the switching table, *x* represent the person's age, *n* represent the contribution period and r is the time after the person begins to receive the pension.

Thus,

$$\text{Monthly pension}=\frac{800}{12\times(73{,}5\text{ -}63)}\times\frac{N_{37}-N_{63}}{N_{63}}$$

As a recap, we can say that whatever type of voluntary pension chosen by the participant, its advantages are consistent. Thus, besides increasing the pension is not paid tax on contributions (the amount to be contributed is deducted from the income tax, maximum 400 euros per fiscal year), the money will be protected in all circumstances including permanent disability or death, freedom of movement (the participant decides: the period that is willing to contribute, the contribution level, the pension fund type).

In conclusion, regardless of the pension system joined by the participant, the *benefits* are significant, including important retirement benefits, tax-exempt contribution amounts (representing the equivalent of 400 lei in a fiscal year for each participant), protected funds, no matter what happens with the beneficiary, including in the case of his or hers death or permanent disability, encouraging at the same time the freedom of movement (the beneficiary establishes the contribution period, the amount paid, the pension fund).

Conclusions

In the end, it is important to highlight that the employees are free to choose either one big basket of eggs or just one egg in a small basket. The amount of state pension could be increased if joining a private pension fund, including the voluntary one, which, along with other benefits (a bank deposit, share holding, life insurance policy, and gold or real estate investments) might provide you with the opportunity to enjoy a decent standard of living at the age of retirement.

The issue of *pensions* is extremely important at the global level, especially in Europe, the old continent where people enjoy the world's best living standards and the longest life expectancy. But money is needed to further enjoy it at the age of retirement.

CONTROVERSIES IN USING DERIVATIVES IN THE CONTEXT OF THE FINANCIAL CRISIS

ALEXANDRU OLTEANU[*]

Abstract
As a phenomenon, risk is specific for any human activity. Following this logic, we can say that this concept is a constituent element in the definition given to the financial sector, investments and market competition. The questions that the whole range of operators (governments, regulation bodies, financial institutions, companies and shareholders) must answer are:
Which type of risk should one assume within an economic entity and to what extent should that risk be taken?
If risk is materialized, to what extent will the financial consequences affect the involved parties?
By enforcing laws that might eliminate economic risk, regulation bodies attempt to create an ideal regime in which the concept of"bankruptcy" does not exist. Thus, financial institutions and companies which hold a key position in the different economic sectors are prevented from performing actions that might lead to their bankruptcy. The positive effects of the regulation are doubled by less appreciated effects, such as the limitation of the investment potential. Working in this environment, the financial and economic agents' behaviour has significantly modified, i.e. it has mitigated the degree of risk aversion.
The solution for this is establishing more flexible regulation lines that do not have as a main objective the elimination of failure, but rather the reduction of frequency with which such incidents occur and to manage the individual investors'/consumers' losses.
One must preserve a balance between the need for facilitating risk internalization and the efficient use of capital (a fundamental operation for maintaining competitiveness and innovation spirit), on the one hand, and maintaining a certain protection level for the investor/client, on the other hand.
For regulation bodies any of the two options will be a priority, since it is obviously in the commercial interest of any company (and, certainly, of the suppliers, customers and associates) to efficiently manage risks that derive from its activity and, for this purpose, to take into consideration the use of derivatives. Recent financial collapses have illustrated the consequences generated by the improper application of the basic risk management principles and of the efficient implementation strategies for derivatives.

Keywords: *risk internalization, derivatives, CDOS (Collateralised debt obligation), CDS (Credit default swap), financial transaction taxes, Paul Volker's financial theories, the Tobin tax.*

Introduction

The use of derivatives – an innovation of the second half of the XXth century – has imposed itself thanks to the **advantages** it offers:

1.Despite the controversies that exist as to the use of derivatives, they remain the best financial instruments for market risk/credit management, as well as for other forms of risk. Both on the stock market and OTC (non regulated market), derivatives have three highly appreciated characteristics: geographical area coverage (derivatives exist on most important financial markets in the world); diversity (derivatives cover the range of all monetary instruments); liquidity (usually, any position may be occupied, diversified or cancelled at low costs).

2.When derivatives are transacted on a stock exchange market, the company benefits of certain advantages:

a. on this completely regulated market, transactions are guaranteed by compensation houses, significantly mitigating credit/counterparty risk;

[*] Professor Ph. D., Dean of the Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: aolteanu@univnt ro).

b.due to the standardized form of contracts, positions may be closed without the least inconvenience. As to OTC, the advantages are: direct choice of counterparty and flexibility of the form of the contract.

3. By using these markets, debtors and creditors can fix the cost of money; importers and exporters may be protected from currency fluctuations; companies can avoid unexpected price rises for raw materials. The way insurance contracts are used by companies to protect their fixed assets is similar with the way derivatives are used for insuring liquid assets. In both cases a premium/its equivalent is paid for purchasing such a means of protection.

In spite of the"pro-derivatives" arguments, **doubt is cast upon derivatives** when managers conceive risk management strategy.

Literature Review

A. The role of derivatives in risk management and their speculative use.

Historical data concerning risk management strategy reveal cases of operators that have recorded significant losses. For a risk manager, giving up derivatives as an efficient means for covering risk is not a solution. The surest solution is to understand the causes that lie behind these wrong movements which lead to important losses. However, discovering these causes is not simple, for they are a constituent part of human behaviour which sometimes does not take into consideration econometric models and results of simulation software. Besides the role they play in risk management, **derivatives are** also **used in a speculative way**. This is not surprising at all. Companies and speculative operators share a different opinion on derivatives. Derivatives have inner characteristics that, in case of minimum investments, allow companies to manage a series of risks. However, speculators perceive derivatives as a potential source of substantial profits and, thus, speculators choose to adopt a position and wait for a market evolution that might bring profits.

Despite operations initiated by speculators who amplify the endogenous market risk, in reality: most treasury and investment funds departments use these instruments for successfully managing market and commercial risks. Consequently, managers cannot ignore the potential of derivatives in managing a significant number of risks to which companies are exposed, except for the case in which one chooses to internalize risk and potential losses.

If the few enumerated arguments have consolidated the decision to pay the necessary attention to derivatives when evaluating risk management for a company, then afterwards one must regulate procedures for managing risks that derive from the use of derivatives. We consider that the following directions are essential for efficiently implementing risk management by means of derivatives:

1. Strategy Compliance. Human Capital

Running financial and banking institutions must maintain compliance between risk management policy by means of derivatives and the company's strategy, economic objectives, financial situation and its attitude as regards risk. To accomplish this function, managers must identify those risks to which a company is exposed (e.g. market risk, credit risk, operational risk, legal risk), establish what is the role of transacting derivatives for the company (a potential profit source or simple hedging operations) and ensure efficiency for the internal control system of transaction operations. In this respect, the appointment of professionals with a proper level of knowledge as to derivatives transaction is absolutely necessary and compulsory.

2. Organizational structure. Internal Control

The manager should establish an organizational structure and an independent control frame for transacting derivatives. This structure should comply with the principles of efficiency and facilitate risk management. The functions of this structure are: identifying, measuring, managing, monitoring, mitigating and reporting present and provisioned risks. This frame should monitor report

transmission, usages for sent/received document, the proper accounting of sent/received documents, the competence of transaction department members, responsibility assignment and procedures provided for unpredictable situations.

3. Managing risks associated with derivatives transaction

The most important risk categories – which one must take into consideration when laying the foundation of the derivatives transaction department – are: market risk, credit/counterparty risk, operational and legal (regulatory) risk.

An efficient risk management associated with derivatives transactions implies efficient procedures and work techniques for every type of risk, namely:

- Market risk – may be generated by unpredictable prices for shares, securities, merchandise, currencies, other market indices, or by their volatility. Market risk policies refer to approval, execution, confirmation, as well as recording, measuring, monitoring and reporting transactions and they set forth procedures for establishing relationships with the authorities in the field, adopting limit positions and evaluating exposures.
- Credit/counterparty risk – we appreciate this risk can be reduced by a collateral guarantee of credits and by techniques that increase loan capacity. Besides the credit/counterparty risk, the risk manager must take into account: third party risk, country risk and risk regulation. The risk manager's functions must include: differentiation of risk profiles for the stock exchange and the OTC market, assessing the advantages and disadvantages of portfolio diversification, the proper use of collateral guarantees for mitigating credit risk and establishing an action plan in case unpredictable changes appear (a partner's position or the position of a broker who faces financial difficulties).
- Operational risk, including the technological one – may be managed by identifying the impact - generated by the new products, partners and clients, the modification of the transaction methods, of the IT services sources or any inconsistency that might occur in running the business - upon risk management.
- Legal (regulation) risk has certain important particularities. Compliance with the legal frame is absolutely necessary for the operational capacity to make transactional operations and the basic principles that set up its functioning. Documentation must refer to the relationship between trader, the own bank and brokers, and it must observe the legal principles according to which the market functions.

It is obvious that these general directions are neither an insurance policy for companies which adopt them, nor an immunization treatment to risks deriving from transacting derivatives; even if followed, these directions cannot cover the different circumstances in which individual operators might be placed. Anyway, the above mentioned directions are a landmark for identifying, managing, assessing and mitigating risks deriving from derivatives transactions. If carefully used and properly controlled, derivatives play and might play an important part in risk management strategies.

B. The origins of the present international financial crisis and directions for regulating the financial market.

Such a leitmotiv used for explaining the present international financial crisis refers to the complexity of the new financial products, the so-called "synthetic" products, which are issued by important banks by means of the "originate and distribute" process. In fact this leitmotiv is used as a self-justification and it avoids tackling the problem.

However, complexity can be defined differently; one can mention an inner not dangerous complexity if the cognitive limits do not generate fatal errors. And there is a human made complexity, which, for example, consists in risky individual actions and precarious control mechanisms.

There are opinions according to which the financial products occupying a central place in the present crisis (CDOS/Collateralized Debt Obligations, CDS/credit default swap) should not be criticized. In our opinion, the problem is that a part of the bank securization activity (titrization) – transformation of loans and more and more sophisticated securities – contains fundamental vices.

Let us explain what is perceived as a "congenital" flaw of the "originate and distribution" pattern. We admit that in the simple transaction involving the lender and the borrower risk is one and it is illustrated by the borrower's reliability. This transactional (counterparty) risk can be checked by means of credit conditions on the market.

However, when loans are transformed into securities or other derivatives, the individual transactional risk starts to increase; the longer the chain of transactions is, the more complex is the securization (titrization) operation (by security "synthesis"); what appears to be more dispersed and smaller as an individual risk becomes more threatening for the system. This effect appears because markets are less and less transparent; some financial products are neither transacted on the effective markets nor do they benefit of credible evaluations (prices). At a certain moment, the cost of identifying risk is overwhelming and the market is blocked, a situation which in fact has already occurred.

The big rating agencies which used quantitative methods (patterns) have been caught in this chain of flaws. These agencies have major vices as to evaluating risk for the new securities.

For banks securization has appeared as a very profitable business to the extent to which they have managed to apparently eliminate risk. Banks used to sell securities to investors or to place them in special derivatives, taking them out of their own balance sheet. However, what appeared as a convenient dissemination of individual risk in the entire financial economic system led to increasing risk in the system. It is naive to state that banks (or at least the ones who were responsible for ensuring securization) did not understand the dangers of the pattern they used. In fact, all banks specialists realised that this was a dangerous attempt. Anyway, these specialists benefited of enormous amounts of money by means of compensation schemes that encouraged risk instead of a cautious attitude.

The collapse that the financial system has experienced in the economically advanced world – especially in the USA – obliges us to reconsider the existing financial markets regulations and surveillance mechanisms.

In the USA reforms are approached from two different positions. Both positions have common points, such as: imposing limits for leverage; more transparency; compulsory transactions of derivatives at specialized exchange offices; regulation of operations performed by all financial entities which generate systemic risk (including risk funds and hedge funds, as well as private equity funds); eliminating (as much as possible) interest conflicts; regulating rating agencies activities; modifications in paying bankers; consolidating surveillance mechanisms; paying more attention to systemic risks.

There are important differences between the position adopted by Paul Volcker (former FED Governor more than 20 years ago and at present counsellor of President Obama) and the position adopted by Lawrence Summers (former Treasurer and at present one of the main counsellors of President Obama). Volcker, together with other specialists in finance - Alexandre Lamfalussy in 2001, Paul Krugman in 1999, Nouriel Roubini in several deep studies, Warren Buffett in his studies on International Bank Regulations and the Bank of England etc. - have warned about the great dangers existing in the financial system and the financial derivative innovations used by important banks, as well as about the imminent financial collapse. In this context, Volcker considers that it would be wrong not to tackle the dimension of certain financial institutions which can hostage a system (see the collapse of the Lehman Brothers investment bank and the USA Government intervention to avoid the collapse of the AIG Insurance Company – which, ironically, acted as a gigantic risk fund).

Volcker and others who share his view suggest that commercial banks should no longer make "proprietary trading" operations, which are operations made in one's own interest. In this way, risky operations are reduced for financial institutions which encourage and use deposits riskily.

The measures announced by President Obama in February 2010 – measures which follow Paul Volcker's ideas – represent a new key step taken in building a new regulation system for supervising financial markets.

For example, let us consider the measure adopted for taxing financial transactions. Such a measure was proposed by the American economist James Token for discouraging speculative transactions on currency markets in order to mitigate their volatility. Today this idea is embraced by specialists in London, Paris, Berlin, in international financial institutions (FMI) with a view to reduce the volume of financial transactions and obtain incomes that might help states intervene in case of systemic risks. Actually, there are countries (Australia, Switzerland, Greece, Hong Kong, India etc.) which tax some security, shares and derivatives transactions. Recently, Brazil has imposed takes on the entrance of speculative capital.

There are opinions according to which taxes on financial transactions should not be imposed with a view to collect fiscal incomes (i.e. Tobin tax, differently from Pigon taxes, which would attempt to collect negative externalities generated by market flaws). This reasoning is supported by envisaging financial mediation as an intermediary production (see P. Diamond's and J. Mirrlees' study), respectively the taxing of intermediary (not final) production would introduce dissensions in the production chain, reducing efficiency.

Conclusions

The conclusion is that the present financial crisis is basically generated not by the complexity of the new financial products, but by a financial innovation pattern and the characteristics of financial products (e.g. CDOS, CDS) which have disrupted the good functioning of markets: **transparency** and **trust**.

Besides proposals for fundamentally reconsidering the existing regulations and surveillance market mechanisms, imposing a tax on financial transactions is not senseless since: it is necessary to register fiscal incomings that would allow necessary interventions to be taken; this would mean imposing a tax on an activity which represents a bad allocation of resources.

Consequently, it is desirable that the financial system should lose a considerable part of its speculative nature. In the USA, in European countries (e.g. Great Britain), the financial system is now over dimensioned and if we take into account the volume of profits obtained in relationship to the total profits obtained (e.g. the USA received 40% of the total profits, though its GDP is a lot inferior to this percentage), one can appreciate that certain states obtain an incorrect revenue. In time this has led to a distorted allocation of resources and it has also generated unacceptable systemic risks.

"REINVENTING" ROMANIAN ECONOMIC HIGHER EDUCATION, A CHALLENGE OF THE KNOWLEDGE SOCIETY

NELUȚA MITEA[*]

Abstract

The revival of Romanian economy could be reached by changing mentalities and by inventing new economic, political, legal and social actions. The Knowledge Society brings many challenges for Romanian people. One of these challenges consists in reinventing Romanian Economic Higher Education, beginning with the increasing of learning process attractiveness, diversifying teaching methods and practices, encouraging the research and the innovation.

The present paper aims to present specific regulations concerning the academic education, in order to identify the most effective applicable system in the current conditions of economic development. In a Knowledge Society, we need a well-trained workforce, highly qualified, able to use efficiently new informational technologies. Universities are held to cultivate the entrepreneurial spirit among their students, that of competitiveness and success in the profession and, therefore, they must encourage performance and excellence.

The research was conducted by using the information furnished on the one hand by Romanian legislation on education, on research and development, on SMEs, on structural funds. On the other hand, the research approach was based on the study of the literature in the field, including reference items such as works of applied and fundamental research. The originality of this paper consists in proposing to the Romanian Economic Higher Education to achieve the real needs of business environment.

***Key words**: Knowledge Society, knowledge management, research, innovation, excellence*

Introduction

We are witnessing the last decades a number of phenomena that characterize the evolution of human society. They show that we are living in a period of deep changes defining the transition from the industrial society to the new type of society: that of knowledge. The most obvious feature of this new society consists in the speed regarding the introduction, the dissemination and the utilization of ICTs (Informational and Communication Technologies). At this point we should consider the speed with which knowledge is renewed, so that its volume doubles every five years. Knowledge is not just a component of the modern economy, but it becomes a basic organizational principle of human existence. Therefore, informational techniques will be considered during this study in relation to their role in knowledge's production and dissemination.

Romanian society could not exist any more outside of Europe. The evolutions taking place at the international level do represent a real chance for Romanian people during our transition from the industrial society to that of knowledge. As well as the rest of Europe, Romania has to manifest an increased interest in research and innovation. The state is required to assume a primary responsibility for financing scientific research as it is shown that scientific and technological discoveries do make possible the economic progress. The revival of Romanian economy could be made by changing the mentalities and by inventing new actions at the economic, political, social and legal levels. For this we should aim to modify people's behavior. An innovative behavior is linked to special measures on learning and professional training, on research and development. The reform of the educational system seems the only solution to our economic recovery.

The purpose of this paper consists in highlighting the challenges and implications of the knowledge society for Romanian Economic Higher Education. This study aims to provide the

[*] Associated Professor, "Andrei Șaguna" University, Constanța (e-mail : nelutamitea@yahoo.com).

specific regulations concerning the academic education, in order to identify the most effective applicable system in the current conditions of economic development. In a Knowledge Society, we need a well-trained workforce, highly qualified, able to use efficiently new informational technologies. Universities are held to cultivate the entrepreneurial spirit among their students, that of competitiveness and success in the profession and, therefore, they must encourage performance and excellence.

The research was conducted by using the information furnished on the one hand by Romanian legislation on education, on research and development, on SMEs, on structural funds. On the other hand, the research approach was based on the study of the literature in the field, including reference items such as works of applied and fundamental research. The originality of this paper consists in proposing to the Romanian Economic Higher Education to be projected in relation to new realities of the labor market's supply regarded at the national level as well as at the European and even global ones. In order to achieve the objectives of this paper, at the beginning, I identified the need for cooperation between business community and that of education and research. I also respected during this study the conditions imposed by a knowledge-based economy. The paper also outlines some specific proposals for reinventing the Romanian economic higher education. These proposals are related to: the increase of learning attractiveness; the diversification of teaching methods and practices; the encouragement of research and innovation; the increase of actors' involvement in educational process; the improvement of the academic management that has to pursue the achievement of excellence and performance.

1. Challenges of Knowledge Society for Romanian people

Change does represent one of the fundamental laws of the society's evolution and to know the change's process could lead to competitiveness in a true competitive environment. In the new economy, named also *the knowledge economy*, main resources are not represented by the material resources or money, but by knowledge itself. This concerns the human and social capital. Knowledge assures the equitable distribution of resources but also the mobility of labor factor. This change supposes a complex process which follows: to reinvent the behaviors, actions and objectives; to generalize IT&C utilization at global level; to reform the higher education system; to create a new status for scientific research with focus on innovation and fundamental research. Informational revolution offers to developing countries possessing intellectual capital a unique chance to skip over traditional stages of the evolution process. By their policies, governments should support IT&C domain through some special measures meant to encourage the development of information society. We all know that passing to an information society is not a simple and common process. This supposes a true revolution: on the one hand, we think of a technical revolution and, on the other hand, of a mental one because "navigation tools upset our way of thinking and our reasoning"[1]. Observing the changes produced by the industrial and managerial revolution, Peter Drucker arrives to consider that "what we mean now by knowledge is effectively information in action, information orientated to results"[2]. He also thinks that „we are living nowadays in a society whose primary resource consists in knowledge"[3]. Information does represent a valuable good, but its value concerns its capability to be transformed into knowledge. Informational technologies associated to knowledge and to communication modify both the production process and even the society, leading to a sustainable economic growth. It is the moment for the Government to encourage research and innovation: it is the way to obtain the competitive advantage. At this point we take into discussion

[1] Musso, P., 2002. L'économie symbolique de la société d'information, *Revue européenne des sciences sociales, Cahiers Vilfredo Pareto*, XL (123), pp. 91-113, http://ress revues.org/618

[2] Drucker, P.F., 1999. *Societatea post-capitalistă*, Bucureşti: Ed. Image

[3] Idem 3

"the spectacular changes in technical and economic paradigm"[4], by which we could modify the production style, the effectiveness and the quality and also the management style that will use very performing technological tools. Therefore, we could not choose between computers and telecommunications: computers assure information's processing and telecommunications its transmission. They both form "the central nervous system of the XXI century's economy and they contribute to the future growth and well-being"[5].

Internet has become a communication tool and it is also the source of information knowing the greatest expansion in the entire human civilization. Informational economy's convergence by the means of IT&C, of Internet and of electronic trade gets important values. International economic landscape is changing and organizational structures are reconfigured at all levels. In such a complex world, full of uncertainties, change could not respond only to material needs; goods representing change's objectives become true informational flows. It is the moment for projecting mutations for classical organizations to partnerships based on research-development-innovation (RDI). Information technology denotes the convergence of standards, hardware, software, telecommunications, Internet, electronics and technologies resulted[6]. As a consequence, it is necessary to change the deployment of affairs and this change will become a true challenge for academic and business environments. We could not develop in Romania a competitive knowledge-based economy unless we solve the problem of the cooperation between business community and that of research and innovation. We should reinvent our economic higher education system; otherwise we will wait for a long time positive results in our economy. General culture has to be doubled by a practical culture, specialized, an entrepreneurial one. Creating a relay higher education with excellence centers should become the basis for the reinvention process of education.

Unfortunately, progress in Romania could not be compared to scientific and technical phenomenon because of the lack of perception and comprehension concerning the importance of ethics and innovation for politicians. The promotion of Romanian business environment has to be oriented to the innovative SMEs. In this respect, we should stimulate the creativity by highlighting the new technologies' role in consolidating the commercial and production activities. We should also encourage the cooperation in order to improve the databases necessary to facilitate the SMEs' access to the results of scientific research. It is imperative to create business partnerships which follow an effective technological transfer. The present paper proposes a free transfer towards interested enterprises in researches' results obtained during R&D programs by the means of public funds. The economic activity must be realized with high-trained, educated and well-informed employees. In the current conditions it is necessary for people to beneficiate of lifelong learning. Reinventing educational system supposes *a new learning paradigm*[7] considering technology a true investment. Among the features of this paradigm there are the following ones: university is seen like a real social partner; university has to provide market value; educational system must be centered on market and on business needs; universities have to be financed by the market; we are supposed to pass to a multidisciplinary approach[8]. Knowledge society involves a series of changes at the academic level too; universities are held to change their services, furnishing learning in a way adapted to the newest needs. This new type of learning must take into consideration the acquisition of some skills like:

[8] Idem 8

communication skills, lifelong learning, leader and team spirit, critical reasoning, the ability to adapt to changes and also a responsible attitude[9]. It is the moment for the academic environment not only to receive information, but "to build knowledge"[10]. In this respect we could appreciate that the organizations encouraging knowledge and technology will have spectacular results in their economy. Used by the enterprises, the researches' results could become in the future true commercial opportunities. Companies activating in business environment have all the reasons to use educational institutions in order to develop new models of thinking and of management which they will apply in their current activity. Tools like: *Porter's five forces, the Balance Scorecard, the Black-Scholes equation* were developed by the academic environment and after that, they were successfully implemented in business. Thus, beginning with these examples, we could hope that the partnerships between academic environment and enterprises could represent the lever to the revival of Romanian economy.

2. The perspectives of Romanian Economic Higher Education

In the context of a knowledge society, Romania needs a highly qualified workforce, able to use the new technologies. Higher education is responsible of learning and training. But, among the universities, even the companies have to manifest interest in training their employees in order to survive in the information society. The cooperation between educational system and business environment will create the premise of the competitive advantage. The concept of competitive advantage could not be taken into account by ignoring that of quality. The latter represents a true successful factor for all the levels. The educational quality system refers to the mechanism by which universities provide trust to their internal clients (employees, students) and to external clients, too. This system supposes a series of policies and processes focused on maintaining and on increasing the educational services' quality. In this regard, in Romania we foresee the need of creation "a quality culture"[11]. In our country, the legal framework of quality assurance in higher education services is provided by Law no 87/2006 that approved the Government Ordinance no 75/12.07.2005. In the same time, this framework is also furnished by Order no 3928 dating from 21.05.2005 issued by the Ministry of Education and Research, by the External Evaluation Methodology, by reference standards of Romanian Agency for Quality Assurance in Higher Education (ARACIS). The latter provides the list of performance indicators which constitutes the basis for universities' assessment.

In spite of all these, until now, we have encountered a lot of difficulties in the definition of the concept concerning *the culture of educational services quality*. We agree that the concept promotes *excellence* as a determining factor of competitiveness for the institutions providing educational services. Experts believe that we should take into account a certain behavior related to the quality, a focus on the benefits of educational services which are held to be understood through their role in producing training as well as a result consisting in their quality of future partner. Educational services will intervene directly in the economic life and contribute to its evolution as a whole[12]. Achieving excellence in all the university's activity will influence the sustainable relation between economy-academic and business environments. Knowledge society brings to the forefront the informational and communication technologies. They influence all areas of activities: economic activity, educational activity, private and public administration etc. Therefore, the higher education system must be adapted to the IT&C and also to the needs of knowledge society.

[12] Idem 12

Unfortunately, in spite of the Bologna Process adoption, in our country there is not an optimum education system whose focus would be on practice and that respond to the market's real needs. Romanian higher education is a faithful mirror of the entire society. Therefore, it is mandatory to correct the deficiencies making difficult the alignment of Romanian educational system to the efficient European systems. This study presents also the differences between the existing specializations and professional careers in Romanian and international socio-economic environment. As Romania's economy is shrinking every day, the European labor market maintains its vitality in order to attract teenagers who are not able to find a job in their country. The lack of an adequate education environment, the lack of a lifelong learning and the lack of research possibilities, of material incentives, all these justify *the brain drain phenomenon* so developed in Romania. This artificial intelligence would have brought to Romania's development a more important added value. The contemporary knowledge economy requires the capitalization of these talents; this is the lesson given to us by the Western developed countries.

It is also imperative to link Romanian higher education to European careers in order to prevent the allocation of funds to some specializations that are no longer on the market. Another major weakness manifested is the poor financing in terms of research or even the absence of it. If we consider the American universities, the Japanese ones and the greatest European universities, we will observe that their budgets are build on important contributions from private companies. It would be ideal to have in Romania a few research centers funded by multinational companies. The results obtained would be used by enterprises in order to bring to Romanian economy the competitive advantage in the struggle on the European and global markets. Especially now, in such conditions of crisis, Romania reveals its deep economic problems. Many international companies have used the local area for the cheap labor and also for our legislative possibilities to export quickly their profits.

Another issue treated during this paper consists in the research fragmentation. After 1990, the greatest part of Romanian research institutes had taken off universities in order to pass to Romanian Academy. At present, they complain of funds' absence which prevent them doing research and, especially, attracting young researchers with studies and works within the greatest Western universities. Some of the threats of this system consist in imposing formal barriers by the management of universities or colleges. At this point we should take into account an assessment of all the existent research centers in order to make the inventory of their resources, both human and material ones, and of their collaborations with the European and international research institutes, of papers and magazines published. The present paper proposes a solution consisting in the creation of some private research centers having legal status allowing them an easier access to the European funds for their own projects. This proposal could help research institutes to participate successfully at the European scientific competition.

A competitive educational system furnishing lifelong learning would be able to develop human resources by its contribution to the increase of skills, of creativity, of initiative and of value spirit. We could not ignore the fact that, besides the well-trained workforce, the European labor market requires high standards of mobility, flexibility and professional retraining. By analyzing the statistics in the field, up to now, we noticed that no university from Romanian space succeeded in entering the Shanghai Top of the 500th most performing universities in the world. Czech Republic, Poland and Hungary are presented in this top while Romania remains completely excluded. Among the differences that separate Romanian universities from those in Shanghai Top, there are the following ones: the innovation capacity of our economy is at least one third of the European average (according to the annual European Innovation Scoreboard), our incapacity to capitalize the intellectual property; the persistence of serious problems connected to the financing of education, to poor quality of education, to the absence of an effective management, centered on performance and excellence. In the meantime, the state does not assume his responsibility for setting as national priorities the allowance of funds according to different skills and to market's needs. Therefore, the involvement of business environment and of local communities is absolutely vital for starting the

projects concerning the reform of the educational system. But the results will be visible on the long term and they suppose a radical change in the mentality and behavior of each individual. Romanian economic higher education needs a transformation at the level of *quality (teaching, learning, research),* of *financing* and of *management.* The mechanisms which assure the quality in education and the development of a performing quality management should be considered as areas of major interest promoting the competitiveness of Romanian education. In this respect, we should have some main directions of actions like: the correlation of Romanian higher education with the European systems; the increase of public and private funds granted to the research institutes and their distribution according to their specific potential and to national development priorities; the introduction of an effective evaluation system of researches' results with focus on concrete results. An institutional innovation specific to knowledge society giving relevance to higher education and to scientific research consists in the creation of some *heterogeneous networks of cooperation.* The fundamental idea of these networks supposes to joint their resources in order to achieve the added value. In Europe, these groups called *Innovation Relay Centers* aim to disseminate rapidly the innovations, particularly in countries with limited research opportunities. The objective of such cooperation is to promote innovations in business. It is desirable to achieve in Europe the networking of excellence centers in research and to join scientific communities, companies and researchers from other areas. The use of Internet has already facilitated the development of an *online learning community* in Romania, too. In general, online systems could improve learning process because students are exposed directly to a lot of case studies. In the meantime, they are connected to distance partners enjoying communication and collaboration. A method like this encourages the expression of their views about the topics discussed, so that reasoning and critical thinking are activated[13]. The implementation of new technologies in universities is more than just buying computers or creating web-sites. The successful use of these technologies for teaching and learning process supposes major changes in organizational culture. New technologies are designed to increase the flexibility of learning process and to improve students' skills, students being regarded as future specialists. However, new technologies could increase even the pedagogic effectiveness and also the profitability[14]. Therefore, Romanian universities require an adequate technological infrastructure which satisfies academic and administrative needs. This infrastructure should allow an optimum space to innovation. In order to achieve their objectives, universities must understand exactly the cost of new technologies. For this purpose, they are held to make transparent the expected cost according to it they will appeal to serious funding from the business environment.

3. Romanian academic management based on knowledge

The organizations' capacity to adapt to economic requirements depends on the development of a new type of management centered on knowledge's values and those of scientific creation. A major challenge of this century, *the knowledge-based management* appears like a result of knowledge's progress. This new system of management develops only in the knowledge-based organizations named as "collectivities of workers charged with the work of conception, interconnected by the means of a technological infrastructure"[15]. As I have already shown during this study, to get performance is not possible without new knowledge, without the permanent involvement of scientific research which represents the basis support for the new type of management brought into discussion. In one of his papers, Ovidiu Nicolescu sustains that the knowledge-based management consists in "studying the managerial process and the relations based on knowledge, in discovering the laws governing them and in creating new systems, methods and

[13] Ibidem 11

[15] Holsapple, C.W., Whinston, A.B., 1987. Knowledge-based organization, *Information Society*

techniques in order to increase the performances and the functioning of organizations, by valorizing the greatest values of knowledge"[16].

Romanian organizational environment could not make exception from the global orientation of the contemporary society towards knowledge and advanced technologies. At the level of debates, the concepts of economy, organization or knowledge-based management have penetrated Romanian higher education. The research projects designed to this field know a significant presence within the themes of fundamental and applicative researches issued by the institutes in our country. In Romania, there is no an institutionalized system of initial or continuous formation of managers from the academic environment. Therefore, we feel an acute need to improve mechanisms within the managerial structures as well as to reorganize the managerial system in order to assure the increase of consistency and effectiveness at the decisional level. By the means of strong scientific research projects, of sustainable actions for the dissemination of researches' results, all the institutions involved should find solutions in order to surpass their organizational limits. Scientific research represents the guarantee of Romanian economic progress on the medium and long term.

After the resolution of problem concerning the academic management, new favorable opportunities will appear for Romanian economic higher education. As a consequence, the projects and partnerships developed in the academic area and also in the business one could make from Romania, in the future, a *true spiritual leader* and also one of the most credible international suppliers of leadership. A series of projects in different stages of evolution succeed in joining prestigious education and research institutions, huge intellectual resources that have the power to move ideas modeling the future of education and the dynamic of innovation[17].

Conclusions

The present paper highlights the challenges of knowledge society with its implications for Romanian economic higher education. One of these challenges consists in reinventing the Romanian economic higher education beginning with the increasing of learning process attractiveness, diversifying teaching methods and practices, encouraging research and innovation. This paper focuses on the fact that, on a long time, knowledge society's success depends on the interest manifested towards the research, particularly the interest coming from the higher education level which has an essential role in the training and development of entrepreneurships and of leaders. The analyses I made for this paper and, especially, the reality lived lead us to conclude that education in Romania is deficient. The economic higher education can not respond to the needs of business environment, both the internal and the international ones. Knowledge society involves a lot of changes in the mentality and behavior of individuals and of institutions too. In business environment we need excellent skills at which we could arrive only by the means of the active intervention of educational institutions. The state itself must participate at this process by encouraging research and innovation, by allowing the necessary resources according to the national priorities and also by reforming the educational system. We could not ignore the fact that, in the future, the research activity would have a significant weight in universities' assessment. This evaluation would be developed during the internationalization process of Romanian higher education. There are some weaknesses which should be corrected like: the educational politics without continuity (the destabilization of national educational strategy); the unfavorable legal framework for the academic

[16] Nicolescu, O., Plumb, I., Vasilescu, I., Verboncu, I., 2004. *Abordări moderne în managementul şi economia organizaţiei,* Bucureşti: Ed. Economică

[17] Batali, A., 2010. România lărgeşte frontierele cunoaşterii prin proiecte educaţionale de anvergură, *Market Watch,* iulie-august, nr. 127, http://www marketwatch ro/articol/6991/Romania_largeste_frontierele_cunoasterii_prin_proiecte_educationale_de_anvergura/

autonomy; the absence of a homogeneous and structured academic supply; the insufficient resources and space for the development of academic activities; a cognitive training against a formative one.

However, the current context offers a series of advantages for Romanian economic higher education like: a multitude of information opportunities at a high level; financing opportunities especially by the means of structural funds; the possibility to achieve strategic partnerships between universities and multinational companies and also partnerships between universities and business environment by the means of SMEs. Romanian higher education should achieve the performance of generating economic results which would be transferred to companies for their own use. The conclusions of this paper highlight the idea that information, as well as the participative business organization and the implementation of a knowledge-based management would influence the revival of Romanian economy. In the meantime, this paper aims to develop some directions for future researches. One of them proposes to find the possibility of accessing more effectively the European funds designed to research and innovation projects. Another direction proposes to study the application in practice by the business environment of the researches' results as a premise of the competitive advantage.

A COMPARATIVE OVERVIEW OF REGULATION OF ACCOUNTING IN KOSOVO COMPARED WITH REGULATION ACCORDING WITH IAS/IFRS

NEXHMIE VOKSHI[*]
MIHANE BERISHA-NAMANI[**]

Abstract
Kosovo already is in an important stage, because we have just lying the foundations of the formation of the new state. Therefore, it is very important to our country to open it's doors to the developed European countries and beyond.. To achieve this we must work hard and sacrifice by all, while as in order to reflect an economic and social development in all areas, it's very important among the development of the accountancy profession, which provide opportunity for a quality financial reporting and acceptable to all. A weak financial reporting and limited, has an effect on the making economic decisions with low quality by decision makers, reduces the possibility of foreign investment and capital spilling. As result, the universal language of the financial report that is understood by all users of accounting information, no matter where they are not used.In addition it is important to note that if we remain limited in the construction of financial statements under accounting rules inherited from the past than opportunities for global development of the economy as a very important pillar for the development of a country are closed, the needs for capital are not fulfilled , foreign investors reluctant to do investments etc.
These components are defined and discussed in the paper, while a law on accounting and finantial statement which could define better and more closed the main directions of accounting regulatory authorities are proposed as necessary.

Key words: *accounting**,** accounting developments, accounting information, finantial statements, accounting standards.*

Introduction

A real presentation of finantial statements according to international standards gives priority to economic content over the legal form of transactions. In Kosovo before regulation of accounting according to international standards was manadory submission of balance sheet and statement of income and expenditure. Furthermore, other statements by international standards were absent and not prepared at all. These facts justify the need for new accounting developments in Kosovo. This paper seeks to explore and justify that finantial reporting according international accounting standards play a major role for the thrift of accounting and realistic presentation of finantial statements. The study proved that a law on accounting and finantial statement is necessary.

The study also gives recommendations how to successfully strandardize accounting in Kosovo with EU standards of accounting.

1. Last regulation of accounting in Kosovo and regulation under IAS/IFRS

The accounting regulation in Kosovo is not providing a basis regulatory, single and complete. Although its importance is to large when it comes to same basis of reporting, which could be only achieved with the implementation of international accounting standards, where are determined more widely unique rules of recognition of financial statements elements, the criteria for classification of these elements, and other qualitative features of the construction of financial statements.

[**] Associated Professor, Department of Management and Informatics, Faculty of Economics, University of Pristina, Kosova (e-mail: mihane_berisha@yahoo.com).

Further, it is very important a real presentation of financial statements, where according to international standards given priority are given to economic content over the legal form of transaction, while as early in accounting regulation were absent such a thing and one element in accounting was recognized only under the legal control.

Before regulation of accounting according to international standards mandatory was submission of the only balance sheet and statement of income and expenditure, whereas two other statements necessary to provide by international standards were are not prepared at all. These and many other facts justify the need for a new accounting development in Kosovo, which should be drawn up according to international accounting standards, as a unique regulator which is not focused simply on the legal obligations of accountability, but also in determining of main rules of establishment of financial statements.

A novelty is that compliance with international standards which makes quite a lot to increase the flexibility of accounting regulation compared with inflexible regulation prescribed by the previous laws of the accounting. According to reserchs the financial reporting in accordance with international accounting standards play a major role and is very important for accounting and realistic presentation of financial statements. Such a fact is fully understood and assessed, when it reached the highest level of implementation of these standards, whereas in the development where we are, such issues has been started to be understood positively by accountants and with development opportunities in the future. This can be understood also by comparing data from accountant respondents, employees of tax administration and directors of companies. Analyses presented in this paper gives us the opportunity to get closely at what level we are currently when is the question of the real possibility of presenting financial statements in accordance with international standards.

On the question how important is the role of financial reporting in conformity with international accounting standards for regular accounting and for presenting real financial statements[1], the data from the categories surveyed (accountants, tax employees and directors of companies) show that: 89% accountants, including those independent and those employed in business stated that such reporting plays a major role an has an effect in real presenting of financial statements, while only 6% of them stated that such role is smaller. Also, 97% of tax employees have positive opinion and 88% of the directors of companies believe that finantial reporting in confirmity with international accounting standards has positive impact (see diagram 1).

[1] 400 people were surveyed: Selected campon: 212 employed in trade (75.5%), servise (8%), manufacturing (1.9%), post (1.6%), banks (9.9%), insurance companies (0.9%), L.L.C.(1.9%). Except them are also interviewed 59 independent accounting and auditing , 35 employees in tax administration, 8 employees in the Chamber of Commerce, and 86 directors in small, medium and large (73.2%) , in the bank (12.7%),insurance companies (9.3%), post (4.6%).

	a	b	c	d	e
Accountants	55%	34%	6%	1%	4%
Tax Employees	76%	21%	3%	0%	0%
Directors	48%	40%	6%	1%	5%

Diagram 1.

The data compared between accountants, tax administration employees and directors, shows that each category surveyed has positive thoughts and approximately the same percentage of thinking about financial reporting, which helps thrift and realistic presentation of financial statements.

We should to emphasize that international standardization of accounting today is the need of global economic developments, and the basis for globalization of the economy, increases the effectiveness on qualitative decision-making as well as to increase the transparency and security of information that investors receive from financial reporting.

Standardization of accounting in Kosovo is an immediate need and demand especially because the Republic of Kosovo wants to be a part of European Union and NATO. New accounting requirements in Kosovo are and will be an excellent step forward developing a modern financial system.

2. Current developments towards the application of IAS/IFRS in the accounting field

Standardization of accounting in Kosovo appears as a necessary process, since the same and the unique language of financial reporting and high transparency would increase the values of decision-making and would make more efficient the Kosovo market. In this direction the regulation of accounting profession would affect the establishment and strengthen operation of professional organism by increasing their role in providing of independent accountants, who will be able to provide quality services, protect the public interest and provide the financial statements quality and highly reliable.

New accounting requirements in Kosovo represent a great step forward for the development of the financial system and controller. This is important because financial reporting in Kosovo will be comparable to financial reporting in developed countries. For this reason are drawn international accounting standards, which provide rules approved by international organism of accounting, which accurately treat accounting facts that are object of accounting. The existence of these standards enables the investors and all users of accounting information to understand the language of financial reporting regardless of where they operate.

The application of international accounting standards in Kosovo presents a challenge. Some of the peak points of the current developments in terms of their application are:

Firstly, the adoption of financial reporting in Kosovo with international accounting standards, should be done step by step and harmonized with needs and capacities of Kosovo. The process of finalizing of such case be adapted to financial reporting, especially of small and medium size enterprises.

The presentation of accounting standards shows the desire to accounting changes, but we should still work to resolve existing deficiencies. Also, it is very necessary to strengthen institutional and professional capacity, especially human capital which covers this area that is so important for standards monitoring and their implementation and preparation of financial statements as well. Furthermore, expansion of the financial reporting requirements should be done in parallel with the strengthening of institutional and professional capacities in order to finally provide a reliable financial reporting .

Secondly, in order to adopt finantial reporting we should be able to made developments to the application of accounting standards by strengthening the statutory framework governing accounting and overall financial reporting basis in Kosovo. Then we should establish the mechanisms for systematic monitoring, through establishing a modern legal framework with such program, which had to revised accounting and auditing standards, control quality of work on their implementation and finally have the opportunity to provide more accurate information about financial reporting to all its users. Furthermore, we must establish and organize the system of public oversight to certify auditors and accountants, which system should provide legal capacity to investigate auditors and then take the necessary steps. Such a system should be very transparent with the publication of its work programs in order to ensure the implementation of standards, by taking necessary steps and direct action.

Obviosly, should be even the expansion of the current authorities of adopting standards, to include so wider degree of interested parties for the implementation of international standards, and by adjusting the field for their implementation. These would help to solve the problem of relatively level unsatisfactory of recognition and implementation of international accounting standards. The regulators of banks and insurance companies should be engaged in international meetings and seminars in order to filter the overall goal of preparing of financial statements in accordance with the standards and thus to assess the advantages if implemention of such report. As a result that this would solve the banking regulatory concern that the implementation of international standards will bring instability in financial reporting as a result of the commitment not to ignore them properly.

In Kosovo also should be improved legislation with the aim to clearly define the authority that will encourage the full implementation of international accounting standards. Then to develop the quality of system control for ensuring a high reliability of financial information and to protect third parties as beneficiaries of this information, such as shareholders, investors, creditors, etc. The establishment of an efficient system for investigation and sanction to correct and to prevent factors with negative impact in reporting and full implementation of standards. This can be accomplished through establishing a system of fines efficient prevention culminating developments towards the application of international accounting standards would improve the quality of work of professionals and accountants.

This could be achived with education and qualification of people who would be capable for preparing of quality of financial statements. The lack of human resources would be a serious obstacle to the implementation of international standards. The financial reporting of high quality contributes to the strengthening the financial structure of our country, reduce the risk of crisis in the financial market, contributes to stimulate foreign investment, facilitates the work of taking and lending in the banking sector etc. It further, presents strong basis for stakeholders and public at large scale to evaluate the management of the business community in Kosovo.

Such financial reporting will contribute to the strengthening of financial discipline and financial system in general. Kosovo is in stage of radical reform accounting, therefore we need to further strength the application of existing standards, their continuous updating and development and application of new standards where is necessary. Kosovo Accounting Standards naturally should be consistent and coherent with international accounting standards, and still working in raising the level of recognition and implementation of them, always with the main motive of cultivation of genuine culture of reporting also in Kosovo.

We think that we should have consider drafting and approval of international standards of financial reporting for small and medium enterprises by the Board for International Accounting Standards (IABS), which are anticipated to appear in 2009, and then to see the possibility of translation on their implementation in Kosovo. In this direction should be determined correctly the classification criteria of small and medium enterprises, as a very necessary condition to determine the group of those economic units that will implement international accounting standards for units of small and medium enterprises, by distinct from those that will implement international standards of accounting/ to financial reporting in complete.

These criteria should refer to the criteria of the European Union for this purpose, but considering the characteristics of this purpose and considering the characteristics of the economy and businesses in Kosovo, accounting regulation should not leave out attention to SME and micro enterprises, which should be provided an accounting and simplified financial statements. It should also pay attention to cooperation and coordination of authorities of regulatory accounting with that fiscal in order to ensure a harmonized presentation of financial statements for the general findings publishable with reports for fiscal purposes. The calculation of the tax results should be based on accounting reporting according accounting standards in Kosovo, or international accounting standards/ financial reporting, and then to make necessary adjustments according to policies and fiscal rules. This would ensure a more consistent reporting, a control and inventory of the respective obligation more precisely.

Conclusions

Standardization of accounting in Kosovo with EU standards of accounting is an imperative the application of IAS enables the unification of financial reporting and transparency to all users of accounting information. It is recommended that in the future should be done more work in strengthening the statutory framework governing accounting and financial reporting, strengthening the structure drafting of accounting quality standards, establishing monitoring mechanisms for implementing further the implementation of standards, increased numbers of professionals skilled accountants to prepare quality financial statements etc.

Also, it would be of special interest to have a specific law on accounting and financial statements, which would define better and more clearly the main directions of accounting regulatory authorities. So development should be done by strengthening the statutory framework governing accounting and in general kosovar basis of financial reporting, the establishment of a modern legal framework with such program, which had the revised accounting and auditing standards, quality control work on their implementation.

The formation and organization of the system of public oversight to auditors and accountants, who must be very transparent with the publication of its work programs to ensure implementation of standards. To ensure a stability and efficiency in accounting developments in Kosovo recommend drafting a strategy and action plan, at least for 3 year period the development of accounting and accounting- based professions. This play will include issues that will be resolved during this period, responsible organisms and necessary financial resources.

INCOME TAX SHIFTS – CAUSES AND EFFECTS ON ROMANIAN ENTERPRISES

VIORICA MIRELA STEFAN-DUICU[*]
ADRIAN STEFAN-DUICU[**]

Abstract
This paper aims to make a point in what the fiscal environment has been and is about in Romania. In 2008, the crisis was obvious to our authorities, who before declared with nonchalance that our system is way back from Europe's and the crisis will pass near us. This didn't happened and here we are, in front of it. The financial crisis has reduced the state budget incomes in a drastic manner, making the authorities to do what they knew better – put more fiscal weight in taxpayer's burden. In this paper we will approach the minimum income tax amount, tax amount which has been the cap for more than 25% of the Romanian enterprises.
The government took the easy way, more tax, no analysis on what the side effects of this tax over the economy will be on short-medium term. As you guessed, the only good that came from this measure was more money at the budget, but only for a couple of months because, as previously said, 25% of the enterprises closed their activity, meaning no more income tax payments, no more social and health contributions, no more wages paid etc. The budget has got a big hole because now, beside the fact that it didn't cashed in from the closed enterprises, has to pay unemployment help for those who worked in those firms. As the crisis goes deeper, the government removed at the end of 2010 the minimum income tax amount, declaring with "drums and trumpets" that these measures are in order to revive the economy and the enterprises activity. We shall see about that.

Keywords*: SMe, income tax, level of taxation, Romanian legislation, global crisis.*

Introduction

After the communist regime has fallen, a sort of market economy has been installed. Since then, a proper fiscal legislation has not been conceived. As Ovidiu Nicolescu (the vice-president of the Worldwide SMes Organization) said: "Sudden decline of economic and political institutions of the old system, institutions that provided leadership through orders received from the center, along with emergence of democratic political institutions has created an incompatibility between various components of the socio-economic mechanism. The hybrid institutional and economic system reform cannot be achieved only by corrections and by adjustments, it also requires making some structural changes in its substance. This process should not be allowed to run as a "natural" process, it must be based on decisions arising from a political will, materialized through strategies and programs, meant to reduce the duration of the transition and to achieve a viable system within a reasonable amount of time. Abrupt canceling of strictly centralized planning system without replacing it with other institutions to take over, at least in part its functions has generated a huge gap in the functioning economic system, fact which led to strong disruption of the entire mechanism of social production. At that time it has been intervened with corrective measures - price liberalization (01/11/1990). It has been tried in this way a removal of distortions and existing inconsistencies in the system of command economy and settlement of the prices on natural principles, related to costs and demand/supply. It has been "hoped" that in this institution, of market economy - the price could replace the central planning, by taking (by the price system) the mechanism for allocating resources, without a real competition in the economy, dominated by producers of "monopoly", the price liberalization has not had the desired effect, but generated a abusive economic behavior of monopoly operators function in the economy"

[**]Economist, Bucharest (e-mail: stefanduicu.adrian@gmail.com).

The legislation in function is meant to put weight on taxpayers, the reason there were more taxes than in any European Union state, an worldwide behind only Belarus, Uzbekistan and Ukraine[1]. The effective taxation percent was at 57,2%. Since the EU accession, Directives have been given to implement. There were many effective systems to copy and implement but no such things have been done yet, only a small reduction of the total taxation percent, which is actually at 44,9%, and overall, the Romanian government has been taken very few action in order to simplify the tax system and ease the taxpayer's fiscal burden.

During the past years, the government has introduced fiscal measures aimed at helping to achieve budget deficit targets. This measures include the minimum income tax, increase in the VAT rate from 19% to 24%, along with the introduction of additional VAT compliance measures[2]; an increase in local taxes (e.g. taxes on the issue of building certificates, higher vehicle taxes, advertising taxes); and the introduction of a new late-payment penalty system.

Local legislation matters

The government has approved a series of austerity measures due the financial crisis, without a proper analysis of medium and long term effects over economy and population. One of the measures was the instatement of the minimum income tax that each firm had to pay no matter the profit or loss it had obtained during the financial exercise.

This measure, which had no reasoning but the desperation of bringing more money at the state budget, did not took into consideration the diminution of the absurd expenses the state system employees are making with no verification and accountability (and we do not refer to the 25% diminution of wages).

Analyzing the down effects of this measure, we infer that all was in vain. It did not do anything but to put more weight that a microenterprise or SMe can handle. In Romania worked about 1.2 million enterprises, from which approximately 320,000 have vanished as an effect of those measures, meaning 25%. Because of this fact the state loss massive, in the sense that this enterprises paid contributions at the social security budgets and at the special budgets, paid income tax, mostly paid VAT and the most important, it paid wages. Now, the state does not cash in from their account and furthermore it pays unemployment help for their former employees.

In all strong working economies, the state is helping the small and medium enterprises, which generate over 90% of GDP and hires over 95% of the occupied work force[3]. In Romania everything seems backwards. In the present, 70 percent of Romanian's GDP is produced by small and medium enterprises. It, also provide in our country about 70% of overall jobs.

Furthermore, info on the European Union states:

Country	% SMe's in overall enterprises	% SMe's in GDP	% SMe's in overall employers
Austria	99.60	50.86	65.50

(source: The white cart of SMe's in Romania)[4]

In Denmark for instance, small and medium enterprises are characterized by a high level of specialization. The particularity is the fact that the enterprise did not develop such sensitivity at global market changes, like the counties that have their industry specialized in just a few sectors. The unique tax percentage is 28% and, from 1976 an avoidance convention for double taxation was signed with Romania, which impose a reduced tax income of 15%.[5]

France has the standard rate at 33,33%. Small enterprises (the enterprises in which less than ¾ of the shares are owned directly or indirectly by individuals or companies that declare business less than 7,7 million Euro) are taxed with 15% for the less than 40k (approximately) Euro taxable income, or at standard rate for what exceeds this amount. The reduced tax amount is applied to industrial royalties also. The latest news in the taxes domain is that France wishes to harmonize it's tax system to Germany.

This harmonization is intended primarily for the elimination of the differences and to create a more stable environment(and here we refer to the global crisis). One of the first measures was that France has dropped the wealth tax.[6]

In Great Britain there are a series of encouragement policies for small and medium enterprises from which we only mention the reduction of income tax from 20% to 19%. The income tax for the first year of activity is reduced from 10 to 0%. This also applies to companies that does not exceed 10,000 Pounds profit (the equivalent of almost 12,000 Euro – at a 1,18 EUR/GBP rate)

One of the strongest European economies is the Austrian. Most of the companies are small and medium, about 80% of these have least than 100 employees and only 1% over 1,000 employees. The state charges with a minimum 1,600 Euro minimum income tax from limited liabilities companies (GmbH) and 3,200 Euro from share companies (AG). But, the state sustains the companies with lots of coaching programs, funding, cooperation with R&D institutes etc. The state also subsidizes 25 to 35% from research and development expenses, until 20% of personnel training expenses etc.

In Germany the economy works with the same types of companies as in Austria. The most common type is the limited liability enterprise (GmbH). This implies a minimum capital of 25,000 Euro. One or more individuals or companies, domestic or foreign can associate trough a society agreement that must be signed by all owners and authenticated at the notary. In the situation that one of the associates could not assist personally, he can be represented by another, but only with a notarized authorization. The registering form must be submitted at the Commerce Registry of the local territorial administration.[7]

The state is also protecting the small and medium enterprises, the competition is strongly shielded and globally promoted. Another particularity is that in Germany, the big companies, like the machines one, do not produce the components, they lend this activity to small and medium enterprises, only dealing with the installation and assembly.

[7] Russell A. Miller, Peer Zumbansen, *Annual of German & European law, Volumes 2-3*, 2006

Czech republic is a country with lots of foreign capital in it's economy. In present there are over 1,600 foreign companies, the foreign investments providing during 1990-2004 about 350,000 work places and saving another about 600,000. Trough personnel reconversion, in 2002, 23,000 new work places were created on an direct foreign investment in amount of 9,1 billion Euro. A qualified analysis revealed that about 65-70% of the export production belong to foreign investment companies. The taxation system contains income taxation (for individuals and companies), VAT, excise (on fuel and lubricant, distilled and alcoholic beverages, beer, tobacco and tobacco products, alcoholized wines, sparkling wine and champagne), the real estate property tax, road tax, tax on inheritances and donations and real estate transfer tax

Next to Ireland, Luxembourg has the lowest taxation level of EU, the global tax reaches 30,38% (from which 16% retirement fund – 8% paid by the employer and 8% by the employee, health insurance 7,5% - 2,6% paid by the employer and 4,9% paid by the employee, unemployment fund of 4% etc), tax income is 22% and local taxes about 7,5%. VAT in Luxembourg is applied in the following percentages: 3% for food and base necessity goods), 6%, 12% (as intermediary VAT) and the general tax of 15%

In Romania, since September 2010, when the negative effects of the minimum income tax were finally obvious for the government, it was removed by GEO 87/2010, measure that is supposed to sustain and re-launch the economy, and I quote from it:

"[...] *In the context of maintaining the current financial and economic crisis that affected Romania and still affects the business environment;*

considering that this crisis affects the cash flow of economic operators, which in his part generates major negative effects like financial blockages, insolvency, with influence over the survival of economic operators and loss of many jobs;

premises in order to create economic recovery by reducing the tax burden of the taxpayer [...]"[8]

Following this measure, 2010 has two financial exercises. It is an unprecedented situation that has puzzled all accounting professionals that will have to fill two income tax statements. The problem it's not here, it's in the fact that just like any article of law issued by the Romanian authorities, this one is incomplete and does not refer to the situation in practice. The problem in practice is who will fill two statements?

The majority, including the representatives of the Ministry of Finance, consider that all contributors, except for those who were founded during 2010, must fill in two income statements. I consider that the law in force is clear enough in this matter:

Article18, paragraph 2 of the Fiscal Code, as amended by Ordinance 34/2009 states:

"(2) taxpayers, except those provided in paragraph (1), art. 13 letter. c)-e), Art. 15 and 38, where their tax is less than minimum corresponding to their income amount, under par. (3), are obliged to pay tax at minimum amount."

Article 34, paragraph 16 of the Fiscal Code, introduced by GEO 87/2010 states:

(16) Taxpayers who, until September 30th 2010 inclusive, had to pay the minimum tax, the income tax due calculation for the fiscal year 2010, will comply with the following rules:

a) for the period between January 1st and September 30th, 2010:

calculation of the profit tax for that period and the effectuation of the comparison with the minimum annual tax amount, as provided by art. 18 paragraph (3), recalculated accordingly for the period January 1st to September 30th, 2010, by dividing the annual minimum tax to 12 and multiplying the number of months in that period, in order to establish the income tax due[9];

[8] GEO 87/2010

[9] Raluca Rizea; Radu Filip *Ordinul MFP 3055 pe 2009. Reglementări contabile*

By exception from the provision of paragraph (1),(5) and (11) and Article 35 paragraph (1),submission of income tax statement for the period January 1st to September 30th, 2010 and income tax due payment from the completion of taxation, is to be made until February 25th, 2011;

b) for the period between October 1st and December 31st, 2010: taxpayers submit the tax statement and pay income tax due under paragraph (1), (5) and (11)and Article 35. Paragraph(1)."

We interpret that, in the prementioned context, the statements in the two periods only draw those who were forced to pay the minimum tax, those who had, between January and September 2010 period, the income tax lower than the minimum tax amount. The opinion according to which all taxpayers (with few exceptions) were required to pay minimum tax, which on those who are of the opinion that all taxpayers must fill the two statements we believe it is not correct and does not comply with the law in force.

The entities who registered income tax (not minimum income tax) do not apply the provisions of paragraph 16, so, will only fill a single income tax statement for the fiscal year of 2010.

Article (18) tax loss recorded in this two periods for the year 2010 shall be recovered according to Art. 26, each fiscal year period being considered as a fiscal year meaning of 5 to 7 years. "

As you can see, there is no distinction between taxpayers nor any reference to an article that makes this distinction.

Currently, as the articles of the Fiscal Code are, the problem is only for interpretation. The application rules cannot modify the law, they should only bring more light in understanding it and more details. The phrase "have been forced to pay the minimum income tax" can be changed only by amending the law.

The comparison between calculated and minimum income tax (for the verification that the calculated income tax is greater than the minimum one) can be based on the Register of Fiscal records at a tax audit.

This change in Art. (18)" tax loss recorded in the two periods for the year 2010 shall be recovered according to Art. 26, each period being considered as one fiscal period meaning 5 to 7 years. "is the only one from which we can conclude that in the year 2010 there are two financial exercises.

Conclusions

Since the accession in EU, the total tax rate has been reduced, mainly as a result of falling labor tax rates for social security, health insurance, and unemployment contributions. In the most recent years, the Romanian government has taken several measures to help and support the business environment during the economic recession, very few being truly helpful. Taxpayers have been granted social security exemption during periods of temporary inactivity, and also the potential to defer tax liabilities under certain conditions. These measures, however, didn't improve the economy and as we actually see, 2011 is going to be the toughest year since the crisis.

In 2010, due to economy recession the minimum income tax has been introduced. This desperate measure battered the economy and closed about 25% of the total number of companies. After realizing this measure was not bringing any benefits, the government approved its removal, as stimulation for both the economy and enterprises. The true effects on this minimum income tax amount have been presented in the upper pages, along with the accounting practice problems.

STATEMENT OF CASH FLOWS - A MEASURE OF OPERATIONAL PERFORMANCE ON AN ACCRUAL BASIS

GHEORGHE LEPĂDATU*

Abstract
Statement of cash flows presents useful information about changing the company's financial position, allowing to assess the enterprise's ability to generate future cash flows and cash equivalents in the operating, investing and financing activities and their appropriate use. Treasury of an economic entity can be considered its strong point. The manner in which they manage money and financial flows, the final outcome will depend on the respective entity. Treasury is also an essential and main restriction of the financial management of the enterprise. Treasury embodies the results of operations and how to achieve financial balance of compliance. Not always an entity that ends year with benefits, has a positive cash (cash at bank and in availability). And this, because the gap between the recording and accounting of revenue and expenditure receipts and payments as they fall due, that gap can be decisive for the fate of the enterprise. This is a major requirement of the accrual. Therefore, an efficient management of the economic entity comprises both the asset management flows (revenues / expenses) and cash management, i.e. the flows of receipts and payments. The statistical evidence shows that most of the failures are due to weaknesses in treasury management.

Keywords*: treasury, cash flows, accrual, IAS/IFRS.*

Introduction

The variety and complexity of the issues of good treasury management entity creates a wide field of analysis and debate, because most of the users of accounting information are interested in the work flow of an entity and in particular its ability to secure a rotational adequate liquidity. In this way, it is necessary to exploit the accounting information, to know that cash flows, with immediate impact on liquidity. In the literature of our country, the concept refers to all cash means of financing in the form of cash and short-term loans available to a trader to cope with its payments. Other authors define the treasury like the image of cash and short-term money investments at a business level, arising from changes in current receipts and payments, or from investment of the excess.

Cash flow situation has become mandatory in the late 1980s in the United States and immediately afterwards in Britain, with an approach that largely reflect American standard, although there is a refinement of classification. The American model is more flexible, leading eventually to a national and international consensus regarding the need for a picture of cash flows is a financial situation. The benefits of presenting a statement of cash flows together with a statement of financial position (balance sheet) and a statement of the entity's performance (profit and loss) were outlined by IAS 7 as:

6. providing an image on the company's financial structure (including liquidity and solvency) and the ability to influence the amount and timing of cash flows appearance,

7. providing additional information to users of financial statements to evaluate changes in the assets, liabilities and equity of an entity,

8. increasing reporting comparability of operating results between different entities, because they eliminate the effects of using different accounting treatments for the same transactions and events.

* Professor Ph. D., Faculty of Finances, Banks, Accounting, Christian University „Dimitrie Cantemir", Bucharest (e-mail: cilezbujor@yahoo.com).

A Treasury trader can be regarded as its strong point. The manner in which they manage money and financial flows, the final outcome will depend on the trader.

More intense concerns treasury management are motivated by some economic instability phenomena both micro and macro: rising inflation, interest rates and lower rates of return and degree of self-financing.

Both positive and negative treasury leads management costs (of opportunity by omission the surplus cash; and financing costs of the cash deficit through new loans). The main objective of treasury management is to avoid a negative structural treasuries (avoidance of what is usual names in the Romanian economy ”financial blockage”, a situation characterized by the inability of the company to meet payments). Through careful cash management, and payment instruments and financing, the secondary objective is achieved profitability, which minimizes, on the one hand, cost and financing volumes and optimize the placement of surplus cash on short time.

Other objectives of cash management include:

- avoid losses at the bank receipts and payments of the enterprise, in the days of settlement
- increasing the efficiency collection company claims, without affecting the policy to customers,
- balanced and relaxed staggering maturity of the liabilities of companies.

1. Financial Risk Management

A not at all negligible size of treasury management is the management of financial risks, which involves the use of instruments of speculation and when financial markets are very volatile, in other words, where exchange rates and interest rates fluctuate greatly in short intervals time. Financial risk management problem becomes even more important today, when Romanian companies are under pressure of high interest rates because of the persistence of high rates of inflation and an economic slowdown, not to mention that in some sectors activity in our country is facing a ”negative growth”.

One of the most popular treasury management policies throughout the world, is ”Treasury zero”. It is to maintain as close to zero balances in order to reduce the treasury management costs (includes avoiding financing costs and opportunity through actions such as: preserving the least possible spare cash, using forms of credit at least costly, in amounts as small and as short a period, etc.). Management of ”zero treasury” faces a number of difficulties, especially for companies with numerous financial flows adjusted by checks, because the date of presentation to the bank can not be accurately represented.

In fact, cash management involves establishing a balance between cost means of financing and cash from investment income. In addition, an effective treasury management requires that the entity to have sufficient capacity to meet the close out at the time wanted. To do so, it is necessary to provide the size and date of chargeability and instant availability resulting from enterprise operation. It therefore needs a firm cash management estimate by budget provided.

All these coordinates are derived from treasury management overall objective of the finance company, the increase of capitalization value.

Before resorting to loans to cover the forecast deficit of the balance, some measures will be required to be taken, arising from the natural logic of treasury management. First is acting for the advancement of revenues (by reducing the volume and / or duration of trade credit to customers or by request in advance of sales receipt) and delay (in legal terms) of payment (extended supplier credits). Secondly, it tries to surrender, for the time, to incurred expenditure (investments, dividends, etc.). Finally, are necessary exceptional revenue (sale of fixed assets or assets available etc.).

Balance deficit, resulting from these measures, should to be covered by new loans and discount treasury, whose selection and dosing belongs to the ”art” of the Treasurer of optimizing the size of their actual cost.

They act as shock absorbers between the increased or reduced need for capital assets and reduce or increase their sources of capital assets, and attracted. These oscillations are reflected in the size of the balance of bank loans. Compared to the previous period, the balance of credits may be decreased by cash surplus released within that period or may be increased to cover (through new loans) resulting cash deficit at the end of the previous period.

The growth of bank credit balance can be made up to a certain limit i.e. the ceiling of a bank credit in its relations with the enterprise.

To achieve its objectives, the decision to finance the operating cycle will make an arbitrage between cash loans and discount loans which can be mobilized from banks, to cover the cash deficit. Selection of one or another will be based on the analysis of their actual cost.

2. Cognitive value of cash flow statement. Theoretical and Practical Aspects

Statement of cash flows presents useful information about changing the company's financial position, allowing to assess the enterprises ability to generate future cash flows and cash equivalents in the operating, investing and financing activities.

The cash flows generated by operating activities are primarily the consequence of the main revenue-producing activities of the enterprise. There are following types of cash flows arising from operating activities:

6. Cash receipts from selling goods and services,
7. cash receipts from royalties, fees, commissions and other income,
8. payments to vendors of goods and services
9. payments to behalf of employees
10. payment of taxes and payments
11. tax payments or tax refunds, they can not be specifically identified with financing and investing activities.

The size of those flows expresses the extent to which the business has generated enough cash and cash equivalents to repay loans and finance lease rates, to pay dividends to shareholders, to maintain the operating capability of enterprise and to make new investments without recourse to external funding sources.

The cash flows generated by investment activities are related to the purchase and sale operations of fixed assets (tangible and intangible) or participations in other companies. We list the following categories of cash flows from investing activities:

- Cash receipts from sale of tangible and intangible assets, sale of equities or debt of other companies, repayment of advances and loans to other parties, interest and dividends;
- Cash payments for: the acquisition of tangible and intangible assets, acquisition of equity instruments or other instruments of companies and cash advances and loans to other parties

These types of flows provides information about how the organization ensures its development, reflecting the extent to which payments were made for the purchase of assets by means which will generate income and cash flows in future.

Cash flows from financing activities are related to those activities which involve changes in size and structure equity and debt business, such as:

- Cash receipts from: the issue of shares or other equity instruments, the issuance of debt securities, loans, unsecured debts, obligations, mortgages and other short-or long-term loans;
- cash payment to shareholders for the purchase or redemption of company shares, repayment of amounts borrowed cash, cash dividend payments to shareholders and related obligations of the lessee for the reduction of finance leases.

Cash flow statement is drawn up according to one of the models set out in IAS 7 "Cash Flow Statements", as exemplified and accounting regulations harmonized with the 4th Directive of the European Economic Community and the International Accounting Standards, in two ways:

a) direct method - which are presenting major classes of gross cash receipts and payments. Information for payments and receipts are taken from records or by adjusting the profit with changes in stocks, receivables and payables during the period.

Table nr. 1
Cash-flow statement (direct method)

Cash flows
Cash flows from operating activities +cash receipts from the sale of goods and services +cash receipts from royalties, fees, commissions and other income -cash payments to suppliers for goods and services -cash payments by and on behalf of employees -cash payments by and on behalf of employees, cash payments or tax refunds (if not directly attributable to investment activities and financial)
Cash flows from investing activities *-cash payments for acquisition of land and fixed assets, intangibles and other long-term assets* *+cash proceeds from the sale of land, buildings, equipment, intangible assets and other long-term payments* *-cash payment for purchase of equity instruments and debt of other companies* *+cash proceeds from the sale of equity instruments and debt of other companies* *-cash advances and loans made to thirds* *+cash proceeds from the repayment of advances in cash and loans made to thirds*
Cash flows from financing activities +cash income from the issue of shares and other equity instruments, -cash payments to shareholders to purchase or redeem their shares + cash income from the issue of bonds, loans, mortgages and other loans -cash repayments of amounts borrowed cash payments to financial leasing
Total cash flows
Cash at the beginning of the period
Cash at the end of the period

b) indirect method - based on the profit / net loss, adjusted for transactions such as money, the liabilities, income and expense items associated with cash flows from investing or financing. Net flows from operating activities can be determined by showing the revenues and expenses disclosed in the income statement and the changes during the period of inventory, receivables, operating obligations.

Table nr. 2
Cash-flow statement (indirect method)

Cash flows
Cash flows generated by operating activities
Profit before income tax and extraordinary items
Adjustments for non-cash items and other non-operating activities. a. Elimination of income and expenditure without affecting cash:

+Depreciation and provisions -Revenue reserves. b. Remove non-operating income and expenses: +Interest expense -Income from interest and dividends, -income re-investment subsidies
Operating result before changes in working capital requirements
-Changes in working capital requirements -Stocks Change -Change in inventories accounts receivable from customers and other service providers +Change in accounts payables and other operating income +Change in cumulative debt accounts
Receipts and payments on associated with operating -Interest payments -Profit tax Payments +Net cash from extraordinary activities (difference between receipts and payments from extraordinary activities)
Flows arising from investing activities
+Proceeds from sale of tangible and intangible assets
+Proceeds from sale of equity or debt instruments of other companies
+Proceeds from repayment of cash advances and loans to other parties
+Proceeds from interest and dividends
-Cash payments for acquisition of tangible and intangible
-Cash payments to acquire equity or debt instruments of other companies
-Cash advances and loans to other parties
Flows generated by financing activities
+Cash proceeds from issuing shares or other equity instruments
+Cash Proceeds from issuance of debt securities, loans, unsecured debts, obligations, mortgages and other short or long term loans
-Cash payments made to business owners to buy back shares
-Payments of dividends to shareholders
-Cash repayments of amounts borrowed
-Cash payments made by the lessee for the reduction obligations under finance leases
Effects of changes in currency exchange rates and cash equivalents
Total flows of cash and cash equivalents (increase / decrease in net cash and cash equivalents)
Cash and cash equivalents at beginning of period
Cash and cash equivalents at end of period

Further, for example, we present cash flow analysis prepared for SC Neptun SA Campina, the direct method.

Table nr. 3

Cash-flow statement (SC Neptun SA) - direct method

	2005	**2006**	**2007**	**2008**	**2009**

III. CASH FLOWS FROM FINANCING ACTIVITIES					
Proceeds from long term borrowings / repayments	(851 231)	(1.749.912)	(1.875.537)	(267.096)	(905.691)
Proceeds from short-term borrowings / repayments	4.388.055	2.066.648	6.495.982	11.697.833	10.557.381
Payments for finance leases	(180 100)	(380 516)	(717.015)	(664.918)	(1.258.664)
Dividends paid	(331.696)	(1.359.967)	(1.757.399)	(3 372.600)	(10.333.686)
Net cash flows from financing activities	***3.025.027***	***(1.423.748)***	***5.897.104***	***7.393.220***	***(1.940.661)***
Effects of changes in currency exchange rates and cash equivalents	(182.478)	2.099.195	(325.937)	306.044	-
Cash flow – TOTAL	***4.451.217***	***(3.533.937)***	***4.245.909***	***(2.775.105)***	***(504.570)***
Cash and cash equivalents at beginning of period	273.998	4.725.216	1.191.279	5.437 188	2.662.083
Cash and cash equivalents at end of period	4.725.216	1.191.279	5.437.188	2.662.083	2.157.514

Net cash flow from operating activity is positive throughout the period under review, except for 2008. The company recorded an increase in the cash flow, 8.035.450 lei in 2005, 12.642.099 lei in 2009 as a result of the cost carried.

Taking into account the direct method, it is noted that the biggest positive influence they had cash receipts from the sale of goods and services and the most significant were the payments to suppliers for goods and services, staff and obligation wages paid and income taxes and interest paid. Cash flows from investment operations highlights an increasing need for cash, 6.426.782 lei in 2005, 11.206.008 lei in 2009, generated by investments made by the enterprise for acquisition of land and fixed assets, intangibles and other long term assets.

To boost investor confidence, the company come to us short-term bank loans, and repay a portion of long-term loans, that net flows are negative long-term loans, while net flows of short-term loans remain positive throughout the period analyzed. Simultaneously make payments for finance leases and paid dividends to shareholders.

Following the company's ability to generate cash, it is found to obtain the total net negative cash flows for the years 2006, 2008 and 2009. Between 2005 and 2007 there is a better financial situation that is getting a net positive cash flow 4.451.217 lei in 2005 and 4.245.909 lei in 2007. The results are encouraging in the last year of analysis the situation is improving although it achieved a net negative cash flow, increasing it from the previous year (from -2.775.105 lei in 2008 to -504.570 lei in 2009).

Conclusions

Due to the structure and methodology for drawing up, cash flow enables users of financial statements:

- to assess the enterprise's ability to release cash from operating activities in particular,
- to determine the liquidity needs,
- to provide maturity and risk,
- to provide future earnings,
- to compare results enterprise, eliminating the effects of using different accounting methods.

Limits of cash flows are related to the definition and role of the treasury function, operating content and method of calculation of the associated flows, performance evaluation through cash flow and its failure to assess and predict the evolution of long-term financial position of the entity.

Also, certain complex combinations of events that relate to business combinations, segment reporting activity, acquisitions that will increase the reporting entity's assets during the period, without any connection to its customers, can not be understood without other information and will reach erroneous interpretations in the absence of cash flows presentation. Explanatory notes on the balance may be an important source of information necessary for external users and privileged users who are primarily owners / investors / shareholders. Therefore the complete set of financial statements represent the cornerstone in financial analysis of the economic entity.

CORRUPTION AND TAX EVASION IN ROMANIA

MARIANA TRANDAFIR*

Abstract
Tax evasion has become a ubiquitous phenomenon in economic and social. Extent it has taken a tax evasion is worrying because the lack of control measures may close in the future stability of national economy. To combat tax evasion is not necessary to impose some severe penalties, but should be made an effective fiscal control, a viable legal system.

***Keywords**: evasion, fraud, corruption, tax system, fiscal record*

1. Preventing and combating tax evasion in Romania

For the prevention and combating tax evasion in Romania will act all measures that are prescribed in regulations came into force. The first step, in this purpose, is the organization of the fiscal record, as a means to record and track the financial discipline and to strengthen administration of taxes owed. Fiscal record is held by the Ministry of Public Finance at the central level and the general public finance departments of counties and Bucharest, electronic forms. In the fiscal record are listed individuals and legal entities and associates, shareholders and legal representatives of legal entities, which are actively works, sanctioned by financial laws, customs, and those relating to financial discipline. These penalties may be included in fiscal record if they have become final and irrevocable. The certificate of fiscal record is mandatory to be presented in the following cases:

- the establishment by parent company, shareholders and legal representatives appointed
- the establishment of associations and foundations by their founding members
- the authorization to exercise independent by applicants.

Since 2003 were established a number of very important measures that will impact favorably towards firm combating tax evasion phenomenon. On this line, is made public the list of contributors (except micro-companies), who recorded outstanding obligations owed to one or another of public budgets, accounting for taxes, contributions and other revenues. This list and the information it contains is made aware of the public on its Internet page of each of the institutions and public authorities responsible for implementation of respective budgets. Updating outstanding debtors and their obligations is made quarterly. Publication of this list has become a practice. New details of the scope of tax evasion made by Law. 161/2003 - which amends the Law. 87/1994 on combating tax evasion - in that it includes waiving the payment of taxes, contributions and other amounts owed to the state, thus having the same connotation as to circumvent the tax taxable matter, we believe that will impact positive to combat tax evasion (publication of the list of taxpayers with outstanding obligations with those who evade the tax, prompting some debtor to pay the arrears before the list is made public).

The Law nr. 161/2003 - which amends the Law nr. 87/1994 on combating tax evasion - includes favourable conditions in this respect. It provides for taxpayers who receive income from trading activities or provide services to the population that are required to show where work, operating authorization and certificate of registration. Is important and necessary point that taxpayers are required to use only primary documents and work accountancy established by law, to be purchased only from the units established by legal rules. At the same time are more clearly defined

* Assistant, Ph. D., "Danubius" University, Galati (e-mail: mtrandafir2003@yahoo.com).

and delineated acts and deeds that constitute crimes, making the presentation according to gravity and severity of sanctions that apply.

2. Competent bodies in combating tax evasion

Lack of a well organized control and properly skilled staff can lead to large-scale forms of tax evasion. For the organization and functioning of financial control and the Financial Guard, on 22 March 1991 was adopted the Law No. 30, published in Official Gazette nr. 64 of 27 March 1991. In accordance with Article. 1 of Law 30/1991, Ministry of Finance, on behalf of the state, made control and managing of the specialized funds of central and local state administration and state institutions and monitor compliance with financial accounting regulations in the work of by autonomous, companies and other operators in connection with fulfilling their obligations to the state. The second paragraph of that article states that the specialized unit of the Ministry of Finance acting for the prevention and combating fraud, violations and offenses to the taxation, customs and prices and taking measures under the law. In Article 4 states that financial control of the state is organized and operated in the Ministry of Finance and is performed by General Directorate of State Financial Control and Financial Guard.

By law, the powers conferred to the General Directorate of State Financial Control and its subordinate units are:

• control the management and use of funds provided from the budget for running costs and maintenance of central and local government and financed by the budget units,

• monitor the use of funds for state investment interest, activities and products and subsidies for other purposes provided by law;

• check the use of endowment funds and funds and accounts in compliance autonomous activity and state-owned companies;

• verify the accuracy and reality of entries in records required by law and the provisions of incorporation of companies and other businesses, seeking the correct and complete and timely fulfillment of all financial and tax obligations to the state;

• control and also perform other duties established by law in charge of the Ministry of Finance.

Are also covered the Financial Guard duties:

• implementation and enforcement of tax laws and customs regulations, aiming to prevent any embezzlements or evasion of payment of taxes

• trade compliance, seeking to prevent smuggling activities and any procedures banned by law

• verify the existence and authenticity of documents during transport, as well as places of production activities, services, acts and deeds of trade, when there is evidence of evasion of tax obligations or of establishing procedures prohibited by law

• verify the records or any other documents resulting tax obligations

• to find violations and apply appropriate sanctions

• to bring prosecution in connection with the crime found in the exercise of duties.

Following the findings of financial control, Ministry of Finance is entitled in accordance with the provisions of Article. 7 of Law No. 30/1991 should:

- take measures to eliminate and prevent irregularities in business accounts of central and local administrations, autonomous and

- correcting and expanding the balance sheets and paying the taxes and other budget revenues legally owed the state

- application for law enforcement measures in prices and tariffs

- suspension of measures contrary to financial regulations and accounting.

Failure, unperforming the provisions within the document control data entered into the financial-fiscal body is, according to the Law System. 87/1994, offense and punishable as such. Tax evasion has become a ubiquitous phenomenon in economic and social. Extent it has taken a tax

evasion is worrying because the lack of control measures may close in the future stability of national economy. The economic situation of balanced state budget would lead to macroeconomic balance and ensuring economic development conditions. To combat tax evasion is not necessary to impose some severe penalties, but should be made an effective fiscal control, a viable legal system may first fiscal education of citizens. Tax laws should be simple, clear, accurate and relatively stable, to make a distinction between cases where laws are violated intentionally violated when fraud or negligence, negligence, or causes beyond the control of the taxpayer. It is necessary to reorganize and control the tax checks, to be developed by The National Bank of Romania clear rules on the conditions to be met and documents to be submitted by individuals. Our country had one of the best tax procedure code, which was repealed by the dictatorial regime established after the Second World War. As measures already initiated or being implemented, with direct impact on preventing and reducing tax evasion can be:

12. strengthening the tax system by harmonizing the tax return with the requirements of Directives of the European Union, promoting measures for its gradual decline (in particular If direct tax), to stimulate the transfer of activities of the informal economy visible in the economy, implementing a simplified taxation system for small businesses, eliminating the effects of inflation
13. the strengthening and adaptation of economic accounting system by applying accounting rules harmonized with European Union directives and International Accounting Standards approved by Ministerial Order No. 3055/2009, for commercial companies and other publicly traded company representative to establish a simple filing system for small and medium enterprises;
14. elimination of firms in economic losses, irrecoverable;
15. approval of the draft Law exemplary management of commercial companies;
16. completing the legislative framework for control of resident associations and joint owners by local councils;
17. mandatory implementation of the acceptance of debit-credit card businesses with a business volume over a certain level and population ;
18. establish a well organized system of principles for tax record for better management of the prevention and combating tax evasion.

As measures to prevent international tax evasion, Prof. Ph.D. Dan Saguna proposes the following measures ”tax heaven”[1]:

19. exchange control
20. steps towards citizenship taxpayer
21. taxation even the income
22. taxation of gains from foreign made not by Legal way
23. using theory of law abuse
24. the refusal to allow access to the courts of foreign organizations deemed suspicious.

Finally, we can say that without a detailed and systematic analysis of internal mechanisms with the international tax evasion is difficult to trigger tools and measures conducive to combating and preventing tax evasion.

3. Tax evasion and corruption

In a world confronted with complex issues, the activities of corruption and of obtaining money by illegal ways are more frequent. History of human society reveals that crime and corruption in all forms of manifestation (embezzlement, trafficking in influence, giving and taking bribes, tax evasion, receiving undue benefits) and drove there with varying intensity of the oldest times. European officials have converging views regarding accession of 10 new member states, due to

[1] Saguna D, *Evaziunea fiscală pe înţelesul tuturor*, Editura Oscar Print, Bucureşti, 1995, pag. 83

alarming issue: corruption in these country could be transferred to the Community market. Corrupt judicial system, which evolves slowly, worried European Union authorities because of the need to actually apply the directives and regulations to be adopted rapidly. From the perspective of EU integration, tackling corruption is needed to materialize unequivocal commitment of the Romanian society as a whole, to take and fulfill membership criteria. Corruption has always been regarded as one of the most serious behavioral misconduct that distorts the administration of public affairs for private order. From a sociological perspective, corruption - as social pathology - concerns a group of immoral and illegal activities conducted by individuals not only functions or exercising a public role, but also by various groups and organizations (public and private) to obtain material benefits or moral, or a higher social status, using forms of coercion, blackmail, deception, bribery, buying, intimidation. In essence, corruption is an abuse of power in order to obtain material advantages or other benefits (honors, titles, advertising exemption from liability, etc.). Most times, it is only ”a trivial contract ” (illegal – that is right), acting under the Roman law principle *do ut des* (I give you to give me) negotiated and placed in underground conditions and privacy.

Conclusions

The corruption has much more varied forms, some of them - like: favoritism, or interference in the work of civil servants, that form the traditional ”intervention” - is considered, if not daily acts, at least minor deviations which can not be criminally sanctioned.

Also included other manifestations of corruption, widely practiced, arising from the influence of money in politics, more publicized, combined with local power decentralization, rapid urbanization and internationalization of economic relations. Corruption are identified with those acts which are committed in the exercise of functions or duties of office, which is the violation of duties, following - in all cases - a profit. Evolution of the phenomenon, reflected in ancient law, shows that bribery is an abuse of office in order to obtain material benefits, goods or other benefits.

Corruption can be considered an economic activity based on the following assumptions:

- corruption is based on limited resources
- has an operational process: support, facilitation, opportunity
- has a specific funding - to satisfy some need
- pursue profits.

Creation of company ”tick”, that thrive in the near moribund state enterprises

In this case fiscal dimension of corruption is localized in the registration of oversize charges (most times even unrealistic), thus narrowing the legal basis of taxation of profits and hence and related income tax due the general consolidated budget. Profitable by outsourcing activities by companies from interest groups, it fails these enterprises after privatization are ”suddenly” extremely profitable.

Trade and transactions entered into evidence - and used as the basis for recording financial records and accounting - does not reflect an actual state of affairs therefore covered by Law No.. 241/2005 on preventing and combating tax evasion as a crime criminalizing evidence of fictitious transactions.

Fraudulent privatizations

Essentially, by means of fraudulent privatizations parasitic capitalism was encouraged at the expense of large privatizations, which could lead to multiple benefits for our country. Many of the companies acquired are dismantled and sold for scrap, the staff is fired and the products made by new investors fail to penetrate the market. The purpose of these investors is not only immediate profit.

Robbing banks

There are interest groups - beneficiaries of bad loans - which were identified in the banking sector favorite target of their criminal activity by providing preferential loans, favorable terms, the

client base. As the banking sector has undergone a privatization process effective and efficient, the phenomenon of illegal or preferred-financing shrank sharply.

Spoliation of the state budget by the tolerance by the public authority in unpaid tax liabilities owed by some companies and illegal VAT refunds

According to Law. 241/2005, VAT refunds have been expressly criminalized acts of tax evasion. This amounts fraudulently diverted money from the state budget lead to distortions and even undermine state functions formal economy, contributing to ”welfare” of public officials who have contributed to the smooth functioning of this mechanism crime. Size corruption tax imposed directly on the public financial resources by returning (illegal!) Significant amounts of money from the consolidated general government accounts of private firms as a result of unrealistic sizing tax liability (in case of VAT).

There are other manifestations of corruption, among which may be mentioned: the smuggling of excise goods, embezzlement of EU funds provided through the Phare program type, with a grant, procurement rigging.

In all cases above, the funds used in criminal transactions intended to create ”break through in the system” and, in substance, to cause weakness manifested in the smooth functioning of state institutions, which - in this context - can be locked and become inoperative. Prevention and eradication of corruption requires measures of social, economic, political, legal and administrative development to prevent and limit the extent and severity of the phenomenon, identifying and neutralizing the risk factors. If eradicate corruption and organized crime is a financial and economic utopia for the foreseeable future to prevent this phenomenon to dictate laws, values and politics of states and international bodies is a current requirement. Between tax evasion and corruption there is a parallel, the similarities and differences (both with devastating effect on ”health” of a society as a whole)[2].

Key considerations stemming from this analysis include:

- tax evasion may be a unilateral act, while corruption requires always at least two parties (usually the one party is a public sector decision-maker)
- tax evasion does not, automatically, further recourse to corruption, while corruption acts and financing is secured, in particular, of pecuniary resources evaded tax
- tax evasion occurs, mainly the underground sector of the economy (being part of it), while corruption found ”fertile ground” in area economy in the world of so-called ”white collars” (although this does not exclude that the intention and the forces that resort to corruption come mainly from the economy underground);
- while corruption is intended, often, access to public resources for personal gain increased (by corruption of people who manage those resources), tax evasion can be equated with an act which would protect the “desires” realized against state (obviously, in substance, a phenomenon also illegal in most cases)
- while evading the tax evasion from tax a certain amount of personal gain, corruption is used to help public servants to get a win as more
- avoidance can sometimes be only a unilateral act, while corruption is always a bilateral or multilateral measure
- corruption always involves recourse to tax evasion, while tax evasion is not achieved with the use of corruption;

Eliminating corruption is the primary element in improving fiscal control as part of combating tax evasion. Along with corruption, another factor which leads to increased tax evasion is incompetence, between the two there is a directly proportional relationship. Action taken against corruption must create legal and institutional prerequisites needed to control the phenomenon. Introducing a comprehensive legislative framework and appropriate the acquis communautaire

[2] Hoanță, N., *Economie și finanțe publice*, Editura Polirom, Iași, 2000, pag. 281

(control wealth of dignitaries and public officials, regulatory incompatibilities with public functions, significant legislative progress in areas related to corruption - money laundering, tax evasion, procurement, etc.), creating the institutional framework for action against corruption at the top, by reorganizing the judiciary. The extent to which Romanian society will be able to manage the further dimension of corruption will depend on the expected positive response from external partners for the economy.

HISTORICAL COST AND FAIR VALUE WITHIN THE CONTEXT OF FINANCIAL CRISIS

DIANA ELENA BRÎNZĂ*

Abstract
Financial crisis determined the fast extension of global financial bankruptcy upon the world, representing at the same time the first crisis of the accounting term of "fair value", under the shade of which subsists a number of standards which request to the institutions to estimate at the market value much of the assets they possess. The Council for International Standards in Accountancy (IASB) revised the rules regarding the accountancy at the fair value, as a reaction before the critics which sustains that the accountancy rules at the fair value were the basis of volatility of financial market. The alternative for "fair value" – the historical cost of assets – has little admirers within the financial crisis. In the pages of the present article, we will try to achieve an incursion through specialized literature while analysing the two methods of valuation within the context of financial crisis.

Keywords: *valuation in accountancy, historical cost, fair value.*

Introduction

The end of 2008 and the beginning of 2009 were marked by a historical event: the global economy was affected by the most serious crisis amplified by a dangerous collapse of developed financial markets, the United States of America being in the epicentre of the global storm. The nucleus of our article is represented by the analyse of two methods of valuation (historical cost and just value) in the context of financial crisis.

Valuation represents the process through which are quantified and expressed in monetary units the assets, debts and elements of own capitals as well as the economic and financial operations with the modifications intervened upon these elements. The monetary unit is identified with money, Leu (RON) being the measure unit of economic value in Romania. The value established after the valuation is the value of assets, debts and own capitals presented in financial situations. This value has to be as real as possible and correctly established, because on the basis of information presented in the financial situations, there are taken the most important decisions at the level of economic entity. Therefore, the presentation of false values of assets, debts and own capitals in financial situations will lead to wrong decisions, with repercussions on long term upon the trading company.

In order to find solutions at the present moment, it is important to analyse the causes and not the symptoms of crisis, which created an unprecedented situation, undermining the thrust in free markets. In this context, there are necessary also unprecedented measures, with a more systematic and global character than those applied till present. Financial crisis was the first big test for European Central Bank and it was the first crisis of the accounting term of "fair value", under the shade of which subsists a number of standards which request to the institutions to estimate at the market value much of the assets they possess. The Council for International Accounting Standards Board (IASB) revised the rules regarding the accountancy at fair value, as a reaction to the criticism which sustains that the rules of accountancy at fair value were at the basis of volatility of financial market.

In the pages of this article, we shall make an incursion into the specialized literature, trying to find some answers regarding the advantages and disadvantages of a valuation at fair value or of the historical cost in the present economic environment.

* Assistant, Ph. D. candidate, Faculty of Economic Sciences, University of Piteşti (e-mail: diana_branza@ yahoo.com).

Paper content

Opinions of different authors regarding the causes of financial crisis.

The financial shock produced by the bankruptcy of mortgage market (underestimated rate of mortgage credit - subprime mortgage market collapse) in United States in August 2007, led to the slowing down of global economic growth in alarming rhythms (reduction with 6.3% in the last trimester of 2008, as compared to the growth of 4% in the previous year). In fact, it is the first global economic contraction after the Second World War (World Economic Outlook, April 2009, pp.49; . IMF Tweaks Loan Program in Bid to Attract Borrowers, by Bob Davis, March 20, 2009). The global financial bankruptcy extended rapidly in the world.

It is important to examine the sources of financial system crisis which gathered cumulatively over the last decades (Ceslav Ciobanu, December 2009). Martin Wolf, analyst at Financial Times newspaper, published in 2008 the book "Fixing Global Finance" where he characterizes the crisis as a result of a series of "obvious bankruptcies" to understand and estimate at fair value(Martin Wolf, 2008, pp. 8-9):

- The inherent risks of liberalized financial markets and of decisions of the respective market institutions;
- The increased risks given the terms that cash flows cross the frontiers, especially for fragile economies of future markets (as it is the case of Romania)
- The inherent risks of loans in foreign currency of debtor countries and the importance of an increased monetary and financial discipline;
- The connected risks of the exchange rate assumed not only by creditors but also by debtors in a world of liberalized circulation of capital;
- The risks of the activity given the terms of instability of exchange rate in the multi-currency exchange world;
- The importance of modernization of global institutions according to the demands of present time.

The credits'crisis appeared in 2007 was the cause of the loss of jobs for many financial managers, but also of the bankruptcy or sale of many financial institutions. After a time, two big problems proved to be at the root of this crisis. One of them is represented by the patterns used in the determination of fair value of those instruments for which there were used entry data of 3rd level, patterns too narrow to have the capacity to connect the modifications appeared in the price of buildings at the values of those financial instruments which were their active support through a structure more or less complex. The second problem consists in the lack to provide information that should be known by investors, lack which would have stopped even the best technique of valuation from generating a significative level of accuracy (Deventer, 2008).

Other sources from specialized literature consider that at the root of present financial crisis there is also the high level accepted in the last years by the mortgage credit market for an indicator specific to the domain of the mortgage credit, that is the value of credit weighted in the value of mortgage property (eng. *Loan-to-Value - LTV*). This indicator represents in fact a lever similar to the one used for entities, determining the weight of loan (mortgage credit) in the total value of the asset (property value), and as for entities, a growth of this lever determins a growth of the risk associated to mortgage credit. Thus, the growing number of beneficiaries of credits who don't cope with payments is directly associated to a higher level accepted for this lever (Matiș, Bonaci, 2009).

Given this situation, one can state that the present financial crisis is due to the relaxation of the process through which it should have been estimated the probability that those granted mortgage credits to be refunded (eng. *underwriting process*) and to a lever too high accepted in the last years for mortgage credits granted on the market (Wallace, 2008).

Many analysts dissaprove of the concept of "fair value" as a cause of credits' crisis in USA, arguing that this can determin a descending spiral of prices, by encouraging institutions to sell the

assets quickly, obliging them at the same time to register in accountancy at "fair"lower prices their principal assets.

The fact that "the fair value" was accused of being so dangerous reflects yet the complexity of products, as well as the present situation of the market. In any conditions, it's difficult to establish a price for derivative products which were repeatedly "repacked, collateralized and structured". "The price of four thousand parts that compose a Porsche is more difficult to estimate than the entire Porsche, and the sum of parts is not equal with the whole," shows Bill Michael adviser at KPMG.

Obviously, some banks underestimated the risk of liquidity. The reports coming from the financial-banking domain indicate that institutions which showed prudence developed since long time ago internal patterns of valuation, using them even when the prices from the market could be estimated very clearly; those which didn't use such instruments, hurried up then to appeal to such patterns when the market came " up ", but losing a series of opportunities. Many banks overlooked the opportunity to transform the lack of liquidity in costs of financing.

It is certain that at the present, the effects of crisis succeeded to propagate even at the level of some economies which tended to present optimistic scenarios, hoping that a certain drawback of little developed national capital markets will constitute this time an advantage, the lack of efficiency representing theoretically an obstacle in transmiting the information at the level of market.

IFRS (International Financial Reporting Standards) pointed out rapidly the problems of valuation arised by this situation of financial crisis**.**

In these conditions, some lessons should be forgotten. The use of market value can transform an unfavourable momentary evolution in a real collapse, prices being more difficult to establish because of the lack of liquidity, and the valuations more liable to be influenced by psychological factors. This fact underlines the volatility and determines the managers to calculate the risks more attentively. If prices decrease very much, investors can become interested to buy those assets.

But beyond the concept of fair value itself, it should be tackled yet the aspect of implementation, often underestimated even at the level of Europe (Veron, 2008). The quality and consistency at international level regarding the implementation of an accounting referential are vital for the ensuring of a financial stability, as the Banking Supervision Committee from Eurosystem showed even before the first signs of manifestation of crisis (European System of Central Banks - Banking Supervision Committee, 2006).

The present financial crisis was of use, if we can say this about such a phenomenon with many negative implications, in bringing the financial instruments and especially their fair value in the searchlight, taking of our shoulders the charge to try to convince the readers about the importance of this theme. Even if at present the financial instruments are called toxic assets and the fair value received more criticism on this occasion than it would have received in the absence of such events which did nothing but favour misinterpretations, let's look at the full part of the glass, since in fact and after all the negative publicity is also publicity (Matiş, Bonaci, 2009).

Another important aspect underlined by specialized literature is the fact that such a serious crisis as the present one is not and cannot be caused by a single involved part, but implies the incapacity of the entire ecosystem which failed to estimate the risks connected to the fast growth of structured risks of mortgages, the other side of the coin in the growth of buildings'prices and an unprecedented lack of market liquidity (Ryan, 2008). There were all these factors that brought on the surface an inadequate character from the part of investors and from those who borrow or are borrowed, making them ignore what the common sense would have showed them, that is never forget to valuate at fair value the real implied risk.

At present, more than ever because of the global economic crisis, the fair value must be correctly interpreted. This was accused of being one of the important causes of crisis, contributing to the global writedowns. Gottdiener presents four keys for ensuring a superior valuation of assets (Gottdiener N., 2008):

- Establishing of some complex valuation hypothesis and of high technical level;

- Precise settling down of objectives and valuation goal;
- Realization of an objective and independent analysis;
- Ensuring of transparency by the clear presentation of the valuation methodology;

In all these stages, it is presumed the contribution of professional and ethic standards of valuation, especially the global ones of IVSC.

The support offered to the concept of fair value is not even far resulted from considering that this is a perfect one, being aware of the existence of a series of amendments to present standards that will be realized in the future, as the IASB president itself suggested not long ago (Tweedie, 2008). Despite of all these, the goal assigned to the fair value accountancy and valuations based on market, it doesn't seem an exagerated one if we integrate it in the picture which represents the characteristics of financial markets in a world in full development , picture reflecting also the lessons learned from anterior crisis. A restrictioning of fair value not only will it cure the wounds of present financial crisis, but on the contrary, it would risk to make them worse, diminishing the level of thrust that investors, and not only them, have in financial situations of financial institutions (Veron, 2008).

In the opinion of an expert evaluator, one of the positive aspects of present financial crisis is that to have made light during debates regarding the concept of fair value from the point of view of two key aspects, stimulating us to give up to a certain accounting utopia which tends to install in present environment and to come back to the financial reality (Rérolle, 2008). The first aspect to which Rérolle makes reference (2008) is the fact that from a conceptual point of view, the drawing up of a balance sheet which have the capacity or should offer a real image of the entity's market value, is an imposing ideal in the context in which the market is much too complex to be surprised by some accounting system.

The second aspect is that the valuation process implies a high degree of subjectivism, and the framing of this process in a series of accounting rules can be dangerous. At the same time it is to appreciate the fact that restrictions imposed to expert evaluators practicians were fortunately relaxed (Rérolle, 2008). As a result, the single administration of ascending doses more and more powerful of fair value within accounting literature didn't necessarily generate an image more realistic upon entities, being necessary the conscientiousness not only of limits inherent to accountancy by its nature itself, but also the complexity of economic reality whose reflection it proposes to realize.

The specialized literature mentions some alternatives regarding the valuation at just value occasionally, but the arguments are not enough convincing. The historical cost would offer a degree significantly low of the information's comparability and relevance, being obviously rejected by the users of this information, especially by financial investors. Other sources make reference to the use of some notional prices established by public authorities, these representing the fundamental accounting principle of economies of collectivistic type, but these enjoy of more reduced credibility, at least among the majority of economists and participants within capital market.

The alternative for "fair value" – historical cost of assets – has little admirers within financial crisis. "Is it better to keep hidden the losses and not to present the situation to shareholders?" asks John Smith from International Accounting Standards Board (IASB).

Conclusions

The use at present of the fair value as valuation basis doesn't make but to impose to banks to recognize the existence of some real problems earlier, making thus possible also the taking of measures to solve them, because they will not disappear without saying, no matter what the deferral period. Even more, these problems not being recognized, the mechanism could have continued, involving also other naive investors.

In the present context there were formulated pro and con arguments regarding the fair value.

Pro arguments:

- It is the only basis of valuation which surprises the derived instruments;

- It comprises the present information;
- It limits the marking practices of gains through the discretionary sale of assets;
- Better an unprecise system but transparent and based on fair value than a precise historical cost but irrelevant;
- The inexistence of active markets doesn't justify the renunciation of fair value but the development of valuation methodologies;
- The fair value hasn't generate the financial crisis and its renunciation will not solve the problems generated by this crisis;
- Renunciation at fair value when markets are in decrease would deprive investors of useful information and affect the neutrality of accountancy and the independence of the normalization organism.

Con arguments:

- The fair value cannot ensure the precision of historical cost;
- The lack of active and liquid markets makes subjective the fair value;
- It doesn't reflect the intention of the management to keep the asset but just to sell it;
- The goal of accountancy is not to valuate the entity;
- At the market decrease, the valuation at fair value can determine the non-fulfillment of criteria to maintain the capital;
- The fair value is procyclical in the sense that accelerates the market decrease by encouraging sales in order to accomplish the capital conditions.

According to an analysis realized by GfK group, Romanian consumers together with the Greek ones, felt the effects of financial crisis and the high level of debt of countries of origin the most intensely of Europeans last year. At the opposite pole, there are the citizens of Germany. Gfk group, present also on the Romanian market, is one of the biggest organizations of market research in the world. The company develops its activity in over 100 countries.

The present crisis is the most serious challenge for the stability and perspectives of future markets, but at the same time it is also an opportunity to restructure them, to bring to a normal state their existing unbalances and weaknesses. The worst thing for these markets is the assumption that "what it has been worse it consumed". At the same time, it is important not to fall out into another extreme – deglobalization with edification of new "Berlin walls" of protectionism, which would separate the developed economies from the becoming ones.

No matter what the modifications that would interfere in accounting standards as a result of the financial crisis, IFRS must remain further on an accounting language at the basis of which there are some principles of high quality, which support the prevention or attenuation of its effects, meant to sustain the difficult mission of accounting domain in the terms of which it is considered the principal culprit in cause.

Nobody knows for sure what will happen in the future, as nobody knows exactly in what stage of the crisis we are or how long will it last and it's enough to look at the past to find the answer. The only certain thing is that recession gives rise to opportunities.

THE INDONESIAN STOCK MARKET PERFORMANCE DURING ASIAN ECONOMIC CRISIS AND GLOBAL FINANCIAL CRISIS

MARIA PRAPTININGSIH[*]

Abstract
Volatility in the stock market had strongly affected by the movement of publicly or even inside information. The movements of this information will generate the perspectives and expectations of investors in decision-making. How strong is the level of market efficiency in determining the movement of stock market, especially to achieve stability in the stock market during the economic crisis? How effective are the policies of central banks in controlling the movement of the stock market? This study aims to measure the factors that influence changes in the movement of stock price in Indonesian stock market in terms of market efficiency hypothesis. This research also aims to investigate the effectiveness of central bank policy in controlling and stabilizing the movement of stocks in Indonesia. The research will focus on the economic crisis in 1997 and the global crisis in 2008 as case studies. Thepaperutilizesthe vector error-correction model, impulse responses and variance decomposition in measuring the contribution of the factors that affect the movement of stock and determine the effectiveness of central bank policy. The findings are beneficialto central banks, governments, companies and investors in strengthening the Indonesian Stock Market particularly in facing the threat of financial crisis.

Keywords: *efficient market hypothesis, monetary policy, stock market, vector error correction, variance decomposition.*

Introduction

The current global financial crisis has affected the economies of countries worldwide, including Indonesia. During the ongoing global economic crisis, it is reported that Asian growth fallen sharply to 1.3 percent in 2009 from 5.1 percent on 2008. (IMF Survey online May 6, 2009). According to the IMF report, that the impact of the global financial crisis particularly on Asia region has been deeper compare to the other region. The most possible reason is many countries in Asia are very dependence on the other region's economy in terms of their economic integration on export and import activities. Increasingly, it will affect to completely macroeconomic stability in such country, including Indonesia. Therefore, the International Monetary and Financial Committee (IMFC) board was emphasizes on the central role of the Fund in order to help the growth restoration and monitoring the government's policies that might be taken to solve the crisis. Nowadays, the governments and international organizations are still debating on how national framework on financial and economic stability should change, including the regulation and supervision of financial institution.

Indonesia faced the fallout from the crisis towards the end of 2008, which started on the third quarter. The economic growth was still above 6% with a good performance particular on financial sector. There were some indicators that supported this condition; such as a stable exchange rate, upward moving on stock index, and the declining yield on government securities. Nevertheless, the global financial turbulence started to bear down the Indonesian economy on fourth quarter in 2008. The weakening of exports had pressure the stability on balance of payments and resulted turmoil on the money market as well. The balance of payments began to accumulate a high deficit and depreciation on exchange rate in terms of external side. On the financial markets, there was a rising perception and expectation particular on the country risk because of the global liquidity condition. According to the Indonesian Economic Report (Bank Indonesia, 2008), the Indonesian Stock Market

[*] Department of Business Management, Faculty of Economics, Petra Christian University Surabaya, Indonesia (e-mail: maria_npa@yahoo.com).

and Government Securities prices were fall sharply. The risk spread on Indonesian securities was consider widening and led the foreign capital outflow from the stock market particular in terms of Bank Indonesia Certificates and government securities.

The impact of global crisis was continuing affected Indonesian economy during 2009. Bank Indonesia projects a drop in economic growth around 4.0% along with downside risks if the global economic downturn is greater than expected during 2009. Therefore, the Central Bank of Indonesia (Bank Indonesia) and the Government were concerned to mitigate the impact of this global financial crisis through optimizing monetary and fiscal policies in terms of money sectors and real sectors. It means that the government and Bank Indonesia should have an effective and efficient in coordination and cooperation in order to solve the macroeconomic problems that caused by the global crisis. The following table (Table 1), represents the differences condition in such main macroeconomic indicators between the 1997's crisis and the current global crisis in terms of Indonesian economy.

Table 1

Indonesia Macroeconomic Condition: Asian Crisis (1997) and Global Crisis (2008)

	1997	**2008**
GDP	4.70%	6.10%
Inflation	11.05%	11.06%
External		
- Current Account (% of GDP)	-2.30%	0.10%
- International Reserve (billions of USD)	21.40	51.60
- (Month of Imports and Official Foreign Debt Repayment)	5.50	4.00
- Foreign Debt (% of GDP)	62.20%	29.00%
Fiscal		
- Fiscal Balance (% PDB)	2.20%	0.10%
- Public Debt (% PDB)	62.20%	32%
Banking		
- LDR (%)	111.10%	77.20%
- CAR (%)	9.19%	16.20%
- NPL (5)	8.15%	3.80%

Source: Bank Indonesia, 2008

As we can see from Table 1, there were significant differences between the impact of 1997 and 2008's crisis on Indonesian economy. The most powerful indicator to give evidence of Indonesia's economy falling is GDP. It was 4.7% on 1997 compare with 2008, which is 6.10%. Indonesia's GDP has gradually declined from 4.7% on 1997 to the lowest level that is -13.7% on 1998 and -10.3% on 1999. This condition was the worst performance on GDP. It was automatically followed by all the main sectors as seen on Table 1. As stated in Yearly Economic Report (1998/1999) by the Central Bank, the pressures on GDP performance occurred when there was a contraction both in aggregate supply and in aggregate demand. On supply side, when the exchange rate was depreciated, therefore the prices of many imported resources in terms of national

production, increased sharply. This condition pushed up the cost of production as well. Meanwhile, on demand side, the contraction happened when the domestic demand was decrease as well. The main part was on the household consumptions. The decrease on household consumption was caused by the decrease on real income and the level of wealth as well. These are the main impacts of economic crisis on particular period. Similarly, the international reserve indicator had been significantly different between 1997 and 2008. In 1997, it was only 21.4 billions of USD, which had not exceeded than 50% compare to 2008. It was sharply decline because of the high foreign debt and the decline of capital flow as well in the balance of payment. The high percentage of GDP in foreign debt was 62.2% on 1997, while it is only 29% of GDP in 2008. When the economic crisis had happened on 1997, Indonesia was one of the most countries with high debt on particular world organization, such as IMF and World Bank. In 2008, the indicators of external vulnerability in relation to foreign debt showed further improvement, in keeping with the still positive performance of exports.

In stock market, movements of the LQ45 Index and Jakarta Composite Index (JCI) are similar. This means investors also attempt to invest and re-arrange their financial portfolio on Jakarta Composite Index and LQ45 Index in the same manner. The movements in the JCI Index and LQ45 Index had a similar direction but different in the market capitalization. It also implied that investors preferred to invest on the JCI than LQ45 because the JCI moved more actively. During 2003, there was an increase in the price index, volume of trading in the stock market, bond market, and mutual funds. According to Economic Report on Indonesia (2003), this was due to the decline in the interest rate. Moreover, several factors boosted a positive performance on the Indonesian capital market. There were relatively low bank interest rate, improved foreign investors' perception on Indonesian capital market and relatively stable macroeconomic indicators.[1] These were reflected through the increase in Jakarta Composite Index (JCI) in response to the increased stock trading by both domestic and foreign investors. The stock market performance remained bullish in 2004.[2] The bullish domestic stock market resulted from continuously improving fundamentals, both in macro and micro contexts, as well as market optimism over the new government. However, the JCI index started to fluctuate, but still generated a positive gain. Internal factors were driving negative sentiment on the stock market including the upward trend in domestic interest rates in consequence to the tight bias monetary policy stance adopted to reduce inflation and depreciation on rupiah. Eventually, the fluctuation on stock market continued until mid of 2008 when the global financial crisis happened.Therefore, this paper will emphasize on investigating whether the monetary policy can have a significant effect on stock market through the monetary policy transmission mechanisms and its indicators.

1. Review of related literature and studies

Efficient market theory is the application of rational expectations to the pricing of securities in financial markets. Current security prices will fully reflect all available information because in an efficient market, all unexploited profit opportunities are eliminated. However, the evidence on efficient markets theory such as market overreaction, excessive volatility on stock prices, and mean reversion condition suggests that the theory may not always be entirely correct. The evidence seems to suggest that efficient markets theory may be a reasonable starting point for evaluating behavior in financial markets but may not be generalizable to all behavior in financial markets. Capital Market plays an important role in the economy of a country because it serves two functions all at once. First, Capital Market serves as an alternative for a company's capital resources. The capital gained from the

[1] Based on Monetary Policy Transmission Evaluation of Bank Indonesia, Economic Report on Indonesia, 2003, p.67

[2] Based on Stock Market Evaluation of Indonesian Capital Market and Financial Institution Supervisory Agency , 2004, p.68

public offering can be used for the company's business development, expansion, and so on. Second, Capital Market serves as an alternative for public investment. People could invest their money according to their preferred returns and risk characteristics of each instrument (Indonesian Stock Exchange Report, 2009). According to Ross (1997); Blanchard, Ariccia, and Mauro (2010), the study empirically proved the existence of a positive relationship between the development of financial systems to economic growth. There are empirical studies that focus on the relationship between monetary policy and financial markets particularly on stock market. Lee (1992) investigated causal relations and dynamic interactions among assets returns, real activity, and inflation in the postwar United States. Major findings are (1) stock returns found to have causality and help explain real activity; (2) stock returns explain little variation in inflation, although interest rates explain a substantial fraction of the variation in inflation; and (3) inflation explains little variation in real activity. Based on these findings, many researchers developed new research and studies in terms of financial markets, particularly on monetary policy effect toward the financial market [e.g. Thorbecke (1997), Rigobon and Sack (2003), and Gupta (2006)]. Thorbecke (1997) examined how stock return data respond to monetary policy shocks. The evidence states that monetary policy exerts large effects on ex-ante and ex-post stock returns. The macroeconomic indicators can affect the stock price movement. Similarly, Rigobon and Sack (2003) investigated the relationship between monetary policy and financial market. In addition, they proved that movements in the stock market can have a significant impact on the macro-economy and are therefore likely to be an important factor in the determination of monetary policy. The results suggest that stock market movements have a significant impact on short-terms interest rates, driving them in the same direction as the change in stock prices. Similarly, Bernanke &Gertler (2000) concluded that in order to explore the issue of how monetary policy should respond to variability in asset prices particularly in stock market, the paper incorporated non-fundamental movements in asset prices into a dynamic macroeconomic framework. It is necessary for monetary policy to respond to changes in asset prices.

There are several empirical evidences that utilized the vector error correction approach in examining the effect of monetary policy to macroeconomic indicators and stock market. Granger (1986); Johansen and Juselius (1990) examined the existence of long term equilibrium among selected variables by utilizing the cointegration analysis. A cointegration happened when a set of time series data were found to be stationary or they had a same order in linear combination. This linear combination shows that they have a long-term relationship between the variables. The main advantage of cointegration analysis is that through an error correction model (ECM), the dynamic co-movement among variables and the adjustment process toward long-term equilibrium can be examined (Maysami, 2004). Mukherjee and Naka (1995) examined the relationship between Japanese Stock Market and exchange rate, inflation, money supply, real economic activity, long-term government bond rate, and call money rate. They applied VECM to test a cointegration. The results found that there is a cointegrating relationship and stock prices had contributed to the variables. Maysami and Koh (2000) applied the similar topic and methodology in Singapore. Meanwhile, the VEC approach is employed to examine the impact and relationship between stock returns and macroeconomic variables in Hong Kong and Singapore (Maysami and Sim, 2002b), Malaysia and Thailand (Maysami and Sim, 2001a), and Japan and Korea (Maysami and Sim, 2001b). Vuyyuri (2005) used similar methodology to investigate the cointegrating and causality between the financial and the real sectors of the Indian economy from 1992 to 2002 in monthly data. Therefore, this study will extend the literatures through utilizing Johansen's (1988) results to investigate the relationship between monetary variables and stock market indices in the long-run equilibrium.

2. Research hypothesis and methodology

This paper utilizes weekly data, which is from 1997 to 2009. The data mainly as a secondary data and collected from International Financial Statistic (IFS)-IMF, CEIC Database and Bank Indonesia as well. The variables that are used in this paper are Bank Indonesia (BI) Rate, Jakarta

Composite Index (JCI), and LQ45 Index. Nevertheless, in order to get additional data to sharpen the analysis, this paper also optimizes the Central Bank Annual Reports, The IMF Reports, World Economic Outlook Database by IMF, and other sources of data.

Co-integration states that if the time series data are not stationary or has a unit root, the combination of two or more of time series variable will form a linear combination that contain a co-movement, assuming there is no deviation in the long term. The paper utilizes the Johansen Cointegration Test to check whether the variables have cointegrating relationship if the variables are found to be non-stationary or I(1), I(2). This cointegrating analysis represents a short-term dynamics of the variables. Impulse responses serve to test the response of each variable in the current period and in the future by assuming that the error of other variables is zero (Stock & Watson, 2007). Stock & Watson (2007) defined that forecast error decomposition is the percentage of the variance of the error made in forecasting a variable due to a specific shock at a given horizon. According to Enders (2004), the forecast error variance decomposition tells us the proportion of the movements in a sequence due to its "own" shocks versus shocks to the other variable. The following are the models:

$$BI_t = \alpha_1 + \sum_{j=1}^{k} \beta_{1j} BI_{t-j} + \sum_{j=1}^{k} \gamma_{1j} JCI_{t-j} + \sum_{j=1}^{k} \delta_{1j} LQ45_{t-j} + e_{1t} \quad (1)$$

$$JCI_t = \alpha_2 + \sum_{j=1}^{k} \gamma_{2j} JCI_{t-j} + \sum_{j=1}^{k} \delta_{2j} LQ45_{t-j} + \sum_{j=1}^{k} \beta_{2j} BI_{t-j} + e_{2t} \quad (2)$$

$$LQ45_t = \alpha_3 + \sum_{j=1}^{k} \delta_{3j} LQ45_{t-j} + \sum_{j=1}^{k} \beta_{3j} BI_{t-j} + \sum_{j=1}^{k} \gamma_{3j} JCI_{t-j} + e_{3t} \quad (3)$$

Where JCI is the Jakarta Composite Index at time t; LQ45 is the most forty-five liquid stocks in Indonesia Stock Exchange at time t; BI is the Bank Indonesia Rate at time t; α is a constant and ε_t is an error term. Time t is in quarterly and j is lagged values that are chosen by the best estimation.

3. Results and analysis

The paper found that for the BI rate, since the computed ADF test statistics (-2.028922) was greater than the critical values (-3.474265, -2.880722 and -2.577077 at 1%, 5% and 10% significant level, respectively), the result could not conclude to reject null hypothesis (H_0). That means the BI rate series has a unit root problem. It means the BI rate series is a non stationary series. Similar results were also found for Jakarta Composite Index (JCI) and LQ45. All these variables are non stationary at level I(0). Therefore, the paper attempted to transform the time series data from non-stationary to stationary, since the estimation required a stationary time series data. All the variables were transformed into first difference or I(1). The paper found that for the BI rate, the absolute computed ADF test statistic (-6.120027) is smaller than the critical values (-3.474265, -2.880722 and -2.577077)and the result concluded that the null hypothesis (H_0) was rejected. That means the BI rate does not have a unit root problem and the BI rate series is stationary at first difference. Similar results also happened to the Jakarta Composite Index (JCI) and LQ45. In general, the paper concludes that all six variables are stationary at first difference or I(1). Thus, this requires the cointegration method to be conducted.

The autoregressive model assumes that all variables might be endogenous variables or exogenous variables. It is likely different from the structural model, which assumes that the variables are exactly precise as the endogenous or exogenous variables, which are supported by economic

theory. Nevertheless, this model is restricted to the dynamic changes that might be occurring on the observation. Hence, the Granger Causality is employed to test the predictability among variables. Table 2 presents several variables that are statistically significant at various levels, which are 1%, 5%, and 10%. The results confirmed that Jakarta Composite Index (JCI) and LQ45could help in predicting the movement in the BI rate. Meanwhile, the Jakarta Composite Index (JCI) could help in predicting LQ45. The following is the summary result of Granger Causality Test:

Table 2

Pairwise Granger Causality Tests

Null Hypothesis:	Obs	F-Statistic	Probability
LN_JCI does not Granger Cause LN_BI_RATE	150	4.28362	0.01558
LN_BI_RATE does not Granger Cause LN_JCI		1.68583	0.18890
LN_LQ45 does not Granger Cause LN_BI_RATE	150	3.81558	0.02427
LN_BI_RATE does not Granger Cause LN_LQ45		1.24940	0.28974
LN_LQ45 does not Granger Cause LN_JCI	150	0.15893	0.85320
LN_JCI does not Granger Cause LN_LQ45		8.83723	0.00024

Table 3provides the Johansen Co-integration summary results.The model without intercept and trends is the best assumption chosen by the lowest value of AIC criterion. The minimum requirement for at least one co-integration was confirmed based on the result. Table 4 presents the max-eigenvalue test which provides one cointegrating equation at 0.05 levels. Thus, it may be concluded that there isonecointegrating vectors found in the series of variables at 0.05 confidence level.

Standard errors in ( ) & t-statistics in [ ]

Error Correction:	D(LN_BI_RATE)	D(LN_JCI)	D(LN_LQ45)
CointEq1	-0.000833	0.003010	0.019855
	(0.00600)	(0.00766)	(0.00893)
	[-0.13883]	[0.39283]	[2.22363]

According to the first ECT (CointEq1), LQ45 is statistically significant at 5% level. The speed of adjustment toward the equilibrium per weekis1.98 percent. The following figure presents the graphical representation of impulse responses. It shows the response due to the shocks among variables. First is the response of Jakarta Composite Index (JCI). The shocks of BI rate bring a negative response to the Jakarta Composite Index (JCI). Second is the response of LQ45. The shocks of BI rate affect LQ45 negatively. Last is the response of LQ45. The shocks of JCI affect LQ45 positively. Therefore, the results confirmed that if the BI rate tends to decrease, the JCI and LQ45 tend to increase. While, there is a positive relationship between JCI and LQ45.

Average	**0.2802334**	**4.2836568**	**91.864217**	**3.8521255**

Table 8 provides the variance decomposition. The first result confirms that the variance of BI rate is mostly affected by the past performance of the variable, which is 96.9045 percent on average, in terms of lagged values,while the JCI contributes 3.081 percent to BI rate, and 0.0143 percent from LQ45. The second findings are the variances of JCI, which is influenced by its lagged

values by 92.5353 percent, 7.3783 percent of BI rate, and 0.0862 percent of LQ45. Third is the variance of LQ45 which is mainly affected by its lagged values of 3.8521 percent, followed by 4.2836 percent of BI rate, and 91.8642 percent from JCI.

Conclusions

The paper concludes that monetary policy is effective in achieving the financial markets stability through each indicator. Findings are consistent with the hypothesis that the monetary instruments have a significant effect in achieving the improvement particularly on stock market index. Bank Indonesia had utilized all the monetary instruments effectively through the monetary policy transmission mechanisms. The effectiveness of monetary instruments, that is Bank Indonesia rate generates market expectations toward the credibility of the policy makers. In addition, there is a positive expectation of investors and firms toward the macroeconomic performance. Therefore, Bank Indonesia as the monetary authority played an important role in straightening up the linkage between financial and monetary policy. The paper recommends Bank Indonesia to use the overnight interbank money market rate as the monetary policy operational target. The evidence proved that 1-month BI rate is effective in affecting the JCI by 7.3783 percent.Meanwhile,1-month BI rate is effective in affecting LQ45 by 4.2836 percent.

Moreover, the paper also recommends Bank Indonesia in reducing the lag effect, which is two quarter particularly in the stock market. By reducing the lag effect, it can reduce the overreaction of the investors. Thus, Bank Indonesia would be effective in controlling the stock market movement. Bank Indonesia should encourage investors to invest in real sectors. Buying stocks of real sector companies such as manufacturing can generate high capital inflows toward the industries. Thus, it can lead to high production capacity and aggregate output. The objective of the monetary policy is to control and boost up the foreign investment through stock market.

Thus, it will achieve a steady economic growth. In order to generate a high economic growth through the changes in monetary policy instruments such as money supply and the interest rates, Bank Indonesia should respond carefully, regarding the trade-off phenomenon between price stability and economic growth.

REVALUATION OF TANGIBLE ASSETS FROM ACCOUNTING AND FISCAL PERSPECTIVES

MARIANA GURĂU[*]
MARIA GRIGORE[**]

Abstract
Acknowledged by the accounting regulations conform to the European directives inside the alternative assessment norms, the revaluation of tangible assets is also accepted by the International Accounting Standards as an allowed alternative treatment. As there is a real interaction between accountancy and taxation, the present study aims to analyze the fiscal vision on the revaluation, the manner in which the above mentioned accepts the revaluation of tangible assets.
It is a known fact that the accounting information is used by the taxation as an object and a support in order to determine and to settle the assessments, the taxes and the contributions.
Still, the taxation authority reserves the rights to punctually impose some financial treatments distinct to the accounting rules. This also happens with the revaluation of tangible assets, and this is exactly what we emphasize in the present paper.

Keywords: *fair value, revaluation, historical cost, alternative evaluation rules, fiscal treatment of revaluation*

Introduction

Starting from the evidence that valuation represents an element of divergence between tax and accounting rules, we shall emphasize in the present work the differences regarding the approach to revaluation from a fiscal and accounting point of view, as well as the way in which taxation deals with the positive or negative results that appear as a result of revaluation of tangible assets.

The study is intended to be important through the pointing out of behavior contradictions of taxation, related to the recognition of accounting treatment regarding the revaluation of tangible assets.

In order to support the above-mentioned affirmations, we shall exemplify the accounting and fiscal treatment of revaluation through a case study.

In the first part of the work we shall try to justify the need to use the fair value in order to express the value of tangible assets in the context in which the accounting regulations corresponding to European Directives present as a criterion of recognition of fixed assets, the condition that these shall be used during a period greater than an year.[1]

The Fiscal Code stipulates also the same criterion of recognition[2] for tangible assets, for which it uses the notion of „physical capital".

In the second part of the work, we shall present the point of view of accountancy regarding the revaluation and in the third part, the revaluation seen through the light of taxation as well as the fact that taxation promotes contradictory rules in its steps to achieve the goal consisting in the calculation, collecting, setting up, payment tracking of taxes, rates and social contributions due by economic units to the State.

[1] Order 3.055/2009 for approval of Accounting Regulations corresponding to European Directives, pct 92.
[2] Fiscal Code, Art. 24 alin (2), pct. c).

Historical cost versus fair value

The task of financial accountancy is related to the drawing up, presentation and publication of financial statements which offer information regarding the true and fair view of the analyzed entity. Due to its characteristics (relevance, simplicity, availability, intelligibility and unity), the monetary unit is the most efficient means through which can be presented economic information to users but also for taking rational decisions.

The monetary quantification of phenomena and accounting operations presents also drawbacks, since the currency is a means of exchange which "expresses a general buying power, given by the quantity of goods and services that can be bought at a given moment."[3] The buying power is yet different depending on the economic, political and social conditions of a country. What can we say about the true image of the financial situation of a company if this has fixed assets (lands for example) bought in 1995, in 1999, in 2007 and in 2010. Can their accounting value be cumulated without affecting the true image of accounting information?

In the above-mentioned work, prof. Feleaga sustains that "the currency doesn't represent a stable measure in time, as for example the meter" and "the simplification brought by monetary nominalism is recommended in the periods of stability of prices because it is objective and incontestable".

Nowadays, the buying power which reflects the value of currency varies over time. After many economies confronted in the last decade with high increases of prices, in the last period these have considerably decreased.

Being part of the category of alternative valuation rules, the valuation of tangible assets is one of the methods of attenuation of monetary nominalism drawbacks through the replacement of historical cost with fair value. Even if this cannot render a certain solution from the point of view of objectivity and neutrality, the fair value seems to allow the elaboration of financial situations which confer better information on the present and future performances of the enterprise.

The principle of historical costs consists in preserving at the level of balance sheet structure, the corrected entry values, if necessary, with the cumulated amortizations or adjustments for depreciation. This reflects the nominal value of the currency without taking into consideration the variations of its buying power.

The fair value, a value more often used in the accounting language and controversial in the terms of present economic crisis, is considered by prof. M. Ristea „ a hope, if not a panacea, to surpass the limits of other valuation bases used for drawing up of financial situations"[4].

As it is defined by the Accounting Regulations corresponding to European Directives, the fair value represents the sum for which the asset could be changed of one's own will between parts with the same knowledge in a transaction with an objective determinant price and is determined, as a rule, on the basis of market evidence data.

Accounting Treatment of Revaluation

Being part of the group of alternative evaluation rules, the revaluation of tangible assets is accepted by accounting regulations according to the European directives approved by the order of Ministry of Public Finances No 3055/29.10.2009, applicable by the date of 1st January 2010, according to which economical entities can choose the model based on the fair value, proceeding to the revaluation of tangible assets at the end of the financial exercise, so the revalued value is reflecting in the financial situations prepared for this exercise.

[3] Feleaga, Nicolae, Feleaga, Liliana, Valuation Patterns and Rules in Financial Accountancy, in "Theoretic and Applied Economy"review

[4] Ristea, Mihai, A*ccounting Business*, Economic Tribune, Bucuresti, 2006, pag 55

According to this model, the initial accounting value is substituted by the revaluation value represented by:

- Fair value revaluation
- any previously accumulated amortization
- any cumulated loss of depreciation

= revaluated value

Revaluated value is a value based on market price.

Use of revaluation relay

Revaluation reserves based on the surplus of revaluation is capitalized through direct transfer, when this surplus represents an accomplished gain, using 1065 account "Reserves representing the surplus developed by revaluation reserves".

No part of the revaluation reserves cannot be distributed, neither direct nor indirect, **except for the case in which the revalued active has been valorificated**, situation in which the surplus of revaluation represents an effective realised earnings. It is understood that not only the sums reflected in 1065 account "Reserves representing the surplus developed by revaluation reserves", afferent to the sold or scrapped assets cam be distributed, **according to fiscal rules.**

Earnings are considered accomplished at emphasizing the active for which the revaluation reserve was developed. Part of the earnings can be accomplished when the active is used by the entity, case in which the value of the transferred reserve is:

- calculated amortization on the basis of revaluated accounting value
- calculated amortization on the basis of initial cost of active

= relay value transferred to relay.

Amortization after revaluation

In case the revaluation of an active is made, the resulted value of revaluation will replace the cost of acquisition/production or any other value attributed before the active. Amortization rules will apply to the active considering its value determined as a consequence for revaluation.

Fiscal Treatment of Revaluation

The Romanian taxation is characterized by instability and a great number of normative acts that regulate the economic activities and abounds in position changes from an accounting period to another or even during a fiscal year. The same hesitation is noticed also regarding the position of taxation as confronted to revaluation.

The Fiscal Code makes reference to revaluation in many sections. The first reference to revaluation of tangible assets is found in the definition that the Fiscal Code gives for **fiscal value**.

The Fiscal Code defines the **fiscal value** for amortizable fixed means and lands as being the entry cost, used for the calculus of fiscal amortization. In the **fiscal value are included also the accounting revaluations** made according to law. In case there are made revaluations of amortizable fixed assets, that determine a decrease of their value under the entry cost, the fiscal value of tangible amortizable assets remaining unamortized is recalculated **till the level of the one established on the basis of entry cost**. In the situation of revaluation of lands which determine a decrease of their value under the entry cost, the fiscal value is the entry cost.

The entry cost is represented by the **„**acquisition, production cost or the market value of fixed means obtained free of charge or constituted as contribution of capital at the date of entry in the tax payer's patrimony"[5] .

[5] Law no. 571 regarding Fiscal Code, approved of at 22nd of December 2003, with ulterior completions and modifications

In time, taxation had different positions as regards the revaluation of tangible assets. We shall present in the below table the perspective modifications of taxation regarding the revaluation:

Period	Fiscal treatment	Observations
Till 01.04.2004	Expenses with amortization related to reserves from revaluation were considered **deductible**	
Between 01.01.2004 and 31.12.2006	Expenses with amortization related to reserves from revaluation were considered **non- deductible**	Yet, expenses related to reserves from revaluation made before 01.01.2004 left **deductible.**
Between 01.01.2007 and 30.04.2009	Expenses with amortization related to reserves from revaluation were considered **deductible**	The fiscal value includes: - revaluations made before 01.01.2004; - revaluations made after 31.12.2006; - part left non-amortizable, made evident in the balance at 31.12.2006 for revaluations made during the period 01.01.2004 – 31.12.2006
From 01.01.2008	Expenses representing the value of depreciations of fixed assets in case in which it is registered a diminution of their value as a result of effectuation of a revaluation, are **non-deductible**	As a result, the extra value obtained after an ulterior revaluation, registered at incomes to compensate the previous depreciation is considered non-taxable income.
From 01.05.2009	Expenses with amortization related to reserves from revaluation were considered **deductible**	Reserves from revaluation related to revaluations made after 01.01.2004 are considered **taxable incomes (**this aspect is detailed further on**).**

The Directive no. 34/2009 introduces the next rule regarding the use of the reserve from revaluation, beginning with 01.05.2009:

The surplus from corporate fixed assets revaluation, which was previously deductible, is taxable at the moment of:

- Modification of reserve destination,
- Distribution of reserve by participants under any form,
- Liquidation, splitting, merger of tax payer or
- For any other reason, *inclusive when it is use for covering of accounting losses.*

For the calculus of taxable profit, these sums are elements similar to incomes. The registering and holding in own capitals, respectively reserve accounts or reported result, distinct analytics of reserves from revaluation is not considered modification of destination or distribution.

With the exception of:

Reserves from revaluation made after 1st of January 2004, which are deductible at the calculus of taxable profit through the fiscal amortization (or of expenses regarding the ceded and/or cancelled assets), **are taxable at the same time as the deduction of fiscal amortization (**at the moment of derecognizing of these tangible assets). *Rule introduced from 01.05.2009.*

This rule is not applied for:

*- Reserves representing the surplus realized from reserves from the revaluation of fixed assets, including lands, made after 1st of January 2004, **existing in balance in the account «1065»** at 30th of April 2009 inclusively, which were deductible at the calculus of taxable profit. These reserves are taxable at the modification of destination.*

*- Part from reserve from the revaluation made after 1st of January 2004, deductible at the calculus of taxable profit through fiscal amortization **till 30.04.2009**, and which wasn't capitalized. These reserves are taxable at the modification of destination.*

-

Example:

A business corporation has in the book keeping a building bought in December 2002, with an entry value of 300.000 lei and a period of amortization of 20 years (with an accounting and fiscal purpose).

The corporation has revaluated the building as follows:

-on 31.12.2004 the revaluated value was of 288.000 lei;

-on 31.12.2007 at the fair value of 247.500 lei;

-on 31.12.2010 at the fair value of 168.000 lei.

At the end of June 2011, the corporation sells the building at the sale price of 155.000 lei

From an accounting point of view:

1. Book entries at:

Acquisition on December 2002:

212 = 404 300.000 lei

Amortization on year 2003 (300.000lei / 20 years = 15.000 lei/year):

681 = 281 15.000 lei

Amortization on year 2004 (300.000lei / 20 years = 15.000 lei/year):

681 = 281 15.000 lei

2. On 31.12.2004 the situation of asset is the following:

a) Before revaluation:

Entry value (accounting value) 300.000 lei

Amortization (2 years) 2003-2004 30.000 lei

Net accounting value before revaluation 270.000 lei

b) Revaluation booking from 31.12.2004 is made through the valuation based on net values, through the elimination of amortization previously registered:

Fair value on 31.12.2004 288.000 lei

Net accounting value 270.000 lei

Difference from revaluation 18.000 lei

Book entries:

Elimination of amortization:

281 = 212 30.000 lei

Registering of differences from revaluation:

212 = 105 18.000 lei

Registering of amortization for 2005, 2006, 2007 (288.000 lei / 18 years = 16.000 lei/year)

681 = 281 16.000 lei

3. On 31.12.2007 the situation of asset is the following:

a) Before revaluation:

Entry value (accounting value) 288.000 lei

Amortization (3 years) 2005-2007 48.000 lei

Net accounting value before revaluation 240.000 lei

b) Revaluation booking from 31.12.2007 is made through the valuation based on net values, through the elimination of amortization previously registered:

Fair value on 31.12.2007 247.500 lei

Net accounting value 240.000 lei

Difference from revaluation 7.500 lei

Book entries:

Elimination of amortization:
281 = 212 48.000 lei
Registering of differences from revaluation:
212 = 105 7.500 lei
Registering of amortization for 2008, 2009, 2010 (247.500 lei / 15 years = 16.500 lei/year)
681 = 281 16.500 lei

4. On 31.12.2010 the situation of asset is the following:
a) Before revaluation:
Accounting value 247.500 lei
Amortization (3 years) 2008-2010 49.500 lei
Net accounting value before revaluation 198.000 lei
b) Revaluation booking from 31.12.2010 is made through the valuation based on net values, through the elimination of amortization previously registered:
Fair value on 31.12.2010 168.000 lei
Net accounting value 198.000 lei
Difference from revaluation -30.000 lei
Book entries:
Elimination of amortization:
281 = 212 49.500 lei
Registering of differences from revaluation:
105 = 212 25.500 lei
681 = 212 4.500 lei
Registering of amortization for 2011 (168.000 lei / 12 years = 14.000 lei/year : 6 months = 7.000 lei/ month)
681 = 281 7.000 lei
Building salles
461 = 7583 155.000 lei
Downloading of the bookkeeping:

7000 281 = 212 168.000
161.000 6583

Fiscal treatment of amortization:

- for 2003 and 2004 the amortization is entirely deductible: 15.000 lei x 2 years = 30.000 lei
- for 2005, 2006: - the amortization is deductible without taking into consideration the revaluation: 15.000 lei x 2 years = 30.000 lei;

- non-deductible amortization = (16.000 – 15.000) x 2 years = 2.000 lei

- for 2007 the amortization is entirely deductible: 16.000 lei x 1 year = 16.000 lei;
- for 2008, 2009, 2010 the amortization is entirely deductible: 16.500 lei x 3 years = 49.500 lei;
- after 01.05.2009 the reserve from revaluation becomes taxable and is taxable during the left period of life of the asset (13 years and 8 months) thus:

- for the reserve related to revaluation made on 31.12.04, in amount of 16.000 lei (18.000 – 1.000 x 2 years; part from amortization which was non-deductible), the sum of 1170 lei will be taxable every year (16.000 lei / (13 x 12 + 8 months) x 12 months);

- for the revaluation made on 31.12.2007 the reserve from revaluation in amount of 7.500 lei will be taxable at the modification of destination of the reserve;

-for 2011 the amortization is deductible at the entry value (15.000 lei), and the expenses representing the value of depreciations are non-deductible (4.500 lei).

Fiscal Treatment of the Reserve from Revaluation:

If the building were sold on 31.12.2010, the reserve from revaluation would be in amount of 25.500 lei:

At the sale of the building, the reserve from revaluation will be conveyed to reserves from the reserves surplus from revaluation (1065). **It is not taxable.** If the destination of surplus from revaluation is modified subsequently (it will be used at the loss covering, for example), it will be considered income and will be taxable, less the amortization which wasn't deductible, respectively 2.000 lei:

23.500 lei x 16% = 3.760 lei

At the title IX, „Local Rates and Taxes", the taxation recognizes the revaluation and punishes the legal entities, which do not proceed to the revaluation of buildings, through the application of a superior tax rate. Thus, if the building tax due by legal entities is established within a rate comprised between 1,25% and 1,50%, this increases to a rate comprised between 5% and 10% applied at the inventory value of the building for legal entities which haven't made the revaluation in the last 3 years previous to the fiscal year of reference. From a fiscal point of view, the inventory value is represented by the entry value of the building in patrimony, registered in the accountancy of the owner.

Conclusions

The subject of the study joins the multitude of scientific approaches regarding the controversial fair value. As we showed at the beginning of the work, taking into consideration that tangible assets are possessed for a period that exceeds a year, to support the carrying out of the goal of financial situations, that is to present a true image of the financial position, performance and modification of financial position, we consider necessary the use of fair value in view of presentation in financial situations of tangible assets.

Taxation, which as a rule, doesn't know the fair value, makes an exception in case of revaluation, although in time, its position related to revaluation has often changed depending on fiscal interests.

Fiscal authority has perceived revaluation as a disadvantage for the State and tried to limit the fiscal consequences through the introduction of some restrictions. In this sense, the first normative acts in domain allow only for revaluation of lands and buildings, on the following reasons:

- it is allowed the revaluation of lands because these are not amortizable. Thus, the costs will not comprise a greater value regarding amortization and the value of fiscal result will not be reduced;

- at the revaluation of buildings, the effect of revaluation is dispersed on many fiscal periods, these having a greater period of amortization. On the other hand, the new accounting value constitutes a basis of calculus for the buildings tax, which makes that the eventual amortization rise which would diminish the profit tax, be compensated for additional resources obtained from local budgets.

The present accounting regulations allow for the revaluation of all categories of tangible assets as well as taxation. Although, economic entities proceed to the evaluation of buildings and lands but very seldom to the revaluation of other categories of tangible assets.

The taxation behavior regarding revaluation, sometimes having a character of fiscal facility, has been in a continuous change and it will not stop here. Through this behavior, the taxation accepts not only the fair value but, also the accounting principle of prudence.

The subject of this paper is very complex and it is not exhausted by the present work. We believe that the revaluation of tangible assets is interesting from other points of views too, such as the call to creative accounting in the economic entity's interest. Another track of research may be the way in which revaluation adjustments influence dividend policy.

ACCOUNTANT'S WARNING REGARDING THE LACK OF MANAGEMENT INTEGRITY

SORIN ADRIAN ACHIM[*]
MARIUS-IONUȚ SOUCA[**]

Abstract
This article highlights the challenges faced by accountants when they find that the integrity of company management is poor. The main problem is in relation with the accountants' fear, mostly: suffering some repercussions from the disclosure of such information. Also, this article aims to emphasize the danger brought by covering and concealing incriminating information against the management; but also, how accountants could expose this information in such a way that they would not suffer, under no circumstances from such disclosures.

Keywords*: accountant, whistleblowing, whistleblower, management integrity.*

Introduction

Almost every sector of our society faces so called fights against the fraudulent practices. Deviant top management behavior can induce huge economic, social and emotional costs for innocent stakeholders and the corporate failure of the last decade have provided examples of this on a grand scale. (Richardson & Richardson 2005). For exemple managers are trying to put company's money into their own pockets through creative or illegal accounting (Yin 2003). Economic fraud destroys shareholders' value, threatens enterprises development, endangers employment opportunities and undermines good corporate governance. (ICC 2008)

The first person to notice the threat of misconduct, mismanagement and corruption within a public or private organization will usually be someone who works in or closely with the organization. While employees are the people best placed to raise any concerns they are also the ones who have the most to lose by disclosing sensitive information. (Hüttl & Léderer 2002)

At the fist view it could be said that every whistleblowing from the inside of an entity is without ethics and that the company's employees should be loyal to that organization. But as an contra argument we could name the moral and juridical obligation of the company to take action into the community purpose. From the moment in which the corporations have an immoral behavior the society has the right to punished it. The companies' employees represent the best instrument for underlying their mistakes. (Yin 2003)

The accountants have privileged position within the society, and due to this position they have access to much information; in the case of appearing some irregularities in the society, they are the first ones who can notice it (Richardson and Richardson 2005).

When accountants identify inappropriate behavior by management, those accountants licensed by Professional Organizations have the responsibility to maintain the interest of the general public in the company (Lauren 2010). This being the case, the guidelines for potential whistle-blowers accountants are set down by professional accounting bodies. They should reflect and support this important potential but unfortunately does not offer any professional body such as guidelines on whistleblower latent and therefore, the accountants will choose to remain silent (Richardson and

[**] Faculty of Economics and Business Administration , "Babes-Bolyai" University (e-mail: marius_souca@ yahoo.com).

Richardson 2005). But what should not be overlooked is the fact that the support may come from elsewhere. Thus, the most important support can be found in specific protective measures offered by each state for whistleblowers.

In this way, each accountant must understand that it is a social duty and moral obligation to make any disclosures of fraudulent practices. He must be aware of the consequences of silence, because it will be subjected to ongoing emotional stress and the management organization will continue to practice illegal actions until the organization would collapse, which will bring huge social consequences.

In order to avoid all these, the accountant needs to act. The first step he should make is informing about the solutions which are available, to overcome all the obstacles encountered when he decided to make revelations about the illegal practices of management.

The whistleblower concept

"The sense of whistleblowing is common ever since the first whistleblower laws have been adopted: promptly reporting instances of suspected misconduct. The first law that can be regarded a whistleblowing law, was the Federal False Claims Act (1863) adopted during the Civil War in the United States. It was enacted in part because unscrupulous tradesman sold ill mules, faulty rifles and ammunition, and rancid rations and provisions to the Union Army". (Hüttl & Léderer 2002)

"A whistleblower is generally defined as an employee who discloses potentially damaging information about their employer to an authority figure, such as their boss, the media, or a government official" (Krancher 2006 p. 80 cited by Evans 2008).

"Whistle blowing is a deliberate non-obligatory act of disclosure, which gets onto public record and is made by a person who has or had privileged access to data or information of an organization, about non-trivial illegality or other wrongdoing whether actual suspected are anticipated which implicates and is under control of that organization, to an external entity having potential to rectify the wrongdoing". (Peter B. 1999 cited by Richardson & Richardson 2005)

As an interpretation of the definitions given above we believe that a whistleblower is a person of integrity who took knowledge about various irregularities in the organization. Once he acknowledged these irregularities he also must be willing to disclose them. Disclosures may be made both inside and outside the establishment. There are several type of disclosures such as corruption, fraud or other wrongdoing.

Regarding the status of whistleblowers there is a paradox. For some (Stonefrost 1990, Vinten 1994) the warning about the integrity of management is an act of treason brought to the organization while for others, it is an act of morality and therefore it is their duty to make such disclosures. (Richardson & Richardson). Jackson (1992) argued that the disclosure of sensitive information is putting out the man who made these revelations in a thankless situation; the disclosures relating to management integrity, without using the internal procedures recommended in such cases, will be considered more likely to be irresponsible. If they still decide to use internal procedures and the problems inside the company remains unresolved, any act of disclosure will be considered further outwards as wicked. (Richardson & Richardson 2005).

On the other hand the supporters of whistleblowers bring the argument that any disclosure of information is an act of honor that protects the organization (Stanford 1990). Other author (David Banisar 2006) considers that disclosure of information is critical to the public, referring to the Enron scandal, where if they would have been made disclosure of fraudulent practices coming from leadership, they would have not be reached the economic and social disaster that took place.

We believe that any disclosure of information about management's integrity cannot be considered an act of betrayal at all, quite the contrary. Hence, like any entity to function properly, needs all its component parts, for it to achieve this status, so the entity has all the components needed to work towards a 'healthy functioning". So when one of the components (management in this case) is against the proper functioning, it is up to the other existing party to remove the existing evil. It is

not considered an act of treason, but rather an act of great loyalty, but of course the main condition being that this is being made in good faith.

According to a survey conducted by Transparency International, the means for making referrals to crime may be internal or external. In general, we can distinguish three different levels: the internal ways can be the counselors of ethics or the hotlines provided by the organization, but which are managed externally; the means provided by regulatory bodies such as police or the institution ' people Advocate "or other external means such as media or civil society organizations. (Alternative to silence: Whistleblower Protection in 10 European countries, p.11, 2009). The controversies that have arisen are the choice of where to make the revelations of information: inside or outside the organization

(Maarten De Schepper 2009) considers that public interest overrides the interest of the company when it comes to fraudulent practices of the company and any fraudulent practices disclosure should be made public.

In our opinion, the differentiation made by sectors would be the most appropriate. Thus, the public sector which provides public services that we are paying for should make the information public. Regarding the private sector, we believe that as long as a company has a well-founded ethical code with clear provisions, there is a certainty that they will take all the necessary internal measures against reported fraud and the problem remains within the organization.

Obstacles faced by the whistleblowers

The accountants, when they decide to make disclosure of information relating to fraudulent practices, they encounter a series of obstacles that lead them most often to stop the act. Whistleblowing often opens up a more difficult life and if one did not expect one's efforts to lead to any discernable outcome; it would not be worth (A. J. Evans 2008).

We divided these barriers into five categories, as follows:

a) Fear of reprisals

Fear of reprisals is a concern. The reprisals made over the employees are often indirect and subtle, very hard to prove to the authorities, the latest being mostly in the inability to take protective measures. (Schepper 2009). Glazer and Migdal say "most whistleblower-protection statutes do not provide remedies for retaliatory actions that fall short of dismissal - such as demotions, unwanted geographical transfers, failure to consider an employee for promotion, freezing an employee out of a decision-making role consonant with level of seniority, inordinate scrutiny and surveillance in and outside the workplace, and psychological pressures" (Hawse & Daniels 1995). Following a survey conducted in 2009 by Transparency International Romania we could see the following fact: even if legal protections are available, often there are limited mechanisms and the implementation of them is too weak to protect whistleblowers. For example, despite the fact that Romania has a very strong law with reference to the protection of whistleblowers from the public sector 40% of whistleblowers have suffered repercussions in one form or another as they have made the notification to the competent authorities.

Some common practices are listed by the US Project on Government Oversight:

- Take away job duties so that employee is marginalized;
- Take away on employee's national security clearance so that he or she is effectively fired;
- Blacklist an employee so that he or she is unable to find gainful employment;
- Conduct retaliatory investigations in order to divert attention from the waste, fraud or abuse the whistleblower is trying to expos;
- Question a whistleblower's mental health, professional competence or honesty;
- Set the whistleblowers by giving impossible assignment or seeking to entrop him or her;
- Reassign an employee geographically so he or she is unable to the job.(Banisar 2006)

"Reprisals can also take more subtle forms that may affect employment opportunities and working environment, such as awkward rosters, request for excessive documentation, petty harassment, harsh treatment by other employees and other forms of mobbing". (Marie Chêne, 2009)

To all this, we would add some more serious repercussions such as threats, physical violence and even murder. The level of crime in each country is a decisive factor. Thereby, in countries with high level of crime the probability that an accountant to make disclosure is very low. "An example for the most brutal retaliation a whistleblower can receive is the story of Milan Vukelic, a civil servant who publicly accused officials in Bosnia-Herzegovina's Republika Srpska of corruption. He was killed on November 7, 2007 when his car exploded. Milan Vukelic, a town planner for Banja Luka's municipal authority, accused both his boss of corruption and the police of threatening him". (*Léderer & Hüttl 2002)*

b) Revenue loss

Here we can include the fear of losing their job and thus the income, wage cuts, the costs that are relating to the legal proceedings which are arising from the processes that follow, the loss of invested capital due to depreciation of any shares (Schepper, 2009). If the entire family's income will depend on the accounting, it is very likely that the accountant does not make any disclosure.

Also, another obstacle is large gains an accountant may have. In order not to risk losing gains, he will choose not to make any disclosure.

c) Culture

The culture of each person is influencing a lot its own behavior. "Beyond legal obligations, this is also significant cultural opposition to whistleblower in many cultures that needs to be overcome. Whistleblowers are seen negatively as ","neaks", "narks", "informers" or "dobbess". (David Banisar 2006). Un bun exemplu este România, țară cu trecut comunist, unde de cele mai multe ori, avertizorii de integritate sunt percepuți ca fiind informatori. A good example is Romania, a country under communist passed regime, where most of the times, whistleblowers were perceived to be informers[1]. "It is likely that many people do not even consider blowing the whistle, not only because of fear of retaliation, but also because of fear of losing their relationships at work and outside work". (*Léderer & Hüttl 2002)*

Anonymous informants were used to maintain power over schemes such as the Inquisition, Nazi occupation, Soviet Union, era apartheid in South Africa. (Banisar 2006)

Another example, more topical this time, would be China where "whistleblowing may be deemed as undesirable and unethical behavior by any Chinese model employee. This is because it disturbs the relationship between employees and employers, particularly since loyalty is a significant factor in this relationship" (Stefen şi alți, 2006).

"In Venezuela, many internal auditors believe that discovering fraud is not only career-limiting, but probably career-ending. If the subject of whistle-blowing came up in a discussion, the perspectives were neither positive nor negative. Some who had done whistle blowing were resentful about the outcome" (Stefen and others, 2006).

d) Legislation

The laws in each country leave their mark on whistleblowers. In many countries, there are laws which refer to the privacy of information, while the laws relating to whistleblowers are inadequate or nonexistent. Thus in many countries there are laws that provide duty of loyalty to the

[1]*Alternativa la tacere: Protectia avertizorilor de integritate în 10 state europene este un studiu realizat de catre* Transparency International România in anul 2009. Transparency International Romania/Asociația Română pentru Transparență (TI-RO) este o organizație neguvernamentală care are ca prim obiectiv prevenirea şi combaterea fenomenului corupției, la nivel național şi internațional, în special prin activități de cercetare, documentare, informare, educare şi sensibilizare a opiniei publice

employer, secret documents, Libelle end Defamation, other law (Banisar 2006). "A breach of contract is very likely as many contracts include confidentiality clauses and "***all*** *contracts of employment involve an* ***implied*** *"duty of fidelity" which requires honest, loyal and faithful service and forbids competition with the employer*" (Maarten De Schepper, 2009). In Romania, we ca give as an example the obligation of expert accountants to maintain confidentiality of data they have access[2].

Another issue is the anonymity of notifications. The anonymity offers a feeling of safety, but unfortunately many legislations do not take into account these kind of anonymous notifications "Most legislations exclude anonymous disclosures while providing for the protection of the whistleblower's identity" (Marie Chêne 2009). Romania is a good example; it is a country that does not take into account anonymous disclosures.

e) Psychological

"Personality is assumed to be one reason why some employees are more inclined than others to engage in whistleblowing behaviour and initiate actions aimed at solving organizational challenges" (Miceu, 2004, cited in Brita Bjorkelo şi alții, 2010).

"Personality in the form of high extraversion, low agreeableness, and high domineering in interpersonal interaction predicts whistleblowing. Together, these findings paint a picture of the role of personality in relation to proactive behaviour in the form of whistleblowing". (Bjorkelo şi alți, 2010)

Solutions for overpassing the obstacles

a. Legislative measures

One of the handiest legislative measures is considered to be the adoption of specific legislation to protect whistleblowers. So as to remove these barriers and to encourage whistleblowers there have been globally and continentally concluded a series of treaties. In this article we will stop on two of them: the UN Convention against Corruption and Civil Law Convention adopted by the Council of Europe at the European level. Thus, Article 33 of UN Convention against Corruption says: "Each State shall consider incorporating into the legal system appropriate measures in order to provide protection against any unjustified treatment for any person who in its reports submitted information to the competent authorities of the various deficiencies noted in the organization based on reasonable grounds. (Léderer & Hüttl 2002)

At European level, the Council of Europe adopted the Civil Law Convention on Corruption which says that: "Each Member State shall provide in its internal law an appropriate protection against any unjustified sanction for employees who have reasonable grounds to suspect corruption and reporting in good faith their suspicion to responsible persons or authorities. (Lederer & Hüttl 2002)

Of an utmost importance are also the laws passed nationwide. On this respect, Romania adopted the Law no. 571/2004 with regards to the protection of personnel from public authorities, public institutions and other units which reports violations of the law. In Article 7 of this law is set out clearly how this law protects whistleblowers, but unfortunately those assumptions are applicable only to the public sector personnel. For those in the private sector it is helpful the Labour Code which prohibits unjustified dismissals.

"Best practice should protect whistleblowers from civil and criminal liability if they make a protected disclosure. In particular, this includes relieving whistleblowers from civil liability for defamation or breach of confidentiality and statutory secrecy provisions. Some WPL3 provide absolute privilege to whistleblowers against defamation but not all of them override the duty of confidentiality. Whistleblowers should also be protected against sanction for misguided reporting". (Marie Chêne, 2009)

[2] Rule 35/2000, issued by CECCAR

[3] Whistleblower Protect Law

Another solution always could be the maintenance of confidentiality and anonymity for those who make disclosure of information, in this way ensuring a sense of security for the persons who make the complaint.

The term "anonymous" should be seen as being associated with an observation made through out a channel that cannot betray in any way the person who provides the information: a file containing the information sent with no return address, an untraceable call from a direct phone line, an email sent from o secure account, IT systems which ensure anonymity and prevent subsequent contacting, etc.. (Alternative to silence: Whistleblower Protection in 10 European countries, p.12, 2009). “By contrast, a confidential disclosure is where the recipient knows the identity of the person but agrees not to disclose it if and when the information is used” (Dehn and Calland 2004).

b. Providing compensations

Another encouraging measure is to offer compensations to whistleblowers. Compensation may be granted in case of immediate loss of salary, to cover the costs of civil proceedings and also for the stress on which the whistleblowers are being placed to (Maarten De Schepper 2009).

"Compensation is a protection that is given as a top-down compensation for job loss - which means the system failed to protect employees and the problem is classified as a work conflict. Often, these compensations are provided in the Labor Codes of each country. In Romania compensation consist of a return to work, pay compensation, restituo in full. "(Alternative to silence: Whistleblower Protection in 10 European countries, p.17, 2009)

In the UK, an award of £ 278.000 was given to a 56-years-old man who successfully argued that he would not be able to find another job (Banisar 2006)

c. Offering rewards

Offering rewards to encourage whistleblowers is rather a controversial issue even if it is a commonly way put in practice. Offering rewards for whistleblowers may have an undesirable effect. Under the impetus of the rewards offered employees can expedite the disclosure of information which may lead to erroneous views, which have no solid basis. Also, we must not forget that firstly, the warning regarding management's integrity should be primarily an act of loyalty. (Howse & Daniels, 1995). A number of Asian jurisdictions offer huge rewards to those who reveal corruption. As an example here we could give South Korea, where anti-corruption law allows for individuals who reveal corruption to receive up to 20% of the amount recovered as a result of denunciations made. (Lederer & Hüttl 2002)

Hawse & Daniels (1995) highlighted very well the problem of rewards. When there is a disclosure of information on illegal practices within the company, the person in discussion is taking high risks, as follows: once the case reached the courts and there is not sufficient evidence, the whistleblower’s reputation will have to suffer. A counterargument made by Hawse & Daniels (1995) themselves is that usually awards are made as a percentage of the amount recovered thus the new problem is as follows: although the employee has acknowledged the illegality, he will not report it but will wait for the amount of the irregularities to grow until the rewards will be the greatest. The same authors point out that any delay in reporting may cause destruction of evidence or some other integrity warning to take it forward and thus collect the rewards. Surprisingly accountants are unlikely to blow the whistle for a cash reward and, furthermore, are unlikely to whistleblower externally. (Shawver & Clements 2008

In our opinion offering rewards is not a healthy practice for the organization because there is a risk that a whistleblower will turn into an informant and the informant’s only goal is to obtain rewards. Any disclosures of fraudulent practice should be done under the impetus of the feelings of morality and loyalty to the organization where the employee belongs. Yes, the whistleblower is facing some risks but given the example shown above, about the risk of there not being available sufficient evidence for a trial, the lack of reward in the middle will lead to the conviction of whistleblowers and his only fault will be he’s just having a highly developed sense of moral. But if

there is a reward in the middle, he will be accused of being a bounty hunter which will bring him even a greater fall into disfavor.

d. Other measures

Steven H. and others give us some recommendations to overcome the obstacles which a warning of integrity might encounter. Recommendations include encouraging employees to communicate their concerns about ethics within the organization by giving them the assurance that they will be heard and will not suffer any reprisals. (Appelbaum and others, 2006)

Protecting the employee's status - the warnings usually have several implications for the integrity and the professional losses may be large. "Whistleblowers should be protected from dismissals, suspensions, disciplinary and other forms of workplace sanctions and discriminations. Protection should be broad enough to cover any retaliation means, including more subtle forms of discriminations and petty harassment". (Marie Chêne, 2009)

Another solution is to encourage private companies to adopt codes of conduct and ethics so as to provide tools and procedures for the employee when he finds some illegal practices in order to encourage disclosures of fraudulent practice.

Conclusions

Many accountants are very reticent regarding the disclosure of information. Most reasons are related to fear of suffering reprisals both in professional and personal life. They should, however, overcome these prejudices and to recognize the importance of disclosure. The reasons for accountants should reassess whistleblowing are:

- Consumers, shareholders and communities are left at risk with neither the information nor the opportunity to protect their own interests;
- Unscrupulous managers or employees are given a reason to believe that 'anything goes';
- Those in charge are denied the chance to look into concerns about wrongdoing and to avert real problems;
- Debates and reforms tend to focus on ways to improve the system, rather than on the conduct of the humans who have to make it work. (Dehn and Calland 2004)

Shawver & Clements (2008) argue that the accountant's inclination is to make revelations related to illegal practices within the organization. The biggest obstacle in making this disclosure is the fear of being fired. If they were guaranteed that they will not be dismissed or that they will preserve their identity anonymous, the accountants would be willing to make disclosures. As a result, the organizations which really want to support them should take steps in this direction by which accountants might not suffer any reprisals. The measures may include codes of ethics within the company, creating a hotline or e-mail throughout there could be made any anonymous complaints.

As we all have seen until now, for every obstacle there is a solution and behind all the obstacles, there is a person. We are the people standing behind them; therefore the change must come from each of us. We need to know and understand this practice before giving a verdict. It is to our benefit.

MANAGING CHANGE: THE PRIVATE UNIVERSITY SECTOR IN CYPRUS, OPERATIONS WITHIN THE EUROPEAN CONTEXT. A CASE STUDY

SIMONA MIHAI YIANNAKI*

Abstract

Our case study attempts to show the manner by which change has been introduced and dealt within the Business School of a private Cypriot University, the European University Cyprus. Then it tries to demonstrate if the success of the change process has its roots in the history of the organization and its representative strategies as per the theoretical framework of the literature review. Out of the main study results it emerges that it is the trust placed on the organization by the management, the staff and the student body that can bring high standards of education to the change process along with the acceptance for process and embedded innovation. At the other end, there are still strong drawbacks that hider change management to its full positive results. These reside mostly the inequalities, the social contract issues and keeping promises.

Keywords: *Change Management, Business Administration, Higher Education, Case Study*

Introduction

Organizations worldwide are confronting with more turbulent, more demanding times and shareholders, less time to act and more astute "customers", hence many are restructuring their business to meet at least these challenges. The only question mark is on how much time and change dependent are such requirements and which is the sustainable effect foreseen on the education industry as a whole.

Sustainable growth in private business has always relayed on the restructuring of the business strategies utilized and on the recovery of the investment and consumption markets. As this latest crisis was an over-consumption- overspending- overleveraging related one, the way to tackle such sustainable growth requires focused socio-economic and financial skills, but in essence, the long term indirect engine is the continuous adaptation to change in all sectors of the economy and now more then ever, in the education system reformation.

In this perspective, the private Universities sector in Cyprus is now operating within a very competitive and highly regulated European environment. The existing private Universities have acted under a much simpler college type organizational structure and have had to face the inevitable changes brought about by a new economic environment. The fact that since 2004 Cyprus has become a member of the European Union has changed the general setup of the problem, since nowadays more then 53% of students study in the EU. (Cyrpus in the EU Scale, 2008.)

Within this general context, private Universities had to develop and adapt to the new demanding regulations that govern the operations of a university teaching and research type institution and continue to be self reliant and economically viable. At the same time, change was inevitable, while circumstances continue to produce new challenges.

In the our case study of the oldest private Universities in Cyprus, the European University Cyprus (EUC) the human resources seem to have beene re-developed, sound personnel policies adopted, proper manpower planning implemented and assessment and a conscious policy revised to improve work and management at all levels. These have been important factors that have contributed to its success story. However, the effects of change are still affecting everyone in their daily activities. Therefore proper change management skills are imperative, if all mismanaged it could

* Assistant, Ph. D., MBA, Programme Coordinator for Banking and Finance, Department of Accounting, Economics and Finance, European University Cyprus www.euc.ac.cy (e-mail: S.Mihai@euc.ac.cy).

have disastrous effects. Also, since change becomes pertaining, mangers in this industry need to strive to find new ways to understand it and act in an optimum way.

Our case study attempts to show the manner by which change has been introduced and dealt with and then to demonstrate that the success of the change process has its roots in the history of the organization and its manpower. It is the trust placed on the organization by the management, the staff and the student body that can bring high standards of education to the change process.

The paper is drawn under a case study and event study methodology combined with exploratory research since the moment of the accreditation of EUC in 2008 till 2011. We plan through this study to capture and integrate people's perceptions, behaviour, cognition or knowledge and creative ideas in the way they have faced change in their environment and then propose a pattern for dealing with concrete change management problems and actions to prevent potential activity disruptions.

Altogether, our study also tries to collect and present information related to the way EUC has dealt so far with current change management issues, especially value changes at its strategic level. Additionally, the study wants to raise the need to know how to handle appropriate ways of correct and wrong application of change management in the industry.

Last but not least, the study aims at redesigning a conceptual framework encompassing strategic and practical aspects emerged from the data analysis that can help managers of other European Private Universities deal in a better and sustainable way with such phenomena.

1. Literature review and the research theoretical framework- responding to the power of change

Be it a large or small organization of any particular industry, the first thing one must understand about dealing with change is that it is a continuous process rather then a status quo. Change implementation difficulty relates mostly its communicating vessels effect. Blaise Pascal proved in the seventeenth century that the pressure exerted on a molecule of a liquid is transmitted in full and with the same intensity in all directions. Meaning, if you change something in one area, it affects other areas triggering thus changes in those areas too. This is to say that change is a continuous process, mostly cyclical (Lawrence *et al.*, 2006), that needs adjustment at any of its phases and various types of leadership control, strategies and behaviour.

Also, no matter the organization, change may be applied at different levels, which have different power to force change themselves. These levels are considered in our research to include the most important 4P's:

1.The people at work, first, as they are the main trigger for change due to their changing nature, second due to their active role in implementing. Changing people offers the least amount of change leverage, due to its actual "impossible task" character to be achieved in a certain timeframe. Bureaucratic systems are designed to work in the way they do, not considering who does the job. One needs to change the culture of those people, but this is a long, slow process that seldom pulls change back through the system.

2.The *processes of work* determines how work is performed. Changing work processes is important, but it won't force change anywhere else-in fact, it is hard to change work processes without changing the organizational structure and administrative systems of an institution.

3.The *power of system* within which the organization functions, including the support system or the administrative one. If you change the education system, you can force change in every institution within it. Systems control their organizations through their administrative systems-budgeting, personnel, procurement, accounting, auditing and the like. Hence changing these administrative systems also creates remarkable leverage.

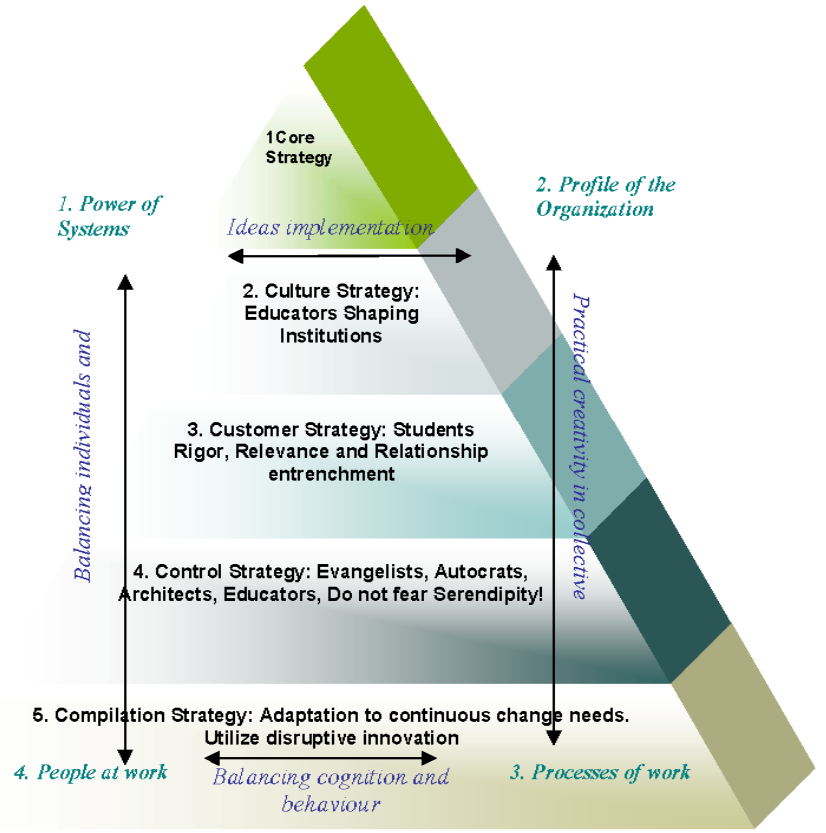
4.The *profile of the organization* level. Learning organizations have been described in reverential terms like employees' paradises, good management practices, socialistic models and workplace democracies etc These organizations provide working environments where the employees

and management together reflect on all decisions, resolve all differences, if any, through mutual dialogue, and open communication systems resulting in high levels of *trust*, *co-operation and commitmen*t on the part of the employees which enables generation of learning. (Akella, 2008). Universities are close to be this type of organization that is however still constrained by the system's rules and incentives, as well as its administrative systems. One can change much within an organization, mostly if one can put up some flexibility from the administrative systems. But, clearly one has little influence to force change in all Schools within the University, due to the diverse panoply of needs.

Either public or private education institutions, due to their publicly originated system in certain countries, have some basic building blocks of organizational structure. This structure must relocate itself from a bureaucratic to a more entrepreneurial model. Such a model would include five basic strategies that have power over change implementation. We have named them as the "five C's.":

1. The Core Strategy. Creating clarity of purpose for University reform.
2. The Culture Strategy. Changing employees' habits, modus operandi, hearts and minds.
3. The Customer Strategy. Making Universities accountable to their customers.
4. The Control Strategy. Pushing control down from the top and out from the center. Do not fear serendipity though.
5. The Compilation Strategy. Creating a set of actions for performance measurement and responsibilities.

Fig. 1. The Research Theoretical Framework (Source: Authors' research)



Our theoretical framework creates under a 5Cs format of strategies, a pyramidal non-vertical relationship concept that is supported by the interactions among the 4Ps presented above. In our framework, the bonder between the 5Cs and the 4Ps resides in:

- Ideas implementation, (when it comes to implementing the system's requirements into the profile of the organization)
- Practical creativity in collective behaviour is necessary both ways when designing the University profile to match the underlying processes of work, as well as restructuring these processes in order to redefine a new organizational image.
- Balancing cognition and behaviour at both individual and group level is know-how and skills related double way of accommodating people in the new processes of work, as well as tailoring such processes for the people's needs.
- Balancing individuals and systems (when trying to fit systems in for people and when accommodating people's need into the system).

To be strategic in restructuring such institutions one must get leverage as high in the system as possible and one must change as many of the fundamental construction blocks (the 5C's) as possible.

By creating a clear purpose and decentralizing power are major changes, for example-but without compilation for performance they are barely sufficient. If the five 5C's represent the central levers for restructuring, then how do they work?

1.1. The Core Strategy

The core strategy focuses on steering, not rowing-making policy and setting direction rather than producing services. It involves three basic approaches.

The first is removing what does not add to the purpose of the University-by abandoning it. This move offers to the decision makers the clarity of purpose they need to manage effectively.

A second approach is uncoupling steering from rowing and compliance from service functions. Separating these roles into distinct organizational units with separate missions can enhance the quality and effectiveness of both steering and rowing. The British and New Zealanders, which are relatively far from the Cypriot education system, have done this systematically, at both the national and local levels. It has helped these two countries achieve enormous improvements in the efficiency and effectiveness of their educational systems.

A third core approach is to clarify the aim by creating new steering mechanisms. This is a specific move in the American educational system. In Cyprus, steering functions tend to be concentrated in the hands of a few people rather than in elective bodies. But elected bodies like the Academic Senate, the Board of Directors, have great difficulty thinking and acting strategically.

There are, however, ways to get around this. When adopting long-term outcome goals of the University, then these are translated into medium- and short-term outcome goals, which then translates into output targets for other Schools and departments. EUC has created a highly visible body representative of stakeholder groups in the community, under the new EUC brand name. It has set long-term goals, which may act as benchmarks, and it measures progress and reports to the all stakeholders including to the community.

While all educators must play key roles in changing mentalities, the burden is even greater for those in leadership positions. Leaders must respond to change appropriately and show others the way. They must take University staff on challenging journeys that the staff often would not take on their own by creating room for creativity and innovation and releasing any other constraints in their activities.

By nature, researching and teaching is a creative work and a liberal individualistic one. Those who try imposing systems in this industry will not perform well at all. Besides, people like to feel

comfortable and do not want to disturb authorities for the sake of being themselves protected. In such case, no development is possible.

1.2. The Culture Strategy

This strategy is the weakest of the five C's in terms of implementation and transparency. However, it is a key component of the pyramid that must be fine tuned when implementing change. The other C's will coerce changes in the culture-but they will not always create exactly the culture reformers want. At some point in the change process, all successful implementers discover that they must deliberately work to change their employees' habits, modus operandi, hearts, and minds.

One approach that creates the most leverage is to change what people do. If one creates new experiences and new behaviour, new thinking will come in. Available tools include interactive strategic planning, job and role rotation, internships and externships, cross-walking and cross-talking (e.g., interdepartmental or inter-schools task forces), and contests.

Dealing with people's emotions has leverage because emotions are far more powerful than ideas. You can do this by celebrating successes in outcomes, processes and initiatives and honoring failures; creating new symbols; setting up new rituals; team building; and investing in your employees and their physical and virtual work space.

The final approach to working the culture lever is what we call “charming minds”.

Some leaders develop new mental models by involving their staff in the creation of mission statements, in the vision processes, and in articulating their beliefs, values, and assumptions. Others use systems models to create familiar understanding of the way things work and how changes will be successful.

Frequent barriers with these strategic levers are related to:

- elected authorities/managers who play politics when leadership is needed;
- resources that are stuck in narrow line items;
- staff rules that eliminate the flexibility employees need to produce changes;
- unions that see their role not as asserting employee's welfare and principles, but as maximizing their connections;
- the intricate array of stakeholders in the existing system.

For sure, there are ways around these various barriers to better serve stakeholders’ needs, but they are not easy, they need to be "worked-out."

1.3. The Customer Strategy

The first best way to change private higher education institutions is to make it accountable to its customers. In terms of customers we have considered students, academic and administrative staff.

When we talk about “customer needs” and stakeholders in education, we come across a lack of consensus for the student as customer concept (see Eagle and Brennan, 2007 vs. Svensson and Wook, 2007). Trying to advance our theoretical framework, we utilize concepts from relational theories, acknowledging that higher education is largely a private good and this essentially “makes the student the customer in the higher education process” (Eagle and Brennan, 2007, p.48).

Related to the internal customers, the academic staff, several countries in the EU including Sweden, Australia and the UK have gone as far as considering compulsory teacher training for lecturers. Some countries, (eg Norway), are currently implementing such a policy. We are not suggesting a similar policy but the acknowledgement that, if you ‘train higher education teachers to teach, they will do a better job than untrained ones’ (Trowler and Bamber, 2005: 80). Also if you train key leaders in change management and use teaching staff from the field from various organizations that used to be exposed to high pace of change, it proves more effective and less time consuming rather then doing it otherwise.

In most public or highly stratified organizations, accountability flows up the chain of command. The most prevailing way to achieve goals that are important to the customer is by creating customer choice. If customers can choose the service providers they prefer-the flow of money follows their choices-then the institution that serves them must be accountable for satisfying their needs.

The second approach is quality assurance. One can set "customer" service standards and require Universities to meet them or offer their customers some form of redress.

However, in order to use the customer strategy, one has to listen to the both internal and external customers, using surveys, focus groups, interviews, rating systems, complaint tracking systems, etc. Although necessary, this is not sufficient to enforce change. The University management may find out what the customer wants, but it may not be willing to go through the pain of the changes required to carry it through for the sake of "push" rather than "pull" and avoiding serendipity (Hagel *et al*., 2010).

In terms of the change application for Universities at their most "visible customer" level (i.e. the student) the Rigor/Relevance Framework further presented in Fig. 2.below (Jones, 2008) may prove an interesting view point knowledge-related. It uses four quadrants that represent levels of learning.

On the Knowledge axis, the framework defines low rigor as Quadrants A and B and high rigor as Quadrants C and D. On the Knowledge axis, Quadrant A represents a basic understanding of knowledge per se. Quadrant A is named "Acquisition" because students gather and store parts of knowledge and information.

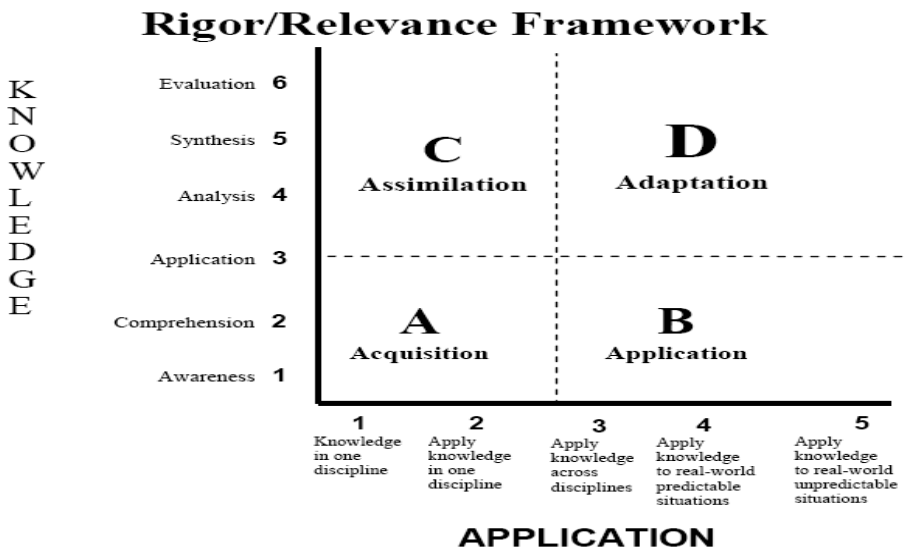
Quadrant C, "Assimilation," represents more difficult thinking, yet still knowledge for its own sake. In Quadrant C, students extend and refine their acquired knowledge to be able to use it automatically and routinely to analyze and solve problems and to create unique solutions.

Quadrants B and D represent actions or high degrees of application. In Quadrant B, "Application," students use asked to solve problems, find solutions, and finalize work.

In Quadrant D, "Adaptation," students have the competence to think in complex ways as they apply knowledge and skills they have acquired to new and unpredictable situations. Students create solutions and take actions that further develop their skills and knowledge.

Knowing that students need a rigorous and relevant curriculum taught in a climate of positive relationships is an important step in school reform (Jones, 2008, pp 7), while the same way of thinking can be applied to other "customers "of the University.

Fig. 2. Rigor/ Relevance framework Source (Jones, 2008, pp 5)



However, Jones (2008) matrix misses a control unit and measure and constant rethinking of the necessary double loops and feedback types necessary in learning and managing the process of learning and change, issues that we further discuss.

1.4. The Control Strategy

The control strategy pushes considerable decision-making power down through the hierarchy and at times out to the community. It transfers the form of control from detailed rules and hierarchical instructions to shared missions and systems that generate accountability for performance. But what is performance for Universities: knowledge towards students, developing life-long learning skills, creating employability, generating academic knowledge, developing a great name worldwide, increasing shareholder's value no matter what?

We have suggested three approaches in tackling this strategy:

- Organizational empowerment moves control down to organizations by loosening the grip of the central administrative structures, such as budget, personnel and procurement systems that are run under equalitarian terms.
- Organizations then use employee empowerment to push decision-making authority down to those with front-line knowledge. Finally, some re-inventers use a third approach, called community empowerment.
- They shift control from the University towards the community, empowering community members and other organizations to solve their own problems and take responsibility of their actions.

In terms of control tools, Private University managers and academia are open relatively reluctant in using the Internet, in the sense of not letting it change exclusive knowledge management practices.

Implementation of Internet had been adjusted to acceptance of intranet and fostering communication among personnel for academic, managerial and supporting roles. It wants to exploit the advantages of online communication without letting such communication challenge its expertise model. But one cannot have it both ways. One cannot participate in a medium fundamentally developed around the concept of ingenuousness if one insists on a closed model of know-how and knowledge control, such as the above mentioned frame: the intranet.

In terms of managerial control over the teachers Unions and vice versa, one cannot act towards major changes unless it offers that "little something" gradually. Teachers' Union negotiations with the management should not be "over the bush", but transparent and with advancements based on concrete propositions and adjusted upon European benchmarks and accomplishments. In this respect, control pressure from the Union should be made from a third party/ consultant involved both in the negotiations process as well in drafting terms and conditions. The Union is always a tool for auditing and maintaining University regulations and system of work down to people.

1.5. The Compilation Strategy

Creating a compilation of strategies and using consequences for performance is probably the most powerful lever in the reformation tool kit.

There are three approaches to working this lever:

- When appropriate, the greatest impact of this strategy can be achieved by using enterprise management: putting the University in a competitive market, making it dependent on its "customers" for its revenue, and letting it sink or swim based on how well it serves its customers. There is nothing like competition to force rapid change. This approach is only appropriate for services that should be paid for directly by their customers, but not for the academic and research work, where competition should come in terms of services and stimuli offered to "internal customers".
- A second approach is called controlled competition. If you cannot put the University in a market you can often create competition through competitive contracting, by using "market testing" approach. As a paradox though, when a British University introduced a certain innovative programme, another American University won the funds in their own country on the same idea. The same thing can happen internally in Cyprus, when private universities compete in coping each others programmes instead of being innovative, searching for blended learning techniques, become innovative and focused on developing student's creativity (MihaiYiannaki and Savvides, 2010) and diversity both in curricula development and in course delivery. Eventually, utilize disruptive innovation, a term of art coined by Clayton Christensen (2010), that can be introduced as a process whereby simple application of creativity related programs and change management for the bottom of a market can then relentlessly moves 'up market', eventually displacing established competitors.
- The third approach is performance management. If you cannot use competition, you can measure results and create incentives or rewards for those who accomplish them. You can use tools such as performance awards, performance pay, performance-based budgets, and gain-sharing to create incentives for high performance at both students and staff members' levels.

2. Research methodology

The qualitative approach has been chosen by the research team as it provides an inventory of in-depth data with higher information content that cannot always be anticipated at the outset of the research process.

The significance, in particular, of qualitative methodology is also in the fact that it enables a contextual and social placement of gathered information, includes the process, causal and related nature of phenomena, and does not study and acquire, respectively, the data separately from other accompanying phenomena. Similarly, it allows for the acquisition of the so called "concealed" contents, which can easily escape the classical positivistic approach. Finally quantitative research often restricts experiences that are so crucial to 'attitudes/opinions' which is the focus of this research.

As the moderator can challenge and probe for the most truthful responses, supporters claim, qualitative research can yield a more in-depth analysis than that produced by formal quantitative methods.' (Mariampolski, 1984).

These interviews contain standardized instruments that emerge from the literature review and the research theoretical framework grouped primarily on the categories of 5C;s and 4Ps.

Also the purpose of the interviews was to discuss the importance of enhancing change adaptation, change behaviour, response to change and acceptance of change within the University/ Business School. Upon the obtained results, the paper has identified the main barriers and constraints related to change introduction in the Business School as well as has improved the research framework.

The main data collection instrument, the semi-structured interview was initiated with 4 of the members of the University and Business School authorities, managers and chair persons. Analysis has been conducted in the spirit of the Miles and Huberman's (1994) approach, manually and mechanically. The manual part has included traditional analytical methods such as introducing marginal remarks and memos within the transcripts and then producing a one-page summary with key points for each semi structured-interview. At this stage, analysis was conducted in search of relationships and patterns.

Coding, for both instruments, was a combination of pre-coding and open coding. The pre-assigned codes were derived from the literature and the study's objectives. Open coding was carried out during analysis, both at the manual and mechanical level.

Following the culmination of the above procedures, the research team was able to describe the current situation and isolate the knowledge, training, coaching and attitude deficiencies which needed to be addressed and included within change management recommendations part. However the results of the project provide an excellent opportunity for the future expansion of the topic idea at European and International level.

2.1. Research Results Interpretation

Table 1. The Pathologies of Changes and EUC management response:

Organisational Imbalance	Change Pathology	Management responses
Over-reliance on individuals: • too many evangelistic and autocrats • few architects and educators	Creativity without learning	-No creative culture implemented, nor efforts in this way undergone till the settlement of change.
Over-reliance on systems: • too many architects and educators • few evangelistic and autocrats	Institutionalisation without creativity	-Overreliance on MIS, without understanding its role in the general strategy, fear of regulators, but positive feedback from them.
Over-reliance on thinking: • too many evangelistic and educators • few autocrats and architects	Ideas without implementation	-No initiative follow up, despite medium to high level of novelty acceptance, advertising is seen in a heterogeneous way.
Over-reliance on doing: • too many architects and autocrats • few evangelists and educators	Change without strategy	-Strong focus on customer strategy without innovation, but based on diversification, which may lead to control, quality and time management issues.

Source: (Lawrence *et al*., 2006, pp.65, and research results)

Table 2. The Research Framework synthetic results

Strategy Analysis	Research Results
1. The Core Strategy. Creating clarity of purpose for University reform.	Clarity recognized at managerial level in both form and content, but the strategy of change is very diversely seen.
1. The Culture Strategy. Changing employees' habits, modus operandi, hearts and minds.	Culture is not identifiable yet at managerial level. Initial stage of shaping organizational culture due to lack of specialized continuous training and human resources allocation. All is based on trust and on existing people's capabilities.
2. The Customer Strategy. Making Universities accountable to their customers.	Very diverse opinions on customer strategy, approach and education, as well as regarding supporting issues and processes.
3. The Control Strategy. Pushing control down from the top and out from the center. Do not fear serendipity though.	Very tall organization, with limited power of action at bottom level, lacking serendipity support and liberty of action regarding investments in people, systems and processes.
4. The Compilation Strategy. Creating a set of actions for performance measurement and responsibilities.	Balanced compilation strategy, yet with missing parts affecting the overall change results, especially linked to management of resource allocation and lack of HRM transparent policies.

Source: Respondent's results based on author's semi structured interview as in Appendix 2.

3. Emerging recommendations for how to change in business schools

The following eight components have been identify the more specific actions that schools must take to achieve rigor, relevance, and relationships. These eight are not sequential, but all must be addressed if schools are to prepare students adequately for their future. The aspects of the living system model should be reflected through each of these components.

1. Be guided by a Common Vision and Goals through the Rigor, Relevance, and Relationships framework. Everyone must be committed to shared goals to measure success, and personnel must have the same viewpoint as to what it the main goal of the University.

2. Be ready to avoid the pathologies of change in the University, by knowing well its imbalance, where is the vision and mission and the next following steps.

3. Give power to Leadership Teams to Take Action and Innovate. Leadership does not reside in a single position, but reflects the aptitudes and attitudes of all personnel, as role models, who take action and improve through effective learning communities.

4. Notify decisions through MIS and budgetary liberty. The entire University reform is a continuous process guided by a well-developed data structure based on several measures of student learning. There is a need for quality data to make fast decisions about curriculum, instruction materials and methods as well as assessment. But , there is a need for separation of budgetary issues for better providing incentives to staff development, trust, commitment and bonding.

5. Adopt effective Instructional Practices for lifelong learning. More than excellent marks, successful instructional practices include having a broad range of strategies and tools to meet the needs of diverse learners in all disciplines and grade levels.

6. Make Clear Student Learning Expectations, letting though in innovation and creativity. When clarity takes place in explaining students what they are expected to learn, they meet with success in improving student realization, but also if creative incentives and modus operandi are enforced.

7. Address Managerial Structures and Processes. Managerial structure should be determined by instructional needs. Only after a comprehensive review of instructional practices should schools begin to address managerial issues such as school schedules, use of time, unique learning opportunities, school calendars etc.

8. Monitor Progress/Improve Support Systems. Highly successful programs recognize the need to monitor student progress on a regular basis. Successful higher education institutions use formative assessments in an organized, deliberate, and ongoing way to monitor student advancement. More, they use this data immediately to adjust instructional methods and adapt to meet student needs.

9. Redefine and reinvent process on an ongoing basis and assure quality without copying models, but basing them on ethical standards and organizational culture. High-performing schools realize that success is a continuing and ever-changing course of action. This step in the process, in fact, should refresh the process and cause University/ Business School leaders to consider new challenges and search potential solutions and successful practices internationally, find benchmarks and assure quality.

3.1. Deliverables from managing change in our research and case study

The following three form the core still pending deliverables of our managing change framework at Universities/ Business School level:

(1). Aim for rigor, relevance, and relationships, inspiring trust,

(2) Begin with the end in mind, and look at the open non-vertical pyramidal cluster of strategies, allowing open innovation and creativity in process, content and form.

(3) Consider Universities an organism that links the above strategies with the 4Ps through its 4 bonders.

Conclusions

This research has produced a theoretical framework backed by a case study where change management was interpreted in terms of semi-structured interviews and event methodology results for the European University Cyprus for the period of 2008-2011. We can conclude that this framework proves to be valid in the conditions and that a series of 10 principles result as conclusions to our research study.

These principles give improved detail to the practices that one needs to focus on when implementing certain changes at in higher education institutions:

1. Decide with data, not intuitions. True data-driven achievement involves much more than simply reacting to “low-test” scores. The choice of what and how much to change must be based on data that shows what the world beyond the Business School expects graduates to know and be able to do, but also what is ethical to know and do.

2. Enlist passionate people who glimpse opportunities. Leadership is one of the keys to success. That leadership is started and designed by a main leader, but is not restricted to a single individual. Successful Universities thrive with models of team and shared leadership.

3. Develop staff through professional and personal learning, training in managing change, and conflict. A staff team that functions as a professional learning community comes together for learning within a supportive community. At the same time conflict, which in times of change is inherent, should not be a threat to cooperation, nor needed to be resolved rapidly and permanently (Huczynski and Buchanan, 2001), but rather in a correct and just manner.

4. Inspire innovative instruction and engagement. Just as standards and tests do not constitute a curriculum, high-performing Business Schools recognize that curriculum is not instruction. The idea is to play the game on the uniqueness of each student and become a student centered organization. Prioritize the curriculum, as less is more. Teachers need to engage in a clear way to help differentiate among curriculum topics that are essential for all students and those that are only nice to know.

5. Make good use with the community to form true partnerships based on keeping the promise and thus enhancing trust. Community and business partners bring many benefits to a University and especially to Business Schools in terms of learning, teaching, sharing, financial support and not least employability.

6. Hold teams accountable for learning results. Good leaders not only set powerful visions and high expectations, but also follow up to make sure staff implement approved practices.

7. Know your "customers", know your strengths. Business Schools need to find ways to customize instruction by fully understanding the culture, prior experiences, learning styles, backgrounds, and interests of its all "customers". At the same time they have to offer various success paths without distorting the most performing ones who are already implemented and have proven unbeaten. Rather than holding instructional approaches constant and putting up with different results in student accomplishment, multiple pathways create different alternatives for students to acquire the same learning.

8. Measure learning by know-how. Many Business Schools need to reexamine grading policies both at the school and classroom levels to ensure that student achievement measurement results in students being graded on proficiency rather than seat time.

9. Compel to high expectations. Business Schools that establish high expectations for all students and provide the support necessary to achieve these expectations have high rates of academic success. High expectations have to be a way of life and drive daily behaviors and actions.

10. Foster positive relationships to close the loop rigor/ relevance/ relationship. Strong relationships based on trust and commitments are decisive in students carrying out thorough work. Students are more likely to make a personal vow to engage in rigorous learning when they know teachers, parents, and other students actually care about how well they do.

APPENDIX 1. RESEARCH SEMI STRUCTURED INTERVIEW BASE

The Interview questions are valid for the period 2008 to 2010.

The questions "how much" have been scaled from 1 to 5. (Where: 1. is very little, 2. little, 3. some, 4. significant and 5. very much.)

1. What is your opinion about change at University level in general?
2. How much has the education environment changed for the past two years?
3. Which are the areas of change needed in the University? (Name at least 3 areas).
4. Where do you see your University coping best with change?
5. What are the most difficult tasks in this respect?
6. What are the three things you would change first now?
7. Have you benefit of training in change management?
8. How can the University improve service to its stakeholders?

A. Students; B. academic staff; C. administrative staff; D. the community

9. How much does money help you in managing change?
10. What financial aids you consider in implementing change?
11. Would a specific strategy that is known to everyone help you in implementing changes? Which is this one?
12. How much uncertainty you think is acceptable when implementing change, if any from a scale of 1 to 5?
13. How much planning do you use when implementing change in general and how much you use for this case?
14. Do you involve your team in implementing change?

a. Yes, why? To what level/ which areas? And how many of all your team members? Do you allocate extra members for this?

b. No, why?

15. How much of change do you consider in your core strategy?
16. How much change you allow in controlling the business?
17. How much have you changed in your department/ area?
18. How much budgeting do you do when implementing change?
19. What are three budget items you consider necessary but had not really thought about prior to this year's change and where would you cut this budget for this year?
20. How much you want to change the believes of your personnel? If so how much you think you have changed their believes?
21. How much you want to change the believes of your students? If so how much you think you have changed their believes?
22. How much creativity from your staff do you allow when implementing change?

23. Do you consider change at advertising level and publicity of your University and by which means?

24. Do you consider change in the pricing, what prices would you use for students fees (promotional, skimming, etc)?

25. Do you consider change in the type of customer niche and which would be this one?

26. Do you consider change in the offerings of products? And to what degree of diversification?

27. Do you consider change in the relationship with your partners (business ones) and other organization? How do you think this would this affect your future business?(How do you keep them happy?

28. How much importance you give for free interchange of ideas?

29. How much leadership you think is required in times of change for your University?

30. How much novelty do you think is acceptable for your University?

31. Do you think is good to follow the market or follow your own strategy?

32. Have you reconsidered changing the goals set up two years ago?

33. What are you most important performance indicator for your Institution?

34. The human resources have had to be re-developed, sound personnel policies adopted, proper manpower planning implemented and assessment and a conscious policy adopted to improve management at all levels. How did you achieve this in your area?

35. Regarding research / (your department) area what was the biggest change you (want to be) implemented?

36. Are you satisfied with the achieved change strategies implemented at your University?

APPENDIX 2. RESEARCH SEMI STRUCTURED INTERVIEW RESPONSES

Question	No. 1	No. 2	No. 3	No. 4
1	change is inevitable, represents a continuos process, we have to learn from it, available to all academics and the society	very important, especially in the light of changes in the EU in higher education of the Bologna process framework.	under the factor of change as a positive promotor regarding the transformation from college to university status ther was a need for rapid change.	it is a fulfillment of the strategy of the Ministry of Education of Cyprus, one of the axis of the strategy of Cyprus for education and health for the next 5 years
2	very significant in the private university area, less in public ones, in order to comform to legislation, internal procedures	in the private higher education yes a lot, nut much in education in general	It has changed subsequently for more than 2 years. It has been expressed in process and procedures to be a university relevant and pertinent to the University status.	The university environment has changed a lot. Level 4 to accommodate students at each stage of the strategy.
3	teaching, research, administration, strategic development, change of burocratic procedures	quality assurance, development and implementaion of international qualitfications frameworks with 3 cycles, lifelong learning	overal university culture, autonomy, the research factor	culture of the people and instructors, systems and procedures, infrastrucutre (MIS)
4	teaching, because research is at its early stage and so is administration	quality assurance and ECTS	in research and cooperation with other universities or established academic networks	procedures we start coping with problems at MIS, infrastructure
5	assessment, find out new changes in the teaching methods, quality is very difficult to assess, aws you assess only students' evaluationa, faculty assessment is dificult and is done subjectively by students, peer review being done only during the first year and not later on.	got everyone involved	the adaptaion of university culture in both administration and academic personnel	culture is very difficult to change due to resistence to change and systems
6	Schedule, too many things to do at the same time for the requirements of others, the system that we have, reducing the teaching load, changing mentalities, which is a long term process	more development of quality assurance, lifelong-learning, social inclusion, social responsibility in the community, capturing older graduate in catching up with their studying	comply with the University Charter, as the operations of schools and departmetns, mentalities	It is very difficult to change things, try to change the attitude of instructors to see themselves as faculty members for 24 hours in this job, to do continuous research oriented institution and in teaching in class
7	Only during my studies it was part of my subjects	Continuously, due to the evolvement in various areas in the Higher Education.	yes, when this trainig is not instrumental oriented services	very difficult to convince and get accepted
8	a). reorganising the advising service, hire professional people just for that,b). by not overloading them, c). should reorganise their MIS, d). increasing contacts with them	a.further enhancement of students Centre approach, b. more opportunities for development, c. more opportunities for development, d. give also programmes that serve university employees, private and public, municipalities.	a. by establishing a constant and perpetual feedback process and procedures. B. establish proven respect of academic outcomes, c. by providing regularly training and management and university oriented culture issues, d. Be again in constant and perpetual communication with community, an open locus for disscussion and activities, collaborative type of activities and synergies in new projects that are of paramount importance for the community	a. see students as clients, adapt all services to be student oriented, to care, continuous monitoring and academic feedback of students, b. developing academic staff, give them opportunities to undertake research and more time for doing that.c. trining and developing career paths, proper proceudres, d. create research centres to solve problems of communities, respond to community needs through expertise and faculty members
9	4	4	5	2
10	they are rare for private universities, just funds from private enterprises	grants from outside society, state budget, in research ang infrastructure	by allocating special budget for managing change oriented culture	money in terms of training and required research, not so important, but needed in bringing MIS, infrastructure supports
11	Change has to be small and continuous, because it can upset people, it should be planed and agreed, no change without asking them and complete buy in.	the SMART objectives we developes every year	interactive communication based on reciprocity	should be comunicated to everybody. But people have resistence to change and it is set by law anyway and the University Charter

22	3	4	5	5
23	essentially it has to increase, improve, consider more possibilities, mainly media and organisation events, conferences organised by the university and abroad.	toward academic nature	yes, this is done through needs and oriented culture advertising	I do not believe in advertising here, only in word of mouth and given results of students and to community
24	In new courses, promotional price for new courses makes sense	they are ok	no idea.	no, just promotional pricing for new programmes.
25	It is not feasable, the target market is given	give them more attention to some countires that were not before in	no idea.	yes, professional experience, executives
26	3/ new programs, adult learning seminars and professional studies	it is Ok. It is not fully controlled. Thre are significant changes in the programmes made.	accommodate balance	yes, high diversification
27	relationships are evolving, intensify networking, studying their needs, satisfy their needs for graduate training and senior staff trainig.	satisfy their needs as well	I consider the community perceptions towards out university is higher, and we got to serve it, this affects positively and forms of our synergism.	they are the final customers eventually, respond to their needs and to the community's needs
28	5	4	5	5
29	5	4	5	5
30	4	3	4	3
31	follow ther strategies that follows market strategy	follow the market	what is to follow the market. No. we serve community needs not the market	follow the market is the boss
32	yes	no, but further enhance them	yes, definitely in order to adjust processes and regulations	yes
33	students retention, no of new students	service to the students in their activity and the overal image of the University	service to the community, students ans state of art research	number of students, research of faculty members
34	to praise the employees achievements, no material items though	involvement of the people and encouraging initiatives	not applicable	2, did not achieve , just a little
35	1. encourage colleagues to carry out research and meeting . 2. provide the time to do that.	get more faculty members involved in the research and teaching. Attracting more grants and financial support for the university	A new research policy that will affect the whole operation of the university and codification of all research performances.	involve faculty members more
36	moderately, not fully, it has to be recognised the need for investment, yet the university is not yet ready to invest in research, teaching and MIS	yes, so far so good. Significant level 4.	to an extended part yes	not really, level 2

IMPACT OF THE FINANCIAL CRISIS UPON EASTERN EUROPE COUNTRIES: STILL A PROBLEM FOR THE ECONOMY OF THE REGION?

MIHAELA-ANDREEA STROE*

Abstract
The paper looks at the impact of the global economic and financial crisis on a number of central, eastern and south-eastern European countries. The global crisis can be viewed as three interdependent and mutually reinforcing crises: a financial crisis, a liquidity crisis, and a crisis in the real economy. The financial crises that have emerged and developed in the recent decades have been characterized, mostly of an international dimension, with shocks quickly propagating through capital markets, through the international banking activities and, through the money markets.East Europe was hit first by the global liquidity crisis, then by declines in capital inflows and plunging demand for their exports.Before the crisis, the Eastern region was experiencing an economic boom with rapid GDP and credit growth, but in the future East European countries will have to rely relatively more on internally-generated sources of productivity growth.

Keywords: *financial crisis; capital flows; Central and Eastern Europe; crisis; EU; EE; recession, causes, policies, remedial measures.*

Introduction

The crisis has not stopped to the U.S. economy, but also propagated to Europe as well, the first country affected by events in the U.S. being the UK, with problems of Northern Rock, which caused a panic among bank depositors. In an overview, we can say that the current crisis has initially propagated only to developed countries, particularly through the acquisition by European banks of derivative products backed by subprime mortgages, as well as through the increasing market for securities backed by assets. Initially emerging countries have avoided a crisis, maybe due precautions taken following the Asian crisis. But, when the crisis began to affect the real sector, emerging countries have also started to be affected through the trade links with developed economies. Also, through the presence of international financial institutions in these countries, the problems suffered by it in the parent country have passed on to the activities in emerging countries.The EU wants the establishment of a centralized financial supervision; while officials from several countries require the application of more effective and accurate risk management practices. Implementing a more robust set of regulations regarding capital adequacy, strengthening liquidity management practices, improving the standards of risk classification and protection against them and, last but not least, creating a new global financial system, now represent, beyond any doubt, unquestioned needs.[1]

The impact of the crisis in Eastern Europe

Until fall 2008, the Eastern European countries had enjoyed a wonderful decade, with an average growth rate for the whole region of 7–8 percent a year thanks to three factors. First, in the 1990's these countries had undergone a successful transition to market economies, with deregulation,

[1] DubravkoMihaljek, "The spread of the financial crisis to central and eastern Europe: evidence from the BIS data", 2009

privatization, and financial stabilization. Second, they benefited from vast underutilized real and human capital. Third, their exports drove growth through international integration and a global boom.

Eastern Europe was making one classical policy mistake. Many countries had fixed exchange rates, notably Estonia, Latvia, Lithuania, Belarus, Russia, Ukraine, and Bulgaria. The illusory safety of the pegged exchange rate attracted large inflows of short-term lending from European banks. The currency inflows boosted the money supply, and inflation surged with money supply growth from 2006. The inflation was worst in Ukraine.

The temptation for international banks was irresistible. They could lend to consumers in Ukraine for 50 percent per annum with minimal financing costs. But this was a dangerous speculative scheme. The foreign exchange inflows accelerated imports and boosted balance of payments deficits. High inflation priced countries with fixed exchange rates out of the market.

The unprecedented global boom had left the IMF dormant, but it quickly woke up and agreed on new stand-by agreements for Ukraine, Hungary, and Latvia. Other countries with new IMF agreements are Georgia, Belarus, Serbia, and Romania.

The Eastern European financial crisis of 2008–09 resembles the East Asian crisis of 1997–98. The fundamental problem then and now was excessive inflows of short-term bank credits, enticed by pegged exchange rates, leading to large private foreign debt. Public finances, by contrast, were mostly in excellent shape with the exceptions of Hungary and Romania, which had significant budget deficits, but only Hungary had a worrisome public debt.

The domestic vulnerabilities were aggravated by the worst financial panic of our lifetime. Capital fled to the perceived safe havens: gold, the dollar, the euro, the yen, and the Swiss Franc. Even the British pound and the Swedish krona plummeted. A financial panic is a market failure that needs to be cured by the state, and internationally the IMF is supposed to provide countervailing financial flows.

The IMF acted fast and well. In the East Asian crisis, the IMF was perceived as excessively intrusive, adding many demands for structural reforms to its traditional agenda. This time, the IMF returned to the more elementary Washington Consensus cure of the early 1990s. Essentially, the IMF posed three demands: a budget close to balance, a realistic exchange rate policy, and bank restructuring with recapitalization. In return for the fulfillment of these conditions, the IMF offered far larger loans than previously.Exchange rate policy has become the bone of contention in the new stabilization programs. If a country devalues, its banks could be squeezed on all sides. The local cost of the loans the banks had taken abroad would sharply rise, and many would default. Their domestic customers that had taken loans in foreign currency would also be unable to repay them with revenues in the devalued currency.[2]

Hungary and Romania had floating exchange rates, which plunged along with the floating rates of other currencies not facing a crisis, such as Poland and the Czech Republic. The IMF forced Ukraine to float and Belarus to devalue, but the Baltic states offered a stumbling block. They have long tied their currencies to the euro, in hopes of adopting the euro as early as 2006 hopes that were frustrated by the rising inflation rates that took hold during 2007–08. As Latvia still aspires to join the euro in 2012, it opposes any devaluation.

The European Union's decision earlier not to provide a massive, 180 billion euro bailout to Eastern European banks made headlines around the world. But that doesn't mean the richer nations of the Eurozone have abandoned their poorer neighbors to the east. Instead of handing over billions to bankers who made terribly poor decisions, as the U.S. Treasury has done in America, each bailout will be considered on a case-by-case basis, and each will be subject to strict "conditionalities" similar to those imposed in any IMF agreement. Next, the graphics that I will present will show us the growth of GVA by sector at the European level in order to show us the importance of financial

[2] See Peter Haiss, Andreas Paulhart and Wolfgang Rainer, “Do foreign banks drive foreign currency lending in Central and Eastern Europe?”, 2009

fluctuation in the European economy, moreover we will also be able to see the impact of the crisis on GDP growth and GDP per capital on each country that has our interest in the analyses that has been proposed.

Nevertheless, during recession in 2008/2009 the contribution of households to value added growth fell, and in fact turned negative from the final quarter of 2008. While positive growth rates were recorded each and every quarter until the middle of 2008, the negative growth rates in the final quarter of 2008 and the first quarter of 2009 were greater in magnitude than any of the growth rates recorded in earlier years, underlying the severity of the recession. In fact these were the first negative rates of change since the series began in 1995 and it is widely acknowledged that this is the worst global recession since the 1930's.[3]

More detailed insights on trends affecting different types of economic agents during the recession can be gained from the sector accounts. Figures indicate the contribution of the institutional sectors to changes in value added, capital formation, and lending/borrowing. Non-financial corporations generally deliver the largest contribution to value added (and GDP) growth, but their contribution is quite volatile. The contribution of households normally fluctuates less, partly because of the stabilishing influence of the imputed rent on owner occupied dwellings.

REGIONAL INDICATORS

South Eastern Europe Indicators	2008	2009	2010f	2011f
GDP, US$bn [1,3]	990	855	983	1,122
Real GDP growth, % [2,3]	1.7	-4.6	5.0	4.3
Inflation, eop, % [2,3]	9.9	5.3	7.9	7.4
Exports, US$bn [1,3]	231.5	177.1	183.2	198.6
Imports, US$bn [1,3]	343.3	237.6	260.2	288.1
Trade balance, US$bn [1,3]	-111.8	-60.6	-77.0	-89.4
Current account, US$bn [1,3]	-77.5	-26.5	-42.8	-54.3
Current account, % of regional GDP [1,3]	-7.8	-3.1	-4.4	-4.8

Source: http://www.emergingeuropemonitor.com

This regional indicators show us on a horizont of time how the inflation,exports, imports or trade balance influenced the south-eastern Europe, this is to say that between 2008-2011 this economic indicators show us the fact that a slight amelioration can be seen at the average of this perioud but compared to other western countries, shown also by the table of content 16, the south eastern region of europe couped more difficult with the crisis, its negative effect can be evalued also during 2010 and 2011 when the real GDP growth is seemingly come to arises.With baby steps the eastern economy begins to recover.This does not mean Europe is now being divided between east and west along old lines. On the contrary, countries like the Czech Republic, Slovenia and Slovakia, which have pursued sane and sober economic policies, are just as opposed as Germany to bailing out the likes of profligate Hungary, Latvia, Romania and the Baltic states. Key EU leaders were simply not prepared to provide a blanket handout to those EU countries that got themselves into deep trouble through the siren call of excessive credit. As a result, 50% of household debt is now in foreign currency in Hungary; 30%-40% in Poland and Romania; and over 70% in the Baltic states.There's little doubt that Eastern Europe's credit crunch will ricochet back into Western Europe. Most Eastern Europe banking systems are dominated by Western European banks. Austria is most vulnerable,

[3] http://epp.eurostat.ec.europa.eu/portal/page/portal/product_details/publication?p_product_code=KS-CD-10-220

since the Eastern European exposure of its banks is about 80% of the country's GDP. Losses for Austrian banks could run as high as 10% of GDP, or over 25% of Austrian bank capital.[4]

On the other side of the imbalances were European banks from Swedbankin the Baltics to Erste Bank, Raiffeisen, Unicredit and KBC in the rest of Europe economies. Interestingly, for EE economies such high level of internationalization meant both that prior to the crisis the building up of the fragility in the system was very fast and, on the other hand, with the crisis actually happening, the high share of foreign ownership in EE banking sector played a stabilizing factor via stemming the reversal of cross-border financial flows. In fact, the latter aspect seems to have saved most EE economies, notably the Baltic countries, from outright default and run to the banks and currencies. However, it can be argued that both the increase in domestic foreign currency borrowing and development of the banking sector in 2000's represented in essence a massive carry trade with EE households and companies receiving both interest rate and currency risks in form of long term debt.

This mix created economic environment that is automatically both very procyclical and somewhat allergic to governments meddling with the markets at the same time. Accordingly, the response to the crisis has been relatively slow in Eastern Europe economies. Yet, as the built-up and cumulative imbalances cannot simply vanish, they are being transformed into other forms of risks and imbalances: either increasing public debt or unemployment, or both. EE economies with floating exchange rates regimes have experienced devaluation of their currencies, the Baltic economies on the other hand are crippled by rapid drops in real wages (more than -5% in 2009).Without the money transfers of International Monetary Found almost all EE countries would face public deficits (or much worse unemployment figures) close to double digits, that is very much like Greece with its 12-13% public deficit in 2009 (Greece receives EU transfers as well). In essence, the EU fiscal transfers allow EE countries, in particularly those with most massive imbalances, export some of the accumulated imbalances back into the EU and in addition attempt to free-ride on stimulus packages enacted in rest of the EU.[5]

In order to resume what happened to the Eastern Europe economy during the crisis and the main features of this one for the eastern economic level I will point out three important characteristics of the crisis taking into account some affinities with the Asian crisis of the years '98. First, while EE and other key developing countries experienced an exhilarating rise in FDI and exports, there is a stunningly obvious divergence in income growth between Asian economies, on the one hand, and economies on the other hand.Eastern Europe economies have struggled throughout the last decades to stay above the 1980 level.second, rapid deindustrialization and primitivization of industrial enterprises or even the outright destruction of many previously well-known and successful companies.

Second, rapid deindustrialization and primitivization of industrial enterprises or even the outright destruction of many previously well-known and successful companies. This happened because of the way Soviet industrial companies, and the industry in general, were built up and ran in a complex cluster-like web of planning and competition. A sudden opening of the markets and abolition of capital controls made these industrial companies extremely vulnerable. The partially extreme vertical integration that was the norm in such companies meant that if one part of the value chain ran into problems due to the rapid liberalization, it easily brought down the entire chain. However, foreign companies seeking to privatize plants were almost always interested in only part of the value-chain.

Third, such a drastic change made it relatively easy to actually replace Soviet industry: with the macroeconomic stability and liberalization of markets, followed by a rapid drop in wages, many former Soviet economies became increasingly attractive as privatization targets and outsourcing of

[4] http://www.ecb.europa.eu/pub/pdf/scpops/ecbocp114.pdf

[5] "Financial Crisis in Central and Eastern Europe"-Reiner Katel, Tallin University of Technology, Estonia,2010

production. Indeed, one of the most fundamental characteristics of Eastern Europe industry since 1990 has been that the majority of companies have actually engaged in process innovation.

In the end of this paper I would want to conclude something about the measures or iniatives that the eastern Europe has had until now in order to diminish the impact of the economic crisis upon their national economies. Nevertheless,it is interesting to be seen if this measures can be upholded and sustained by all Eastern European countries but this could be the subject of an another heated debate because the differences between the eastern European countries is an interesting subject.The policy response to the crisis in the EE countries focused on standard and non-standard monetary policy action as well as fiscal measures. Standard monetary policy remained very cautious in most countries until the end of 2008 when the severity of the recession became clear and most EE countries embarked on a process of monetary easing. In most EE countries, however, policy rates remain at higher levels than in major industrialised economies. Fiscal policy responses to the crisis varied within the region and were mainly determined by the fiscal situation at the beginning of the crisis. Overall, the various national and international support measures appear to have helped to cushion the impact of the global economic and financial crisis on the EE countries.

Conclusions

The global economic and financial crisis affected the EE region through various channels of transmission. Although the schematic depiction below is not exhaustive and there might be overlaps and feedback loops between the various channels, it provides a good starting point for analysing the spillovers of the global crisis to EE. In addition, one should bear in mind possible second-round effects of spillovers from affected emerging economies to developed countries and/or spillovers among emerging economies. In general, there are three financial transmission channels through which the global crisis may affect the EE region: direct and indirect channels, as well as second-round effects. The direct channel works mainly via changes in the prices of toxic assets in the portfolios of financial institutions. The indirect financial channels, which become important once there is a deterioration of foreign investor sentiment towards emerging markets, relate to asset prices, money and debt markets as well as capital flows. In this regard, the first two channels explain price effects, while the third one refers to volume effects. Looking in more detail at the indirect financial transmission channels, a loss of investor confidence can hit the EE region first via foreign exchange, stock and real estate. The policy response to the crisis focused in the EE countries on standard and non-standardmonetary policy action, as well as fiscal measures. In countries with flexible exchange rates, key interest rates were lowered as from the end of 2008 when the severity of the recession became clear.

Thus, it should not come as a great surprise that EE countries became the epicenter for the global financial crisis. On the contrary, EE experiences in the last two decades seem to epitomize the problems created during these years globally. On the one hand, there is the fast and furious industrial restructuring driven by massive inflow of FDI; the rise of modularity in production means that large parts of restructured industry are oriented towards lower value added activities with low domestic linkages. On the other hand, equally transformative change in the banking sector essentially breaks the ties with domestic productive sector only to marry with help of enormous inflow of cross-border lending with domestic consumers. This led to loss of competitiveness through low productivity growth and through currency appreciations. All of this is accompanied by fragmented and hollowed out policy arena incapable of creating structural and innovation policies to further productivity growth. Fiscal transfers from the EU are to remain highly important for all EE economies, yet without significant enhancement in policy capacity, EE economies will simply free-ride on EU transfers and stimulus programs and postpone much needed industrial policies even further into the future. This way, however, EE threatens to become a real burden on EU's competitiveness.

Fiscal policy responses to the crisis varied within the region and were mainly determined by the fiscal situation at the beginning of the crisis. Overall, the various national and international support measures appear to have helped to cushion the impact of the global economic and financial crisis on the EE countries and the region's integration into European banking networks turned out to be, on balance, an asset during the crisis (although it also played a role in fuelling the boom before the crisis). The EU anchor also provides a functioning institutional and regulatory framework forEE countries that promotes the convergence process and is expected to prevent extreme policy slippages.

The disruptions in domestic and international financial markets, together with the real transmission channels such as the plunge in global trade flows, had a pronounced effect on real economic developments since late 2008, ultimately resulting in severe recessions in most countries in the region. Future domestic demand will dependinteraliaon the success of private debt restructuring and the willingness of the financial sector to continue lending. This is to say that the financial crisis hit hard the Eastern Europe countries because their developing economy and financial instability, on the other hand their dependence on outside financial incomes has increased their budgetary balance and during this following years will see how the return of this debt will affect or not their future development. Needless to say that the effect of crisis in the eastern Europe has had different effects on the countries in this region, more effected being the south-east countries as Greece, Bulgaria, Ukcraine and Romania were the economic collapse and the ending of crisis has had a more large horizont of time and the governamental measures were more severe due to the lack of financial stability and also due to the fact that competitiveness of governments is still a subject open to argue about.

NEW CONCEPTS REGARDING THE FUNCTIONING OF FINANCIAL SYSTEMS

MĂDĂLINA ANTOANETA RĂDOI*

Abstract
On the financial market, the last three decades have gained the status of a real "revolution" as a consequence of the amplitude, transformation and restructuring of financial services and competing processes. The importance that should be paid to the transformations of financial systems is also given by their impact both at micro and macro level over economy as a whole.

***Keywords**: consolidated financial regulations, special regulations, surveillance of objectives, financial conglomerates, unique market of financial services etc.*

Introduction

Over the last decades the evolution of financial markets has indicated the fact that national financial markets are opened towards private financing due to the necessity to attract international capital resources, a situation which has led to an increase of competition. A series of phenomena has generated this situation: the increasing number of budgetary deficits and the payment deficits incurred by many OECD countries or emerging countries, the chaotic development of credit systems and the use of unregulated financial instruments. These have contributed to the appearance of financial crises which still exist at international level, including in the Euro zone.

Increasing the efficiency of financial markets implies restructuring actions including for the regulation structures of these markets – these issues being frequently tackled during the last two years both within the G7 and G20 countries and especially within European financial and banking bodies – ECOFIN (Economic and Financial Affairs Council), ESCB (European System of Central Banks) and ECB (European Central Bank).

Literature Review

1. Regulation systems for financial markets

Over the last 5 years, the evolution of the European financial systems has become convergent with the American one. These convergent movements had as former matrices the adoption of the unique Euro currency and the globalization of financial markets. The European model continues to be different from the American one because it emphasizes solidarity and consensus, thanks to its more thorough regulation of financial markets. However, the evolution of financial markets is characterized by convergence.

Present developments within the financial regulation systems both worldwide and within the European zone are based on two principles: consolidated regulation and special regulation.

Economies of scale and several political advantages are favorable to consolidated regulations; this kind of regulations is more adapted to the tendencies of forming Financial Conglomerations and it offers a whole set of services and financial products. ,

Arguments for:	
a unique financial regulation authority	**a financial regulation authority**
- one-spet undertaking for authorization	- more facile organizing
- expertise concentration and economies of scale (e.g., by conglomerating authority positions)	- more clearly defined powers
- lower surveillance costs	- closer to regulation activities
- more adapted to the evolution of the financial sector towards financial conglomerates	- more adapted to the differences regarding risk and financial activities, a clearer insistence on objectives and regulation motivation
- cooperation ensured between surveillance forms: a coordinator for conglomerate surveillance	- better approach to regulation activities
- no arbitration required for regulation problems	- more discrete presence
- more transparent form for the consumer	- more inclined towards objective accomplishment surveillance

1) Source: Karel Lannoo

According to European Commission directives, financial systems regulations refer to three categories of financial institutions: credit institutions, investment services suppliers and insurance companies. Credit institutions include commercial banks, building and loan associations, mutual and co-operative banks and mortgage banks (or building societies). Investment services are enumerated in the annex to the identically named Directive and are linked to the use of the mentioned instruments; performing institutions are investment banks (or merchant banks or banques d'affaires) or stockbrokers for one, more or the whole set of services. Insurances include societies that are authorized to issue life or goods insurances.

The basic problem is the information exchange between the different surveillance structures seen especially in the context of the appearance of financial conglomerates that are active at international level and as a necessity to establish a (national) coordinator for the surveillance.

Surveillance performed on the basis of objectives. A method to adapt to the conglomerate formation is creating a more objective oriented surveillance and directing surveillance towards separate issues such as:

- stability, creditworthiness;
- business deontology: information and transparency, practice based on correctness and honesty, equality between market participants.

The agency for stability would concentrate on systemic problems and the deontology agency would concentrate on behavior – protection of depositors/investors. Thus, a model that combines functional surveillance with the objective oriented surveillance would result. For banks/investment services, surveillance could be based on objectives, and for banks insurance could remain fundamental, because of the difference between products and the inverted structure of risk.

Such a surveillance structures exists in Italy. D'Italia Bank supervises financial institutes in order to ensure financial stability, while COMSOB deals with banking and stockbrokers' deontology. Objective-oriented surveillance can be increased within the wholesaling and retailing areas of activity, considering that information asymmetry and market failure are more frequent within the retailing areas of activity, this fact increasing the need for consumer protection. This formula that is supported by France has the advantage of reducing contamination risk between the two sectors.

2. The Problem of EU Financial Regulation

Creating a unique market for financial services is based on three pillars:

- a minimum of homogeneity for the various national markets – an effect of EU directive implementation within the areas of banking, investment services and insurance which are meant to ensure a mutual acknowledgement of the financial instruments, services and services suppliers;

- the principle of the "unique passport", that is the authority granted in one country for establishing branches in any other member country or for providing trans-border services;
- the responsibility of the host country to act as a supervisor.

Directives were introduced late and quite differently in the member countries so that the actual setting up of the unique market for financial services recorded important delays.

The Commission reacted taking into account the reluctance manifested by the member countries, but this let to the creation of a quite insignificant Forum of the EU Stockbrokers' Commission (FESCO – a British abbreviation), whose mission is to promote cooperation between regulating authorities for the stockbroker markets.

FESCO lacks an official status, it works on the basis of consensus and it cannot make compulsory recommendations. That is why, as soon as EURO currency was issued, EU leaders adopted – during the March 2004 Lisbon Summit – the Financial Services Action Plan (FSAP), at the Commission's initiative.

France considered it necessary to go further and faster; thus, during the second semester of 2000, when this country held the Presidency for The Council of Ministers, Laurent Fabius (The Minister of Economy and Finance) asked for the creation of a small work group that had to study the possibility of creating a more daring plan, including the creation of a Pan-European Regulation Forum, located in Paris. England opposed the idea and tried to block it. The group was nevertheless created and it included a British official, Sir Migel Wicks, and its president is Alexandru Lamfalussy, former President of European Monetary Institute. Reports were presented in November 2000 and Februrary 2001 to the group.

At present, the points of view are the following ones:

Most of the member states support the idea of having a unique regulation forum, e.g. France, and an integrated but dual system. The idea of a Pan-European regulation forum is regarded as a solution for the present chaos in this field. Germany supports the idea of a unique Pan-European authority. England opposes it.

Other countries continue to prefer the system of national authorities and concurrence between the existing different jurisdictions.

The Lamfalussy Group does not intend to propose a Pan-European regulation authority although the creation of a Stockbrockers Committee has the role to accelerate this process, which is seen by a few as the beginning of creating a SEC (an American regulation body known as the Securities and Exchange Commission).

The group identified the numerous and important gaps existing in the EU legislation and proposed the following priority measures, which were adopted and applied by the end of 2003:

- a unique prospect for issuers, with a unique preliminary registration system;
- modernizing quota registration requirements and introducing a clear distinction between quota admission and transaction admission;
- generalizing the mutual recognition principle for wholesaling markets, including a clear definition of the professional investor;
- modernizing and developing investment rules for investment funds and pension funds;
- adopting IAS (International Accounting Standards);
- unique passport for recognized stock markets and applying the principles that surveillance is ensured by the host country.

Lamfalussy Group noticed that within the EU there are about 40 public bodies that deal with regulating and supervising stockbrokers' markets. Competence and responsibilities are different. "At European Level the result is fragmentation and, often, confusion."

The main point that the Group aims to attain is represented by the measures that are meant to accelerate the decision process within the EU and to ensure a more thorough control over directive

implementation by the member states. In this respect, a four stage approach was proposed for the decision and implementation process.

3. Unifying financial services regulation and surveillance in Romania

Taking into account the tendencies generated by the financial revolution and especially by the increase of capital market importance in financing firms and setting up financial conglomerates and supermarkets, as well as the dominating opinion expressed by most EU states, the re-consideration of regulation and surveillance structures is regarded as an opportunity in Romania, this process leading to a concentration of the existing structures in a unique authority.

Distinction between wholesaling and retailing markets, which is supported by France and applied in Italy, is regarded as fertile and it could be taken into account in a later development stage on the Romanian markets, if the case may be. For the moment, however, our country should follow the way opened by the UK and embraced by Hungary. The conceiving and application of unitary standards might create better conditions for the development of financial services and the accomplishment of a more efficient surveillance.

The development of self-regulating bodies is not a way to be followed (see the problems tackled by ANSVM – which, after years, was granted this right by the CNVM).

Conclusions

Tendencies regarding the transformation and restructuring of the financial system that manifest at international and European level will continue to exist, including in Romania.

Information exchange and collaboration between regulation and surveillance institutions, if well organized, have chances to generate positive results.

We do not believe that, at present, there are many persons who support the idea of setting up a surveillance authority, but such persons exist in all the three sector of financial services in our country (the banking system, the capital market and the insurance market).

The public debate could contribute to clarifying points of view and the choice of a regulation and surveillance system that could correspond both to the need for a normal development in this area and to the tendencies that exist in Europe.

FIXED INCOME INSTRUMENTS IN THE CAPITAL MARKET IN ROMANIA

CIPRIAN ALEXANDRU*

Abstract
The presence of government bonds on the Bucharest Stock Exchange has changed the behavior of institutional investors on capital market and revenues from these titles made them more attractive than those with variable income, such as shares. In this paper is presented results of research on fixed income instruments in the capital market in Romania. In conclusion, are presented some opinions about the possibility of diversification of fixed income instruments and aspects of their use in portfolio management.

Keywords: *fixed income securities, stock exchange indicators, index, trading volume, rate of liquidity*

Introduction

In the current global economy, based increasingly on consumer debt and spending of anticipated future expected revenues, the role of fixed income instruments is more important, both for investors and for those who attract investment by such means. Further evidence was provided by the financial crisis over the 2007-2009 that the friction on financial market caused an economic blockade and a change in the behavior of buyers of goods and services.

Institutional investors such as pension funds, need adequate liquidity for investment instruments and any financial market can only succeed through a market with strong fixed-income instruments.

In the 15 years since the reinstatement of the stock exchange in Romania bull periods have managed to reduce the negative impact of the corrections from time to time, but given that most investments were made in shares. The existence of very few fixed-income instruments on the capital market has made very few international investors to be present here.

First is presented an analysis of the dynamics of capital market during the representative, in terms of structure, liquidity and the main indexes. The paper continues with the development of fixed income securities market, and the third is illustrated by some aspects of investment behavior in recent years. A representative picture of the dynamics of this behavior, the feeling of trust and loss aversion is given by the evolution of investment funds in diversified portfolios structure.

1. Capital markets dynamics

From 1996 until now, the evolution of exchange transactions in Romania and investor confidence in capital markets is linked to a number of factors such as the yield obtained by placing the amount available in the financial instruments, the state economy, local exchange rate, integration at the European Union and other financial information or less financial, national, regional or global.

Romania's capital market still fails to fulfill the primary role of attracting the funds available in the economy, and most investments are made without any recourse to stock system. After four years of appreciation in share prices between 2003 and 2007, the global recession of 2008 demonstrated that emerging capital markets are more vulnerable to large capital inflows. At the same time prove the foreign investment often speculative and conjectural elements to produce a short-term impact of high volatility, which is not specific to long-term capital.

* Assistant, Ph. D., Faculty of Economic Sciences, The Ecological University of Bucharest (e-mail: ciprian.alexandru@ueb ro).

Because of possible distortions in the BET analysis, from Bucharest Stock Exchange, caused by changing composition of the index in terms of the 10 companies included in the index, we considered more relevant BET-C index, which covers all listed companies. Even in those circumstances there could be a problem given the extremely low liquidity of shares, but this is partially solved by free-float factor included in the formula for calculating the index.

BET-C had the highest value on July 24, 2007 to 7432.63 points. February 25, 2009 was 1231.05 points recorded minimum, representing a decrease of 83.44%. (Fig.1)

BET-C index value has made a comeback in 2009 and the last trading session of December there were 2714.77 points, with 120.5% more than the minimum in February of that year. But 2010 was a year of stagnation, the year that ended BET-C index was 3111.17 points, up only 14.6% over the previous year. Note there are two moments in 2010, the minimum registered on 25 May of 2658.23 points, after the peak of 3655.27 points recorded on April 4.

The stock exchange market in Romania is a heterogeneous, but with a reduced number of issuers, which belong to different economic sectors. Unfortunately the structure of capital market capitalization, by industry sector, does not reflect the structure of GDP. In some sectors the number of listed companies is much less to be representative of that area. An example is given by the service sector and information technology, each represented by a single issuer.

Table.1 Number of companies listed on the BSE, during the period 1995-feb.2011

Source: *BSE, annual reports, 2000-2009 and public information on www.bvb.ro, feb.2011*

Bucharest Stock Exchange showed good performance between 2000 and 2007, with a significant increase in the amount of equity, from 15 billion Euro in 2005 to over 24 billion Euro in 2007 (Table 2). Basically, the most important years of stock exchange, from its foundation until now,

have been 2004-2007. The financial crisis has brought the market capitalization value of the years 2004-2005, with a return in 2009 and strengthened in 2010.

Table.2 BSE capitalization in the period 2000-2010
- million Euro -

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010

Source: *BSE data after the last trading session in the respective years*

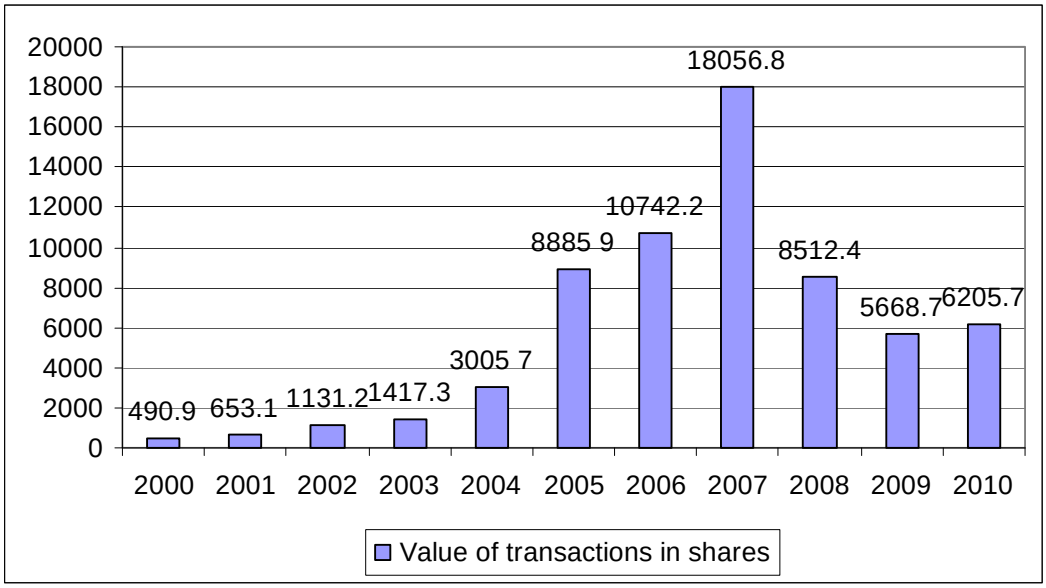
The BSE capitalization fell by 53% dec.2008 months, because in 2009 to recover 64% from year-end 2008.

Similar to the U.S. stock market, the depreciation recorded in October 2008 was approximately 40 percent, but some companies have registered over 90% discount to the values recorded in November 2007. Historical average decline on a global scale, the stock price is 55.9 percent, with a recession of about 3.4 years. (Reinhart, 2009: pp.226).

In absolute values, the value of transactions in shares of listed companies increased from U.S. $ 8.89 billion in 2005 to 18.06 billion USD in 2007. A 68% increase in the volume of transactions was recorded in 2007 compared with 2006, due to both several initial public offerings, but also by price increases.

In 2008, the global financial crisis, most notably the withdrawal of foreign investors on BSE was made a modest volume of transactions under the 2005 level of 36%.

Fig.2 Evolution of the value of transactions in shares on the BSE during 2000-2010, million RON



Source: *BSE data after the last trading session in the respective years*

Liquidity ratio, calculated as the ratio of annual turnover and market capitalization, declined from 16.4% at the end of 2007 to just 5.5% in 2010.

$$L = \frac{\text{Turnover value}}{\text{Market Capitalization}}(\%)$$

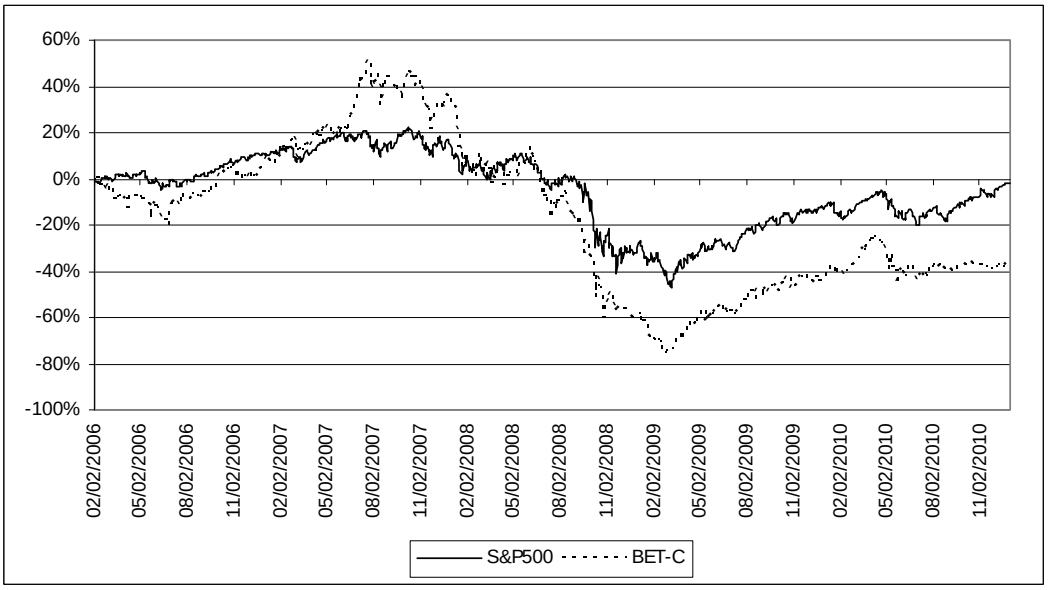
Even if the amplitude of which varied with the BET-C was significantly higher than S & P500, however, values were correlated to August 2010. From this month there is a mismatch due to continued stagnation in the capital market in Romania, while the U.S. to continue its growth in 2010 (Fig.3).

Fig.3 Changes in BET-C index and S & P500 over the period 2006-2010



Source: *BSE, NYSE, the daily data series at the end of trading session*

In 2011 it is possible to register some higher assessments on BSE, and this could lead to a further recovery and correlation with the market in Romania in the U.S.. The assessments are possible in light of new and attractive listings from the state, particularly in energy, utilities and telecommunications.

2. Fixed Income Securities Market

The first fixed-income securities traded on the Bucharest Stock Exchange were municipal bonds since 2001. Until 2004, due to very low trading volume relative to the value of all capital markets in Romania, we can say that the bond market was insignificant. Under these conditions, no bonds were among the preferences of investors, while municipal bond yields have been consistently above the interest paid on bank deposits.

Because, if fixed-income securities, the number of transactions is not relevant, as in market shares, we will use in this study the volume of transactions in these securities. From this point of view, the 2006 bond issue was important for the International Bank for Reconstruction and Development, worth RON 525 million. At the same time, it also marked the first issue of securities made by an international body on the Bucharest Stock Exchange.

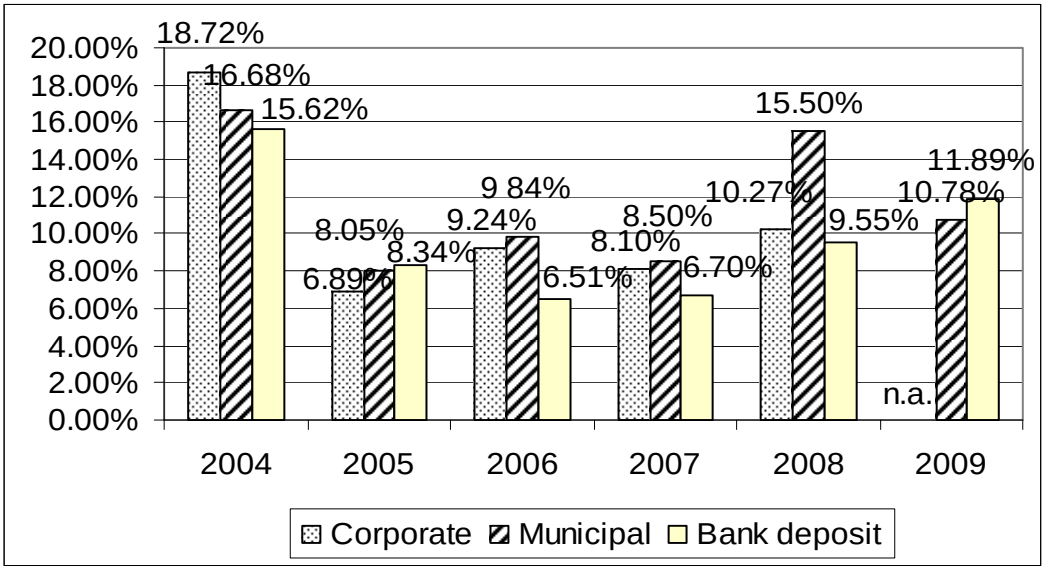
Year 2006 was a good year for corporate bond segment, and has contributed to these results definitely favor the International Bank for Reconstruction and Development. Launching a public issue of bonds, in September 2006, amounting to 525 million, doubled the value of fixed income securities markets at that time. The operation has a greater importance, since it is the first issue of international financial institutions through capital market in Romania and more, is the first on such a scale. Credibility assessment of the issuer and the AAA rate was the listing in October to be a success. Overwriting 21% of the issue, by a total of 635,948 bonds, compared to 525,000 allocated is still a positive factor in considering this issue as a success. Among domestic bond issues are made by the Romanian Commercial Bank, the important value of 200 million and approximately 21.5% by overwriting.

Volume and number of these issues in 2006 ranked first in the bond transactions, the creation of the stock exchange until 2008. Total value of transactions in bonds, of 281.67 million euros, close to the threshold of 10% of transactions in shares, but also far enough away from the practice of recognized exchanges encountered. At this time mention the existence of only two types of fixed-income instruments on the BSE, municipal and corporate bonds.

To assess the efficiency of such investments is provided taking into account three key elements. First, the risk associated with these instruments, and discusses the risk of bonds is given by the indebtedness of the issuer. Secondly interest loan offered by the issuer of that bond, and thirdly return correlation with the risk associated with each fixed income instrument.

The average interest rate corporate bonds in lei, at the end of 2006 was 9.24%, up from 6.89% at the end of 2005. The average municipal bond interest was the end of 9.84%, up from 8.05% in 2005. It may be noted an unusual situation with developed capital markets, higher interest granted by the municipal bonds from the corporate, but have a lower risk than the latter. One explanation is that sometimes the biggest bank in the country, as is the BCR, may have greater credibility than a municipality, which allocated funds and sometimes depends on the state budget.

Fig.3 Average interest rates for the corporate bonds, municipal bonds and the bank deposit, from 2004 to 2009



Source: *www.intercapital.ro (values for the month of December), not available interest rates for corporate bonds in 2009*

The average interest rate for corporate bonds at the end of 2007 was 8.1%. The average interest rate for municipal bonds was 8.5% (compared with 9.8% in 2008 and 8.1% in 2005).

The relationship between specific data and household savings stock market is not very close, but can be a strong interest in reducing individuals to stocks in 2006, a period when household savings, volume compared to the population registered a slight increase, caused by investment in real estate.

In 2008, recorded the first issuance of state bonds, first due in 2007 and the existence of private pension funds, which are required by law in Romania to a prudent asset allocation, most of the funds must be invested in securities issued by state.

In 2010, as recorded on the stock market stagnation, there were no new issues of corporate bonds. For municipal bonds have been recorded four IPO, and traded a total of 35 bonds in 2010, compared with 31 in 2009, 20 in 2008, 16 in 2007 and 11 in 2006.

The average annual interest rate for municipal bonds has fallen from 10.78% at end 2009 to 7.43% at the end of 2010, virtually the values recorded before the financial crisis.

On the stock fund development stagnation in 2010, the total value of fixed income instruments registered a value of 620 million euros, an increase of 104% compared to 2009, when he recorded a value of 303 million euros. This historic high was supported by state securities representing an attractive low risk high in both, but especially by balancing the portfolios of private pension funds, which have an increasingly important presence in this market.

3. The balanced funds

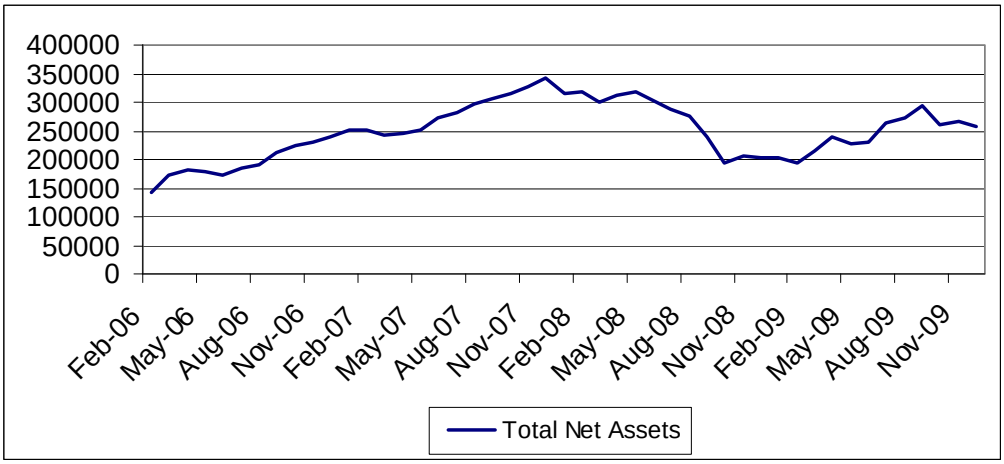
If loss aversion can be explained by reducing the number of investors, it is not sufficient to determine the low participation (Barberis, Huang and Thaler (2006)).

Maximum total net assets of the diversified investment funds was reached in December 2007, RON 343.57 million, about 95.17 million euros, 40% more than in February 2006. During this

period, total net assets trend was correlated with the number of investors and BET-C evolution and shows that loss aversion is important for investors on BSE.

During this period, total net assets trend was correlated with the number of investors and BET-C evolution and shows that loss aversion is important for investors on BSE (Fig. 4).

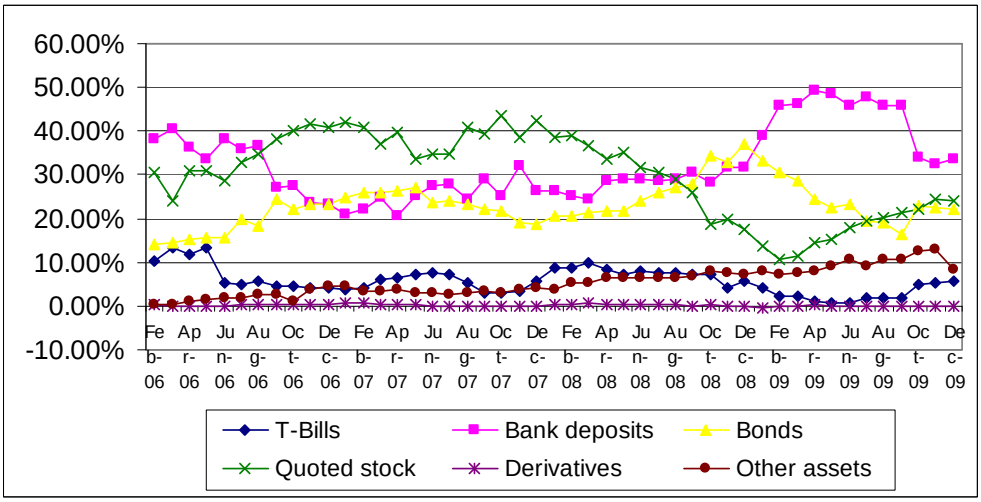
Fig.4 Total net assets from balanced funds (thousand RON), from Feb., 2006 to Dec., 2009



Source: *Romanian Association of Asset Managers, series of data from web site: http://www.aaf.ro/index.php?option=com_content&task=section&id=4&Itemid=35*

Dynamic performance of shares is reflected in investor sentiment, as shown in Figure No. 5. With the reduction in average interest rate on bank deposits, bonds, interest rate stability and good results of stocks, investments are changing from August 2006 to bank deposits for stocks. A change of trend is observed in July 2008 when institutional investors have turned to bank deposits. Evolution and other assets for government securities was not significant.

Fig.5 Portfolio structure of balanced funds, from feb, 2006 to dec, 2009



Source: *Romanian Association of Asset Managers, series of data from web site: http://www.aaf.ro/index.php?option=com_content&task=section&id=4&Itemid=35*

If institutional investors, like those analyzed in this study, loss aversion and "tools" to preserve much of the profit, other investors have no faith that the stock market can be an alternative for their investments.

Conclusions

Fixed income instruments market has grown much less than that of the stocks and is represented by a small number of issuers. As a diversified bond market in Romania can be compared with the U.S. more than the '60s, because it consists solely of government bonds, municipal bonds and some corporate bonds. Moreover, these bonds are characterized by a fixed maturity, a principal and coupon interest rate fixed or anchored to the average interbank interest rate at three or six months. Another feature of this market is almost non-existent secondary market because most buyers keep the bonds until maturity, because of low maturity, but also due to low offers, without the variations of interest.

The private pension funds will have larger amounts available to be placed on the capital market, fixed income instruments are known as greater liquidity, but also possible that more issuers to use this form to attract sources of investment money.

With the spot bond market development will be considered derivatives and structured to provide portfolio management capabilities found on all dedicated capital markets.

Not least of the market surveillance authorities must take an active role to prevent any slippage in this area, and the dynamics of the sector will require adaptation of specific tools to the requirements of investors and issuers.

CURRENT ACCOUNTING DEVELOPMENTS IN KOSOVO

NEXHMIE VOKSHI*
MIHANE BERISHA-NAMANI**

Abstract
For the study of the developments in accounting in Kosovo and its prospects, it is necessary to review the current situation of the developments in accounting, the recognition and acceptance of accounting standards. It is clear that the actual and perspective development level in an affected by many factors, such as social, cultural, etc. Therefore, the main aim of the research work in this study is to give an overview of the current developments of accounting in Kosovo. To obtain the required information, 400 respondents have been chosen through a questionnaire designed for this purpose[1]. The respondents operate in different branches, they work in small, medium and large enterprises, insurance companies, banks, and while some of them are independent accountants and employees in the tax authorities. The data obtained are processed and analyzed from two aspects: the aspect of descriptive statistics reflected through histograms, and econometric aspect of reflecting through econometric models.

Key words: *accounting requirements, international accounting standards, econometric models, logit model and probit model.*

Introduction

In actually Kosovo has begun to fulfill the financial reporting requirements in accordance with accounting standards, because accounting standards has multiple importance for us, firstly because represents a model of high quality in regards to the manner of accounting regulations and secondly accounting informations are important for decision making.

Proper accounting helps Kosovo to fulfill its vital interests and for its active participation in the European Union. Currently Kosovo is implementing international accounting standards (IAS), particularly in entities with public interest financial statements is seen as of quite large importance, because they serve as the main source of information that serves as the basis for decision making of a wide range of users. Furthermore, containing elements of business financial statements are the basis for the production of accounting information, which further serves the financial needs.

2. Characteristics of businesses and implementation of IAS: Empirical analysis throught econometric models with discrete variables

In this study, a regressive analysis is done a through ordered logit model and ordered probit model on the probability of implementation of IAS by the business community in Kosovo. Regression or regression analysis in this study indicate the dependence of a variable or characteristic that is called a dependent variable or some other variables (explanatory). In order to predict or assess an average value of the first variable based on values known or fixed (by choosing repeatedly) last.

[1] The data collected reflect to the situation, belong to a three year time period 2008, 2009 and 2010.

* Assistant, Department of Accounting, Finance and Banking, Faculty of Economics, University of Pristina, Kosova.

** Associated Professor, Department of Management and Informatics, Faculty of Economics, University of Pristina, Kosova (e-mail: mihane_berisha@yahoo.com).

3. Methodology

According to the questionnaire drawn up, looked at the empirical aspects, a functional depending probability is found between the questions in the questionnaire, which in our case we have treated as the dependent variables, and characteristics of businesses which we treated as variable independent variables. Taking into consideration the responses of respondents and characteristics of businesses, which had not quantitative value but qualitative value, in order to find the functional dependence multiple regression is used with additional variables (dummy variables).

Furthermore, given the responses of the respondents in five levels, with quality characteristics of which we have coded with discrete values listed (ordered). The ordered logit model and ordered probit model are used with the help of which we counted regression the parameters through the Stata program and depending on the significances of the relevant parameters, we have given comments from the results achieved. After the ordered logit model and ordered probit model we have given approximately the same results and they differ only in the distribution at the edge. We conclude that both models are working regardless of which of them is taken and we have the same results.

4. Data

As dependent variables the questions are taken from the questionnaire designed for this purpose, which are marked with Yi as dependent variables, where i=1,2,… n, whereas Xi are independent variables, where i=1,2,3,…..,7.[2]

5. Results

A functional depending probability is found between the level of implementation of accounting standards in Kosovo and characteristics of businesses from the aspect of size and sectors they belong to. Also, a functional dependence between Yi, (where i=1,2,…5[3]), and Xi, (where i=1,2,3,….7), is realized through ordered logit and probit models, and counted in the Stata program. The results are presented in four cases, as follow:

Case I

Functional dependence between dependent variables Yi (where i=1,2,…5), and the independent variables Xi (where i=1,2,3), which means that we take only enterprises based on size, where X1= small enterprise, X2=medium enterprise, X3= large enterprise taken as a basis.

In this case, according the ordered logit model and ordered probit model, we have results as follow:

Table1.1[4]

Y / X	Small	Medium	…..
Y_1 Logit	-0.85217 (0.2884959)***	-0.2688543 (0.3095237)	Numb.of obs=283 LR chi2(2)=10.18

[2] With X we have marked independent variables that are ranked according to size of enterprices and the sectors they belong to.

[3] With Y we marked dependent variables which are the following questions, Y1=is known as the law on accounting, Y2=known as IAS/IFRS, Y3=are accounting rules applied for accounting keeping and financial statements, Y4=how do you think that the implementation of IAS/IFRS is effective and is likely to be implemented in Kosovo, Y5=how much do you think that the implementation of IAS/IFRS gives the opportunity of reading our financial statements by external users of accounting informations.

[4] With ***, **,*, we marked significance of 1%, 5%, 10% respectively, while the standard deviations of parameter are shown in parentheses.

			Prob>chi2=0.0062 Pseudo R =0.0167
Y_1 Probit	-0.5005933 (0.1691068) ***	-0.1614733 (0.1835569)	Numb.of obs=283 LR chi2(2)=10.25 Prob>chi2=0.0059 Pseudo R2=0.0169

The first question that was posed to the accountants and managers of enterprises in this case relates to their knowledge that, they have initially about the law on accounting (Y1) and the current regulation in force[5] for financial reporting of business entities. From the significance of the relevant counting parameter through the Stata program applied in the ordered probit model and ordered logit model we came with the result (table 1.1) that the probability that accountants of small enterprises that recognize this law is smaller in comparison with accountants of large enterprises.

Table 1.2

Y_2 Logit	**-0.7171404 (0.276951)*** **	**-0.0467202 (0.2994556)**	**Numb.of obs=283 LR chi 2(2)=9.63 Prob>chi2=0.0081 Pseudo R2=0.0139**
Y_2 Probit	**-0.4194094 (0.1618822)*** **	**-0.4339363 (0.1754734)**	**Numb.of obs=283 LR chi 2(2)=9.39 Prob>chi2=0.0091 Pseudo R2=0.0136**

Such a situation is also in the passed question to those regarding the recognition of international accounting standards (Y2), where the probability is also that small enterprises accountants who recognize standards is small compared with large enterprises (see table 1.2).

This is a clear problem, perhaps to small and medium enterprises the cost, firstly for the recognition and then the implementation of standards, will probably currently has its benefits and this is why small and medium enterprises are further from acknowledging the law and accounting standards. Therefore, the appropriate recommendations are given for finding the most suitable route and the path for genuine financial reporting for these enterprises.

Table 1.3

Y_3 Logit	0.8522741 (0.3393852) ***	1.434234 (0.3605902)***	Numb.of obs=271 LR chi2(2)=16.99 Prob>chi2=0.0007 Pseudo R2=0.0288
Y_3 Probit	0.400481 (0.1851023) ***	0.7569815 (0.2017334) ***	Numb.of obs=271 LR chi2(2)=14.45 Prob>chi2=0.0002 Pseudo R2=0.0338

The question addressed to the respondents whether rules are applied for maintaining the accounting and financial statements (Y3), results in table 1.3, according to the significance counting parameters purposes, it is obvious that the probability that these rules apply to small enterprises is

[5] Regulation 2001/130 (29 October 2001)on establishment of the Board for Financial Reporting in Kosovo as well as financial reporting regime of business organizations, represents business organizations (whether annual circulation of over 100,000 or total assets over 50.000E) expect small enterprices and public-owned enterprises and social enterprises, preparation of financial statements in coherence with SKK and IAS.

large in comparison with large enterprises. This shows that small and medium enterprises currently maintain the simplified rules and without a high cost, balance sheet, statement of income and expenditure, purchase book, sales, inventory, etc. Taking into consideration the following facts, then their responses above are expected to show job progress and thus fulfill the existing gaps.

There is also the possibility of enforcement of accounting standards (Y4) to enterprises classified according to size, where again in regards to small and medium enterprises the probability that standards find enforcement is lower than in large enterprises. These results are proven us in the table below (table 1.4) pertaining to the question of how effective standard are and implementation opportunities.

Table 1.4

Y_4 Logit	**-0.6011726** **(0.2790317) *****	**-0.6877438** **(0.3136443) *****	**Numb.of obs=247** **LR chi2(2)=6.18** **Prob>chi2=0.0456** **Pseudo R2=0.0095**
Y_4 Probit	**-0.3582893** **(0.1687239) *****	**-0.3964415** **(0.184027) *****	**Numb.of obs=247** **LR chi2(2)=5.85** **Prob>chi2=0.0536** **Pseudo R2=0.0090**

It does not always mean that independent variables affect the concerned dependent variable. This is indicated, for example in the question addressed to the accountants on how they think that with the application of accounting standards, the opportunity is given to read financial statements not only by internal users but also from those outside (Y5).

Table 1.5

Y_5 Logit	-0.4459745 (0.3003326)	-0.3878014 (0.3224904)	Numb.of obs=266 LR chi2(2)=2.38 Prob>chi2=0.3036 Pseudo R2=0.0044
Y_5 Probit	-0.2610202 (0.1791692)	-0.2171985 (0.1918715)	Numb.of obs=266 LR chi2(2)=2.23 Prob>chi2=0.3281 Pseudo R2=0.0041

As seen from above table (table 1.5), the enterprises divided by size have no impact as is explained above. A response that explains the awareness of accountants and other respondents in regards to fact that the implementation of IAS/ IFRS financial reports can be read by external users, which in this case creates the same communication language on the same European line, which results in transparency, comparison of PF, and finding business balance.

Case II

The functional dependence between dependent variables Yi, where i= 1,2 [6]and independent variables Xi, where i=4,5,6 and 7 which means that we have taken only the enterprises based on sectors they belong, where X4=commercial enterprises, X5=service enterprises, X6=manufacturing enterprise, X7=financial enterprises, are taken as a base.

In this case, according the ordered logit and ordered probit model, we have these results:

Table 2.1

X / Y	**Commercial**	**Service**	**Production**	
Y_1 Logit	-0.4486755 (0.3874121)	0.250153 (0.6412136)	0.10223 (0.6525899)	**Nr. of obs=283** **LRchi2(3)=3.54** **Prob>chi2=0.3160** **Pseu R2=0.0058**
Y_1 Probit	**-0.2307094** **(0.2249647)**	**0.2418676** **(0.3932849)**	**0.0874398** **(0.3795382)**	**Nr.of obs=283** **LRchi2(3)=3.57** **Prob>chi2=0.3122** **Pseu R2=0.0059**

Table 2.2.

Y_2 Logit	**-0.3985266** **(0.3520866)**	**-0.9183662** **(0.6362862)**	**-0.5230442** **(0.6297275)**	**Nr.of obs=283** **LRchi2(3)=2.40** **Prob>chi2=0.4936** **Pseu R2=0.0035**
Y_2 Probit	**-0.2563193** **(0.2161494**	**-0.566349** **(0.381603)**	**0.3344314** **(0.3539983)**	**Nr.of obs=283** **LRchi2(3)=2.55** **Prob>chi2=0.4654** **Pseu R2=0.0037**

Therefore, the results achieved through ordered probit model and ordered logit model, tell us that the sector of the enterprise does not impact on the question regarding the knowledge of the accounting law (Y1) which is seen by non significance of the relevant parameters (table 2.1), and knowledge of international standards accounting (y2) (table 2.2). Thus, the viability of IAS does not depend on the sector concerned which a company belongs to, which is the application of the law on accounting or which is applied to financial reporting.

Case III

The functional dependence between dependent variables Yi and independent variables Xi (where

i =1, 2, 3,….7), where we take the enterprises according to the size and the sectors that they belong to, where X1=small enterprise, medium enterprise X2, X3=large enterprise (taken as a basis); X4=commercial enterprise, X5=service enterprise, X6=manufacturing enterprise and X7=financial

[6] In this case we analyze only questions Y1 and Y2, respective knowledge of the law on accounting and recognition of IAS/ IFRS by the employees in companies based on the sectors they belong.

enterprise (that were taken as a basis). Thus, we have the same results as in case I and II, where we have been taking enterprises and separately by size and sectors.

Case IV

A functional dependence is found between the dependent variables between Yi, where i=1, 2, and the independent variables, taking X1=independent accountants interviewed and X2=TAK employees[7]. Results presented throught ordered logit model and ordered probit model through the Stata program are as follows (table 4.1.)

Table 4.1.

Y X	**Independent accountants**	**……**
Y_1 Logit	-0.9057387 (0.4251882) ***	Numb. of obs = 83 Lr chi2 (1) = 4.65 Prob>chi2 = 0.0310 Pseudo R2 = 0.0259
Y_1 Probit	**-0.5097235** **(0.2499189) ***	**Numb. of obs = 83** **Lr chi2 (1) = 4.19** **Prob>chi2 = 0.0406** **Pseudo R2 = 0.0233**

Table 4.2.

Y_2 Logit	**1.776325** **(0.5130097) ***	**Numb. of obs = 85** **Lr chi2 (1) = 13.72** **Prob>chi2 = 0.0002** **Pseudo R2 = 0.0788**
Y_2 Probit	**0.8942152** **(0.2644612) ***	**Numb. of obs = 85** **Lr chi2 (1) = 11.90** **Prob>chi2 = 0.0006** **Pseudo R2 = 0.0684**

In regards to the knowledge of the law on accounting (Y1), the probability that independent accountants are knowledgeable of this law is small enterprices in comparison to employees of the tax administration that is seen by significance of the relevant parameter found through ordered logit and ordered probit model of the counting purposes of the Stata program (table 4.1). Such a thing has a logical link in the manner of training and gaining professional independent accountants, who are more closely involved in the knowledge of accounting standards, and less of the law.

This is explained by the results of the answers in the question about the knowledge of international standards (Y2) where the likelihood that the knowledge of accountants and independent auditors is larger compared to that of the tax employees, which is seen through positive relevant significance parameter in table 4.2. Independent accountants have worked and are still working in their acquisition of knowledge regarding the complete knowledge of the International Accounting Standards (IAS)/International Financial Reporting Standards (IFRS) through training seminars and various lectures. This represents very positive indicator in terms of continuous development of the

[7] In this case we analyze only questions Y1 and Y2, respective knowledge of the law on accounting recognition of IAS/IFRS by the independent accountants and employees in the tax administration.

profession, as a requirement under asquis communautaire[8]. This result in the fact that accountants retain the knowledge received and add continually adds knowledge with time requests.

Conclusions

The situation highlights the fact that international accounting standards are accepted in Kosovo, as well. The largest percentage of accountants (87%) accept IAS to increase the quality of financial reporting. While, based on the analysis made by the ordered probit model and ordered logit model, we can say that there is a depending functional probability as well as between level of implementation of accounting standards and size of enterprises. Depending from the sectors they belong to independent accountants and auditors have more knowledge compared with tax administration employees. A certain level of dependency in cases where it exists is reflected through significance arising in certain cases. Therefore, based on the great role that IAS has on financial reporting, it is recommended that further steps should be taken in Kosovo towards promoting, recognition and enforcement of international accounting standardizations. Tis is necessary, because this has effect on the ability and competence of businesses to prepare reliable financial statements, that are transparent and readable for all users.

INFORMATION, KEY ELEMENT OF ACCOUNTING AND AUDIT IN THE KNOWLEDGE SOCIETY

NELUȚA MITEA[*]

Abstract
In a knowledge society, the advantage of nations will not result from their natural resources, nor to the cheap labor, but from their ability to valorize the intellectual potential and to use efficiently the information. The knowledge based economy represents a new step in the development of human civilization that promises us a better future. The knowledge transfer between people and generations in order to facilitate human society's evolution is the basic function of information science.
This paper aims to examine how, in Romania, accounting and audit use and create information in current conditions of economic development. The purpose of this study consists in offering perspectives of improving the information quality. An information is high quality when, by its form and content, it corresponds integrally to all the needs, the exigencies and expectations of its user, without sacrificing the reality. A number of errors made by the accounting profession have been identified along this paper. These errors led to the decrease of information's credibility. But the study proposes some changes in order to restore the image of this profession: the changes are sustained by the advantages of Knowledge Economy and Information Society.
The research method consists in studying a rich background material, including reference items, such as works of applied and fundamental research. The originality of this work is given by the identification of knowledge society's challenge which could be used as a lever of revival for accounting and audit in Romania.

Keywords*: knowledge society, information technologies, information science, credibility, conformity.*

Introduction

In a knowledge society, nations' advantage will not result from their natural resources, nor from the cheap labor, but from their ability to valorize the intellectual potential and to use the information in an optimum way. Knowledge society represents more than information society or computer society. Since the Internet has occurred in the world with its advantages (e-mail, electronic commerce, electronic transactions, Internet market), we have been living in an information society. Knowledge is, in fact, understandable information and, in the same time, information that acts and produces effects. Knowledge society is now present throughout the world. However, an expression more used is that of *new economy*. It is true that in knowledge society we are witnessing a new economy covering Internet economy too. This new economy is the result of the growing role of science in the economy, a moment marking the so-called *knowledge revolution*. This is the way of the transition from the economy based mainly on physical resources to the knowledge economy[1]. The new economy does not involve a total replacement of physical products with digital products, but physical products are strongly influenced by digital technologies and by Internet during production and commercialization processes. The Knowledge-based economy offers to the society the premises of a better future. The development of information technology, doubled by a rapid increase in computing techniques creates a new vision of society's evolution, of its way concerning needs' identification and the establishment of new directions regarding the economic growth. Information becomes the fundamental resource of the organizations. Romanian society has to face not only the radical change at political and economic levels, but also the significant mutations which

[1] Rădoi, D., 2005. Locul şi rolul comerțului electronic în noua economie, *Oeconomica*, nr. 2

are taking place at a global level. Romanian society's transition to the information system seems an important component of the development strategy.

The present paper aims to analyze the challenge of the knowledge society and that of information society which could be used as revival levers of the accounting and audit in Romania. The paper also presents the way by which the accounting profession creates information during the current conditions of economic development. The purpose of this study consists in offering some perspectives improving the quality of financial accounting information. We could consider that an information is high quality when, by its form and content, it fully corresponds to the needs of a variety of users, without compromising the reality and the truth. During this study I undertook a review of the accounting profession's errors which led to the decrease of information's credibility, without losing sight of the possible changes needed in order to regain this profession's image. The measures proposed are sustained by the advantages of knowledge and information societies. Applying information technologies in order to collect, to organize and to distribute the information could reduce physical effort and also the errors caused by the manual system designed to process it. New technologies provide a greater access to information. Technological progress has an essential influence on the working methods of the accounting profession and also on the necessary level of competence, as well as on public needs. This study has a highly theoretical character and the scientific research methodology has focused on a critical analysis concerning the newest publications in the field, the different studies and the applied and fundamental research papers. The originality of this work consists in identifying knowledge society's challenge for the accounting profession. Contemporary trends (globalization, information society, knowledge society) change the perception of individuals on accounting and audit. Information becomes a key element for the accounting profession within a knowledge society. Therefore we are held to take into account the importance of information both in social and in professional life. Information represents an unequalled good, without which the evolution in the society and in the economy seems impossible. It is the moment for the professional accountant to know how to create useful and reliable information for all the users. In this respect, knowledge society provides to the accounting profession the necessary resources for improving its image and mostly the public confidence in the information furnished.

1. The importance of information for the accounting profession in the context of knowledge society

Nowadays, the society's expectations concerning business world are increasingly complex. We all agree that we are witnessing a change in the public attitude towards business environment. As a consequence, we could discuss about enterprises' social responsibility, about social and environmental accounting so that the relations arising between organizations and consumers do acquire unknown meanings. All these phenomena governing economic and social world are based on information's circulation. The development of the accounting profession had virtually the same rhythm as the information's dissemination, as business evolution and that of market economy. The objective of the accounting profession consists in "creating confidence in the modern environment of market economy; confidence needs credibility and credibility bases on sincerity"[2]. The professional accountant is required to seek and present the truth, but also to act in public interest. In this respect, the accounting profession must be seen through its role of providing confidence in the market economy; without this confidence, the commercial relations could not exist any more.

It is vital for the accounting profession to be centered on *truth*. The concept of truth has been extensively treated in literature. In fact, truth has an important place in *knowledge theory*. One of the guidelines considers truth as an exclusive ownership of knowledge's object (of processes, phenomena or real systems). On the other hand, truth is considered an exclusive ownership of

[2] Țurlea, E., Nicolăescu, E.G., Mocanu, M., 2010. Nevoia de etică în auditul financiar, *Audit financiar*, anul VIII, nr. 8, București: C.A.F.R.

knowledge's subject (of our consciousness). Starting from these two directions, specialists have arrived to consider truth as an ownership of consciousness which is the result of the interactions between the knowledge's object and the subject matter. A sentence is true, if its content could be verified and confirmed by observation, by experience or by logical demonstration. Furthermore, we appreciate that a sentence is true, if it proves useful. This premise is the beginning point in studying *the accounting truth.* The professional accountant is held to seek, to present and to act in public interest, as I have already shown during this paper. The accounting profession provides confidence in the market economy. Accounting has also a major responsibility in the process concerning capital employment. Business profitability, partners' credibility and enterprises' creditworthiness are legitimized by the calculations of accounting. Audit is required to verify the compliance between accounting registrations and the reality. Because of the formalized language, we could notice an essential mutation in the business world: "the transition from empiricism to rigueur, from arbitrary appreciations to economic truth and to *the true and fair view*"[3]. The fair reflection of the economic and financial reality and of its consequences on social, human and institutional levels, do represent the defining attribute of accounting for whose improvement are fighting today the most prestigious specialists in "the science of accounts". Preoccupied by standards, by convergence, by the accounting reflection of reality's truth, the professional accountants are, in fact, concerned in the economy and in human beings. This is probably one of the reasons for which the European Union has taken into account the opportunity of recognizing the accounting profession at European level. Faced with this challenge, Romanian accounting could not remain passive. In this respect, Romanian accounting has to adapt to the processes of normalization, harmonization and convergence, both through its national institutions and through the action of organizations representing the accounting profession. However, Romanian accounting mechanisms still have a high rigidity in the implementation of accounting concepts and principles.

The analysis of information's essential characters presents an interest, on the one hand, by the means of the transmission mechanism and, on the other hand, by its content. These are issues which have been exploited by many approaches from different fields such as mathematics, sociology, psychology, linguistics and economics. A series of studies from the literature in the field analyze accounting as *an information system*, in a mathematical sense, through a quantitative approach of information and not through a qualitative one. Therefore, "the balance sheet is perceived as a decomposition of total amounts (total assets, total liabilities, total expenses or total revenues)"[4]. In Lee or Bedford's view, "accounting operations represent an information process consisting in the collection, the classification, the systematic arrangement and data presentation"[5]. According to this paper's orientation, we could perceive the accounting as an information system that "enables information's production and dissemination for making decisions"[6]. In a knowledge society, the measurement of the intellectual capital of an enterprise does represent a very sensible element, especially for the economy with undeveloped financial markets, as it is the case of Romanian economy. A study dating from 2006 shows us that there is a substantial difference between the value of intangible assets registered by the accounting and the value of the intellectual capital recognized by the market[7]. In a knowledge-based economy, despite the accessibility of information transfer between different users, we notice that economic actors do not have a free access to any information

they need. The consequences of such an observation prove that information itself has a cost and that there is a limited and differential access to information. Therefore, we consider that the available information on market is truly partial and asymmetric.

2. Accounting and audit: key providers of information for the society

This paper aims to examine how, in Romania, the accounting and audit use and create information in the current economic conditions. The purpose of this paper is to provide perspectives to improve the quality of this information. An information is high quality when, by its form and content, it fully meets the needs, the requirements and the expectations of its users, in the same time reflecting the reality.

2.1. The failures of the accounting profession

Accounting generates, by the means of financial statements, information necessary for the owners in order to invest their capitals. In the context of markets' globalization, it has been imposed a common language centered on rigorous and accurate information assuring communication on international markets. The beginning of the third millennium marked the acceptance of the accounting standards IAS/IFRS as global accounting standards. We are witnessing the convergence of accounting referential with US GAAP[8]. However, the accounting and audit activities are taking place in a conflicting environment, under social, political and economic pressures. The existence of these pressures often put into question the quality of the information provided by the professional accountants, both at our country's level and as the global one. The negative influence of these conflicts could be overcome only by professional ethics. Therefore, in order to maintain its high quality which provides information's credibility, the professional accountants are supposed to keep their reputation intact.

This current global crisis proves, among many causes, some failures of the accounting profession, failures regarding financial statement. These failures are linked to the names of prestigious companies like: Enron, WorldCom, Quest Communication, Adelphia, Nortel, Parmalat etc. Moreover, these failures must be considered in a close connection with the auditors of the companies involved. Corporate scandals have reinforced the need for a more sophisticated regulation and for a better supervision. Despite the multiplication of these imbalanced phenomena, we are now witnessing the spread of *best practice corporate governance* in the world and of regional analyses conducted by various international bodies. These analyses are designed to assess the economic environment in terms of the respect concerning the principles of corporate governance. As a consequence of the situation created, the International Federation of Accountants (IFAC) has initiated a number of measures for regaining public confidence in the services provided by the professional accountants, including the periodic review of International Standards on Auditing (ISA). In this respect, we should consider ISA 540 concerning "the Audit of accounting estimations, including the accounting estimations at fair value and the related disclosures". At this point, the paper brings into discussion the concept of *fair value* that has become a widely used reference in the accounting estimation. In spite of its defectiveness, the fair value approaches perfection more than *historical cost.* While the latter is oriented towards the past, the fair value is oriented towards future. The concept of fair value has been in the middle of international professional accountants' preoccupations for more than two decades. According to international valuation standards, this concept concerns "the most predictable price, agreed between the buyers and the sellers of an available good or service, the value not representing a simple fact, but an estimation of the price at a

[8] Ionaşcu, I., 2008. *Internaţionalizarea contabilităţii. Evoluţii şi consecinţe în mediul românesc. Culegere de studii şi cercetări,* Bucureşti: Ed. ASE, p.7

certain moment"[9]. In Romanian practice, for many specialists, the notion of fair value knows only one reality: *market value*. This value assures a greater objectivity because it is based on external information which could not be easily influenced by the enterprise. However, from practice, we have noticed that markets lost their liquidity or ceased to exist. As a consequence, the assessment at the fair value based on market information became irrelevant and it was affected by uncertainty[10]. There are situations when fair value could be determined only by using assessment techniques based on management estimations related to future cash flows and to the actualization rates adjusted in function of risks. Therefore, this paper shows that the concept of fair value "is placed at the border between evaluation and accounting"[11]. The responsible with financial reporting is required to prove expertise and professionalism, an adequate behavior inducing transparency, fairness and seriousness for being able to proceed to estimation during his activity. According to a dictionary of accounting, the estimation represents "the act of determining the approximate value of an asset or of a liability at the end of the accounting exercise in order to be attributed to a position in the financial statements"[12]. However, the estimation process involves professional reasoning focused on the newest information. The purpose of the estimation consists in foreseeing the future result of a transaction or of an event. In some cases, estimation involves even the assessment of elements at fair value. The international accounting referential treats fair value as a market value. In the same time, fair value represents "the amount for which an assess could be exchanged between the two interested parties in informed consent, during a transaction developed in conditions of objectivity, with a price objectively determined "[13]. However, the assessments led to significant distortions within the financial situations, which caused the current economic crisis.

In order to correct the situation that decreased the credibility of financial situations, a new assessment procedure has been established in Romania whose applicability started from January 2010. This procedure concerns the possibility that the value's depreciation of tangible and intangible assets could be found using many assessment methods, including cash flows-based methods[14]. By this procedure, we try to connect Romanian accounting practices to the international accounting referential. Therefore, Romanian accounting regulations sustain that the fair value of assets is determined, in general, as evidenced by market data, through an assessment accomplished usually by professional evaluators. But there are also systems in which, entities' management proceed to estimations by the means of internal specialists. In this case the auditors have to verify if the methods chosen by the management do correspond to the nature of the asset or of the liability evaluated. On the basis of relevant information, the decision makers must be able to diagnose the health of the company starting from well established criteria such as: the size of the guarantees offered; the capacity to get profits; the capacity of auto financing and of development. On the other hand, the utility of financial systems is determined by the creation of conditions in which the decision makers could identify and compare the information concerning enterprises among whom, there are or there are not relations. The failures of the accounting profession prove that information dissemination is presented as a real power source; dissemination process has been, many times, the result of the negotiations and of compromises between companies and the external factors. However, we should

not ignore the fact that information's users do have different interests. Therefore, those working inside the organization are interested in knowing business development strategy in order to adopt right decisions in managerial process. Users outside the company are interested in getting information in order to guide their relations with the entity in discussion. Usefulness of the accounting information in financial disclosure shall be tested under the circumstances in which receptors use it in order to understand enterprise's economic reality and to take the best decisions. Changes in this profession may be entered on the line to find a common language in the globalization's conditions. Professional's efforts converge to the internationalization of the accounting starting from the idea concerning "the homogenization of information provided, the analyze in time and space of accounting information […] but also the guarantee of other users regarding the consistency and rigor of the profession"[15]. Besides the lack of credibility and the distortions in financial reporting, the professional accountants have proved also subjectivism in determining the estimated values. In order to avoid such errors, we should take into account the adoption in every company of adequate accounting policies and of procedures manual which is held to follow: the solidity of accounting recordings; the manner used to conduct and to record the operations; the composition of the existing balances and accounts. Therefore, auditor has a very important role in implementing new procedures concerning the identification of various potential errors or frauds made by the accountants, which may affect financial health. In this respect, ISA 240 presents a series of elements supporting the auditors in order to identify and to assess distortion risks due to fraud[16]. The fact that we are going today through hard moments for the global economy characterized by instability and worry, force us to take measures for the future. First of all, auditors and accountants must reassess their role on the market and proceed to actions by which they are held to restore financial information's confidence for the safe of the entire economy.

2.2. The improvement of the accounting information's quality

A sound system managing financial reporting and statements, supported by high quality standards and also by appropriate regulatory and governance frameworks, does represent an integral part of the economic development. The benefits of accounting and auditing standards are various. In order to make profitable these benefits, we should surpass many obstacles. One of them refers to the quality of information provided by accounting and auditing. The quality of accounting information has been the subject of many theories in the field. All evaluation criteria concerning the accounting information arise from the objectives of financial information. Therefore, every change in the objectives' list will influence the characteristics of information. We could appreciate that, regarding the quality of financial and accounting information, it is strongly connected to the interest conflicts appearing between different economic actors being preoccupied by the entity's economic reality. Thus, internal audit gains a significant role for providing more value to the enterprise. Previous researches show that companies proving by their financial statements material deficiencies in their internal control system are included within the smallest, the newest and the weakest financial entities[17]. Internal control deficiencies could affect information's quality in two ways. One of these ways consists in allowing random and unintentional distortions, caused by the lack of appropriate policies, by the insufficient training of employees. The other refers to the failure in detecting intentional misrepresentations, caused by management or employees' omissions. Among intentional misrepresentations, it is necessary to bring into discussion during this paper, the following ones: the overstatement of profits for the current period; the opportunistic underestimation of current profits

[17] Doyle, J., Geb, W., McVay's, S., 2007. Determinants of weaknesses in internal control over financial reporting, *Journal of Accounting and Economics*, p. 193-223

anticipating weak future performances or even the creation of exaggerate reserves. The challenge for internal audit is to increase performance level consisting in providing information and comments on the deficiencies found, but also in optimizing the process of risks evaluation and in assuring the security of information systems. In the same time, internal audit should also enjoy the benefits of knowledge society and maximize information technologies' utilization. When the quality of accounting and financial information is higher, informational asymmetry between the various users is reduced. Therefore, at this point we could not ignore that companies are required to establish and maintain a quality control system assuring that the organization itself and its employees comply with professional regulations and standards in the field. They have also to assure that reports issued from the entity are in accordance with the current circumstances[18]. The interest of Romanian professional accountants concerning the contribution in enhancing the effectiveness of internal controls must be supported by local management practices. The purpose of the internal control is to increase the credibility of financial statements and reporting. Unfortunately, up to date, risk management has not been able to manifest strongly in Romanian enterprises. The organizational culture itself could not develop an environment suitable to control.

3. Knowledge society – a premise for the revival of accounting profession in Romania

In a knowledge society, nations' advantage will not result from their natural resources, nor from the cheap labor, but from their ability to valorize the intellectual potential and to use the information in an optimum way. The knowledge-based economy offers the premises for a better future. The development of information technology, doubled by a rapid increase in computing techniques creates a new vision of society's evolution, of its way concerning needs' identification and the establishment of new directions regarding the economic growth. At this moment we should renounce to consider information technologies as a method for spending money. New technologies represent a true investment, having an important role in determining the added value. As the global economy recovers, business innovation by the means of information technologies starts to get more substance. The extensive use of technologies in the management and processing of financial-accounting data, will determine effectively the quality of information provided. We consider that information is high quality when there is certainty that transactions took place, when they are authorized, registered and processed correctly and completely (ISA 315 clarified). The paper treats knowledge society and information society as premises of the revival for the accounting profession in Romania, depending on the fact that the professional accountants have an access to a collaborative work environment based on performing information systems. The information technologies available on software market offer various alternatives for the accounting profession. On the latter depends the choice of the optimum alternative but also the accountants' training and their lifelong learning perspective necessary for increasing their skills. Moreover, the rapid development of information technologies as well as their integration at the level of all companies' activities requires a particular emphasis on the aspects connected to computer systems used by the accounting profession. Integrating new technologies into the financial and accounting systems also provides a number of advantages including the assurance that information representing the basis of financial system is complete, accurate and reliable and it could be quickly transmitted to all users. Therefore, we should set up the adequate methodology which would support the professional accountants in verifying the credibility of financial systems. They have to make sure if internal control is efficient and whether regulations have been met. Another advantage refers to the idea that new technologies reduce many of the risks associated with the manual recording systems. Despite all these, new technologies do present a number of risks. Among the risks, the present paper highlights: the risk concerning the data which will be processed to be invalid, incomplete and to contain errors; failed results obtained by

[18] Cantwell, C., 2010. Considerații privind controlul calității firmelor de audit, *Audit financiar*, anul VIII, nr. 11, București: CAFR

data processing if there are modifications or if some important files are deleted; unauthorized or even inexistent transactions might be recorded; there might be cases when the users of information technologies are insufficiently prepared and they are supposed to process data for getting financial statements. Therefore, this study aims to attract the attention that information technologies are effective only if they maintain information's integrity and data's security. These new technologies must include general controls as well as specific controls regarding the applications in discussion[19]. In order to cover the risks of using information technologies, companies have the opportunity to resort to some particular internal control mechanisms. The objective of these mechanisms consists in: assuring compliance to settlements and regulations; realizing properly the financial reporting; conducting effectively the operations etc. Therefore, we consider that it is obvious for every organization to keep justifying documents in their traditional form. The possibility of a coherent risk management presents a lot of benefits that enhance the credibility of the accounting information. Audit as well as the accounting profession could be involved in achieving the entity's objectives and also in its reshaping. The integration of data's technologies in the software specific to company's needs might lead to a new development direction of the accounting profession. This direction aims to regain the profession's image and to achieve performance indicators.

Conclusions

This study highlights the implications of knowledge society for Romanian accounting profession. The knowledge-based economy creates new opportunities for a profession that has lost its credibility and image. The valorization of the intellectual potential and the optimum use of information should represent priorities for governments and also for the specialists in accounting field. Romanian society must face not only the radical change produced at political and economic levels, but also the significant mutations taking place at the global level. The transition of our society to the information system seems a very important component of the development strategy. The paper shows the way by which the accounting profession creates information in the current economic conditions. The purpose of this study consists in offering some perspectives concerning the improvement in the quality of financial information. During this paper, I proceeded to a review of accounting errors that led to the credibility's decrease of the information provided, without losing sight of the possible changes necessary to regain the image of the profession. The proposals of this study are supported by the advantages of knowledge economy and of the information society. The increasing complexity of business environment requires a continuous improvement of the information system and also its organization in a unified, an effective and a modern form. Information leads to managerial decisions. Therefore, managers appreciate more often information as a true resource that could give to its holder a competitive advantage. Applying new technologies in order to collect, to organize and to distribute information, we could reduce the physical effort and also the errors caused by the manual system of data processing. Technological progress has a great influence on the working methods of the accounting profession, on the level of competence required and on public needs. One of the conclusions of this paper highlights the idea that the value of the intellectual capital, the so-called *knowledge value*, represents a concept which could not be ignored any more. It is the time for the professional accountant to know how to create useful and credible financial situations, both for the enterprise's management and for its partners. In this respect, I consider that knowledge society offers the opportunity of a coherent information system. In the meantime, knowledge society could become the lever for the revival of Romanian accounting profession. The actors involved in accounting and auditing should make every necessary effort to improve the profession's image and to increase the confidence in accounting reporting and

[19] IFAC, 2009. Manual de Standarde Internaționale de audit și control de calitate. *Audit Financiar*, București: coeditare CAFR-Ed. Irecson

statements. This study aims to identify some perspectives of future researches. Among the possible directions of exploration, there are: finding alternative sources of accounting and financial information which are supposed to increase the quality of financial communication; determining the cost for effective information. The way by which we could assure a moral behavior for the professional accountant, might be an interesting topic of investigation for future researches too.

COMBINING MULTI-LEVEL AND NETWORK GOVERNANCE WITH A SPILLOVER EFFECT: THE CASE OF THE EUROPEAN "INNOVATION UNION" FLAGSHIP INITIATIVE

ANDRA POPA[*]
IOANA DODI[*]
OANA-ANDREEA ION[*]

Abstract
The purpose of this paper is to demonstrate the possibility of a theoretical up-grade to the framework offered by the theory of governance: from a middle-range theory to a full theory through adding a neofunctionalist component that would enhance its explanatory capabilities by projecting them at the systemic level. The authors have chosen, as a case study, the flagship initiative "Innovation Union" within the Europe 2020 Strategy; this initiative provides a set of actions that can be undertaken at different levels of political authority (supranational, national, etc.) and involving several types of actors (state, supranational, non-state, etc.), context which validates the theoretical components of governance, represented by multi-level governance and network governance. The authors consider that the integration of the research policy of the Member States will produce a spillover effect (in neofunctionalist terms) on other policy areas; the argument is based on the fact that the Europe 2020 Strategy, in general, and the flagship initiative "Innovation Union", in particular, require concerted actions within different policy directions (research, education, industrial policy, fiscal policy, employment, communications, environment, etc.), context that determines an "integration" trend of these policies on the basis of a spillover process. The authors believe that the integration of all policy areas involved in the flagship initiative "Innovation Union" would lead, through a spillover effect, to a better European economic integration. The normative foundation of the analysis is the Treaty of Lisbon, as the flagship initiative is part of the research and development policy of the European Union, in which the EU currently holds not only the competence to support, coordinate and complement the actions undertaken by the Member States, but also to define and implement programs.

Keywords: *Multi-Level Governance, Network Governance, Spillover, Europe 2020, Innovation*

Introduction

The global financial and economic crisis had a great impact on the European Union, cancelling part of the social and economic progress that has been achieved in the years preceding the crisis. Now, the most important objective of the EU is to recover soon and continue with the reforms. The world has changed, but Europe is still failing to adapt to the new reality around it. Besides the effort to overcome the crisis, the EU faces a number of other internal and external challenges (aging population, resource scarcity, climate change, globalization, the spread of new information and communication technologies, the emergence of new economic powers etc.[1]) which are continuously multiplying. In this context, it becomes imperative for the EU to reconsider its priorities and to

review its sources of competitive advantage on global scale. Europe's only chance to return as a major player on the international stage depends on all Member States acting together as a Union. Therefore, the current developments within the EU are an important testing ground for EU scholars, who can closely analyze the means through which the integration/convergence of the Member States can be achieved, thus developing an improved theory of European integration.

This paper is meant to explore the possibility of a (theoretical) up-grade of the theory of governance: from a middle-range theory to a full theory by adding a neofunctionalist component that would enhance its explanatory capabilities by projecting them at the systemic level. This research initiative is based on the belief that the great theories in European integration (neofunctionalism and intergovernmentalism) aren't able to explain the current developments of the EU and that the recent theoretical perspectives on EU governance (multi-level governance and network governance) aren't enough to form a comprehensive theory of EU integration (they seem to lack the prescriptive component). Thus, it calls for a rethinking of the EU integrationist theories in order to be able to reflect the present reality of the European Union.

The authors of this article believe that the good explanatory capacity of the EU governance theory, in both of its forms – multi-level governance and network governance, can be improved by adding a neofunctionalist component of spillover. For proving this assumption, we have chosen to analyze – as a case study – the flagship initiative "Innovation Union" within the Europe 2020 Strategy. We believe this initiative is the most important of all seven flagship initiatives because it focuses on innovation, a thing which, in our opinion, must define every EU policy in order for the EU to develop and to become a significant player on the global stage; thus, the integration of the research and innovation policies of the Member States can produce a spillover effect on other policy areas.

The theoretical framework of this paper is represented by the neofunctionalist approach and the theory of governance; these perspectives on European integration are presented in the light of the existing specialized literature in the domain and by trying to identify a correlation between them, in order for a new, more comprehensive EU integration theory to emerge. The methodology used for this article consists in the study of documents, especially research papers of the main authors in the field of EU studies or official documents of the EU, such as the Treaty of Lisbon and other documents that establish the framework and the functioning of the Europe 2020 strategy and of the Innovation Union flagship initiative.

The analytical approach is structured in three chapters as follows: the first chapter presents the theoretical framework of the analysis; the second chapter corresponds to the case study and the third is meant to draw the conclusions of the paper.

1. Theoretical Framework

1.1. The Theory of Governance

Within recent decades, the area of European Studies has become extremely flexible; the very concept of integration has been strongly challenged, both in terms of its traditional neofunctionalist perspective (emphasizing the importance of different types of actors pressing for integration, which would eventually lead to a supranational state able to satisfy both the security and welfare needs of its components), or from an intergovernmentalist point of view (focusing on integration as a type of cooperation between countries seeking to meet their national interests, like the model of classic international organizations). New approaches have emerged in the '80s, which were more interested in issues such as streamlining the decision-making process or in other aspects of daily political life; we are talking about "the governance turn", when studies became less concerned about international relations theory, but more focused on comparative studies and public policy. Currently, there are either theories concerned about conceptual clarification or theories which seek to build explanatory

political models, but, unlike the classical theories, they remain at a middle-range and seem to ignore the prescriptive aspect rather much.

Of all these middle-range theories, the governance perspective distinguishes itself both as a research interest in its own right and as an orientation that underlies the majority of the new approaches developed within the EU studies. In this case, the EU studies are perceived (see Chryssochoou 2009) as a combination of instruments coming from the two lines of research (the international relations theory and the comparative policy studies), in a context where traditional conceptions of both the international system and the nation-state are caused by a phenomena that determines a change of the old analytical categories (Chryssochoou 2009, p. 72)[2]. According to Rosamond, the questions addressed by this kind of analysis refer to "the nature of authority, statehood, the organization of the international system in the contemporary period", researchers being now less interested in explaining the EU *per se*, but more in the impact of the European construction on other factors/actors/ entities etc. (see Rosamond 2007, pp. 117, 119-121).

As we already stated within the introductory section, the purpose of this paper is to demonstrate the possibility of a theoretical up-grade to the framework offered by the theory of governance: from a middle-range theory to a full theory through adding a neofunctionalist component that would enhance its explanatory capabilities by projecting them at the systemic level.

Since the voices who insisted that the EU should not be considered strictly a classic international organization or a state in the making, have currently gained more power, the topical question remains: how can we tackle the EU phenomenon theoretically? By further applying the tradition of the great theories of integration or preferring to focus on particular aspects of the European experience? In our opinion, a solution may consist of the EU governance theory – one of the newest elements within the theories of integration – which distinguishes itself from the classical theories or form the once developed in the 80s especially through the way of conceiving/perceiving the levels of authority and the types of actors involved in the process of policymaking. However, a discussion about the theory of governance starts with the operationalization of the concept of *governance*. Analyzing the literature, we note that the presence of governance assumes an irregular distribution of power between administrative levels and between different types of actors (public and private, but also from the voluntary sector) and a constant process of negotiation between all these elements. One of its main merits is its capacity to bring together institutions and citizens (as individuals or, more often, as interest groups). When talking about governance, we tackle the issue of the "re-allocation of [formal] authority" in relation to state actors - individual decision-making levels, subnational (local or regional), supranational, international or transnational, are being developed - and the fact that "networks of diverse kinds have multiplied at every level"; therefore, we refer to the multiplication of actors, within an increasingly decentralized decision-making context (Hooghe and Marks 2001, p. 2; see also Gallagher, Laver and Mair 2006, p. 154).

As a working definition for governance, the following interpretation (proposed by Chhotray and Stoker) is worth mentioning: "governance is about the rules of collective decision-making in settings where there are a plurality of actors or organizations and where no formal control system can dictate the terms of the relationship between these actors and organizations" (Chhotray and Stoker 2009, p. 3). The debate on the idea of EU governance has occurred in the context of the extremely dynamic beginning of the millennium, when some European policy makers wanted to change the EU's institutional scaffolding for this to be consistent with new developments and the new political and social challenges. Thus, for the European Commission, the discussion on governance has been primarily centred on how the "the Union uses the powers given by its citizens" or on the existing solutions in order to increase transparency in policy making through involving as many elements of

[2] Pollack also believes that the development of governance studies has been influenced equally by both research perspectives (Pollack 2005, p. 42)

civil society as possible[3]. The proposals presented by the Commission in the *White Paper on European governance* for the achievement of the above mentioned objective, seek: (a) to increase citizen participation in the process of public policies making and bring greater openness to EU citizens, (b) to improve policies, regulations and results (quality improvement of the policy implementation process), (c) to promote global governance (increasing EU's role in the international system), (d) to redefine the role of EU institutions[4]. Summarizing the ideas of the European Commission, "«Governance» means rules, processes and behaviour that affect the way in which powers are exercised at European level, particularly as regards openness [of the European institutions towards other actors], participation [of actors], accountability [of actors], effectiveness and coherence [of policies][5]".

When exploring the theoretical aspects of governance, we must start by saying that the idea of governance is intensively used in analysis about the European Union, especially in its multi-level aspect - multiple decision centres, multiple territorial levels involved in decision-making, multiple actors (Chhotray and Stoker 2009, p. 16-22). In any case, in Gary Marks' articles, **multi-level governance** was mainly a simple description of processes related to the implementation of structural policies (George 2004, p. 107); this phrase (multi-level governance) was assumed later also by other analysts, like Liesbet Hooghe in 1996[6], at the beginning in similar contexts and afterwards in different other areas. The emergence and development of the concept of "multi-level governance" was determined also by the exponential growth of the number of analysis on the EU in terms of being a political system, in detriment of those interested in finding the causes and purpose of the integration process. Ben Rosamond argues that the EU has a vague character ("a hybrid form: neither political system nor international organization, but something in-between" – 2000, p. 110)[7], which is why studies on governance in general, and especially in its multi-level expression, are extremely useful for exploring the originality of this Union, which is seen as an expression of postmodernism; in this context, (multi-level) governance is not considered a theory, but more of "a metaphor used to depict the mature stage of the EU polity" (Rosamond 2000, p. 201), in which authority is no longer located within the nation-state, but divided among various types of actors involved in the decision making that simultaneously takes place within several levels. In the context of the governance turn that led to a shift towards "studying the EU as a political system in its own right", M. Cini sees multi-level governance as "an approach to the study of EU politics which emphasizes the interaction of many different actors who influence European policy outcomes" (Cini 2007, p. 460, 462)[8]. Papadopoulos (2005, p. 316) doesn't consider this phenomenon to be representative enough for an analysis; he is rather seeing it at the confluence between organizational theory and the policy networks analysis[9]. Thus, among the theoretical principles of multi-level governance features the fact that power is

[6] See Hooghe, Liesbet, ed. 1996. *Cohesion Policy and European Integration: Building Multi-Level Governance*. Oxford: Oxford University Press.

[7] For William Wallace, in the EU one should "remark on the persistence and adaptability of the provisional", that is why the organization is seen as "relatively stable *provisorum*" and "a partial polity", although it remains "a stable structure of collective governance" (Wallace 2005, p. 471, 473).

[8] A type of multi-level governance analysis preferred by "those studying federalism, decentralization, European integration, regional and global regimes" is the one which "prepares a list of policy areas and sees how authority is allocated among them" (Hooghe and Marks 2001a, p. 3).

[9] For other authors, multi-level governance is not an alternative in itself but a "gradual incremental development in which institutions still play a decisive role" as a "complement for intergovernmental relations in a certain regulatory framework" (Peters and Pierre 2004, p. 75-76).

spread among several levels of asymmetric authority and several actors - there are differences both horizontally and vertically - the interaction between public actors and other types of actors (coming from the secondary or tertiary sector) leading to the removal of "the debate about authority away from the zero-sum notions associated with discourses of sovereignty" (Rosamond 2000, p. 110).

Another aspect of governance is the **network governance** perspective of carrying out public policies, which is perceived as an alternative for hierarchy and market. Not denying the fact that following this "third way", most processes are conducted through a network, the term "network governance" as a mode of governance seems a bit restrictive; however, networks are just one part – although significant – of governance. Thus, in our opinion, governance represents a type of governing, and its two main characteristics are its multi-level aspect and the presence of networks. An analysis of the elements of network governance (Kohler-Koch 1999, p. 24; see also Eising and Kohler-Koch 1999, p. 6) would lead to conclusions on:

- The activating role of the state – through mobilizing stakeholders and carrying out strategies to "reduce transaction costs and give stability to self-regulatory agreements";
- The dominant orientation of decisions - the negotiation to achieve the common interest without omitting to maximize private interests (however, the maximization is, usually, a sub-optimal one, compared to other cases)[10];
- Models of non-hierarchical interaction, overlapped interactions, involving both public and private actors, which differ from one context to another;
- The dominant actors - different government authorities (not the "state" as an abstract entity) and numerous interest groups;
- The level of political action - difficult to identify, with horizontal and vertical cooperation actions in order to achieve goals; Kohler-Koch insists much on the idea of the emergence of problems associated with the application of the principle of subsidiarity within the EU (the "rise to provincialism and the exploitation of the general interest").

The relationship between multi-level governance and network governance remains rather loosely defined, although theorists explicitly recognize the link between the two events occurring within governance, still the nature and purpose of the interaction between the two aren't explained as accurate as they should be. Papadopoulos, for example, mentions the recent efforts on trying to tie multi-level governance, "which developed in response to state-centric approaches to integration – and the literature on network governance, which focuses on the local level, but also on specific policy sectors at the national level" (Papadopoulos 2005, p. 316). However, his own version of their correlation is not satisfactory: multi-level governance should be intrinsically linked to "formulation and implementation of public policies by networks" (Papadopoulos 2005, p. 316), but there may be networks operating at a single decision-making level, as well as multi-level process carried out through other means than networks.

In our opinion, governance can be interpreted as a mixture of different theoretical approaches brought together under the same roof, multi-level governance and network governance being the most developed of its branches. Multi-level governance or network governance, taken separately, may represent ideal and symbolic models for the European Union; as Bunge (1974) explains: having the same referent (the EU), the two types of governance can serve as models for different – competing or not (the new institutionalism or constructivism, for example) – theories. Put together, however, the two gain the valences of a middle-range theory that explains the daily political processes of the European Union; in addition, with a neofunctionalist input, oriented towards processes at systemic level, it could lead to a full theory of European governance, having a major predictive capacity linked to the development of the system.

[10] The consensus-oriented nature of negotiations and the "sub-optimal policy outcomes" within the EU would be determined by "the complexity" and "unpredictability of the EU policy agenda" (Eising 2007, p. 207).

1.2. The Neofunctionalist Theory

Many of the researchers interested of the phenomenon of the European integration (independent of the way one looks at it – as a process or as a final target) consider that between the concept of neofunctionalism and the notion of *integration theory* there is a practical equivalence and some of the main reasons for supporting this view are that this stream is omnipresent in the theoretical approaches concerning the EU and also the similarity between the development of the EU and the predictions of early neofunctionalist analysts. In fact, we can say that the experiences of the neofunctionalist theory – the fundamental explicative theoretic framework in the first years of the EU; the main theoretical opponent of the major stream developed afterwards, the intergovernmentalism; the current significant influence on the new types of analysis of the European frame – follow rather exactly the sinuous course of the evolution of the EU, all the way from the excessive optimism of the 50's, to the difficult times of the 70's and to the recovery from these during the 90's.

The key elements of neofunctionalism, according to the systematization of Ben Rosamond, would be the spillover and the loyalty transfer. From an adjacent point of view influenced by Charles Pentland, C. Strøby Jensen (2007) also mentions the thesis of the socialization of elites and that of the supranational interest groups, besides the spillover component, indicating that these three elements are perceived as "different reasons" aimed at explaining the "dynamic integration process".

The spillover process has been introduced by Ernst Haas and was afterwards refined by other researchers. The spillover refers to the way that the creation and deepening of integration in a certain economic sector will produce pressures for a wider economic integration in and outside that sector and for a higher authority given to the European level (E. Haas, 1968 *apud* Rosamond 2000, p. 60). The example that neofunctionalists prefer is that of the creation of the European Coal and Steel Community. In a context dominated by national sensitivities of the member units interested only in a formal cooperation limited at the lowest possible level, the evolution of the idea of spillover, monitored by the researchers concerned with the evolution of the integration theories, indicates however Haas's subsequent conviction related to the need for a strong supranational institutional framework that would be able to supervise and provide the essential impetus for integration, both in terms of its scope and the increase of its own authority in the new emerged space.

If we limit the analysis to the classic type of spillover supported at first by E. Haas, we can distinguish two types of spillover, differentiated by the importance it gives either to cooperation by areas and the pressures that are being involuntarily generated by it in the direction of a wider integration – functional spillover, or to a political input, as limited as it may be, which would provide the basis for a similar cooperation.

The second main element of the neofunctionalist theory is the so called loyalty transfer from the national to the European level, and one of the explications for this kind of transfer has envisages the exemplary manner in which the new institutions at this level are supposed to action, in a way that their relationship with the citizens will be almost as direct as that of the nation-states (or even closer in some areas). In fact, in order to maintain the accuracy of the terminology, the word "citizens" appears quite rarely in the neofunctionalist analysis, as they are more interested in the role of the supranational interest groups and elites, as it is indicated also in Strøby Jensen's two thesis. Thereby, by emphasizing the role of training and socialization of these categories (let us not forget that pro-European approaches that come from that loyalty transfer have a positive extrinsic motivation), Haas, however, seems not to regard the success of the integration process as an automatic consequence of the spillover, feeling the need of constant pressures of sub-national entities, but especially those of supranational ones (those new emerged institutions that would have a political development that would eventually get out of the control of the initial design established by egocentric states; the

phenomenon was actually proved by the evolution of the European Commission and the EU Court of Justice). In other words, it would also be necessary a political spillover[11].

The transition from the functional spillover to the political one, especially through the intervention of elites and interest groups, is insufficiently argued by neofunctionalists and often criticized by analysts. In fact, this extremely important role assigned to the elites was one of the main sources of critics towards neofunctionalism. We can recall for example Rosamond's vision that said that neofunctionalism is "an attempt to theorize the strategies of the founding elites of post-war European unity" (Rosamond 2000, p. 51) and also Strøby Jensen's questions regarding the importance of a „democratic and accountable governance" (Strøby Jensen 2007, p. 87).

Leon Lindberg seemed to be more interested in the way decisions were taken at the supranational level than in the change of attitudes and preferences, meanwhile Ben Rosamond points out the possibility that „the likes of Monnet were playing typical games of power politics, but employing the fashionable rhetoric of supranationalism and European unity" (Rosamond 2000, p. 53). Although the progress of the EU offered a possible answer to the critique regarding the democratic deficit and the opacity towards its own citizens by increasing the European Parliament's powers and through various programs of information/communication/consultation for direct contact with the EU's nations, the neofunctionalist thesis that stipulated that "interests, loyalty, and power must lie at one level or another: to be *retained* by states, or *transferred* to a new entity" has proven to be inadequate, given the fact that they can actually be "shared and dispersed" (Wallace 2005, p. 463).

For a while, neofunctionalism was an integration strategy with pretty convincing results in an environment clearly defined by researchers of the international relations as anarchical (or intergovernmental as the Europeans would put it). Despite the criticism that neofunctionalism had to face during the 60s and 70s, it (relatively recent) returned to the attention of researchers. As a concession to the years when neofunctionalism couldn't explain the evolution of the EU, Philippe Schmitter doesn't think that the EU will follow the steps that the nation-state made in its consolidation process, but neither the ones of an interstate organism, no matter under what aspect. He considers that what will remain will be something new, with "major implications for the actors, the processes and the outcomes of policy-making at all levels in Europe: supranational, national and subnational" (Schmitter 1996, p. 14), outlining the need for a level of authority that could avoid the situation in which the multiplying of actors should lead to "free riders" of the public policy making process (it is also reminded the important role that the EU's Court of Justice has had over the years in this respect).

The current rediscovery of the main concepts and principles of neofunctionalism may also mean their dilution in various research approaches that are resistant to the idea of building a mega-theory of integration and focused on explaining the specific elements of the EU phenomenon (the so called middle-range theories). Although constantly present in the explanatory dichotomy of the mainstream EU visions, neofunctionalism is in C. Strøby Jensen's opinion currently just a middle-range theory, „a partial theory […] which would explain some but not all of the European integration process" (Strøby Jensen 2007, p. 96).

[11] The definition of political integration and that of supranationality in Haas's case: (1) the political integration represents "the process whereby political actors in several distinct national settings are persuaded to shift their loyalties, expectations and political activities toward a new centre, whose institutions possess or demand jurisdiction over the pre-existing national states. The end result of a process of political integration is a new political community, superimposed over the pre-existing ones" (Haas 1968, p. 16); (2) "Supranationality in structural terms means the existence of governmental authorities closer to the archetype of federation than any past international organization, but not yet identical with it" (Haas 1968, p. 59).

2. Case Study

As mentioned before, the purpose of this paper is to demonstrate the possibility of a theoretical up-grade to the framework offered by the theory of governance: from a middle-range theory to a full theory through adding a neofunctionalist component that would enhance its explanatory capabilities by projecting them at the systemic level. After reviewing the main features of the theory of governance and of the neofunctionalist approach on EU integration, in order to sustain our assumption about making the two perspectives complement each other, we have chosen to analyze the flagship initiative "Innovation Union" within the Europe 2020 Strategy. From all the seven initiatives, we have chosen this one because we believe it is the most important of all due to the acute need of innovation in every policy field of the EU and the spillover potential of innovation.

2.1. Defining the Issue

First of all, we must define what we understand under the term *innovation*. Ann Mettler (2009, p. 14-15) cautions that innovation mustn't be seen only as a "social phenomenon that is mostly about research and technology", but as a means that provides change within the society (both in the economy and in the social structure); innovation shouldn't be considered an exclusive feature of private companies, which seek to gain profit through using it, because in the public or in the third sector innovation is also needed to "solve societal challenges or empower users and citizens". In the documents of the EU institutions, innovation is mainly seen as an instrument for increasing EU's economic competitiveness[12], but also as EU's "best means of successfully tackling major societal challenges"[13]. Thus, innovation is especially associated with research and technology through which new products and services can be delivered to the citizens, but it also implies a renewal of business and social processes and models.

The importance of research and innovation to the European construct is first stated in Article 3 (2) of the Treaty on European Union[14] within the Treaty of Lisbon[15], where, besides the commitment to enforce an internal market and work for the sustainable development of Europe, the EU engages to "promote scientific and technological advance". By including this statement in the General Provisions of the TEU, scientific and technical innovation becomes one of EU's core values; thus, every EU policy and activity must be designed and implemented in an innovative manner, by both using the latest technical and scientific findings and contributing to the development of new research outcomes.

[13] The European Commission, *Europe 2020 Flagship Initiative "Innovation Union"*, 2010, p. 2.

[14] When referring to the Treaty of Lisbon we mean both documents adopted in December 2007 and entered into force on 1 December 2009, i.e. the Treaty on European Union (TEU) and the Treaty on the Functioning of the European Union (TFEU); in all other cases, the document being referred to will be indicated: TEU or TFEU.

[15] Through its entry in force on 1st December 2009, the Treaty of Lisbon marks the adapting of the EU legislation to the global economic and political context of the early 21st century: a Union of 27 states - or maybe more sometimes in the future - that one can not apply the same rules which were valid for six states. As stipulated in the Treaty, some of the main changes in the functioning of EU institutions and to the EU in general are: the redefinition of EU powers, the strengthening of the role of the European Parliament and of the national parliaments, the social partners' active involvement facilitating social dialogue at all levels and the horizontal "social clause" etc. (For a brief review of the changes brought by the Treaty of Lisbon to the functioning of the EU, see http://europa.eu/lisbon_treaty/glance/index_en htm). The legislative and political reform within the EU has been necessary in order to create the favourable prerequisites for internal economic and social reforms, but also in order to strengthen the EU's external action.

The increased pressure for the progressive integration of research activities within the EU is revealed by the fact that, in the research and technological development field, the EU shares with the Member States the competence to legislate and adopt legal binding acts[16]. Thus, according to the TFEU (Article 4.3), in the area of research and technological development, the European Union is entitled to "carry out activities, in particular to define and implement programmes", but by doing so, the Union should by no means prevent the Member States from exercising their competence in this field. Articles 179 to 188 of the TFEU outline the main features of the R&D domain within the EU. Thus, the EU seeks to create a European research area (n.b. some sort of "internal research market") where researchers, knowledge and technology circulate freely, and supports research within the European enterprises, including SMEs, research centres and universities, by facilitating the cooperation between such entities at EU level, but also with similar entities from third countries. As mentioned before, the Union encourages research activities to be delivered within every policy field of the EU and urges for the dissemination and use of research outcomes within all its activities, which is expected to lead to an increase of the external competitiveness of the Union. In order to carry out the outlined objectives, the Union and the Member States have to coordinate all their actions in the field of research and technical development. Therefore the European Commission, with the support of the Member States, has the task of developing guidelines and indicators in this field, but also of creating the necessary conditions for a fair exchange of good practices and a just monitoring and evaluation process. According to Article 182 of the TFUE, a multiannual framework programme, which includes all EU actions in the R&D field, is adopted by the European Parliament and the Council, following the ordinary legislative procedure and after consulting the European Economic and Social Committee. This framework programme is implemented through a number of specific programmes, which are adopted by the Council acting according to a special legislative procedure after consulting with the European Parliament and the European Economic and Social Committee. All decisions regarding the establishment of the European research area are also taken by the European Parliament together with the Council on the basis of the ordinary legislative procedure, after a consultation with the European Economic and Social Committee. Therefore, we can conclude that, according to the Treaty of Lisbon, the decision making process in the field of research involves a multitude of actors coming from different levels of authority – national and European – which interact with each other in order to influence the research policy outcomes.

2.2. Presenting the Data

In a time of big social and economic uncertainties, like the period we are currently going through, after the global financial crisis, the best way for the European economy to recover is to capitalize the innovation and development potential of its Member States. To give an impetus to the EU's future development, the European Commission defined in March 2010, the Communication "Europe 2020 - A European strategy for smart, sustainable and inclusive growth", laying out the main objectives and initiatives for the Europe 2020 Strategy, which was approved by the European Council in June 2010 and thus formally became the new EU's development strategy. This isn't EU's first such attempt, because the Union went through a similar process in 2000, when the Lisbon Agenda[17] was adopted, whose final results were far below expectations. Hence, the following (justified) question may arise: why would Europe 2020 have a different fate from the previous initiative? One possible answer might be that, learning from past mistakes, in the new EU strategy,

[16] For more details about what a "shared competence" means, see TFEU Article 2 (2).

[17] The Lisbon Agenda was EU's development plan to turn the European economy into "the most competitive and dynamic knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion" by 2010 (*Presidency Conclusions* of the Lisbon European Council Meeting on 23-24 March 2000). Based on its modest progress in reaching its goals, seen at the mid-term report, the Lisbon Agenda has been reviewed in 2005 through focusing on achieving a strong and sustainable economic growth and on the creation of more and better jobs. In 2010, the final year of the Lisbon Agenda, its unfulfillment has been intensively debated upon.

the coordination of national economic policies and the monitoring progress will be stricter. This will be possible, especially due to new legislative framework provided by the entry into force of the Treaty of Lisbon.

The Europe 2020 strategy was designed as EU's response to the crisis and as EU's development plan for the next 10 years, which would make the EU smarter, sustainable and more inclusive. As stated in the European Commission's Communication[18], the EU will focus on 3 main priorities:

✓ Smart growth – the development of a genuine knowledge - and innovation - based economy,

✓ Sustainable growth – the establishing of a resource-effective, greener and more competitive economy,

✓ Inclusive growth – the built of an economy with a high employment rate, which will be able to ensure economic, social and territorial cohesion throughout the EU.

These three priorities, as well as the five goals[19], through which they are developed and given a more concrete shape, and the seven flagship initiatives[20], which support the strategy, all are deeply inter-connected. Thus, the strategy provides guidelines for actions to be undertaken, by both the EU and the Member States (as an example of multi-level governance), in policy areas such as education, employment, research, ITC, environment, energy, industry, economic, social and territorial cohesion. It rests on the idea that by taking a collective action in one domain (e.g. the coordination of Member States' research and innovation activities) – thus acting as a Union – it will encourage the integration of other policy fields as well (e.g. industry and employment). The strategy also provides an institutional framework which has the task to ensure the surveillance of the process and give it an integrationist boost[21]: the European Council first approves the strategy, the EU and national targets and the integrated guidelines and afterwards keeps an eye on the implementation of the Europe 2020 programme, while focusing, in its meetings, on specific issues (e.g. research and innovation). In each domain, the relevant Council formations ensures the implement of the programme through facilitating the exchange of information and good practices between different Member States; on the basis of a set of indicators, the European Commission will annually monitor the overall progress in achieving the Europe 2020 goals, but it will also assess the country reports and convergence programmes of the Member States, and make policy recommendations, warnings or proposals; the European Parliament has the task to convince and mobilize the citizens and the national parliaments to contribute to the success of the strategy.

Through the inter-connections it creates between different policy areas and the well defined institutional framework responsible for the strategy's management, Europe 2020 is a good example for the use of the spillover effect within the EU. Integrationist pressure in the policy areas targeted by the strategy is expected to come from the local, regional and national authorities within the Member States, as well. By involving these authorities in the development and the implementation of national

---

[18] The European Commission, *Communication from the Commission. Europe 2020 – A strategy for smart, sustainable and inclusive growth*, p. 10.

[19] The strategy sets five measurable goals to be achieved by the EU by 2020: - a 75% employment rate for women and men aged 20-64; - 3% of EU's GDP to be invested in R&D (by both public and private entities); - the reduction of school drop-out rates below 10% and at least 40% of 30-34–year-olds completing third level education; - the reduction of greenhouse gas emissions by 20% compared to 1990 levels, the increase of the share of renewables in final energy consumption to 20% and a 20% increase in energy efficiency; - at least 20 million fewer people in or at risk of poverty and social exclusion.

[20] As mentioned before, the Europe 2020 strategy is accompanied by seven supportive flagship initiatives, which demand actions from both the EU and the Member States: "Digital Agenda for Europe", "Innovation Union", "Youth on the Move", "Resource Efficient Europe", "An Industrial Policy for the Globalization Era", "An Agenda for New Skills and Jobs", "European Platform against Poverty".

[21] The European Commission, *Communication from the Commission. Europe 2020 – A strategy for smart, sustainable and inclusive growth*, pp. 28-31, 34.

reform programmes[22], side by side with the national parliaments, the social partners and the civil society, the strategy aims to establish a permanent dialog between different levels of governance and bring the EU decisions and initiatives closer to the stakeholders, to EU citizens (thus, moving towards a neofunctionalist loyalty transfer from national to the European supra-national level or to the regional and local level). Another implicit goal of the strategy is to encourage the establishment of policy networks within the EU in order to involve more citizens, business entities, civil society organizations and other public or private entities in the making and implementation of the much needed socio-economic reforms. In order to ensure both the loyalty transfer and the implication of various stakeholders in the success of the Europe 2020 strategy, several information programmes and consultations have been initiated by the European Commission, so that the importance of taking action towards the Europe 2020 goals is well understood by everyone and concrete measures will be taken.

As part of the integrated framework of the Europe 2020 strategy, the **Innovation Union flagship initiative** focuses on improving access to finance for research and innovation, and ensuring that innovative ideas can be turned into products and services that create growth and jobs[23]. The initiative is part of EU's efforts to achieve smart growth through improving the level and conditions for innovation within the Member States. It aims at readjusting the research and innovation policy to the societal challenges of the 21st century (climate change, resource scarcity, aging population, globalization etc.) by intensively exploiting Europe's innovative potential and strengthening every link of the innovation chain – from 'blue sky' research to commercialization[24].

As we said before, innovation is the fundamental value for the EU, therefore the initiative urges for the embracing of a strategic approach where all EU policies and funds "are designed to contribute to innovation[25]". This desire to make innovation a cross-cutting policy, is a sample of the functioning of the spillover effect within the EU: it is believed that, through integrating the innovation policies of the Member States, the appropriate conditions for the integration of other policy areas, such as education, industry, employment etc. are created. The European Commission[26] admits that the Innovation Union initiative has been developed and will only have the expected outcome when it is accompanied by other EU initiatives, such as An Industrial Policy for the Globalization Era, Digital Agenda for Europe, Youth on the Move, An Agenda for New Skills and Jobs, which are meant to improve the conditions for innovation through their specific lines of action. Other already much more integrated EU policy areas (i.e. single market, competition policy, trade policy) are also designed to support and strengthen the goal of achieving a European innovation union. This comes as a proof for the fact that, in the case of innovation, the spillover effect works both ways: innovation acts as an integrator for other EU policies, but, at the same time, the integration of the research and innovation field is encouraged by actions coming from outside this policy area. Responsible for the political boost towards the integration of research activities within the EU are the European institutions (the European Council, the EU Council, the Commission and

the European Parliament) which set out the main strategic guidelines and monitor the implement of the innovation agenda. According to the European Commission[27], the delivering and implementation of the tasks within the Innovation Union initiative fall in the burden of regional, national and European entities; thus a multilevel governance approach is imprinted to the process of creating EU's innovation union. The EU and national research policies have to be closely aligned and, in order to achieve that, all types of actors (local, regional and European) must act together creating a network for promoting innovation (this is a proof of the need for network governance in order to achieve the innovation union).

2.3. Data Analysis

In the next part of the paper, the main actions included in the Innovation Union initiative will be analyzed through the grid of the two European integration theories described in the theoretical part of the paper: governance and neofunctionalism.

One of the main goals of the European Union is to promote innovation throughout its member states and an important part of this process concerns the education of the European citizens. This involves improving the education system from every point of view. For example, one of the weaknesses of the basic education system that were identified by the European Commission refers to the gender dimension, more specifically the small percentage of girls that reach an advanced level in science in the case of some Member States[28]. The higher education system should also be strengthened in order to become more attractive to potential talents, offering smarter specializations across different fields[29]. Europeans must become more competitive in this R&D field because, as it is underlined in the European Commission's Communication regarding the Innovation Union Flagship Initiative, by comparing the number of researchers as share of the population, Europe is "well below" that of the US, Japan and other countries.

Therefore, the EU and the Member States will work together for promoting excellence in education and skills development[30] so that more young people are attracted and trained in the research field. The EU's support can be illustrated by the Marie Curie fellowships under the Research Framework Programme, and the one of the member states by the Finish example of using inter-disciplinary approaches in universities as to bring together skills from different areas. More specifically, the Member States must take provisions so that by the end of 2011, they have enough researchers as needed for reaching their national R&D target and so that they promote attractive employment conditions in public research institutions (it is outlined the importance of taking into account the gender and dual career considerations at the moment of developing these strategies). The role of the European Commission is to support an independent multi-dimensional international ranking system to benchmark university performance that will make it easier to identify the best European universities. Furthermore, the European Commission will propose an integrated framework regarding e-skills for innovation and competitiveness, in accordance with the stakeholders. Not only the national and supranational authorities should be part of this process, but also other actors, like the business sector, that should have a more consistent contribution to the curricula development and

[30] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 8-10.

doctoral training. As to make this possible, the European Commission will create *Knowledge Alliances*, which will support business-academia collaborations, in order to develop new curricula addressing innovation skills gaps. All these emphasize the fact that we are dealing with more than just a multilevel governance (highlighted by the national and supranational examples examined before), but with a real network governance, that involves not only actors from different authority levels, but at the same time from different activity sectors (like universities, non-state actors like the business sector, supranational state actors or national state actors).

Another important aspect of the R&D development is the creation of a European Research Area[31], which is meant to reduce unnecessary costs that may appear in case of duplication in national research. In 2012, the European Commission will propose a European Research Area framework and also a set of supporting measures to remove obstacles to mobility and cross-border operation, so that they can be in force by 2014. The neofunctionalist perspective in this case is obvious, given the spillover effect that is expected with the creation of the European Research Area, because first of all, a part of the national attributes in the research area pass on to the supranational level, and at the same time, this unification of an important part of the research policies will determine a wider cooperation in more aspects of the education national policies or even other policies (for example a possible harmonization of the PhD areas or an enlargement of the variety of these areas so that they can be correlated to the demands on the European single market). Along with the neofunctionalist theory, the multilevel governance is the component that can help us fully understand the integration process. Thereby, the collaboration between the European Commission and the Member States on account of reaching by 2015 the 60% target of the construction of the priority European Research infrastructures is significant, given the fact that they are already identified by the European Strategy Forum for Research Infrastructures (the European Commission), leaving the Member States with the mission of reviewing the Operational Programmes so that they facilitate the use of cohesion policy money for this purpose.

Furthermore, the EU funding instruments shall focus on Innovation Union priorities[32], making them more efficient in accordance with the European goals in this area. The idea of all EU research and innovation programmes focusing on promoting excellence at European level highlights the neofunctionalist effect of the spillover, which will determine the integration of research and innovation at the supranational dimension. As always, the spillover will affect other dimensions of public policies that have to be taken into account, such as the societal challenges, the industrial and technological priorities). In this case the European Commission, the supranational actor, plays the main role in supporting this part of the European Strategy, because it will design future EU research and innovation programmes and took the commitment to strengthen the science base for policy making through its Joint Research Centre (creating also a European Forum on Forward Looking Activities in order to add coherence and efficiency to this step).

The promotion of the European Institute of Innovation and Technology as a model of innovation governance in Europe[33] emphasizes the fact that the network governance pattern is clearly applied in the European innovation strengthening process, as the EIT must set out by 2011 a Strategic Innovation Agenda to expand its activities, close links with the private sector and build a stronger

role in entrepreneurship (thus outlining the importance of the cooperation between the state and non-state actors).

Due to insufficient funding opportunities for investing in innovation, European companies can hardly develop new products and technologies; therefore the EU aims to improve the innovative companies' access to financing. In order to do so, actions both at European and national level have to be undertaken; hence, a multilevel governance perspective is embraced. The main actor which ensures the implementation of all actions at EU level is the European Commission[34]: by 2014, it will have to make a proposal, to the Council and the European Parliament, for financial instruments meant to increase private financing in the field of R&D; by 2012, it will make sure that venture capital funds established in one of the Member States will function in the whole EU; it will strengthen cross-border investment in innovation and focus on innovative SMEs' financing problems; by 2011, it will make a mid-term review of the state aid R&D and innovation framework. In finding solutions for increasing private financing of innovation, the Commission will work closely with the European Investment Bank Group and other national financial intermediaries and private investors, thus creating a policy network for developing the best response to the critical gaps in investing in R&D. The European Commission had a spillover effect in mind when it engaged in liberalizing the venture capital market in order to ease investment in innovation. Since venture capital is a type of capital, it ought to "run freely" within the single market of the EU (free capital movement is one of the features of the European single market); by reading between the lines, we understand that the EU seeks to strengthen its single market and thus create an integrationist pressure on R&D and innovation. The European Commission plays also a mobilizing role through bringing together innovative firms with potential investors and building a network through which companies have better access to capital.

The establishing of the single innovation market[35] implies a series of actions to be undertaken at EU level – by the European institutions – and within every Member State (multilevel governance approach). One of the most important steps towards the integration of the EU innovation market is the adoption of the EU patent. The European Parliament together with the Council are encouraged to adopt the EU patent, its linguistic regime and the unified system of dispute settlement as soon as possible, so that the first EU patents be delivered in 2014. A significant pressure towards the integration of the European innovation markets is being delivered – through a spillover effect – from other EU policy areas such as competition policy (an effective competition policy is expected to stimulate the demand for innovation), environment policy (stricter environmental standards would stimulate eco-innovation) or telecommunication policy (the liberalization of the telecom market together with the GSM standard started the success story of mobile phones in Europe). Another important issue, having a spillover effect on the innovation domain, is the establishing of EU-wide standards. The European Commission plays the central role in integrating EU standards by presenting a communication accompanied by a legislative proposal on modernizing of standard-setting procedures in order to be able to enhance interoperability and stimulate innovation; the communication will include an analysis of how to adapt the standardizing system to a constantly changing environment, how this system could best contribute to EU's internal and external objectives and what kind of influence the European standardization system would have on innovation.

In 2011, under the guidance of the European Commission, both the EU and the Member States will engage in evaluating the regulatory framework of key areas such as eco-innovation and

[34] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 14-15.

[35] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 15-17.

the European Innovation Partnerships in order to identify which rules need to be changed, updated or introduced so that innovation can be promoted. By early 2011, the European Commission will present an action plan for eco-innovation, focusing on finding ways to achieve environmental goals through innovation (this action plan counts on a spillover effect resulting from the integration of the innovation field which will determine the integration of environment policies). Making use of the multilevel governance principle, starting 2011, the Member States and the regions will have to adopt budgets exclusively devoted to pre-commercial procurements and public procurements of innovative products and services. The European Commission has the task to provide the necessary guidance and create the financial support mechanism to help the regional and national authorities deliver the procurements in an open and non-discriminatory manner.

In the process of promoting openness and capitalizing Europe's creative potential[36], the European Commission plays a key role by collaborating with stakeholders for the development of a set of model consortium agreements, thus creating a policy network meant to ease the knowledge transfers and research collaboration initiatives. After working together with the Member States and the stakeholders, the Commission will have to present, by the end of 2011, a proposal for the establishing of a European knowledge market for patents and licensing. The initiative encourages the recognition of the so-called "fifth freedom" – the free movement of researchers and innovative ideas within the EU, which could be added to the four features of the European single market, thus consolidating it and making pressure towards the integration of the innovation markets. Through EU-wide networks (i.e. Enterprise Europe Network) large companies are brought together with SMEs, universities, research centres and communities of scientists and practitioners to exchange knowledge and ideas, but also contribute with suggestions to the improvement of the functioning of knowledge transfer offices within the public research organizations in order to make the results of publicly-funded research more available to everyone.

Another EU goal is to maximize the social and territorial cohesion, first of all by spreading the benefits of innovation across the Union[37]. The EU is a heterogeneous structure and any development initiatives must take this into account so that the effect of such action does not deepen the current gaps in the core of the Union. Consequently, the Innovation Union must involve all regions, avoiding the situation in which it produces disproportionate effects that result in less performing regions, endangering the convergence that has been reached so far. In order to succeed, the EU can use the Structural Funds, that are not fully taken advantage of and that should be used more effectively for innovation and achieving the Europe 2020 objectives, especially in a way that each region can become excellent in a certain area in which it has relative powers. Accordingly, the Member States should start improving their use of Structural Funds for research and innovation projects, by helping people to acquire the necessary skills in this respect and implementing smart specialization strategies and trans-national projects. The neofunctionalist element of the existence of trans-national interest groups can be found in this part of the strategy because it supports the cooperation between this type of actors and national state actors in the advantage of the supranational progress, which in turn produces benefits for all member states and European citizens. As a matter a fact, an important role is given to the Member States, which have to prepare post 2013 Structural Funds programmes with an increased focus on innovation and smart specialization. The spillover's influence is found here because of the crossing of different types of policies at the EU's level (that regard for example the structural policy and the innovation dimension).

[36] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 18-20.

[37] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 20-21.

The EU wants to increase the social benefits that innovation can produce[38]. The European Commission's document uses the phrase *social innovation* to define the idea that brings together the actors in charge of meeting this goal and the benefits of their set of actions. Although thanks to its influence in the institutional system of the EU and the fact that it represents the supranational interest, the European Commission may have a leading role (given the fact that it has made a commitment for: a) promoting innovation through the European Social Fund, which will be complemented by the social experiments developed in the framework of the European Platform against Poverty, b) launching a European Social Innovation pilot partnership that will provide expertise for the social entrepreneurs and the public and third sectors and c) supporting a research programme on public sector and social innovation that emphasizes on measurements, evaluation, financing and barriers to scaling up and development), it doesn't work alone, but in cooperation with the Member States (that will also have to step up efforts regarding the promotion of social innovation through the European Social Fund) and different non-state actors (like the social partners that are to be consulted on how the knowledge economy can be spread to all occupational levels and sectors). Consequently, we have a very good example of the functioning of not only multilevel governance, but true network governance, which involves supranational, national and non-state actors. Furthermore, the development of an Innovation Union becomes more than just a goal, but also a mean to be used as to increase the social welfare of the European society and its citizens, in an obvious use of the spillover, the main element of the neofunctionalist theory and in the same time the way that the EU uses as to gain the progress it aspires to, by using all the instruments it has at hand, even if that involves the need of further cooperation in that specific area or in other related ones.

The establishment of European Innovation Partnerships[39] is another important issue aimed to be delivered through the Innovation Union flagship initiative. A wide range of actors coming from both the European supra-national level and the national level, as well as from the local and regional level, are all involved in the creation and implementation of these partnerships (a multilevel governance approach combined with a network governance perspective): the Council, the European Parliament, the Member States, the industry and other stakeholders are first invited to determine the extent to which they will get involved in making these partnerships work; afterwards, they are expected to contribute with competences and resources to the achievement of each partnership goals. As to be expected, the central role in defining and carrying out of the European innovation partnerships belongs to the European Commission, which, alongside with the Council and the European Parliament, will secure the political support of each partnership. Following a neofunctionalist perspective, the Commission is the supranational institution which launches – after taking account of the Council's and European Parliament's views and of the stakeholders' opinion – a wide series of innovation partnerships in key areas addressing societal challenges and, more or less directly, watches over their implementation. For defining the EU innovation partnerships, the Commission has to first develop a set of selection criteria and a transparent selection process; afterwards, it has to present the partnership proposals which have met the criteria and then set out the governance and financial arrangements for the selected partnerships; last, but not least, the Commission would evaluate the efficiency of the partnerships and decide whether it is worth continuing with the partnership in the context of the next Research Framework Programme and under what circumstances.

[38] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 21-22.

[39] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 22-26.

The idea of creating innovation partnerships in areas such as energy and water supply efficiency, sustainable supply and management of raw materials, transport with lower greenhouse gases emissions, digital society, agricultural sustainability and active and healthy aging, comes from the belief that by contributing to the deepening of the integration of the innovation sector within the EU – through a spillover effect – an integrationist impulse would be given to other EU policy areas. An issue that requires special attention in the developing of the European innovation partnerships is the establishing of an appropriate governance framework for the implementation process of these partnerships. Thus, each partnership will be led by a Steering Board, composed of a certain number of high representatives of the Member States (Ministers), members of Parliament, industry leaders, researchers and key stakeholders; the board will be chaired by the lead Commissioner(s) and supported by a secretariat assigned by the Commission, but also by operational groups of experts, practitioners and users coming from both the private and the public sector. Once again, a multilevel governance approach is used alongside with a network governance perspective which has the purpose of bringing the policy making process closer to its stakeholders.

In the context of a globalization of the competition for knowledge and markets, Europe has to reverse "several decades of a relative *brain-drain*"[40], so that it can assure the possibility of remaining in Europe for the ones who leave their countries in search of a better career in the research field. The EU should work together with the Member States in order to take measures meant to ensure that leading academics, researchers and innovators reside and work in Europe, but also for attracting a sufficient number of highly skilled third country nationals to stay in Europe. For this end, both the EU and its Member States (as parts of a multilevel governance functioning) should treat scientific cooperation with third parts as an issue of common concern and develop common approaches. The European actor who plays an important role is once again the European Commission, that will propose common EU-Member States priorities in S&T as a basis for coordinated positions or joint initiatives vis-à-vis third countries.

After setting the targets and the measures which would lead to the establishing of the Innovation Union, the role and responsibilities of every actor engaged in this process, alongside with the evaluation methods must be very well defined[41]. In order for the research and innovation systems of the Member States to integrate, some reforms have to be made to their national and regional policies. For conducting this reform of the research and innovation policies, a multilevel governance approach needed to be embraced. Thus, the European Commission has identified the set of key policy features for a best-performing system. The Member States have to assess their research and innovation systems based on the features presented by the Commission and then define, within their National Reform Programmes, the reforms they need to undertake. In this multilevel policy framework, the Council – to be more precise, the Competitiveness Council component – could play an important role in monitoring the progress of the Member States on reforming their R&D policies via the integrated economic coordination framework, the so-called "European semester". The Commission will support the Member States in their assessments by facilitating the exchange of best practices regarding the reform of innovation policies between EU states. The degree to which the national innovation systems of the Member States converge and thus the European Innovation Union is achieved, are measured through two indicators set by the European Council together with the European Commission, which can be analyzed, in neofunctionalist terms, as being the institutions which monitor and boost the integration process.

[40] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 27-28.

[41] The European Commission, *Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions. Europe 2020 Flagship Initiative "Innovation Union"*, pp. 28-31.

The first indicator for measuring the performance towards the Innovation Union is the Europe 2020 target of achieving a R&D investment value of 3% from EU's GDP; the second innovation-related indicator needs to be developed by the European Commission. For finding the best way to measure the share of fast-growing innovative companies in the economy, the Commission will call on the help of Member States and international partners, thus applying a network governance approach. Last, but not least, the Innovation Union flagship initiative describes the role and responsibilities of each actor involved in creating this Union, by basically using a multilevel governance approach. Thus:

- the European Council is responsible for the coordination and the political impetus of the initiative;
- the Council should adopt the necessary measures for improving EU's framework conditions and, through its semester meetings as an "Innovation Council", should evaluate the progress and identify the areas where more actions are needed;
- the European Parliament should have annual debates on the progress of the initiative with members of national parliaments and different stakeholders (this way, a loyalty transfer – in neofunctionalist terms – from the national to the European level comes out);
- the Commission is responsible for developing the main lines of actions within the initiative, for assisting the Member States in their reforms and facilitating the exchange of best practices within the EU, but also for systematically monitoring the progress, reporting once a year the achieved progress and giving country-specific recommendations in the field of innovation;
- the Member States should reform their innovation systems, review their operational programmes co-financed by EU Structural Funds in order to respond to the priorities set by the Europe 2020 strategy and allocate extra financial resources for R&D and innovation;
- in the attempt to involve more and more stakeholders in the policymaking process, the European Economic and Social Committee, the Committee of the Regions and other stakeholders are invited to support the initiative and help disseminate the good practices;
- also for filling in the gap between the policymakers and the stakeholders, the European Commission plans to call for an annual Innovation Convention which would complement the European Parliament's debate on the progress of the Innovation Union;
- in the debates of the convention a large range of actors should be involved: Ministers, Members of the European Parliament, business leaders, deans of universities and research centres, bankers and venture capitalists, top researchers and innovators, and last, but not least, citizens.

Due to the fact that the actors coming from different levels of authority need to permanently interact with each other and act together towards achieving the integration of the R&D and innovation sector, we can conclude that a network governance perspective has also been in mind of the European Commission when writing this initiative.

3. Conclusions

The recent global financial crisis reshaped the international environment profoundly. As one of the important global players, Europe has to recover soon from the losses it suffered due to the crisis (i.e. economic recession in most of its Member States, the Euro-Zone crisis) and start engaging in serious reforms in order to ensure a better life for its citizens. The EU started reforming in 2009 with the entry into force of the Treaty of Lisbon and continued in 2010 with the Members States agreeing on the Europe 2020 strategy and its initiatives and with the setting of guidelines for future developments through the Project Europe 2030.

Regarding the process of European integration, reality has by far overcome theory. Classic theories have many times failed to describe the evolution of the EU and recent theoretical approaches seem to be incapable of fully explaining the complexity of the EU. In this paper, we followed the assumption that the theory of governance can be upgraded from a middle-range theory to a full theory by adding a neofunctionalist component to it, so that the explanatory capabilities of the governance theory can be increased and thus a more exhaustive theory of European integration can be developed.

In our attempt to prove our assumption, we first reviewed the main features of the theory of governance (putting a great emphasis on multi-level governance and network governance) and of neofunctionalism (especially the spillover element) as they are shown in the literature. Then, we applied these concepts on an EU initiative – the "Innovation Union" flagship initiative within the Europe 2020 strategy. Through our in-depth analysis of the initiative, we emphasized that the actions included in the initiative must be undertaken at different levels of political authority (supranational, national, regional and local), involving several types of actors (state, supranational or non-state actors) which permanently interact with each other – all these being characteristics of multi-level governance and network governance as components of the EU theory of governance. The analysis has also shown us that the initiative is based upon the belief that the integration of the research and innovation policies of the Member States would lead to a better economic integration within the EU, through the spillover effect it produces on other policy areas. The fact that the actions included in the initiative target not only the R&D policies of the Member States, but also other policies, such as education, industrial, fiscal, employment, ICT and environment, is very likely to create a spillover between all these policies. Through increasingly involving non-state actors (including supranational European entities) in the delivering of EU's innovation objectives, a significant loyalty transfer (in neofunctionalist terms) from the national to European level appears and thus the EU decisions are brought more closely to their true stakeholders, to the citizens.

The concrete examples provided by the "Innovation Union" flagship initiative come to acknowledge the fact that the current evolution and functioning of the EU cannot be explained solely through a governance perspective; multi-level governance and network governance aren't enough for delivering a full, exhaustive image on the present European integration process. Therefore, by adding a "touch" of neofunctionalism (some spillover effect) to the mixture, a clearer theoretical explanation of the real EU integrationist process can be provided. The initiative also shows that the gradual involvement of the stakeholders in the policymaking process (another aspect of neofunctionalism) can occur through using policy networks.

The implications of the conclusion we have reached after the analysis are quite important because this study aims to offer a different theoretical approach for the explication of the European integration process. The mixture of the two theories in order to create a new way of understanding the EU's internal functioning and its consequences for the future of the European construction seems to be the best theoretical framework for analysis in this area because it has a larger explanatory capability than other theories or than each part separately considered.

We believe that, when researching the European construction and its integration incentives, a particular, increasing attention should be given to the impact that the inter-connectivity and inter-dependence of various types of actors coming from different sectors of activities and different levels of decision-making have on EU law and EU's way of functioning. The main reason why it is imperative that this issue ought to be taken account of is the fact that there is a wide range of actors already involved in EU's decision-making (having specific ways of collaborating and acting, depending on the policy area in question) and this number is expected to increase in the future. The spillover effect is also present in more and more policy areas, transmitting integrationist impulses from one domain to another. Thus, we believe future research in European integration should focus more on combining the elements of the existing theories of integration – as we have done in this article – in order to develop a comprehensive theory of European integration.

THE ROMANIAN ASPECT OF THE E.U. GOVERNANCE CASE STUDIES: EDUCATUION POLICY AND ENVIRONMENTAL POLICY

OANA-ANDREEA ION[*]
MIHAI CARADAICĂ[*]
CODRIN CĂULEA[*]

Abstract
This paper belongs to the domestic studies which try to connect the Romanian research to the current debates within the EU studies. The authors' aim is to analyze the aspects and the implications of the EU governance at the Member States' domestic policies level, as most of these policies are currently facing the challenges brought by the Europeanization process. Therefore, the theoretical framework selected is the theory of governance, focusing on the explanatory and analytical opportunities of two components – multi-level governance and governance networks; in this way, it is underlined the separation from the classic model of relation between the (multiplied) levels of political authority (supranational, national, subnational) and the exponential increase in the number and types of actors participating at the decisional process and implementation of European public policy. Within the selected case studies (environmental policy and education policy), the authors advance a research structure with the aims (a) to identify the relevant actors involved in the policy-making process of these policies, at all stages of its cycle; (b) to offer an explanation of the types of interactions between these actors, and (c) to identify the influence these interactions exert on the communitarization pronounced tendency of some EU policy sectors. The analysis is performed in terms of the Treaty of Lisbon (the selected policies being part of distinct categories of the Union competences) and it is oriented towards the national level of the making process of these policies.

Keywords: *Multi-level governance, Governance networks, Environmental policy, Education policy*

1. Introduction

The theme of this article is extremely important in the EU studies: the analysis of the implications that the new policymaking methods have at the Union's and at the national states' level. Moreover, it is about analyzing the relationship between different administrative levels involved in the design and implementation of public policies and the relationship between different types of actors that influence all stages of the policy cycle. The actuality and the importance of the subject are determined, therefore, especially by the theoretical potential offered by the governance (through two of its components, multi-level governance and network governance), the researches built on this framework being still insufficient - both quantitatively and qualitatively – in order to simultaneously capture the common points, but also the diversity within the analyzed public policies. In addition, extremely interesting is the fact that the EU "realities" can differ from the national ones, in terms of authority levels and actors involved in various policies.

Therefore, our option was to select two case studies – the environmental policy and education policy – and to try to build a triple-founded research structure: (a) the identification of the relevant actors involved in the policy-making process of these policies, at all stages of its cycle; (b) the

explanation of the types of interactions between these actors, and (c) the identification of the influence these interactions exert on the communitarization pronounced tendency of some EU policy sectors[1]. The researches we want to accomplish by subsequent steps are double-oriented in what concerns the triad actors-relationships-consequences: firstly, it is envisaged the situation existing at the EU level; in the second row, we consider the situation of Romania, in which case, to better reflect the before-mentioned triad, we narrow the scope of the research and we refer to two specific cases: (a) the Sectoral Operational Programme Environment (environmental policy), (b) the legislative framework, including the recent National Education Law (education policy).

It should be noted here that the choice of these two case studies is not accidental, being based on the Treaty of Lisbon, document where there are explicitly listed the „categories and areas of Union competence". Thus, environmental policy belongs to the „competence shared between the Union and the member states" section, while education policy can be found within the EU „actions to support, coordinate or supplement the actions of the Member States" area (TFEU, art. 2). These are counter-intuitive cases to be analyzed in terms of governance[2]; however, also following the works of other EU and governance-interested scholars[3] (mostly foreign analysts, because these studies are still at the beginning in the domestic academic landscape), we selected them in order to test the explanatory power of the theory of governance. Therefore, the theoretical statement that we submit to tests is this one: whatever the nature of the EU policies, in Romania one can hardly talk about governance, as the involvement of several levels of authority and of several types of actors is precarious.

The structure of the article will comprise two parts: the theoretical framework and two case studies in the second part. The theoretical framework (second chapter) will try to cover the aspects of governance, more exactly Multi-Level Governance and Network Governance, and also a broad frame of works on public policies, Europeanization and the relation with governance. In the third chapter, we will analyze two case studies – environmental policy and education policy – and how the theory of governance can be applied to them. In both cases we tried to build a research structure based on three elements - identification of the actors, the relations between the actors and the influence these interactions between the actors have on the EU integration process. We identified the actors who operate in both European and Romanian environmental and education policy, the interactions between supranational, national, regional, local or non-governmental actors, when it was the case, and also how these interactions provide the factors for multi-level governance or network governance.

2. The Theoretical Framework

Although in Romania there have been very few academic writings on topics such as governance or its components; nevertheless, in spite of a fairly reduced number of local contributions on the topic, the issue of governance, as a theory as well as a practice, is a widely spread one in foreign research groups. Therefore, the attempts to coagulate a theory of governance that would properly apply to the space of the European Union and the conduct of precise analyses by which well defined sectors of the EU political and institutional construct are studied through a focus on

[1] Despite the fact that the entry into force of the Treaty of Lisbon abolished the pillar-based EU structure, we use the "communitarization" notion to underline the well-known processed of integration deepening in different (more or less) EU-determined policies.

[2] One should not forget that the governance studies applied within the EU framework firstly developed in areas of policies that usually belong to the Union's exclusive competence.

[3] For example, Piattoni (2010) – in a volume about the multi-level governance theory – has the same case studies; however, our contribution is different for two reasons: (a) her selection was determined by different arguments (mainly, the probability of some EU policies to subscribe to the multi-level governance pattern); (b) our approach innovates on the applicability dimension, as we explicitly take into consideration the policymaking at the national level.

governance components, have represented for almost twenty years a well-established path within the European (but not only) studies.

2.1. Governance. The Theory of Governance: Multi-Level Governance and Network Governance

Defining the concept of governance can take into account more dimensions: definitions comprised in lexicographical papers; definitions offered by different researchers in the field of (but not limited to) political science, interested in the phenomenon of governance; definitions present in the glossaries of large (international) organisations that are more or less influenced by this process.

There are several reasons for which it is extremely difficult to talk about a commonly accepted definition of this term. Firstly, the theorisation of governance as a distinct phenomenon is relatively recent (twenty years at the most, period in which considerable changes have occurred in the perception of this phenomenon, making it even more difficult for us to talk about continuity of visions), leaving insufficient time for researchers to agree on a general and relatively stable framework for defining the term. Secondly, the conclusion has been reached that there are several political, economic, as well as social sectors that are affected by the reality of governance, reason for which the unifying of these descriptions has turned out to be not so much only a difficult process, but also an impractical one. Thirdly, even when analyzing a single well-defined sector, the variety of aspects associated with governance, concerning the actors involved, the possible relations between them, the management of such interactions etc. leads to a great range of interpretations and descriptions.

From the perspective of political science and to better serve as a working definition of governance, we decided to work with the definition proposed by Chhotray and Stoker (2009, p. 3) on this concept: „governance is about the rules of collective decision-making in settings where there are a plurality of actors or organisations and where no formal control system can dictate the terms of the relationship between these actors and organisations". Thus, governance has a concrete dimension, involving interactions determined by political factors (negotiation between „conflicting power positions and perceptions") of human factors characterized by „bounded rationality" (Chhotray and Stoker 2009, pp. 3-6). We believe that the implications of this definition should be further clarified in respect to:

• (i) the rules of collective decision, both formal as well as informal, and (ii) the wide applicability of governance both for systemic activities and ordinary activities, as one has to point out to the fact that regardless of the decision type, this decision should be made, as much as possible, by negotiations, be they formal or informal;

• (iii) the fact that the state remains the most important actor of these processes, without having – in general or evermore often – the capacity of directing the game, but rather of coordinating and influencing it;

• one should also add another point, (iv), in order to mention the multiplication of decision making levels as well as the predominance of networks as means of tackling the collective action processes.

Here is a schematic presentation of the ideas concerning the *main traits of governance*, traits that one can also find in the case of the European Union:

Structure	Plurality of decision centres No clear hierarchy between these various centres The presence of networks as decision structures formed by „relatively stable relationships between formally autonomous organizations or actors" Decision making units formed on functional criteria, not territorial ones.
Actors	The access of actors to decision making structures is relatively easy. By actors they understand the representatives of the public sector (mainly the ones with administrative

	roles and not directly elected by citizens), private or non-profit sector, but these authors place their emphasis on "collective actors", interest groups that have the capacity to influence the decision making process.
Decision making process	Based on negotiations, a system often configured by informal strategies, showing too little transparency and legitimacy from a democratic point of view[4].
Source: Adaptation after Benz and Papadopoulos 2006, pp. 2-3.	

In order to be able to talk about a theory of governance as a political theory, in a general sense, or as a theory of integration, in a more particular sense[5], that theory must fulfil several functions. For example, on the lines suggested by Diez and Wiener, it should have the functions of:

1. explaining or understanding the causes or the unfolding of a phenomenon;
2. describing and analyzing, aspect which infers "development of definitions and concepts (…) labels and classifications";
3. critique and normative intervention; this refers to questioning the existing realities or offering „normative alternatives" (Diez and Wiener 2009, p. 18).

Additionally, one has to identify the area of research targeted by the theory, with the relation between the three possibilities being a variable one, in accordance to their being defined as dependent or independent variables:

1. the political system (*polity level*) a whole;
2. European policies (*policy level*) from the EU perspective and the perspective of the member countries;
3. *politics level* – day to day political phenomena (Diez and Wiener 2009, p. 19).

From our standpoint, in the case of the EU, there is a theory of governance localized at a middle range of generality[6], in other words, applicable to at least the areas of policy and politics. This theory satisfies the above-mentioned functions by two major components: *multi-level governance* and *network governance*.

Multi-level governance (MLG) represents a phrase whose appearance in closely linked with the European Union, with it being used in the beginning of the '90's by Gary Marks in order to describe the, novel in his opinion, way in which a public policy was forged within the EU: this concerned the administration of structural funds from different regions of EU member states, activity undertaken in a partnership by different types of actors (public and private) located in different administrative levels (supranational, national, sub-national). Currently, this practice has expanded to other policies. What would be the advantages of a MLG in the EU? European integration and multi-level governance intersect of several key traits: a decision making process that equally involves different levels of authority, a decreased weight of the state actor – in a post-westphalian definition – in this decision-making process, the fact that a hierarchic perception of these decision making levels no longer exists, fact which determines the acceptance of the involvement of different types of actors at any level, in different policies (Hooghe and Marks, 2001). Referring to the European Union, Rosamond sees the attempt to highlight the complexity of the European structure as a fundamental trait of the MLG approach, with emphasis on the „variability, unpredictability and multi-actorness" involved and the „fluidity, the permanence of uncertainty and multiple modalities of authority"

[4] Which is why, in the governance case, the authors give a secondary role to parliaments.

[5] As a brief academic support regarding our understanding of the meaning of (a) „political theory" and (b) „theory of integration", please consult (a) *The Blackwell Encyclopaedia of Political Thought* (Basil Blackwell 1991, second edition), translated in Romanian as *Enciclopedia Blackwell a gândirii politice*. Bucharest, Ed. Humanitas, 2006 and (b) Diez and Wiener 2009, p. 4.

[6] About „middle-range theories" in general see the contribution of Robert K. Merton in the mid-twentieth century (Chelcea 2004, 40). Considering the middle-range status of the governance theory, see Rosamond 2000 or Hix 2005.

(Rosamond 2000, p. 111). For Papadopoulos, MLG represents a result as much a solution for „resource dispersion and to social fragmentation" (Papadopoulos 2005, p. 318).

All this considered, the orientation towards multi-level governance does not represent a panacea for the formulation of policies in a political system characterized by complexity and fragmentation, for several reasons, either general ones or defined strictly by reference to the EU. Here is a short presentation of these considerations, as described by Papadopoulos (2005, p. 322):

- there is no presence of key actors defined by the control of different types of resources (financial, of authority, of knowledge), within the essential points of MLG, reason for which the entering of other actors that only posses the quality of having been chosen democratically is complicated;

- the complicated structure of MLG is in itself lacking in transparency due to the informal nature of many decisions;

- there are credibility costs related to the involvement of decision making factors (the decreased credibility being associated, for example, with the increased resistance by the affected groups to the implementation of policies);

- the presence of more actors is often translated in a decrease in the intensity of the decision-making responsibility experienced by each individual unit. Furthermore, each unit is responsible before different political, economical and social groups, which does not lead to a greater overall responsibility before all of these categories, but a blurring in the collective responsibility, etc.

Despite all these deficiencies, the balance between the advantages and the disadvantages of using MLG looks tilted towards the positive end, with many researchers preferring to highlight its positive aspects.

Network governance (NG) represents, unlike multi-level governance, a concept also applied in contexts different to the EU space. In general, as a specific manifestation of governance, it is an insufficiently clear term that indicates a multiplication in the number of actors and a dislocation of decision-making authority from central level (DeBardeleben and Hurrelmann 2007, p. 3). For Torfing, according to an analysis of the specialized literature and especially Rhodes and Jessop, governance networks refer to:

„(1) relatively stable horizontal articulations of interdependent, but operationally autonomous actors who (2) interact with one another through negotiations which (3) take place within a regulative, normative, cognitive and imaginary framework that is (4) self-regulating within limits set by external forces and which (5) contributes to the production of public purpose" (Torfing 2005, p. 307).

The following table shows in a structured manner part of the arguments and explanations that Torfing initially presented in favour of the upper-quoted definition.

Keyword	**Argument/explanation**
Interdependence	Resources, capacities
Autonomy	There are no hierarchical constraints in order to adopt certain decisions; voluntary involvement in network processes.
Horizontal	There are no hierarchies, but there are differences in power and resources that do not allow for the monopolisation of control.
Negotiation	Involves a mixture of talks (for maximizing results during a decision making process that does not use unanimous voting) and deliberation (for the consolidation of certainties in the system, the increase in expertise by learning from past lessons and by facilitating the creation of common meanings between actors).
Normative, cognitive and imaginary framework of regulation	It is not „an institutional vacuum, (but) a relatively institutionalised framework, which is more than the sum of its parts, but does not constitute a homogenous and completely integrated whole". The structure and way in which the network functions may change according to the actors, the stakes etc.
	„It has a regulative aspect, since it provides rules, roles and procedures; a normative

	aspect, as it conveys norms, values and standards; a cognitive element, given that it generates codes, concepts and specialised knowledge, and an imaginary aspect, seeing as it produces identities, ideologies and common hopes".
Self-regulation	Implies the delimitation from the political hierarchies of the state, as well as from the rules of the market.
Set boundaries	There is, however, „a particular organisational environment that must be taken into account, since it both facilitates and constrains their capacity for self-regulation".
Public aim	Network governance appears within well defined policies in the wider context of public interest.

Network governance is sometimes perceived as a third way, an alternative to the state and markets. We have summarized in a chart the differences identified between these three ways of achieving the goals of a system. One also should specify that the information included here are mainly based on a previous article by Torfing, as in a paper written in 2007 together with Eva Sørensen he reproduces, at least for this part, the analysis from the original article:

Presented difference	**Network governance**	**State**	**Market**
Relationship between the actors	Pluricentric governance system (actors are interdependent, but relatively autonomous, with a common public goal)	Unicentric system	Competitive multicentric system – actors with no common goals or obligations
Decision making	Reflexive rationality (based on interaction and negotiations)	Substantial rationality (emphasis on values and norms)	Procedural rationality – "invisible hand" type
Compliance with collectively negotiated decisions	Trust in the other actors and political agreements according to self-constituted rules and norms	Legal sanctions	Economic loss
Information processed from Torfing (2005, p. 309), Sørensen and Torfing (2007a, pp. 11-12).			

Generally, taking into account the feedback from the academic environment as well as the one coming from the political area to which the NG is actually applied, the advantages brought upon by using NG can be summarized as follows:

- by involving more actors, NG has a deeply democratic and legitimate character;
- NG increases the efficiency in the realization of public policies process by influencing all of its stages: it entails technical benefits by facilitating access to know-how even from the early stages, due to the diversity of the categories involved, contributing to a better identification of the public involvement necessary (by consulting all the interested parties, reason for which the decision making process obtains an increase in the level of information in accordance to which the respective policy is to be formulated), as well as the solutions for it (solutions that should not be directed towards a single group of beneficiaries, but satisfy the interests of as many groups as possible, with the aim of minimizing the possibility for the emergence of an opposition to the policy implementation);
- the fragmentation and dynamics of the political system are well controlled by NG, with the rate of consensus occurrence versus crisis occurrence being clearly in the favour of the first one.

One also has to point out to the fact that network governance does not represent a universal solution to the problems of collective decision, for two reasons. Firstly, the evolution of network is on many occasions unpredictable, with it being dependant on certain variables. Secondly, the networks structure itself can induce objectionable effects or even lead to "the failure" of such networks. Amongst the vulnerabilities of NG one can mention „precarious social and political processes", „uncontrollable political and economic context", „high transaction costs", „small

immediate chances", „common solutions that [usually do not] go beyond the least common denominator", „difficulties identifying the relevant political authority with whom to negotiate its policy proposals" (Sørensen şi Torfing 2007b, p. 96), whilst the failure of governance networks[7] is seen as the „inability to provide effective governance through negotiated interaction between a plurality of public and private actors"; in other words, one can also discuss in terms of „the failure to balance openness and closure, consensus and conflict, and efficiency and legitimacy" (Sørensen and Torfing 2007b, pp. 97, 110).

The applicability of network governance to the EU can be given, on the one hand, by the structure of the European institutional system („a multi-level structure, the combination of supranational and intergovernmental elements, and a strong role for the judiciary" - Eising and Kohler-Koch 1999, p. 269), and on the other, by the decoupling of competences associated with different stages of forging a policy, with the conception most often being associated with the supranational level (with a tendency towards consensus, be it formal or informal) and the implementation, to the national one; the key words than can describe this system are fragmentation (if we take into account the extreme specialization present within European institutions), homogeneity and fluidity, especially due to the upper-stated reason – the involvement of more actors just in the policy formulation stage, but not in the implementation one, that takes place at a national level, often involving the same people; the competences of those involved are, therefore, not only different from one policy to another, but they also vary in the separate stages of the policymaking cycle (Eising and Kohler-Koch 1999, pp. 269-271).

2.2. Public Policies, Europeanization and Governance

But what kind of policies can we identify within the EU? One way of classifying policies within the EU could be that of considering the different „categories and areas of Union competence" as defined by Treaty of Lisbon (TFEU, art. 2-6): (a) Union's exclusive competence (concerning legislative issues), (b) competence shared between the Union and the member states and (c) EU „actions to support, coordinate or supplement the actions of the Member States", whilst also keeping in mind the areas of special policies, such as the economic ones or the ones regarding the occupation of the labour force (fields in which states only coordinate their actions) or the common foreign and security policy (with competence falling to the Union, but also with specific procedures that preserve the main role for intergovernmental actors, such as the European Council and the Council of the European Union).

What do the majority of these extremely different types of policies have in common? One possible answer is the following: the process of their realization involves multiple levels of authority and most often it takes place inside networks that appeared in the context of developing public policies specific to the EU. One can notice the fact that, from this perspective on governance, the process of policymaking involves multiple categories of actors, differentiated according to administrative levels on which they operate as well as in compliance to their own constitutive character – public, private, non-profit – that determines their agendas and extremely varied interests. Applying this to the case of the European Union we can talk about:

• **Supranational actors**: from the category of supranational actors involved in the EU process of governance one can mention the European Commission, the European Parliament and the European Court of Justice, alongside a multitude of organisms created by the Union with the aim of obtaining a better regulatory process in different sectors of policies;

• **Intergovernmental actors**: The European Council and the Council of the European Union. In the whole of their existing working formations, as well as the dual character by which they are

[7] The meanings of the "governance failure" concept may be: failure of the actors, suboptimal results compared with other modes of governance, the divergent interests of the actors involved, poor management of the network (Chhotray şi Stoker 2009, pp. 48-49).

defined (common institutions and national representatives of the member states), they remain, to a overwhelming extent of actions, the expression of a intergovernmental philosophy;

• **National actors**: member states, each with their own agenda derived from distinct national interests;

• **Regional and local actors**: the process of policymaking at EU level cannot ignore the existing political, economical and social differences existent not only amongst member states, but also within them, with each national administrative unit presenting its own internal organization and decentralization peculiarities, fact which require – to a smaller or larger extent – the involvement of regional and local authorities in the decision making process;

• **Actors from the secondary and tertiary sectors**: aggregated in a manner organized according to the groups whose interest they represent, this type of actors exercises their presence in all the administrative levels by constant attempts to influence the design of the different types of policies in question, with the major impact taking place at the highest level – EU institutions – by specific lobby actions undertaken both directly and indirectly. In this context, one can discuss the pressure of national representatives, national authorities, or the business environment (multinational, national and local companies), worker unions from different economic sectors, NGO's (cf. Cuglesan 2006) and even individuals.

More authors are drawing attention to the differences that exist within the European policymaking process between the conception and implementation stages, or between the cycles of realizing different policies (Wallace W. 2005, p. 458; Kohler-Koch 1999, p. 29). Cini (2007, p. 6) or Andersen and Eliassen (2001, p. 16) admit to the fact that **one cannot discuss a unitary European policymaking process**, taking into consideration the major intra-sectors differences. Similarly, Warleigh (2003, p. 22) finds that there is no unitary policymaking process because of the variations (in terms of „decision rules and policy styles" and involved actors), within the EU, depending on „the policy area and the stage in its development". Concerning variations at the level of member states, one has to emphasize the fact that the policymaking cycle raises issues especially in the stage of effective implementation[8]. The reasons are extremely different and often transcend the unwieldy structure of the normative apparatus of the Union, thus leading to many situations in which there are major discrepancies between the form in which certain laws (that one could even refer to as being progressive) are adopted and what is actually put into practice (Gallagher, Laver and Mair 2006, p. 143), and the deviations are mostly caused, willingly or not, by national authorities trying by any means at their disposal to firstly satisfy the national interest and/or minimize the electoral costs of that particular government. Moreover, the involvement of sub-national authorities varies from one state to another, mainly because of the states' different internal structure (Gallagher, Laver and Mair 2006, p. 164).

Hofmann and Turk claim that any discussion about the "transformation of forms of government and governance in Europe" should be based on analyzing the stages of the public policy realization process which involve public actors from four levels – sub-national, national, supranational and international – and the institutional configuration that determines the degree of involvement of the supranational level in the process (direct involvement, actions taken through states or mechanisms of influencing just the national normative framework). In theory, the majority of the implementation process takes place, according to the "executive federalism", with regard to the principle of subsidiarity which states that supranational intervention should be limited to the cases in which the decision making process efficiency would be potentiated by its presence. In fact, the cooperation between all administrative levels would be felt during all the phases of the policy realizing process, therefore in the implementation phase as well, hence leading to "a multitude of

[8] For more information about the typology of implementation measures that may lead to differences, see Hofmann and Türk (2006, p. 74): „rule interpretation, rule application, rule-setting/rule-evaluation, approval of funds, the extension/new specification of funding programmes and information management".

institutional structures and ad hoc policy solutions" united under the general concept of „the EU administrative network" (Hofmann and Türk 2006, pp. 1-3). In this way, the bottom-up „transfer of competences" actually „increased the demand for implementation at European level"; this process is possible by vertical and horizontal cooperation (contextualized depending on the field under scrutiny), most often regulated by the secondary law of the Union (Hofmann and Türk 2006, p. 75).

The analysis of the EU public policies in regard to the impact governance has on the way such policies are realized has to take into account the phenomenon of Europeanization[9], as this usually influences EU policies and the policies of its member states.

Europeanization: National Institutions with European Policies

There are "different levels of Europeanization" according to Radaelli (2006/transl. 2009, p. 113). Thus, the influence of the EU governance on its member states should depend on three variables:

a.*the EU type of governance* – the functionalist spillover on the level of extended integration cannot be equivalent to an assimilation by member states of the modes of governance, especially since these are so different from one sector to the other;

b. *types of governance on the national level and „the degree of their institutionalisation"* – widely varied. Nevertheless, the top-down penetration is mainly achieved by policies, with the national institutional system being less affected;

c.*the ratio between costs associated to adaptation to the European norms and the potential further benefits of such adaptation*. If between points a. and b. from above significant differences should appear, a possible outcome would be the reification of the network (Eising and Kohler-Koch 1999, pp. 278 - 280).

Some authors consider that adaptation to the European context would present a greater challenge at policy level rather than at the level of national institutions (Eising and Kohler-Koch 1999, p. 284). Metcalfe also draws attention to the impact that the policy internationalization process has on the states, exemplifying by EU member states that have to permanently adjust to the EU *acquis* in order not be subjected to pressures by different interest groups[10] that could "begin to disregard the national level and jump directly to the European one", situation that could even lead to interferences with the national interests of governments (Metcalfe 2008, pp. 107, 132). Be that as it may, top-down Europeanization doesn't always act in perfect accordance with the lines established by the stakeholders in Brussels, with situations existing in which the implementation of a central norm would be reported as a success, without taking into account the way in which the rule was reinterpreted on the field (the member states, in this case). A good example of such situation is the implementation of the subsidiarity principle[11] - focal to the EU – and the negotiation of its sense (by

[9] One of the most frequently mentioned definitions of Europeanization is that of Radaelli, for which it means „processes of (a) construction, (b) diffusion, and (c) institutionalization of formal and informal rules, procedures, policy paradigms, styles, 'ways of doing things', and shared beliefs and norms which are first defined and consolidated in the making of EU public policy and politics and then incorporated in the logic of domestic discourse, identities, political structures, and public policies" (Radaelli 2003, p. 30).

[10] I refer here only to the strategies of the states, not to the nature of these pressures, if made by some powerful interest groups or expressing a view widely shared by many citizens of that state that decided to "jump" over the national level (considered, for example, inefficient or undemocratic) to directly address the supranational one.

[11] Justification for the transfer of competences either upward or downward, is always based on the principle of subsidiarity; the keyword is to maximize efficiency (Veggeland 2004, p. 161).

For Iordan Barbulescu, the concept of sovereignty is central for integration, namely the changes suffered in terms of: "renunciation of the dogma of absolute sovereignty (...). Giving up his own powers is voluntary, the Member States being the only actors that can decide on the integration process in its entirety, but also on its configuration". Important here are ideas as "transfer of sovereignty" or "joint exercise of sovereignty at the EU level", and constant association with the principle of subsidiarity (cf. Barbulescu and Rapan 2009, pp 399-400).

loopholes left intentionally during the normative codification or searched by every participant) between different types of actors from the Union's multi-level decision making system (according to Van Kersbergen and Verbeek, 2007).

3. Governance and Categories of Competences of the Union: Two Case Studies

As we have already stated, our aim is to analyze the aspects and the implications of the EU governance at the Member States' domestic policies level, as most of these policies are currently facing the challenges brought by the Europeanization process. Therefore, considering the different competences existing within the EU framework of policies, in the light of the Treaty of Lisbon, in order to cover a larger testing area, we have selected the environmental policy for the section of „competences shared between the Union and the member states" and the education policy as illustrative for the EU „actions to support, coordinate or supplement the actions of the Member States" (TFEU, art. 2). Our analysis is not exhaustive. We mainly intend to propose an analytical framework (to be used in a further research) for studying (a) the types of actors and decision levels involved in the policymaking process of these cases, in all the stages of the policy cycle[12]; (b) the interactions between these actors; (c) the binomial relation between Europeanization and governance in these sectors.

3.1. The Environmental Policy: EU and Romanian Aspects

This section of the paper will focus on how the multi-level and network governance can be identified in the Romanian environmental policy, more exactly in the implementation of the Sectoral Operational Programme Environment (SOP ENV). For all this to be possible we will first try to summarize EU's environmental policy and identify the most influential actors and how they affect the development of the policy as a whole. The second part of this case study is focused on the implementation of SOP ENV and the actors involved in it. Also we will try to observe how the paradigm of multi-level and network governance is applied in this specific case of Romanian environmental policy.

3.1.a. General Context

Regarding multi-level governance, environmental policy is one of the best examples that can be analyzed. This is due to the multitude of actors involved in the field of environment protection, from governmental institutions to civil society actors with more or less influence in the policy making process. From the EU's point of view, there are even more actors involved, given the supranational level that has been added and the influence that transnational nongovernmental organizations have on environmental issues.

EU environmental policy[13] came to attention in the early 1970s as a complementary policy for the development of the common market. This new policy input in the European Communities (EC) was due to the different environmental standards the member states have had at that time. To be more precise, "the [European] Commission feared that different national environmental standards would

[12] In fact, we subscribe to the idea that there is no clear linearity of the policy cycle and it should be seen more as a useful analytical instrument: „policies are shaped and reshaped in the early decision making step, as well as in later steps, by the environment and the implementation process itself. Moreover, policies have effects which have or have not been estimated, they imply actions and reactions. The policies are defined in a subjective manner and they cannot be analyzed independently from their own elaborating process" (Hâncean 2009, p. 6). This analysis was carried out by Hâncean on a text written by Adrian Kay. 2006. *The Dynamics of Public Policy. Theory and Evidence*. Edward Elgar Publishing Limited.

[13] We based our short historical description of the EU environmental policy mostly on Scheuer (2005) and Piattoni (2010).

act as non-tariff barriers and produce trade distortions that would slow down the creation and impede the proper functioning of the common market" (Piattoni 2010, p. 133).

The moment that raised the awareness on environmental problems was the United Nations Conference on the Environment held in Stockholm in 1972, the first conference on environmental issues that has ever been held. This moment gave the Commission the opportunity to act towards the establishment of a new policy for the EC, opportunity accomplished through the approval of the first Environmental Action Programme (EAP) in November 1973. Among the most important objectives highlighted by the first EAP were "the prevention, reduction and containment of environmental damage, the conservation of an ecological equilibrium and the rational use of natural resources"; the EAP also "emphasized the need for a comprehensive assessment of the impacts of other policies, in an effort to avoid damaging activities" (Hey 2005, p. 18).

Until the 1970s there was no legal basis for environmental action stipulated in EC treaties, although the member states "agreed to setting compulsory environmental standards in a handful of hazardous industries — for example, Council Directive 59/221 on ionizing radiations, later replaced by Council Directive 66/45/Euratom, and Council Directive 67/548/EEC on the classification, packaging, and labeling of dangerous substances" (Piattoni 2010, p. 134). The fact that unanimity voting in the EU Council was needed in order for a decision to be taken made it hard for environmental issues to pass the negotiation level. This problem was partially solved by the introduction of qualified majority voting (QMV) regarding environmental policy elements related to the common market, by the Single European Act (SEA) in 1986, completed by the cooperation of the European Parliament, while the unanimity rule remained in use for the rest of the aspects of environmental policy. Through the SEA, an environmental policy with a stronger legal basis was instated which gave the opportunity for the future development of the policy in areas not related to the common market.

Further on, ratification of the Treaty on the European Union (TEU) in 1992, in Maastricht, meant that the Commission and the European Parliament played a more significant role in the decision making process regarding environmental policy. "The TEU […] brought those areas of environmental policy not linked to internal market harmonization under QMV in the Council of Ministers and the cooperation procedure with the European Parliament. Areas linked to internal market harmonization became subject to the stronger procedure of co-decision with the European Parliament" (Sbragia, Alberta. 2000a. "Environmental Policy," in eds. H. Wallace and W. Wallace, *Policymaking in the European Union*. Oxford: Oxford University Press, pp. 293–316; p. 297 in Piattoni 2010, p. 134).

Another significant step in environmental policy development was the establishment of the European Environmental Agency (EEA) in 1994, followed by other measures of empowering the Commission and the Parliament through the Treaty of Amsterdam (1997). According to the Treaty of Amsterdam, the EU "further expanded the scope of legislation to be decided by QMV (Art. 95) and through the simplified co-decision procedure, thus giving the European Parliament—and the environment-friendly parties and groups that either sat in it or had easy access to some of its members—a much stronger voice in environmental matters" (Piattoni 2010, p. 134). The Treaty of Nice didn't bring any changes in European environmental policy, although there were changes in the QMV procedure of the Council. The changes consisted in the modification of the qualified majority threshold for the weighted votes and in the fact that the proportions between Member States votes in the Council changed (and, implicitly, the Member States' voting powers).

Nowadays, competences in environmental policy are shared between the EU and the member states, as it is stipulated in art. 4 of the Lisbon Treaty, signed in 2007. But, comparing the legal basis provided by the Lisbon Treaty with that of the previous treaties, the competences of both the Commission and the Parliament have increased in significance. EU is in charge of the strategic overview and the general legal frame on environmental issues; on the other hand the member states

are responsible with the implementation of the grand strategies envisaged by the EU, controlling the specific details of policy implementation.

3.1.b. Actors within the EU Environmental Policy

In order to sustain the development of EU's environmental policy, specific bodies, with the purpose to prepare, define and implement the environmental policy's specific actions, were created. These institutional actors are in a permanent consultation with national environmental institutions of the member states, but also with nongovernmental actors, such as NGOs and environmental think tanks.

In this section of the chapter we will try to identify the most influential actors at the supranational and transnational level on environmental policy. First, we will begin with a short description of EU institutions responsible with the development and implementation of environmental policy, and we will continue by identifying the most important and active NGOs and think tanks on environmental actions and their contribution to environmental policy.

The first actor to be mentioned is **the European Commission** through the *Environment Directorate-General or DG Environment* (as it will be referred to from now on). The main objective of the DG Environment is "to protect, preserve and improve the environment for present and future generations" (http://ec.europa.eu/dgs/environment/index_en htm). This Directorate-General has been instated in 1981, and since then it has been given extended competences on environmental policy. It also has the role to monitor, elaborate and implement the aspects of environmental policy, and, also, it can take legal action against the member states if the environmental law is infringed by them.

The **Council of the European Union,** as *Council of Environment Ministers*, is also an important actor of the environmental policy making. The Council of the European Union can pass laws, usually in a joint procedure with the European Parliament named co-decision, and it coordinates the policies of the EU. In the environmental field, the Council of the EU has mostly legislative responsibilities and it can adopt acts such as "regulations, directives, decisions or common actions" (http://www.consilium.europa.eu/showPage.aspx?id=242&lang=EN).

Another actor that influences the environmental policy is the **European Parliament** which has a specialized committee on environmental issues, the *Environment, Public Health and Food Safety Committee*. The members of the European Parliament, being direct representatives of the citizens of their country, have a greater accountability for their actions and decisions; therefore, there is an indirect implication from the citizens in the legislative process. Also, given the fact that there are two ecologist groups in the European Parliament, the Group of the Greens/European Free Alliance (GREENS/EFA) and the Confederal Group of the European United Left - Nordic Green Left (GUE/ NGL), we can assume that the development of environmental policy has its support in the legislative body of the EU as well.

The two groups obtained during 2009[14] elections a total of 90 out of 736 seats available in the European Parliament; the first group, GREENS/EFA, won 55 seats, and the second, GUE/NGL, won 35 seats, but even though the number of seats is not a great one, the coalition potential of the two groups can be decisive in environmental policy making.[15]

Although the **European Economic and Social Committee** is only a consultative body, it represents the interests of nongovernmental actors from the member states, such as entrepreneurs, representatives of trade unions or of a whole range of NGOs. The EESC represents the interest of the

[14] Our main source for European elections results was http://www.europe-politique.eu/.

[15] The first elections the GREENS took part were the European Parliament elections in 1984 and they won 20 seats out of a total of 434. Their percentage was higher in the next elections in 1989, but the most significant result of the group was the 1999 elections, when they obtained 48 seats out of 626, also due to the partnership with the European Free Alliance. On the other hand, GUE/NGL first elections were in 1999 and they won 42 seats, from 626, and 41 out of a total of 732 in 2004.

civil society at decision level and can bring a new perspective on environmental policy, especially if we take in consideration that some of the representatives from EESC are public figures at the national level and that they can arouse public support on important issues and put pressure on the decision makers.

Also a consultative body, the **Committee of the Regions** has a special commission on environment, the *Commission for Environment, Climate change and Energy*, and plays an important role in environmental policy development, with a perspective from regional and local level. The Lisbon Treaty "obliges the European Commission to consult with local and regional authorities and their associations across the EU as early as the pre-legislative phase, and the CoR, in its role as the voice of local and regional authorities at the EU level, is heavily involved right from this early stage" (http://www.cor.europa.eu/pages/PresentationTemplate.aspx?view=folder&id=be53bd69 -0089-465e-a173-fc34a8562341&sm=be53bd69-0089-465e-a173-fc34a8562341). It is essential to keep in mind that the Commission (and the other EU institutions) is only obliged to consult the CoR, but the practice shows that there is not an "obligation to take into consideration" the amendments brought by the CoR.

The CoR has representatives from all 27 member states which are members of the regional or local national authorities of the member states. Given the fact that the CoR representatives "continue with their local or regional government responsibilities, whether as regional president, mayor of a major city or county councilor, [they keep in touch] with the views and concerns of the people they represent." (http://www.cor.europa.eu/pages/PresentationTemplate.aspx?view=folder&id=be53bd69 -0089-465e-a173-fc34a8562341&sm=be53bd69-0089-465e-a173-fc34a85 62341).

The **European Environment Agency** started its work in 1994, after the regulation which established the agency was adopted by the EU in 1990 and came into force in 1993. The main objective of the EEA is to provide European actors, member states of the EU, business society, academia or nongovernmental organizations "sound, independent information on the environment" (http://www.eea.europa.eu/about-us/who). The EEA is a very important instrument for decision-makers, "the aim of the EEA being to ensure that decision-makers and the general public are kept informed about the state and outlook of the environment" (http://www.eea.europa.eu/about-us/who). Although the EEA is not involved directly in the decision making process, it provides the European institutions the necessary information in adopting new strategies and protection measures for the environment at the community level.

Other important actors for the environmental policy come from the nongovernmental scene and are represented by **NGOs or NGO coalitions, think tanks or by actors from the business community**. These actors can be either national actors that can put pressure on member states national governments, or transnational ones that act at the European institutions level.

As we mentioned in the beginning of this chapter, the environmental policy, even though it is a separate policy, it is also complementary and dependent of other policies, especially the common market and trade policy. The financing of the environmental policy comes from both the Cohesion Fund and the European Fund for Regional Development with the purpose to preserve the environment quality and to develop the new member states environmental infrastructure to the EU level.

3.1.c. Environmental Policy in Romania

The history of environmental policy in Romania started in 1990 when the first **Minister of the Environment** was established. The Minister of the Environment has been the main actor in the environmental policy making and implementation ever since. Between 1990 and 2007 there were three National Strategies for Environment Protection elaborated, in 1992, 1996 and 2002.

In 2007, Romania became a member of the EU and with this another strategy for environmental protection and development of environment infrastructure has been adopted under the name National Development Plan (NDP) 2007-2013. This new strategy was adopted in 2005 as a

condition for Romania's accession to the EU, and it contained European environmental regulations and a plan to finance environmental development in Romania. "The main objective of the environment sector of the NDP is the protection and the enhancement of environment quality, in conformity to the economic and social needs of Romania" (The National Development Plan 2007-2013, p. 282).

From its inception, the Minister for Environment changed its name many times, and was associated with other policies. Since the parliamentary elections in 2008, the environmental policy is administered by the Minister for Environment and Forests (MEF). The MEF is the most important actor involved in environment policy making and implementation and its main attributions are: "development of strategies and plans for the environmental field, water management, sustainable development and forestry; (…) elaborates normative papers and approve the normative papers of other governmental bodies [related to environmental law]" (Operating and Functioning Code Regulations of the MEF, pp.6-8).

The MEF has no less than 21 directorates in its composition and other agencies directly under MEF's subordination, authority or coordination. From these agencies, the National Environment Protection Agency, the National Environment Guard or the National Forest Administration is worth mentioning, without disregard of the importance of the other bodies subordinated to MEF.

As in the case of EU's environmental policy making process, the Romanian environmental policy development is influenced by other actors. The **Romanian Parliament** is an important actor due to its legislative function and the influence it can have on passing environmental legislation. The **nongovernmental sector** is of great importance too, given the fact that the most active NGOs are environmental ones, even though the degree of influence in environmental decision-making is not high.

3.1.d. Sectoral Operational Programme Environment: Actors and Governance

Our main attention in this section of the paper will focus on one of MEF's directorates, the Sectoral Operational Programme Environment Managing Authority Directorate (SOP ENV) that covers a financing timeline from 2007 to 2013, and the implications of MLG and network governance in the implementation process of this programme. The main concepts we will be analyzing are SOP ENV actors, the relations between them and the Europeanization process through the *acquis* implementation in the Romanian environmental policy.

The SOP ENV is responsible with the "protection and improvement of the environment and living standards in Romania, focusing in particular on meeting the environmental *acquis*. The aim is to reduce the environment infrastructure gap that exists between the European Union and Romania both in terms of quantity and quality" (Sectoral Operational Programme Environment Paper, 2007, p. 7).

In order to achieve the objectives, SOP ENV runs a financial instrument funded from the Cohesion Fund and the European Fund for Regional Development. The financing is divided in six axes which will be presented in Addendum no.2. There is a close link between environment and other social or economic sectors, and due to this the SOP ENV has been developed in correlation with the other Sectoral Operational Programmes in order to secure a uniform and complementary development towards the Lisbon Treaty's objectives. To attain the objectives established by SOP ENV, EU has allocated approximately Euro 4.5 billion from a total of Euro 5.6 billion, the rest of the funds representing the national contribution to SOP ENV.

The management framework of the SOP ENV is divided in several levels of action: the Managing Authority, the Intermediate Bodies, the Beneficiaries, the Monitoring Committee, the Certifying Authority and the Audit Authority. Also, through the Priority Axis 6 Technical Assistance, another level of management is added and it consist of the consultancy services offered to governmental actors by private enterprises qualified on environmental issues.

The **Managing Authority** (MA) for SOP ENV is the Minister of the Environment and Forests and has the role to ensure the strategic overview of the SOP ENV. The MA is also responsible for the programme implementation and it "ensures compliance with national and EC policies on state aid, in close cooperation with responsible bodies, public procurement, environment protection, equality of opportunities for men and women and non-discrimination" (Sectoral Operational Programme Environment Paper, p. 106).

The **Intermediate Bodies** (IB) are the regional representatives of the SOP ENV implementation. There are eight IBs, each one responsible for one of the eight development regions in Romania. They play an important role, due to the fact that they are the interface between the MA and the beneficiaries. Their main attributions are related to "programming, monitoring, controlling and reporting activities. They have also been involved in the monitoring of ISPA projects in their region and in the development of grant schemes of environmental projects run under PHARE" (Sectoral Operational Programme Environment Paper, p. 106). Being the direct link to the beneficiaries and the process of implementation of SOP ENV, the IB's reporting is essential to further development of the SOP. Although, until 2010, the IBs had fewer responsibilities, a gradually increase of these responsibilities in programming and selection process is a midterm objective for the SOP.

The main actors in the management and implementation process are the **Beneficiaries**. Beneficiaries can be NGOs, local public authorities or even state organizations and their main responsibilities are to ensure that the services and contract for their projects are as incorporated in the application for SOP ENV funding. The funding is eligible as long as the projects help attaining the SOP ENV's objectives and the beneficiaries are accountable for any problem the implementation of the project has. Through some technical assistance projects the beneficiaries are also able to get involved in the amending of the regulations in which they are directly involved, more exactly the project evaluation and application process. This is possible through joint meetings between the IBs and the beneficiaries in which issues related to the application framework are discussed.

The **Monitoring Committee** is another actor involved in the SOP ENV implementation process and it is comprised of representatives from ministers with a Managing Authority role, representatives from business or professional associations and of members of the civil society involved in environmental protection sector. It also comprises representatives from the European Commission and from international financial institutions.

The **Certifying Authority** and the **Audit Authority** are two other actors involved in the implementation process of the SOP ENV. The first one is a part of the Certifying and Paying Authority within the Minister of Public Finances and is "responsible for drawing up and submitting to the Commission certified statement of expenditure and applications for payment in line with the provisions of Article 61 of the Council Regulation No 1083/2006" (Sectoral Operational Programme Environment Paper, p.117). The Certifying and Paying Authority is also responsible with the payments beneficiaries should receive. On the other hand, the Audit Authority is an associated body to the Court of Accounts and it provides, on one hand, internal audit for the MEF, and on the other hand audit services for SOP ENV.

3.1.e. Conclusion: Multi-level and Governance Networks in the Structures of MEF and the DG SOP ENV

The **MEF** is the main actor in the environmental policy making in Romania and it has a hierarchical structure which contains state secretaries, directorates and other bodies under the authority of the MEF. The highest rank in the MEF is occupied by the minister followed by his/her state secretaries; directorates are the next level of authority, under the subordination of the state secretaries, and also have specialized divisions depending on the specific domain they are responsible with. The **SOP ENV** is one of the directorates of the MEF and is under the authority of

the minister and his/her state secretaries. There are also separate institutions, also public ones, which are under the coordination or the authority of the MEF and its subordinated directorates or divisions.

The simplistic structure stated above is the official structure of the MEF, but there are also other methods of interaction that transcend the hierarchical structure and make possible the influence of non-governmental actors in environmental policy making. Although the Operating and Functioning Code Regulations of the MEF contain a statement regarding cooperation relations between the MEF and other subordinate governmental structures or non-governmental actors, a clear method through which non-governmental actors can influence the policy making process does not exist at the moment.

Given the fact that there are no institutionalized ways in which the non-governmental actors can intervene in the environmental policy making process, through the sixth financing axis, Technical Assistance, it is possible to bring the **Beneficiaries** perspective in the process. This consists in regular meetings to discuss the improvement of project selection regulations and process within the SOP ENV. The meetings are organized by the **Intermediate Bodies** with the assistance of experts coming from the consultancy part that implements the project; the Beneficiaries proposals and the conclusions of the discussions are filtered by the Intermediate Bodies and then reported to the DG SOP ENV; the DG SOP ENV then decides which proposals are feasible and then modifies the Solicitors Guide and the project selection procedure depending on the requested modifications.

There are also other forms of influencing the environmental policy making process through interest groups or NGO coalitions. These actors lobby in order to attain their own interests by influencing the environmental policy development. This type of intervention can influence the whole environmental policy from Romania, and not only a small part, like the project selection procedure, as in the case of DG SOP ENV seminars.

In terms of MLG or governance networks, the Romanian environmental policy has a high degree of centralization. The decision stays in the hands of central government, with little influence from regional, local or non-governmental actors, even though in some instances the perspectives of these actors could be more feasible. The implication of non-governmental actors is not visible, partly due to the lack of instruments to do so, and partly because the policy making process is not a transparent one. This is one of the factors that make it hard to measure the level of implication and influence that the non-governmental actors truly have in the policy development process.

Our preliminary findings show that, at a first glance, the MLG and network governance cannot accurately describe the Romanian environmental policymaking. Nevertheless, although the decision stays mainly at the centre, the EU directives have a great influence on the environmental policy, bringing the involvement of the supranational level within this policymaking process. Also, in some aspects, the local or regional bodies influence, even though in a minor way, the development of environmental policy. Non-governmental actors have even less influence on environment policy making, but they can be present in the process of policy evaluation, especially the national non-governmental actors. The presence of at least three levels of governance actors is the proof that MLG is present in Romanian environmental policy, but we have to keep in mind that MLG is not a frequently used method in Romanian environmental policy development. In regard to governance networks, the high centralization of decision making to the MEF makes the existence of multiple decision nodes almost impossible. The MEF is a decision node, considering that it has relations in the same time with supranational actors and with local or regional ones.

In this analysis, our goal was to frame a research structure which can be developed by a thorough policy analysis based on empirical research. This thorough analysis consists in following certain aspects of environmental policy and assessing the course a certain policy topic has from its inception to its implementation. The specific aspects that we intend to study comprise a broader analysis of the actors involved in the environmental policy, a deeper research on the relations between the actors and the exact influence each actor has on the policy-making process. Such an analysis will be the subject of future research.

3.2. The Higher Education Policy: EU and Romanian Aspects

3.2.a. General Context

In this case study, we intend to examine education policy in general, and policies concerning higher education (HE) in particular. We will start with the analysis of the Lisbon Treaty which specifies that the EU, through its institutions, support, coordinate or complement the actions of Member States in terms of education. Why is this happening? Why is it that we do not find a greater involvement of the supranational level in formulating policies in higher education? A general and common response among scholars would be as follows: it was always a sensitive area for EU Member States because of its complex social implications. More specifically, there is a direct link between the educational process and the formation of identity, which has always been operated by the state in order to create specific citizens. However, in recent decades, globalization and technological developments in communication, lead us to a different conclusion: „At the same time, knowledge knows no boundaries. Despite the effort of national states to nationalize knowledge and excellence, intellectuals often display marked cosmopolitan attitudes and identify themselves more with their own brand of science than with their nationality" (Piattoni 2010, p. 151).

Therefore, in the space of the European Union we can see two trends in terms of education: (1) One is keeping policies under the control of member governments; in this case education is understood as a political project of national conservative elites; (2) The other is the breaking down of boundaries of nation states and correlating the entire educational process to the supranational level[16]. Regarding the first possibility, things are relatively easy to understand, the national education system is generally dominated by local norms and traditions: „National and professional identity, political organization, policy formation and public/private markets are all viewed as contained within the borders of the state" (Novoa and Lawn 2002, p. 1). But the trend of education (transferring authority to supranational level) is in turn strongly influenced by two factors: pressure from academics which get involved in broader cultural facilities to be up to date with what is written in a certain area in the world; and, as regards the European Union, the process of globalization that leaves states of this old continent behind the other world powers like the United States, China and India.

Next we will refer to higher education policies from both the EU and the transnational level (Bologna Process), where the EU is only a partner. As a general characterization, the main strands of higher education policy at European level, as shown by Simona Piattoni are:

- Attempting to create a university or university system with a high standard of quality;
- Mutual recognition of vocational training[17] diplomas, for greater ease in the free movement of skilled workers across Europe;
- Community policies on the mobility of students and scholars (for example, Erasmus and Socrates);
- Intergovernmental processes of harmonization of the higher education system inside and outside of the EU (Bologna process and the Open Method of Coordination).

The purpose of this case study is to identify the appropriate European and national actors who participate in HE policy, and to analyse the types of relationships between them. Regarding the theoretical framework of this study, HE policies may be, on the one hand, interpreted in the light of MLG: „The governance of Europe has specific problems and forms. It can be conceptualized as a

[16] These two trends (that can be seen as the intergovemmental versus supranational disputing viewpoints) influenced in comparable degrees the evolution of the education policy; therefore, nowadays, one can say that its design can be considered as sitting somewhere in the middle of an axis limited on the one side by the intergovemmentalists, and on the other by the supranationalists.

[17] This was the wording of the Treaties of Rome for the education in general. This extension of the concept of education to vocational trainings was possible after a decision of the European Court of Justice.

multilevel system of governance where private and public actors at the transnational, national and local level deal with problems of a lack of central authority and a dispersal of resources (Novoa and Lawn 2002, p. 5). The specific of this type of governance is the territorial level at which decisions are taken and not necessarily the logical order between institutional levels. On the other hand, the governance also can be understood as a "networking" process, where the state has only a motivating role (establishing the rules, reducing or increasing transaction costs, etc.). In this case, we talk about policymaking processes where interactions present non-hierarchical features, where the network depends on the actors' resources and where it is emphasized the importance of the nodes of the network, nodes which contribute in a greater or lesser level to achieve its targets.

3.2.b. European Actors Involved in the Educational Policy

In this chapter, we are going to present European actors from European educational policy in the chronological order of their establishment. The first discussions regarding the HE dimension began immediately after the signing of the Rome Treaties in 1957, as a proposal by Etienne Hirsch, chairman of the EURATOM[18], to create a European University or a network of universities with profiles based on a supranational quality assurance. This project met a strong opposition from the French president, Charles de Gaulle. Although this first initiative had no concrete results, its contribution was important in shaping the image of the two kinds of actors which were going to be decisive for the future of this policy: the national actors (Member States) and the supranational ones (the Commission). One can also see how the interests of these two entities contrasted when the educational policy, the most viable tool of creation identities and loyalties, starts to be a subject of international debates.

The dialogue continued between the education ministers of member countries at that time; in turn, in 1971 the Commission created two working groups on this issue led by Altiero Spinelli. This work culminated with an approved "Program of Action" in 1976[19]. Furthermore, four years later - in 1980, the Commission implemented the follow-up programs: Comett I and II (Community Programme for Education and Training in Technology), Erasmus I and II (European Action Scheme for the Mobility Community of University Students) Lingua (Language and Training Program).

The Action Programme provides a transnational intensification of university relations, mutual understanding of educational systems and guarantees education for children of migrant workers. This program, however, appeared as a result of "mixed process resolution of the Council of Ministers of education meeting with the Council," whose implementation was also to be controlled by a "mixed process committee" which acted under direct control by the Council, but had the Commission as a full member, given its expertise and ideas on how to get Community funding for the implementation of the Action Program" (Corbett, Anne. 2006. "Higher Education as a Form of European Integration: How Novel is the Bologna Process?" *ARENA Working Papers*, WP 15/14, December; pp. 13–14 in Piattoni 2010, 156). But national ministers have classified it as an intergovernmental policy and they have done everything possible to keep the Commission far from this area so that it could not be tempted to expand its mandate.

Afterwards, in 1985, the ministers of education from all twelve Member States agreed for the first time to use Community funds and legislation to implement two projects of European education: the Erasmus program and the European Credit Transfer System. On the other hand the implementation of these projects required a change in the nature of education policy. From an intergovernmental coordination, it would gradually move to a supranational one. However, the

[18] The proposal came from the President of the EURATOM's Commission because the community sought to develop techniques for producing atomic energy, exporting and the excess out of EU borders. In these conditions, it had to be created a „know-how" European area.

[19] We should mention here that the results appear 20 years after the initiative of Etienne Hirsch. This is a topic for a further analysis.

Maastricht and Amsterdam treaties would do nothing but strengthen the idea of promoting the quality of education and specify the supporting role of Community regarding the educational policy in Member States.

Consequently, two major agencies were created in the field of education. The first is the European Centre for the Development of Vocational Training (Cedefop), which provides analysis on vocational education systems, facilitates the exchange of information between Member States and actively participates in the process of recognition of qualifications. Basically this centre has done nothing but increase research capacity in the field through regular dissemination activities (publications, documentation centres or research groups). „Furthermore, it provided a focus for exploring various policy options, a function which can be seen as decisive for the Commission's policy in the late 1970s and 1980s" (Preston, Jill. 1991. *EC Education Training and Research Programmes. An Action Guide*. London: Kogan Page; pp. 51f in Ertl 2003, p. 19). The second is the European Training Foundation (ETF) that is designed to „help transition and developing countries to harness the potential of their human capital through the reform of education, training and labour market systems in the context of the EU's external relations policy" (ETF.EUROPA 2011, http://www.etf.europa.eu/web nsf/pages/AboutETF_EN?OpenDocument). In addition to these agencies, the Commission also established a DG EAC (Directorate-General for Education and Culture) which is used for a supranational coordination of educational policy.

Among all the committees established to manage the educational programs, Socrates and Eurydice were the most stable. The first was simply an information program which contained countries from the outside of EU and the second was nothing more than a comitology committee, its members being appointed by the Ministers of Education from Member States. „**The operation of the entire Socrates program involved "centralized" and "decentralized" actions and configured a multi-level system of governance**" (Piattoni 2010, 158).

To complete this process, two other agencies, based on network structure, have been established: NARIC (National Academic Recognition Information Centres) and ENIC (European Network of Information Centres). „The NARIC network is an initiative of the European Commission and was created in 1984. The network aims at improving academic recognition of diplomas and periods of study in the Member States of the European Union (EU) countries, the European Economic Area (EEA) countries and Turkey" (ENIC-NARIC) 2011, http://www.enic-naric net/index.aspx?s=n&r=g&d=about#ENIC). It must be said that this network was part of the Community's Lifelong Learning Programme (LLP) and empowers mobility of scholars and students by facilitating information access and recognition of diplomas. Regarding ENIC, it was established to implement the Convention on the Recognition of Qualifications Concerning Higher Education in the European Region signed in Lisbon (1997) and entered into force in 1999. On the same website, we also find that this network cooperates closely with the NARIC and aims to provide information in the following areas: recognition of any kind of foreign qualifications (ex. diplomas or degrees), the educational systems of foreign countries and the ENIC's countries, opportunities of studying abroad (scholarships or loans and advice on mobility and equivalence).

These networks have managed to build a very close dialogue both among themselves and with the Commission DG EAC, and so has appeared the first European Network for Quality Assurance in Higher Education, which aimed to promote cooperation in the field of quality assurance. Then, in 2004, the need for supranational coordination led to the creation of a European agency dealing with the HE quality assurance issues: the European Association for Quality Assurance in Higher Education (ENQA[20]). The proposal was made by the European Commission and then accepted by the Council and the European Parliament.

[20] The mission of this association is „to represent its members at the European level and internationally, especially in political decision making processes and in co-operations with stakeholder organisations; to function as a think tank for developing further quality assurance processes and systems in the EHEA; to function as a communication

In parallel with the European initiatives which outline a coherent educational policy, in 1999 appeared the well-known Bologna Process through a political statement where officials from 29 European countries pledged[21] to reduce disparities in the European education across the continent, by creating a European Higher Education Area; in other words, the aim is „to create a European Higher Education Area (EHEA) based on international cooperation and academic exchange that is attractive to European students and staff as well as to students and staff from other parts of the world"[22]. This project had as main objectives the establishment of an official European Credit Transfer System (ECTS), improving the quality of European education or the production of diploma's supplements for courses compatibility. Under this project, regular meetings were established to assess the national HE systems, structural comparisons between systems, the creation of indexes serving the before mentioned purpose or making regular progress reports. Many of these ideas were present in long debates and initiatives in the integration of HE national systems.

To ensure the permanence between meetings, Bologna Follow-Up Group (BFUG) was created as a secretariat. The Bologna Process website shows that it consists of all members of the Bologna Process and the European Commission, with the Council of Europe, the EUA[23] (European Universities Associations), EURASHE[24] (European Association of Institutions in Higher Education), ESU[25] (European Student's Union), UNESCO-CEPES[26], Education International[27], ENQA and BUSINESSEUROPE[28], as consultative members. „The BFUG is being co-chaired by the country holding the EU Presidency and a non-EU country, which rotate every six months. The vice-chair is the country organising the next Ministerial Conference" (EHEA 2011, http://www.ehea.info/article-details.aspx?ArticleId=5).

Through these mechanisms, it was succeeded in creating a European academic community which has worked increasingly better, editing a growing number of European journals and creating of European organizations. Further, „a **Standing Group on Indicators and Benchmarks** (SGIB) was also established and (roughly eighty) non-governmental organizations have been involved in the process as well, mostly to act as watchdogs vis-a`-vis their national governments in case these lagged behind in the implementation of agreed goals." (Piattoni 2010, p. 162).

Finally, we will present a classification of the actors indentified as taking part in the evolution of this policy, both within the EU and in the field of trans-national cooperation, in accordance to their nature:

---

platform for sharing and disseminating information and expertise in quality assurance among members and towards stakeholders." (ENQA 2011, http://www.enqa.eu/mission.lasso).

[21] Statement had not coercive power.

[22] Quotation from the official website of the Bologna Process within the July 2007 – June 2010 period: http://www.ond.vlaanderen.be/hogeronderwijs/bologna/.

[23] Supports and represents around 850 HE institutions from 46 countries. Its role is to provide them a forum for cooperation and exchange of information on higher education policy.

[24] „EURASHE is the (international) association of European Higher Education Institutions – Polytechnics, Colleges, University Colleges, etc. – devoted to Professional Higher Education and related research within the Bachelor-Masters structure." (EURASHE 2011, http://www.eurashe.eu/RunScript.asp?page=108&p=ASP\Pg108.asp)

[25] It is an international network which includes 45 student organizations from 37 countries.

[26] „The UNESCO European Centre for Higher Education/Centre européen pour l'enseignement supérieur (CEPES) promotes co-operation and provides technical support in the field of higher education among UNESCO's Member States in Central, Eastern and South-East Europe" (CEPES 2011, http://www.cepes ro/cepes/mission htm).

[27] „As the world's largest Global Union Federation, and the only one representing education workers in every corner of the globe, Education International unites all teachers and education workers no matter where they are." (EI-IE 2011, http://www.ei-ie.org/en/aboutus/).

[28] „BUSINESSEUROPE plays a crucial role in Europe as the main horizontal business organisation at EU level. Through its 40 member federations, BUSINESSEUROPE represents 20 million companies from 34 countries. Its main task is to ensure that companies' interests are represented and defended vis-à-vis the European institutions with the principal aim of preserving and strengthening corporate competitiveness. BUSINESSEUROPE is active in the European social dialogue to promote the smooth functioning of labour markets." (BUSINESSEUROPE 2011, http://www.businesseurope.eu/content/default.asp?PageID=582).

Supranational actors	• European Commission – DG EAC, European Education Information Network: Eurydice, European Information Network for Young People: Eurodesk.
Intergovernmental actors	• Council of the European Union (Education, youth, culture and sport)
Transnational actors	• European Centre for the Development of Vocational Training (Cedefop) • European Network of Information Centres • National Academic Recognition Information Centres • European Association for Quality Assurance in Higher Education (ENQA) • European University Association (EUA) - 850 members in 46 countries • Bologna Follow-Up Group (BFUG) • European Training Foundation • European Association of Institutions in Higher Education (EURASHE) • The European Students' Union (ESU) • Confederation of European Union Rectors' Conferences (CRE) • European Quality Assurance Register for Higher Education (EQAR)[29]

We observe two directions in terms of higher education in Europe. On the one hand, we have policies and programs coordinated by the EU through specialized institutions; on the other hand we have a general process of policy coordination in this field where 47 countries are participating with other international institutions and organizations. Any further research in this area has to clarify some of the dilemmas arising from the rays of the system of European actors: what is the relationship between the EU and the Bologna Process? To what extent all these organizations and networks contribute to a rapprochement between Bologna and EU objectives? We can also wonder which is the exact role of each actor in policy formulation and management of both the EU and the Bologna Process?

Besides the questions listed above, questions addressed to researchers interested in the supranational/transnational level of the European HE system, there can be identified items to be analyzed at the national level of the member states. For example, in the Romanian HE area, to what extent all these European processes and policies contribute to the Europeanization of the Romanian HE dimension? In order to offer the appropriate answers, we must begin with an analysis of the national actors involved in the implementation of the HE policy.

3.2.c. National Actors within the Romanian HE Policy

In this part, we analyse the Romanian HE actors, as well as the relations between them in order to reveal exactly their role in the policymaking process; we underline that our goal is not to make an exhaustive description of these actors, but to propose a structure for a further research. The analysis will be based on a study of official documents such as the current education law or informal documents (for example, barometers of public opinion) or specific literature.

We consider as stakeholders in higher education those institutions or combinations of institutions that contribute, to a greater or lesser extent, to the national formulation, implementation and evaluation of policies in this area. One such actor is the state, defined here as an institutional ensemble characterized by relations and tensions, and whose role is to legitimate itself (alongside its comprising institutions) in front of the higher education establishments. The State exercises its

[29] An important actor at the larger European level is EQAR, „founded by ENQA, ESU, EUA and EURASHE, the European representative bodies of quality assurance agencies, students, universities and other higher education institutions, respectively, to increase the transparency of quality assurance in higher education across Europe" (www.eqar ro).

powers in higher education through Parliament, Government and Ministry of Education, Youth and Sports" (National Education Law, 2011).

Included in the state level, we also meet governmental actors represented by the Government and the Ministry of Education. As educational law stipulates, "Ministry of Education, Youth and Sport[30] is a public authority and it is entitled to monitor, to control the application and enforcement of regulations in higher education and to apply sanctions where it is appropriate" (National Education Law, 2011). We may also meet 'buffer' institutions in higher education such as: ARACIS (Romanian Agency for Quality Assurance in Higher Education), CNCSIS (National Council of Research in Higher Education), UEFISCDI (Executive Unit for Financing Higher Education, Research, Development and Innovation), CNFIS (National Council for Financing Higher Education) and ACPART (National Agency for Qualifications in Higher Education and Partnership with Economic and Social Committee), accordingly to a 2009 document elaborated by Miroiu, Birzea et al. within the SOP HRD financed project „Quality and Leadership for the Romanian Higher Education"[31].

Institution	Nature of the institution	Mission
ARACIS (Romanian Agency for Quality Assurance in Higher Education)	• "autonomous public institution of national interest, with legal personality and its own budget of income and expenditure. The agency is not subject to political or other types of interference" (ARACIS 2011 - *http://www.aracis.ro/despre-aracis/istoric/*).	• "External evaluation of the quality of education offered by higher education institutions and other organizations providing specific curricula of higher education" (ARACIS 2011 - *http://www.aracis.ro/despre-aracis/misiune/)* • To develop institutional culture within the Romanian HE; • To notice that the education meets the requirements of the beneficiaries; • To protect beneficiaries by developing quality evaluation; • To propose policies to the Ministry for improving the HE quality.
CNCSIS (National Council of Research in Higher Education)	• "It is an advisory body to the Minister of Education, Research, Youth and Sports, expressing the view of the university community in terms of policy research" (CNCSIS 2011 – *http://www.cncsis.ro/*). • Members appointed by the ministry on the basis of scientific and managerial competence.	• „CNCSIS provide the interface between academic research community and the Ministry of Education, Research and Youth, which represents the Government, in allocating funds for research in universities and performance evaluation of scientific research" (CNCSIS 2011 - *http://www.cncsis.ro/*). • To mediate the relationship between universities and the ministry on scientific research.
UEFISCDI (Executive Unit for Financing Higher Education, Research,	• Public institution with legal personality, subordinated to the Ministry.	• „Organization's mission is to manage the financial resources needed to support development of higher education and scientific research. • This organization is seeking to attract new financial resources and focus its activity on quality management of funding for higher education and

[30] From the same National Law of Education, we also find that the functions of Ministry of Education are: the proposal of national policies and strategies, development of organizational and operational regulations of the higher education system, monitoring and verifying the bodies which operate in higher education, managing the process of continuous evaluation, recognition and equivalence of diplomas according to internal laws, elaboration of the draft budget and of a report for higher education.

[31] The title of the document is „Understanding the Romanian System of Higher Education: Internal functions and structures" and it was created as a panel report within the above mentioned project, implemented by UEFISCDI.

Development and Innovation)		scientific research"(UEFISCSU 2011 - *http://www.uefiscsu.ro/text.html*)
CNFIS (National Council for Financing Higher Education)	• National advisory body to the Ministry of Education and Research.	• „Develop principles and methods of distributing public funds to state universities in Romania. • Through its work, CNFIS promote continued growth of the Romanian system of higher education quality, ensuring all citizens equal opportunities in higher education" (CNFIS 2011 - *http://www.cnfis.ro/*).
ACPART[32] (National Agency for Qualifications in Higher Education and Partnership with Economic and Social)	• Specialized body under the Ministry of Education and Research that has legal personality and branches in major cities of Romania.	• „Developing, implementing and updating national qualifications framework for higher education development, recognition and certification of qualifications based on knowledge, skills and competences acquired by the beneficiaries of the higher education system; • Compatibility analysis of curriculum specialization in the fundamental areas of higher education with national qualifications framework standards; • Involving Romanian higher education institutions in the development of a European society based on knowledge and productivity, with a competitive and dynamic economy; • Promoting the opening of higher education institutions to socio-economic environment through collaborative actions of cooperation between higher education institutions, businesses and other organizations to develop specific partnerships, labor market research, entrepreneurial dimension to universities in Romania and the transfer of Knowledge" (ACPART 2011 - http://www.acpart ro/index.php?page=misiuni)
CNATDCU (National Council for University Titles, Diplomas and Certificates)	• Specialized institution under the Ministry of Education control.	• „it proposes a set of minimum standards necessary and obligatory for conferring titles in academic institutions, research and development professional degrees, the quality of doctoral coordinator and certificate of entitlement. […] • annually checking, at the request of Ministry of Education, Youth and Sport or its own initiative, the competitions for university teachers and researchers jobs. • report annually to the Ministry of Education, Research, Youth and Sports on human resource for teaching and research in higher education, based on specific indicators" (National Education Law, 2011).

The institutions listed above participate in different degrees in the policymaking process by expertise offered by to the Ministry regarding the current state of higher education, as well as by external norms that have to be implemented at a national level, norms that are retrieved by these institutions through constant dialogue with various European actors.

[32] This agency was abolished in 2010 by the Romanian Government.

We offer here some additional details about the national actors presented in the table above. We mention that, for the purposes of this article (to identify relevant stakeholders and possible links between them, from the perspective of governance theory and in the context of the Europeanization process, proposing a structure of an extensive research), the next descriptions are based primarily on the official data available on the websites of these institutions. We are aware, however, that the continuation of this research requires further information.

ARACIS is a very important player for the Romanian HE; it has three key dimensions of action: evaluation of universities, partner of the ministry on policy formulation and bond between the Romanian and European HE. This relationship was strictly necessary after Romania's accession to the Bologna Process by which they try to create a European Higher Education Area. It must be said that the independence of this institution and its credibility come from the way of financing: taxes on institutions of higher education for credential evaluation, assessment service contracts or external grants and funds (ARACIS 2011, http://www.aracis ro/despre-aracis/istoric/).

Besides the before mentioned actors, there are also other institutions formed by experts with an advisory role for the Ministry of Education in policy formulation: the National Council for Higher Education Statistics and Forecasting (CNSPIS), National Council for Titles, Diplomas and Certificates (CNATDCU), National Scientific Research Council (CNCS), the Advisory Board for Research and Innovation Development (CCCDI), National Council of University Libraries (CNBU), the Board of Ethics and University Management (CEMU) and the National Council of Ethics in Scientific Research, Technological Development and Innovation (CNECSDTI). "Teachers and researchers may be part of these organisms, with at least the title of lecturer or researcher II or equivalent titles from abroad, members of the Romanian Academy and the institutions of culture" (National Education Law, 2011) and a student representative. But we assume that their role is not a very important one in the process of making policies, because they are practically branches of the ministry, financially dependent on them, while the appointments have usually political connotations.

Moreover, at the central level of analyzing the HE National Policy there is the civil society sector that includes trade unions, student groups and associations or political parties. Perhaps the most important role belongs to academic unions, but they act only on specific issues and their lobby action lacks consistency. Usually, parties have a purely electoral behaviour, getting involved only when their actions appeal to voters (and because higher education has no significant media impacts[33], public interest is also very low).

As to the local level, one can "analyse the institutional profile and how organizations such as municipalities, county councils, research centres, etc. influence the behaviour of public and private universities" (Miroiu, Birzea et al., 2009). These do not, however, have much significance because Romania is a highly centralized state, at least in the education policies, where the political decision is formed at the centre and applied implemented locally. The data obtained from an ARACIS barometer is very relevant: "Given that local authorities have been indicated as the main decision makers of a small number of respondents (2.7% of the financing and less than 1% otherwise), we decided to unite this category with the category of central authorities" (ARACIS Quality Barometer 2010, p. 138).

Another category of actors, even if they may be seen as some of the most important ones, is represented by the very core elements of the whole system, the universities. They may participate in the policy process by acting individually, their importance being given by the size and financial strength, or jointly by the National Council of Rectors, for example. But this does not happen actually; universities work more on domestic policies because of the centralized system. The potential of the universities' involvement has to be strengthened in the extended version of this article.

[33] Some debates, as that of the recent law of education in general, and the stipulations regarding HE in particular, have appeared in the national media, but the interest was fleeting.

3.2.d. Conclusions: Multi-level and Governance Networks in the Structures of the Romanian HE Policy

The majority of the institutional actors presented above are largely dependent on the Ministry of Education; even the expertise offered by them on specific areas is not always taken into account. Anyway, there are also significant exceptions, like ARACIS, an independent organization in terms of structure or finances.

All these things show that the Romanian system of making higher education policies is hierarchical. The biggest influence is held by the ruling party or coalition which exercises its power through parliament (the main legislative institution) and the government. Romania is, moreover, a strongly centralized state; the sub-national level has not a vital role in the HE politics and the institutions at this level often act as the agents of central power in the territory. We can therefore conclude that internally, we do not have governance, but rather a classic process of government (understood as "state" or "hierarchy"): the vertical action of government occupies the central place.

Nevertheless, the analysis of the European actors showed that HE policy has both a transnational dimension (Bologna Process) and a European one (EU) through a more pronounced role of supranational institutions. And here we refer particularly to the starting period of the student and teacher mobility process, when the Commission has begun to play an increasingly more important role. Here is what Simona Piattoni said in her latest book regarding multi-level governance: „From a purely intergovernmental "mixed process" mode, higher education has become increasingly supranational, first, by finding some legal basis in a broad interpretation of the ECJ; then, by developing a proper legal basis in the Treaties of Maastricht and Amsterdam; further, by developing a full-fledged comitology system that brings in experts, stakeholders, and education providers; and, finally, by generating a rather complex multi-level governance system that connects commission functionaries directly with national and local administrators." (Piattoni 2010, p. 171)

4. Conclusions

In terms of multi-level governance and governance networks, the study we conducted showed that the European level of policy-making works differently than the Romanian process of policy development. We also found differences between the policy-making process in environmental sector and the educational one. If the European environmental and the education and training policy have a high presence of MLG and GN practices, given the influence of supranational, transnational and non-governmental levels/actors, the same policies, this time at the national level, follow a different pattern.

The case of Romanian environmental policy-making revealed a low level of governance practices – either MLG or GN – as consequence of the high centralization of the decision making responsibilities to the central government. Nevertheless, despite the absence of the network features and despite the fact that SOP ENV is a subordinated body of the MEF, the level of MLG is higher in its case, especially due to the fact that the financing is from European funds and there is a direct link between the actions of SOP ENV and European legislation in the environmental field. The evaluation of SOP ENV comes both from national institutions and from supranational ones, this being one of the reasons that can explain the higher level of MLG. Being able to restrict the funding, the Commission plays a more powerful role in controlling some environmental policy sectors.

On the other hand, in the Romanian education policy is present a more hierarchical system, where the MLG and governance networks practices are weak, if not missing at all. Similar to environmental policy, the education policy is highly centralized; the sub-national level plays a minor role in the final decision making process, and also, the supranational level has no direct competences in the educational policy-making process of the Member States. In the case of Romanian HE policy, we can conclude that the process of governance is not present, and that a classical governing mechanism is functioning. Nevertheless, there are two peculiar aspects of this conclusion. On the one

hand, in comparison with the EU attempts to foster a greater cooperation between different types of actors situated at different decisional levels, in Romania – as we mentioned before – there are still lessons to be learnt in this cooperation aspect. On the other, one cannot say however, that there is not an Europeanization trend of this policy, even if it is mainly a top-down one, driven by national official entities; this trend can be seen if we basically compare the Romanian HE framework to the general European (not specifically EU) one.

The current analysis is just a general assessment of the levels of multi-level and governance networks in environmental and educational fields, but a future research will comprise a deeper evaluation of both policies. This future research will be based on empirical facts discovered by following certain aspects of environmental and education policies and assessing the course a certain policy topic has from its inception to its implementation. Resulting from the envisaged research will be a clearer view of the relations that the actors have in both policies and which levels of policy-making are involved. The research will also involve a broader documentation on the two subjects, other than the official documents provided by the actors we identified, to ensure a better understanding of the general framework and to better enounce the evolution the two policies had accordingly to the multi-level (on the one hand) and network (on the other) governance practices.

ADDENDA

Addendum 1

The specific objectives of the SOP ENV are:

1. "Improve the quality and access to water and wastewater infrastructure, by providing water supply and wastewater services in most urban areas by 2015 and by setting efficient regional water and wastewater management structures;
2. Development of sustainable waste management systems, by improving waste management and reducing the number of historically contaminated sites in minimum 30 counties by 2015;
3. Reduction of negative environmental impact and mitigation of climate change caused by urban heating plants in most polluted localities by 2015;
4. Protection and improvement of biodiversity and natural heritage by supporting the protected areas management, including NATURA 2000 implementation;
5. Reduction of the incidence of natural disasters affecting the population, by implementing preventive measures in most vulnerable areas by 2015". (Sectoral Operational Programme Environment Paper, 2007, p.7).

Addendum 2

- **Priority Axis 1** "Extension and modernization of water and wastewater systems";
- **Priority Axis 2** "Development of integrated waste management systems and rehabilitation of historically contaminated sites";
- **Priority Axis 3** "Reduction of pollution and mitigation of climate change by restructuring and renovating urban heating systems towards energy efficiency targets in the identified local environmental hotspots";
- **Priority Axis 4** "Implementation of adequate management systems for nature protection";
- **Priority Axis 5** "Implementation of adequate infrastructure of natural risk prevention in most vulnerable areas";
- **Priority Axis 6** "Technical Assistance" (Sectoral Operational Programme Environment Paper, 2007, p. 7).

CARTELIZATION AS EQUILIBRIUM? EVIDENCE FROM ROMANIA

SILVIU-DAN MATEESCU[*]

Abstract
This paper discusses the development of the Romanian party system in view of the cartel party thesis proposed by Richard Katz and Peter Mair. The paper is divided into three sections. In the first section I offer a brief review of the cartel party thesis and present a few theoretical arguments regarding the study of cartelization. I argue that Katz and Mair may have overemphasized the importance of cooperation between established parties as necessary for the passing and enactment of cartel related legislation. I hold that the existence of cooperation between established political parties, with or without overt collusion, may be difficult to pinpoint due to the strategic voting that goes on in most legislative bodies. Thus I think it is appropriate to view the passing of the cartel associated legislation as a collective action problem: given high electoral volatility the rules and regulations needed for reducing political uncertainty will be adopted and enacted but not necessarily through cooperation. I suggest that such a perspective can explain every instance when the passing of cartel legislation is dependent on cooperation as well as those instances where no evidence of cooperation can be found. The second section presents some methodological aspects. In the third section I analyze the development of the Romanian party system with emphasis on those electoral rules and regulations that limit open political competition as well as on the system of party finance. I show that electoral rules have gotten progressively harsher and that the system of party finance clearly handicaps new competitors. Moreover the cartel has been extremely successful in keeping new competitors out of Parliament: since the transition from communism to democracy only one genuinely new party has won legislative representation.

Keywords: *cartelization, equilibrium, electoral volatility, electoral legislation, party finance*

Introduction

This paper offers a theoretical and empirical analysis of the process of cartelization using evidence from Romania. The aim of the study is to discuss the theoretical assumptions of the cartel party thesis and to propose a solution for some of the inconsistencies contained in the original model. The study of cartelization is an important topic in political science as it relates to party system consolidation and the relationship between political parties and voters. Party systems in Central and Eastern Europe have been characterized by very high levels of electoral volatility which suggests party system instability yet the party incumbency rate (the number of parties which remain in Parliament after each election) has been high and the success of genuinely new parties has been extremely limited. Thus the development of the Romanian party system can best be explained by using the cartel party thesis which argues that the established political parties use their control over the legislative body in order to prevent new competitors from gaining paliamentray representation and in order to gain acces to state resources, specifically state funding. One of the main arguments of this paper is that such a strategy is an equilibrium outcome: if electoral volatility (which is the most common indicator of electoral uncertainty) is mainly influenced by government performance (poor government performance leads to an increase of electoral volatility) and by permissive electoral

Candidate, National School of Political and Administrative Studies, Bucharest (e-mail: danm1985@yahoo.com), Beneficiary of the project "Doctoral scholarships supporting research: Competitiveness, quality, and cooperation in the European Higher Education Area", co-funded by the European Union through the European Social Fund, Sectorial Operational Programme Human Resources Development 2007-2013.

rules[1], the major political parties will always decide to pass and enact progressively harsher electoral legislation in order to reduce uncertainty. This is because such a strategy implies a very low cost and its effects are immediate while trying to reduce electoral uncertainty by ensuring a good performance in government is costly and its effects are difficult to predict. In order to support this claim I shall analyze the relevant electoral legislation as well as the system of party finance, the incumbency rate of Romanian parties and the success of genuinely new parties. The second aim of this paper is to strengthen the cartel party model by offering a solution to some of the theoretical problems of the original thesis.

A Discussion of the Cartel Party Thesis

This paper discusses the development of the Romanian party system in view of the cartel party thesis proposed by Richard Katz and Peter Mair[2]. They argue that, by the 1970s, political parties in Western democracies were faced with a series of challenges: a decline in formal party membership and in party psychological identification, due to the weakening of traditional social boundaries associated with the emergence of welfare politics and mass society (the process of partisan dealignment); the growing costs of professional electoral campaigns brought about by the increasing reliance on mass media (particularly television) and the fiscal limits of catch-all politics. Katz and Mair also point out that politics has become a profession and in many cases the politician's primary source of income which means that politicians have a common interest in lowering the costs of electoral defeat. Since all the major or established parties face these challenges they have an incentive to set up a cartel which ensures the collective survival of its members. The process of cartelization has two primary aspects: the restriction of policy competition and the use of the state's resources in the interest of the cartel parties. Established political parties use their function as lawmakers to introduce state subventions in order to compensate for the decline of internally generated funds and to devise the system of public finance and the electoral laws in ways that disadvantage new competitors[3].

Katz and Mair base the cartel party model on the movement of political parties toward the state, in the sense that parties are heavily influenced by laws and regulations laid down by the government. Building upon this uncontested finding Katz and Mair propose a set of hypotheses, two of which I would like to discuss. The first such hypothesis states that if parties are drawing closer to the state then they are also likely to be drawing further away form the electorate[4]. Herbert Kitschelt has already pointed out that, as far as party leaders are concerned, the best strategy would be to allocate resources to their own parties and to enact the preferences of their electorate in order to improve their chances of winning a larger share of the vote[5]. There are however a few other issues regarding this hypothesis. Katz and Mair insist on the declining levels of party identification suggesting that a fair share of the voters act as consumers would, rationally assessing political parties on the basis of past performance and experience. If this is the case, rather than distancing themselves from their voters, parties would have a very strong incentive to closely enact the preferences of their constituencies since they can no longer rely on subjective votes. Even if we accept the contentious assumption of high policy convergence in a multiparty system, party leaders still need to convince

the electorate of their managerial expertise. A significant part of the electorate may lack the information or analytical tools[6] necessary in order to assess the managerial performance of an incumbent party with any degree of objectivity (baring extremely poor performances). The same goes for the competing claims of the opposition and we may reasonably assume that political parties are well aware of this fact and that the risk adverse politicians described by Katz and Mair would not stake their electoral fortunes on such a strategy. In fact we can assume that the extreme difficulties involved in explaining complex social and economic issues to the voters may have been one of the reasons why the established chose to devise laws that disadvantage new competitors, regardless of their own performance.

Another reason why parties can't distance themselves from their voters refers to the fact that while it may be true that "the pecuniary difference between being in office and out of office"[7] may be reduced in a cartel arrangement, constantly being out of office entails significant risks. Parties which fail to become part of a national governing coalition for more than two turns are more exposed to the threat of new entrants regardless of the institutional barriers devised by the cartel parties. Secondly, some of their members in the legislature may choose to defect to other parties. There is also the possibility that other established parties may appropriate their particular issues in order to win a larger share of the vote (if we accept some degree of policy divergence) or they may lose some part of their electorate due to strategic voting. Particularly in countries with a high degree of electoral volatility the threat of being excluded from Parliament provides a strong incentive for parties to maintain close relations with their electorate. The Romanian party system provides good examples of this sort of threat.

The second hypothesis I would like to discuss refers to Katz and Mair's argument that while parties are more influenced by the state, it is in fact the parties who devise and vote the laws and rules they are influenced by and that it is "necessary for parties to cooperate with one another if general party regulations are to be accepted and if a system of public financing is to be introduced"[8]. Katz and Mair emphasize the importance of cooperation although it is not at all clear why parties must cooperate in order to create the institutions that define the process of cartelization. Consider for instance the situation in which a governing coalition decides to introduce state subventions for political parties or to raise the electoral threshold. Let us assume that the main opposition party votes against such measures but that they are implemented nonetheless. Such an example illustrates that it is not in fact necessary for the established parties to cooperate in order for the laws and regulations associated with the process of cartelization to be adopted. Let us now assume that the government does not have a majority in Parliament and that cooperation is needed if the cartel legislation is to be adopted. How exactly does the process of signaling, which can produce the effects of collusion without any illicit communication or covert coordination, work? In their attempt to negate the fact that the process of cartelization relies on an actual conspiracy Katz and Mair may have gone too far by explaining concerted action on the basis of signaling. Legislative parties routinely negotiate with one another and in this respect it is quite unclear what illicit communication refers to. There are no rules stating that political parties are forbidden to negotiate with each other or that they may not cooperate as a result of said negotiations. Bargaining and log-rolling are the trademarks of representative assemblies and there is no strong argument why they should not apply to the process of cartelization. Katz and Mair do not contest this fact but state that parties might "be disinclined to

[8] Katz, Richard S., Peter Mair. 2009. "The Cartel Party Thesis: A Restatement": 756

rely heavily on overt deals with another"[9], although the legislative process offers multiple opportunities for direct and relatively private negotiations. In some European countries the introduction of state subvention for political parties was preceded by a public debate on the advantages of such an arrangement in which case parties would have had the opportunity to send out signals concerning their stance on the matter. In some countries however, such as Romania, there was no debate before the introduction of the system of public finance. Regardless, there are may be opportunities for signaling but Katz and Mair make the contentious assumption that such signals are necessarily followed by the corresponding action. The main problem with the signaling argument is that parliaments don't approximate an oligopolistic market very well (except in the case of a minority government) due to the dominant position of the governing coalition. Also, in an oligopolistic market a signal might equal commitment but in the case of representative assemblies it does not, mainly due to strategic voting and therein lies one of the problems associated with the cartel party thesis: although one might assume that the major or established parties share a common interest in devising and enacting laws that ensure their own survival and disadvantage new competitors said common interest may prove difficult to pinpoint empirically due to strategic voting. If the governing coalition wishes to implement cartel legislation the opposition doesn't have to vote alongside it in order to enjoy the benefits, nor does it have any incentive to pay any of the costs. More importantly, cooperation is unnecessary for the implementation of most cartel associated laws.

In my view, Katz and Mair impose two unnecessary constraints on the emergence of the cartel of parties or, more accurately, on the implementation of cartel legislation: the need for cooperation and the lack of direct negotiations. If we eliminate these two constraints and reject the assumption that parties distance themselves from their constituencies we can look at cartelization from a fresh perspective. I propose a model based on Mancur Olson's collective action theory. The major political parties in a legislature can be viewed as a privileged group and voting for the enactment of cartel related laws and regulations closely resembles the production of collective goods. There are two important factors which influence the production cartel related legislation: electoral uncertainty and the political cost of enacting said legislation. According to Katz and Mair[10], in order to reduce electoral uncertainty political parties have used to types of laws: a) laws which disadvantage new competitors, such as the rising of the electoral threshold and harsher ballot access requirements and b) laws which help maintain the dominant position of the established parties such as an advantageous system of public finance and privileged access to public and private mass media. The cost (in lost votes) of producing these public goods is generally not very high. Let us, for example, analyze the cost of raising the electoral threshold from 3% to 5% as shown in figure 1. For the major parties the political cost of such a measure is nonexistent. The political leaders of the major parties would reason that party supporters have no motive to oppose such a move while the supporters of other parties could hardly be convinced to defect by a different stance on the issue. It is worth mentioning that the raising of the electoral threshold cannot be used against parties that are ideologically opposed.

Figure 1.

In this example, raising the electoral threshold to 5% would result in party X getting a share of party Z's votes and in party Y getting a share of party W's votes, regardless of whether we use the

[9] Katz, Richard S., Peter Mair. 2009. "The Cartel Party Thesis: A Restatement": 757
[10] Katz, Richard S., Peter Mair. 2009. "The Cartel Party Thesis: A Restatement".

proximity model or the directional model. Of course, whether parties Z and W would in fact manage to pass the electoral threshold at the next election depends on many other factors but they might lose votes due to strategic voting. Even if the immediate gain for the major parties might be uncertain the cost is clearly nonexistent. If this is the case then why wouldn't party X simply enact the measure? In my view there is no strong argument as to why the two major parties would have to cooperate in order for the law in question to pass. Similarly there is no reason why the supporters of major parties would oppose privileged media access or harsher ballot access requirements. There is the problem of the undecided voters but it can be alleviated by enacting the entire set of cartel related laws during one legislature. Of the laws that define the party cartel only the introduction of state subventions carries a significant cost of potentially lost votes. There is the possibility that the electorate might penalize the parties which vote for such a measure if it is seen as rent-seeking. There are certain alternatives for the process through which this particular law could receive the necessary votes. One of them is that Olson's model is correct and that the privileged member will pay the entire cost of producing the good[11], that is the governing party or coalition might decide that gaining a significant source of revenue is worth losing a certain number of votes. However Olson's model has been criticized for not taking into account the possibility of strategic interactions taking place between the members of a privileged group. According to McLean[12] the smaller a group is the higher the probability that strategic interaction will take place between its members. Thus, Olson's model must be modified in order to recognize the fact that the privileged members of a group could engage in a repeated game of Chicken[13]. When the game of Chicken is played repeatedly it becomes a game of bluff and precommitment. In the particular case of privileged groups this refers to the fact that, when there is more than one member who would be better of if the good was produced even if he had to pay the entire cost himself, each of them has an incentive to make a precommitment, announcing that he will not pay for the production of the good, in order to force the other(s) member to pay the entire cost. Even if there is a single privileged member he still has an incentive to precommit to not paying in order to force the non-privileged members to contribuite[14]. McLean's argument does not refer to the fact that privileged groups will fail to produce the good but rather to the fact that it is not necessary for one of the privileged members to pay the entire cost by himself. In order to reach a cooperative solution in a repeated game of Chicken one must resort to irrevocable precommitments. Brams and Kilgour[15] offer a solution for cooperativley solving a repeated (with an undefined number of rounds) Game of Chicken. The situation of parties in a legislative body is different however. Each of the parties would like for state subventions to be introduced but would prefer it if the other parties payed the electoral cost. Let us assume that there is only one privileged member, the governing party or coalition, and that he doesn't want to pay the entire cost by himself. The privileged member could make a irrevocable precommitment anouncing that he will not vote for the introduction a state subventions unless the opposition also votes for the law. There is the possibility that this strategy will work and that the major parties will all support the bill. The opposition could however also make a irrevocable precommitment not to support the bill in order to force the governing coalition to pay the entire electoral cost in which case the bill wouldn't pass. Each of the players is aware of this and also knows that the game has a defined number of rounds, given that the legislative turn lasts four years and that the vote can only be repeated a few times each year. Thus, before the last game, both the governing coalition and the opposition know that if they maintain their position the law will not pass and the opportunity of gaining the extra funds will be lost for that legislative turn. It follows that, in

[15] Brams, Steven J., Kilgour, D. Marc. 1986. "Is Nuclear Deterrence Rational?", *PS*, Vol. 19 (3), 645-651

the last game, both the government and the opposition should cooperate. Moreover the value of the good decreases if its production is postponed (if state subventions are introduced in the first year parties recevie subventions for the next four or three years, depending on when the budget law gets voted, before the state subventions are introduced or after) so it is reasonable to assume that the players will cooperate from the first game in order to maximize the time span during which they can enjoy the benefits of the good. If my argument is correct then the introduction of state subventions should happen during the first year of a new legislature and the bill should pass with a supermajority. The only remaining problem concerns the manner in which parties can make irrevocable precommitments. This depends on the route a new bill must follow before it is voted upon. In Romania a new bill must first go to a specialized commision which is composed of members from every legislative party (in proportion to each party's number of seats). In order for the bill to go to the vote it must first recevie a majority of votes in the commision. In my view this is the arena where parties can make precommitments and negotiate with each other, away from the media.

What I have tried to show is that, from a theoretical standpoint cooperation between the major political parties isn't necessary for cartel legislation to be enacted and that, when it does occur, it has more to do with the desire to share the associated electoral cost of certain cartel laws than with an actual need for cooperation.

Research Questions, Hypothesis and Methods

Research Question 1: Can we speak about the cartelization of the Romanian party system?

Research Question 2: If the major Romanian parties form a cartel how effective did it prove in keeping new parties out of Parliament?

Hypothesis I: Due to the electoral uncertainty facing political parties during the 90's cartel related legislation has been implemented in order to reduce it. This hypothesis includes to elements:

a) progressively harsher electoral legislation: Since one of the main functions of the cartel is to keep new competitors out of Parliament and out of the electoral market in general, electoral legislation should become progressively harsher following the 1992 elections;

b) the system of public finance: The second important function of the cartel is to ensure that cartel members maintain their dominant position. In this respect, the rules for the allocation of state subventions should favor legislative parties.

Hypothesis II: If the major parties in Parliament form a cartel I expect that, following the 1992 elections, the number of new parties that gain parliamentary as well as the number of minor legislative parties which are excluded from Parliament should drop towards zero.

In this paper I shall analyze the cartelization of the Romanian party system only at the systemic level. As Allan Sikk[16] has already pointed out theoretical models regarding western democracies don't always translate well in the case of post-communist countries. There are however certain characteristics of post-communist politics which approximate the developments described by Katz and Mair quite well: the weak ties between parties and the electorate, especially during the first years of democratic politics, and the political party's inability to fund professional electoral campaigns through internally generated resources.

One of the first methodological issues when looking for cartelizing behavior in the case of a post-communist country regards the moment one can expect such behavior to start. Given the fact that we cannot talk about established parties in this context it is my opinion that the logical place to start is the moment when there are at least two major parties or coalitions. In the case of Romania I believe we can expect to see cartelizing behavior following the 1992 elections.

[16] Sikk, Allan. 2003. „A Cartel Party System in a Post-Communist Country? The Case of Estonia", ECPR General Conference, Marburg, 18-21 september 2003,
http://www.essex.ac.uk/ecpr/events/generalconference/marburg/papers/16/3/Sikk.pdf

Methods

Party systems in Eastern Europe have generally been characterized by high electoral uncertainty which represents a important precondition of the emergence of the cartel. Given this fact the first step will involve determining the extent to which this precondition is met. I shall use *electoral volatility* and the *percentage of the voting population which were party members* (in order to assess party's capability to generate internal resources and party's ties with the electorate) as indicators.

In regard to the system of public finance the following indicators shall be used: *a) the existence of state subventions for political parties; b) the evolution of the amount available as state subventions; c) the rules for allocating state subventions, particularly if these rules favor legislative parties; d) the proportion of state subventions in party's budgets.*

I shall also analyze the rules for access to publicly owned television and radio stations during electoral campaigns as well as the regulations imposed on private media enterprises at election time. Another important aspect regards the electoral legislation, particularly the *evolution of the electoral threshold* and the *regulations regarding the establishment of new political parties*. Finally I shall analyze the success of what Sikk called "genuinely new parties" that is parties "that are not the successors of any previous parliamentary parties, have a novel name as well as structure, and do not have any important figures from past democratic politics among its major members" (Sikk 2003: 8). Additionally I shall also look at the number of legislative parties that are excluded from Parliament after each election.

I would like to mention that Romania's Parliament consists of two houses: The Chamber of Deputies (Camera Deputatilor) and the Senate. The following data only refers to the Chamber of Deputies. This paper stops at the 2004 elections as there have been no new developments regarding cartel related legislation.

The Romanian Party System

During 1990-2004 Romania has used a system of proportional representation (d'Hondt electoral formula) with closed lists. There was no electoral threshold at the 1990 elections (the first democratic elections after the fall of the communist system), a 3% threshold for the 1992 and 1996 elections and a 5% threshold for parties and 8-10% for alliances (depending on the number of parties) for the 2000 and 2004 elections.

The evolution of the Romanian party system has been rather complicated and requires a brief introduction. There have been four major party families in the Romanian party System.

The Social Democratic family included: The Party of Social Democracy (PSD, former PDSR, the Party of Social Democracy in Romania, 1992-2000) appeared when the National Salvation Front (FSN) split in 1992; The Democratic Party (PD) was the second party which resulted from the split of the National Salvation Front; the Romanian Social Democratic Party (PSDR, merged with PDSR in 2000 to form PSD).

The Christian Democratic family: the National Christian Democratic Peasants Party (PNTCD) was the main party of two large coalitions, the Romanian Democratic Convention (CDR) and Romanian Democratic Convention 2000.

The Liberal family: the National Liberal Party (PNL) split into four parties in 1992-1993. These parties were: the National Liberal Party (PNL), the Liberal Party '93 (PL '93), the National Liberal Party-Democratic Convention (PNL-CD) and the National Liberal Party the Young Wing. These four parties merged again under the label of the National Liberal Party after the 1996 elections.

The Nationalists: the Romanian National Unity Party (PUNR) and the Greater Romania Party (PRM).

In addition the party of the Hungarian ethnic minority, the Democratic Union of Hungarians in Romania has been in Parliament since 1990.

At the 1992 elections the Romanian Democratic Convention (CDR) consisted of: PNTCD, PNL-CD, PNL the Young Wing, PSDR, the Romanian Ecologist Party (PER) and the Civic Alliance Party (PAC).

At the 1996 elections the Romanian Democratic Convention (CDR) consisted of: PNTCD, PNL, PNL-CD, Romania's Alternative Party (PAR), PER and the Romanian Ecologist Federation (FER).

Table 1. Electoral Results, Chamber of Deputies, 1990-2004

Electoral Uncertainty in Romania

The Romanian party system has been characterized by very high electoral volatility, mainly due to the weak ties between the political parties and the electorate as well as to the high number of inconsistent, minor parties. The effects of electoral volatility on the electoral fortunes of different types of parties can be illustrated with a few examples. Let us first look at the evolution of the National Christian Democratic Peasants Party. The party contested the 1990 elections with a program that emphasized radical change: the privatization of state owned enterprises, the return of the proprieties confiscated by the communist regime to their rightful owners, the exclusion from public office of all significant members of the Communist Party and clear pro-European and pro-NATO stance.

Table 2. Electoral Volatility in Romania, 1992-2008

Year	Volatility
1992	30,2
1996	14,3

2000	29,1
2004	14,94
2008	17,48

Source: Sikk (2005) for the years 1992, 1996, 2000 and own calculations for the years 2004, 2008

The party fared poorly at the 1990 elections and as a result it gradually adopted a catch-all approach to politics, contesting the following three elections in broad coalitions. It went on to obtain 41 seats at the 1992 election and 82 seats at the 1996 elections following which it formed the coalition government together with PD, PSDR and UDMR. Although there is a rather serious debate among Romanian political scientists about the performance of the Romanian Democratic Convention government in my view it had a number of very important achievements: it managed to stop the violent strikes of the miners (by offering generous unemployment packages), who were protesting against the reform of the mining sector, which had been responsible for the fall of several governments since 1990, it managed to avoid the bankruptcy of the Romanian state and it started the negotiations regarding Romania's integration in the EU. However it failed to implement significant economic reforms and its administration was characterized by the failure to limit corruption and the interpenetration of politics and business. Moreover it utterly failed to explain its policies to the electorate and went on to be excluded from Parliament.

On the other hand the two parties that have sought to form close relations with their constituencies, the Democratic Union of Hungarians in Romania and the Party of Social Democracy, the only Romanian party that is organized as a mass party, have mostly been spared the effects of the high electoral volatility.

In regard to the percentage of the voting population which were party members this was 3,3% in 1993[17]. Unfortunately, since political parties were under no obligation to declare the number of their members there isn't any official data for the 1990-2000 years. However based on the fact that the nr. 8 Decree of 1989 required parties to have 251 members and taking into account the electoral volatility for the years 1992 and 1996 it is very likely that most parties didn't have large memberships and that they were unable to fund electoral campaigns and political activity on the basis of membership fees. As a result 10 of the 17 parties which had gained legislative seats at the 1990 elections were excluded from Parliament following the 1992 elections. As a result of the 1992 elections 12 parties gained electoral representation (although as I have shown 6 of these contested the elections as the Romanian Democratic Convention) with two more parties being excluded from Parliament following the 1996 elections. We may conclude that electoral uncertainty was very high between 1990 and 1996 and that the preconditions for the emergence of cartelizing behavior had been met.

Party Financing in Romania

The system of state subventions was introduced in 1996 through Law no. 27/1996[18], the Law of Political Parties. Unfortunately I have been unable to find hard data on the positions adopted by the political parties regarding law 27.

Law no. 27/1996 states that political parties can finance their political activity through the following sources: party members' dues; donations and legacies; funds obtained through specific activities (the sales of party literature, bank interests, letting out of their own space for conferences and cultural actions, etc.) and state subventions.

[17] Letki, Natalia. 2004. „Socialization, for Participation? Trust, Membership and Democratization in East-Central Europe", *Political Research Quarterly*, Vol. 57 (4), 665-679

[18] http://www2.essex.ac.uk/elect/database/legislationAll.asp?country=romania&legislation=rolpp#chapter6

Regarding members' dues the law stipulated that the sum of the dues paid over the period of one year by a single person cannot exceed fifty minimum basic wages countrywide. The countrywide minimum basic wage taken as reference shall be the one existing on January o1 f the respective year.

Regarding donations the law forbids donations from public institutions, from self-managed public companies, from trading companies, and from banking companies where the state is the majoritary shareholder as well as donations from foreign states, organizations, firms and private individuals.

Donations received by a political party over a period of one year may not exceed 0.005 per cent of the state budget income in the respective year. In the financial year in which parliamentary, presidential or local elections take place, this ceiling doubles. A donation received from an individual over a period of one year may not exceed one hundred minimum basic wages country-wide in the respective year. The donation received from a legal entity over a period of one year may not exceed five hundred minimum basic wages country-wide.

Political parties receive yearly state subventions which are transferred monthly to the account of each political party. The sum allocated yearly to political parties may not be greater than 0.04 per cent of the state budget income. Political parties which are represented at the beginning of the legislature by a parliamentary group in at least one Chamber shall receive a basic subsidy. The total of basic subsidies shall represent one third of the budgetary subsidies allocated to political parties. Political parties represented in Parliament shall also receive a subsidy in proportion to the number of seats obtained. The sum due for one mandate shall be established by dividing the remaining two thirds of the subsidies from the state budget for political parties by the total number of parliamentarians. The total subsidy granted from the State budget to a political party after these operations may not exceed five times the basic subsidy. Political parties which have not obtained parliamentary seats but have won at least *two per cent* of the votes cast shall receive equal subsidies, which shall be established by dividing the sum which remains after the procedures concerning parliamentary parties have taken place by the number of the respective political parties. The total sum granted to non-parliamentary parties may not be greater than a basic subsidy. The sums unconsumed by redistribution shall be distributed to the parliamentary political parties in proportion to the number of mandates.

The Court of Audit was the institution charged with checking that parties respect the provisions on the law. Until 2000 there was no audit report regarding the state subventions received by political parties and a significant number of them had not presented the lists of donors. Moreover party finances could not, in fact, be checked as the methodological guidelines, which had to be adopted by Parliament, had never been devised.

The 1996 Law of Political Parties was replaced with Law no. 43[19] of 2003 regarding the financing of political parties and electoral campaigns. The legislative proposal was initiated in 2001 by the National Liberal Party, then in opposition. The proposal finally passed in the Chamber of Deputies with 184 favorable votes versus 41 negative votes. The main aim of the new law regarded members' dues and donations. Thus the ceiling for donations became 0,025% of the state budget income in the respective year and 0,050% in years when parliamentary, presidential or local elections take place. The ceiling on donations from an individual became 200 basic wages countrywide per year.

Regarding members' dues the sum of the dues paid over the period of one year by a single person can not exceed 100 minimum basic wages countrywide. Another interesting development was that, in order to receive state subventions, political parties which had not obtained parliamentary representation had to obtain at 4% of the votes cast. The rest of the procedures for allocating state subventions remained the same.

http://www rcc.ro/documente/raport%20partide%20politice%202005.pdf

[10] The Greater Romania Party and the Romanian Humanist Party (PUR) didn't declare their donations for 2002; the Romanian Humanist Party changed its name in May 2001 to the Romanian Social Liberal Humanist Party (PUR-SL). PUR-SL declared that it had received 9.000 lei as donations in 2002.

The data presented in Table 3 shows that state subventions were the main source of revenue for political parties in the years of 2002 and 2003, with the exception of the Democratic Party. Funds received from donations have a greater share in every party's budget than state subventions in the year of 2004. This can be explained by the fact that 2004 was an election year and that the maxiumum ceiling allowed for donations was 0,050% of the state budget income. As I have shown the ceiling for a non-election year is 0,025% of the state budget income. Secondly it is a well known fact that political parties greatly increase their efforts to attract donations at election time.

The National Liberal Party, the Democratic Party and The Conservative Party (the curent name of the Romanian Conservative Party) have recevied more money from donations than from state subventions in the year 2005, while The Party of Social Democracy, The Greater Romania Party and the Democratic Union of Hungarians in Romania gained more funds from state subventions than from donations.

As there is no data regarding donations for the years 1996-2001 I cannot make any firm statements as to the degree to which parties are dependent on public funding. As Table 4 shows, the total sum of the state subventions to political parties has been rising since the system was first introduced in 1996 until 2003, after which the total sum remained the same until 2006. If we take into account the fact the 1996 Law of Political Parties stipulated that the maximum ceiling for donations was 0,005% of the state budget income for the respective year there is a good chance that state subeventions were the main legal source of party revenue until Law no. 43/2003 was adopted.

Table 4. Total State Subventions allocated to political parties, 1996-2003 (Lei)

1996	1997	1998	1999	2000	2001	2002	2003
450.000	1.575.506,1	2.780.000	3.390.000	3.900.000	5.800.000	7.020.000	7.030.000

Source: Monitorul Oficial (the Romanian Official Gazette)

Regardless of whether parties were in fact dependent on public funds the data from Table 3 proves that state subventions were a major source of revenue for the legislative parties. In my view it is clear that both laws regarding party financing offered a significant advantage to legislative parties given the fact that state subventions allocated to **all** parties without legislative representation cannot exceed one basic subsidy. Even theese sums are conditioned by the necessity that non-parliamentary parties gain at least 2% of the votes cast, according to the 1996 law, and 4% of the votes cast according to the 2003 law. It is worth mentioning that following the 1996, 2000 and 2004 elections no party (without legislative seats) has met these conditions. The fact that the laws regulating party finance favor legislative parties is also supported by the way in which state subventions are allocated. First of all the subventions for non-parliamentary parties are not fixed, but rather they are allocated whatever remains after the legislative parties have been allocated their subsidies according to the rules. Secondly, the laws (27/1996 and 43/2003) state that if there aren't any non-parliamentary parties which meet the required conditions the remaining sum is distributed to the legislative parties in proportion with their number of seats. However there is no rule stating that, at this point, a legislative party cannot receive more than the equivalent of 5 basic subventions.

The Romanian legislation regarding the establishment of new parties

The legislation regarding the establishment of new parties has progressed from a set of minimal requirements to a set of very restrictive conditions. The firts act which regulated the establishment of new parties was the Law Decree no. 8/1989. In order to be formally registered parties had to have 251 members. This law was replaced in 1996 by the Law of Political Parties according to which a new party had to have 10.000 founding members reziding in at least 15 counties, but no less than 300 per county. The requirements changed again in 2003 through Law no. 14/2003 which required 25.000 founding members reziding in at least 18 counties and Bucharest, but no less than 700 per county.

Legislation regarding access to publicly owned media at election time

The first law regarding the access of political parties to publicly owned media at election time was the Law Decree no. 92/1990 which stipulated that all political parties shall have equal access to radio and television services at election time and that access is free of charge. This law was replaced by Law no. 68/1992 which stated that the parliamentary political parties shall receive access to state owned radio and television servicies at the expense of the state budget. Non-parliamentary parties were required to pay for broadcast time. The law also stated that the broadcast schedule and broadcast time was to be determined by a parliamentary commission and that the broadcast time for parliamentary parties was to be double the time recevied by non-parliamentary parties. Each parliamentary party was to recevie broadcast time in proportion with its number of seats. Furthermore the law stated that political parties which didn't enter candidates in at least 10 districts wouldn't be granted broadcast time at the national level. There are two more rules which advantage parliamentary parties. First, commercial publicity with the intent of electoral propaganda in the media and printed press was forbidden. Secondly, interviews and news reports of general interest to the citizens were not to be taken into consideration by the parliamentary commission when allocating broadcast time. The provisions of Law no. 68/1992 disadvantaged parties without legislative representation by having them pay for broadcast time, which they could only buy a limited amount of as well as by excluding interviews and news buletins, through which members of the major parties

could gain the attention of the public, from the time granted to parliamentary parties. This law was in effect until 2004 when it was replaced by Law no. 373/2004. The new law still forbade publicity for electoral purposes but granted free access to state owned media to all political parties. A special parliamentary commission determines broadcast time for each party in proportion with the number of complete candidate lists for the Chamber of Deputies and the Senate. However parties which do not enter candidates in at least 50% of the electoral districts do not recevie broadcast time. The law does not specify how the broadcast time is to be divided between parliamentary and non-parliamentary parties so, assuming that every party entered candidates in every electoral district, it is up to the parliamentary commission to decide. Law no. 373/2004 contains provisions regarding private radio and televisions stations which must allocate 75% of the broadcast time in which they cover the election to parliamentary parties in proportion to the number of seats they have in Parliament. Non-parliamentary parties recevie 25% of the broadcast time if they have entered candidates in the electoral district in which the radio or television station is located.

It is worth mentioning that the provisions of Law no. 373/2004 contradict Ruud Koole's criticism of the cartel thesis which state that private media enterprises are a powerful counterweight to a possible cartel of parties[20]. How this can be if new competitors cannot in fact buy air time remains up to debate.

The success of genuinely new parties and the exclusion of minor legislative parties

The cartel has proven very effective in Romania: following 5 elections only one genuinely new party has managed to gain legislative representation: the Greater Romania Party. The Greater Romania Party was founded in 1991 and is a far right party.

The number of minor political parties in Parliament has been steadly decreasing since the 1990 elections. As I have already mentioned 10 of the 17 parties which had gained legislative seats at the 1990 elections were excluded from Parliament following the 1992 elections. As a result of the 1992 elections 12 parties gained electoral representation (although as I have shown 6 of these contested the elections as the Romanian Democratic Convention) with two more parties being excluded from Parliament following the 1996 elections. Six more parties lost legislative representation following the 2000 elections, one of them being the National Christian Democratic Peasants Party, a major party until then. No parties were excluded following the 2004 elections.

Conclusions

The Romanian party system displays all the major characteristics of a cartelized party system as identified by Richard Katz and Peter Mair: electoral legislation which has gotten progressivly harsher; party financing laws and laws regarding access to state owned media at election time which clearly favor the major legislative parties and the upward evolution of the electoral threshold. State subventions are definitely one of the major sources of revenue for political parties. It is my view that the high level of electoral uncertainty has been the determining factor for the emergence of the cartel which has been instrumental in reducing it. Since the 2000 elections there has been no change of the parties in Parliament (at the 2004 elections) despite the fact that electoral volatility remains high. New political parties have had very little succes while minor legislative parties which have gained representation during the early stages of the democratic system have been excluded from Parliament. My interpretation is that, in the case of the Romanian Party system, there is no evidence of a toning down of competition. Further proof of this issue regards the exclusion of the National Christian Democratic Peasants Party from Parliament at the 2000 elections and the exclusion of the Greater Romania Party at the 2008 elections. This goes to show that, although

[20] Koole, Ruud. 1996. „Cadre, Catch-All or Cartel? A Comment on the Notion of the Cartel Party", *Party Politics*, Vol. 2, No. 4, 507-523: 519

institutional structures meant to ensure the organizational survival of the major parties are truly effective, there is still a significant need for parties to maintain strong bonds with their constituencies. The main implication of the existence of a parties cartel is that it is a major factor in the consolidation of party systems in new democracies. The emergence of the parties cartel also appears to be an equilibrium outcome. On the other hand, the existence of the cartel may have a detrimental effect in regard to the functioning of the democratic system if new political alternatives are unable to gain representation due to the institutional rules created by the established parties, especially if this gives rise to far right anti-system parties.

The Romanian case is unfortunatly not ideally suited for the testing of my theoretical arguments regarding the way cartel related legislation is adopted as the Romanian Parliament archives only record votes in favor of a bill and negative votes and not what parties the parliamentarians in question belonged to. Law 43/2003 was adopted with a supermajority which would seem to confirm both my argument and Katz and Mair's argument. On the other hand the modification of the electoral threshold from 3% to 5% before the 2000 elections was done by a governmental emergency decree, no. 129/2000 which would support my claim that such electoral laws carry no associated electoral cost as far as the major parties are concerned (of course the National Christian Democratic Peasants Party must have bitterly regretted this decision). Whether parties cooperate with one another on a regular basis using signals or whether they only cooperate because the governing coalition refuses to pay the entire electoral cost requires further study. It is my hope that the argument I have presented might offer a different perspective on the emergence of the parties cartel.

THE EUROPEAN DIMENSION OF ROMANIAN CULTURE IN CONSTANTIN NOICA'S PHILOSOPHICAL WORK

PHD LECTURER CARMEN D. CARAIMAN[1]
PHD LECTURER CAMELIA NEAGU[2]

Abstract:
After joining the EU, the concept of European cultural identity became a much debated issue in all the new member states of the Union, alongside with the "old" EU members. Our paper aims to present the contribution brought by Constantin Noica to preserving the spirit of Romanian culture alive during the totalitarian period that our country underwent from 1945 to 1989. We also intend to point out that Constantin Noica's attempt to define the particular profile of our country remains a current topic nowadays. In fact, this topic should be tackled more frequently by students, professors, research workers in order to help us rediscover the European vocation of our culture.

Key words: *Romanian culture, European culture, cultural identity, history of Romanian thinking, European cultural model.*

"...s-a ivit de vreo 1500 de ani o cultură europeană care a împânzit, a exploatat, e drept, dar a şi educat, cu valorile ei restul umanităţii/.../ aşadar aproape tot ce se întâmplă azi pe glob şi se va întâmpla mâine chiar în cosmos poartă pecetea Europei, oricât ar pretinde altfel etnografii şi istoricii, care descoperă alte lumi, în fond pentru a le scoate din letargie şi a le jefui de comorile lor spirituale. Suntem piraţi, conchistadori şi corsari în continuare, dar conchistadori ai spiritului – şi asta schimbă totul."[3]

"Orice coborâre în infern poate fi suportată dacă paradisul culturii e cu putinţă"[4]

Constantin Noica (1909-1987) was one of the most famous and a prolific Romanian philosopher, whose work widely enjoys the appreciation of contemporary intellectuals both in our country and abroad. Constantin Noica manifested interest for a various range of philosophical directions of research: gnoseology, ontology, axiology, logic, the philosophy of culture and the history of philosophy.

Perhaps at present Constantin Noica's name is mainly linked to the School of Păltiniş, basically to the closest collaborators of the philosopher – Andrei Pleşu and Gabriel Liiceanu, as well as to the research workers that tackled the famous thinker's philosophical work (e.g. Laura Pamfil, Sorin Lavric – to mention only two of the most important specialists who undertook this difficult attempt).

The repeated publication of Noica's volumes, especially after December 1989, has brought into evidence the philosopher's continuous strain to define the specific features of Romanian

[3] Constantin Noica, *Modelul cultural european*, Editura Humanitas, Bucureşti, 1993, pag. 7: ".. for about 1500 years a European culture has evolved and it has widespread, exploited, it is true, but also educated with its values the rest of mankind /.../ thus almost all that is happening in the world at present or that will happen tomorrow, even in the outer space, bears the mark of Europe, no matter what ethnographers and historians, who are discovering other worlds to take them out of lethargy and to deprive them of their spiritual treasures, would pretend. We are sea robbers, conchistadors and corsairs, but corsairs of the spirit – and this makes the whole difference." (our translation).

[4] G. Liiceanu, *Jurnalul de la Păltiniş*, Editura Humanitas, Bucureşti, 1991, pag. 124 ("One can face up to any decent into the inferno, should the paradise of culture be possible" – our translation.

spirituality, to outline a history of Romanian thinking, as well as to highlight the main characteristics of European culture, of which our country has always been part (see the posthumous volume *Modelul cultural european* – initially published in German under the title *De dignitate Europae*, 1988, and later on translated and published in Romanian, in 1993).

The particular features of our culture – outlined by the Romanian philosopher in a large number of volumes (*Pagini despre sufletul românesc*, 1944, *Rostirea filosofică românească*, 1970, *Creaţie şi frumos în rostirea românească*, 1973, *Sentimentul românesc al fiinţei*, 1978, *Spiritul românesc în cumpătul vremii*, *Şase maladii ale spiritului contemporan*, 1978) – must appear to the nowadays reader as worth being praised because they were meant to preserve the spirit of our culture alive during half a century of totalitarianism. Consequently, Constantin Noica's merit was basically to re-establish and consolidate the connection existing between Romanian culture and the European one. Our spiritual values – which were either denied or permanently reinterpreted from a political perspective as the one-party state dictated – found in the famous philosopher a real defender, whose voice made itself heard despite of the harsh censorship which functioned at the time. From this perspective, Noica's attempt to outline and promote the spiritual profile of Romanian culture, as well as of the European one, during the communist regime, was an effort aimed to recover and preserve our cultural identity alive and to oppose the spiritual annihilation of our nation.

Now, after 22 years since the Romanian political regime was changed, a discussion about Romanian cultural identity is still an isolated issue, which draws the attention of a small segment of the population. Normally, such an issue should have concerned most of the Romanian citizens not just after December 1989, but also before this year. However, the attitude of indifference towards essential issues (such as preserving and enriching cultural values, enhancing the level of civilization) that one can notice today in Romania can be regarded as an indicator of their superficial relation to collective past. Education and culture have been for too long a secondary existential problem in Romania. Today we ask ourselves why the effort made by Romanian intellectuals (among whom Constantin Noica) to preserve these values during the restrictive communist period is now not widely discussed and valued by the majority of our co-nationals. The question can be answered in several ways: the fundamental value and respect for culture has been either ''deleted'' (see the 1950's when the most important men of culture were interdicted in schools, universities and were forbidden to be mentioned in any kind of publications) or constantly attacked by ideological slogans or even replaced with the allowed political cliches of the time. Culture became not just a target to be assaulted by oppressors, but also a shelter, in which citizens tried to preserve their freedom of thinking. It was against such a background that Constantin Noica strived to become a mentor for a young group of promising students and, in fact, to make his conationals aware of their duty to cultivate the spirit of Romanian culture and transmit it to the new generations.

Constantin Noica supported with arguments the originality of our culture and tried to bring into evidence its identity by approaching complex subjects such as: proposing the creation of a history of Romanian thinking, identifying representatives of our cultural elite who could be regarded as real voices of their centuries (Neagoe Basarab, Dimitrie Cantemir, Mihai Eminescu and Lucian Blaga). In fact, the famous philosopher continued to manifest a particular interest in Romanian spirituality as other important Romanian thinkers did during the interwar period (see Mircea Vulcănescu, Lucian Blaga, Emil Cioran, Dimitrie Gusti and others).

During the interwar period the obsession of cultural identity was a normal consequence for Romanians whose country had just become united (on the 1st of December 1918).

So far we have used terms like *identity* and *culture*, but we have not explained them in order to reveal the multiple connotations that these terms involve. For defining *identity*, we are going to quote Professor Ion Goian, who gives the concept of identity the following fundamental connotations: "In order to understand the whole complexity of this topic, it is necessary to sum up all the meanings attributed to the notion of identity. The term itself is borrowed from Latin: *identitas* is the quality of being equal to oneself or the same (idem, eadem). /…/ Identity might be understood as

similarity, according to which something is regarded as wholly similar to something else /…/ but, analyzing the term from a different perspective, one could understand it as the quality of a subject to remain unchanged as time passes and to be <<identical to itself>>, while escaping the universal ceaseless change and transformation, which affects all undermoon realities, as the antique people used to think. Consequently, the second meaning confers a temporal, historical, and basically, dialectical meaning to the term which is, in fact, the main characteristic of the notion of identity."[5] (our translation)

Nevertheless, as Ion Goian points out, the problem of a European cultural identity is an old issue, characteristic of ancient times, when it defined itself under the influence of two major cultures (the Roman and the Greek cultures): "Undoubtedly, the European identity issue is even older and it naturally appears in connection with the contacts existing between cultures and civilizations. Since the Mediterranean was the place where several cultures and civilizations met, it was natural for the notion of cultural identity to appear during ancient times and, within the Greek and Roman worlds, there is no important antique historian who has failed to write about this subject. That is why, once the antique thinkers were rediscovered, the Renaissance authors rediscovered the European identity issue, too."[6]

According to Constantin Noica[7], European culture began in 325 at Niceea, when the first religious Congress was held here. The seven religious Congresses that were organized in Niceea (325-787) are in the Romanian philosopher's opinion the starting point for the problematic philosophical spirit of Europe. The Christian perspective of Divinity – as a Unity of three Parts (The Father, The Son and The Holy Spirit) – reflects the matrix of European culture, as a unity in diversity. However, according to Constantin Noica, this unity in plurality is not static, but expansionist and it tends to cover other cultural areas and to assimilate those influences that are assumed to be akin to it. Through the tolerance and universalist spirit of the Christian faith, as well as through prospective philosophy and science, European culture is an open structure which refuses stagnation and pre-established/commonly shared beliefs.

Like any minor culture, within the European one, Romanian culture has strived to correlate its creative directions to the ones introduced by the major cultures of the world. However, a minor culture, as Constantin Noica points out, is not necessarily an inferior one. On the contrary, the philosopher's conviction is that Romanian culture – basically founded on the popular anonymous creations – will be surpassed in time. Like Lucian Blaga, Constantin Noica appreciates that a minor culture needs continuity in order to become major. It is, in fact, this problem of lack of continuity that interrupted the smooth evolution of culture during the years of totalitarianism, when severe censorship brought with it the denial of Romanian valuable cultural heritage (except for the years of *ideological thaw* – from 1964 to 1971).

[5] Ion Goian, *Eseu despre identitățile culturale*, în *Revista de Științe Politice și Relații Internaționale*, VI, *4*, p. 95–105, București, 2009, pag. 96: "Pentru a înțelege întreaga complexitate a acestei teme, este necesară o sumară trecere în revistă a sensurilor atribuite noțiunii de identitate. Termenul însuși este preluat din limba latină: identitas este însușirea de a fi egal cu sine, același sau aceeași (idem, eadem). /.../ Identitatea poate fi înțeleasă ca însușirea similarității, prin care ceva anume este arătat a fi întru totul asemănător cu un altceva /.../ dar și, privind lucrurile din altă perspectivă, drept însușire a unui anume subiect de a rămâne neschimbat odată cu trecerea timpului, de a fi „identic cu sine", salvându-se, într-un fel, din fluviul eternei schimbări și transformări universale, la care sunt supuse toate realitățile sublunare, cum credeau anticii. Prin urmare, acest al doilea înțeles se deschide asupra unei perspective temporale, istorice, dialectice, în fond, în care se integrează noțiunea complexă de identitate." (original text).

[6] Ion Goian, *Revista de Științe Politice și Relații Internaționale*, VI, 4, p. 95–105, București, 2009, pag. 98: "Fără îndoială, tema identității europene este mult mai veche și ea apare, firesc, legată de contactele dintre culturi și civilizații. Cum în bazinul mediteranean s-au întâlnit mai multe culturi și mai multe civilizații, era de așteptat ca ideea unei identități culturale să fie elaborată încă în lumea antică și nu există niciun istoric important al antichității greco-romane care să nu fi scris, într-o măsură sau alta, cu privire la acest subiect. De aceea, odată cu redescoperirea anticilor, autorii din epoca Renașterii au redescoperit și tema identității Europei." (original text).

[7] Constantin Noica, *Modelul cultural european*, București: Editura Humanitas, 1993.

It is interesting to notice that Constantin Noica's optimistic vision (identifiable in the volume entitled *Pagini despre sufletul românesc*, 1944) – as to the faith of Romanian culture – was not lost during the totalitarian regime, but, on the contrary, it determined the writer to concentrate all effort for continuing his mission of prophet for his people's cultural rebirth.

The above mentioned book (*Pagini despre sufletul românesc*) outlines – by means of three symbolical figures (Neagoe Basarab, Dimitrie Cantemir, Lucian Blaga) – three main directions of development in Romanian spirituality: the religious stage (Neagoe Basarab), the stage of self-awareness and criticism as to improving the character and education of the autochthonous population (Dimitrie Cantemir), and, last but not least, the stage of conceiving a stylistic profile of Romanian culture (Lucian Blaga).

In this volume, Constantin Noica depicted Romanian culture as a particular presence in the European context, no matter about what century we discuss: the XVIth, the XVIIIth, the XIXth or the XXth. For the XVIth century, the book written by Neagoe Basarab – *Învăţăturile lui Neagoe Basarab către fiul lui, Teodosie*[8] – is regarded as a landmark in our culture. The book reveals the subjection of Romanian spirituality to Christian dogma, which encourages the cultivation of all religious virtues and points out the uselessness of searching another form of truth outside faith in God.

As far as the XVIIIth century is concerned, Constantin Noica regards Dimitrie Cantemir as the prominent voice of Romanian culture of the time, not just for the philosophical and history books written by the famous scholar, who became a member of the Academy of Berlin, but also for the well-documented description of Moldavja – *Descriptio Moldaviae*[9]. Regarded as a half bitter-critical, half objective presentation of Moldavja, Constantin Noica appreciates that this book is the first attempt of a Romanian ruler to compare the Romanian spiritual profile with the Western European one, offering accurate information about his country's geography, politics, social classes, traditions, history, religion and approximate information (not very praising) about the particular features of the Romanians' character.

An impressive approach to the philosophical dimension of Romanian language can be found in *Rostirea filosofică românească*, 1987. In the philosopher's opinion, Romanian language reveals an unexpected capacity to create words whose connotations lead to an original interpretation of existence. It is Constantin Noica's conviction that: "If our language really tells us things that have never been uttered before in other languages and that could determine these languages to mould themselves according to our word, then, if there exists a Romanian component in thought, we owe to share it with the world."[10]

In *Modelul cultural european* (1993), Constantin Noica attempts to identify the inner mechanism of the European culture, which he deciphers linguistically, by applying morphologic parts of speech to the morphology of spirit. In the author's opinion, before becoming a model, a culture has been a scheme and a structure. Thus, one could narrate the history of European culture by using parts of speech to describe it. Cultural epochs are attributed a part of speech: e.g. the Renaissance is analogous with the noun, the Baroque with the adjective and so on.

Besides the conferences gathered in the volume *Pagini despre sufletul românesc*, besides discovering the philosophical dimension of Romanian language in *Rostirea filosofică românească*, Constantin Noica had the merit to publish Mihai Eminescu's 44 manuscripts in 17 facsimile copies (known as *Caietele Eminescu*). The philosopher made a huge effort to have these manuscripts copied

[8] Neagoe Basarab, *Învăţăturile lui Neagoe Basarab către fiul său Theodosie*, Editura Litera, Chişinău, 1998.

[9] Dimitrie Cantemir, *Descriptio Moldaviae*, Editura Litera, Chişinău, 1998.

[10] Constantin Noica, *Rostirea filosofică românească*, Editura Eminescu, Bucureşti, 1987, pag. 8: "Dacă graiul nostru spune într-adevăr lucruri ce nu s-au rostit întotdeauna în alte limbi şi care le-ar putea îndemna pe acestea să se mlădieze după cuvântul nostru, atunci, în măsura în care există un rest românesc în cele ale gândului, suntem datori lumii cu acest rest".

and offered to the public and research workers for reading and analysing. For ten years Constantin Noica asked persons with important positions in Romanian cultural life to support him in accomplishing this project. Finally, after continuous hard work, the philosopher made the impossible possible.

Constantin Noica regarded these manuscripts as the laboratory of our absolute poet's creation. The approximate 9,000 pages that are included in the manuscripts contain accurate translations from Kant, unknown poems, everyday thoughts and notices, pages written in German Gothic, prose writings a.s.o.

In Constantin Noica's opinion, Mihai Eminescu represents the prototype of the European universal spirit through his permanent search for knowledge in a large and diverse sphere of foreign cultures: Indian, Greek, Latin, Hebrew and German.

Not only did Constantin Noica praise Eminescu's wide culture and ceaseless thirst for knowledge, but he also praised the poet's incredible historical intuition. For exemplifying this aspect, Constantin Noica quoted Eminescu's comments regarding the role that the Germans were about to play in history during the second half of the XIXth century: "He loved, admired the German people and, still, for the period 1870-1871, he has this intuition; in a letter sent to Negruzzi, in the unused manuscript 2[2]91, he wrote: "Oh, the silent thinkers, the German humanitarians…Where are they? I confess you that you cannot find them anymore." And he says this thing, which must make us ponder today: "A part of the world's historical faith is today, in 1871, when the clock of their forgetfulness has struck, in their hands. You will see what they will do." This man – who puts an end to his manuscript with the thought that "Every existing thing bears in itself its measure, the trees cannot grow up to the sky" – was a visionary. We cannot either grow up beyond our measure and our measure is Eminescu. We shall not grow more than that. But I would we grew that much! Because our soul must be fertilized in the same way in which land is. And unless we feed our souls with Eminescu – but not with an idealized Eminescu, not with Eminescu isolated in his geniality – but with this Eminescu of the germinative chaos, unless we feed our souls with this Eminescu, then we shall remain hungry in culture."[11] (our translation)

Constantin Noica's books on Romanian culture, language and history of thinking, as well as his attempt to identify the fundamental characteristics of European culture still represent a current issue for our society.

As a man of spirit, Constantin Noica understood that nothing valuable can be built outside spiritual evolution and permanent cultural progress.

The prophecy that one finds in Constantin Noica's books points out the right path that we should follow as Romanians and European citizens: the cultivation of spirit, the nurture of mind and souls with culture and knowledge. This permanent contact with ideas and spiritual values is not only a means for progressing as human beings but it is also a form of preserving our identity as Romanians.

[11] *Eminescu – Omul deplin al culturii românești*, Conferințele Bibliotecii Astra, nr. 2/2007, pag. 43, ISSN: 1843 – 4754: "Iubea, admira poporu' german și totuși, în '70-'71, are intuiția aceasta; într-o scrisoare către Negruzzi, în manuscrisul 2[2]91, nefolosit: „O, tăcuții, gânditorii, umanitarii germani… Unde sunt ei? Vă încredințez că nu-i mai găsești." Și spune lucrul acesta, care trebuie astăzi să ne pună pe gânduri: „O parte din soarta lumii e azi, în '71, în ceasul uitării lor, în mâinile lor. Veți vedea ce vor face." Avea simț istoric omul acesta, care încheie manuscrisu' de care vă vorbesc cu gândul: „Fiecare lucru poartă în sine însuși măsura sa, arborii nu cresc până în cer." Nici noi nu putem crește dincolo de măsura noastră și măsura noastră este Eminescu. Nu vom crește mai mult decât atât. Atât însă să creștem! Pentru că sufletul trebuie hrănit ca pământul. Și dacă nu ne vom hrăni cu Eminescu – nu cu un Eminescu idealizat, nu cu un Eminescu trimes în genialitatea lui –, cu Eminescu acesta al haosului germinativ, dacă nu ne vom hrăni cu Eminescu acesta, atunci vom rămâne, în cultura, mai departe înfometați.".

ROMANIA'S SECURITY POLICY CONCERNING THE FIGHT AGAINST CORRUPTION AND ORGANIZED CRIME

VALENTIN-BOGDAN DĂNILĂ*

Abstract
The corruption is an ubiquitous phenomenon that can be met in different countries from an ideological, economical or state development point of view. Taking in consideration the way how this phenomenon affects the economy and the process of taking decisions in the public and private life , there is no doubt regarding the fact that the damages resulting from corruption exceed the individual interests acquired as a result of corrupt actions. The fight against the corruption must constitute one of the main points on Romania's public agenda, with a view of aligning to normality from a political, economical and social point of view, and also to the effective harmonization of the Romanian society with the European practice. The corruption is being perceived moreover like a severe and dangerous phenomenon undermining the force and the authority structures, deceiving the citizen's expectations concerning the maintenance of a social equity climate that can provide equal chances for everyone, but favoring the progress of certain groups and persons. The causes that generate this phenomenon are different from a country to another, from a region to another, generating specific forms of manifestation.

Keywords: *"anti-corruption legislation", "national security", "organized crime", "conflicts of interest", "criminal investigation", "reports".*

Introduction

The present work illustrates corruption like an expression of moral disintegration and spiritual degradation manifestations, a complex social problem, its modes of utterance, social consequences and solution ways concerning public opinion and the legalized level of social control.

Corruption is perceived as a major negative weak point, a disease of the Romanian transition society, which undermines the efficiency and the state institutions lawfulness and restricts the economic development in Romania.

Thus, it was obtained a work reflecting in detail how the state institutions intercede as a response to the necessity of performing rapidly the entire spectrum of action regarding civil security.

Through this work it is suggested the improvement of the existing regulatory framework to ascertain the efficient application of the law norm not only theoretically but also in practice, and at the same time, to outline an image of the corruption phenomenon against the state democracy, social equity, justice and human fundamental rights and liberties observance.

The national defence system, which at the present is undergoing a serie of changes, remains one of the fundamental pillars of our society. But this phenomenon developing to the level of the entire society affects also domains which jeopardize the safety and the integrity of the country. Hopefully, after finalizing the reorganization process in the designated state defence institutions, and by adopting adequate regulations, the corruption would disappear or at least decrease its ampleness.

Those situations can be avoided by taking certain measures like practicing severe and objective inspections from competent commissions on events that allow the appearance of this more and more wide-spread infringement of the law in our society. A measure like that could certainly reduce this constantly rising phenomenon proportions.

* Graduate, "Nicolae Titulescu" University, Bucharest (e-mail: danila.bogdan@yahoo.com).

The current state of corruption in Romania

The lack of transparency of regulations regarding public works contracting, fluctuating import duties, tax reductions, subsidies and access to foreign currency, can facilitate, unintentionally, criminal activities. If the law is confusing, it is easier for groups of criminals to circumvent or to interpret it for their benefit.

These problems are becoming more acute, due to the low level of funding for law enforcement institutions, lack of training and knowledge needed in the fight against organized crime and the insufficient level of cooperation and coordination on an international level. The emergence of corruption is related to the deterioration of morality in social relationships.

The economy has become increasingly stronger and the social system more complex, so corruption has taken various forms.

After a period of almost two decades of democratic development in post-communist space, we can estimate that the social-political system and administrative environment in Romania is vulnerable to corruption and this kind of risks have increased with the liberalization of movement of people and ideas.

In the early stages of transition, organized crime, through the forms of black and gray economy, filled much of the present vacuum in the legal economy, with few structures able to respond to this rapid change, especially economic ones.

Power structures of the old regime were abolished, and new ones have experienced a difficult process of affirmation. Thus, criminals were able to freely carry out illicit activities, such as bank fraud, extortion, illegal trade, illegal formation of corporations, embezzlement and the black market.

"Savage Capitalism" has become a dominant feature of the democratic germs in the last decade of the twentieth century in Romania.[1]

Samuel Huntington said that, "In a society where corruption is widespread adoption and implementation of special laws against corrupt individuals only serves to multiply the opportunities for corruption"[2].

Given the scale and diversification of corruption, the government need to align to European standards, the Romanian authorities have adopted a "National Anti-Corruption Strategy" embodied in the "National Program to Prevent Corruption" and "national Action Plan Against Corruption" adopted by Government Decision no. 1065/2001.

The two programs express Romanian Government's position towards corruption, the unprecedented scale and diversification are the main motivation for developing a strong and unified strategy for the prevention and control in the future.

The adoption of a secondary anti-corruption legislation consisting in the Law side. 161/2003 regarding some measures to ensure transparency in the exercise of public dignities, public functions and business environment, preventing and punishing corruption, also arose form the same necessity.

The finding that corruption tends to globalize and embrace severe forms in Romania has become a regular coordinated of public speeches of high officials of the Romanian state, which permanently evokes new methods and tools for prevention and social control of corruption. As a member of the European Union, Romania has been the concern of the European Commission, which monitored and is still examining corruption in our country.

Thus, according to European Commission's Report on Cooperation and Verification Mechanism in Romania, which was published on 18.02.2011, is required "independent review of the judiciary system, reform of the disciplinary system for judges and measures likely to increase the rapidity of the act of justice in cases of high level corruption and strengthen the overall policy in the fight against corruption.

[1] AbrahamPavel, *Coruptia*, Ed. Detectiv, 2005, p.420.
[2] *Ibidem*, p.420.

"Within the Cooperation and Verification Mechanism were established for Romania the following benchmarks:

1.providing a measure of justice more transparent and efficient, especially by strengthening capacity and accountability of the Superior Council of Magistracy; reporting and monitoring the impact of new civil and criminal procedure codes;

2.establishment, as foreseen, an integrity agency with responsibilities for verifying assets, incompatibilities and potential conflicts of interest, with the task of issuing mandatory decisions based on which dissuasive sanctions can be applied;

3.on the progress made so far, making further professional and impartial investigation regarding the allegations of corruption at high level;

4.additional measures to prevent and combat corruption, especially in local government. "[3]

It should also mentioned the results of studies conducted by international organizations such as Transparency International or Freedom House Inc.. presenting the main positive and negative aspects related to the efforts and recommendations of organization continuing fighting corruption in Romania (Annex 1)

The relationship of information services with law enforcement

Information Services provide information for judicial authorities regarding potential criminal activity. Not infrequently, such information is obtained from an underground hardly penetrated and inaccessible to judicial authority. In such cases, law enforcement is not possible without compromising sources and methods protection, because intelligence can not be admitted to the probation system.

Judicial authorities are different from traditional consumers of intelligence from at least the following respects:

• lack of experience in information services;

• their interest in specific subjects must not have operational priorities of the intelligence services, but post-operative problems;

• potential public use (under judicial investigation) of classified information which they receive.

Judicial authority need tactical information to serve criminal construction, that lead to certain people or to bribe, a source of material evidence or to suggest new directions of investigation, to indicate an aggravation or a mitigation of responsibility of subjects of the investigation.

According to data presented by the General Direction of Anticorruption account activity during 2010, the institution has conducted research and submitted to the prosecution 2.000 papers and criminal files (+40.15% compared to 2009). Of these, 424 were submitted to the National Anticorruption Directorate and 1576 the territorial structure of H.C.C.J (High Court of Cassation and Justice). A criminal investigation was initiated in 458 criminal cases (43%), of which 65 to the National Direction of Anticorruption and 393 to territorial structures of H.C.C.J. [4]

In terms of intelligence for the purpose of achieving national security is a dissatisfaction with the manufacturers and suppliers of classified information about the degree of responsiveness shown by the recipients of information.

This problem is neither new nor unique, and cases deserve to be highlighted ca, at least the following aspects:

• conditions to obtain and limits of use secret information are not intimately known to recipients of that information;

[3] http://www.consult-avocat ro/stiri/raportul-comisiei-europene-privind-MCV-in-romania html;

[4] http://www mai-dga ro/ "*Analiza principalelor activităţi desfăşurate şi a rezultatelor obţinute în anul 2010*";

• acceptation, significance and meaning of information messages are different to law enforcement authorities, receiving information directly to the realities perceived by those who receive and provide information;

• important intelligence with obviously degree of relevance and utility are sometimes left unexploited because it could not create a possibility of their use under conditions not detrimental to the security interests or national security circumscribed to rules of classification;

• capitalization requirements of the information provided in the decisions of their beneficiaries are not always sufficiently well known to operators of information services;

• in the relationship between intelligence community and law enforcement involvement are some disorders that are perceived by the public, press, Parliament.

Nr.51/1991 Law on National Security of Romania

Currently, all laws that relate to this concept, refer to Law 51/1991 on national security, adopted shortly after the change in December 1989.

National security is defined in Article 1 of the Act, as "state of law, balance and social economic and political stability, necessary for the existence and development of the Romanian National State, as sovereign, unitary, independent, indivisible, maintaining the order of law and the climate of unrestrained exercise of the fundamental rights, freedoms and duties of citizens under the democratic rules and principles in the Constitution."

Threats to national security of Romania, under article 3 of Law on national security of Romania nr.51/1991 is the legal basis for the state authorities with responsibilities in national security, to propose to the state prosecutor, where justified, to request authorization to conduct certain activities to collecting information, consisting of:

• interception and recording of communications, seeking information, documents or writings to which access is required to obtain access to a place, an object or at the opening of an object;

• lifting and restoring to its place of an object or document, review it, extracting the information it contains, and recording, copying or taking of statements by any means;

• installation of objects, maintaining and taking them from places that have been submitted.

The proposal is made in writing and must include:

• *data or evidence showing the existence of a threat to national security, for whose discovery, prevent or counteract the issue, an authorization is required;*

• *categories of activities which is necessary to authorize: the identity of the person whose communications must be intercepted, if known, or person holding the information, documents or objects to be achieved;*

• *general description, if where and when possible, the place where the activities are authorized to be made, the duration of the authorization.*

The proposal is submitted to the general prosecutor of the High Court of Cassation and Justice and is examined in terms of merits and legality by the specially appointed prosecutors. If satisfied that the request is justified, with the completion of admission, the judge issuing the warrant authorizing the carrying out proposed activities.

Application, issuance and implementation of the mandate are the observance of the Law 182/2002 on protection of classified information.

In special situations which require immediate removal of threats to national security, specialized state authorities in this field may perform those activities without the required permit, followed: it may be claimed as soon as possible but no later than 48 hours.

If the judge considers that no further work performed without authorization is necessary, he dispose immediately cessation of them.

Anti-corruption campaigns

As noted in the report of Freedom House, the most important anti-corruption campaigns have been "Coalition for a Clean Parliament" and "Do not give bribe. "

The first was aimed at informing citizens about the integrity of the candidates on lists in parliamentary elections in November 2004, being mentioned candidates who have been involved in various scandals. This campaign was conducted at the initiative of major non-governmental organizations, including the Pro Democracy Association. The objectives of this campaign, voter education and the empowerment candidates can be said that have been if not totally satisfied, at least useful, showing that the initiative will not remain without an echo in public opinion in Romania.

The second campaign involved here, was one entitled "Do not give bribe." To conduct this campaign, there was collaboration between the Concept Foundation, Media Transparency International Oops (See Appendix 6.).

This was meant to warn the population through mass media on the negative effects of the practice is bribery. Through television and radio spots as well as the placement of billboards containing the message "Do not give bribe" people would be followed to inform and especially aware of the extent that it has "small" corruption in Romania. The target population for this campaign was created by the population aged between 15 and 25 years in urban areas, which according to the initiators of the campaign is most receptive to such a post but at the same time the bribery among which produces a feeling of frustration or even revolt.

At the initiative, the campaign was widely appreciated, but an impressive number of difficulties and obstacles to achieving this campaign was revealed by the Concept Foundation executive director, Radu Mateescu. From the absence of initial investigations to even refusing to transmit certain television commercials[5], along with the already usual funding difficulties (including those by European programs), have hampered development and likely diminished the impact of campaign against small corruption.

With all this indicative of the difficulties encountered by organizations that have taken the initiative campaign, as in fact is mentioned in the report of Freedom House, the campaign was recognized as a success.

These were the main campaign of civil society structures in Romania to raise awareness about corruption, and despite remaining obstacles (charges of libel, financial bottlenecks, etc..) they are likely to continue to exist and may even become more frequent.

In January 1997 was established at the initiative of the presidential institution, the National Action Against Corruption and Organized Crime Council (N.A.A.C.O.C.C.) as informal structure designed to facilitate cooperation in investigating corruption cases thoroughly for submission to court. This "collective" organism with an advisory and coordination role, has been challenged from the outset on grounds it violates principles of separation of powers is a political interference in the judiciary.

Eventually, in early 1998 to boost efficiency concerns for combating corruption, a part of overall efforts N.A.A.C.O.C.C. were taken and continued by the Consultative Group on preventing and combating crime, organized by the Ministry of Justice.

Bringing together representatives of all institutions involved (except those of the judiciary) working group examined in the fortnightly sessions, issues of corruption, so preoccupied with the shortcomings of the Romanian legislation in force and its improvement opportunities, as well as difficulties encountered in the practice and the legal treatment of some important cases.

The effectiveness of the fight against corruption were reflected in the reorganization in 1998 of the Prosecutor's Office Supreme Court of Justice by establishing anti-corruption Department,

[5] An example would be considered even if the TVR spots as "violent. "

forensic investigators and that it was intended to strengthen the capacity of the Public Ministry to deal with corruption cases throughout the country and resolve the priority of new cases of corruption.

It has been founded the National Institute of Forensic Expertise aiming at streamlining these procedures required in criminal proceedings[6], and the Division for coordination strategies to prevent and combat corruption and crime[7], was created within the Ministry of Justice.

In November 1998 he signed a Protocol of Cooperation between the Ministry of Justice, Ministry of Public, Ministry of Administration and Internal, Ministry of Finance (Directorate General of Customs and Finance Guard), the Romanian Intelligence Service and Foreign Intelligence Service, under which national and county will establish working groups coordinated by prosecutors to speed up prosecution and coordination of the institutions involved to better handling of cases of corruption, organized crime, money laundering.

National Office for Preventing and Combating Money Laundering[8] was established in 1999 consisting of representatives of the Ministry of Finance, Justice, Internal, Prosecutor of the Supreme Court of Justice, National Bank, the Romanian Banking Association and the Court of Auditors. The office was established as a specialized authority of the Government's aims to prevent and combat money laundering activities that aim receives, analyzes and processes the information and notify the competent authorities[9].

In May 2000 Law 78/2000 was promulgated on preventing, detecting and sanctioning corruption[10]. For tracking and investigation of offenses under this law, in June was set up Anti-Corruption Department of the Supreme Court of Justice and the prosecution services in the specialized tribunals which have not worked because there were busy vacancies contest.

In the Ministry of Administration and Internal was established the Central Task Force Organized of Crime and Corruption Group.

Since 2001 they focus in particular on concrete measures to combat corruption. The government program, some of the set priorities includes restoration of state authority, reducing bureaucracy and fight corruption and crime.

In the National Program for Prevention of Corruption prerequisites to success are predicted in this fight, the political will, accountability of institutions, the correct estimate of the cost, transparency and public access to information, support civil society and the media are highlighted.

The program details the notion of corruption as the misuse of public power to obtain improper benefits and makes direct reference to the abuse of power in the line of duty, fraud (deception and harm another person), use of illicit funds to finance political parties and campaigns elections, establishment of an arbitrary mechanism for the exercise of power in the area of privatization or procurement and conflict of interest (commitment in transactions or acquiring of a position or an incompatible commercial use is with their role and official duties).

Government Control Office Department was reorganized in the Control and Corruption Department[11].

This change was one of the points of the acquis communautaire to be performed by Romania in order to integrate into European structures, to have a specialized state authority to combat corruption. Later, is organized the Prime Minister's Control Authority part of the apparatus of the Prime Minister headed by a secretary of state named by decision of the Prime Minister[12], and its functions including the detection and reporting corruption cases to empowered state authorities in criminal investigations.
