contracts that include the representation of another party. There is no doubt that the commercial intermediation is a complex operation, one that includes several legal relations concluded between its contractual partners, having various names and various capacities, carried out either under the domestic commercial law or under the provisions of the international commercial laws, and the history of the development of the concept shows also the same.

Probably the most important new improvement that this paper brings is that it separates the traditional concept in the sense that the commercial intermediation is based only on the idea of representation. But the notion of intermediation is not only expressed in the contract of mandate, the entire legal nature of the other contracts that have a link to the notions, which we thoroughly presented in the paper, shows that the perspective should be much wider. From this the definition of the commercial intermediation had been extracted.

It must be noted also, that the implications of the New Civil Code are mostly as regards the classification of the concept. This is because after the New Civil Code has institutionalized a new conception regarding the regulating system for civil and commercial legal relations. By doing so it redefined the characteristics of mostly every contract that refers to the commercial intermediation. Also, it settles more clearly the criterion of the powers granted to the intermediary, by which we find the four types of commercial intermediation contracts, to which we referred in the paper.

PRINCIPLE OF PROPORTIONALITY, CRITERION OF LEGITIMACY IN THE PUBLIC LAW

MARIUS ANDREESCU[*]

Abstract
A problem of essence of the state is the one to delimit the discretionary power, respectively the power abuse in the activity of the state's institutions. The legal behavior of the state's institutions consists in their right to appreciate them and the power excess generates the violation of a subjective right or of the right that is of legitimate interest to the citizen. The application and nonobservance of the principle of lawfulness in the activities of the state is a complex problem because the exercise of the state's functions assumes the discretionary powers with which the states authorities are invested, or otherwise said the 'right of appreciation" of the authorities regarding the moment of adopting the contents of the measures proposed. The discretionary power cannot be opposed to the principle of lawfulness, as a dimension of the state de jure.
In this study we propose to analyze the concept of discretionary power, respectively the power excess, having as a guidance the legislation, jurisprudence and doctrine in the matter. At the same time we would like to identify the most important criterions that will allow the user, regardless that he is or not an administrator, a public clerk or a judge, to delimit the legal behavior of the state's institutions from the power excess. Within this context, we appreciate that the principle of proportionality represents such a criterion. The proportionality is a legal principle of the law, but at the same time it is a principle of the constitutional law and of other law branches. It expresses clearly the idea of balance, reasonability but also of adjusting the measures ordered by the state's authorities to the situation in fact, respectively to the purpose for which they have been conceived. In our study we choose theoretical and jurisprudence arguments according to which the principle of proportionality can procedurally be determined and used to delimit the discretionary power and power abuse.

Keywords: *discretionary power, power excess, subjective right, principle of lawfulness, principle of proportionality constitutional law*

I. Introduction

The lawfulness, as a feature that needs to characterize the juridical acts of the public authorities, has as a central element the concept of "law". Andre Hauriou defined the law as a written general rule established by the public powers, after the deliberation and involving the direct or indirect acceptance of the governors[1]. In a wide meaning, the concept of law includes all juridical acts that contain the law norms. The law in a restricted acceptance is the juridical act of the Parliament elaborated in compliance with the constitution, according to some pre-established proceedings, that regulates the most general and most important social rules. A special place in the administered legislative system is owned by the constitution defined by the fundamental law that is placed on top of the hierarchy of the legislative system which contains juridical norms with a superior juridical force regulating the fundamental and essential social relationships, mostly those regarding the installing and exercising of the state power.

The lawfulness status in the public authorities' activity is founded on the concept of supremacy of the constitution and supremacy of the law.

The supremacy of the constitution is a quality of the fundamental law which in essence expresses its supreme juridical force in the law system. An important consequence of the supremacy

[*] Marius Andreescu, Phd, (e-mail: andreescu_marius@yahoo.com).
[1] André Hauriou, *Droit constitutionel et institution politiques*, (Paris, Ed. Montchrestien, 1972), p.137.

of the fundamental law is the compliance of the entire law with the constitutional norms[2]. The concept of juridical supremacy of the law is defined like "its characteristic that is seeking its expression in the fact that the norms it establishes should not correspond to neither of the norms, except for the constitutional ones, and the other juridical acts issued by the state bodies, are subordinated to it, from the point of view of their juridical efficacy"[3].

Therefore, the supremacy of the law, in the above given acceptance is subsequent to the principle of supremacy of constitution. Important is the fact that the lawfulness, as a feature of the juridical acts of the state authorities involves the observance of the principle of supremacy of constitution and supremacy of the law. The observance of the two principles is a fundamental obligation of constitutional nature consecrated by the provisions of item 1 paragraph 5 of the Constitution. The non observance of this obligation results, as the case might be, into sanctions of non-constitutionality or unlawfulness of the juridical acts.

The lawfulness of the juridical acts of the public authorities involves the following requirements: the juridical acts should be issued with the observance of the competence stipulated by the law; the juridical act should respect the superior law norms as a juridical force.

The "legitimacy" is a complex category with multiple significances that forms the search topic for the general theory of the law, philosophy of law, sociology and other branches of instruction. The significances of this concept are multiple. To remind a few: the legitimacy of the power, the legitimacy of the political regime; the legitimacy of a governing, the legitimacy of the political system, etc.

The legitimacy concept can be applied also in the case of the juridical acts issued by the public authorities being linked to the "appreciation margin" recognized to them in the exercising of the duties.

The applying and observance of the principle of lawfulness in the activity of state's authorities is a complex problem because the exercise of the state's powers implies also the discretionary power with which the state's bodies are invested, or otherwise said the right of appreciation of the authorities regarding the adopting moment and the contents of the disposed measures. What it is important to underline is the fact that the discretionary power cannot be opposed to the principle of lawfulness, as a dimension of the rightful state.

In our opinion, the lawfulness represents a particular aspect of the legitimacy of the juridical acts of the public authorities. Thus, a legitimate juridical act is a legal juridical act, issued outside the appreciation margin recognized by the public authorities, that does not generate unjustified discriminations, privileges or restraints of the subjective rights and is adequate to the situation in fact, which is determined by the purpose of the law. The legitimacy makes distinction between the discretionary power recognized by the state's authorities, and on the other side, the power excess.

Not all the juridical acts that fulfill the conditions of lawfulness are also legitimate. A juridical act that respects the formal conditions of lawfulness, but which generates discriminations or privileges or unjustified restrained to the exercising of the subjective rights or is not adequate to the situation in fact or to the purpose aimed by the law, is an un-legitimate juridical act. The legitimacy, as a feature of the juridical acts of the public administration authorities should be understood and applied in relation to the principle of supremacy of Constitution.

II. THE DISCRETIONARY POWER OF THE POWER EXCESS IN THE ACTIVITY OF STATE INSTITUTIONS

Antonie Iorgovan asserted that a problem of essence of the rightful state is that of answering to the question: "where ends the discretionary power and where begins the law abuse, where ends the legal behavior of the administration, materialized by its right of appreciation and where begins the subjective law or the legitimate interest of the citizen? "[4]

Approaching the same problem, Leon Duguit in 1900 makes an interesting distinction between the "normal powers and the exceptional powers" conferred to the administration by the constitution and the laws, and on the other side the situations in which the state's authorities act outside the normative framework. The last situations are split into three categories by the author: 1) the power excess (when the state authorities exceed the limits of the legal mandates; 2) the embezzlement of the power (when the state's authority fulfils an act that enters its competence aiming a different scope, other than the one the law stipulated), 3) the power abuse (when the state's authorities act outside their competence, but through acts that don't have a juridical character)[5].

In the administrative doctrine, that studies mainly the problematic of the discretionary power, it was underlined that the opportunity of the administrative acts cannot be opposed to their lawfulness, and the conditions of lawfulness can be split in general lawfulness conditions and respectively in lawfulness specific conditions on opportunity criterions[6]. As a consequence, the lawfulness is the corollary of the conditions of validity, and the opportunity is a requirement (a dimension) of the lawfulness.[7] Nevertheless, the right of appreciation is not recognized by the authorities of the state in the exercising of all duties they have. One must remember the difference between the *linked competence* of the state's authorities that exists when the law imposes them a certain strict decisional behavior, and on the other side the *discretionary competence*, situation in which the state authorities can choose between more decisions, within law limits and its competences. To remember the definition proposed in the literature in specialty to the discretionary power: "it is the margin of liberty that is let to the free appreciation of the authorities, so that in view of fulfilling the purpose indicated by the law maker, to use any means of action within its limits of competence."[8]

Yet the problematic of the discretionary power is studied mainly in the administrative law, the right for the appreciation in the exercise of some duties represents a reality met in the activity of all state's authorities.[9] The Parliament, as a supreme representative organ and with a unique law making authority, disposes of the largest limits in order to show its discretionary power, which is identified by the characterization of the legislative act. The discretionary power exists in the activity of the law courts. The judge is obliged to decide only when it is noticed for, within this notification limit. Beyond these it is manifested the sovereign *right of appreciating* the facts, the right to interpret the law, the right to fix a minimum punishment or a maximum one, to grant or not extenuating circumstances, to establish the quantum of the compensations etc. The exercising of such competences means nothing else but the discretionary power.

[4] Antonie Iorgovan. *Forward to:* Dana Apostol Tofan, *Discretionary power and the power excess of the public authorities*, (Bucharest, All Beck Publishing House, 1999).

[5] Leon Duguit, *Manuel de Droit Constitutionnel*, (Paris, 1907), p.445-446.

[6] Antonie Iorgovan, *Treaty of administrative law, .Nemira Publishing House, Bucharest 1996,volI,p.301*

[7] Ibidem, p.292.

[8] Dana Apostol Tofan, *quoted works*. p. 22.

[9] In the doctrine, Jellinek and Fleiner sustained the thesis according to which the discretionary power is not specific only to the administrative function, but also it appears in the activity of the other functions of the state, under the form of a liberty of appreciation upon the content, on the opportunity and the extent of the juridical act. (see Dana Apostol Tofan, *quoted works*. p. 26)

Exceeding the limits of the discretionary power signifies the violation of the principle of lawfulness and of legitimacy or, of what in legislation, doctrine or jurisprudence is named to be the "excess of power".

The power excess in the activity of state's organs is equivalent with the law abuse because it signifies the exercising of the legal competences without the existence of a reasonable motivation or without the existence of an adequate relation between the disposed measures, the situation in fact and the legitimate purpose aimed at.

The law of the Romanian administrative prosecution[10] uses the concept of "power excess of the administrative authorities" which is defined to be the "exercising of the right of appreciation belonging to the public administration, by the violation of the fundamental rights and liberties of the citizens stipulated by the Constitution or by the law" (item 2, paragraph 1, letter m). For the first time the Romanian law maker uses and defines the concept of power excess and at the same time acknowledges the competence of the administrative prosecution instances to sanction the exceeding of the discretionary power limits throughout the administrative acts.

The exceptional situations represent a particular case in which the Romanian authorities, and mainly the administrative ones, can exercise the discretionary power, obviously existing the danger of the power excess.

Certainly, the power excess is not a phenomenon that manifests itself only in the practice of the executive organs it can be seen in the Parliament activity or in the activity of the law courts.

We appreciate that the discretionary power acknowledged by the state's authorities is exceeded, and the measures disposed represent a power excess, anytime it is ascertained the existence of the following situations:

1. The measures disposed do not aim to a legitimate purpose;
2. The decisions of the public authorities are not adequate to the situation in fact or to the legitimate purpose aimed, in the meaning that everything that is needed in order to reach the aimed purpose, is exceeded;
3. There is no rational justification of the measures disposed, included the situations in which it is established a juridical treatment that is different for identical situations, or a juridical treatment identical for different situations;
4. By the measures disposed the state's authorities limit the exercise of some fundamental rights and liberties, without the existence of a rational justification that would represent, mainly, the existence of an adequate relationship between those measures, the situation in fact and the legitimate purpose aimed at.

III. THE PRINCIPLE OF PROPORTIONALITY, CRITERION DELIMITING THE DISCRETIONARY POWER FROM POWER EXCESS

The essential problem remains that for the identification of criterions through which are to be established the limits of the discretionary power of state's authorities and to differentiate them from the power excess, that should be sanctioned. Of course there is the problem of using some criterions in the practice of the law courts or in the constitutional prosecution.

In connection to these aspects, in the literature in specialty it is expressed the opinion according to which the "purpose of the law will be then the legal limit of the right to appreciate (the opportunity). Therefore the discretionary power does not mean a liberty outside the law but one allowed by the law."[11]

[10] Law no.554/2004, published in the Official Gazette no.1154/2004.

[11] Rozalia Ana Lazăr, *The Lawfulness of the administrative act. Romanian law and the compared law, quoted works* p. 165.

Of course, "the purpose of the law" represents a condition of lawfulness or, as the case may be, of constitutionality of the juridical acts of the state bodies and that's why it can be considered as a criterion to delimit the discretionary power from the power excess.

Such as results from the jurisprudence of some national and international law courts, in relation to our search topic, the purpose of the law cannot be the only criterion to delimit the discretionary power (synonymous with the margin of appreciation, term used by C.E.D.O.), because a juridical act of the state can represent a power excess not only in the situation in which the measures adopted do not aim to a legitimate purpose, but also in the hypothesis in which the measures disposed are not adequate to the purpose of the law and are not necessary in relation to the situation in fact and with the legitimate purpose aimed at.

The suitability of the measures disposed by the state authorities to the aimed legitimate purposes represents a particular aspect of the principle of proportionality. Significant is the opinion expressed by Antonie Iorgovan which considers that the limits of the discretionary power are established by the: "written positive rules, the general law principles subscribed, the principle of equality, the principle of non retroactivity of the administrative acts, the right to defense and the principle of contradictoriality , *the principle of proportionality" (s.n.).*[12]

Therefore, the principle of proportionality is an essential criterion that allows the delimiting of the discretionary power from the power excess in the activity of state's authorities.

This principle is consecrated explicitly and implicitly in the international[13] juridical instruments or by the majority of the constitutions of the democratic[14] countries. Romania's Constitution regulates explicitly this principle in item 53, but there are other constitutional dispositions that imply it.

In the constitutional law, the principle of proportionality finds its use mainly in the field of protection of human fundamental rights and liberties. It is considered as an efficient criterion of appreciation of legitimacy of the interventions of the state authorities in a situation limiting the exercise of some rights.

Much more, even if the principle of proportionality is not consecrated expressly in the constitution of a state, the doctrine and jurisprudence considers it as being a part of the notion of a rightful state[15].

This principle is applied in many branches of the law. Thus, in the administrative law it is a limit of the discretionary[16] power of the public authorities and represents a criterion in the exercising the jurisdictional control of the discretionary administrative acts. Applications of the principle of proportionality exist in the criminal law[17] or in the civil law[18].

[12] Antonie Iorgovan, *quoted works* vol. I, p.296.

[13] To remind on this topic item.29, paragraphs.2 and 3 of the Universal Declaration of Human Rights items 4 and 5 of the International Pact regarding the economical, social and cultural rights, item 5, paragraph 1, item 12 paragraph 3, item 18, item 19 paragraph 3 and item 12 paragraph 2 of the International pact regarding the protection of the national minorities; item G Part V of the European Social Chart – revised; items 8, 9, 10, 11 and 18 of the European Convention for the defense of human rights and the fundamental liberties or item B13 of the Treaty regarding the European Economical Community.

[14] For example, item 20, point.4; item 31 and item 55 of Spain Constitution; items 11,13.14,18,19 and 20 of the German Constitution or the provisions of items.13,14,15,44 and 53 of Italy Constitution.

[15] For the development see Petru Miculescu, *The Lawful State,(* Lumina Lex Publishing House, Bucharest, 1998) pg.87-88 and Dana Apostol Tofan *quoted works.*, p.49.

[16] On this meaning see Dana Apostol Tofan, *quoted works* pg.46-50; Iulian Teodoroiu, Simona Maya Teodoroiu, *Lawfulness of opportunities and the constitutional principle of proportionality* in: Law no. 7/1996, p.39-42.

[17] The provisions of item 72 of the Criminal Code refer to the proportionality as a general criterion of judicial individualization of the punishments or the provisions of item 44, paragraph 3 of the Criminal Code considers the proportionality as a condition of legitimate defense.

[18] The provisions of items 951 and 1157 of the Civil Code, allow the cancellation of a contract for the obvious disproportion of the service conscriptions (lesion).

The principle of proportionality is found also in the community law, in the meaning that the lawfulness of the community rules is subject to the condition that the means used to be adequate to the aimed objective and not to exceed what it is necessary to reach this objective.

The jurisprudence has an important role in the analysis of the principle of proportionality, applied in concrete cases. Thus, in the jurisprudence of the European Court of the Human Rights, the proportionality is conceived as a just, equitable ratio, between the situation in fact, the restraining means of the exercise of some rights and the aimed legitimate purpose, or as an equitable ratio between the individual interest and the public interest. The proportionality is a criterion that determines the legitimacy of state interference of the contracting states in the exercising of the rights protected by the Convention.

In the same meaning, the Constitutional Court of Romania, by several decisions established that the proportionality is a constitutional principle[19]. Our constitutional instance asserted the necessity to establish some objective criterions, by the law, for the principle of proportionality: "it is necessary that the legislative institutes objective criterions that should reflect the exigencies of the principle of proportionality" [20].

Therefore, the principle of proportionality is imposed more and more as a universal principle consecrated by the majority of the contemporary law systems, to be found explicitly or implicitly in constitutional norms and acknowledged by the national and international jurisdictions[21].

In the literature in specialty were identified three jurisdictional levels of the administrative acts: "a) the minimum control of the procedure rules (form); b) normal control of the juridical appreciation of the facts; c) the maximal control, when the judge asserts upon the necessity and proportionality of the administrative measures**".**[22]

The maximal control, to which the quoted author refers to, represents the correlation between the legality and the opportunity, otherwise said, between the exigencies of the principle of lawfulness and the right of appreciation of the public authorities, the proportionality couldn't be considered as a super legality criterion, but as a principle of law, whose main finality is to represent the delimiting between the discretionary power and the power excess in the activity of the public authorities.

There are situations in which the Constitutional Court used a "proportionality reasoning" as an instrument for the interpretation of the correlation between the legal contested dispositions and on the other side the constitutional dispositions, and in situations in which the proportionality, as a principle, is not explicitly expressed by the constitutional texts. Self evident in this meaning are two aspects: invoking in the Constitutional Court's jurisprudence of C.E.D.O. jurisprudence, which, in the matter of restraining the exercise of some rights, analyzes also the proportionality conditions, and the second aspect, the use of such a principle in situations in which it is raised the question of respecting the principle of equality.

Declaring as non constitutional a normative disposition on the ground of non observance of the principle of proportionality, applied in this matter, signifies in essence the sanctioning of the power excess, manifested in the activity of the Parliament or of the Government. Also excess of power, sanctioned by the Constitutional Court, using the criterion of proportionality, are the situations in which the principle of equality and non discrimination are violated, if by the law or by the Government ordinance it is applied a differentiated treatment to equal cases, without the existence of a reasonable justification or if exists a disproportion between the aimed purpose and the means used.

IV. Conclusions

There are two most important finalities of the constitutional principle of proportionality: the control and the limiting of the discretionary power of the public authorities and respectively the granting of the fundamental rights and liberties in situations in which their exercising could be conditioned or restricted.

The proportionality is a constitutional principle, but in several cases there is no explicit normative consecration, the principle being deducted by different methods of interpretation from the normative texts. This situation creates some difficulties in the application of the principle of proportionality.

In relation to these considerations we propose that in the perspective of a reviewing of Romania's Constitution, that at item 1 having as a side denomination "Romanian state" to be added a new paragraph that will stipulate that :"*the exercising of the state power must be proportional and non discriminatory"*.

In such a manner many of requirements have been answered:

a) The proportionality is consecrated expressly as a general constitutional principle and not only with a restrained application in case of restraining of the exercise of fundamental rights and liberties, such as it may be considered presently, when having into consideration the provisions of item 53 in the Constitution:

b) This new constitutional provision corresponds to some similar regulations contained in the "Treaty instituted by the European Community" or in the draft for the Treaty for the establishment of a Constitution for Europe, which is very important in the perspective of Romania's adhering to European Union.

c) This new regulation would represent a genuine constitutional obligation for all state authorities to exercise their duties in such a way that the measures adopted, to subscribe within the limits of the discretionary power limits acknowledged by the law and not to represent a power excess;

d) To create the possibility for the Constitutional Court to sanction, by the means of control of constitutionality of the laws and ordinances, the power excess in the activity of the Parliament and the Government, using as criterion the principle of proportionality;

e)To make a better correlation between the principle of proportionality and the principle of equality.

THE SUSPENSION OF THE ADMINISTRATIVE ACTIONS –A SYNTHESIS OF THE RECENT JURISPRUDENCE

MARTA CLAUDIA CLIZA *

Abstract
The suspension of the administrative acionts is an exceptional measure which can be decided by the administrative courts and whose purpose is the temporary interruption of the effects produced by these actions. That is why the issue debated in this study has a great importance and we tried to point out the courts' trends in the interpretation of the legal texts, texts that regulate the suspension of the administrative actions' issue. But this study took also into account a theoretical approach from which the administrative courts should start when the matters that are subjected to their analysis cases assume the temporary interruption of the effects of some acts which, normally, have an ex officio execution and whose effects can be suspended only exceptionally.

Keywords*: administrative actions, suspension of execution, administrative court law, High Court of Cassation and Justice.*

1. Introduction

Administrative actions, as power actions, enjoy the ex officio execution rule, which rule has its origin in the assumptions underlying the edifice which creates the legal force of such documents: presumption of legality, which in its turn is based on other two assumptions: reliability and authenticity.

That is why the effects of administrative actions can not be permanently or temporarily interrupted, unless in exceptional cases.

If the final interruption is usually the work of issuing authority, the hierarchically superior authority or the court, the temporary interruption of the effects of administrative actions is an exceptional operation.

2. Suspension of administrative actions

Suspension is not - or should not be considered - a way of ending the enforcement of an administrative action. And this is simply because the idea of "*ending the enforcement*" contains in itself, the *final extinctive process*. Or, the suspension by definition is only a transient state, an incident in the normal application of an administrative action; a sort of *purgatory* that settle out the uncertain situation of an administrative action classified as "suspicious" in terms of its legality.

As defined in the dictionary of public law, the suspension is "a legal transaction, part of the legal regime of the administrative action, which consists in interruption of producing legal effects of an action over which are hanging over certain doubts on its legality. It is a guarantee of legitimacy and an exception to the legal regime of administrative actions. Temporary cessation of legal effects lasts up to the clarification of the situation that caused it."[1]

3. Cases of suspension of an administrative act

If an administrative action is legal and appropriate, it should apply. On the contrary, if such an action is clearly illegal or clearly inappropriate, its place in the legal system is not justified.

* Lecturer Ph. D., Faculty of Law, "Nicolae Titulescu" University, Bucharest, ROMANIA, (e-mail: cliza_claudia@yahoo.com).

[1] Verginia Vedinas, Teodor Narcis Godeanu, Emanuel Constantinescu, *Dictionary of public law,* (C.H.Beck, Publishing House, Bucharest, 2010), p. 127.

Therefore, it must be "disconnected from the apparatus", either by the administration, through revocation or, if it does not consider it necessary, by the court on notification, through its cancellation.

But the actual situation is not always so clear: as *between white and black there are infinite shades of gray.* For instance, the action *seems* legal but is not sure that this is so: or, on the contrary, the action *might* be affected by any illegality flaw, but this is not *indisputable*. So one thing is certain: that a doubt is surrounding the legality of administrative action in question. And in such a case, any extreme measure is at least risky: to keep it enforceable may create subsequently irreparable or hardly reparable damage, the *cancellation* it may be also costly for the government, because, if subsequently the legality of the action is approved, a similar action is required to be adopted, with the corresponding waste of human resources, time and money. We must therefore appeal to a compromise: a measure to preserve a certain *status quo* and hence to reduce any possible losses, as much as possible. Suspension of the action in question is such a compromise. The idea is surprised even by our legislator: pursuant to Article 14, 1st paragraph of Law no. 554/2004, the administrative court may order the suspension of the contested action "*in well justified cases*" i.e., according to the content of art. 2, 1st paragraph, letter t), in those circumstances *relating to the "state of things that are likely to create* ***a serious doubt on the legality of an administrative action***."[2]

4. Judicial suspension

Suspension of an administrative action may be also ordered by the administrative court in terms of art. 14-15 of Law no.554/2004. In order to suspend an administrative action by the administrative court, a **procedure condition** must be complied with: the petitioner must have already filed the prior complaint under Art. 7 of law (in case of suspension based on the provisions of Article 14), respectively to have registered the action of repealing the action to the court (in case of that based on the provisions of Article 15), as well as a **double substantive condition**: to be a well-justified case (existence of a serious doubt upon the legality of contested action - appearance of illegality), as well as to be an imminent damage. If the first condition does not create particular problems, the second would involve discussions on the nature of the damage that may occur. Thus, starting from the reason of the text that tends to avoid an *imminent* damage, but has not yet occurred, the following observations can be made:

a). ***nature of damage*** - material or moral - *has no relevance at all*, as long as it is *imminent;*

b). ***suspension is not required for actions that have already created a permanent damage by their own issuing***. For example, if by an administrative action is created a moral damage - injuring their right to the image - as it is already produced and not an immediate one, practical importance and interest will present only the *annulment* of the action and granting moral damages, but not its suspension;

c). ***suspension of normative administrative actions is questionable***. Thus, although the legal text does not distinguish, it is quite difficult to suspend such an action, because on principle it is not likely to **directly** cause damages, but only through some individual administrative actions. However, reported to the new conception of the legislator regarding the legitimate interest possible to be protected through an administrative action, we believe that the legislative act could also be suspended by the court provided that, for example, introducing some obligations considered illegal in charge of individuals, whose breach would attract sanctions, the imminence of damage is therefore obvious. Moreover, from the economy of analyzed legal text, it is clear that the individual does not need to

[2] O. Podaru, *Administrative law, Academic course, Vol.I. Administrative Action (I) Reference points for a different theory*, (Hamangiu şi Sfera Juridică Publishing House, 2010), p.338-339.

wait for an individual act to cause him a direct damage and can request the suspension of the legislative act if he can prove the imminence of the damage by its future sanction.

d). negative administrative actions can not be suspended (refusal decisions). Just a simple vocation (even legitimate) to obtain in the future a subjective right; therefore, as the **suspension of negative action does not mean implicit recognition by the court, of the existence of positive action**, it would do nothing but bring the claiming individual at the status before issuing the negative act, a status that did not allow him to exercise any subjective right. Therefore, in this case, if by its refusal to issue a positive act, the individual proves that it has suffered any damage, it can only get a subsequent repair.

e). as regards the administrative actions which, by their application, deprives the individual of a certain amount of money (for example, a taxation or a fine payment notice, late payment penalties, etc.) it is not enough only to be invoked the damage consisting just in the payment of such amount of money and negative consequences of this payment must be justified: imminence of bankruptcy for legal entities or lack of subsistence means for individuals, etc. in this respect the jurisprudence has constantly given its verdict[3].

5. Considerations drawn from legal practice on conditions to be met because the court can order the suspension of administrative actions.

As mentioned before and drawn from the text of art. 14 of Law no. 554/2004, in order that the court should dispose the suspension of an administrative action, it must "touch" the test case and to observe the cumulative fulfillment of two conditions: well justified case and imminent damage.

That is why the analysis of jurisprudence on these issues is very useful. In this study we focused on the practice of the High Court of Cassation and Justice, Administrative and Fiscal Department, practice that we find to be relevant for the assessed areas. Besides the two conditions and their specific way of fulfilling, the High Court of Cassation and Justice has also reported other issues on the suspension of administrative actions, issues that will be further analyzed.

From the jurisprudence related to 2006, we indicate by way of example Decision no. 843 of 14th March 2006[4], decision stating that the suspension of executing an administrative action can not be directly requested to the court, such a request being inadmissible. Thus, the High Court shows that according to art. 14 paragraph 1 of the Administrative Court Law in force, in duly justified cases and for prevention of imminent damage, along with the appeal, in terms of art. 7, of the public authority which issued the act, the aggrieved party may request the competent court to order the suspension of the administrative action until the pronunciation of first instance court. To the extent that the plaintiff does not make the proof of filing the request subject to preliminary procedure, its request for suspension of administrative action will be rejected as inadmissible. It follows therefore that prior to the filing of suspension request, the plaintiff will need to notify the issuing authority on the preliminary stage of the procedure, otherwise its action could not be received by the court.

In another decision rendered in the same year 2006, the same court ordered the suspension of an administrative action on the grounds that applying a sanction consisting of a civil penalty with a superior value to the net profit of a company in its 11 years of activity is likely to produce a significant disruption in the company business, also reported to the nature of its activity (distribution), in this case the suspension request being fully justified.[5]

[4] To see, I.C.C.J.,*s. adiminstrative and tax accounts*, dec. no. 843 of 4th March 2006, in J.S.C.A.F. semester I/2006, (Hamangiu Publishing House, Bucharest, 2006), p. 131.

[5] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 1723 of 16th May 2006, in J.S.C.A.F. semester I/2006, (Hamangiu Publishing House, Bucharest, 2006), p. 147.

Showing circumstances on the state of things, the nature of the plaintiff's activity and the possible effects of the execution of act upon it is absolutely necessary in order to argue that it is well-justified case, in the meaning of the legal text ,being unable to note that the relevant issues in the application or retained by the court initiates the case substance and is equivalent to an ante-pronunciation on it.

Regarding the same issue of well-justified case, the High Court of Cassation and Justice held that the revocation of a tax repository authorization, measure that basically requires the cessation of trading activity, make proof of the existence of well-justified case.[6]

Analysis of the two necessary conditions to be cumulatively met in order to suspend administrative actions is carefully detailed by the Supreme Court in the Decision no. 1390 pronounced on 20th April 2006.[7] Regarding the first condition - the well justified case - the law does not include regulations, but it is clear that the existence of a well-justified case, to defeat the principle according to which the administrative action is enforceable ex officio, requires a strong doubt on the presumption of legality of an administrative action issued pursuant to law and for its enforcement. Regarding the second condition - the imminent damage - the law has defined it as a future and foreseeable material prejudice or the serious disruption of operation of a public authority or a public service. Also, this decision contains the role of motivation in the court order by the court. Thus, the High Court shows that both the well justified case and the damage whose imminent occurrence would be eliminated by the suspension of enforcing administrative action must be concretely indicated, not just asserted by taking over legal texts, in the contents of court decisions ordering the measure of suspension under the provisions of Law no. 554/2004.

What the Supreme Court wants to emphasize by this decision is the following issue: the court must that, during the trial of an action subject to the suspension of an administrative action, to consider the rules of evidence that the parties understand to administer in order to actually see whether the two conditions are met. A brief analysis is not sufficient, but fulfilling of both conditions must be deeply investigated. Only in case the court conclude that both conditions are met, may order the suspension measure. The court investigation must be careful just because we face with an exceptional measure, considering the binding and enforceable character of administrative action.

From the practice of the supreme court, we also have examples in which some situations have not been considered to be likely leading to such a measure. Thus, contracting some loans for the development of business and any delay in payment of installments are not elements to prove, by their mere existence, of the well-justified case and the imminence of producing any damage in the sense of art. 14 of the Administrative Court Law, in order to justify the suspension of enforcing the administrative action.[8]

The distraint, as a precautionary measure, upon movable property of the appellant, even if they are its production equipment, does not involve paralysis of the productive activity of the company and can not be appreciated as a well-justified case, because the company can continue to use those assets according to their purpose, even if they can not form the subject of disposal acts of the company.[9] There is no ground according to which the distraint upon property would have been turned into an enforcement distraint, with the consequence of selling those goods, as there was no proof in this regard.

[7] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 1390 of 20th March 2006, in J.S.C.A.F. semester I/2006, (Hamangiu Publishing House, Bucharest, 2006), p. 150.

[8] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 1000 of 23rd March 2006, in J.S.C.A.F. semester I/2006, (Hamangiu Publishing House, Bucharest, 2006), p. 266 .

[9] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 3747 of 1st November, in J.S.C.A.F. semester II/2006, (Hamangiu Publishing House, Bucharest, 2006), p. 38.

On the non-fulfillment of the two conditions, the Supreme Court stated that a decision of a public authority cannot be suspended, by which it is decided the organization of a competition on the grounds that previously it had not been done the promotion, transfer or redeployment of public servants existing within an agency, no public servant holding a public position equivalent to those vacant which have been announced was included in the competition committee, the members of the competition committee did not possess the necessary knowledge for assessment of examinations, the secretariat of the competition committee was not provided by a public servant from the human resources department or by another public servant with responsibilities in this area, the committee for settling appeals has not been legally established, the applicant right to participate in both competitions has not been complied with and persons whose files did not correspond to the legal provisions have been admitted to take part in the competition. All these reasons, in the plaintiff's opinion were grounds subscribing to the well justified case, also being implied the condition of imminent damage.[10]

The court considered that in this situation, the condition of well justified case is not legally met, the circumstances alleged by the complainer, as well as the filed documents are not likely to cause a strong doubt in terms of legality of the contested administrative action.

There was no proof made on imminent damage to which the plaintiff would be subject by complying with the decision of organizing the competition, it occupying a certain position within the defendant authority. Damage caused by non-promotion of the plaintiff, previously to organization of contested competition, in a leadership position within the respondent is not obviously predictable and can not be ground for suspension of administrative action.

Also on these issues, we retain those ruled by the High Court of Cassation and Justice in Decision no. 1377 of 6th March 2007.[11] Thus, the assertions on the fact that the imminent damage produced to the plaintiff by the dismissal action from the public position, applied as a disciplinary sanction, consists in losing the salary rights, are not sufficient and conclusive in order to be considered that the legal requirements for the suspension of execution are met, as such assertions are not likely to overthrow, by themselves, the presumption of legality of the contested administrative action.

Assessment of the illegality of administrative action whose suspension is required under art. 15 of Law no. 554/2004, does not prove the existence of well-justified case, provided by art. 14, paragraph 1 of law as one of the conditions in which presence the measure of suspension may be ordered. In deciding on such assertions and thus examining the legality of the action, the court made a prejudgment of the substance, which exceeds the procedural framework of the application for suspension of administrative action.

The provisions of art. 14 of Law no. 554/2004 is a transposition into the national law of the provisions with principle value contained in Recommendation (89) 8 of the Ministers Committee of Europe Council on provisional legal protection in administrative matters, according to which 'interim protection measures can be primarily granted, if the enforcement of the administrative action is likely to cause serious damage, is likely to cause serious damage, repairable only with difficulty and under the condition of the existence of a prima facie case against the validity of such action." [12]

In decision no. 4748 of 16th December 2008, already mentioned above, the High Court of Cassation and Justice examines several issues arising from the application of art. 14 and 15 of Law no. 554/2004, as follows: according to art. 14, paragraph 1, the measure of suspension execution of

[10] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 1150 of 2nd February 2007, in J.S.C.A.F. semester I/2007, (Hamangiu Publishing House, Bucharest, 2007), p. 6.

[11] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 1377 of 6th March 2007, in J.S.C.A.F. semester I/2007, (Hamangiu Publishing House, Bucharest, 2007), p. 45.

[12] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 2090 of 19th April 2007, in J.S.C.A.F. semester I/2007, (Hamangiu Publishing House, Bucharest, 2007), p. 144.

the administrative action may be ordered only if two conditions are cumulatively met, which we presented in detail in this study. The fulfillment of two conditions must be substantially proved by the party and substantiated by the court by the sentence rendered.

In case of administrative actions charging the aggrieved party with the payment of a sum of money, the fulfillment of condition to prevent an imminent damage is not proven and demonstrated by the mere assertion that payment of such amount leads to a loss in the debtor's assets, because in this way it would reach the conclusion that this requirement is assumed in most administrative actions in this category, which would be contrary to the exceptional character of the suspension institution.

The asset retirement reason stipulated by art. 304, section 3 of Code of Civil Procedure is unsubstantiated in case the Court of Appeal is vested with the settlement of appeal against the conclusion by which it has been settled the request to suspend the execution of an administrative action, formulated pursuant to Art. 15 of Law no. 554/2004, as the issue of material competence of the First Instance Court need to be resolved by the court of first instance vested under article 1 and 15 of the Administrative Court Act with the action having the main object the annulment of the act and, subsequently, with extrinsic character, the suspension of executing such action, because the request for suspension can not be separated from case substance.

The practice of the High Court of Cassation and Justice brings into question other procedural issues related to decisions rendered on such test cases, such as the term for appeal against such decisions. According to the provisions of Art. 14, paragraph 4 of Law no. 554/2004, the court resolution or, if necessary, the sentence rendering the suspension may be appealed within five days of notification.

The mention provided in the content of the suspension decision, which aims at indicating a different appeal term than the one stipulated by law, is not likely to alter the statutory period of appeal and can not be taken into account in exercising it, according to the "nemo censetur ignorare legem" principle.[13]

Another important procedural issue is that according to which the request for suspension of administrative action formulated under Article 15 of Law no. 554/2004, i.e., within the main application containing annulment, is being settled urgently, but by summoning of the parties, as the legal text expressly provides and to allow the parties to exercise their right to defense.[14] A decision subject to a request of suspension, to the judgment of which the parties have not been summoned, violates not only the imperative text of the law, but also some of the fundamental principles of civil case, namely the adversarial principle and that of the defense right.

Conclusions

Of all the above issues, drawn from the practice of High Court of Cassation and Justice, it follows that the court may order the suspension of an administrative action, but only as an exceptional measure. Since this is an exceptional case of temporary interruption of the effects of the action, the court must carefully pronounce upon an evidence aiming only at issues related to the suspension of action, as well as the fulfillment or not of the conditions under which suspension may be ordered. Evidence cannot aim at the legality of the action itself, because the legality issues will be reviewed by the court on the occasion of the action of repeal. It should also be noted that the court must carefully separate those aspects concerning the suspension of those related to annulment, in order not to risk pre-empting on annulment of the action.

[13] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 3067 of 26th September 2006, in J.S.C.A.F. semester II/2006, (Hamangiu Publishing House, Bucharest, 2006), p. 42.

[14] To see, I.C.C.J.,s. adiminstrative and tax accounts, dec. no. 1966 of 12th April 2007, in J.S.C.A.F. semester I/2007, (Hamangiu Publishing House, Bucharest, 2007), p. 135.

Also, the court will have to take into account in the pronouncement of the judgment, the other procedural issues, corroborating in this regard the provisions of Law no. 554/2004 with those of the Code of Civil Procedure.

It can be also noted that the solutions are varied from case to case, being specifically about the review of fulfillment of imminent damage to well-justified case conditions. In this case, the use of jurisprudence in reasoning some requests for suspension must be done carefully, because of the risk of not identifying similar test cases.

ASPECTS REGARDING THE EU MEMBER STATES COMPETENCE IN THE ENFORCEMENT OF THE EUROPEAN LEGISLATION[1]

CONSTANȚA MĂTUȘESCU[*]
CLAUDIA GILIA[*]

Abstract
During the EU's progressive consolidation process, the relation between EU and national law has turned out to be extremely complex, being subject both to a positive evolution, but also to a number of difficulties of assimilating EU norms and enforcing them in relation to national legal systems, an uniform regulation proves to be necessary. Still, the adequate and correct enforcement of EU legislation is essential when it comes to maintaining the EU's strong foundation and ensuring that European policies have the effect desired, by acting in favor of European citizens. The effectiveness of governance is menaced when Member States are not capable to enforce common rules correctly, enforcing EU legislation with delay or errors does nothing but weakening the European system, reducing the latter's possibility to achieve its objectives and deprives citizens, as well as enterprises, from various benefits.
At the same time, the enforcement of EU law is the duty of all Member States. Any state has the duty to enforce EU law, as well as the liability for its transgression, no matter which is the state authority, central or local, which committed the violation. The important role played by EU law – the observance of which must be insured both by Europeans institutions and national jurisdictions – imposes on every state the duty to order the most suitable methods of guaranteeing the observance of community law by its public collectivities.

Keywords*: EU law, national law, enforcement of EU legislation, national competencies, autonomy*

Introduction

The present paper proposes to analyse one of the EU's law principal subjects, namely its enforcement by the national authorities of the Member States, in accordance with the latest case-law developments regarding this issue. We also take into consideration the fact that the Member States' role in the enforcement of the European legislation has a specific description in Treaty of Lisboa. For the first time, this treaty emphasis on the fact that the Member States' competence is a *principle competence*, thus EU could interfere if only a uniform regulation proves to be necessary . Equally, according to the constant case law of Court of Justice this competence is not only a simple prerogative but a genuine obligation which makes the Member States to be considered as titulars of the EU's executive function.

The Member States' cooperation regarding the enforcement of EU's law may consist in a normative, judiciary or an administrative action. It can be a legislative intervention in order to complete EU's law provisions, to ensure the European regulations' observance even under the compulsion of the judiciary system. But, most of the national measures bound on the EU's executive function involving the execution of the European decisions by the national administrative institutions.

Taking into consideration the complexity of the theme and the impossibility to be analysed exhaustively in a few pages paper, we are to point out, especially, the methods of enforcement of the

[1] This work was supported by CNCSIS-UEFISCSU, project number PN II-RU, code 129, contract 28/2010.

EU law; we also analyse the institutional and procedural autonomy of the Member States regarding the enforcement of the EU law and the limitations which results from the necessity of ensuring an uniform application and of guaranteeing an effective protection of the rights deriving from the community regulations.

Thus, we propose to contribute to the actual considerations on this issue basing on a critical report of the European doctrine and case-law, especially French and Belgium doctrine and case-law, seeing that at the present moment, it cannot be discussed on a specific concern on this matter in the Romanian doctrine.

1. The EU Member States – as titulars of the EU executive function

Belonging to European Union involves, amongst other aspects, the necessity of conferring a full application of the European regulations. The legal order of the EU bases on a complementarity between the different levels of the authorities – the European authorities and the national ones[2]. EU's law does not deprive the Member States of the decision making authority but, on the contrary, these have an essential role in the enforcement of EU law.

EU's institutions and authorities dispose of enlarged competences regarding the enactment of measures which are compulsory for the Member States. The adopted measures have priority over the national provisions[3] and they also have a direct effect in the national law[4]; thus the derived law is autonomous in comparison with international and national law, at the same time. However, the enforcement of this law depends on the cooperation between the statal institutions.

In the complex system of the EU which has an important supranational character, the supranational bodies founded by the Member States' will have been charged with working-out the legislative acts. But, the Member States preserve an enlarged power of action in the enforcement of the adopted regulations[5]. This prerogative joined to the Union which is endowed with important attribution competences that are exercised by a dualist executive formed by the Council and by the Committee.

Generally speaking, it can be stated that the EU's law execution principally bases on the Member States competences which are exercised according to the institutional and procedural autonomy principles developped by the community case-law[6] but, at the same time respecting the cooperation and loialty obligations[7]. These competences can be subsidiarily

entrusted to the Committee which exercise them basing on the Council's delegation[8] and under the control of the Member States[9].

[2] P. Pescatore, *L'ordre juridique des Communautes europeennes. Etude des sources du droit communautaire,* (Bruxelles: Bruylant, 2006), 199.

[3] Stated for the first time in 1964 in Costa/Enel Decision (Case 6/1964, Rec. p. 1141 and next).

[4] Therefore, private persons can directly invoke them in front of the national judge – CJCE, the 5th February 1963, Van Gend & Loss, Case 26/62, Rec. 1963, p. 1.

[5] Considering this specificity, the doctrine has qualified the EU's legal system as being „an incomplete and imperfect one". It is stated that although EU has enlarged competences, it still remains bound on its Member States regarding two aspects: these complete the EU's regulations and lay at its disposal their administrative bodies and besides there are states which have to use their legal power in order to ensure the execution of the EU adopted regulations - Loïc Azoulai, *„Pour un droit de l'execution de l'Union Europeenne"*, in *L'execution du droit de l'Union, entre mecanismes communautaires et droits nationaux,* ed. Jacqueline Dutheil de la Rochere, (Bruxelles: Bruylant 2009), 2-3; Jacqueline Dutheil de la Rochere, *„Rapport de synthese"*, in *Droits nationaux, droit communautaire: influences croisees. En hommage a Louis Dubuis*, (Paris: La documentation Francaise, 2000), 198.

[6] Which are to be detailed on the following point of the paper.

[7] On the strength of these obligations, their competences of execution must not diverge from the common rules.

[8] Under the reserve of specific cases when the Council exercises directly these competences. Treaty of Lisboa reforms the delegation legal proceedings, article 29 TFUE empowers the Parliament and the Council to delegate to Committee the power of to adopt general and non-legislative acts which complete or modify certain unessential

The method of enforcement the European legislation reasserts a fundamental descentralization principle, establishing an "executive federalism"[10] – as it has been stated in the doctrine. On the strength of it, if the legislative function is prevailingly controlled by the institutions, then the legislative acts' executions falls on the Member States, on the ground of a self-competence or a delegated one (it concerns an exclusive community competence)[11].

The Member States' cooperation regarding the enforcement of EU's law may consist in a normative, judiciary or an administrative action. It can be a legislative intervention in order to complete EU's law provisions, to ensure the European regulations' observance even under the compulsion of the judiciary system. But, most of the national measures bound on the EU's executive function involving the execution of the European decisions by the national administrative apparatus. It comes to an indirect administration which interferes in the absence of an European descentralized administration, the EU Member States have the responsibility to ensure the administrative genuine execution of EU's law by taking individual decisions and working out material acts[12].

Doctrine evokes even the existence of an indirect administration principle, officially proclaimed (but without a binding force) in the 43th Declaration attached to Treaty of Amsterdam; according to it the enforcement of the community law, on an administrative plan, it devolves upon the Member States, in the main. Even more, on the background of the distinction between direct and indirect administration as an expression of the competences division which works in the EU and also considering the intensification of the cooperation between national and European authorities regarding the enforcement of the European policies – in the judicial practice – it is stated about the existence of a "*co-administration*", a *compound administration*[13] or a *divided (shared) execution*[14], some authors stating the existence of a new model[15].

Anyway, direct administration represents the exception[16]. Concerning the indirect administration rule, besides the absence of a community field administration the indirect administration bases on the proximity principle stated in the 1st article EUT. According to it, EU's decisions must be adopted as close as possible to the citizens ; thus, giving effectiveness to the principles of subsidiarity and proportionality, at the same time and in the Member States' favour. By this system of enforcement the European legislation, the Member States preserve a right of control regarding the enforcement of the EU law.

---

elements of a legislative act. Non-legislative acts adopted by the Committee are named „delegated acts". In the new treaty it is made a distinction between „delegated" acts and „execution" acts (stipulated in the article 291), the first corresponding to quasi-legislative measures and the latter to the execution measures stricto-sensu. These two types of acts have different significations and they exclude each other, an act adopted on the ground of article 290 is excluded from the domain of application of article 291, according to definitions and viceversa.

Auby, J. D. de la Roche (Bruxelles, Bruylant, 2007), 245.

[16] It has been noticed a partial renationalization even in domains as the competition, as a consequence of the enactment of the 1st Regulations/2003 - D. Ritleng, *op. cit.*, p. 40.

The great role of the Member States in the enforcement of the European legislation did not have a specific description in the texts of the community treaties with the exception of some precise regulations, especially concerning the directives[17] and legal frame-decisions [18] transposal and the provision of article 10 ECT (the former article 5 CEE) which stipulates: "The EU Member States take all general or special measures that are necessary to ensure carrying out the obligations which derive from the present treaty or result from the acts of the community institutions. EU Member States facilitate EU's carrying out its mission. They abstain themselves from taking measures which could endanger the achievement of the present treaty's goals".

In the absence of rigorous and exact regulations regarding the Member States' role in the community law execution, the Court has brought a series of explanations which converge on the fact that this competence is not a simple prerogative but a genuine obligation[19]. Thus, the Court has stated that "in accordance with the general principles which are the basis of the EU's institutional system and which regulates the relations between the EU and its Member States, the execution of the community regulations appertains to the Member States in order to ensure the observance of the regulations in their jurisdictions, on the strength of article 5 EEC"[20]. Furthermore, in its latest case-law[21] the Court has stated that the national authorities must understand their own powers in a mode which ensures the most proper execution of the EU law.

Treaty of Lisboa, taking over the corresponding stipulations from the constitutional Treaty Project, it brings a series of precise information regarding this issue. Thus, it ponts out for the first time that the Member States' competence is a *principle competence*, EU could interfere if only an uniform regulation proves to be necessary[22]. On the one hand in article 4 EUT is pointed out the principle of loyal cooperation which is compulsory for the Member States, on the other hand article 291 EUFT states the following: *"(1) The EU Member States take all legal measures in their domestic law that are necessary for the enforcement of the compulsory acts of EU. (2) In case that unitary conditions are needed in order to enforce the compulsory acts, then these acts give the Committee the execution competences or they give* to *the Council such competences in special and solid grounded cases and also in the cases stipulated in article 24 and article 26 from Treaty of Euroapean Union".*

2. The EU Member States' autonomy in the enforcement of the European legislation

The national authorities which interfere in the EU law enforcement always act "as bodies of a Member State"[23]. On the strength of their statal character, they are not submitted to a hierarchic power of the European institutions. Therefore, the latter ones cannot send them instructions, they cannot replace them and also they cannot modify or repeal the decisions adopted by the national authorities[24].

In the enforcement of EU law, the Member States preserve an institutional and a procedural autonomy which is acknowledged even by the Court of Justice[25]. This autonomy involves, in the

[25] Even if it has tried to limit it by time.

main, the fact that the protection of the rights acquired by the justiciables as a consequence of the community direct invoking regulations it is also ensured within the national legal systems by the domestic juridical instruments. As a consequence, national law is the one which decides the types and the powers of the authorities entitled to interfere.

Thus, the institutional and procedural autonomy of the Member States represent an "expression of a preserved sovereignity"[26]. The concrete signification of this autonomy is that the Member States have to lay their means by which they carry out their executive mission at the disposal of the EU. But, they have the right to choose both the bodies charged with the execution and the proceedings and legal forms that are applicable for the enforcement of the EU law.

2.1. The principle of institutional autonomy

Although it is absent from the community treaties, this principle is considered by the doctrine as fundamental principle of the community legal order[27]. The institutional autonomy of the Member States which involves their free choice regarding the bodies charged with the enforcement of the EU law, it is the result of the community case-law that identified this principle in *International Fruit Company decision*[28] and reiterated it many times, stating its importance. Thus, the Court considers that "in case that the provisions of the treaty or of the regulations give powers to Member States or they impose them obligations of enforcement the community law, then the matter to know in an explicite manner if their exercise of these powers and execution of these obligations can be entrusted to determined bodies by the member states, it is a problem that regards exclusively the constitutional systems of each member state"[29].

Therefore, it does not matter for the EU if the execution of the acts adopted by European institutions appertains to the executive or legislative member states' authorities or if it is entrusted to the central or local agencies or to offices more or less autonomous in comparison with the state or to the local colectivities. The member states cand even entrust the execution to private persons or to legal private law entities, but under the condition of disposing of means in order to ensure that they carry out their missions observing the EU law[30]. It is considered that "ensuring the obervance of the community norms in their jurisdictions appertains to the member states' authorities, whether it comes to central statal power authorities, to federal authorities or to other territorial authorities"[31]. The Court stated that this principle is applicable inclusively in the case of exclusive competences of the community[32].

Not only the appointment of the national competent authorities but also the selection of the national competent jurisdictions is submitted to the principle of institutional autonomy[33]. In this respect, the Court stated that "the appointment of the competent jurisdictions to settle the litigations that involve individual rights derived from the community juridical order belongs to the legal order of each state, but, however it is established that the member states have the responsibility to ensure an effective protection of these rights, in every case"[34].

2.2 The procedural autonomy of the EU member states

The autonomy of the member states concerning the exercise of their EU law execution function is not only an institutional one but also they are acknowledged a procedural autonomy which consists in the fact that the domestic legal bodies charged with the execution determine the acts which must be adopted and the enforcement legal proceedings.

So as the institutional autonomy, procedural autonomy's founding and establishment derives from a case-law work. At the beginning of the case-law the community judge limited to offer a minimal level of orientation in this matter[35] and he stated that the mode of protection of the rights belonging to a person unfavourably affected by the infringement of the community law appertains to the national legal system[36]. Later on, the community judge has given a series of explanations, stating that the enforcement of the EU law is made by the member states with the observance of the legal proceedings and forms stipulated by their national law[37].

Procedural autonomy enforces equally to domestic jurisdictions charged with the enforcement of the EU law insofar as the member states are the only competent concerning the legal solutions determination. On the basis of their national law, they have to establish the competent jurisdictions, the means of attack and the rules of writing summons and of development in front of the instances. The Court stated that the national judge has to select "from the different proceedings of the juridical domestic order those which are proper for the protection of individual rights conffered by the community law"[38]. Recently it considered that the national judge must ensure the full effectiveness of these regulations, removing if necessary any application of a national contrary provision[39] (inclusively a procedural norm[40]) without requesting or waiting the elimination of that provision by a legislative method or by other constitutional proceedings.

However, procedural law of the member states is not harmonized so that a competence of the EU should be necessary. Considering all these, the Court had to give up the approach in case that community regulations in this matter do not exist, then the responsibility to determine the conditions of protection of the rights deriving from the EU regulations appertains to the member states. Thus, the Court has imposed two "community" legal requests concerning the national conditions[41]: the request of equivalency and the request of the national means effectiveness regarding the enforcement of the EU law. Under the condition of carrying out these requests, the EU member states must determine the competent authorities and the procedural methods to ensure the protection of the justiciables' rights conffered by the community law[42]. The EU member states are not obliged, in the main, to set up other legal measures to ensure the observance of the national law[43] than the existing ones, under the condition that these measures mustn't affect exercise of law in the legal practice[44].

3. Limitations of the institutional and procedural autonomy of the EU member states

The necessity of ensuring a unitary application and of guaranteeing an effective protection of the rights deriving from the community norms, especially because of the increasement diversity of the national systems as a consequence of the successive accessions, it has determined the progressive introduction of some case-law limitations regarding the institutional and procedural autonomy of the member states. As it is stated in the doctrine, "the dialectics autonomy/uniformity represents the essence of the juridical integration process"[45].

The recourse at the national institutions in order to ensure the enforcement of EU law makes that its efectiveness depends on the efectiveness of the statal authorities. Under these circumstances, the pronouncement of contrary solutions in the enforcement of EU law seems to be predictable. These solutions are contrary to the principle of the law rule and of the uniform enforcement of the EU law and they justify, on the one hand the limitation made by the Committee as a "guardian of treaties" and on the other hand the limitations made by the European judge concerning the enforcement methods[46]. Thus, the rules of conduct which are compulsory for the member states in the exercise of their execution competences are clearly defined[47].

Concerning the principle of the institutional autonomy of the member states, its limits result from the fact that no matter the independence degree of the legal bodies charged with EU's law policies execution, the state is responsible for the effectivity of this execution and for the observance of the principles and provisions stipulated in the treaties, in the Court of Justice case-law and in the derived law[48]. At the same time, member states are responsible for the injuries caused to private persons as a consequence of the EU law infringement, no matter the statal body that infringed it[49]. This responsibility was stated by Francovich decisions[50] and also in the later case-law based on it[51].

The EU member states have a sovereign competence to establish the legal bodies charged with the enforcement of EU law and their powers. But, member states do not have a complete freedom of appreciation. Their autonomies are directed and controlled in order to avoid the deviations which may lead to the infringement of EU law.

The European Committee is the one that guards the legal and correct enforcement of the community law by the member states. This competence of "guardian of treaties" is stipulated in the article 17 from EUT ("…The Committee supervises the enforcement of EU law under the control of the European Court of Justice.") and it was completed by the Court's case law which stated the existence of a "general supervision competence" which allows it to guard the manner the member states observe their obligations which result from the treaties and their decisions taken in order to enforce them[52].

The Committee has preventive competences such as the right of information which result from various provisions of the treaty completed by enlarged verification competences or even repressive ones (as it happens in the competitional law concerning the state aids (grants)).

[50] EECJ, 19th November 1991, Francovich şi Bonifaci, Cases C. 6/90 şi C. 9/90, Rec, I-5402.

[51] The principle of states' responsibility for the infringement of the community law has been admitted since 1960, EECJ stating conclusions regarding the redress obligation. In decision Humblot/Belgium (Case 6/60, ECR 559), the Court considered that if she states in a decision that a legislative or an administrative act deriving from the authorities of a member state is contrary to community law, then that state is obliged to repeal it and to repair its illicit effects, on the ground of article 86 CECO.

[52] EECJ, 5th May 1981, Commission/Olanda, Case 804/79, Rec. p. 1045.

Regarding the procedural autonomy of the member states, the Court has stated that the reference to the national legal rules works in the absence of stipulations which should harmonize national law procedure existing in the community law. National judges cannot apply to the actions based on the infringement of the community law norms more severe legal rules than those applied to national actions with the same object (the principle of equivalency/of national treatment)[53] and in all cases the protection ensured for the justiciables must be effective (the principle of effectiveness)[54]. As a consequence, national jurisdictions must ensure the enforcement of the EU law with the same effectiveness and rigour as they do it for the enforcement of the national law[55].

Concerning the principle of equivalency, we mention that according to a constant case-law all the legal rules applicable to actions should be applied without a distinction both to actions derived from the infringement of EU law and to actions derived from the non-observance of the domestic law[56]. However, this principle does not oblige a member state to enlarge its most favourable legal treatments concerning all the actions introduced in a certain law domain[57].

4. The procedural autonomy of the member states concerning the European judicial framework

In a general point of view, the enforcement of the EU law hasn't brought great alterations in the national legal system. Despite the absence of the community procedural norms the member states have procedural autonomy on the condition of the observance of the principles of equivalency and effectiveness (analysed before). The enforcement of Treaty of Amsterdam has created a particular situation concerning the European judicial framework. Article 29 from EUT (and article 61 ECT) stipulates the target of establishing a framework based on liberty, security and justice with the observance of the fundamental rights and of the different law systems and their juridical customs. But, by introducing article 65 in ECT the processual law – as it was stated in the doctrine – it became a self-objective of the community construction[58]. This text is resumed in Treaty of Lisboa (article 81 EUFT) and it stipulates the enactment of measures in the civil juridical cooperation with cross-border implications. The 2nd paragraph, letter f) provides that it comes to the "elimination of the obstacles regarding the normal developpment of civil procedural rules enforced in the member states". The main objectives in this domain are the juridical security and the free access to justice equality which involves various aspects: an easier identification of the competent jurisdiction, a clear indication of the enforceable law, the existence of fast and equitable trials and also the existence of effective execution proceedings. Legal proceedings must conffer to private persons the same guarantees thus

[53] To be seen, EECJ, 12th September 2006, Case *Cauza Eman and Sevinger/ College van Burgemeester en Wethouders van Den Haag*, C-300/2004, ECR I-8055.

[54] EECJ, 9th July, *Case Bozetti*, mentioned before.

[55] In the decision pronnounced in case Rewe, the Court states that "any type of action provided by the national law must be used to ensure the observance of the community norms which have a direct effect in the same conditions of admissibility and procedure which ensure the enforcement of the national law" - Case Rewe Handelgesellschaft Nord MBH and others, Aff. 158/80, Rec. p. 1805.

[56] To be seen in this respect decision from 15th September 1998, *Edis*, C-231/96, Rec., p. I-4951, point 36, decision on 1st December 1998, *Levez*, C-326/96, Rec., p. I-7835, point 41, decision on 16th May 2000, *Preston and other*, C-78/98, Rec., p. I-3201, punctul 55, Decision on 19th September 2006, *i-21 Germany and Arcor*, C-392/04 and C-422/04, Rec., p. I-8559, point 62 and also Decision on 26th January 2010, Transportes Urbanos y Servicios Generales, unpublished, point 33.

[57] Decision *Levez*, mentioned before, point 42, decision Transportes Urbanos y Servicios Generales (mentioned), point 34.

[58] Mathias Audit, *Autonomie procedurale et espace judiciaire europeen*, în *L'execution du droit de l'Union, entre mecanismes communautaires et droits nationaux*, ed. Jacqueline Dutheil de la Rochere, (Bruxelles: Bruylant 2009), 254.

the legal treatment shouldn't be unequal amongst the different jurisdictions. The rules may be different but they must be equivalent one to another.

The doctrine states with good reason[59] that once with the European judicial framework the principle of procedural autonomy is redefined; this principle is "diluted" in this legal framework because of the intrinsic incompatibility between the common procedural norms and the preservation of the national processual laws. Basing on the stipulations mentioned above, a common procedural law is wanted to be developped in order to replace the national provisions enforced in this matter (inclusively regarding the competence, the procedure or the effects of the judicial decisions)[60].

The Court of Justice has brought its contribution to the unity of the European procedural law. The Court considered that a certain uniformity or at least an equivalency between the domestic procedural laws is required[61].

In any case, at the present moment it can be discussed only about a minimal approach in the procedural domain for cross-border cases and not about a material law, at least for the moment. It's obvious that certain domains are very sensitive and some of the EU member states insist on the fact that the EU should not exceed its competences in these domains. On the other hand, the judicial cooperation based on the mutual recognition involves the existence of a mutual trust which can be realized only by a minimal harmonization of the procedural and enforcement legal rules. As a overall view, the principle of procedural autonomy in the domain of the European judicial framework is being seriously discussed, national procedural laws must be subordinated to this framework formation. According to the doctrine, a possible "fracture" of the processual law could interfere, which could also involve a complication both for the judge and for the justiciables. Thus, two processual laws would coexist in front of the national judge: a specific one which is enforceable in intra-community litigations and it is common to all member states and a national law enforceable to any other types of litigations[62].

5. Conclusions

A proper and a correct enforcement of the EU legislation is essential for the maintenance of a solid basis of the EU and it also important for the achievement of the exepcted European policies impact. The construction of an autonomous legal order of the EU completed with the national legal orders and with an extremely complex and coherent case-law hadn't been enough in order to ensure the effective enforcement of the EU law. In this respect, there are necessary more combined efforts of the EU institutions and of the member states in order to achieve this goal.

Nowadays, the enforcement of the EU law has to cope with great challenges. For a long time, the Community and the Union performed in their legislative competence, they increased their normative production and they offered it a binding force in the member states' territories; thus, they hoped to get closer to carryout the fixed goals. At the present moment it is considered that this legislative abundance has complicated the acknowledge and the enforcement of the European norms, thus the legal system became complex and to a certain extent it becam unenforceable. Under these circumstances, working out of some operational enforcement criteria and creating new enforcement instruments prove to be necessary in order to offer effectiveness to EU legislation. It comes to limit

[59] M. Audit, *Autonomie procedurale et espace judiciaire europeen...*

[60] The enactment of various instruments which institute a series of European proceedings is explanatory; for instance: the European executory title (Regulations 805/2004),, the proceeding of European writ of debt (Regulations 1896/2006) or the regulations of little conflicts (Regulations 861/2007).

[61] To be seen, EECJ, 8th May 2003, *Gantner*, Case C-111/01 or EECJ, 27th April 2004, *Turner/Grovit*, Case C-159/02, Rev. 654.

[62] M. Audit, *Autonomie procedurale et espace judiciaire europeen...*,260-261. According to the author, the solution would be a determined uniformization of the member states processual laws basing on the EU law which could become a standard law for the procedural law of the member states.

the legislative production and to improve its effectiveness thus charging the member states with enlarged obligations in concordance with the EU law[63].

Generally speaking, it can be stated that the EU's law execution principally bases on the Member States competences which are exercised according to the institutional and procedural autonomy principles developped by the community case-law but, at the same time respecting the cooperation and loialty obligations. It comes to an indirect administration which interferes in the absence of an European descentralized administration, the EU Member States have the responsibility to ensure the administrative genuine execution of EU's law by taking individual decisions and working out material acts. The method of enforcement the European legislation reasserts a fundamental descentralization principle, establishing an "executive federalism" – as it has been stated in the doctrine. On the strength of it, if the legislative function is prevailingly controlled by the institutions, then the legislative acts' executions falls on the Member States, on the ground of a self-competence or a delegated one (it concerns an exclusive community competence).

As a consequence of the explanations brought by Treaty of Lisboa (article 291 EUFT) it can be stated that the member states are the titulars of the EU executive function. This competence of the member states represent a general principle. The intervention of the European institutions can be only subsidiary because they have a limited competence. The very necessity of an uniform execution of the EU acts justifies and imposes the entrusting of these obligations to the European echelon[64].

In the enforcement of EU law, the Member States preserve an institutional and a procedural autonomy which is acknowledged even by the Court of Justice. This autonomy involves, in the main, the fact that the protection of the rights acquired by the justiciables as a consequence of the community direct invoking regulations it is also ensured within the national legal systems by the domestic juridical instruments. As a consequence, national law is the one which decides the types and the powers of the authorities entitled to interfere.

Thus, the institutional and procedural autonomy of the Member States represent an "expression of a preserved sovereignity"[65]. The concrete signification of this autonomy is that the Member States have to lay their means by which they carry out their executive mission at the disposal of the EU. But, they have the right to choose both the bodies charged with the execution and the proceedings and legal forms that are applicable for the enforcement of the EU law.

The necessity of ensuring a unitary application and of guaranteeing an effective protection of the rights deriving from the community norms, especially because of the increasement diversity of the national systems as a consequence of the successive accessions, it has determined the progressive introduction of some case-law limitations regarding the institutional and procedural autonomy of the member states. Thus, the rules of conduct which are compulsory for the member states in the exercise of their execution competences are clearly defined, their autonomy is directed and controlled in order to avoid the deviations that can lead to the infringement of the EU law.

A particular situation has been noticed in the European judicial framework. This domain has registered the greatest evolutions in the last years. It is also an important uniformization of the procedural law of the member states, existing the possibility to turn it into a common processual law which should replace the national legal rules applicable in this matter. The problem which interferes in this case is that of a national processual law halving which involves the existence of two categories of laws: some of them enforceable to intra-unional litigations which is common to all member states and other laws enforceable to other types of litigations which could overturn the national judicial system. A solution that should be taken into consideration is that of a determined uniformization of the processual law of the member states; thus the EU law could become a standard law for the

procedural law of the member states[66]. However, it's obvious that such a proposal is subordinated to the future developments in this matter and we should take into consideration that these evolutions depend on the political will of the member states, in a great extent.

EFFECTIVENESS OF EU LAW IN MEMBER STATES

ANCA-MAGDA VLAICU[*]

Abstract
When the original Rome Treaty was drafted, it was envisaged by the authors that the procedure as set out in what is now article 258 T.F.E.U. (infringement procedure) would be the primary means by which EU law is enforced - a "centralized" and "public" form of enforcement assured by the ECJ, the Commission and Member States, which was itself innovative, since most international treaties contained no such mechanism. It was a point of view shared by Member States, who could see no reason why provisions of EC Treaties should be treated any differently from those of other international treaties.
Thus, on the one hand, the effect of international treaties was generally governed by the principle that they cannot by themselves create rights and obligations for individuals, but only for contracting states - therefore, states were considered the only ones entitled to claim respect of international norms in international courts (individuals and national courts were excluded); on the other hand, as the text of EC treaties made no specific reference to the effect their provisions were to have, the general rule governing international treaties should also apply to them. The European Court of Justice disagreed and engaged in a prolonged judicial activism, resulting in the creation of other legal mechanisms by which national courts and individuals (rather than ECJ, Commission and Member States) were to take the leading role in the enforcement of EU law - a "decentralized" and "private" form of enforcement, governed by three interrelated principles developed jurisprudentially by the ECJ: direct effect, indirect effect and state liability.
In this context, the purpose of this paper is to provide an overview of actual means of EU law enforcement, as presented above; to this end, there will be considered the legal/judicial basis, scope, limits and practical difficulties of the "centralized" and "decentralized" form of enforcement.

Keywords: *infringement, direct effect, incidental horizontal effect, indirect effect, state liability*

1. Introduction

The paper intends to provide an overview of primary means by way of which, at present, EU law is enforced against Member States, national authorities and individuals.

The topic proposed is central for EU law, both from theoretical and practical point of view.

From a theoretical perspective, the importance of analysis results, on the one hand, from the fact that means of EU law enforcement are different from those provided in case of international law enforcement; on the other hand, nor treaties or the other EU law sources identify a general scheme of these means (of which some have been established, in fact, by the case-law of Court of Justice of the European Union) – the analysis should therefore prove useful, taking into account the lack of legal provisions and also the evolving jurisprudence of ECJ on the subject.

From a practical perspective, although EU law measures should willingly be complied with in Member States, experience has proved that existence of coercive methods of enforcement is still necessary, and a good knowledge of those methods is undoubtedly useful.

In this context, the paper will systematically present the public and private means of EU law enforcement which are part of the complex coercive means at the disposal of all those involved in application of EU law (EU institutions, Member States, national authorities, individuals); it will also discuss their legal or judicial basis, area of application, limits and possible interferences; to this end, both ECJ case-law and doctrinal opinions will be presented.

[*] Ph.D. candidate, Faculty of Law, "Nicolae Titulescu" University, Bucharest (e-mail:magda_vlaicu@ yahoo.com).

2. General aspects

Since none of the sources of EU law provided a general scheme of means ensuring EU law enforcement, the difficult task of conceptualising most of them fell on the European Court of Justice; the concepts established by ECJ were subsequently discussed and systematized by juridical literature.

The starting point was represented by the distinction between „public" and „private" enforcement – „Law can be enforced either through a public arm of government, which is accorded power to bring infringers to court, or through actions brought by private individuals, or a mixture of the two"[1].

The „public" enforcement was stipulated by the EEC Treaty and initially considered as the only means of enforcement; nevertheless, the ECJ conceived a complex system of „private" means, at the same time pointing out that „public" and „private" ways of enforcement do not exclude each other, but must coexist in order to ensure a complete effectiveness of EU law in Member States[2].

It can be concluded from those presented above that, at the present time, there are two channels which secure compliance with EU law in Member States: on the one hand, a „centralised" and „public" system of enforcement, assured by the Commission/Member States through actions brought before ECJ, and on the other hand a „decentralised"[3] and „private" system, assured by national courts in proceedings brought by individuals; the coexistence of these two forms amounts to what the European Court of Justice[4] and juridical literature[5] have referred to as „dual vigilance".

3. Public enforcement of EU law

When the original Rome Treatiy was drafted, the principal channel of Community law enforcement conceived by the authors consisted in a specific procedure by which the Commission/Member States could demand sanction of failure to fulfil an obligation under the Treaty, through actions brought before the European Court of Justice.

It was a „public" and „centralised" form of enforcement of Community law, stipulated by articles 169-170 of the Treaty and assured by the ECJ, the Commission and Member States, which was itself innovative, as most international treaties contained no such mechanism of international law enforcement.

The procedure mentioned above still exists and finds its actual legal basis in the provisions of articles 258-259 T.F.E.U.[6]

[6] Ex articles 226 and 227 EC Treaty.

There are nevertheless significant limits of this form of EU law enforcement, which will be presented further on.

The first and most important limit is represented by the fact that individuals[7] take absolutely no part in this procedure (which was, indeed, conceived not for the protection of individuals, but as a form of EU law enforcement) – therefore, legal proceedings cannot either be initiated by individuals, nor used against them (active procedural position is attributed to the Commission/Member States[8], and passive procedural position to Member States).

Secondly, in most of the cases, the Commission itself finds out non-compliance with EU law only as a consequence of individual complaints (not every breach is as blatant as to determine the Commission to take action or result in a complaint on part of a Member State) and therefore its actions depends on the vigilance of individuals; on the other hand, the Commission does not have the institutional capacity to prosecute but a rather small number of infringements; finally, the Commission has discretionary power over the decision to initiate or not legal proceedings[9].

Thirdly, the sanction itself in case the Court of Justice of the European Union finds that a Member State has failed to fulfil an obligation under the Treaties is rather ineffective, as long as the ECJ decision (althouhg compulsory) is not self-executing and has only declarative effect – the Court limits itself to declare non-compliance of a Member State with an EU law obligation[10].

Thus, the Court cannot impose on Member States in breach certain obligations or particular measures – it is only for the domestic authorities to establish and carry on measures of execution of the infringed EU obligation so as comply with the judgment of the Court; the most „burdensome" sanction consists, eventually, in imposing on the Member State concerned payment of a lump sum or penalty payment (the Commission indicates the amount of the lump sum or penalty payment to be paid by the Member State which it considers appropriate in the circumstances[11])[12].

---

[7] Both physical and moral persons - A. Fuerea, *Drept comunitar European. Partea generală*, All Beck Publishing, Bucharest, 2003, p. 34.

[8] The procedure stipulated by article 258 T.F.E.U. is used frequently by the Commission; by contrast, Member States themselves make use of provisions of article 259 T.F.E.U. quite rarely (e.g., ECJ decision, 04.10.1979, *French Republic v. United Kingdom of Great Britain and Northern Ireland*, C-141/78 and ECJ decision, 16.05.2000, *Kingdom of Belgium v. Kingdom of Spain*, C-388/95), choosing instead to inform the Commission of the infringement, which continues the procedure in conformity to article 258 T.F.E.U.

[9] O. Ţinca, *Drept Comunitar General*, Third Edition, Lumina Lex Publishing, Bucharest, 2005, p. 337; C. Boch, *op. cit.*, p. 2, points out that in practice, in most cases, Commission's decision depends on political considerations.

[10] This is the reason why „judgements declaring Member States in breach of their Community obligations were all too often ignored" – C. Boch, *op. cit.*, p. 4.

[11] According to article 260 T.F.E.U. (ex article 228 EC Treaty).

[12] G. Gornig, I. E. Rusu, *Dreptul Uniunii Europene*, Second Edition, C. H. Beck Publishing, Bucharest, 2007, p. 104, pointed out that it was only in 2000 when the ECJ first decided to impose on a Member State penalty payments (ECJ decision, 04.07.2000, Commission v. Greece, C-387/97) – as a consequence of having been found in breach of EU obligations by judgment of the Court from April 1992, case C-45/91, Greece had been imposed to take measures necessary for the disposal of waste and toxic and dangerous waste from the area the area of Chania without endangering human health and without harming the environment in accordance with Article 4 of Council Directive 75/442/EEC of 15 July 1975; as Greece had not implemented the measures necessary to comply with the judgment in Case C-45/91, penalty payments were ordered by the Court. "Greece has been imposed payment of penalty payments (20.000 Euros per day) ... The Court took into consideration calculations proposed by the Commission, which assured transparency, predictibility, legal certainty and proportionality of the measure".

4. Private enforcement of EU law

In this context, starting from the first and well-known case Van Gend en Loos[13] up to the present, the European Court of Justice "has engaged in a prolonged and radical programme"[14], which resulted in the judicial establishment of methods by means of which „national courts, rather than the Court of Justice, are expected to play the lead role in the enforcement of Community law against the Member States, national authorities and private parties"[15].

The Court thus legitimated a „private" mechanism of EU law enforcement which integrated individuals into UE legal order, by establishing their capacity to invoke EU law, respectivelly challenge domestic non-compliance with EU provisions before national courts[16].

English literature[17] appreciated that three principal means have been conceived and subsequently developped by the Court: direct effect, indirect effect (harmonious interpretation of domestic law in accordance to EU law) and state liability for breach of EU provisions (methods to integrate EU law into domestic law[18]).

In addition to these channels of compliance, juridical literature also made reference to the preliminary ruling procedure[19] regulated by article 267 T.F.E.U.[20] and incidental horizontal effect[21] consacrated by the Court.

Preliminary ruling procedure will not be discussed in the present paper – although it undoubtedly allows individuals to invoke EU law before domestic courts, its efficiency is still weak concerning individuals' implication in the procedure and their protection.

On the one hand, decision to send the case before ECJ belongs exclusively to domestic courts (individuals have absolutely no competence in this respect), and on the other hand the procedure was designed in order to ensure the correct and uniform application of EU law by internal courts, and not for the purpose of individual protection.

Concerning incidental horizontal effect, for reasons to be presented, its efficiency is also diminished, mainly because this judicially established notion has not yet been intirely clarified by the Court.

4. 1. Direct effect

No legal provision consacrated direct effect, and therefore the main role in establishing the theory belonged to the ECJ[22] – the Treaty on the Functioning of the European Union contains a

[15] Idem; B. Moriarty, *op. cit.*, p. 159.

[16] A. Howard, D. J. Rhee, *op. cit.*, p. 307, underline the exclusive judicial effort of ECJ which, in spite of the contrary opinion expressed both by G.A. Roemer and the Member States in Van Gend case, has dismissed the argument that the Treaty addresses only to Member States and thus the only means of enforcement is the one stipulated by ex articles 169 and 170 EEC Treaty, emphasising that the Treaty also creates individual rights, which can be invoked before domestic courts.

[19] C. Bosch, *op. cit.*, p. 1.

[20] Ex article 177 EEC Treaty, respectively ex article 234 EC Treaty.

[21] B. Moriarty, *op. cit.*, p. 112.

[22] The theories of direct effect and supremacy of EU law (the latter was consacrated by ECJ decision, 25.06.1964, *Flaminio Costa v. E.N.E.L.*, C-6/64) have been established together (this is the reason why there are cases where the Court discusses both theories in the same judgment); in addition, direct effect and supremacy are inextricably

single disposition regarding direct applicability[23] (and not direct effect) of EU regulations (and not all sources of EU law), respectively article 288 T.F.U.E.[24], according to which regulations are directly applicable in all Member States.

In essence, direct effect theory[25] stipulates that a EU provision (should certain conditions be satisfied) has the capacity of creating individual rights and obligations, which can be relied on before national courts[26].

It can easily be observed that, by establishing direct effect theory, the most important deficiency of the infringement procedure has been eliminated – individuals have been brought into the legal order of European Union and could rely directly on EU law[27].

On the other hand, enforcement of measures of EU law partially shifted to domestic courts[28], which from this point on could sanction Member States at national level for failure to comply by means of direct application of EU provisions[29].

Effectiveness of EU law was therefore achieved even in cases where the „public" means of enforcement had proved ineffective – e.g., Member States ignored an ECJ decision declaring them in breach of EU law, choosing instead to pay the lump sum or penalties imposed.

Nevertheless, direct effect theory has important limitations[30], which result both from the Court's case-law, and also from national legislations.

In this respect, it should be noticed that not every source of EU law has been acknowledged the capacity of producing direct effect (e.g., the situation of non-binding secondary measures of EU law - recommendations and opinions).

Also, there is not always the case that the EU norm concerned fulfils the judicially established direct effect criteria of clearness, precision and unconditionality (this is the situation when direct effect is conditional).

---

linked, as the problem of solving a conflict between a domestic and a EU law provision and decide which one should apply to the dispute (supremacy) cannot be settled but after having already established that both cathegories of norms produce effect in the national system concerned (direct effect).

[23] Direct applicability defines a specific characteristic of EU law which means that it needs no transposition measures in order to be applied at national level (therefore, EU law can be directly applied by domestic courts or national administration to particular litigations).

[24] Ex article 249 EC Treaty.

[25] Consacrated by ECJ decision, 05.02.1963, *NV Algemene Transport - en Expeditie Onderneming van Gend & Loos c. Netherlands Inland Revenue Administration*, C-26/62, quoted before.

[26] The narrower sense of direct effect consists in the capacity of a provision of EU law to confer rights on individuals (this sense is referred to as „subjective direct effect"); there is also a broader sense of the definition of direct effect, which can be expressed as the capacity of a EU law provision (clear, precise and unconditional) to be relied on by individuals before national courts – the provision does not necessarily create individual rights, but individuals are still interested in invoking it, e.g., in order to protect themselves in a dispute with a national authority or obtain disapplication of a national provision contrary to EU law (this sense is known as „objective direct effect").

[27] By contrast to the situation of „international law, where individuals are powerless before the all mighty State, the doctrine of direct effect of EC law opened for individuals effective channels, and thus made EC law a reality states should respect"– P. Pescatore, *L'effet direct du droit communautaire*, Paricrisie Luxembourgeoise, Imprimerie Joseph Beffort, Luxembourg, 1975, p. 19.

[28] Juridical literature pointed out the importance of the role played by domestic courts in enforcement of EU measures - R. Kovar, *L'integrité de l'effet direct du droit communautaire selon la jurisprudence de la Cour de Justice de la Communauté*, Das Europa der zweiten Generation, Nomos Verlagsgesellschaft, Baden-Baden, 1981, p. 164; also, see P. Pescatore, *op. cit.*, p. 1 – the author concludes that integration of EU law into domestic systems of Member States by way of direct effect entrusts its application mainly to the national judge and national courts.

[29] Direct effect "does not have the sole purpose of individual protection, but at the same time aims to guarantee effectiveness of EC law in national juridical orders." - D. Simon, *Le système juridique communautaire*, Second Edition, Presses Universitaires de France, Paris, 1998, p. 268.

[30] For a critical point of view over direct effect doctrine and an exhaustive presentation of its deficiencies - I. Sebba, *The Doctrine of „Direct Effect": A Malignant Disease of Community Law*, in *Legal Issues of European Integration*, Law Review of the Europa Instituut, no. 2/1995, Amsterdam University, p. 35-58.

Finally, there are UE measures in case of which only vertical direct effect was accepted (the well-known situation of directives, where the Court constantly denied horizontal direct effect)[31].

In the first case (EU measures which do not have the capacity of producing direct effect), the theory of direct effect is totally ineffective and, in addition, the infringement procedure is also not available, given the fact that recommendations and opinions are non-binding (effectiveness of these EU measures is therefore difficult to be achieved, but for the situation they are willingly accepted by the Member States).

In the second situation (failure to satisfy the conditions imposed in situation of conditional direct effect), although direct effect theory still remains useless, the public way of enforcement provided by article 258 T.F.E.U. becomes available, as the EU sources concerned are binding (nevertheless, in this situation, there is practically a turn over to the initially single form of enforcement stipulated by ex article 169 EEC Treaty).

The third case (no horizontal direct effect for directives) represents one of the most important judicially established limit of the doctrine, which means that non-implemented/inadequately implemented directives cannot be relied on in litigations between private parties (regardless that the directive in question should fully satisfy direct effect criteria).

Some authors[32] remarked also limitations imposed by Member States' legislation – litigations at national level where direct effect of EU measures is relied on must be judged by domestic courts in accordance to their own internal procedural rules, different fron one state to another, and which have obviously not been adopted for the purpose of enforcing EU law (e.g., a case solved by a Romanian court by application of the status of limitation concept[33] renders impossible the analysis of the merits, and therefore the enforcement of rights conferred by EU provisions on individual parties by way of direct effect theory).

4. 2. Horizontal incidental effect

Horizontal incidental direct effect was also established judicially by the ECJ[34], with the purpose of lessening the deficiency of direct effect doctrine consisting in denial of horizontal direct effect in case of directives; in essence, it means that directives can be relied on in litigations between private parties, in order to set apart inconsistent national legislation.

This does not mean that the directive concerned creates rights or obligations for individuals, but simply that it has an „exclusionary" impact of contrary domestic law and the protection it provides for individuals; the „vacuum" thus created is filled in by another conforming national provision, and private parties can therefore be subject of liability deriving from obligations created by the latter provision.

In other words, in such cases, the directive is invoked in litigations between individuals to preclude the application of inconsistent domestic law, and the result is that parties are exposed to a potential liability[35] under another consistent provision of national law - which would not have happened if offending national law would have been applied.

English doctrine[36] concluded that „The crucial factor in these horizontal cases is that one party suffers a legal detriment and the other party gains a legal advantage from the terms of an unimplemented directive".

---

[31] In the particular case of directives, acknowledgement of direct effect is in fact a sanction against the Member State to which the directive is addressed – or, the sanction should apply strictly to the Member State who committed a wrong, and not also to other subjects, such as individuals.

[32] C. Boch, *op. cit.*, p. 6.

[33] In Romanian law – "excepția prescripției dreptului la acțiune".

[34] ECJ decision, 30.04.1996, *CIA Security International SA v. Signalson SA and Securitel SPRL*, C-194/94; ECJ decision, 26.09.2000, *Unilever Italia SpA v. Central Food SpA*, C-443/98.

[35] Although the State itself is in breach of EU law, individuals must accept the advantages/disadvantages of exclusion of the national law.

[36] P. Craig, G. de Burca, *op. cit.*, p. 297.

The most important limit of incidental horizontal direct effect theory, remarked by juridical literature[37], is that it is often difficult in practice to clearly distinguish it from horizontal direct effect theory, as the case-law of the Court in the area of incidental horizontal direct effect is rather confuse.

Thus, the no-horizontal-direct-effect-of-directives rule (unimplemented/inadequately implemented directives cannot be relied on in litigations between private parties) is based on the argument that directives cannot impose obligations upon individuals – or, incidental horizontal direct effect has the result that, although the directive itself does not create obligations upon individuals, it allows removal of domestic legal protection and makes the individual subject to potential liability; thus, indirectly, directives produce effects in private litigations.

4. 3. Indirect effect

Most deficiences presented above were stepped aside by creation of indirect effect theory[38] (a second „private" means of enforcement of EU law), according to which domestic courts[39] must interpret national legislation in conformity with EU law.

It must be underlined that indirect effect theory applies to all EU sources[40], even those non-binding, such as recommendations[41]; also, it applies to all measures of national law (including domestic case-law[42]).

In addition, indirect effect theory applies regardless of fulfilment of direct effect criteria[43] by the EU provision concerned – in this respect (independence of theories of direct and indirect effect), it was pointed out[44] that „duty to construe national law in conformity with Community law ... gives an individual the possibility of obtaining satisfaction, not because he can derive rights from directly effective Community law ... , but because he can derive rights from national law once it has been interpreted in conformity with Community law."

In the same line of reasoning, indirect effect operates independently of complete direct effect –directives do not have horizontal direct effect, but national courts are still under the obligation to interpret national law according to directives even in litigations between private parties.

---

[37] B. Moriarty, *op. cit.*, p. 155; P. Craig, G. De Burca, *op. cit.*, p. 296.

[38] The Court established the indirect effect theory in Von Colson case – ECJ decision, 10.04.1984, *Sabine von Colson and Elisabeth Kamann v. Land Nordrhein-Westfalen*, C-14/83, based on provisions of ex article 5 EEC Treaty (ex article 10 EC Treaty and the actual article 4 alin. 3 T.E.U.).

[39] Indirect effect theory is to be considered not only by domestic courts, but also by all national authorities applying EU law, either legislative, administrative or judicial – G. C. R. Iglesias, J.-P. Keppenne, *L'incidence du droit communautaire sur la droit national*, Mélanges en hommage à Michel Waelbroeck, vol. I, Bruylant, Bruxelles, 1999, p. 530.

[40] In case of Treaties – ECJ decision, 05.10.1994, *Van Munster v. Rijksdienst voor Pensioenen*, C-165/91, ECJ decision, 26.09.2000, *Rijksdienst voor Pensioenen v. Robert Engelbrecht*, C-262/97; in case of regulations – ECJ decision, 07.01.2004, *Montres Rolex S.A. and others v. Customs Authorities Kittsee-Austria*, C-60/02; in case of directives – ECJ decision, 10.04.1984, *Sabine von Colson and Elisabeth Kamann v. Land Nordrhein-Westfalen*, C-14/83; liberalisation of indirect effect theory was consacrated in the Pfeiffer case (ECJ decision, 05.10.2004, *Bernhard Pfeiffer, Wilhelm Roith, Albert Süß, Michael Winter, Klaus Nestvogel, Roswitha Zeller, Matthias Döbele v. Deutsches Rotes Kreuz, Kreisverband Waldshut eV*, joined cases C-397/01 to C-403/01), where the Court stipulated that requirement of conforming interpretation is „inherent to the system created by the Treaties" and thus applies to all sources of EU law (including decisions - measures of secondary binding EU law - in case of which it could not have been identified a case explicitly taking in discussion harmonious interpretation).

[41] ECJ decision, 13.12.1989, *Salvatore Grimaldi v. Fonds des maladies professionnelles*, C-322/88.

[42] L. Flynn, *Simple catchwords and complex legal realities: recent developments concerning the juridical effects of EC legal norms*, Irish Law Times, no. 16, 2000, p. 260, exemplifies by ECJ decison, 13.07.2000, *Centrosteel Srl v. Adipol GmbH*, C-456/98, where the Court makes reference to case-law.

[43] Idem, p. 260 - „the direct effect of a legal norm forming part of the Community legal order is not the only way in which such a norm can have juridical effect ... principle of loyal interpretation also gives rise to such effect even in the case of measures which do not have direct effect themselves".

[44] W. van Gerven, *From "direct effect" to "effective judicial protection"*, in Schritfenreihe der Europaischen Rechtsakademie Trier, Bundesanzeiger, 1996, Band 12, Academy of European Law, Trier, p. 31.

Nevertheless, establishment of harmonious interpretation theory succeeded only in smoothing the limit consisting in prohibition of horizontal direct effect of directives, but not creating a secure means of repairing of loss suffered by individuals as a consequence of non-implemented/inadequately implemented directives – this is because the juridical effect of such a directive concerning the rights it confers on individuals is left to the power of appreciation of domestic courts, which are sovereign in the interpretation of national law according to the said directive[45].

On the other hand, the Court itself was fully aware of the risks implied by use of indirect effect theory, and therefore specifically established two important limits of its application.

Firstly, the Court has held that „in applying national law, ... , the national court called upon to interpret ... is required to do so, *as far as possible*, in the light of the wording and the purpose of the directive"[46] – indirect effect does not require thus *contra legem* interpretation of national law (the force of the interpretative obligation is not so strong as to impose a provision of domestic law to be given a meaning that clearly contradicts its ordinary meaning)[47].

Secondly, the Court was very cautious in allowing application of indirect effect in the area of criminal law, where legal certainty is especially important for the protection of individual rights and freedoms[48] - provisions of criminal law must be interpreted and applied *stricto sensu*, and indirect effect cannot result in determining or aggravating liability in criminal law[49].

4. 4. State liability

As a consequence of limits presented above, there were still cases when individuals could not use direct/indirect effect theories, and therefore a third „private"[50] way of enforcement of EU law against the Member States was conceived by the Court[51], namely the theory[52] of state liability for breach of EU law.

The starting point was the situation of unimplemented/inadequately implemented directives – in horizontal litigations, rather than attempting to enforce the obligation stipulated by such directives against the opposite party by way of incidental horizontal direct effect or indirect effect[53], the individual can bring proceedings for damages against the state (a much more effective means to impose Member States correct and in due time implementation of directives).

[46] ECJ decision, 13.11.1990, *Marleasing SA v. La Comercial Internacional de Alimentacion SA*, C-106/89.

[47] ECJ decision, 16.12.1993, *Teodoro Wagner Miret v. Fondo de Garantía Salarial*, C-334/92 (where the Court suggested legal proceedings based on state liability procedure, as indirect effect procedure was inapplicable) – for a comment on this decision, see S. Drake, *Twenty years after Van Colson: the impact of "indirect effect" on the protection of the individual's Community rights*, European Law Review, vol. 30, no. 3, 2005, p. 329-348, p. 342 ("As a result, it is clear that the duty of purposive interpretation imposed on national courts is not absolute and is not designed to give national courts a legislative function so as to allow them to re-write national law"); in the same line of reasoning, see D. Chalmers, C. Hadjiemmanuil, G. Monti, A. Tomkins, *op. cit.*, p. 365.

[48] ECJ decision, 26.09.1996, *Criminal proceedings against Luciano Arcaro*, C-168/95.

[49] ECJ decision, 08.10.1987, *Criminal proceedings against Kolpinghuis Nijmegen BV*, C-80/86.

[50] P. Craig, G. de Burca, *op. cit.*, p. 300.

[51] ECJ decision, 19.11.1991, *Andrea Francovich and Danila Bonifaci and others v. Italian Republic*, joined cases C-6/90 and C-9/90.

[52] Some authors use the expression "*principle* of state liability" - D. Chalmers, C. Hadjiemmanuil, G. Monti, A. Tomkins, *op. cit.*, p. 365; T. Ştefan, B. Andreşan Grigoriu, *Drept comunitar*, C. H. Beck, Publishing, Bucharest, 2007, p. 236 or „*doctrine* of state liability " - D. Chalmers, C. Hadjiemmanuil, G. Monti, A. Tomkins, *op. cit.*, p. 391 (interchangeable use of these expressions is also characteristic for direct/indirect effect).

[53] In this case, direct effect theory is inapplicable.

Over the years, application of state liability theory extended beyond the original situation of non-implementation/inadequate implementation of directives[54] (the said theory had been created as a means of enhancing the ability of national courts to enforce directives, still without allowing them full direct effect), and in consequence the state could also be held liable in case of breach of EU law by way of legislative[55], administrative[56] or judicial[57] actions (which did not have to relate to directives at all).

What should firstly be noticed is that state liability theory applies regardless of the direct effect of the concerned EU provision (even in case of a directly effective EU norm, the individual is not imposed to use the direct effect theory prior to bringing proceedings based on state liability theory) - nevertheless, until having been clarified by the Court in *Brasserie du Pecheur*[58] case, this was a subject of debate.

Some domestic courts[59] and a part of juridical literature[60] opinated that state liability as a remedy for breaches of EU law should be made available only in case of infringement of directly effective EU provisions (arguing that non-directly effective norms do not have the capacity of having any juridical effect whatsoever).

There was also an opposite opinion, according to which state liability should apply only for breaches of non-directly effective measures of EU law[61] – individuals can assert their rights by way of direct effect theory if they are directly effective.

The Court dismissed both opinions in the *Brasserie du Pecheur* case, holding that „The right of individuals to rely on directly effective provisions before national courts is only a minimum guarantee and is not sufficient in itself to ensure the full and complete implementation of Community law. That right … cannot, in every case, secure for individuals the benefit of the rights conferred on them by Community law and, in particular, avoid their sustaining damage as a result of a breach of Community law attributable to a Member State."

Secondly, state liability theory is available independently of any prior use of the infringement procedure regulated by articles 258 and 259 T.F.E.U.[62], and this aspect was also clearly stated by the Court in the same *Brasserie du Pecheur* case:

„ … to make the reparation of loss or damage conditional upon the requirement that there must have been a prior finding by the Court of an infringement of Community law attributable to the Member State concerned would be contrary to the principle of the effectiveness of Community law, since it would preclude any right to reparation so long as the presumed infringement had not been the subject of an action brought by the Commission under Article 169 of the Treaty and of a finding of an infringement by the Court. Rights arising for individuals out of Community provisions … cannot

[58] ECJ decision, 05.03.1996, *Brasserie du Pecheur and Factortame III*, joined cases C-46/93 and C-48/93, quoted before.

[59] S. Prechal, *op. cit.*, p. 299, identifies the judgment of Hoge Raad (the Netherlands), 11.06.1993, AB 1994, no. 10, regarding the proceedings which concerned the so-called „Roosendaal-method" of expulsion of aliens. The author points out that, generally, proceedings setteled by domestic courts prior to the *Francovich* decision (the case concerned a non-directly effective directive) implied only application of EU directly effective provisions (for discussion, see A. Barav, *State Liability in Damages for Breach of Community law in the National Courts*, in Heukels and McDonnel (eds), *The Action for Dameges in Community Law*, Kluwer Publishing, Haga, 1997, p. 363).

[61] In this respect, S. Prechal, *op. cit.*, p. 299, makes reference to M. Nettesheim, *Gemeinschaftsrechtliche Vorgaben für das deutsche Staatshaftungsrecht*, Die Offentliche Verwaltung, 1992, p. 1002.

[62] B. Moriarty, *op. cit.*, p. 119.

depend on the Commission's assessment of the expediency of taking action against a Member State pursuant to Article 169 of the Treaty or on the delivery by the Court of any judgment finding an infringement."

In fact, direct effect of the EU provision concerned or prior use of the infringement procedure are not at all mentioned among criteria to be satisfied for incidence of state liability theory (which are: the EU rule of law infringed is intended to confer rights on individuals, the breach is sufficiently serious, and there is a direct causal link between the breach of the obligation imposed on the Member State and the damage sustained by individuals).

This final private way of EU law enforcement also has its limit, belonging to the procedural area, namely the principle of national procedural autonomy, according to which cases involving state liability are to be judged by domestic courts by applying national relevant provisions.

Still, this principle is subject to two conditions: 1. procedural circumstances required by national law may not be less favourable in the context of EU law enforcement than they are in case of norms deriving from domestic law[63]; 2. procedural domestic circumstances must not be applied if their effect is practically to make impossible to exercise the EU rights which national courts are required to enforce[64].

5. Conclusions

There are two channels which secure at present effectiveness of EU law in Member States: on the one hand, a „centralised" and „public" form of enforcement assured by the ECJ, the Commission and Member States, based on the procedure stipulated by articles 258 and 259 T.F.E.U., and on the other hand a „decentralised" and „private" form of enforcement in which national courts and individuals play the leading role, through legal proceedings based either on direct/indirect effect theories, or on the theory of state liability for failure to comply with EU law (the coexistence of these „public" and „private" means of enforcement amounts to the notion of „dual vigilance", initially legitimated by the Court and later accepted in doctrine).

All these „public" and „private" forms of enforcement are legally independent one from another, and their use in practice evolved over the years, as the ECJ attached increasingly more importance to integration of individuals in EU legal order and therefore to the significant contribution of the „private" way of enforcement of EU law[65].

The „public" means of enforcement has never been contested, nor by Member States or doctrine (contestation would anyway have been difficult, as legal basis was provided by the Treaty); on the other hand, in spite of the initial opposition of some of the Member States to the judicial creation of the „private" channels, the theories of direct effect, indirect effect and state liability are nowadays fully accepted.

Judicial acknowledgement of horizontal incidental direct effect remains though highly controversial, especially as a consequence of an insufficient delimitation from the concept of horizontal direct effect (and this is an aspect which needs to be cleared by the Court in its case-law to follow).

PUBLIC LAW AS A VICTIM OF THE ECONOMY

MARIUS VĂCĂRELU[*]

Abstract
Every day of 2009 has a common speech: economic crisis and its consequences, not only in economic topics, but also in few others domains, connected with the real economy.However, in this public speech, it was a problem: we must find a guilty element, because it must be someone who was not able to function correct, to not respect some rules that was good many years, but not in first years of 21st century. And, as always, every specialist and whole political class offered an answer. But this is not enough: a crisis has not only causes, but it has its victims. The globalization was one of them; human rights – in few states, young generation is a perpetual victim.
In legal branch, the consequences were much simple: private law (banking law and commercial law) didn't suffer too much, but public law – because whole eyes were settled in this direction – felt this pressure. State intervention in the economy was considered not really political correct, not really a benefit for economies, but something necessary. In fact, public law was considered only a reserve. In this case, can we speak about a de-legitimization of public law? Is the purpose of public law available for 21st century or it become now only a simple reserve, necessary only to solve the "side-slip" of the private law? And, because the connection between private law and the economy is too strong, can we see now the public law as a victim of the economy?

Keywords: *public law, private law, economy, legitimization, victim.*

Introduction

Every day of 2009 has a common speech: economic crisis and its consequences, not only in economic topics, but also in few others domains, connected with the real economy. However, in this public speech, it was a problem: we must find a guilty element, because it must be someone who was not able to function correct, to not respect some rules that was good many years, but not in first years of 21st century. And, as always, every specialist and whole political class offered an answer.

But this is not enough: a crisis has not only causes, but it has its victims. The globalization was one of them; human rights – in few states, young generation is a perpetual victim.

In legal branch, the consequences were much simple: private law (banking law and commercial law) didn't suffer too much, but public law – because whole eyes were settled in this direction – felt this pressure. State intervention in the economy was considered not really political correct, not really a benefit for economies, but something necessary. In fact, public law was considered only a reserve.

But this reserve was forced to solve all the difficulties of banking system – of private law mistakes, in other words. This process must be understood somehow: as a manifestation of private law force? As a demonstration of continue sacrifice of public law during the economic crisis? It is very important to offer an answer to those questions, because, without it, during another new crisis we'll discover that we didn't learnt nothing from this, and we'll make the same mistakes: erare humanum est, perseverare diabolicum!

The author intends to answer underlining few ideas who are still available in legal science, especially in their relation with new socio-political paradigm. In the same time, we must offer a perspective for the future: the dispute between public law and the economy will have, on this lack of resources time, a long continuation: the pressure for both direction of human activity is too big now to can be avoided.

[*] Assistant, Ph.D, SNSPA (Scoala Nationala de Studii Politice si Administrative) /NSPAS (National School of Political and Administrative Studies) Bucharest. (E-mail: marius123vacarelu@gmail.com).

There is some literature for this subject: less in Romanian doctrine, more in Western Europe and other developed part of the world. But this idea is not too much studied, because it is a Pandora box for a fundamental change to some truths understood as "eternal", after 1989: the complete victory of capitalism (the economy) against communism (state intervention and public law).

The author believes that is time to come back to normal logic in public law and into the economy, because this way of world organization cannot be changed.

Paper Content

1. Toward the end of the 1990s, a group of economists, specializing in finance and building upon the emerging emphasis on institutions, conducted cross-country econometric research to determine what legal rules best contributed to strength in the financial sector and thereby to economic growth. Their studies in Law and Finance represented an unprecedented focus on microeconomic analysis of the influence of legal rules on economic growth. Their work led to another researches by other economists and by lawyers into the role of legal institutions in economic development[1].

A major conclusion reached in their studies was that countries whose legal systems originated in the English common law have enjoyed superior per capita income growth compared with so-called civil law countries, whose law is based on European codes, especially those countries whose law is based on the Napoleonic codes and hence on French law[2].

Their conclusions have drawn criticisms on various grounds, especially because many civil law countries—not only those in Western Europe but also some developing countries—have enjoyed superior economic growth and because many common law countries in the third world have done quite poorly in the economic growth tables.

But this idea is not new, Max Weber had spoken about this is his fundamental book dedicated to the ethics. The religion was seen as an obstacle, the strongest one for the society to achieve economic development. But the center of Weber's study was the relation between Catholics and Protestants, this rivalry being easy to find for empirical studies. But Max Weber didn't imagine the first years of 21st century, when communist China represents the strongest economic force, and its religion is something completely different by the Western Europe; for sure, the Arabic petro-dollars was not imagined by Weber too – and, of course, the deep economic transformation in global political and legal world.

Despite such criticisms of these economists' specific results, the idea that institutions and especially legal institutions are crucial to the process of economic development is now broadly accepted in the academies and in the research departments of international financial institutions such as the World Bank.

When we speak about economic development, we must analyze a framework that includes:

a) A correct attitude for work belonging to the citizens;
b) A coherent legal framework;
c) The dimension of demography;
d) The possibility to have access to important amount of resources;
e) The quantity of energy consumed for produce one piece of product.

If we try to explain the first and the third causes of a real and strong economic development, we must talk about geopolitics.

In the same time, speaking about the possibility to have access to important amount of resources we are forced to analyze mainly the possibility for new wars, because in modern times the

[1] Kenneth Dam: *The law-growth nexus : the rule of law and economic development*, Brookings Institution Press, (Washington D.C., 2006), p. 8.

[2] Ibidem.

prices of few important materials are more important than law principles of human rights and peaceful existence.

Only the last point (e) is connected with productivity, because to loose energy is a crime for today's economy. In fact, the difference between states is represented by this percentage: a modern technology means to economize not only the material resources used to create a new unit of product, but also it means o use less energy (and, if is possible, clean or renewable).

However, it is necessary to describe in a few words all these steps for the economic development, to understand much more the second idea: a coherent legal framework.

2. Several social scientists and historians have found strong evidence that culture explains at least some differences in the rate at which countries develop. An economic history said: if we learn anything from the history of economic development, it is that culture makes almost all the difference.

Unlike political and economic factors, cultural factors, such as ethnicity, language and religion, suffer relatively few changes over a comparatively long period of time. They can, therefore, serve as an important instrument for the comparative analysis of the world economy. However, given the great varieties of ethnic, linguistic, and religious groups throughout the world, the number of individual cultures is too large to be a practical tool and it would be very difficult to conduct useful multicultural economic comparisons. Consequently, to facilitate multicultural economic analysis and comparison, our analytical framework will be based on a synthetic term – "culture area"[3].

There usually exists a small and relatively homogeneous core in each culture area. Culture areas also have boundaries. The influence of a specific culture is always strongest in the core and becomes weaker from the core to peripheral areas. In theory, the boundary of a culture area can be determined as the line beyond which the influence of culture reduces to zero.

However the boundaries between culture areas are not necessarily distinct; recognizable cultures within a given area may contrast with those of neighboring ones, and if the boundaries are not sharply delineated, zones of composite culture or blended traits may make the transition from one to another a matter of gradation. Within a single area, quite different ways of life may coexist as characteristic patterns[4].

3. Natural resources once figured prominently as a production factor in studies of economic growth. At times, natural resources (such as land, climate, biology, water, minerals and energy) have indeed been the primary component among the factors that influence social and economic activities. But early pessimists like Malthus and Ricardo were probably wrong about the importance of scarce natural resources as a retardant of growth[5].

However a huge labor force does not sufficiently represent an advantage in human resources for economic development, particularly when a country is undergoing transformation from an agricultural society, mainly using traditional methods of production to an industrial society, which requires not only new and advanced technologies but also well-trained personnel.

A well-educated and law-abiding population that possesses a strong work ethic is the sine qua non of modern economic growth. A striking feature of the world economy in the twentieth century was the enormous increase in the average level of education. Before the nineteenth century the majority of the population was illiterate in almost all countries.

Since then, universal enrolment in primary education has become obligatory in advanced countries. As a result the proportion of people receiving secondary and higher education has risen steadily

Technological innovation has been the most fundamental element in promoting, either directly or indirectly, economic development and social change. Although it is very difficult to

measure its short-term impact precisely, no one would reject the idea that technological progress is changing the world at an incredibly high rate.

The most obvious contributions are in transport and communications where crude means (such as horses, carriages and handwritten letters) have been superseded by super-jets, telephones and faxes, as well as by increasingly efficient computer networks, including the Internet which is becoming the most important means for transmitting information. Mobile telephones, computer networks and other technological inventions which were once considered to be either impossible or useless are now becoming the necessities of our daily life[6].

Before the early twentieth century, technological innovation had been contributed mainly by individual inventors or small-scale entrepreneurs. But now the great bulk of it – such as the space shuttle and the Internet, to list but two – is conducted by prominent firms with substantial budgets, as well as by governments. As a result the process of technological innovation has become more complicated than ever before.

Specifically, technological and related products are positively related to capital stock of, and personnel engagement in, technological innovation. In addition, technological innovation is also related to educational levels, as the content of education changes over time to accommodate to the growing stock of knowledge. There has been a proliferation of specialized intellectual disciplines to facilitate the absorption of knowledge and to promote its development through research[7].

4. If we are to explain why economic growth rates have been so diverse among nations, it is necessary for us to consider political and institutional influences. Institutions in economic research are analyzed as formal (laws, regulations) and informal (customs, traditions, norms) rules that structure and simplify human interactions within a society. Historically, institutions have been devised by human beings to create order and reduce uncertainty in exchange[8].

They evolve incrementally connecting the past with the present and the future. According to new institutional economics, the economic system, like other production factors required in economic development, is a special kind of scarce resource and should be treated thus.

The economic system of any nation is the mechanism that brings together natural resources, labor, technology and the necessary managerial talents. Anticipating and then meeting human needs through production and distribution of goods and services is the end purpose of every economic system.

While the type of economic system applied by a nation is usually artificially decided, it is also to a large extent the result of historical experience, which becomes over time a part of political culture.

5. Public sector purchases totaled some 1.5 trillion euros in 2002. This explains the seriousness with which European Community institutions approached the task of injecting competition into public procurement as part of the single market project.[9]

By 1993, the institutions of the European Community had enacted the legislation required for completion of a single European public procurement market, potentially introducing competition into the huge market for purchases of goods and services by governments at all levels in member states.

Drawing on EC Treaty articles prohibiting restrictions on the free movement of goods, the rights of establishment, and the right to perform services within the single market, the Commission had proposed "positive" legislative measures supplementing these prohibitions, including procedures

for purchasing of supplies, commissioning of works, and contracting for services by public authorities at all levels—local, regional, and national[10].

As national governments transposed these measures into law the European Community formally moved toward a single market in public procurement.

However, as this chapter demonstrates, in practice little interpenetration of national markets ensued; legislation was a necessary but not sufficient condition for the genuine introduction of competition. Political leaders of the EU member states had supported the single market in public procurement, the appropriate legislation had been crafted by the European Commission and approved by the Council of Ministers, and single market public procurement rules had significantly altered domestic administrative practices.

Yet more than a decade after the formal completion of the single market in public procurement, there is only limited cross-border competition for public works and supplies contracts within the EU, and closed local, regional, or national public contracting practices constrain the emergence of a single European market[11].

National governments support competition in the 1.5 trillion euro public procurement market because of the gains in efficiency and competitiveness it promises. Moreover, the fiscal benefits to be captured by competitive procurement coincided with objectives of budget consolidation central to the process of economic and monetary union accompanying the single market.

As an additional ingredient in the recipe for sector reform, the European Commission has supplied supranational leadership by promoting awareness of the potential benefits to governments and mobilizing support for a legislative package. Yet in successive Commission reviews of the progress of the internal market, public procurement persistently ranks among the "missed targets" of efforts to complete the project.

6. For the countries of the European Union as a whole, the protections traditionally accorded markets served by the public sector have been eroded significantly, and governments and public service providers that seek to sustain restrictive practices face further challenges.

Public services in numerous sectors now operate in a competitive environment that would have been unthinkable a decade ago. Governments cannot freely subsidize state-owned public service providers and thereby keep markets closed to foreign-owned or domestic private sector competitors. But the case studies also indicate that European economic integration has not created a liberalization steamroller that simply "flattens" the public sector across EU governments, rendering it an apolitical mechanism for the pursuit of economic efficiency[12].

Nor has liberalization advanced without accommodating the interests of protected public service providers. There are few more vital contemporary questions for political scientists than those that emanate from the relationship between neo-liberalism, the exercise of state power, and the institutions and practice of global governance.

Since the demise during the early 1970s of the first "Washington Consensus" provided by the capital controls and fixed exchange rate system of the Breton Woods international economic order, its neo-liberal successor has come to dominate the relationship between states and markets in both the industrialized and the industrializing economies.

Policies of privatization, deregulation, and liberalization of markets have not only given entrepreneurs and trans-national corporations greater freedom to innovate and take risks in pursuit of profit, but also largely redrawn the boundaries between the public domain of the state and citizenship and the private domain of the market, entrepreneurship and consumerism[13].

[10] Ibidem.
[11] Mitchell P. Smith: States of liberalization …, p. 94
[12] Kenneth Dam: The law-growth nexus …, p. 109
[13] Mitchell P. Smith: States of liberalization …, p. 127

Globalization, often when allied to arguments about the need to maintain international competitiveness, has provided a generation of politicians with both a convenient alibi, to explain their inaction or indifference to rising inequality and other social consequences of unfettered market forces, and an ideological weapon, to justify major restructuring of domestic political, economic, and social institutions in the guise of urgent and overdue modernization. In fact, this was the program created by Anthony Giddens (the Third way) and implemented by Tony Blair.

7. The parallel response of a generation of voters, to this attempt to roll forward the frontiers of the private domain of the market, entrepreneurship and consumerism as agencies of social change, has been to abandon the public domain of political parties and the electoral ballot box in increasing numbers.

The first is that neo-liberalism has failed to provide a framework for state power and global governance capable of delivering stable and lasting prosperity for the richer industrialized economies, and a developmental route out of poverty for the poorest economies.

Second, the role of politics and the exercise of public policy should be more broadly defined that the simple construction of institutions for the market. While the World Bank has argued that this limited role for the state is an effective one, the analyses furnished by the contributors to this volume suggest otherwise. The relationship between the state and market needs to be reordered to foster a broader conception of the public domain that will deliver greater effectiveness in both state power and the pattern of global governance, and thereby advance human development. In particular, the contemporary pattern of state power and global governance needs to be re-balanced in favor of the public domain of the state and citizenship, in order to redress some of the inequalities bequeathed by three decades of liberalization, privatization, and deregulation.

Third, while international flows of finance, goods and trade have challenged and constrained the exercise of state power, the degree to which globalization has undermined the policy autonomy of the democratic state has in many cases been overstated. Consequently, any analysis of the impact of neo-liberalism upon state power and global governance must recognize the importance of context, including the impact of society, historical traditions and culture, in mediating the effects of neo-liberalism.

8. The 3rd May 2004 was widely marked, if not celebrated, by the British media as the 25th anniversary of the election of Margaret Thatcher as Prime Minister of the United Kingdom[14].

This event was remembered as one of the pivotal turning points of twentieth century peacetime British politics. However, it was equally important for global political economy because it marked the beginning of the process by which the political leadership of the Group of Seven industrialized economies began to embrace the New Right's project of rolling forward the frontiers of the market in the name of neo-liberalism. This was the point at which the Thatcher Government, equipped with 'a different analysis and a different set of policies' challenged the social democratic orthodoxy about the role of state power, both domestically and internationally. Domestically, it identified six main obstacles to full employment and prosperity, namely, high state spending; high direct taxation; egalitarianism; nationalization; a politicized and Luddite trades union movement; and the presence of an enterprise culture[15].

To restore the political and moral authority of the state, and to return politics to the "common ground" of prosperity would require nothing less than salvation for an "endangered species", and the rediscovery of the "missing dimension in our economic thinking" and "the only route to our prosperity, namely the entrepreneur".

Ronald Reagan supported this thesis, contending that "In this present crisis, government is not the solution to our problem; government is the problem".

---

[14] Simon Lee, Stephen McBride: *Neo-Liberalism, State Power and Global Governance*, (Springer, 2007, Netherlands), p. 31

[15] Ibidem.

Neo-liberalism thrived ideologically on both sides of the Atlantic during the 1980s and 1990s because it was able to exploit a loss of confidence in the efficacy of the Keynesian social democratic welfare state. Internationally, the suspension of the convertibility of the dollar, the introduction of floating exchange rates, and the liberalization of its financial markets by the United States had brought an end to the Bretton Woods era of managed capitalism through fixed exchange rates and capital controls. Domestically, the coincidence of rising inflation and unemployment in the aftermath of the 1973–1974 Oil Crisis had challenged longstanding assumptions about the attainability of full employment, the desirability of high rates of taxation, and the dangers of welfare dependency and subsidy addiction[16].

Neo-liberalism was able to exploit this uncertainty by placing faith in the market as a discovery process for entrepreneurs to acquire the knowledge and information that would enable them to take risks and innovate to provide new goods and services to consumers. The superiority of the market mechanism over the state was held not just to be economic, in terms of a more efficient allocation of resources, or political and social, as a better and more spontaneous basis for human organization, but also moral, because of its maximization of individual liberty from the state[17].

9. If state and public intervention is not welcomed, it means that the economy is the single one correct ideology, because the struggle between two very old social notions cannot be finished without a real and clear winner: when two capital concepts fight one against each other, it cannot be a real scientific debate: there is only a place for one winner, and only one place for the second place (not looser, because these institutions are eternal).

But Stiglitz and other economists predicted that this moment (victory of economics) cannot be too long – it will be a time for "state revenge", or – precisely – a moment of truth, for remake the balance, the equilibrium. The main problem was the dimension of the gap between economy and public intervention. If this gap was small, it was easy to recreate the balance.

But since Reagan moments and the first days of crisis (economic crisis) it was a long time, almost 25 years. In this time the gap becomes huge. The economy consolidated its image, but, as always, there is a difference between image and reality. And, when the reality finally had spoken, it was obvious that the economy is not only an image, and the state intervention, as expression of public law was necessary.

The author doesn't want to talk about the great ideological debates that appeared in 2007 in whole Western Europe about the collapse of capitalism. In fact, this debate is only an expression of something impossible to imagine 50 years ago: intellectuals cannot believe in state intervention in economy.

For sure, to understand this is necessary to come back to famous Fukuyama's essay about the end of history, where the capitalism was considered the only one legitimate way for humanity. This text was written soon after communism collapse, and for few years it was almost an acceptable idea. For sure, in modern times 15 years (1991 to 2006) represent a big period of time, with important changes in social reality. It is sure that the world as it was seen in 1990 was radically (and not only in a small part) modified by the technological advance of this time.

But 2007 was tremendous. And, like always in first moment of crisis, first months are used to talk about "what can we do, what kind of idea can bring a light is a tunnel". But the ideological debates (of course, ideology, not scientific dialogue) were accompanied by the governmental actions, straighter and more unequivocal: they intervened to save the big actors of the private economy.

Of course, this is an administrative mechanism, created by state in the moment when state was created too. However, this intervention was claimed, and it was for many people the only chance to survive. In this case, we must note that this intervention was considered a "necessary bad",

[16] A.M. Stoenescu: *Istoria loviturilor de stat* …, p. 104.
[17] Simon Lee, Stephen McBride: Neo-Liberalism …, p. 58.

because, like everyone understand, the economy is only one truth owner, and state is only a palliative when the speed of the economy decrease.

Conclusions

As we can see, the state intervention – a form of administrative action – it was a perfect medicine to save great banking actors (and especially their bosses[18]), but it was seen only as a violation of ideological terms of society after communism fall. It is amoral to claim state intervention, and to present it like a wrong method to solve a problem, because for many years the ideological debate tries to impose a bad idea: that public law and its actions are the worst thing for the society.

So, we can conclude, without any hesitation – public law represent, in ideological war of 21st century only a victim of economy. In fact, we must understand this phenomenon, because a lawyer cannot stay only as technician: he must understand the context of the law science.

In this case, the specialists of public law felt that their works is not necessary. You can works well, but if public image of your work disregard whole activities of public sector, we can predict, for sure, for the next 10 years a great migration of best specialists from this sector to the private one. In this case, the quality of public services will decrease, because the interest for them is only at speech level. So, it must be adopted new regulation to prevent this exodus, otherwise, the gap between public and private law specialist will be very important, and nothing can replace the differences.

For us, like for other researchers, it is a time to re-evaluate these aspects, because is not the time to stay immobile. In fact, our opinion is sure that is necessary a new education of people in a sense of state intervention acceptance. And for this it is compulsory – again this imperative verb – to recreate and to re-present public law in its normal and correct light.

LENIENCY POLICY AND ITS IMPLICATIONS ON THE INSTITUTION OF ADMINISTRATIVE RESPONSIBILITY

MIHAELA MUSAN[*]
NAOMI RENIUŢ-URSOIU [*]

Abstract
According to the Order of the Competition Council. 300/2009, individual denunciation of participation in anticompetitive agreements eliminate the contravention liability imposed by the provisions of Law no. 21/1996, or reduce the fine imposed, if the conditions to qualify for leniency, contained in the Guidelines on conditions and criteria for application of the leniency policy, part in the order mentioned above, are fulfilled.The amendments to competition legislation establish a case of removing anti-competitive acts liability for rewarding companies that cooperate with the authorities to denounce anti-competitive practices and a case for reducing the penalty for contravention, for those who, although not qualified for immunity from fine, actually have an important and actually role in uncovering anticompetitive practices.
This paper presents interest to the current developments of the institution of administrative responsibility resulting from the takeover in the national legislation of the elements of Community law, transposing the general principles also comes into the right to good administration.

Keywords*: leniency, responsibility, competition, law, cartel*

Introduction

The usefulness of finding the contraventions and applying the sanctions by the concurrence authorities as a remedial tool to restore a normal competitive environment is undeniable.

First, the imposition of fines by the competition authorities generates a deterrent effect among undertakings. It creates such a real threat of being pursued and punished, and this is likely to outweigh the possible intentions of the companies to engage in anti-competitive behavior.

Second, applying of differentiated fines, according to the role of each participant in the case of collective violations such as cartels, aims to increase the costs to organize and maintain such an anti-competitive agreement .

In addition, differentiated fines correlated with an effective leniency policy increases the risk that some cartel members do not respect anti-competitive agreements and intend to denounce others participants.

Third, applying fines against those who violate the competition law has a cautionary effect, reinforcing the belief to comply with these rules for those people who follow these prescriptions.

At EU's level, The Commission's action is the most important tool in the fight against the crimes covered by the competition law and therefore a fine is the most effective way to punish and deter the commission of such crimes .

The main objective of leniency programs is to provide an incentive to an undertaking participating in an unlawful cartel to come forward and to expose the cartel by offering immunity from, or a reduction of the fines that would have been applicable to that undertaking had the cartel been discovered by the relevant competition enforcement authorities whitout the undertaking's assistance.

Leniency in antitrust enforcement can be defined as granting of immunity or reduction on penalties for antitrust violations in exchange for cooperation with the public authorities mainly in the form of provisions of intelligence and evidence of competition infringements.

Lenient treatment is particularly convenient for discovery of hidden cartels because of the mere character of the violation and the fundamental features of collusion being continuative, collective and hard to detect[1].

The origin of this policy as part of public enforcement mechanism can be traced back to 1978 when the US adopted its first Corporate Leniency Notice. In the US, the encouragement of whistle-blowing has proven to be higly successful,which inspired the European Commission to follow the example and to adopt in 1996 its first Leniency Notice .

The Commission subsequently amended it twice in 2002 and 2006 to make leniency more efficient and to take into account the lessons learned from its operation. The main changes were that immunity became automatic, that fine reductions became more strictly aligned to the timing of the cooperation and also improved the transparency and certainty of the conditions on which the immunity and the reduction of fines is granted.

European Union's leniency policy

In order to obtain immunity the undertaking has to provide sufficient evidence for the Commission to commence an investigation , or must be the first to enable the Commisssion to establish an infringement of Article 81 EC.

The 2006 Notice on Immunity from Fines and Reduction of Fines in Cartels Cases states that an undertaking that has coerced any other undertaking into participating in the infringement or remains in it does not qualify for immunity, although it may qualify for a reduction of fines, between 20 and 50 per cent, depending on the importance of the provided information :

The Notice, II.A, §8 : "The Commission will grant immunity from any fine which would otherwise have been imposed to an undertaking disclosing its participation in an alleged cartel affecting the Community if that undertaking is the first to submit information and evidence which in the Commission's view will enable it to:

(a) carry out a targeted inspection in connection with the alleged cartel; or

(b) find an infringement of Article 81 EC in connection with the alleged cartel".

The Programme does not protect an undertaking from civil litigation whose purpose is the coverage of the damages resulting from the cartel actions.

There was concern that leniency programmes should operate by the rule of total immunity, to include all applicable penalties: fines, civil damages and / or criminal sanctions, considering the U.S. experience, where it was only after they waived the triple sanction system, the leniency program has made notable results, encouraging individual interest of cartel participants to abandon such an anticompetitive agreement[2] .

It is important to note that leniency as operated by the Commission does not mean absence of prosecution in all cases. The Commission might adopt a decision finding an infringement of the competition rules which might constitute a reason to treat the whistle-blower as a recidivist if any involvement in other cartels is subsequently discovered. [3]

As the Commission has currently no powers to impose penalties on individuals other than undertakings, the grant of immunity to a company does not concern its directors or employees and

[3] European Commission 2006 Leniency Notice [Commission Notice on immunity from fines and reduction of fines in cartel cases, [2006] OJ C298/17.]

there is no separate immunity policy for individuals.[4] This is another major difference with the US model which operates a Leniency Policy for Individuals.

It is interesting to note, however, that managers of undertakings can be still punished for their role in the cartel, if the Member State"s antitrust legislation provides for individual sanctions. Member States retain their competence to adopt sanctions for breach of antitrust rules and to provide or not for any lenient treatment of whistle-blowers.[5]

That point leads to another important feature of leniency in the EU context: the existence in parallel of the Commission"s policy of distinct leniency programmes of the Member States which concern infringements of both EU and national competition rules.

The Commission has the jurisdiction to decide on the existence of a competition law's violation , even if the term of extinctive prescription of the fine was fulfilled, because the fulfilling of this term does not prevent establishing the existence of an anti-competitive act.

The Commission retains the power to adopt a decision on the existence of prescribed anti-competitive acts, but only if there is a legitimate interest in this, such as clarifying an issue of principle or facilitate the introduction of "actions for damages" by individuals to the national courts in civil law.

The Commission still retained an important role in the enforcement mechanism, as the co-ordinating force in the newly created European Competition Network (ECN). This Network, made up of the national bodies plus the Commission, manages the flow of information between NCAs and maintains the coherence and integrity of the system.

This policy has been of great success as it has increased cartel detection to such an extent that nowadays most cartel investigations are started according to the leniency policy. The purpose of a sliding scale in fine reductions is to encourage a "race to confess" among cartel members. In cross border or international investigations, cartel members are often at pains to inform not only the EU Commission, but also National Competition Authorities.

Romanian leniency policy

Leniency did not exist in the Member States before the Commission adopts its first Notice. Although mostly similar to the Commission's model, a number of significant differences do exist between the EU and national programmes due to the freedom of the Member States with regard to the substantive provisions of leniency which has resulted in a variaty of leniency procedures and lastly in a lack of harmonisation. [6]

In our legislation, the participation of firms in anti-competitive practices is prohibited by the imperative provisions of art. 5. 1 of the Competition Law no. 21/1996, republished : "Are prohibited any express or tacit agreements between undertakings or associations of undertakings, any decisions by associations of undertakings and concerted practices which have as their object or effect the restriction, preventing or distorting competition in the Romanian market or on a part of it, especially those aimed at:

a) Concerted fixing, directly or indirectly, of the sale or purchase prices, tariffs, rebates, markups, and any other trading conditions;

b) limiting or controlling the production, distribution, technological development or investments;

[5] Article 5 of Council Regulation (EC) No 1/2003 of 16 December 2002 on the implementation of the rules on competition laid down in Articles 81 and 82 of the Treaty, OJ L 1, 04.01.2003, p.1-25

[6] See 2009 Report on assessment of state the convergence, ECN Model Leniency Programme available at: http://ec.europa.eu/competition/ecn/model_leniency_programme.pdf

c) sharing markets or sources of supply, on a territorial basis, the volume of sales and acquisitions criterion or other criteria;

d) application to trading partners of dissimilar conditions to equivalent transactions, thereby creating, for some of them, a competitive disadvantage;

e) conditioning the contracts of partners' acceptance of clauses stipulating supplementary obligations which, by their nature or according to commercial usage, have no connection with the subject of such contracts;

f) participation in a concerted manner, with fake offers in auctions or other forms of competitive tendering;

g) elimination of other competitors in the market, limiting or preventing access to the market and the free exercise of competition by other companies, as well as agreements as not to buy from or sell to certain parties without reasonable justification. "

In the current legislation, the Competition Council may impose a fine of up to 10% of the total turnover of the previous financial year for the most serious violations, punishable as contraventions, of art. 5 para.1 of Law no. 21/1996.

The agreements between two or more competing undertakings[7] resulting distortion of competition are generally called cartels, the main types of cartel being those aimed at pricing and / or market sharing.

Leniency in antitrust enforcement can be defined as granting of immunity or reduction in penalties for antitrust violations in exchange for cooperation with the public authorities mainly in the form of provision of intelligence and evidence of competition infringements[8].

The discovery and dismantling of cartels prevail over sanctioning economic agents participating in a cartel. By their cooperation with the Competition Council they are able to help at the detection and punishment of such behavior.

In this context, in order to encourage the cooperation of the competition authorities with those undertakings that have resorted on practices forbidden by law, the Competition Council established, by Instructions[9], the conditions and the criteria for application of the clemency policy. According to the Order of the Competition Council 300/2009, the individual termination and exposure of participation in a contravention anticompetitive agreement eliminate the liability or reduce the fine imposed by the provisions of Law no. 21/1996. This is the case if the conditions to qualify for clemency are fully met, these conditions being mentioned in the guidelines and criteria for the application of the leniency policy, contained in the Order mentioned above.

The amendments to the competition legislation establish a case of removing liability for anti-competitive acts, by rewarding those operators who are cooperating with authorities to denounce anti-competitive practices and a case for reducing the contraventional penalty, for those which have actually an important role in the disclosure of anti-competitive practices, although not fulfilling the conditions of immunity from fines.

However, the facts referred to are subject to the clemency program only if they have a high degree of seriousness and gravity. This means that it reffers to horizontal agreements or concerted practices cartel-type oriented, through which actions such as those prohibited by art. 5(1) of Law no. 21/1996 are deployed, influencing decisively the market or other vertical agreements and concerted practices, aimed at restricting the territory or customers and giving absolute territorial protection.

The two main elements of the leniency policy are: immunity from fines and reduction of fine. Immunity from fines represents exoneration from the fines provided for violations of art. 51 (1a) of the Competition Law. 21/1996, republished, and is granted for the following situations:

---

[7] A.Fuerea – „Drept comunitar al afacerilor", (Ed. Universul Juridic, Bucharest, 2006), p.. 215

[8] W. Wils, Leniency in Antitrust Enforcement: Theory and Practice, (2007) 30 Competition Law Review 1, p. 4 available at http://ssrn.com/abstract=939399

[9] The Competition Council's Order no. 300/2009 , M.Of. no.. 610/7.09.2009

• the economic agent as a whistle blower, is the first to provide evidence that will allow the initiation of an investigation and will authorize and conduct to unannounced inspections, when the Competition Authority had no such evidence (A-type immunity)

• the economic agent is the first to provide evidence which, according to the Competition Council, will prove a breach of art. 5(1) of the Competition Act no. 21/1996, republished, given that the Competition Authority had failed to gather sufficient evidence to show violation of art. 5(1) of Law no. 21/1996 or art. 81 of the Treaty (B -type immunity).

The immunity of the type A and type B is granted only if the general conditions for granting clemency are met, namely:

• the whistle-blower cooperates effectively and continuously with the Competition Council;

• it provides the Competition Council with all the evidence it has, without destroying or falsifying information;

• it is not disclosing the existence of the application for leniency;

• effectively terminates its involvement in the alleged anticompetitive agreement.

With regard to the second measure - reduction of the fine - may be applied also to those businesses which, although not the first to denounce anticompetitive agreements, provide information and evidence, revealing their participation in the cartel.

However, the information provided must make a significant additional contribution to the evidence already held by the Competition Authority, that is to allow proving the existence of a certain organized anticompetitive cartel, through the evidence provided by the applicant economic agent.

One criticism of the leniency programs, not only at the national but also at European level, is concerning insufficient protection of information provided by applicants. Within the European Competition Network (ECN) and the national networks organized by this model, all network members are informed about the existence of an applications for clemency. It has been contended that the security of these networks is weak, with the possibility of leaking information to those affected.

National leniency program is criticized from the same point of view but more then this it is considered not providing effective protection of the identity of the trader alleging anticompetitive agreements.

The specific legislation is requiring written request for prior immunity and it contains no such provisions to ensure confidentiality of the identity of the applicant for immunity, while the European legislation has added protection of the applicant, imposing just oral forms for prior immunity.

The threat of disclosure of these confessions could have a negative influence on the quality of the whistle-blower's submission or even dissuade him from applying for leniency at all[10]. Therefore, adequate protection against disclosure in private actions must be ensured for corporate statements submitted by all leniency applicants and not only the successful one in order to avoid placing the applicants in a less favourable situation than the non-cooperating co-infringers.

To avoid these risks, the White Paper proposes uniform rules for evidentiary disclosure and special provision of non-disclosure at any point in time of the corporate statements of both successful and unsuccessful leniency applicants.

Another major deficiency[11] can be found in the whistle-blowers' insufficient protection from discovery rules in cases covering multiple jurisdictions. The decentralization of EU competition enforcement can often lead to investigations being simultaneously carried out in several Member

[10] White paper, Section 2.9., p. 10 [Commission White Paper on Damages Actions for Breach of the EC antitrust rules COM (2008) 165.]

[11] A. Kaczorowska – „European Union Law", Routledge-Cavendish , London, UK, 2008, p. 903

States[12]. The frequent involvement of different jurisdictions and thus different legal systems might deter some cartel members from confession, because they would fear not to receive the same treatment under other States' national standards.

Conclusions

The legislative changes are absolutely necessary, as the main instrument of European integration is legal integration through the establishment of community law, based on the principle of the primacy of Community law to the national law[13]. Unlike other international organizations, The European Union is an organization of integration that primarily involves the building of a supranational legal system and the harmonization of national laws with it.

Building a stable legal framework compatible with EU recommendations, in line with the new economic realities, can equate with changing the competitive and create new competitive advantages, such as that resulting from the adoption of the leniency policy in the national competition law.

Promoting leniency policy and severely sanctioning cartels must become an essential objective in the activity of any competition authority, in order to induce positive effects in maintaining a normal competitive environment and to guarantee a proper functioning of the market economy.

Finally, adapting national legislation, especially in the field of administrative responsibility to the requirements of the European Union helps us to define mechanisms to protect the rights and interests of citizens of Member States from the government actions in general, the ultimate purpose aiming of ensuring equity in relationships between citizens and public power.

POLITICAL PHENOMENOLOGY OF LAW

ANTON PARLAGI*

Abstract
The present paper is a presentation of three regulation phenomena that are characteristic of society: the phenomenon of antroponomic regulation, the phenomenon of socioeconomic regulation and the phenomenon of politonomic regulation. The paper is also a clear introduction to the most important concepts used in the field of political phenomenology of law.

***Keywords**: political phenomenology of law, antroponomic regulation, socioeconomic regulation, politonomic regulation, politocracy*

Introduction

The Phenomenon of Antroponomic Regulation

As a political being, man cannot manifest himself outside juridical regulations because human behavior evolves towards the *homo juridicus* status only through normativism. According to phenomenology, antroponomic normativism regulates social behavior through political relationships that act – in a positive way – within a juridically formalized system. Antroponomic effects are produced due to the simultaneous action of sociocracy, namely in relationship with politocracy. Antroponomic regulation phenomenology assumes that human evolution is – in a positive way – a rule for any system of law.

The Phenomenon of Socioeconomic Regulation

Paradoxically, the stronger social regulation is (social regulation being regarded as a political phenomenon), the weaker political power becomes; in other words, the more juridical regulation institutions exist, the less necessary the political regulation power is. From a socioeconomic point of view, normative institutions regulate themselves both as far as their inner structure is concerned and they also regulate each other thanks to the information they exchange in order to formalize social values for sociocratic interests to correspond to politocratic will. Politocracy *in actu* – as a form of exercising public power – depends on a multitude of institutions that communicate norms, principles and values for the political system and that interact permanently. Phenomenology of law reveals the fact that the setting up of certain hybride political and juridical institutions aims to make the two systems (the political and juridical systems) function synchronically to preserve the status quo or, in other words, to maintain public order. Ideonomy can describe the functioning of a society better than any economic mechanisms. As to the systems in which the legal norm is valued the most – see the American system – politocracy recognizes the obligation to subject to the law; on the other hand, where no superior norm is recognized by political authorities – see the French system – control exercised by the constitutionality of laws is not accepted.

The phenomenon of politonomic regulation

The interdependence between law and politics is revealed by the fact that politocracy has the capacity to create and apply juridical norms, transforming political will into a juridical imperative; it is also true that the existence of political institutions is pre-determined by juridical norms. Politocracy creates law thanks to the assumed antroponomic and socionomic values, but, in a rule of law state,

* PhD Associate Professor, *Nicolae Titulescu* University, Bucharest; (email: antonparlagi@yahoo.com).

politocracy must limit itself to the juridical field it created. The fact that politocracy *in actu*, as public power, imposes its will through the application of juridical norms, if necessary by means of its coercitive force, can lead to the conclusion that law is a politocratic instrument.

1) The Phenomenon of Antroponomic Regulation

As a political being, man cannot manifest himself outside juridical regulations because human behavior evolves towards the *homo juridicus* status only through normativism. According to phenomenology, antroponomic normativism regulates social behavior through political relationships that act – in a positive way – within a juridically formalized system. Antroponomic effects are produced due to the simultaneous action of sociocracy, namely in relationship with politocracy. Antroponomic regulation phenomenology assumes that human evolution is – in a positive way – a rule for any system of law.

One could not talk about antroponomic regulation outside the identity of meaning that exists between socionomic norms, principles and values and politonomic principles and values. This ideonomic identity is revealed by the fact that no individual can simultaneously comply with contrary regulations, i.e. the *homo juridicus* status cannot be in contradiction with the *zoon politikon* status within the same system. Political phenomenology of law argues that any fact is empirically perceived in different ways, according to the field in which it occurs, although ideonomically the fact has the same meaning. E. g., for defining the antroponomic regulation of human behavior we use the notion of *permissiveness*, for defining the socionomic regulation – the notion of *lawfulness*, and for defining the politonomic regulation of human behavior – the notion of *legitimacy*. Consequently, political-juridical identity is possible only if there is ideonomic compatibility between sociocratic and politocratic institutions. The fact that man has a *homo juridicus* status if and only if he is a *zoon politikon* could be regarded as an axiom.

Every sociocratic type has its own system of ideonomic filtration by which only those norms which are highly efficient in regulating society are selected; in a contrary case, the satisfaction of social needs generates other needs, thus, as a consequence, the significance and content of antroponomic regulation is modified almost in parallel with socioratic institutions. Ideonomically, antroponomic conformity states that a regulation can be normative only if there is such a regulation of normativity. Political phenomenology of law states that regulation normativity depends on a series of conditions, such as: the clarity of the law terms and concepts, as well as the clarity of the implementation techniques and/or policies.

Phenomenologically, no regulation can have an antroponomic effect unless the individual understands the politonomic significance of the regulation. In other words, the political regulation of human behavior assumes that regulation is characterized by humanity as long as human nature is characterized by *universality*. From this perspective, regulating social behavior means actualizing the human being's general potentiality to manifest as *homo juridicus*, beyond morality, society or history. The effects of antroponomic regulation have as a premise the idea that natural rights are political rights within politonomics, as Leo Strauss noticed: *political life, in all its forms, unavoidably implies the problem of natural right.*

Phenomenology reflects the interdependence that exists, in time and space, between antroponomy - as the being of *homo juridicus* in itself and socionomy - as the being of *homo socialis*; in other words it is a transposition of human nature in sociality and, vice versa, it is a socialization of human nature. Socionomically, socialization is an expression of normativism that transcends sociality and manifests itself as biunivocal correlation between politocracy and sociocracy. On the one hand, politocracy acts through the judicial effect of legislative, administrative or jurisdictional acts which express the will of politocratic authorities: parliament, government, public authorities. On the other hand, sociocracy acts through the force of those social institutions which reflect the will of sociocratic entities: corporations, trade unions, employers' associations, pressure groups etc.

Ideonomically, law defines the sphere of juridical institutions that are conceived by abstract thought in such a way that they correspond to the political-social reality.

Political phenomenology of law states that, in principle, political regulation has antroponomic effects due to the simultaneous action exercised by the juridical and political systems within a finite spatial and temporal universe. Analysing this principle, antroponomic regulation takes as a starting point the individual's subjective manifestations to come to the awareness of normativity which is understood as an expression of *politicity*. After being set up, the behavior types (matrices) become stable, extra-individual units, with a serious coercitive power over beahavior. Antroponomically, people lose a part of their personality through political integration because they assimilate a certain behavior type (matrix) which is different from their initial individuality.

The effects of political and juridical regulation imply the simultaneous action of the political and law systems through their elaboration, transmission and assimilation of normative information. The phenomenology of law reveals the fact that, differently from other systems in which information is sent in a *non-formalized* way, the juridical system accomplishes a formalization of legal norms, principles and values in accordance with ideocracy (the ideatic system promoted by public power), which makes normativism become a certain type of politonomic communication. Antroponomic regulation is not accomplished unless the transmission (communication) of the norm is not followed by its application. In other words, any time a public authority applies a law in an individual case, it does not simply materialize a text, but it imposes a political will. Normativism – as a regulation means – signifies the power to apply a rule now and here.

Political phenomenology of law points out the fact that social and political regulations have effect upon *homo juridicus* through the normativity of the law systems. A first particularity rests on the fact that ideonomy is a *sine qua non* condition for regulating human behavior. In other words, the (in) formed individual is ideonomically an ally to politocracy, apart from the uninformed individual (the politonomically isolated individual) who socially is neutral or even hostile to power. It is obvious that *homo non-juridicus*, who does not know and does not understand normativity as a condition for his social existence, will not accept his political condition either. This socionomic lawfulness determines politocracy to intervene by regulating the antroponomic formation and information. In order to ensure the individual's right to information, politocracy *juridically* organizes institutions that grant access to public information and that have a political purpose. This type of hybride (political and juridical) institutions most eloquently express the fact that communicating "public information" is always accomplished in accordance with politocratic will and its content is strictly determined. Ideonomy is the phenomenologic expression of political ideas which have a normative significance by which politocracy accomplishes antroponomic regulation and it implements political information. From the point of view of antroponomic regulation, for example, the phrase *public information* has a politonomic meaning because it refers both to those normative acts that regulate the organization and functioning of *political* institutions and to the audience program for the citizens, the ministers' or other political leaders names. Moreover, the granting of the right to information has a political significance also as a consequence of the fact that state institutions are obliged to ensure the ways of attack in case this right is aggrieved.

For political phenomenology the regulation of social institutions has antroponomic regulation effects depending on the extent to which politocracy ensures the identity (not the equality) of treatment for individuals through a certain type of juridical normativism. Apart from other types of social regulation, juridical regulation is ideonomically accomplished through the setting up (conceiving) of a certain antroponomic model. Juridical regulation aims at creating a certain socionomic model, i.e. a model with a certain politonomic value that is established by the lawmaker without a direct correspondence to the place and time in which that regulation will be applied – this being an expression of positive law. Any time the antroponomic model is not juridically defined, it is politically conceived. From the perspective of antroponomic regulation,

the accomplishment of the social scope is more important to the lawmaker than the law itself – politonomically this is a *ratio legis*.

Political phenomenology of law proves that any politocratic regulation led to a sociocratic change which generated an antroponomic effect, so that we may state that law is in fact a politonomic institution. Politocracy could not regulate any law system unless antroponomy would define the individual as a political being; one might say that the individual's rights, from a juridical point of view, are derived – politically speaking – from his/her freedom.

Antroponomic effects of political regulation depend on normative order, which is the order that ranks the other social values and which has a politonomic character thanks to its social modeling capacity. In other words, antroponomic regulation through juridical norms is a political phenomenon on condition that social norms formalized by politocracy ensure (self) regulation of human behavior.

Antroponomic regulation is a *sine qua non* condition for the existence of politocracy to the extent to which the individual can be ideonomically integrated as a particular consciousness within a common political consciousness. In this respect, one may say that political and juridical regulation functions as an interface for sociocracy and politocracy. A first remark can be made with reference to the fact that normative systems generated by sociocracy are ideonomically processed by politocracy and become political and juridical institutions. One can notice that any type of ideonomy is a consequence of creating, imagining and rationalizing normativity by a political power. The fact that law is a juridical "fiction" does not mean that it is meaningless, but, on the contrary, that it has a political meaning since this "fiction" produces antroponomic effects.

For politocracy the most important criterion for assessing validity of law has an antroponomic character because it appreciates political value of juridical norms either as an expression of consensus between people, or as an institutionalization of everyone's will, as an expression of collective will. Nobody can empirically establish the extent to which collective will has a "social", respectively "political" character in the process of juridical regulation. Socionomy – as a reflection of normativity in collective consciousness – is the result of the simultaneous action of both sociocractic and politocratic systems. One can define ontonomy – the *creation and existence* of law – as an attempt to solve the problem regarding the existence or inexistence of a collective consciousness; at the same time one can define antroponomy as the *creation and existence* of *homo juridicus*. Juridical idealism rejects the socionomic character of law arguing that collective consciousness does not exist; juridical positivism, on the contrary, denies the antroponomic character of law, arguing that juridical systems express only the will of the state.

2) The Phenomenon of Socioeconomic Regulation

Paradoxically, the stronger social regulation is (social regulation being regarded as a political phenomenon), the weaker political power becomes; in other words, the more juridical regulation institutions exist, the less necessary the political regulation power is. From a socioeconomic point of view, normative institutions regulate themselves both as far as their inner structure is concerned and they also regulate each other thanks to the information they exchange in order to formalize social values for sociocratic interests to correspond to politocratic will. Politocracy *in actu* – as a form of exercising public power – depends on a multitude of institutions that communicate norms, principles and values for the political system and that interact permanently. Phenomenology of law reveals the fact that the setting up of certain hybride political and juridical institutions aims to make the two systems (the political and juridical systems) function synchronically to preserve the status quo or, in other words, to maintain public order. Ideonomy can describe the functioning of a society better than any economic mechanisms. As to the systems in which the legal norm is valued the most – see the American system – politocracy recognizes the obligation to subject to the law; on the other hand,

where no superior norm is recognized by political authorities – see the French system – control exercised by the constitutionality of laws is not accepted.

As long as the positive law (as a system of applicable juridical norms) is regarded as the expression of politocratic will, the problem of law validity is settled by ideonomy. From a teleological point of view, law should have as an aim (goal) *the common welfare* or the *general interest* –understood from an ideocratic perspective. Adopting J. Bentham's theory on utilitarianism, any political will, including the one referring to law, must be practically dealt with, that is to say by searching the appropriate instruments for achieving social *good*.

The juridical system produces more important socioeconomic effects for politocracy than any other economic, social or cultural systems do because law ensures the functionality of all the other systems and, consequently, the functionality of the whole political system; this determines us to state that the juridical system represents the basis for politonomy. Phenomenology reveals the fact that, although one can find a whole range of juridical systems in time and space, these have a common feature, namely their capacity to regulate the political system. The regulation of social institutions in conformity with the law principles has *isonomic* effects, by the normative institutions that ensure the individual's freedom and political equality; *socionomic* effects, by the institutions that ensure right to autonomy as a form of human communities freedom and equality; *politonomic* effects, by the institutions that guarantee the individuals' right to political association – as a form of free political association. For political phenomenology of law, the effect of the interaction between political and juridical institutions – that is the effect of *the status quo* – is the one that matters. Any political system can extend itself through the normativity function or, in other words, through the (self) regulation of its organization and functioning.

Political phenomenology also describes the intervention of politocracy in regulating social dysfunctions because a social deregulation manifests itself as entropy at political level. Social deregulation generates a series of negative phenomena at all the system levels; at communities level (family, school, culture, religion etc.) isonomy degrades itself and isoarchy appears as an informational and normative lack of order; at the level of human collectivities, dysfunctions lead to the appearance of socio-archy (understood as normative-informational disorder) and it can reach such a high threshold that it can lead to politocracy (political system disorder); at state level, institutional dysfunctions generate unwished forms of polyarchy (see the dictatorial, totalitarian etc. type). Socionomic regulation brings into evidence the correlation existing between sociocracy and politocracy, which is an evolution of interacting juridical systems, and the evolution of political institutions; however, this regulation does not make reference to social and historical modifications.

Political phenomenology of law considers that lack of social self regulation is equivalent with socionomic disorder in that politocratic institutions – which are incomplete, disorganized or contrary to the lawful order – generate socio-archy. In all the cases in which social disorganization could not be normatized, politocracy evolved towards anarchy or dictatorship, especially because of the fact that political and juridical systems did not adapt to the evolution. In case of socionomic dysfunctions, the conflict between the governed and those who govern is more acute; this points out the disorganization of the political system as the entropy model reveals. The openness of the juridical system towards socionomic values leads to a decrease in politonomic entropy by the increase of the information volume and its quality (reduction of juridical ambiguities or unpredictable norms).

Political phenomenology of law allows us to compare open (democratic) systems to the closed ones (the dictatorial systems); this comparison reveals the fact that socionomic regulation is politically more efficient in democratic systems because politocracy promotes social values; on the contrary, in a dictatorial system, socionomic effects are limited because of the lack of correspondence existing between antroponomic and politonomic values.

Taking Habermas' theory as a starting point, one can state that political phenomenology of law is, in fact, a synthesis based on the assumption that the nationalized domains of society interact with state socialized sectors. Socionomy reflects the fact that phenomenology made it possible for

classic private law to appear, as a "socialization" of private law, in correlation with "privatization" of public law. In the first case, one can find the example of restraining property rights by transforming location contracts to quasi public contracts for location surfaces. In the second case, one can find the example of the way in which the state gives up public law prerogatives in favour of private law, by transferring tasks from administration to private economic agents.

From a phenomenological point of view, any social structure in which entropy has an increased level may be regulated by a juridical system in which entropy has a low level and vice versa. This regulation type exists at sociocratic level and it is created by the action of social groups (trade unions, employers' associations, lobby societies) which influence governing and which constitute a power reservoir for politocracy. On the other hand, political institutions (Parliament, Government, parties etc.), which are a power reservoir for social structures, function at politocratic level. Through these connections, the entropy of juridical and political systems will be proportionally reduced as information flow increases and it will be reflected in political phenomenology by regulation at structural level.

The bigger the disorder in juridical or political systems is the more necessary synchronization of structural changes is. In certain conditions, socio-archy uses different *self-organization* types for setting up a certain sociocracy that should replace the inexistence of a legitimate politocracy. One of the solutions for reducing social disorganization consists in regulating ideonomy through modern knowledge instruments, forms and the regulation possibilities offered by IT. In other words, the better politocracy knows the institutions with sociocratic potential and it transfers them on ideonomic level, the more efficient it becomes.

One of the conditions for regulating socionomy is represented by information technology, because politocracy, which is based on information, has more chances to reach its political goals. The more efficiently socionomic information is assimilated, the more legitimate the institutionalization of power is, because, ideonomically, political decision reflects social information and socionomically, a governing becomes a power strategy. Political phenomenology of law pointed out the fact that in time trust (rating) decreases in comparison with politocracy, as an effect of power inefficiency (government), self regulation, and also as an effect of not accomplishing what was promised to be accomplished or of giving up public interest for the personal one etc. Thus, institutional socionomic regulation is a chance to maintain trust (often in an artificial way) in political power.

Structural regulation opens way for the "rationalization" of public services and organizations through which differences between the sociocratic functioning of the state and the politocratic functioning system are regulated. Rationalization of social structures seriously depends upon the normative capacity of political self organization, because it allows new institutions to be continuously created and to contribute to adapting politocracy to the new requirements (interests) of society. In this context, as one of the key state components, politocracy acquires functions that are different from the classical ones, exactly because of the obligation to reduce social disorder.

Political regulation acts in a different way in comparison with socionomic entropy – in the same way in which social order acts differently from politonomic entropy. Politonomic regulation is obviously a consequence of the interaction between the juridical and political systems. Within each of these systems other subsystems act so that divergent, neutral and convergent relationships are created within and between the two systems. Phenomenologically, the regulation of relationships between these systems – by means of political and juridical institutions – reduces the differences existing between sociocracy and politocracy. In this sense, politonomy is a reflection of juridical regulation and normativity because it explains the way political power mechanisms function. Normativism can be approached ideonomically, socionomically (as legitimacy) or politonomically (as a governing type) – through the institution named *legitimate violence* by Max Weber.

Juridical systems, as well as political systems, do not evolve in a linear manner; they undergo stages of stability and transition, in which disorder makes the system reorganize in a new structure. Moreover, the recognition of one politocracy by another politocracy depends upon the politonomic

compatibility between themselves, upon the concordance of their principles and socionomic values that are institutionalized by each of them. As to non democratic politocracies, there appears a non synchronization between the evolution of social institutions and the outer environment, which is settled in a relatively simple manner thanks to the fact that the system is quite stable since it is dominated by a unique ideology and a unique order parameter. Politocratic systems need to be regulated in a democratic/authoritarian/anarchic way only when the system faces up a stage crisis. In democratic states the prediction of juridical and political systems regulation is significant from a politocratic point of view (as to parliamentary, presidential and local elections) and also from a sociocratic point of view (as to the way local communities are organized). Political phenomenology demonstrates that transition determines the setting up of institutions whose normative action is different ideonomically, socionomically and politonomically.

The diminishing of state authority as well as of its institutions depends on the inefficiency of government and the implemented public policies. Politocratic normative authority decreases along with sociocratic efficacy. On the one hand, state authorities reduce their capacity to adopt decisions autonomously under the pressure of interest groups and/or the more and more organized public opinion; under these conditions socionomic regulation, (harmonization) between juridical and political systems is no longer possible because politocracy tries to impose norms that are different from the ones of sociocracy. On the other hand, sociocratic structures start to function autonomously from politocratic institutions; administrative technocratism, globalization and transnationalism, as well as techno-scientific systems (bionics, office machines and equipment, Intenet etc.) restrain the capacity of traditionally regulating institutions to adopt decisions.

Socionomic regulation has not always generated positive politonomic effects, that is to say it has not always led to the appearance of superior social organization and ruling systems. The contesting of politocracy and even institutionalized forms that oppose politocracy do not always produce a contrary reaction and, even when facing opposition, politocracy did not disappear. Most often, the act of contesting and opposing politocracy is expressed only antroponomically, as a way of breaking normativity by the revolted individual, or socionomically, as an expression of defense and common resistance against confinement. Thus, social fight against politocracy does not represent a form of regulation for the political system. Political phenomenology proves that opposition, revolt or revolution are not meant to modify ideonomy, in the sense that they do not come up with new legal principles, nor do they rely on axionomy, that is to say they do not impose other values to the juridical system.

3) The phenomenon of politonomic regulation

The interdependence between law and politics is revealed by the fact that politocracy has the capacity to create and apply juridical norms, transforming political will into a juridical imperative; it is also true that the existence of political institutions is pre-determined by juridical norms. Politocracy creates law thanks to the assumed antroponomic and socionomic values, but, in a rule of law state, politocracy must limit itself to the juridical field it created. The fact that politocracy *in actu*, as public power, imposes its will through the application of juridical norms, if necessary by means of its coercitive force, can lead to the conclusion that law is a politocratic instrument.

Within the state, antroponomic regulation and socionomic regulation are accomplished differently, depending on the way politocracies are organized, as democracies or autocracies, as parliamentary, presidential, semi-presidential regimes etc. Basically, polinomics keeps democratic systems working because it allows sociocracy and politocracy to normatively regulate each other in a transparent and continuous way and also in real time. Politocracies that are open towards the inner and the outer have the capacity to adapt more easily to social changes, they can organize themselves more quickly and can be adequately controlled by civil society. That is why political control of social institutions has been the politonomic regulation instrument of society that has been present in all

political systems in the course of time. Politonomically, we are interested in the fact that, no matter the nature of control, politocratic intervention in the sphere of law has, among other effects, the effect of regulating not only social institutions, but also its own institutions.

Political phenomenology of law takes into consideration the fact that politonomic regulation is possible as a ***mediation*** procedure for the disputes that appear between the governants and the governed ones. As soon as the mediator institution appeared – as a conciliation institution between citizens and authorities – it spread incredibly quickly thanks to its socionomic regulation effects. The (inter) mediation procedure, as a social mechanism, has a politonomic content as long as the mediator regulates the relationships between citizens and the state. From a politonomic perspective, the moderator's activity has a political character and it generates social effects even if it is juridically limited to making *recommendations*. In this respect, one should mention the fact that the mediator can make publicly available the annual activity report that it presents to the Parliament and this, obviously, generates socionomic effects.

The problem of mediation, as a form of regulating society, transcends the philosophy of law to the extent to which political decisions precede juridical regulation. At a political level, normative acts on social regulation are always the result of an (inter)mediation or negotiation process which leads to an agreement that is expressed either as an identity or as a compromise. For this type of idiocracy to become nomocracy it is necessary to politonomically formalize certain norms, principles and values as: laws, decrees, decisions etc.

Arbitration is a method used for settling socionomic or politonomic disputes outside the juridical system. As a form of politonomic regulation, it involves two conditions: the existence of two conflicting parties that agree for a third one (that is invested with authority by the other two parties) to mediate the conflict incurred between them; secondly, the settling of the dispute should be accomplished without applying preexistent juridical norms, the arbiter being free to decide how to settle the conflict.

From a socionomical point of view, arbitration has the advantage of reducing tension accumulated between the conflictual parties and it conciliates disputes more quickly than a court of justice does, because the latter has to observe specific procedures. From an antroponomic point of view, a person feels less humiliated if it resorts to arbitration instead of going to a court of justice and this is a plus for the humanism of the judgement act. Finally, for politonomy it is relevant the fact that a *court of arbitration* is constituted of arbiters, chosen by each of the parties, and a neutral president that is also chosen by the two parties on condition that the president's opinion is defining for for settling the dispute.

The enactment of laws is also the result of a permanent arbitration process existing between the political objectives that are expressed by politocracy and the social reality generated by sociocracy; the enactment of laws is also the result of mixing *politics* and social *policies*, and of the interaction between politics and its beneficiaries. Different ideonomic trends do not successively integrate, but in a simultaneous way, through the action of economic, industrial and commercial vectors which concur for ensuring convergence of options. From a politonomical perspective, the enactment of laws is the result of the interference between sectorial interests and consequently it implies a power stake. Expressing and selecting a legislative option is, from an ideonomic perspective, a confrontation of interests, a solution for settling conflicts, a negotiation or a sociocratic compromise.

From an axionomic perspective, political regulation of society is important because the rule of law state is an instrument for promoting and ensuring social security or, as J. Chevallier pointed out, it is an institution which can limit state's supremacy due to rediscovering law as a means for social regulation. After World War II politonomy included social regulation within the sphere of law because law could be regarded as an ideonomic solution to antitotalitarianism. In the former communist states, politocracy accepted juridical institutions that are specific for the rule of law state

both in theory and in practice. Moreover, the regulation force of law was overrated with the result that far-fetched theories were created as to *the law without state* or *the law against the state*.

Politonomic regulation reveals the fact that beyond the harmonization of politocratic functions and sociocratic necessities, the exercise of social power implies the setting up of new structures, institutions, services and organizations that are capable of "producing" public goods, security and social protection, welfare etc., depending on the level and structure of the social need.

The power of sociocracy over politocracy (particularly over social regulation institutions) is reflected in the way in which public resources are distributed (especially in the private economic sector). The latest and, to be frank, the most efficient politonomic regulation method in society is represented by the way in which welfare is (re) distributed. Politocracy adopts various ideonomic positions: either it makes a distinction between the so-called strategic problems and the other existing problems in order to avoid discussing them in the public, or it presents them separately in order to avoid comparing them simultaneously.

When we deal with politocratic institutions, we must take into consideration the fact that politonomic regulation works on the basis of institutions hierarchy. Institutional hierarchy seems to be the expression of political democracy if we accept the idea that political institutions reflect the citizens' will and are subject to this will. In all democratic systems, parliament, as the most important political institution, sets forth the organization and functioning of the other institutions in order to eliminate arbitrary action and to establish the lawful order. Institutional hierarchy reflects the politocratic will to impose supremacy in society on the basis of political norms, principles and values, which must be institutionalized; the most eloquent proof of power institutionalization is juridical institution hierarchy.

Institutional hierarchy is the expression of politocratic will to set a certain juridical norm in accordance with social phenomena it has to regulate. The juridical force of normative acts provides what institutions are politically empowered to adopt those juridical acts. One can state that over hierarchized juridical institutions lead to subordination within political institutions. In reality, the pyramid of normativity is no longer efficient unless it is doubled by politocracy; a person (institution) that has the power to issue a juridical act will not do this because it "likes" to observe superior juridical acts, nor because it respects the ideonomic content of superior acts, but because it is afraid of political consequences. The institution which passes a juridical act is bound to observe the existing juridical hierarchy for fear of political constrains: the fear of losing the present office or position in the party (thanks to which it obtained the present power).

In order to increase social regulation, politocracy multiplies social institutions so that the political system gradually becomes a special form of *corporatism*. Ministers and political party members organize their cabinets, which are made up of members belonging to the same party, in order to promote the interests of the group they belong to; presidents of local public administration authorities and public administration couselors become the voice of the group's interests; persons appointed to public offices on political criteria will promote their individual interests.

Conclusions

Political phenomenology of law defines social regulation as the juridical regulation of the political power. Ideonomically, this thesis contains a logical contradiction: political power can be limited by the policy of power. In socionomic terms, the problem of socially limiting political power has not been settled ever since the French Revolution because fight against power (which confines democracy) implies the further exercise of power (for maintaining democracy). Of course, the "lawfulness" of power institutions is the first condition for politocracy not only from a chronological or sociological, but also from a politological point of view.

The adaptation of juridical institutions to politocratic structure modification (the new political elite, new leaders, new ideologies and political parties) and vice versa. This synergic characteristic of

politocracy - as an effect of social dynamic, which creates new sociocratic structures - makes it possible for the juridical system to evolve in a relatively synchronic way with the political system. The existence of political catalyzers influences politonomic regulation of juridical, political and social systems because they ideonomically define the directions followed by politocracy when a change appears or/and the new typology of power. The capacity to ideonomically integrate these catalyzers makes it possible for ideocractic strategy to be implemented. In fact, it is impossible to politonomically define a society without pointing out its catalyzers that act in order to modify juridical and political systems. Naturally, the most powerful catalyzers are the sociocratic ones because they promote power institutions – democratic or autocratic ones – as governing solutions, although one must not ignore catalyzers who promote totalitarian, theocratic, military institutions etc.

Synchronization of the political system evolution with the juridical system in the context of politonomic regulation may be approached as a governing form if it ensures reproduction of politocracy through normative institutions; although political systems are cyclically affected by social crises, still they survive thanks to their capacity to self regulate.

THE INTERFERENCE OF EUROPEAN UNION LAW WITH PUBLIC INTERNATIONAL LAW

ROXANA-MARIANA POPESCU[*]

Abstract
The European Union Law is an unique legal phenomenon developed in the process of European integration within the framework of the European Communities and the European Union; a result of the implementation of the supranational authority of the European institutions. The European Union law is a specific legal system having independent sources and principles that developed at the border-line of international law and domestic law of the EU's Member States. The authonomy of the European Union law is affirmed by a case-law of the Court of Justice of the European Union.
The European Union has its own legal order which is separate from international law and forms an integral part of the legal systems of the Member States. The legal order of the Union is founded on various different sources of law. The different nature of these sources has imposed a hierarchy among them. At the pinnacle of this hierarchy we find primary law, represented by the Treaties and general legal principles, followed by international treaties concluded by the Union and secondary law founded on the Treaties.

Keywords: *EU law, international law, domestic law, sources of law, international treaties.*

Introduction

In this paper, we intend to present and argue the fact that between European Union law which, currently, represents a system of law analyzed distinctly from international law, and public international law, is a close relationship, but not only in terms of respecting the international legal order by the first.

We believe that creating a unified legal system, as the one of the European Union, is no innovation at international level, as long as at the basis of what today forms *the European Union law*, we find several international treaties concluded under the existing rules of international law. In this respect, we consider, first, the three treaties establishing the European Communities, and which, from the viewpoint of international law, have at least three fundamental characteristics, namely: first, they express the legal bond between member states of the Communities, secondly, they represent an organized set of legal rules, and thirdly, documents drawn up under these treaties, by bodies with responsibilities in this regard, produce legal effects in States Parties.

Paper Content

1. The constituent treaties are authentic international treaties

Concluding international treaties requires a set of procedures that must be fulfilled in order for a treaty to be created, to become binding on parties and to enter into force. According to Nguyen Quoc Dinh[1], the conclusion of an international treaty "is a process involving multiple issues", such as:

- adopting the text of the treaty and certifying it;
- the state consent to be bound by the treaty ;

[*] Lecturer Ph.D. candidate, Legislativ Council, (e-mail: rmpopescu@yahoo.com).

[1] Nguyen Quoc Dinh, Patrick Daillier, Alain Pellet, *„Droit international public"*, 7th Edition, (L.G.D.J, 2002), p. 125.

- the international notification of the consent;
- the treaty entry into force, according to its terms, on states that have expressed their consent.

The international notification of the state consent to become party in a treaty and the entry into force of the treaty are subject exclusively to international law, while expressing the state consent to be bound by that treaty is governed solely by the law of that State. Given this, it is undisputed that treaties constituting the European Communities and the European Union have been concluded by sovereign states, which have willingly expressed their approval. Thus, states became *"contracting parties"*[2] to three multilateral treaties, before becoming *"Member states"* of some organizations whose primary purpose was the economic integration.

Although Community treaties have entered into force over 60 years ago (one of these treaties even ceased to have legal effect because the period for which it had been concluded, has ended), that purpose has not been yet achieved, the process of economic integration continuing even today; this is why, we believe that member states, despite the fact that "they have limited, only in some areas, their sovereign rights and have created a system of law applicable to nationals and states themselves"[3], they are still contracting parties, keeping, naturally, their sovereignty. This aspect was stressed whenever the issue of concluding new EU treaties, in order to amend the constituent treaties, by negotiating reciprocal rights and obligations, arose.

The constituent treaties contain both obligations, but also rights for States Parties. At a closer examination of these international legal instruments, we see that they contain general obligations, but also some special obligations.

1.1. The rights of States Parties

The constituent treaties confer certain rights to states, as contracting parties, which are, in fact essential for the functioning of the Union. Thus, we find: the participation of states to the establishment of common institutions and entities, the right of action before the Court of Justice of the European Union in order to ensure compliance with treaties, immunity from execution, the right to decide on the accession of new member states, the right of revising treaties.

A. Under the constituent Treaties, States Parties have the right to take part, according to certain criteria, in establishing the main institutions of the European Communities[4] and subsequently of the European Union. In this respect, each state has one representative at ministerial level in decision-making institutions. Member states governments appoint Commission members - the true executive of the European Union. As for the Court of Justice, its members are appointed by the common agreement of member states governments.

B. States Parties to the constituent treaties have the right to bring before the Luxembourg Court of Justice, a claim against any contracting party; this claim aims at ensuring compliance with Community law and, more recently, with European Union law.

C. Another right granted to States Parties to the constituent Treaties is the immunity from execution, as resulting from the fact that these Treaties contain no provisions concerning the enforcement of states in case they do not fulfil their obligations[5]. In this situation, we believe that the

[2] Under the Preambles of the three constituent treaties.

[3] Court Order of July 15th, 1964, *Costa v./ ENEL*, C-6/64.

[4] According TCECA: the Special Council of Ministers, the High Authority, the Common Assembly, the Court of Justice. Each one of Treaties establishing EEC and Euratom sets the following institutions: the Council, the Commission, the Assembly, the Court of Justice.

[5] The situation was, however, different in the case of the Treaty of Paris which initially provided in art. 88, paragraph (3), two penalties for the state failing to enforce its obligations, namely: the suspension of payment by CECA to the state in cause and the authorization given by the High Authority of member states to take, notwithstanding the common market principles, measures of defense or retaliation on the state concerned (see http://eur-lex.europa.eu/fr/treaties/dat/11951K/tif/TRAITES_1951_CECA_1_FR_0001.pdf).

immunity from execution applies on grounds of states sovereignty. It is clear that if the EU Court of Justice gives an order against a state that did not fulfil its obligation, this judgement is, in fact only a matter of principle, because it is not likely to be enforceable. This situation was considered in the specialized literature as "essential for understanding the Community institutional system. Unlike what happens in a federal state in which the federal power has the means to reduce a possible resistance of the federal state against the federal order, in the Community, there is no community enforcement"[6]. Within the European Union, member states keep their sovereignty; nevertheless, if they voluntarily refuse to execute their obligations, then the non enforcement exception applies *("non adimpleti contractus").* By invoking this exception, a suspension of the Union's own obligations towards that member state is obtained until the moment it will fulfil its incumbent obligations.

However, there is still a way to penalize the member state which is guilty of failure of obligations. Thus, if by not fulfilling the obligations, that state breaches individual rights and interests, persons aggrieved may appeal to national jurisdictions and obtain, under certain circumstances, compensation for the damage caused, like, for example, the conviction of the state to refund illegally collected taxes.

D. EU accession of a state entails, among other things, the agreement of all other member states. In other words, any EU member state is entitled to express its consent or, conversely, to make use of its right of veto on the accession of new member states.

E. The constituent treaties contain a clause under which any revision can be made only with the unanimous agreement of all member states. The review is achieved through a diplomatic treaty subject to ratification. Thus, no commitment can be altered without formal consent.

1.2. The obligations of member states

Naturally, States Parties to the constituent treaties acquire, next to rights, also a series of obligations, which we shall classify into general and special.

General obligations. Although not numerous, they are fundamental and specific to international law.

A. A first general obligation is loyalty to the Union. Constituent treaties contain a clause of loyalty to the Union, under which States Parties should implement the treaties in good faith and take action to ensure the achievement of objectives. This clause is nothing more than a way of expressing the principle of international law, *pacta sunt servanda*[7]. The idea, from which the obligation to fulfil and act in good faith results, is found in art. 5[8] of the Treaty establishing the EEC[9], under which member states shall take all appropriate measures, either general or particular to comply with obligations under this Treaty or under acts of Community institutions. At the same time, it facilitates its mission. Under the same article, member states must refrain from any action likely to endanger the achievement of objectives of this Treaty.

Moreover, the Court of Justice, even from its early decisions, has resorted, in its motivations, to this general obligation of cooperation and loyalty to member states, either by citing articles that consecrate it, or by referring, in a more general form, to the obligation of solidarity between member

[6] Pierre Pescatore, *„L'ordre juridique des Communautés Européennes. Etude des sources du droit communautaire", (*Presses Universitaires de Liège, A.S.B.L., 1975), p. 54.

[7] For modifying treaties, the Vienna Convention of 1969 on the Law of treaties is also relevant; in art. 26, it provides that: "Every treaty in force is binding upon parties and must be executed by them in good faith".

[8] The current art. 4 TEU.

[9] Similar clauses are found in art. 192 of the Euratom Treaty, but also the Treaty of Paris contained such clauses in art. 86, para. (1) and (2).

states. In this respect, we find several court orders, of which we mention the first data of the Court, in this field:

- the 1969[10] court order of the ECJ mentions that "solidarity is the basis of the whole Community system, according to the agreement provided in art. 5 of the Treaty";

- the *Scheer* court order[11] of 1970, in which the Court orders the following: at the beginning of the implementation process of the common agricultural policy, during which the Commission could not fully assume its role, member states were entitled and were bound to take measures of the national legislation in order to facilitate the proper implementation of EU law;

- the court orders of 1971: *Commission v. / France*[12] and *Commission v. / Italy*[13]. In the first court order, the Luxembourg Court speaks of a general obligation of cooperation provided in art. 192 of the EAEC Treaty, under which parties must use the means offered by the Treaty to resolve any legal uncertainty that states are required to overcome in order to cover the fact of not fulfilling their obligations;

- the court order of July 13, 1972[14], in which the Court states that the Community law effect, considered as having force of judgement by the Republic of Italy, involves the competent national authorities' refraining from applying a national prescription recognized as incompatible with the Treaty and the obligation to take all necessary measures to facilitate the effect of Community law.

B. Another general obligation has as object the coordination of national policy in order to ensure the common interest, established initially in art. 6 of the EEC Treaty. According to the Treaty, member states commit to coordinate their economic policies in order to achieve objectives of the Treaty. Unlike the principle of good faith that exists in all three constituent treaties, this obligation is not provided, in similar terms, in ECSC and Euratom Treaties. However, in the last two treaties, we find a general clause which gives to the Council of Ministers, the task of coordinating national policies with the Communities action[15].

C. The financial contribution is another obligation of States Parties to the constituent Treaties. This obligation is found in the Treaties of Rome, but it is absent in the Treaty of Paris. This absence is not a shortcoming, but has a reasonable explanation in the sense that this Community had its own resources in the form of samples of the coal and steel production[16]. The obligation of financial contribution no longer exists today because, since 1970, national contributions of member states have been gradually replaced by own resources[17].

D. The obligation of responsibility for Communities / Union actions towards third states. Although this general obligation is not covered by any of the three treaties, we believe that it should, however be taken into consideration, because it results from the general rules of international law.

Special obligations. By joining the constituent Treaties, member states have undertaken a number of obligations resulting from the economic character and main objective of the European Communities, which is the creation of a Common Market. It is about taking action, about obligations characteristic, in particular for the transition period, in other words, about the States Parties' commitment. We mention that this is not about rules directly applicable to member states subjects. Given the large number of these special obligations, we will only do a listing of those that we

consider as being illustrative for the achievement of the major Communities objective, namely the economic integration. Thus, we find:

- the obligation to gradually eliminate, national customs rates and replace them with a common customs rate;
- the obligation to abolish quantitative restrictions within the Common Market;
- the obligation to establish the free movement of workers;
- the obligation to establish the freedom of residence and to provide services;
- the obligation to liberalize the financial services;
- the obligation to renounce at the state aid;
- the obligation to eliminate tax differences, etc.

2. Institutional systems under the constituent Treaties

As known, under international law, one of the constituent elements of international intergovernmental organizations is the existence of an institutional system. The constituent Treaties of the European Communities, and subsequently the European Union are not limited only to achieve mutual legal relations between the contracting parties, but they also create one institutional system, for each organization that they found. In other words, constituent treaties provide the establishment of an "organized social ensemble towards a common goal, which is totally different from the result of national interests in attendance. This ensemble is provided with entities, invested, to a certain extent, with autonomy and capable to work towards achieving a common interest"[18].

A significant part of the constituent treaties content is reserved to the European Union institutions.

3. The Revision of instituting Treaties

Under international law, international treaties in force may be changed under the conditions when reasons for which they have been completed or conditions of application require the transformation of some provisions in order to be adapted to the new requirements. Treaties usually, contain express clauses on modification procedures, through amendments that are being adopted by unanimity or by qualified majority of two thirds or by simple majority. In general, amendment is the generic term which indicates any change to the text of a treaty. However, terms used for such changes vary and are often equivalent: amendment, revision. The amendment relates to certain changes, partial and of minor importance, and the revision designates substantial and extensive changes to the text of a treaty[19]. In any case, there are two general rules on the modification of Treaties (Art. 39, Vienna Convention, 1969):

- any treaty can be amended only with the parties' agreement;
- in order for changes to take effect, this agreement must follow, in principle, all prescribed steps for signing the Treaty[20].

Within the European Union law, revision is defined as any change or addition to institutive Treaties, and is a legal intervention that has the same legal value as the original Treaties. Unlike international law, where we find two rules on revising treaties, the European Union law distinguishes between classical revision, specific revision of international law and independent revision.

Anghel, *"The Law of Treaties"*, vol. 1 and 2, second edition, revised and enlarged, (Lumina Lex Publishing House, Bucharest, 2000); Nguyen Quoc Dinh, Patrick Daillier, Alain Pellet, *op. cit*., etc.

[20] Negotiation, adoption, ratification and entry into force.

1.3.1. The classical revision, under international law

Each constituent treaty contains a revision clause. So, we remember that the Treaty of Paris provided that "after the expiration of the transitional period, the government and the High Authority of each member state can propose amendments to this Treaty. The proposal will be presented to the Council. This issues, by a two thirds majority, a favourable assent in a conference of representatives of member states governments, which will be immediately convened by the President of the Council, in order to reach a common agreement on amendments to the Treaty. Amendments shall enter into force for all member states, after being ratified by all member states in accordance with their respective constitutional rules"[21]. Similar provisions can be also found in the Treaties of Rome, as it follows: the government of any member state or the Commission may submit to the Council, proposals on the revision of this Treaty (EECT respectively EECAT n n.[22]). In case the Council, after consulting the Assembly, even in cases received from the Commission, issues a favourable assent, in a conference of representatives of member states governments, convened by the President of the Council in order to reach a common agreement on amendments to this Treaty. Amendments shall enter into force after being ratified by all member states in accordance with their respective constitutional rules[23].

Currently, provisions relating to the revision of EU Treaties are found in art. 48 of the Treaty on European Union. According to that article, treaties can be amended in accordance with an ordinary revision procedure. Also, they can be amended in accordance with simplified revision procedures. As for the ordinary procedure, the following aspects are important: the Government of any member state, the European Parliament or the Commission may submit proposals for treaties revision, to the Council. These proposals may aim, among others, either at increasing or at reducing competences conferred in Treaties, to the Union. These proposals shall be submitted to the European Council, by the Council and shall be notified in national Parliaments. If the European Council, after consulting the European Parliament and the Commission, adopts by simple majority a decision in favour of examining amendments proposed, the president of the European Council shall convene a Convention composed of representatives of national Parliaments, Heads of State or Government of member states, of the European Parliament and of the Commission. The European Central Bank is also consulted if institutional changes in the monetary field occur. The Convention analyzes the proposals for revision and adopts, by consensus, a recommendation addressed to the Conference of representatives of member states governments. The European Council can decide, by simple majority, with the European Parliament's approval, not to convene a Convention if it is not justified by the extent of amendments. In the latter case, the European Council shall define the terms for the Conference of representatives of member states governments. The President of the Council convenes a Conference of representatives of member states governments in order to adopt, by common agreement, the amendments that are to be brought to treaties. Amendments shall enter into force after being ratified by all member states in accordance with their constitutional rules.

Referring to the simplified revision procedures, it should be mentioned that they only apply if the total or partial revision of the provisions of Part III of the Treaty on the functioning of European Union concerning the internal Union policies and actions is wanted. The initiative belongs to the government of any member state, Parliament or Commission. The draft for total or partial revision is submitted to the Council. The European Council may adopt a decision of totally or partially amending the provisions of Part III of the Treaty on the functioning of the European Union. The European Council shall decide unanimously, after consulting the European Parliament and the Commission, but also the European Central Bank, in the case of institutional changes in the monetary

[21] Article 96 TCECA (1951 version).
[22] Our reference.
[23] Art. 236 TCEE and art. 204 TCEEA (1957 version).

area. This decision shall enter into force only after the approval of member states, in accordance with their constitutional rules.

To a careful analysis of texts presented above, we note that the revision procedure has a preparatory stage, with community character and a diplomatic stage. Thus, we note that the preparatory phase, which develops within the Union, consists of the fact that the initiative of Treaties revision can be of a member state government, of the Commission or European Parliament. The draft is then submitted to the European Council which must consult, in turn, the European Parliament, and in case the initiative belongs to one of the member states governments, then it must be submitted to the Commission. Subsequently, the European Council will convene a convention in order to revise the Treaty in question. Once the decision to convene a convention is made, the diplomatic phase begins. The Convention's mission is to reach a common agreement on the total or partial revision of a European Union Treaty. We believe that within the Convention, nothing happens other than the completion of negotiations on amending the Treaty, by signing it, by representatives of Member States, since negotiations are held within the preceding phase. In other words, the amendments are negotiated and agreed within the European Council and the convention's object is represented by the required formality of signing. The amendments shall enter into force only after all member states have expressed their consent, according to their national constitutional rules.

In conclusion, the European Union Treaties can be revised in whole or in part, in accordance with the rules of classical international law, under which the amendment of treaties in force follow the procedure stipulated for their conclusion, namely: negotiation, signature and ratification by all States Parties to the original Treaty.

1.3.2. The independent revision

Treaties establishing the European Communities and European Union have provided and still provide the possibility for EU institutions to amend certain provisions. However, this procedure is not specific to the European Union, being also used for other treaties concluded under the auspices of other international organizations. For example, we bring the following to the forefront of attention:

- art. XX of the Constitutive Act of the United Nations Organization for Food and Agriculture[24] allows to the Organization's Conference to amend the Constitutive Act, by the vote of two thirds of the votes cast. Amendments adopted by the Conference must not, however, establish any new obligations on member states;

- art. XII of the UNESCO Constitution[25] allows the adoption, by the General Assembly, of some amendments to the constitutive act, by a majority of two thirds of the votes. This time too, it is expressly provided that the amendments must not represent "fundamental changes" in the organization's purpose;

- art. 41 of the Statute of the Council of Europe[26] contains a provision under which the Committee of Ministers can adopt amendments to the Statute.

4. The compatibility of international law with EU law

The European Union has a legal order which can be confused neither with the international order, nor with the state order, but rather, stems from these two, being different from them in its essential points. Those features, which highlight the unique character of the construction which Jean Monnet imagined, have important consequences for the legal and political institutions of the system, whose development is carried out according to integration steps of the Union.

[24] October 16th, 1945 (http://www fao.org/docrep/003/x8700e/x8700e01 htm#20).
[25] November 16th, 1945 (http://www.un-documents net/unesco-c htm**).**
[26] May 5th, 1949 (www.coe ro).

Regarding the existing relation between EU legal order and rules of public international law, the Luxembourg Court admitted the compatibility of the two systems in a number of areas such as: the extraterritorial effect of the right to competition, the law of the sea, the basic principles of international liability or international criminal law. Likewise, ECJ often applies, as rightful source of EU law, the rules of international law in defining treaties, as well as methods of interpretation of their effects, by invoking the Vienna Conventions of 1969[27] and 1986[28] or based on customary international law[29].

Thus, in case of interpretation or coverage of gaps of EU law, it does not resort directly to specific principles of international law, but indirectly; they can be used only if ECJ determines their compatibility with EU legal order. Conversely, EU law can not claim that it directly contributes to the development of public international law.

However, the Union, as object of international law, is subject to compliance with general international law, and certain rules or principles of the latter create for the Union, obligations which are likely to produce effects within the EU legal system; their compliance is required both to institutions and member states.

A careful study of ECJ jurisprudence shows that it proves certain reluctance on the principles of international law. In this respect, the European Court of Justice rejects the use of any principle regarded as incompatible with the legal nature of EU institutional structure. Thus, the EU principle of public international law which entitles member states to do justice by themselves, can not be applied in EU legal order; Treaties establishing the European Union contain a complex system of judicial tools used in case of default, from a state, of obligations under the Treaty.

The principle of reciprocity also enters the category of international law principles to which the Court does not recognize the applicability within the EU system.

However, the Court admits the possibility of using some originating principles of international law provided that they meet the specific requirements of Community law. In this way, if there is a conflict between an EU treaty and a convention relating a member state to another state or a third party, the Court states that, under the principle of international law, a state that assumes a new obligation contrary to its rights recognized by a previous treaty, by this action, it renounces to the execution of the new obligation[30].

Among principles of international law frequently used by the Court are, in particular, the followings: the principle under which a state can not refuse its nationals the entry into and staying on its territory[31], the principle of continuity in matters of states succession and the principle of good faith. The First Court[32] took into consideration the principle of good faith, in order to point out that signatories of an international agreement can not adopt, before the entry into force of that agreement, acts likely to deprive it from its object or purpose, as a customary rule recognized by international jurisprudence, being imposed to the Community.

I believe, however, that due to the increased role of the European Union, as an actor of the international community, through the proliferation of agreements with many countries, the presence in international organizations, the diplomatic relations involving both the representation in the European Union and its foreign delegations, as well as the development of foreign policy and common security, all this will lead to a development of using the principles of international law in ECJ jurisprudence.

Conclusions

In conclusion, we note that the Treaties which established the European Communities and, subsequently the European Union are international legal instruments governed by rules of public international law. The negotiation, conclusion, expression of consent, amendment of Community Treaties, and of ones of the European Union are specific phases for the entry into force of any international treaty, being governed by the same rules of international law.

As an argument, we mention, by way of example, the Treaty of Accession of Romania to the European Union, which is a modifying treaty of European Union constituent Treaties. Thus, as methodology, procedurally speaking, in order to conduct negotiations for Romania's accession to the European Union, the national authorities have prepared to be sent to the European Union Council, one position paper corresponding to each negotiation chapter. The position papers were drawn up under the commitments that Romania had and could assume within the negotiation chapter.

Once developed, the position papers were submitted for adoption, by the Government. Once adopted, consultations were held with the relevant committees, for each chapter of negotiations, in accordance with the provisions of the Constitution. To the position papers of Romania, the EU Council responded with common positions, in which the position of Romania was accepted or our country was asked to change its views on certain specific issues. In the latter case, Romania adopted a new position paper on that chapter, modified depending on requests received and on its own interests and possibilities.

On December 14, 2004 in the 12th ministerial meeting of the Conference of Romania's accession to the EU, it was shown that our country had successfully completed the first phase of the timing of accession, namely the completion of negotiations in 2004. Based on the outcome of this Conference, the European Council of December 17th politically confirmed the closure of Romania's accession negotiations, moving on, so the next phase: adopting and signing the Accession Treaty. Once accession negotiations completed, since December 2004, Romania has started the formalities for drawing up the Treaty of Accession. The Treaty of Accession to EU is the legal act of accession of a State to the European Union. The English version for the Accession Treaty was completed in late January, so that on February 4th, 2005, it was agreed by Member States of the EU in Brussels, within the COREPER[33]. A week later, Romania was agreeing on the text. After translating the Treaty in all 20 official EU languages, as well as in Romanian and Bulgarian, texts were officially transmitted to the member states, Parliament, European Commission, Romania and Bulgaria. On April 13th, 2005 the European Parliament gave its assent[34] to the accession of Romania and Bulgaria to the European Union.

The assent, introduced by the Single European Act[35], is a way of the European Parliament of approving a proposal from the Council. Thus, the legislative act must be approved by Parliament in order to be adopted. However, the procedure does not allow the Parliament to act directly. For example, it can not propose or require amendments in the assent procedure, its role is only to approve or reject the proposed act.

[33] COREPER, the French acronym under which is known the Permanent Representatives Committee, is composed of the permanent representatives (ambassadors) of member states and, in a stage which involves preliminary negotiations, assists the Council of Ministers (Council of European Union) in dealing with issues on the agenda. This Committee occupies an essential position in the union decision-making system; at the same time, COREPER is a forum for dialogue (among permanent representatives and between them and the capitals that they are representing) and a body of exercising political control.

[34] With 497 votes for, 93 against and 71 abstentions, the recommendation of the rapporteur for Romania, Mr. Moscovici, on Romania's accession to the European Union was adopted.

[35] It entered into force in 1986.

The assent from Parliament in Strasbourg gave the possibility to go further through with the procedure of Romania's accession to the EU. Thus, on April 20th, 2005, Member States agreed in COREPER, the draft of EU Council Decision on the Treaty of Accession of Romania and Bulgaria.

The official signing of the Treaty of Accession of our country to the EU took place on April 25th, 2005, in the presence of member states representatives, and of representatives of Romania and Bulgaria.

It is known that signing the text of a treaty, according to international regulations, does not usually commit parties under any aspect, because the signing only authenticates the text. However, starting from the signature of the Treaty of our country accession to the EU, new rights and obligations on the parties have been created.

CONSTANT ASPECTS OF LAW

ELENA ANGHEL[*]

Abstract:
"Are we watching, in the succession of history, the appearance and disappearance of legal systems or assisting, in a greater or lesser extent, to what might be considered, in a sense, an evolution of those systems?"[1]
Law, indissolubly linked to the general evolution of society, has recorded a number of differences in time and space, both in terms of content of various types and positive law systems, and also in terms of forms that take the rules of law, authorities who have the ability to edict it or the procedure to be followed.Indeed, there is no law for all times and all places, as law is not an abstract product of our reason, it comes from the human experience, it is a product of history and that is why institutions of each society can only be different from one society to another.[2] *But, as in reality there are not quantities of history - many, little or very little - but just history*[3]*, we can say that in typology there is not socialist law absolutely different from bourgeois, feudal or slave law, so there is just law.*
By this approach, I wanted to bring back into question the existence of some factors of constancy in law, those "legal permanencies" investigated by Edmond Picard, believing that "there is something in the legal relationship that necessarily subsist anywhere"[4].

Keywords*: constant aspects, diversity, "given", "constructed", continuity*

Introduction:

This subject has been researched in the specialized literature under different aspects: unity and diversity in law typology, "given" and "constructed", continuity and discontinuity in law.

Unity and Diversity in Law Typology

Any state has its legislated laws, in accordance to its own social-political exigencies, to the traditions and values it proclaims. Unlike the principles of natural rights, the legislated norms are variable over time and space.

Man himself renders different value to the abstract concept of equal chances and the abstract freedom of choice. We are born with a common biological setting, nonetheless we each consolidate our own features, aspirations, values. And, although we are alike through the values which are given to us, we are different by the capitalizations we make. There is no perfect, timeless, spatial and universally moral model.

Individual identity is given by the sense of belonging to a certain community and therefore the potential conflicts that might arise cannot be settled through instituting a universal positive law; the law of each state represents the expression of living experience.

Our planet's mankind is not at the present moment in the same historical phase or stage[5]. Correspondences and contamination between cultures are common, however uniformity is out of the question. Behaviors differ depending on race, ethnics and religion. The normative structure of

communities has always differed from one tribe to another, from one people to another, from one nation to another. Even the Romans, who conquered so many people, understood the existing differences between civilizations and did not impose the established law of Rome to abolish the existing rules governing the conquered people.

The evolution of the human civilization is not a uniform process. Thus, every law areas and types emphasized by historical evolution have specific particularities, which are determined by ensemble set of factors influencing law, rendering it dynamic, of evolutive nature, distinctive. The natural framework, social-political transformations from one phase to another, the interests of social structures, human individuals with their aspirations, the role played by tradition in different historical moments, ideological differences, in other words, the totality of factors that have configured the law have generated changes in the normative contents of the law, qualitative and quantitative modifications in the systematical structure of law, emphasizing on one hand the idea of juridical progress and, on the other hand, the fact that there cannot exist an universally valid legislation.

However, summing up, we can say that just as history cannot be expressed as a quantity a lot of history, very much history, some history, very little history – but there simply is history[6], there is no socialist law in typology that is absolutely different than the bourgeois law, the feudal or the slave law, but there is law; institutions and principles exist that are based on roman law and that have survived over societies that have created them, being applied throughout millennial evolution; notions and concepts exist (such as subjective right, legal deed, legal act, legal will) that surpass national framework and have the same significance in any theory on the system of law; a general theory of law exists (juridical encyclopedia) that "chooses from all law elements what is essential, what constitutes the very articulation of legal thinking and by willingly establishing its logical process, defines what law is". [7]

Therefore, there cannot exist a common legislation for all societies however "there is in the juridical relation something that necessary subsists anywhere"[8] and that "something" is represented by the legal permanencies, the **constant aspects of law**, subject matter to the legal encyclopedia.

Given and Constructed in Law

Montesquieu drew attention over the fact that "the laws that seem opposed are in some cases based on the same spirit".[9] In this context, we will attempt to answer the following question: can the legislator create ("originate") the law by simply establishing norms in the form and upon the procedure required by laws or, on the contrary, besides these "exterior marks", is the legislator conditioned by some merits, contents criteria because of which the efficiency and validity of legal norms depend? [10]

François Gény distinguishes between the "***given***" that arises from the very nature of things, and exists prior to the legal phenomenon, and the "***constructed***", which consists of the legislator's work. As regards the "given" aspects of social life, Gény classified such in four categories:

a) real "given", consisting of all conditions that arise from the nature of things and that impose themselves to any will (both natural conditions and conditions that refer to the anatomic and psychological structure of man, his moral aspirations);

b) historical "given", that accompany mankind evolution, and provide such with a series of precepts arising out oflived experiences (for example those concerning private property);

[10] Anita M. Naschitz, *Problema dreptului natural în lumina filozofiei marxiste a dreptului*, în „Studii și cercetări juridice" nr. 3/1966

c) rational "given", meaning the totality of rules dictated by reason, basically referring to the content of natural rights;

d) ideal "given", that concentrates all aspirations, feelings, beliefs of mankind in respect with the progress of positive right, the utmost objective to which law aims.

Paul Roubier also is of the similar idea that the work of legal creation has two phases: acknowledging such "given" elements of social life and based on them constructing the legal rule[11]. By analyzing the basics of legal rules, Roubier shows that in case the legislator creates the legal rule without taking into consideration the "given" aspects of the social order, then the legislator creates a useless piece of work. Consequently, there are three groups of factors that need to be taken into consideration: economical factors (interests), religious and moral factors (traditions) and political and social factors (ideologies).

Emphasizing the importance of the fact that the historical materialism developed by Karl Marx exaggerated the importance of the economical factor, placing such as the basis of all social phenomena, Roubier considered it was absurd to render unilateral explanation to great historical events, whereas such are always based on a complex set of causes.

Essentially, Marx asserted that the legislator did not invent laws, but merely formulates such.[12] In the opinion of Marxist philosophy, the rights (equivalent to positive rights) is the result to the conscious creation of people; nevertheless, Marxism admits the idea of a "given" in law, which it places in the natural and social environment and in the framework of which the work of "constructing" law is developed.

The Marxist philosophy considers that the legislator cannot create laws randomly but, in order for the legal norms to be efficient, a series of factors must be taken into consideration regarding not only the form but also the grounds of juridical regulations, which factors compose the "given" side of law and that concern *social relations, the human factor and objective laws on the development of society and thinking.*

Therefore, the relations established between people at a certain historical moment (economical, political, cultural, family relations) represent a fundamental "given" aspect of the law whereas, on one hand, they represent the subject matter of legal provisions and, on the other hand, by their specific nature, by means of their influence over the human reason, feelings and will, they drive the solutions comprised in such provisions.[13] Nonetheless, the action of law over social relations is always meant as a participation of the legal conscience[14], an idea which will be further developed herein.

Man is a complex factor to be considered by the legislator; man, with his biological and social specific nature, is a product of his era, is a fundamental "given" of law, from two standpoints: as subject of the legal provisions and furthermore as their addressee. His interests, beliefs, ideals are the ones that drive the legislator's activity and the evolution of law.

Moreover, only if the aims set up by the legislator and the solutions created in order to fulfill such are in accordance with the laws of nature and society development, then legal provisions can play a positive social role, guiding society's evolution on a normal path, and not hinder historical development. That is because "efficiency can only be achieved grounded on what exists. The

purposes only have a precise significance if they are adapted to the means. Problems are not socially meaningful unless they can be solved"[15] and law giving is the product of discerning human actions.

The study of the three main components of the "given" aspect in law shape the Marxist notion over the historical nature of law, over its dependency of time and place conditions as well as the powerful connection established by Marxism between the right of every formation and the development level of the production forces at a given moment.

Continuity and Discontinuity in Law

The idea of a "given" aspect in law does not have to lead to establishing some general and invariable criteria, situated beyond human experience, which criteria would discipline creation in law. On the contrary, the "given" in law being itself variable, explains the existing differences between legal systems, also under the aspect of content and finality of legal regulations belonging to some different types of law.

Admitting nonetheless that, on a psychological level, in the way of thinking of an age traces can be found of the thinking method of the previous age/ages and, furthermore that life does not start over with every instauration of a new production method (idea which has been emphasized from the very beginning of this research), we can mention a series of continuity elements in the "given" aspect of law and, in addition, the transposing of such into "constructed" of law as well.[16]

Thus, referring to social relations in various historical ages, we can easily notice the differences of content between ownership relations in the slave society, for example, and that of feudal, bourgeois and socialist societies; however through an abstractization process, elements of continuity can be noticed on the level of such relations' structure, which elements are reflected in law under two aspects: in the juridical regulation subject matter – the fact that certain categories of social relations (ownership relations, relations between spouses, between seller and buyer) are regulated in all areas of law; in the logical-conceptual mechanism – certain legal categories and concepts (such as the ownership ones, contract, juridical rapport) can be found in all the systems of law, emphasizing the permanent value of the logical structure of law.

Irrespective of the existing differences, all law families (German-Roman, Anglo-Saxon, Muslim, etc) protect the same fundamental institutions: individual's primate, property, family. Although etatic law changes along with states (34 at the beginning of the 20^{h} century, approximately 102 at the middle of the same century, over 200 at the beginning of the 21st century),[17] the notion of legal norm does not render different meanings, but it has "the same significance, same legal function and the same logical form, irrespective time and space, and regardless to the legislator and the normative form that includes it".

Professors Traian Ionaşcu and Eugen A. Barasch, while researching the legal institution of contract in socialist and bourgeois law, reveal that what has changed from one regime to another are the interests to which the law serves; therefore, the end scope of the two types of contracts are different from one age to another, thus "the contract in the socialist law is a whole new different contract"[18]. Nevertheless, in both regimes the concept of contract exists and thus the concepts are maintained, while what changes are the concepts' functions, the substance; the same technical construction, i.e. the contract –, takes, fundamentally different end scopes and contents.

A current positive does not cease connections with the precedent positive law, meaning a series of principles and normative ideas are maintained. The institution of the civil contract, the principle of liability for an illegal action, are not the creations of a certain modern positive law, but have instead a millenary legal oldness[19]. Conclusive to such end is the way how many of the principles, institutions, concepts and categories created by the Roman law have survived to the society which had created them and were taken over and successfully applied in feudal society as well as in the modern one.

To this end, the words of Professor N. Popa are clarifying: "In the case of law, but not only, it is necessary that each time we start with the Greek and Roman antiquity because that is where the source of the entire European development lies. Although nowadays society is no longer similar to the old one, while the institutions which govern us are radically different, somewhere deep, at the level of the founding principles, universally valid ideas can be found, which govern us in the present as well."[20]

The existence of principles is innermost related to human activity; "law cannot function outside general principles."[21] They constitute the underlayer of positive law. The general principles of law represent a stability factor in law; they ensure the legal system's evolution, the continuity of the legal order and are characterized by longevity. If the loss or modification of a simple law rule is only "of episodic nature", then eliminating a principle "risks causing a large damage to the legal order because the fate of numerous legal rules is at stake"[22].

In this respect, Professor Nicolae Popa shows that the general principles of law have a double dialectics[23]. The internal dialectics refers to "the set of internal connections characteristic to the legal system, the interferences of its composing parts", while the external dialectics regards the dependency between principles and the set of social conditions, being reflected in the legal conscience of a nation at a certain moment; its evolution imposes the "rethinking of some principles in accordance to the economical-social mutations that demand for adequacy according to the legal regulations and institutions"[24].

Continuity in law also has that law fundamental "given" aspect, consisting of objective social laws, the action of which sometimes exceeds the frame of a single social-economical formation; for instance, the law of value, whereas "the precise law is unviable outside values, which values are always typically expressed in the wording of a law system's principles." [25]

The more so the human factor, the central area of interest for the legislator, represents a continuity factor in law, on one hand, through their physical, biological, physiological characteristics – which are common to all people – and on the other hand, due to volitions, ideals, interests for which they have fought along history and which are also found in the plan of legal regulations' end scope. Therefore, the history of human rights can be synthetically described as being the struggle for having human dignity respected by the state authorities.

In its grand historical-spatial diversity, in spite of the normal differences, the law presents a permanent nature represented by a bunch of constants. Law does not mean the simple recording of facts but also the permanent relation to values and principles and, thus, observing these constant guide marks.

Professor Djuvara considers that "the law can be a science, and the legal knowledge changes also into science when, having as an objective a higher number of documents related to law, they arrange and relate them according to their essential characteristics through legal notions or principles that are universally valid, just like the laws of nature". [26]

The Transition from "Given" to "Constructed": Legal Conscience

Researching the fundament of legal regulations and end scopes pursued by such represents the essential task of legal science. But scientific research, fundamental or applicative, is elaborated in consideration of practice. Research means knowledge, practice means action, it calls for finding solutions to answer the needs revealed by theory.[27] Establishing what it is, the scientific research has to also determine what it could be, what it needs to be. As emphasized by Paul Roubier[28], the essentially normative nature situates law science in the "has to be" domain and subordinates it to the law of end purpose an, unlike sociology, which is an explanation science, dominated by the laws of causality and necessity. Law is not simple "social engineering", but it implies a social order inclined to reaching some end purposes.

Any positive law has its end scopes of which the law makes use differently, "legally dimensioning such, measured in terms of times and people; the Nazi social order, Arabic-Saudi or Japanese one do not portray the same meaning".[29]

The scientific research pursues at detecting that process of transition from "given" aspects to "constructed" aspects, from what it is to what it could be, from indicative to imperative. Social efficacy of law depends on the degree of compliance between "given" and "constructed".

The law creation activity cannot be arbitrary; tracing the correct line between necessity and freedom implies finding optimal solutions for assuring a climate that is favorable to all; the transition from what it is to what it should be is made by means of legal conscience.

Law, before being a normative state, is a state of conscience, a set of representations, ideas, beliefs. Legal conscience thus appears as a premise to law giving and the enforcement of law norms.

Juridical reality does not only imply norms, but also assumes value judgments, legal conscience, relating to facts and interests. Therefore, "a law system can only exist if its creators and addressees are aware of it".[30]

The transition from *sein* to *sollen* implies, first of all, knowing and understanding the phenomena of social life (the cognitive phase of legal conscience), so that those necessities that claim for legal regulation can be selected; legal conscience then proceeds to their examination, in its aim to take from the entire set only the social relations that, in relation to the interests that need to be protected, will wear the legal clothing (action hypostasis); also the axiological phase implies their capitalization, establishing the essential solutions that need to be promoted and the technical-legal means through which such can be inserted in law order.

The legal conscience has a complex structure: legal ideology contains elements of rational nature by which it is understood what it is, and legal psychology, composed of affective elements, refers to what must be accomplished.[31]

[30] Gheorghe Mihai, Fundamentele dreptului, vol. I - II, (Bucuresti , Edit. All Beck, 2003), p. 156

The shift from conscience to norm is a process carried out through that determining factor of legal conscience, legal will, focused on the regulation of social relations, which will the legislator rises to the level of state will, expressed in the form of legal norms.[32]

Legal conscience and, consequently, the law, are changing along with the society in which they have appeared, depending to the ruling process such reflects. The form changes (law, legal conscience) correspond to some content modifications.

However, in spite of the existing differences between legal civilizations, there can easily be noticed the common aspects that compose the essence of law. To research the essence of law implies entering the intimacy of legal phenomenon, noticing its internal qualities, "establishing its substance" (Aristotle). Legal will is that which can be found in every norm and in the set of laws; irrespective the transformations faced by law, such legal will, of mandatory nature, represents a constant element of law.

Nevertheless, from the point of view of essence, the law systems are "identical", in terms of the way how they organize the content they are different from one another.

Conclusions

By distinguishing in any legal relation a factual element and a rational one, Mircea Djuvara shows that, as two individuals having the same figure or two leaves with identical shape cannot exist, the same goes for two factual relations that cannot be identical in their entire complexity[33]. The factual element always varies from on moment to another. "Laws do not remain the same, although their letter stays the same…The way in which Napoleon code is applied today is in many ways different than the one applied 100 years ago; how it is applied in our country is in many ways different that in France".

Therefore, "the idea law is fixed, eternal, immutable, purely rational, however its content varies". In their content, legislations are always different, norms and regulations differ in time and space, but in essence and form, constant elements do subsist.

THE RIGHT TO AN INDEPENDENT COURT

ALIN-GHEORGHE GAVRILESCU*

Abstract
The independence of the court is essential of state of rule, to maintain the stability in juridical intercourse, for the existence of a constitutional democracy achieved through a warranty of the necessary objectivity for the steady and legal settlement of the causes deducted to the trial and the achievement of a fair trial.
The article emphasizes the main international juridical tools in which independence of justice is reflected, achieving an examination of judicial practice of European instance as well as an analysis of this principle as it is regulated by Romanian justice.

Keywords: *independence, impartiality, justice, judge, instance*

1. Introductive Notions. Juridical Framework

The justice independence is, beside its impartiality, essential for the legal state, in order to keep the stability in the juridical relations, for the existence of a constitutional democracy, being constituted in order to guarantee the objectivity needed for the reasonable and legal settlement of the causes, for protecting the society's general interests, the legal order and also the civic rights and liberties.

The two notions never overlap whereas independence does not necessarily suppose impartiality. A court may be independent, automatically meaning that it does not necessarily have to be impartial[1], but if a judge can be independent and not partial, he cannot be impartial unless he is independent[2]. Therefore, independence is prior to impartiality.

Even independence and impartiality are two separate and distinct values of justice, there is a tight connection between them. Given this connection between independence and impartiality, the two values are regulated together by the stipulations of the main incident international juridical tools in the legal matter at an equitable lawsuit, respectively:

- art. 10 of Universal Declaration of Human Rights consecrating every person's right to be equitably, publically examined in a reasonable term by an independent and impartial court;

- art. 6, paragraph 1 of the European Convention for protecting the human rights and basic liberties that, by regulating the right to an equitable process, shows that the judgement of any person's cause must be equitably and publically made in a reasonable term by an independent and impartial court;

- art. 47, paragraph 2 of the Charter of Basic Rights of the European Union that acknowledges any person's right to an equitable, public process in a reasonable term in front of an independent and impartial judicial court constituted in prior by law.

The tight connection between independence and impartiality also results from art. 2 of the Basic Principles referring to the magistracy independence[3] that, specifies that justice must decide in

[3] Adopted by the 7th Congress of the United Nations for preventing the offences and the delinquents' treatment (Milano, August, 26th – September, 6th 1985) and confirmed by the General Assembly of the United Nations Organization by means of resolutions no. 40/32 from November, 29th 1985 and no. 40/146 from December, 13th 1985.

the causes brought to it based on the facts and according to the law, with no restrictions, no unwanted influences, no delusions, pressures, threats or direct or indirect interferences of anybody, no matter the reason, considering elements related both to independence and impartiality[4]

Beside the stipulations of art. 10 of the Universal Declaration of Human Rights, of art. 6 of the European Convention for Protecting the Human Rights and Basic Liberties and of art. 47, paragraph 2 of the Charter of Basic Rights of the European Union at the international level, a special importance regarding the judges' independence belongs to the Basic Principles regarding to the magistracy independence stipulating the obligation of every government and of the other institutions to acknowledge and respect the judges' independence.

Following the promotion of the judges' independence in order to reinforce the law supremacy in the democratic states, at the European level it was adopted, in the matter of the judges' role and the justice independence, Recommendation no. (94) 12 regarding the judges' independence, efficiency and role[5]. At point 2 letter d of Principle I – General principles regarding the judges' independence, it is established, in imperative terms, that in the process of making decisions, judges must be independent. Also, point 3 letter a of Principle V- Judicial responsibilities of the same Recommendation shows, among other things, that especially judges must act as fully independent in all the cases and ignoring any extern influence.

The judges' independence principle is also regulated by art. 1 of the Judges' Universal Status[6] stipulating that the judge, as an owner of the judicial authority, must be able to exert his function in a full independence in relation to the constraints / the social, economical, and political forces even in relation to other judges and to the judicial administration.

The judge's independence is also reflected by Bangalore principles where it is shown that justice independence is the premise of the legal state and a basic guarantee of the equitable lawsuit (Value 1-Independence). The judge must independently exert his judicial function based on his own appreciation of the facts and in the spirit of the law, with no external influences, suggestions, pressures or direct or indirect interference, no matter whom they come from and under what reason.

Considering the stipulations of art. 6 of the Convention for Protecting the Human Rights and Basic Liberties, of the Basic Principles referring to the judges' independence, referring to Recommendation no. (94) 12 of the Minister Committee of the Member States and interested ones in the fact that the promotion of the judges' independence needed for reinforcing the supremacy of law and of protecting the individual rights and liberties in framework of the democratic states should be effective, the participants to the multilateral reunion regarding the judges' status in the Europe organized by the European Council on July, 8th – 10th 1998 at Strasbourg adopted the European Charter regarding the judges' status[7]. This contains stipulations showing that the Judges' Status wants to provide the competence, the independence and the impartiality any person legally waits from the courts and from every judge whom the protection of their rights is entrusted to. He excludes any stipulation and any procedure able to debase the confidence in this competence and impartiality. The Charter contains the stipulations most able to guarantee the achievement of these objectives (General Principles, point 1.1.).

[5] Adopted by the Minister Committee of Member States of the European Council on October, 13th 1994.

[6] Adopted by the Magistrate International Union in 1999 at Taipei.

[7] When contracting the works of the first multilateral reunion in Strasbourg from July 1997, the participants to this reunion, coming from 13 countries of Western, Central and Eastern Europe, together with the representatives of the Magistrate European Association (MEA) and the European Magistrate Association for Democracy and Liberty (EMADL) expressed their will to be offered by the European Council the frame and the support needed in order to elaborate a Charter regarding the judges' status. The Juridical Affairs Direction entrusted to an expert in France, Poland and Great Britain the publishing of a Charter pre-project. The pre-project was elaborated in the spring of 1998 and presented to the participants to the second multilateral reunions develop still in Strasbourg on July, 8th – 10th 1998. After being brought a series of amendments, the text was unanimously adopted.

As it results from the Basic Principles referring to the magistracy independence, the magistracy independence must be guaranteed by the state and stated in the Constitution or in other national law. In the same sense, at point 2 letter a of Principle I – General Principles regarding the judges' independence of Recommendation R (94) 12 it is specified that judges' independence must be guaranteed (...) by adopting express stipulations in this sense in the Constitution or in other legislative texts (or by incorporating the stipulations of this Recommendation in the intern law).

In the Romanian law, the justice independence principle is consecrated by art. 124, paragraph 3 of the Constitution stating that judges are independent and only obey to the law. Thus, in the constituting legislator's conception, the judges' independence is accomplished by the fact that they only obey to the law. As a consequence, independence also supposes the settlement of the cause deducted to the judgement only based on the administrated evidence and according to the legal stipulations that are mandatory for the judges, without other factors influencing his conviction. Considering the importance of this principle, the legislator established in the basic law that the justice independence cannot make an object of the Constitution review.

The justice independence principle also results from other texts of the Romanian legislation in the matter and of the Judges and Prosecutors' Deontological Code. Thus there are:

- art. 2, paragraph 3 of Law no. 303/2004 stating that judges are independent, only obey to the law (…);

- art. 10 of Law no. 304/2004 that, under the direct influence of the stipulations of the Universal Declaration of the Human Rights and of the European Convention for Protecting the Human Rights and Basic Liberties establishes that all the persons have the right to an equitable lawsuit and to settling the cases in a reasonable term by an independent court (…), constituted according to the law;

- art. 3 of the Judges and Prosecutors' Deontological Code that, after instituting the judges and prosecutors' obligation to protect the justice independence, shows that they must objectively exert their function (…) their only basis being the law, without encouraging any type of pressures and influences.

2. Institutional Independence and Individual Independence

The magistrate's independence must be analysed under a double aspect, namely:

- The one of the institutional (or functional) independence referring to the relations between magistrate and other internal factors (other magistrates) or extern ones this interferes with (legislatively, executively, parties etc);

- The one of the personal independence referring to the actual magistrate's independence (de facto independence).

The two aspects are in an interdependence relation and together, they provide a real independence of justice. The institutional independence and the personal one must not be dissociated and analysed separately from each other whereas it may occur for a judge to be in that mood providing the personal independence but, if the court he belongs to is not independent in report to other factors, we cannot say that the judge is independent.

1. Institutional independence. The essence of justice independence consists in the judge's full freedom to decide in the causes deducted to the judgement. In this sense, in the content of Principle I of Recommendation no. (94) 12 (point 2 letter d) it is shown that judges must be absolutely free to decide impartially on the causes they are announced of based on their intimate conviction and on their own interpretation of the facts and according to the valid legal norms. In the decision making process, judges must act with no restriction and without making the object of any influences, suggestions, pressures, threats, or direct or indirect interferences, no matter where they come from and under what reason. Judges must not be forced to account to any person outside the judicial power on the settling offered to the causes. The stipulations of the Recommendation no. (94)

12 develop the ones contained by the UN Basic Principles regarding the justice independence establishing that the judges must solve the causes deducted to judgement based on the facts and according to the law, with no restrictions, inadequate influences, suggestions, pressures, threats or direct or indirect interferences, no matter where they come from and under what reason (Justice Independence, Principle 2). The stipulations meant to provide the judge's full freedom in the judging activity are also found in Bangalore Principles where it is shown that the judge must independently exert his judicial function based on his own appreciation of the facts and in the spirit of the law, with no external influences, suggestions, pressures, threats and with no direct or indirect interference, no matter where they come from and under what reason.

Institutional independence should be analysed at least from the following viewpoints:

- Independence to the other powers of the state;
- Independence to the parties;
- Independence to court leaders and to colleagues.

A) Independence to the executive and legislative. The constitutional principle of justice independence gives the magistrates the possibility to pronounce decisions according to their own convictions, independently from the executive and legislative power, supposing that the judge may impose his controlling power in relation to these powers[8].

The independence of the judicial power to the executive and legislative one is indirectly consecrated in the Romanian Constitution, by instituting in art. 1, paragraph 4 the principle of powers separation[9]. Thus, the principle of powers separation involves the one of justice independence. This could be compromised if the magistrate's career depended on the executive power or if the rules referring to this career could be changed at any moment[10].The executive and legislative power should provide the fact that judges are independent and that there were not adopted measures able to endanger this independence[11]. The arbitrary interference of the legislative or of the executive in the justice business would constitute an obstacle in the way of the exertion of the judicial court functions. The interferences of any kind and the "suggestions" given to judges in order to judge in one way or another would put into the shade the idea of justice, would hack, would damage or diminish judges' prestige, making them dependents on certain political forces[12].

The judge has to have no kind of inadequate connections and not to be influenced by the executive and legislative power, but he should be perceived like that by any outer observer[13].

a) Independence to the legislative power. The Parliament has no right to interfere in the process of accomplishing the justice because, according to art.125, paragraph 1 of the Constitution, the justice is accomplished by the High Court of Cassation and Justice and by the other judicial courts. The legislative power cannot arrogate the competence of settling no lawsuit. At the same time, the legislative cannot adopt retroactive laws able to trouble the stability of the juridical reports consecrated or constituted by a judicial decision, it cannot change a decision given by the judicial court, it cannot issue interpretative laws whose purpose is to supply the solution of a developing process. Also, the legislating authority cannot adopt normative documents in order to block the jurisdictional procedures or the execution of judicial decisions. In this sense, the Constitutional Court stated that a legal stipulation by means of which the judgement development or the execution of the

[13] Bangalore Principles, Value1 - Independence, point 1.3.

definitive judicial decisions referring to certain determined causes is unconstitutional when it does not result from a decision of the judicial court[14], but it operated legally[15]. In the same sense, the Constitutional Court decided that "a legal stipulation, by means of which it would be forbidden – even only temporarily – the execution of a judicial decisions would represent an interference of the legislative power in the process of justice accomplishment, being contrary to the constitutional principle of the powers separation within the state" referring to certain determined causes, such legal stipulations being unconstitutional[16].

The parliament may exert the controlling right on the way of judicial authority bodies' operating, establishing in this purpose rules of judicial organization of competence and of procedure, namely the ones according to which the judicial activity develops. This right may be exerted only by respecting the authority of the judged thing, art. 15, paragraph 2 of the Constitution, stipulating that laws, except for the criminal or the contravention ones that are more favourable cannot have a retroactive feature. Thus, the legislative cannot approve laws that retroactively change certain judicial decisions. Regarding this problem, the European Court of the Human Rights showed that the judge is prevented from applying a retroactive law of a litigation he is noticed about, this fact has incidence on the independence in accomplishing his mission[17].

In case of this control, the Parliament cannot stop the judicial courts from exerting their mission of accomplishing justice, any interference of the legislative power that could put the judicial authority in the impossibility to work, having as a consequence the breach of the constitutional balance between these authorities. In this sense, it was shown in jurisprudence that the principle of law pre-eminence and the notion of equitable lawsuit are opposable to any interferences of the legislative power in the justice administration in order to influence the judicial ending of litigation[18].

The judicial courts cannot refuse the application of a law emitted by the legislative power, prevailing their independence. The only exception is constituted by the refuse to apply legal stipulations against the stipulations of the Basic Laws, and the judge has the possibility to lift ex officio the unconstitutionality exception of the stipulations of a law or of an emergent ordinance, interfering thus in the control of the law constitutionality accomplished by the Constitutional Court[19].

b) Independence to the executive. Regarding the relations between the executive power and the judicial one, the first one can mainly settle no lawsuit, cannot stop the judging development, cannot oppose to the execution of the judicial decisions. To the executive power, the judicial one depends by the fact that judges' appointment is made by the Romanian President, but this dependence is apparent because the President can assign judges only at the suggestion at the High Magistracy Council. The Constitutional Court stated[20] that the Romanian President is the only exponent of the people's will in the reports to the judicial authority; the appointment of a judge involves a juridical responsibility and that is why it is explainable the possibility to refuse the

[14] Only the judicial authority is competent to suspend the execution of a judicial decision. According to the stipulations of art. 403, paragraph (1) of the Civil Procedure Code until settling the complaint at execution or of other demand regarding the forced execution, the competent court may suspend the execution, if there is a bail in the quantum established by the court, beside the case when the law stipulates differently.

[20] Romanian Constitutional Court, Decision no. 375/2005 published in the "Official Gazette of Romania", Part I, no. 591/2005.

suggestion made; since the second refusal is not allowed, it means that the final word belongs to the High Magistracy Council.

In the practice of the European court of human rights contentious it was considered in several causes that the Government appointment of the members of a court is not compatible with the notion of court independence[21]. But, in another cause, the Court considered that a disrespect of art. 6 paragraph 1 of the Convention is represented by the fact that the members of the sea chamber (the president and the vice-president) who should have judged the cause referring to the establishment of the guilt of the crew members regarding the wreck of a ferry were also called revoked from their job by the minister of justice with the notice of the minister of transports, appreciating that they cannot be considered as irremovable and that there is a hierarchical subordination between them and the ministers[22].

B)Independence to the parties. Magistrates' independence should equally be expressed to the litigants. In this sense, at point 1.2. of Value 1-Independence of the content of Bangalore Principles it is shown that the judge will be independent in the relations with the society, in general, and in the relations with the parties placed in a litigation it is called to judge.

Regarding the court independence to the parties, the Romanian Constitutional Court decided that the judicial assistants assigned in composing the panels settling the work litigations in the first place as representatives of the association, respectively to the syndicates, did not accomplish sufficient guarantees of independence and impartiality as long as the representatives of the parties were in litigation, given the fact that they participated to the decisional process next to the judge, the decisions being taken together with most of the complete members[23]. The solution of the Romanian constitutional court agrees with the practice of the European court that decided that, since in a court there is a person who is subordinated, the litigants may legally doubt that person's independence[24].

In order to provide justice independence, the distribution of the causes should not be influenced by the desire of any party in lawsuit or of any other persons interested in the result of the decision. Regarding this distribution, point 2 letter e of Principle I of Recommendation no. (94) 12 shows, as an example, that it cannot be made by lot or by a system of automatic distribution based on the alphabetical order or by other similar criterion.

In the Romanian law, one of the principles that should be respected in the development of the judging activity is, according to art. 11 of Law no. 304/2004 republished, as further amended and completed, the principle of the random distribution of the files. The rule governing the random repartition of the causes on panels is that they are distributed in a computerised system (art 53 paragraph 1 of Law no. 304/2004), by ECRIS programme (art. 95, paragraph 2 of the Internal Regulation of the judicial courts). As an exception from this rule, art. 95, paragraph 3 of the Regulation stipulates that, when the computerised repartition cannot be applied because of objective reasons, the causes repartition is accomplished by the method of the cyclic system. By this last method, the files are taken over by the person or the persons yearly assigned by the court president, with the notice of the leading college that distributes a file, in order, to the judicial panels that are constituted at the beginning of every year and that are numbered according to the court or, depending on the case, to sections. The same rule is applied at the causes repartition to the specialized panels (art. 96 of the Regulation).

C) Independence to the court leaders and to colleagues. As it is shown at point 1.4. Value 1 – Independence contained in Bangalore principles, in exerting his juridical function, the judge will

[22] CEDO, Brudnika cause etc. vs. Poland, Decision from March, 3rd 2005.

[23] The Romanian Constitutional Court, Decision no. 322 from November, 20th 2001, published in the "Official Gazette of Romania", no. 66/November, 20th 2001.

[24] CEDO, Sramek cause vs. Austria, Decision from October, 22nd 1984; Pantea cause vs. Romania, Decision from May, 22nd 1998, published in the "Official Gazette of Romania" no. 251 from April, 16th 2007.

have to be independent to his magistrate colleagues regarding those decisions he has to take independently. The independence must be manifested both to the leaders of the higher courts or of the active courts that does not have to interfere with directives, and also to the other colleagues.

Judges are only administratively subordinated to the court leader who cannot exert on them a control regarding the proper development of the judging activity. In this sense, art. 46, paragraph 2 of Law no. 304/2004 establishes that the checking personally made by the presidents or the vice-presidents of the judicial courts or by assigned judges should respect the principles of the judges' independence and of their submission to the law, and also the authority of judged thing and art. 16, paragraph 2 of the Judges and Prosecutors Deontological Code shows that the magistrates with leading functions cannot use the prerogative they have in order to influence the process development and the causes settling.

On the other side, even if a higher court has the possibility to censure the decision of an inferior one, the judge of the inferior court is not hierarchically subordinated to the one of the higher court in exerting his function. The Constitutional Court decided that the background judges' independence is not hacked by the fact that, re-judging the cause, it adopts the legal settling established by the cassation court, because this is why they are not submitted to the will of an authority different from the judged cause, but they obey to the judicial decision given in the exertion of the legal competence of judicial control. The judges of the court of sending to re-judgement, after the admission of the attack way, have the processual obligation to obey the juridical viewpoints solved by the decision that admitted the attack way, but this obligation does not reach the independence of the judges who, in the shown limits, keep the right to decide according to their consciousness.

The European court established that the judges' obligation to obey a jurisprudence established in sections united by the supreme court of a country is not contrary to the independent feature of a court since the reunion in chambers or sections of a high jurisdiction has as a purpose the offering of a special authority of certain principle decisions in important fields of the judicial activity, without reaching the law and the obligations of the inferior courts to examine totally the concrete causes deducted to settling, in a total independence[25].

2) Personal independence. Before everything, magistrates' independence represents a temper problem. Under this aspect, Bangalore Principles trace, as a behaviour reference point, the target for the judge to manifest and to support a qualitative judicial behaviour in order to reinforce the public confidence in justice, without which we cannot keep the independence of the judicial power. (Value 1 – Independence, point 1.6.). Therefore, judges, as well as the prosecutors, should be equidistant to their own tendencies, passions, ideological affinities that could influence them, to have consciousness, balance, courage, objectivity, understanding in order to provide the correct application of the law and the equitable, efficient and quick instrumentation of the causes.

The magistracy independence does not represent a personal prerogative of each judge, but rather their responsibility.

Internationally, this responsibility is established in the target of the judges of Principle V of Recommendation no. (94) 12 where, since the judicial responsibilities are treated, it is shown that the judges should especially assume their responsibility to act independently in all the cases and with no outer influence.

In the Romanian law, the responsibility to provide the justice independence belongs both to judges and to prosecutors. In this sense, there are the stipulations of art. 3 of the Judges and Prosecutors' Deontological Code instituting in the target of both of the magistrate categories, the obligation to protect justice independence. Also, this responsibility of judges and prosecutors results from the stipulations of art. 107 of Book I of Law no. 161/2003 regarding certain measures in order

[25] CEDO Ciobanu cause vs. Romania, Decision from July, 16th 2002, unpublished, quoted by C. Bârsan, *European Convention of Human Rights. Comment on articles*, vol. I, C. H. Beck Press, Bucharest, 2005, p. 493.

to provide the transparency in exerting the public dignities, the public functions in the business environment and the corruption prevention as it was changed and completed[26] that stipulates that the magistrates have the obligation to announce immediately the court president or, depending on the case, the general prosecutor in whose suborder it works any interference in the judicial, political or economical document, from a natural person or legal entity or from a group of persons. Also, the stipulations of the same law establish that the contracting of stipulation of art. 107 constitute a disciplinary deviation sanctioned according to the report of its seriousness to the job suspension of maximum 6 months or even the removal from magistracy.

3. Appreciating the independence

In the European jurisprudence, there were considered criteria of appreciating the independence of a court: the assigning way and the mandates time of the court members, the existence of an adequate protection against the outer pressures, and also the independence appearance[27].

Regarding the assigning way, the European court of human rights contentious showed that judges' appointment should not be let at the discretion of the executive power[28] and that their independence is provided if they are assigned in order to pronounce individually and they cannot receive instructions from the public powers[29]. Regarding the mandate time, the European Court considered that it was not necessary to assign the judges for life[30], since they may be assigned also for a shorter term, for example 2 years[31] or 5 years[32] as long as they enjoy being irremovable during their mandate[33].

Referring to the protection against the outer pressures, the Court specified that they are related to the protection of the court members against their replacement during the mandate[34].

Regarding the independence appearance, it represents the confidence the courts must inspire to the litigants[35].

4. Conclusions

Justice independence is a fundamental guarantee for exercising human rights. It creates the conditions for the objectivity necessary for thorough and legal settlement of matters which results in the consolidation of parties' trust in the activity of judicial courts.

This constitutional principle of justice gives the magistrates the possibility to sentence resolutions in accordance with their beliefs and independently both from the legislative and executive power and from their colleagues and parties.

[34] CEDO, Sramek cause vs. Belgium, Decision from October, 22nd 1984.

[35] C. Bârsan, *op. cit.*, p. 490.

Independence is first of all a matter of character. Magistrates have to protect justice independence not as a privilege that belongs to them, but rather as a guarantee for the society without which there would be no democratic society organized on the principle of law supremacy. Within the development of any activity magistrates have to display a conduct that does not jeopardise the trust in their independence.

Judges have to make all the efforts possible in order for their sentence to be in accordance with the reality. The force of the lawful state is in the promotion of truth in the work of carrying out the justice.

THE RELATIONSHIP OF THE ACCOUNTING LAW WITH THE MODERN SOCIETY AND THE PRESENT-DAY KNOWLEDGE ECONOMY

IACOB BACIU[*]

Abstract
The relevance of the accounting information in the knowledge of the company's patrimonial situation is not only a problem of economic theory, but also of accounting law. Beyond the norms regarding the meaning threshold and the axioms of the economic sciences there appear aspects of contractual nature. The most accurate, systematized and representative data can be obtained only from accounting. The managers and members of the Board will want to obtain by this means as much information as possible, sometimes exceeding the natural capacity of the bookkeeping. For such situations, the accounting law as border discipline will have a word to say.

Keywords: *accounting law, globalization, owner's equity, costs, IAS/IFRS*

1. Introduction

The leap into the *globalization era* is not possible without remarkable progress in the generalization of some rules and norms accepted by the accountants in different countries. Among these norms, principles and conventions, nowadays there are the International Accounting Standards (IAS), the International Financial Reporting Standards (IFRS) and other similar regulations. The manner, rhythm and amplitude of their extension will be monitorized by members of the Board, managers and company owners in order to know the rhythm in which their business can be developed all over the world without the discomfort of the different accounting systems. Strictly methodological, the International Accounting Standards and the other similar regulations form the *international accounting law,* which is another argument in the recognition of the accounting law as a distinct and advanced branch of law.

2. The present-day knowledge economy and the accounting law.

By means of the *accounting law* the costing and the management accounting play a more and more important part in pursuing the observance of the rules of *honest business practice.* Without such rules, the extension of trade - and especially of the international one – is inconceivable. As a matter of fact, the most efficient control instruments over the ratio between the price and the purchase cost can be found in the accounting of the economic agents. The accounting arguments are based on figures having as foundation the documents. Thus, the evaluations are accurate and the degree of the law infringement can be appreciated in figures. The use of the accounting instruments in monitorizing the market behavior is a part of the accounting law. Those documents «produced » by the accountants will be chosen, which can legally be proofs in the relations of protection of the competition. Not any accounting document – and so much the less not any accounting information – can enter the system of proofs or evidence in litigations of the kind of competition protection. In the contemporary economy the accounting law will be the legal basis for the selection of the accounting documents or information in such cases.

[*] Assistant, „Dimitrie Cantemir" Christian University, Bucharest (e-mail : cilezbujor@yahoo.com).

The management of the owner's equity and its specific activities, such as the inventory, supplies a rich study material for the accounting law.

The aspects of legal procedure related to the concrete performance of the inventory, the stages to be covered, the situations in which the inventory is compulsory, the turning to account of the inventory results and the effects of different concrete situations created by this activity are the moments in which the accounting law intervenes. Some chapters of the accounting law, such as the revaluation of the owner's equity, enters into direct connection with branches of law. The law of the present-day business cannot be conceived without the legislation concerning the revaluation.

The companies' working out of their own accounting policies within the framework of the present norms of international accounting law determines a set of legal relations that can be clarified only by the same accounting law.

The internal body meant to make proposals and the decision body will comply at the same time with the commercial law, that however cannot explain and solve all the aspects implied by the company accounting policies. Within the management mechanism of the modern patrimonial entities, the method of budgets enters more and more as an indispensable part.

The accounting law will regulate, in principle, the working out of budgets, their transmission and layout, perhaps their monitoring and inclusion in the system of performance and salary indices. On this stage there are interferences with the labour law and with the commercial law. The occurrence of a complex institution cannot modify the specific feature of each of the law branches that intervenes in the budgetary procedure.

3. The accounting procedures and their integration in the general system of the modern compay.

The procedure aspects – by their nature – belong rather to branches of law than to accounting. The monitoring of the accounting procedures and their integration in the general procedure system of the modern company can be only part of the accounting law in its position as branch with a strong interdisciplinary character.

A component part of the contemporary accounting law is represented by the operating of the professional bodies. The relations between them and the public authorities or other civil organizations, the relations of the professional bodies with their members or with the representatives in the elected bodies including with their own technical staff are elements which belong to the interest area of this new branch of law and in which the lawyers together with the economists must sometimes give solutions. Therefore they are going to know the operating peculiarities of different types of bodies, including by relating to the international practice in similar circumstances.

The introduction of the accountant survey (audit) among the means of evidence in different legal procedures (civil, commercial, criminal a.s.o.) raises, for the judge, the problem of construction of the conclusions reported by the experts. Beyond the technical character of the survey, the court of law will relate to norms of accounting law in order to reach a fair verdict.

Within the department of human resources one of the tasks is to draw up the job description. In the case of persons with leading positions or with tasks in the financial-accounting field, this document of the labor law will relate to the accounting law.

The lawyers' position at the beginning of the 21^{-st} century as members of the local, national and universal community should not be omitted. A new type of fraud is more and more frequent and therefore it is natural that a branch of law should develop to study the basic juridical relations. Automatically appears the interest for this activity which can produce greater financial disasters than we can imagine. In Eastern Europe – and especially in Romania – the population was accustomed to the concealing of this kind of fraud. We can say that the criminal law and the coercion power of the state have reached the edge of the juridical relations regulated by the accounting law due to the special position of the guilty persons in this field.

By the norms of the accounting law and of the civil law, the owner's equity of the associations of proprietors, one of the broadest collective structure of social organization on national level, is protected. Most people live in a collective system and are integrated in this organization system. During the recent years, many cases of fraudulent management by the administration staff have occurred, with direct impact on the members 'personal income. Such frauds can be explained first of all by infringements of the accounting law.

The activity within the community includes the participation in the discussion of some present-day topics in fields of general interest. Such a field is represented nowadays, for example, by sports. In Romania, in the world of sports, there have been intense disputes within certain clubs or between certain personalities. The analysis of the activity of some club leaders, the debates regarding the organization and creation of professional football clubs as public limited companies and the manner of distribution of the voting rights in them are only a few examples that draw the attention on the problems tackled by the accounting right.

Within the interdependence created between the older law branches and the accounting law lies also the definition of the entities on the level of which the accounting is organized. The terms of legal person, branch, subsidiary company, and workshop are taken over by the accounting law as well as by the bookkeeping from the classical law system. Without these exogenously defined categories, the accounting and the accounting law would lack the necessary fundamental landmarks.

4. The Generalization Of Application Of The International Accounting Standards In The Contemporary Business Environment

In the contemporary economy there are more outstanding differences in the accounting system of the states based on the common law tradition, including the USA and the U.K. and of the states based on the legal system of the Code law tradition, to which France, Germany and all the other states belong, that have adopted the code law regulation.

At present, examining the whole of the components of the accounting systems in the USA and the U.K., respectively France and Germany, important differences or only some slight differences can be noticed.

If we refer only to the taxation of the achieved income in the world of the business performed in companies, we are obliged to mention:

- the different manner of calculation and accounting of the taxation on the expected income in France and Germany resides in essence in the rather different legal tax regulation;
- another example refers to the creation of provisions for reserves.

In both above mentioned countries there are regulations in the sense that the patrimonial entities have the right to create a reserve that is legal from the viewpoint of accounting, by taking amounts of money from the profit, within the limit of a certain percentage (normally 5%). It is also stipulated that such an operation may be continued over several years, until the level of about 10% of the face value of the capital is reached (10% of the share capital in France, respectively 10% of the face value of the share capital in Germany, in general). Such takings from the profit are not reflected in the costs because they are exempted of the corporation tax. It is useful to point out that the accounting rules adopted in Japan have been initially moulded after the German accounting, as a result of an association on multiple levels between these countries in the first half of the 20-th century. Recently, in Japan an American influence in the field of accounting can be noticed, what leads to a generalization of the U.S.-G.A.A.P. system.

In spite of the American influence, that manifested itself in the area of the profession of public accounting, the Japanese accounting and financial reporting continues to follow the model of the European accounting. Thus, there have been stipulated statutory provisions that have envisaged the diminishing of the reported profit, in the sense of a harmonization with the legal provisions existing

in the U.S. or U.K -G.A.A.P. Prudence is one of the most important concepts lying at the basis of accounting.

In a similar manner, the states in Central and South America, which were under Spanish and Portuguese influence for a long time, have accounting rules which are similar to those in force in the European countries.

Although there existed some specific differences in the field of accounting in the above mentioned countries, the conventions, principles and rules of the double-entry bookkeeping are universally applicable, and the differences related to taxation are diminished to a broad extent. The need to enhance the harmonization of the system of financial positions leads to a generalization of the I.A.S.C. standards. Especially the standards IAS 1-41 can and must become more and more reference instruments.

The internationalization of the financial markets, the stronger development of the multinational companies constitutes objective factors which lead to a more complex organization in the field of bookkeeping and especially referring to the financial positions.

The multinational companies (M.N.C.) have become a reality in the business world. Especially in the last quarter of the 20-th century, they have taken on an outstanding role in several market shares and have stimulated many activities in the national economies of different countries.

5. The bookkeeping depends on the type of economic system to which it belongs.

The bookkeeping is a component part of the economic sciences and, at the same time, a remarkable technique improved lately in order to be more and more useful for business and people. The accounting is anchored in the knowledge economy. The political economy supplies the bookkeeping, as well as the other economic disciplines, with the basic conceptual "infrastructure". The accounting, - although it has a great functional autonomy – will however depend on the type of economic system to which it belongs. In the era of globalization we come across opinions and arguments in favour or against the globalization. Consequently, there will be viewpoints to anchor the accounting in this tendency or to point out its development in the isolationist national context. Some economists will study the possibility to adapt the accounting to the great challenges of the transparent business in any place of the earth so that worldwide business should be encouraged. Others will find errors or inherent elements of incompatibility between the international accounting framweork and the national economic realities.

For any of these cases, the need to use judgment is essential. The analyst must use judgment when performing ratio analysis. A key issue is wheyher a ratio for a firm is within a reasonable range for an industry, with this range being determined by the analyst. Although financial ratios are used to help assess the growth potential and risk of a business they cannot be used alone to directly value a company or determine its creditwothiness. The entire operation of the business must be examined, and the external economic and industry setting in which is operating must be considered when interpreting finantial ratios.

The financial analyst who is interested in assesing the value of creditworhiness of any entity is required to estimate its future cash flows, assess and risk associated with those estimates, and determine the proper discount rate that should be applied to those estimates. The objective of the financial statements is to provide information which is useful to users in making economic decisions. However, the financial statements do not contain all the information that an individual user might need to perform all of the above tasks, because they largely portray the effects of past events and do not necessarily provide nonfinancial entity (its income and cash flows), as well as its current financial condition (assets and liabilities) that are useful in assessing future prospects and risks. The financial analysis must be capable of using the financial statements in conjunction with other information in order to reach valid investment conclusions.

The notes to financial statements should be issued according to the accounting law and are an integral part of the IFRS financial reporting process. They provide important detailed disclosures required by IFRS, as well as other information provided voluntarily by management.

6. Conclusions.

The bookkeeping plays an important part in the management of the modern patrimonial entities. This contribution can be noticed on several levels.

In the modern management system, the *budgets* are frequently used for planning, monitoring and control of the activity as well as for the establishment of some easily measurable parameters. In the substantiation, working out and monitoring of the budgets, there are used, first of all, data from the bookkeeping. The main "referential" mark for the indices in the budgets is the financial management accounting of the patrimonial entity.

In the current activity of the modern company, sometimes there must be made *evaluations* and revaluations of owner's equity or of the performed business. For such evaluations and revaluations, the data from the accounting are used, even if other sources are used as well.

A concept of the modern management is that of management by means of costs. In order to calculate the costs of the patrimonial entity, most of the data are taken over from the financial accounting. The cost calculation is itself a part of the activity in the management accounting.

The development of the patrimonial entities, as well as the drawing of additional financial resources from the banking system or from the capital market, suppose – in principle – the working out of feasibility studies or of business plans. For these documents of the guidance of the future activity much information is needed that can be found only in the accounting.

The manager's or administrator's instrument board is another leading instrument proposed by the contemporary business science. Within this instrument board, a great part of the information comes from the accounting. Some are recorded as such on the board, while others undergo some processings. The accounting remains, however, a significant supplier of such information.

THE HARMONISATION OF LEGISLATION ON COMBATTING TAX EVASION IN THE EUROPEAN UNION

DANIELA IANCU[*]
CARMINA ALECA[**]
ANDREEA TABACU[***]

Abstract
Combating tax evasion is part of the Lisbon Strategy. Tax fraud created a significant distortion in the functioning of the internal market and prevented fair competition.
In its resolution of 2th of September 2008 on a coordinated strategy to improve the fight against fiscal fraud (2008/2033 (INI)) the European Parliament stressed that the Member States cannot combat cross-border fraud in isolation and called on the Commission to propose mechanisms to promote cooperation between Member States.
This paper aims to analyse the main mechanisms to combat the tax evasion at the European level and, also, the changes that our country had to make in the field of legislation in order to achieve the EU standard on the fight against tax evasion.

Keywords: *tax evasion, fraude, harmonisation, VAT, Eurofisc*

Introduction

The harmonisation of fiscal legislation in the field of preventing and combating tax evasion constitutes an imperative for Member States of the European Union, especially in the current economic context. At present, there are many efforts to diminish the effects of fiscal evasion at a community level, especially in the case of VAT tax evasion. This is the reason why a document that contains proposals for the modification of legislation on the value added tax has been put forward for discussion, with the goal of unifying this legislation in the member states of the European Union.

The Member States cannot fight fiscal fraud each on its own, therefore cooperation mechanisms have been instituted among them.

The battle against tax fraud is a challenge for the European Union that goes beyond its borders and consequently it must be reflected in the international agreements concluded by the European Union with third party states or in multilateral covenants of which it is a signatory.

In order to efficiently combat fraud, the European Union negotiates agreements or multilateral covenants, on behalf of itself and the Member States.

The paper analyse the main mechanisms created in order to fight against the fiscal fraud at the European level and, also the measures that must be taken to achieve this goal. Those measures are underlined, especially, in the European Parliament Resolution from 2 September 2008. Part of them were already applied, but some of them are still object of a proposal submitted to the Member State's analyse, as the proposal of modifying the Directive concerning VAT.

1. Measures on combating fiscal fraud in the European Union

The protection of their financial interests has been a main concern for the Member States of the European Union, so on 26 July 1955 it drew up the Convention on the Protection of the European Communities' Financial Interests. Any type of fraud that injures community interests is defined as[1]: in respect of expenditure, any intentional act or omission relating to: "the use or presentation of false, incorrect or incomplete statements or documents, which has as its effect the misappropriation or wrongful retention of funds from the general budget of the European Communities or budgets managed by, or on behalf of, the European Communities, non-disclosure of information in violation of a specific obligation, with the same effect, the misapplication of such funds for purposes other than those for which they were originally granted" and in respect of revenue "the use or presentation of false, incorrect or incomplete statements or documents, which has as its effect the illegal diminution of the resources of the general budget of the European Communities or budgets managed by, or on behalf of, the European Communities, non-disclosure of information in violation of a specific obligation, with the same effect, misapplication of a legally obtained benefit, with the same effect."

Pursuant to the provisions of the Convention, serious fraud is any type of fraud whose minimum value must be fixed by every Member State, though no more than 50 000 euros.

Article 3 from the Convention sanctions the principle, according to which leaders that exert a legal power or that head businesses cannot be automatically exonerated from any form of liability, when there is fraud affecting the financial interests of the European Union.

The text of the definition in the Convention has been assimilated into the national legislature, in Law 78/2000 on the prevention, discovery and punishment of acts of corruption, thus fulfilling the obligation stipulated by article 1, paragraph 2 from the Convention [2].

Tax fraud causes important distortions in the workings of the domestic market and constitutes an obstacle for loyal competition.

In its resolution from 2 September 2008 on a strategy coordinated for the intensifying of the fight against tax fraud (2008/2033 (INI)), the European Parliament highlights the fact that Member States cannot fight against cross-boarder tax fraud each on their own and therefore they appeal to the Commission to propose measures of promoting the cooperation between member states.

An efficient fight against VAT fraud in the domestic market requires a common approach both in the legislative field but also on certain aspects of the operational management of the VAT system, operational differences between Member States can provide fraudsters the opportunity to undermine the efficiency of subjacent community legislative measures.

The measures that the Commission was to propose or implement aimed to[3]: prevent the illegal use of the VAT system by potential fraudsters, consolidate the means used to detect TVA fraud and improve possibilities of collecting taxes lost due to fraud and the punishment of the tax evaders.

Measures for enhancing the tax system and fiscal cooperation with the goal of preventing VAT fraud impose: common minimum standards for the registration and deregistration of taxable persons[4], confirmation of information, invoicing rules, chargeability on intra-Community transactions.

Among the measures for enhancing the efficiency of the tax administration in order to detect VAT fraud, we must mention the reduction of the timeframes for both the reporting of intra-

[1] Article 1 from the Convention on the Protection of the European Communities' Financial Interests.

[4] A correct and valid VAT indentification number represents an essential element within the framework of current VAT systems, because it establishes the rules and obligations applicable especially in intra-Community commerce. Both financial administrations, as well as companies must be able to rely on the correct information concerning the VAT status of the economic agent.

Community transactions by traders and the exchange of information between tax administrations, exemption of VAT at importation, enhancing cooperation between Member States, automated access to data, the creation of a European network, called Eurofisc, for closer operational cooperation between Member States in the fight against VAT fraud.

The measures of enhancing the capacity of the tax administration to collect and recover taxes include several liability[5], recovery of taxes - uniform instruments including enforcement or precautionary measures, which should reduce the administrative burden of the authorities concerned and allow quicker reactions -, shared responsibility for the protection of all revenues of Member States.

Concerning the rules of invoicing, Directive 2006/112/CE on the joint VAT system was amended through Directive 2010/45/UE[6] by the Council, on 14 July 2010.

The directive contains measures in view of the simplification of different existing requirements concerning invoicing, including electronic invoicing. The directive stipulates the equal treatment applied to both invoices on paper an in electronic form, the principle applicable to both types being that the authenticity of the origin, the integrity of content and the legibility of the invoice should be ensured from the moment of issue until the invoice is placed in storage. The directive contains the method of electronic data exchange and the advanced electronic signatures, as well as the stipulations concerning self-invoicing, invoice simplification, translation of invoice, currency, centralised invoices, modifications concerning the origin and VAT changeability, the right to deduct VAT, etc.

Member States must adopt and implement the provisions of the directive by 31 December 2012.

On 6 October 2009, pursuant to article 93 of the Treaty establishing the European Community, the Council decided to consult the European Economic and Social Committee on the Proposal for a Council Directive amending Directive 2006/112/CE as regards an optional and temporary application of the reverse charge mechanism in relation to supplies of certain goods and services susceptible to fraud COM (2009) 511 final – 2009/0139 (CNS)[7].

The EESC was in favour of the proposal for a Council Directive, which introduces a reverse charge mechanism for certain products and services.

The EESC has expressed its approval of the proposals contained in the European Parliament Resolution from 2 September 2008 concerning a coordinated strategy for enhancing the fight against tax fraud, especially taxation in the country of origin with a single 15% rate for intra-Community transactions. This option would conform to the provisions of article 402 from Directive 2006/112/EC.

Combating fiscal fraud, especially intra-Community fraud, has not made great progress these last years. Total fiscal losses caused by fraud amount to a sum between 200 and 250 billion EUR, the equivalent of 2% of the EU gross domestic product.

VAT fraud accounts for 40 billion EUR, i.e. 10% of revenues from this tax.

The progressive increase of exchanges has led to a proliferation of the so-called „carousel" fraud. Legislation on this matter stipulates that merchandise transiting through the EU should pass freely, the VAT on commercial transactions between Members States are to be collected in the country of destination.

By introducing a fictitious taxable person in the transaction, one obtains an illegal triad, which thus simulates the double transfer of the same goods. The buyer has the right to reclaim VAT, which has not been paid by the third conspirator however, who in turn has bought the VAT-exempt goods from a supplier from another Member State. The third conspirator thus vanishes.

[5] The provision concerning several liability already exits in the VAT Directive, however until now Member States have used it only in national transactions.

[6] http://discutii mfinante ro/static/10/Mfp/infotva/Directiva_2010_45_facturarea.pdf.

[7] Official Journal C 339(14/12/2010): 0041 – 0044.

Due to the reverse charge mechanism, the supplier from the same Member State does not invoice the VAT to the taxable persons who, in turn, must pay this tax. Theoretically, the possibility of using the carousel fraud is eliminated by this procedure.

The contraindications of the system based on applying the country of destination principle, which – in order to function correctly – is conditioned by a consolidated and efficient system of exchanges of information between Member States, give rise to fiscal frauds, which are difficult to counteract. The Community has definitely opted for the country of origin principle, which provides a form of compensation between Member States, by redistributing VAT. Article 402 from Directive 2006/112/EC from 28 November 2006 states that taxation on intra-Community exchanges should be done in the country of origin.

Redistribution is necessary for the compensation effect on the revenue resulted from taxation, exportation and import tax deductions, which are already charged in the country of origin.

Adopting a permanent scheme, which should drastically reduce intra-Community fiscal fraud, needs a system integrated by administrative cooperation.

In order to counteract the growing cases of intra-Community fraud perpetrated through the so-called *missing traders* (Missing Trader Intra-Community fraud) better known as *carousel fraud* (given that it refers to the repeated transfer of the same goods between operators in different Member States), some Member States have appealed to the Commission to grant the derogation stipulated in article 395 of the EU VAT Directive, which allows the introduction of a temporary system of reverse taxation on certain goods and services.

The Commission considered that an amendment of the VAT Directive would be more suitable, by introducing article 199 a, which grants the derogation until 2014.

On the list of goods that might benefit from the optional introduction of this reverse charge system, there are among other things common appliances, such as mobile telephones and devices with integrated circuits. This scheme is already being used in the United Kingdom, which has been granted derogation from the Council.

Perfumes and objects made from precious metal, which are not collection pieces or antiquities, complete the list of the four types of goods given by the directive. The services include transactions with issued certificates.

Since 2008, the European Parliament has emphasized the risks connected with the possibility of new acts of fraud occasioned by the introduction of the generalised reverse charge system, especially in retailing and by the abusive utilisation of the VAT identification number, via an appeal addressed to the Council to act more decisively in the fight against fiscal fraud[8]. Parliament suggested in its resolution that the transit and charge policy of intra-Community delivery of goods should be surpassed by a rate of 15%, as an optimal solution.

The European Court of Justice has already decided on the matter of reverse taxation[9]. The decision refers to the request of payment from a tax administration, owing to a misinterpretation of the reverse charge mechanism. In order to avoid useless and costly proceedings, it will be necessary to verify the national legislations, which although applying general principles, present inadvertencies for example between the terms of the reimbursement requests and those for the payment of taxes.

The administrations of Member States which will adopt this system shall have to examine a great number of requests for the reimbursement of VAT surplus, filed by taxable persons who can no longer deduct the VAT previously charged.

The burden of paying this tax is transferred onto smaller and smaller economic operators, who may prove to be less reliable than the VAT taxpayers (medium-sized and large companies that pay

[8] The European Parliament Resolution from 2 September 2008 on a coordinated strategy for the enhancement of the fight against fiscal fraud [2008/2033(INI)], JO C 295 E/13 from 04.12.2009.

[9] Reunited cases C 95/07 and C 96/07 from 08.05.2008.

the most considerable part of the revenues obtained from these taxes). By eliminating the fragmented payments, the system increases the risk of losing fiscal revenues.

After a complete analysis, it seems that a rigorous control system is necessary, in order to protect Member States against the negative effects, which the reverse charge mechanism could occasion. It is necessary that the process of enhancing the monitoring measures take place at the same time as the consolidation of administrative cooperation and the utilisation of standard systems of information exchange between administrations.

A part of the European strategy to combat tax evasion and fraud in general, the European Council adopted on 7 October 2010, Regulation 904/2010 on administrative cooperation and combating fraud in the field of value added tax[10] with the purpose of extending and strengthening the legal framework for the cooperation and exchange of information between the competent authorities of Member States. The regulation does not prevent Member States from applying the rules on mutual assistance in criminal matters.

Starting from the premise that, in order to collect due taxes, the Member States should not only monitor the correct application of the tax owed on its own territory, but it must also equally offer assistance to other Member States, so that it guarantees the correct application of the tax owed in another Member State as a result of activities on its own territory, the regulation establishes the conditions, in which the competent authorities from the Member States responsible for the application of VAT legislation should cooperate amongst themselves and with the Commission, in order to ensure the respective legislation.

Every Member State designates a single central liaison office, which has been delegated with the responsibility for contacts with the other member states in the field of administrative cooperation. The competent authority of every Member State may designate liaison departments, in which case the central liaison office must update a list of these departments and supply it to other central liaison offices from other Member States.

At the request of a requesting authority, the requested authority communicates information, including any information concerning one or more specific cases, which could help to effect a correct assessment of VAT, to monitor the application of VAT, particularly on intra-Community transactions, and to combat VAT fraud.

This information will be transmitted, without any prior request, by the competent authority of each Member State to the competent authority of every other Member State concerned, in the following cases: when it is considered that the taxes will be collected in the Member State of destination, and the information given by the Member State of origin is necessary to the efficiency of the control system of the Member State of destination; when a Member State has reasons to believe that a breach of the VAT law has been committed or is possible in the other Member State; when there is a risk of fiscal losses in the other Member State.

Every Member State may abstain from taking part in the automatic exchange of information, with respect to one or more categories of information, in case the collection of the respective information would impose new obligations on the persons liable for VAT or would force a disproportionate administrative burden upon the Member State.

From 1 January 2015, the competent authority in every Member State will proceed to automatically exchange information, which will allow the Member States to ascertain whether taxable persons not residing in their territory declare and correctly pay VAT owed for telecommunication, television and radio services as well as electronically supplied services, regardless of whether these persons use the special scheme stipulated by Directive 2006/112/EC in Title XII, chapter 6, section 3, or not. The Member State of residence informs the Member State of consumption of any discrepancies discovered.

[10] Official Journal of the European Union L268/1 from 12.10.2010.

The regulation also regulates the storage and automatic exchange of specific information, simultaneous controls[11] and providing of information to taxable persons.

In order to promote and facilitate cooperation in the fight against VAT fraud, the regulation establishes a network of quick exchanges of specific information between Member States, called Eurofisc. Within the framework of this network, the competent authorities of every Member State designates at least one Eurofisc liaison official to establish a multilateral early warning mechanism for counteracting VAT fraud, to coordinate the rapid and multilateral exchange of information within the Eurofisc working fields[12].

The battle against tax fraud is a challenge for the European Union that goes beyond its borders and consequently it must be reflected in the international agreements concluded by the European Union with third party states or in multilateral covenants of which it is a signatory.

In order to efficiently combat fraud, the European Union negociates agreements or multilateral covenants, on behalf of itself and the Member States.

In the context of the reinforced arrangement of the EU and the G-20 to establish a high level of cooperation internationally with the financial centres and tax havens in third party countries, which meet the OECD standards on fiscal cooperation, and following the Ecofin Council meeting of February 2009, the Commission amended its proposal, adopted on 10 December 2008, for a Council Decision on the signing and concluding of a cooperation agreement between the European Community and the Member States, on one side, and the Principality of Liechtenstein, on the other side, to combat fraud and any other illegal activity to the detriment of their financial interests[13]. The amended proposals were adopted in November 2009 and include the recent standards providing for the exchange of information in the field of taxation and the changes imposed by the coming into effect of the Lisbon Treaty.

This agreement would bring considerable value to the extent to which its scope covers not only tax evasion, tax fraud and any other unlawful activities affecting the financial interests of the parties involved, but also the exchange of information on fiscal matters, in accordance with the OECD standard, in this way preventing banking secrecy from being invoked as an exception that would hinder the exchange of information.

The agreement is particularly important because it should be used as an model for anti-fraud agreements made with third party countries, in accordance with the recommendations adopted by the European Commission in June 2009.

„The existence of tax havens and the effects of economic activities of people residing in such places impose the adoption of a strong joint stance of all states. The stated purpose is to attract the financial resources to the state budget of the country, which receives the taxable revenue, in order to efficiently use it for the benefit of the respective country's nationals."[14]

2. The harmonization of the Romanian legislation with the European legislation

The accession of Romania to the European Union has led to a series of important measures in the fight against tax evasion and fiscal fraud, with efforts aimed firstly at diminishing underground commerce and promoting legislative measures to accelerate the development of the market economy.

The following measures have been taken in view of the Romanian accession to the European Union: the acceleration of reforms in public administration; the reform of the social security system

[11] Member States may agree to perform simultaneous controls every time they consider such controls to be more efficient than controls performed by a single Member State.

[12] Article 33 from Regulation 904/2010 on the administrative cooperation and combatting VAT fraud.

[13] http//ec.europa.eu/anti_fraud/reports/commission/2009/RO.pdf Commission Report to the Council and the European Parliament - The Protection of the Financial Interests of the European Union – Combatting Fraud – Annual Report 2009.

[14] Dan Drosu Şaguna, Mihaela Tofan, *Drept financiar şi fiscal european, (*Bucureşti: Ed. C.H.Beck, 2010), 289.

with an emphasis on social insurance – especially financial reliability and the relation between paid contributions and received benefits; the general reform of indirect taxation, especially VAT, in agreement with the conditions for integration into the European Union; the increase of regulation simplicity, transparency and stability concerning taxes and tariffs; the elimination of wasteful policies that generate problems in the activities of the official sector of the economy; the acceleration of institutional reforms, in accordance with the conditions of integration into the European Union.

Romanian legislation on fiscal fraud and tax evasion has been adapted to the requirements of Community directives, and the main provisions are contained in the Position Document of Romania, Chapter 10 – Taxation, Chapter 12 – Statistics, Chapter 24 – Justice and Domestic Affairs, Chapter 28 – Financial Monitoring, Chapter 29 – Financial and Budgetary Provisions. However, national legislation is not effective enough to eliminate tax evasion[15].

Conclusions

Combating fiscal fraud, especially intra-Community fraud, has not made great progress these last years. Total fiscal losses caused by fraud amount to a sum between 200 and 250 billion EUR, the equivalent of 2% of the EU gross domestic product.

An efficient fight against VAT fraud in the domestic market requires a common approach both in the legislative field but also on certain aspects of the operational management of the VAT system, operational differences between Member States can provide fraudsters the opportunity to undermine the efficiency of subjacent community legislative measures. So, it must be realised: common minimum standards for the registration and deregistration of taxable persons, confirmation of information, invoicing rules, chargeability on intra-Community transactions.

According to the EC, the tax evasion concerning VAT is about 100 billion EUR every year, at the communitarian level[16]. That's why the European Union wishes to reduce the tax evasion effects at the communitarian level. In this respect, it was submitted to a public debate a consultative document concerning the amendments to the VAT legislation with the purpose of using a single rate, reducing the number of exceptions to the payment and extending the tax base.

Reducing tax evasion and increase revenue collection will be the result of simplifying the system and reducing administrative burdens.

CONSIDERATIONS ON THE PROTECTION OF WOMEN'S RIGHTS IN THE LIGHT OF THE EQUAL OPPORTUNITIES PRINCIPLE BETWEEN MEN AND WOMEN

MARINA LOREDANA BELU[*]
ALEXANDRA ELENA ILINCA[*]

Abstract
Development cannot be achieved if fifty percent of the population is excluded from the opportunities it brings! Gender equality and women's empowerment are human rights that lie at the heart of development and the achievement of the Millennium Development Goals. Women's rights around the world is an important indicator to understand global well-being. A major global women's rights treaty was ratified by the majority of the world's nations a few decades ago. Yet, despite many successes in empowering women, numerous issues still exist in all areas of life, ranging from the cultural, political to the economic.Equality between women and men is also a fundamental right, a common value of the European Union and a necessary condition for achieving the objectives of economic growth, employment and social cohesion.

Keywords: *sex discrimination, sexual harassment, equality of chances, dignity, rights*

Introduction

European society is changing, influenced by different factors such as technological progress, the globalisation of trade and an ageing population. European employment, social affairs and equal opportunities policies contribute to improving people's living conditions with a view to sustainable growth and greater social cohesion. The European Union (EU) plays the role of a trigger in social change. It has introduced a protective legal framework for European citizens. It fosters the cooperation of Member States, the coordination and harmonisation of national policies, and the participation of local authorities, unions, employers' organisations and other stakeholders involved.

The priority aims of this policy are to increase employment and worker mobility, to improve the quality of jobs and working conditions, to inform and consult workers, to combat poverty and social exclusion, to promote equality between men and women, and to modernise social protection systems.

Equality between women and men is one of the fundamental principles of Community law. The European Union's objectives on gender equality are to ensure equal opportunities and equal treatment for men and women and to combat any form of discrimination on the grounds of gender. The EU has adopted a two-pronged approach to this issue, combining specific measures with gender mainstreaming. The issue also has a strong international dimension with regard to the fight against poverty, access to education and health services, taking part in the economy and in the decision-making process, women's rights and human rights[1].

Starting with 2007 - "International Year of Equal Opportunities for All" - women's rights issues, particularly with regard to equality between men and women, has acquired new meanings in general and the rights of defense and fundamental rights.

The Protection of woman's rights in international documents

The differences that had happened based on the person`s gender have imposed the statutory principle of equality between men and women in terms of international regulations. The issue of women's rights, proclaiming and subscribing their inclusion in official statements and laws (including constitutions), and the existence of a system to guarantee those rights both internationally and locally, implicitly requires the existence of policy instruments and legal defense[2]. The concerning of the international community to eliminate all forms of discrimination against women has led the United Nations to act in this direction by enrolling in this action to promote the principle of equality between men and women.

The first intergovernmental organization to adopt concrete measures against gender discrimination was the Organization of American Republics. Thus, at the 5th Inter-American Conference, held between March 25th and May 3rd, 1923, in Santiago de Chile, decided to enroll in the program of the future Conference to study the means like the abolition of constitutional and legal incapacity of women for it can enjoy all civil and political rights. This has led to the creation of the Inter-American Commission of Women.

The general instruments enshrining the principle of general equality between women and men are:

a) The preamble of the United Nations Charter which proclaims the people` faith "in the equal rights of men and women ‘’;

b) The first article of the UN Charter states one of the UN goals, namely to encourage "the respect for human rights and fundamental freedoms for everyone, without the question of race, gender ...", and the 8th article guarantees "the access for men and women, on equal terms, in all functions, the principal and subsidiary institutions ‘’;

c) The Universal Declaration of Human Rights which stipulates in art. 2 that "everyone is entitled to all rights and all freedoms set forth in the Declaration, without distinction of any kind such as race, color, gender;

d) International Covenants on Human Rights, which also prohibit discrimination based on gender.

Among the specific tools to eliminate discrimination against women, the most common include[3]:

- Declaration on the Elimination of Discrimination against Women, reaffirms, on the one hand, the principles of the UN Charter, the Universal Declaration of Human Rights and two international pacts and, on the other hand, new principles are proclaimed, establishing itself as a necessity because the equal rights of women continue to be the subject of extensive discrimination.

- Convention on the Political Rights of Women, wich entered the express provision that women have, on equal terms with men, the right to vote in any elections without any discrimination that may be, under conditions of full equality with men, elected in political oragnisms/institutions, established under the national law.

- Convention on the Elimination of All Forms of Discrimination against Women, defines "discrimination against women" which, in terms of article 1, "refers to any distinction, exclusion or restriction based on gender, which has the effect or purpose of impairing or nullifying the recognition, enjoyment and exercise by women regardless of their marital status, based on equality between man and woman, human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field.

---

[2] Roxana Radu, *Elements of social security law* (Craiova: Aius PrintEd, 2009), 184.

[3] Cezar Avram and Roxana Radu, "Considerations on sex discrimination and sexual harassment in the light of the equal treatment principle", *Euro-Dreptul* 1(2006):26-35.

- Inter-American Convention on the Prevention, Punishement and Eradication of Violence against Women, "Belem do Para Convention"[4], provides in art.3 that "every woman has the right to be free from violence in both the public and private spheres". The article 4 affirms the fact that "every woman has the right to the recognition, enjoyment, exercise and protection of all human rights and freedoms embodied in regional and international human rights instruments and mentions other categories of rights: the right to have her life respected; the right to have her physical, mental and moral integrity respected; the right to personal liberty and security; the right not to be subjected to torture; the rights to have the inherent dignity of her person respected and her family protected; the right to equal protection before the law and of the law; the right to simple and prompt recourse to a competent court for protection against acts that violate her rights; the right to associate freely; the right of freedom to profess her religion and beliefs within the law; and the right to have equal access to the public service of her country and to take part in the conduct of public affairs, including decision-making".

The principle of equality (of treatment) among men and women in international labor law

Millions of women and men around the world are denied access to jobs and training, receive low wages, or are restricted to certain occupations simply on the basis of their sex, skin colour, ethnicity or beliefs, without regard to their capabilities and skills. In a number of developed countries, for example, women workers earn up to 25% less than male colleagues performing equal work. Freedom from discrimination is a fundamental human right and is essential for both workers to choose their employment freely, to develop their potential to the full and to reap economic rewards on the basis of merit. Bringing equality to the workplace has significant economic benefits, too. Employers who practise equality have access to a larger and more diverse workforce. Workers who enjoy equality have greater access to training, often receive higher wages, and improve the overall quality of the workforce. The profits of a globalized economy are more fairly distributed in a society with equality, leading to greater social stability and broader public support for further economic development. ILO standards on equality provide tools to eliminate discrimination in all aspects of the workplace and in society as a whole. They also provide the basis upon which gender mainstreaming strategies can be applied in the field of labour[5].

The field in which women are the most flagrant discriminated is the employing management. International Labour Organization has developed two special agreements on this issue. It's Convention no. 111 from June 4, 1958 concerning the discrimination in respect of employment and occupation and the Convention no. 100 from 1951 on equal remuneration for men and women's labor, for work of equal value. This fundamental convention requires ratifying countries to ensure the application to all workers of the principle of equal remuneration for men and women workers for work of equal value. The term "remuneration" is broadly defined to include the ordinary, basic or minimum wage or salary and any additional emoluments payable directly or indirectly, whether in cash or in kind, by the employer to the worker and arising out of the worker's employment.

The principle of equal treatment or discrimination in matters of employment is a creation of the International Labour Organisation. Enshrines the principle of equal treatment, the Convention no. 111 defines discrimination as " any distinction, exclusion or preference made on the basis of race, colour, sex, religion, political opinion, national extraction or social origin, which has the effect of nullifying or impairing equality of opportunity or treatment in employment or occupation. It requires

[4] Adopted in Belém do Pará, Brasil, on June 9, 1994, at the twenty fourth regular session of the General Assembly

[5]"Equality of opportunity and treatment", accessed February 15, 2010, http://www.ilo.org/global/standards/subjects-covered-by-international-labour-standards/equality-of opportunity-and-treatment/lang--en/index htm

ratifying states to declare and pursue a national policy designed to promote, by methods appropriate to national conditions and practice, equality of opportunity and treatment in respect of employment and occupation, with a view to eliminating any discrimination in these fields. This includes discrimination in relation to access to vocational training, access to employment and to particular occupations, and terms and conditions of employment. "

The discriminations based on the gender have imposed the statutory principle of equal treatment between men and women in the field of labor relations in terms of international regulations, but they were equally the source of numerous controversies about the unacceptable discriminations and distinctions based on gender. The rules that ensure the protection of women who do a paid work are considered by some authors as a violation of the principle of equality between the gender[6]. It was stated in the literature, that it must be generally accepted that "neither men nor women should not be subject to safeguards based on gender, except in strictly biological reasons. The existence of traditional stereotypes regarding gender division of labor is not considered a valid reason to grant special protection to women[7]. Therefore, differences in treatment are admitted to the strictly biological grounds requiring special protection to women especially during pregnancy and post-partum".

The changes appeared in Europe in terms of gender roles within the family and society led to the adoption of Directive no. 76/207/EEC[8] that governs the implementation of the principle of equal treatment for men and women as regards access to employment, vocational training and promotion, and working conditions.

The principle of equal treatment means that there should be no discrimination whatsoever on the grounds of sex**,** either directly or indirectly, by reference in particular to marital or family status. Member States may, however, exclude from the Directive's scope occupational activities for which, by reason of their nature, or the context in which they are carried out, the sex of the worker constitutes a determining factor.

The Directive is without prejudice to provisions concerning the protection of women (pregnancy, maternity), or to measures to remove existing inequalities which affect women's opportunities in the areas covered by the Directive.

Application of the principle means that there should be no discrimination on grounds of sex in the conditions, including selection criteria, for access to all jobs or posts at all levels of the hierarchy.

The principle applies to access to all types and all levels of vocational guidance, basic and advanced vocational training and retraining. Application of the principle to working conditions, including conditions governing dismissal, means that men and women must be guaranteed the same conditions.

Member States must take the measures necessary to ensure that any laws, regulations and administrative provisions contrary to the principle of equality are abolished or amended if they were originally based on a concern for protection which is no longer well-founded; inappropriate provisions included in collective agreements, individual contracts of employment, the internal rules of undertakings or rules governing independent professions can be declared null and void or amended.

[7] Ruth Nielsen, "La legislation protectrice des femmes et les pays nordique", *Revue internationale du Travail, vol.119,* 1(1980):51, cited by Jean-Michel Servais – cited work:127, cited by Avram Cezar and Roxana Radu, "The European year of the Equality of Chances for all. The protection of woman rights in 2007", *Revue de Sciences Politiques,* 13(2007), 22-35

[8] For full document please http://www.equalitytribunal.ie/uploadedfiles/AboutUs/council_directive_76207eec.pdf

Labour and management must be requested to undertake the revision of such provisions in collective agreements. Persons wronged by failure to apply the principle must have the right to pursue their claims by judicial process.

Employees must be protected against dismissal by the employer as a reaction to a complaint within the undertaking or to any legal proceedings aimed at enforcing compliance with the principle of equal treatment.

The provisions adopted pursuant to this Directive and the relevant provisions already in force must be brought to the attention of employees by all appropriate means.

Member States must periodically assess the occupational activities excluded from the field of application of the Directive in order to decide, in the light of social developments, whether there is justification for maintaining the exclusions concerned. They must forward all necessary information to the Commission by the stipulated deadline, to enable it to draw up a report on the application of the Directive.

Article 119 of the EEC Treaty establishes the principle of equal pay for equal work between men and women. The principle of equal pay entails, for the same work or for work to which equal value is attributed, the elimination of all discrimination on grounds of sex with regard to all aspects and conditions of remuneration. Where a job classification system is used for determining pay, it must be based on the same criteria for both men and women. Employees wronged by failure to apply this principle must have the right of recourse to judicial process to pursue their claims.

Member States shall abolish all discrimination between men and women arising from laws, regulations or administrative provisions which do not comply with the principle. They shall take the necessary measures to ensure that provisions appearing in collective agreements, wage scales, wage agreements or individual contracts of employment which are contrary to the equal pay principle may be declared null and void. They shall ensure that the equal pay principle is applied and that effective means are available to take care that it is observed.

Employees shall be protected against dismissal by the employer as a reaction to a complaint within the undertaking or to any legal proceedings aimed at enforcing compliance with the equal pay principle.

The aim of the Directive is to reinforce the basic laws with standards aimed at facilitating the practical application of the principle of equality to enable all employees in the Community to be protected, as there are still disparities between Member States despite efforts to date.

There is a clear need for a Convention to prevent and combat domestic violence and other forms of violence against women and to protect and support the victims. The Council of Europe is the first European organisation to tackle this problem head on by setting up the Ad Hoc Committee on Preventing and Combating Violence against Women and Domestic Violence (CAHVIO) which began its work in April 2009. At its meeting in December 2010, the CAHVIO approved the Draft Council of Europe Convention on preventing and combating violence against women and domestic violence for transmission to the Committee of Ministers. The CAHVIO concluded its work in January 2011 with the approval of the draft Explanatory Memorandum.

The member states of the Council of Europe and the other signatories hereto[9]:

- Condemning all forms of violence against women and domestic violence;

- Recognise that the realisation of de jure and de facto equality between women and men is a key element in the prevention of violence against women;

- Recognise that violence against women is a manifestation of historically unequal power relations between women and men, which have led to domination over, and discrimination against, women by men and to the prevention of the full advancement of women;

[9] For more informations see the *Preamble* of the Council of Europe Convention on preventing and combating violence against women and domestic violence

- Recognise the structural nature of violence against women as gender-based violence, and that violence against women is one of the crucial social mechanisms by which women are forced into a subordinate position compared with men;

- Recognise the structural nature of violence against women as gender-based violence, and that violence against women is one of the crucial social mechanisms by which women are forced into a subordinate position compared with men;

- Recognise, with grave concern, that women and girls are often exposed to serious forms of violence such as domestic violence, sexual harassment, rape, forced marriage, crimes committed in the name of so-called "honour" and genital mutilation, which constitute a serious violation of the human rights of women and girls and a major obstacle to the achievement of equality between women and men;

- Recognise the ongoing human rights violations during armed conflicts that affect the civilian population, especially women in the form of widespread or systematic rape and sexual violence and the potential for increased gender-based violence both during and after conflicts;

The purposes of this Convention are to:

a) protect women against all forms of violence, and prevent, prosecute and eliminate violence against women and domestic violence;

b) contribute to the elimination of all forms of discrimination against women and promote substantive equality between women and men, including by empowering women;

c) design a comprehensive framework, policies and measures for the protection of and assistance to all victims of violence against women and domestic violence;

d) promote international co-operation with a view to eliminating violence against

e) women and domestic violence;

f) provide support and assistance to organisations and law-enforcement agencies effectively co-operate in order to adopt an integrated approach to eliminating violence against women and domestic violence.

The protection of women's rights and the principle of equality between men and women in Romania

According to art. 20 para. (1) of the Romanian Constitution, constitutional human rights provisions are interpreted and applied not only under international treaties to which Romania is party, but also to the Universal Declaration of Human Rights.

The law reviewing the Constitution amended art. 16, adding that Romania shall guarantee equal opportunities between women and men to fill public office or dignity, civil or military.

The framework law on protection against discrimination against women is Law *no. 202/2002 on equal opportunities between women and men.* Thus, article 1 of the law regulates the measures to promote equal opportunities between women and men, in order to eliminate direct and indirect discrimination based on gender criteria in all spheres of public life in Romania.

Measures to promote equal opportunities between women and men and to eliminate direct and indirect discrimination on the criteria of gender is in labor, education, health, culture and information, participation in the decision, and in other areas governed by special laws[10].

In labor, equal opportunities between men and women means non-discriminatory access to:

a) choice or the free exercise of a profession or activity,

b) employment in any position or job vacancies at all levels of professional hierarchy;

c) equal pay for work of equal value;

[10] Nicolae Voiculescu , "Some considerations on the Law nr. 202/2002 concerning the equality of chances of men and women and its harmonization with the community directives", *The Romanian Review of Labor Law*, 2(2003): 17

d) information and counseling, initiate programs qualification, training, specialization and retraining

e) promote any hierarchical and vocational level

f) working conditions that comply with health and safety at work, according to the legislation in force,

g) benefits, other than such wage and social protection measures and insurance.

The equality of opportunity and treatment between women and men in labor relations is enjoyed by all workers, including those self-employed and agricultural workers.

It is prohibited the discrimination by employers using practices which disadvantages people of a particular gender in relation to industrial relations, on:

a) announcing, organizing competitions or examinations and selection of candidates to fill vacancies in public or private sector,

b) termination, suspension, modification and/or termination of employment or legal service,

c) establishment or modification of job duties;

d) determining the remuneration

e) benefits, other than salary and social protection measures and insurance;

f) information and counseling, program initiation, qualification, training, specialization and retraining;

g) assessment of individual professional performance;

h) promotion

i) disciplinary measures;

j) the right to join unions and access to its facilities ;

k) any other conditions of work performance, according to the laws in force.

Exceptions are the jobs that, given the nature or conditions of performing the work prescribed by law, are essential features of gender.

Regarding the access to education, health, culture and information is prohibited any form of gender based discrimination in terms of access of women and men at all levels of education and training, further training and generally to lifelong learning. Education institutions both public and private, social factors are involved in processes of educational and all other training providers and training, authorized by law are required to include in curricula, and analytical programs other curricula measures respect the principle of equal treatment and opportunities between women and men. These institutions will implement measures to promote equality of opportunity and treatment between women and men in their current activities[11].

Extending equal opportunities between men and women in employment of any functions, both public and private sectors and to all rights stipulated by labor legislation (wages, working conditions, promotion, etc.) derives from art. 5 of the new Labour Code (Law no. 53/2003).

The principle of equal treatment between men and women in the field of labor relations is a consequence of the principle of equal treatment of all employees and employers, according to art. 5(2) of the Labor Code, which prohibits, any direct or indirect discrimination against an employee based on gender.

It is direct discrimination "acts and deeds of exclusion, distinction, restriction or preference based on one or more of the criteria set out in para. 2 (gender, sexual orientation, age, national affiliation, race, color, ethnicity, religion, political option social origin, disability, family situation or responsibility, trade union membership or activity), which have the purpose or effect of granting, restriction or removal of recognition, use or exercise rights under labor law. "

It is indirect discrimination "acts and deeds apparently based on criteria other than those provided in par. 2, but having direct effects of discrimination."

[11] Avram Cezar and Roxana Radu, "The European year of the Equality of Chances for all. The protection of woman rights in 2007", *Revue de Sciences Politiques*, 13(2007): 22-35

According to Article 2 paragraph 1 of Law no. 217/2003 on preventing and combating domestic violence, domestic violence is any physical or verbal action deliberately perpetrated by one family member against another member of the same family that causes physical pain, psychological, sexual or material damage. In para. 2 of the same article states: "It is also preventing women from domestic violence to exercise their rights and fundamental freedoms." This provision of the law proves the concern of the legislature to defend against any infringement of women's rights in general, and against domestic violence in particular. The law seeks to protect the rights of women against any breach came from a family member, a family member taking into account the spouse and close relative as defined in Art. 149 of the Criminal Code. The effects of this law and persons who have established relationships similar to those between spouses or between parents and children, established on the basis of social inquiry, that people living in concubinage, adopters and adopted or persons actually dependent on others.

For the provisions of Law no. 217/2003 on preventing and combating domestic violence in February 2004 was established the National Agency for Family Protection, as a specialized body with legal personality, subordinated to the Ministry of Health and Family. The agency`s objectives are:

a) promoting family values, understanding and mutual assistance in family violence prevention and control in relationships between members,

b) to assist family members in distress as a result of acts of domestic violence,

c) to assist victims through the recovery of health and social reintegration,

d) assisting the perpetrators of alcoholism treatment, rehabilitation, psychological and psychiatric

e) protecting victims, particularly minors, confidentiality measures to preserve their identity and psychological measures for their protection during handling of the case;

f) initiating and coordinating social partnerships in preventing and defending from the domestic violence.

To achieve the objectives in the care and protection of victims of domestic violence, the agency shall:

a) prepare, justify and implement strategies and programs to care and protect the victims of domestic violence,

b) controll the application of regulations in their own field and the business units operating under its authority,

c) fund or, where appropriate , co-specific defense programs and strengthen the family and the care and protection of victims of domestic violence;

d) establish shelters and telephonic hotlines for victims of domestic violence,

e) education, professional licensing and coordinating the activities of family assistants,

f) organizing courses on knowledge of forms of domestic violence;

g) studies and research, strategies, forecasts, production and publication of scientific and specific promotional materials;

h) manage the database of domestic violence situations;

i) involve and support initiatives for social partners in tackling domestic violence,

j) establish rehabilitation centers for victims of domestic violence,

k) establish call centers for abusers.

Conclusions

Promoting equal opportunities for women and men and ensuring full enjoyment of all human rights is a priority in Romania. Romania’s non-discrimination legislation has been constantly modernized to incorporate the most advanced international norms and standards .

Although Romania has made important steps forward in the field of gender equality and it is moving in the right direction, the pace is not fast enough. Speaking about gender issues, one can easily notice that further efforts are still necessary to improve the situation. Some measures could include:

a) To increase awareness on gender issues;
b) To better inform and raise the awareness of people on the protection of their rights;
c) To enhance the transparency (reports and statistics available);
d) To raise the financial support at the level of local authorities and local public administration;
e) To deliver an extended and diverse educational offer within the non-formal educational system;
f) To improve the collaboration among specialized organisations and bodies at all levels;
g) To make the agencies and other specialised bodies more visible and active.

THE RIGHT OF WITHDRAWAL FOR CONSUMPTION CONTRACTS

MOISE BOJINCĂ*

Abstract
The romanian legislature in its attempt to align the national legislation with European law requirements stated by a series of acts the right of termination in some consumer contracts.
The rule is not a general application one of this category of contracts but concerns only the conventions more dangerous or more disadvantageous to the consumer through the procedure for their termination or by the effects of engaging them.
These consumerism rules relating to prior mandatory period of reflection and denial free and legal right applicable to training of certain consumer contracts aimed at trying to protect the consumer before the transaction contract.
By the regulation, there is either delaying the final formation of the contract or subsequent withdrawal, in a certain period of time stipulated by the law of consent expressed, leading to derogate from the traditional way of reaching at the volitional agreement .

Keywords: *the right of termination, consumer contracts, volitional agreement, the offer to contract, the moment of signing the contract*

1. Classical Form of a Volitional Agreement

1.1. Preliminaries

The volitional agreement notion expresses one of the meanings[1] of the consent[2] that is the will agreement, a result of the understanding between two or several persons in order to produce juridical effects.

In this case, it is about "consensus" as a structural element of the conventions.

According to art. 942 Romanian Civil code, the contract represents "the will agreement of two or several persons in order to constitute or turn of a juridical report between them"[3].

As such, the contract execution supposes the accomplishment of the will agreement of the parties on the contractual clauses, by meeting on a full concordance, under all aspects, the offer to contract its meaning.

The contract offer and its acceptance represent the two sides of the will to contract, sides that initially appear separate, but that, by their meeting, may be reunited in what we call a will agreement.

The mechanism of reuniting the offer and the meaning represents the mechanism of the contract execution itself. It is usually complex and that is why it is preceded by negotiations.

1.2. The Offer to Contract

The parleys related to the contract signing start with a suggestion to contract made by a person. This suggestion is called offer or unfinished offer and represents the first will expression for forming the volitional agreement.

---

* University Prof. Ph.D. "Constantin Brâncuşi" University of Târgu-Jiu, Faculty of Juridical Sciences and Letters, Law Chair, (e-mail: moisebojinca@yahoo.com).

[1] The other acceptation assigns the will manifestation to be force.

[2] Etymologically, the term of consent comes from the Latin expression „cum sentire", meaning "to feel" or "you together". See, Gh. Iliescu, Civil Law. General Part, Sibiu, 1977, p. 173, M. Bojincă, Romanian Civil Law. General Theory, („Academica Brâncuşi" Press, Târgu Jiu, 2008), p. 186.

[3] In the acceptation of art. 1166 of Law no. 287/2009 (Assumed Civil Code) "The contract is a will agreement between two or several persons wanting to constitute, change, transmit or turn off a juridical report".

The offer to contract is often preceded by commercials, publicity, discussions, negotiations, and it is finally materialized in an offer juridically valid.

The offer may be made in writting, verbally or even tacitly.

For the offer validity, mainly, it is not required any special condition of form.

The offer to contract can be addressed either to a determined person, but also to some undetermined persons – addressed to the large public. Also, the offer can be made with or without a term.

The offer, being a side of the consent, must fulfil its general conditions. Thus, it should be:

-a real, serious, conscious, non-vitiated will expression having the purpose to juridically conclude a contract;

- firm, meaning that the tenderer has no possibility to change or retract it;

- unequivocal – specific, exact and punctual;

- complete, namely it should contain all the essential elements of the contract.

The problem of the mandatory force of the offer regards the moments before its acceptation. After being accepted, we deal with a formed contract, regarding which we may apply the rules regarding the mandatory force of the contract.

In literature, there were the following two problems:

- if the offer is launched, before being accepted, it gives birth to an obligation in the tenderer's target;

- if it creates obligations in his target, what the nature is and how long this obligation lasts.

Whereas in the current Civil Code there is no express regulation that could elude these things, and the only text referring to this matter– art. 37 of Commercial Code[4] – leaves us to understand that, until signing the contract, the offer may be unilaterally revoked by the one who did it, the judicial practice and the special literature accept that, in discussing the mandatory effect of the offer it is necessary to consider two situations whether the offer arrived or not to its addressee[5].

If the offer did not get to the addressee, the tenderer may revoke it freely and with no consequences. But it is necessary for the revocation to get to the addressee at the same time with the offer, the latest.

If the offer got to the addressee, we must distinguish it whether it has or has no term.

If it has a term, the tenderer has to keep it until the term expires. As soon as the term expires, the offer becomes weak.

If the offer has no term, it is admitted that the tenderer is forced to keep it for a reasonable time appreciated depending on the factual circumstances, in order to allow its addressee to deliberate and to pronounce on it.

1.3. Accepting the Offer

Accepting the offer constitutes, similar to the unfinished offer a unilateral voluntary document by means of which its addressee accesses the contracting suggestion.

Symmetrically to the offer features, an acceptation is valid if:

- it is the expression of a juridical will consciously elaborated and freely declared;

- it corresponds to the unfinished offer, namely it constitutes a response to all the offer requirements and data;

---

[4] Art. 37 Commercial Code stipulates that "Until the contract is perfect, suggestion and acceptation are revocable. However, even if the revocation stops the contract from being perfect, if it gets to the knowledge of the other party, after it had proceeded to its execution, then the one revoking the contract is responsible for damages – interests".

[5] L. Pop, *Civil Law. General Theory of Obligations. Treaty, (*"Chemarea" Foundation Press. Iaşi,) 1994, p. 47-48; C. Stătescu, C. Bârsan, *Civil Law. General Theory of Obligations*, (All Press, Bucharest, 1993), p. 44-45; T. R. Popescu, P. Anca, General Theory of Obligations, Scientific Press, Bucharest, 1968, p. 72-73; R. *Sanilevici, Civil Law. General Theory of Obligations*, (laşi University, 1976), p 40-41.

- it is unequivocal, namely it expresses, no doubt, the contracting will of the unfinished offer addressee;

- it is opportune, and it should interfere when the offer is current or efficient.

The material modalities used by the acceptant in order to show his accession may be very different whereas, just like the unfinished offer, the acceptation is expressed in written or verbally, by gesture or by attitude, or by the simple execution of the offer content.

1.4. The moment of signing the contract

1. 4. 1. The importance of the moment of signing the contract

Whereas most of the contracts are consensual, the moment of signing the contract coincides to the one of accomplishing the will agreement. The exception is represented by the solemn contracts that are signed when accomplishing the formalities stipulated by the law for their validity. The determination of the moment of signing the contract presents a practical importance whereas, in report to this moment, it is appreciated:

- the parties' ability to contract;

- the civil law applicable for law conflict in time;

- the date when there start certain legal and conventional terms, such as: the extinctive prescription term and the suspensive or extinctive term of executing the contract;

- the date of the transfer of the property right or of other real rights and of the risk of the fortuity disappearance of the good from the one estranging to the acquirer in the translative contracts, having as an object certain goods;

- nullity causes or causes of annulling the contract;

- the place of the contract signing.

In order to determine the moment of the contract signing, it is necessary to distinguish, in the first place, if the contracting parties are present, or they are not in the same place, a situation when the convention is contracted by correspondence. In the last case, we should distinguish between mutual obligation contracts and unilateral contracts.

1.4.2. Determining the moment of the contract signing between present persons

If a contract is signed between the present parties, it is formed since the moment of the agreement accomplishment, for the consensual contracts or of the accomplishment of the other formalities or material requirements for the solemn or real ones.

Both of the parties being present, the moment of the contract signing will be concomitantly known by each of them, the problem of specifying the constituting time has no special interest for the juridical technique. The moment coincides to the one of declaring the integral acceptation of the offer, with no reserves. The acceptation declaration should interfere immediately so that the tenderer knows it even from the moment it is expressed by the other party. As a consequence, in that moment the contract is signed. To these, we assimilate the contracts signed by phone from the viewpoint of determining the moment of their signing.

1. 1.4.3. Determining the moment of the contract signing between absents

1.4.3.1.Determining the moment of signing the mutual obligation contracts[6]

For contract signing between absents or by mail (post office, courier, telegraph, telex, internet etc.), whereas the offer transmitting and the answer reception suppose a lapse of time that is often difficult to establish, it is necessary to specify the moment when the convention is accomplished if the addressee accepts the offer.

[6] Juridical term of signing these contracts is constituted by the stipulations of art. 35 and the following ones of Commercial Code, by means of which the mutual obligation contract is regulated between distanced persons.

For determining this moment, there were suggested several systems, namely:

a) ***The emission system or the system of the will declaration***. It considers that the contract is signed when the offer addressee expresses the will to access the suggestion made and to contract the convention. It is a juridical wording that emphasizes the consensualism principle. It considers the contract as being signed since the moment of the acceptation emission whereas, no matter how it gets to the tenderer's knowledge, the acceptation produces juridical effects like a unilateral juridical document. The emission system has the advantage of not being able to specify with no doubt for both of the parties the moment when the acceptation is produced and also the one of allowing the acceptant to come back to the accession before it is known by the demander.

b) ***The dispatching system***, establishes that the contract signing is produced the moment when the acceptant entrusts his affirmative answer in order to be sent to the tenderer, to the postal services or to other means of transmitting the mail: It is a system having efficiencies under the aspect of the security conditions offered by the tenderer's rights as it does not allow him to be immediately aware by the acceptant's consent. In the lapse of time between sending the acceptance and its reception by the demander, the acceptant being allowed to come back on his voluntary manifestation and to create difficulties to the other party, by means of it.

c) ***The system of reception acceptation*** by the demander whose basic idea is concretized in the increased certainty provided to the juridical operation by the tender of the one who accepts. Elaborated depending on two of the hypotheses that may interfere in reality - the simple mail reception by the addressee without opening the letter and its reception followed by its opening and finding its content, this formula is presented as „***the reception***" or the simple reception of its acceptation and the one of „***information***".

c_1) According to the ***first option*** of the reception or of the simple reception of the acceptation, the acceptation is considered as being known by the tenderer since the mail containing the access to the unfinished offer gets to its residence (the reception system) without being necessary for the tenderer to be informed on the content of the received letter. The offered solution, settling the moment of the contract signing when the mail is received, even it is more specific and, by that, more prudent by the others, still keeps an uncertainty coefficient whereas it does not allow the addressee to be fully elucidated on the mail content.

c_2) ***The second option*** – the informing system– considers that the agreement was contracted and the convention was formed only when the tenderer received the mail from the acceptant addressee, opens it and it is informed on its content. This time, there were also spotlighted deficiencies regarding the acceptant's position. He is left in the terms of the informing system at the arbitrary of the tenderer that may tergiversate or stop the contract signing by an intentional delay or a deliberate refusal to acknowledge the content of the received mail.

The relativity of the practical results of these systems of establishing the moment of the contract signing determined the doctrine to grant them the value of certain presumptive data having a limited proving efficiency of accomplishing certain contrary evidence. Practically, it is useful to consider, in choosing the system, the stipulations of the special laws or the contractual stipulations of the parties. In their absence, it is necessary to settle the moment of the contract signing, the one corresponding, depending on the cause circumstances, real will of the parties.

The contract is usually considered as being signed at the tenderer. However, according to the stipulations of art. 37 Commercial Code it is possible for a contract to be also signed at the acceptant if the tenderer considers the convention as being contracted by the simple execution of its object by its addressee.

1.4.3.2. *Determining the moment of signing unilateral contracts*

The moment of signing unilateral contracts is mainly determined according to the acceptation starting from the stipulations of art. 38 Commercial Code stipulating that: "the suggestion is mandatory as soon as it gets to the knowledge of the party for which it is made". The law relatively

presumes that the acceptance interfered when the offer is received. This presumption may be removed by contrary evidence.

The system of the acceptation emission is applied only as a principle, since there are no special derogatory legal stipulations. For example, for the donation contract, by an exception norm, it was consecrated the informing system or the acknowledging one with a correction, namely it had place when the donor accepted the reception.

In this sense, art. 814, paragraph 2 Civil Code stipulates that, when the donation acceptance is made by subsequent authentic writing, it is necessary for the acceptance document to be communicated to the donor during his life.

2. Juridical mechanisms of accomplishing the volitional agreement in some consumption contracts

2.1. Preliminaries

The Romanian legislation, by transposing the stipulations of certain Directives and European Regulations[7] in the field of consumption contracts, integrated, regarding the contract signing of the mechanism of the mandatory prior reflection term and the one of the legal and free right of unilateral denunciation of the contract in order to protect the consumers by juridical means.

2.2. The mechanism of the mandatory term of prior reflection

In the Romanian right of consumption, Law no. 289 from June, 24th 2004 regarding the juridical system of the credit contract for consumption meant to the natural persons stipulate in annex 1 called "Mandatory minimal causes of credit contracts, depending on the object of each of them, at point 1 Credit contracts having as an object the financing of the goods and services supply, letter g)" indicating the eventual term of reflection (indicating a grace term in order to analyse the credit opportunity).

The Romanian legislator, even if he stipulates the necessity to indicate this term, does not establish the legal time of such a reflection term and it does not show the sanction applicable to the professional who would ignore this protectionist proceeding.

3. Mechanism of the unilateral denunciation of certain consumption contracts

3.1. Notion

The unilateral denunciation right represents the proceeding (mechanism) offering to the consumer the possibility to come back, after signing the contract, in an usually quite short time placed in the proximity of its acceptance.

3.2. The application field

This mechanism of accomplishing the volitional agreement – consisting in the retraction right that is constituted in a legal denial right that can be manifested in a certain lapse of time established by the law refers to:

[7] See, for example, the Directive of the European Parliament and of the Council no. 97/7/CE from May, 20th 1997 regarding the consumers' practice for the distance contracts, Directive 1999/44 from May, 25th 1999 regarding certain aspects of the sale and of the connected guarantees, CE Regulations no. 593/2008 regarding the law applicable to the contractual obligations (also called Roma I Regulations). This regulation was adopted by the European Parliament on June, 17th 2008 and became valid on December, 17th 2009 in all the member states of the European Union (except for the United Kingdom of Great Britain and of the Kingdom of Denmark). The regulation replaces the Rome Convention regarding the law applicable to the contractual obligations.

- distance contracts[8]. According to art. 7 of G.O. 130/2000 regarding the consumers' protection when signing and executing distance contracts, the consumers have the right to unilaterally denounce the contract in a 10-working day term, with no penalties and without invoking a reason";

- contracts outside the commercial spaces. According to art. 9 of the Government Ordinance 106/1999 regarding the contracts signed outside the commercial spaces, the consumers are allowed to unilaterally denounce the respective contracts "in a 7 working days term that start flowing: a) since the contract is signed, if this date is concomitant to the date of the product deliverance; b) since the contract of service performance is signed; c) since the consumer receives the product, if the deliverance was accomplished after signing the contract";

- *time sharing* contracts. According to art. 6, paragraph 1 letter a) of Law no. 282/2004 prevents the acquirers' protection regarding certain aspects of the contracts referring to the gaining of a using right on a limited term of some real estates, the acquirer has, complementarily to the common law options related to the contract nullity or annullable feature, the right "to unilaterally denounce the contract, without needing the invocation of a reason, in a 10 calendar days term since it has been signed by both of the contracting parties or since the parties have signed a pre-contract, depending on the case".

3.3. Reasons of the legislator regarding the regulation of the unilateral denunciation right of these contracts

Naturally, for each of the three categories of contracts, the legislator referred to the consumers' protection, but the reasons this protection is based on are different.

Thus, in case of distance contracts, the legal retraction right of the consent resides in the fact that the consumer contracts, based on some simple images or descriptions of the product or of the services, and this is the risk of receiving a good that would not correspond to his expectations comes from.

Actually, the consumer is able to appreciate the opportunity of contracting and the correspondence of the good features to his needs only after receiving the product.

The reason of unilateral denunciation right of the distant contract is different from the one applicable to the contracts signed outside the commercial spaces. Thus, unlike the residence offer, when the buyer is deprived, in the first place, of the possibility to compare and, in the second place, of the possibility to reflect enough on the contracting opportunity, in case of the distance selling contracts, the consumer has a sufficient lapse of time for thinking, but he has no possibility to accomplish a sensorial direct contact with the respective product. As such, it is possible for him to be disappointed regarding the product qualities when he has contact with it.

In case of the *time-sharing* real estate contract, the reason of the consumer's legal right of consent retraction comes from the dangers the consumer is liable to, reported to his contractual situation that comes from a location contract[9].

---

[8] The distance contract, defined by art. 2, paragraph 1 letter a) of the Government Ordinance no. 130/2000 regarding the juridical system of the distance contracts that transposes in the intern legislation the requirements formulated in the Directive 97/7/CEE from May, 20th 1997 regarding the consumers' protection in matter of distanced contracts, represents "the contract of supplying products or services contracted between a merchandiser and a consumer, in frame of a selling system organized by the merchandiser who exclusively uses, before and when signing this contract, one or several techniques of distance communication".

[9] For the time-sharing contract, the consumer has a series of inconveniences such as:

-accomplishing a contract in order to temporarily use a real estate that is still unconstructed or being constructed but for which he is forced to pay in advance the integral price of the future using periods;

-the lack of finishing the real estate or the recovery of the advanced sums;

-the big time of contracting, the law stipulating the minimum time of 3 years, but it does not limit the maxim lapse of time.

4. Conclusions

The special literature[10] has tried to explain the juridical nature of these contracts and has advanced a series of theories. As far as we are concerned, we acquiesce to the opinion according to which the unilateral right of denunciation of these contracts registers in the specific mechanism of accomplishing the volitional agreement in a progressive way. This supposes that the valid forming of these contracts is not accomplished anymore when the offer meets the acceptation.

The initial meeting of the consumer's content with the professional's one does not lead to the fully forming of the volitional agreement, but only for a short time, whereas the legislator – starting from the professional inequality in matter of the two co-contracting parties – offers to the consumer a term of 7/10 days of growing and gradually reinforcing the consent – in a direct contact with the good. Only when the respective term is achieved, the consent is considered as fully formed and definitely expressed.

As such, in these contracts, the consumer's initial juridical will is not enough in order to improve the respective contract, but it needs a subsequent confirming will expressed in the 7/10 days term since the initial moment. This confirming will is accomplished by non-exerting in this lapse of time the legal denial right. On the contrary, if the consumer uses the retracting right, the initial juridical will is denied and the parties are put in the situation before the initial meeting of the contracting offer with its acceptation.

As such, the consumer's original consent is insufficient for the full accomplishment of the volitional agreement.

PRESENTATION AND REASONING INSTRUMENTS OF THE DRAFT NORMATIVE ACTS

MIHAI GRIGORE[*]

Abstract
The aim of this paper is to present an important activity in the law-making process which is reasoning of draft normative acts, fact that consists of an intellectual operation that presents the basic reasons of the new legal regulation, its configuration, the expected social effects and the costs required by the application of the new normative act. The paper makes a description of the presentation and reasoning instruments that need to accompany the draft normative acts that are to be adopted in the Romanian legal system: exposures of reasons, substantiation notes, submission reports and impact studies.

Keywords*: law-making, law-making technique, exposure of reasons, substantiation note, submission report and impact study.*

Introduction

Until the apparition of Law no. 24/2000, the reasoning necessity of the draft normative acts was regulated by the parliamentary regulations and by the Government decisions in this domain[1].

The Law no. 24/2000, republished[2] introduces an independent and general regulation regarding the reasoning of the normative acts, stating that the draft normative acts submitted for adoption must be accompanied, according to the dispositions of the article 6 paragraph (3), read in conjunction with the article 30 paragraph (1) from the republished Law no. 24/2000, by the following presentation and reasoning instruments:

a) *exposures of reasons* – for draft laws and legislative proposals;

b) *substantiation notes* – for ordinances and decisions Governmental[3];

c) *submission reports* – for the other normative acts.

d) *impact studies* – for draft laws of major importance and great complexity, for draft laws about which the Government assumes its responsibility, for the approval draft laws of the ordinances emitted by the Government under an enabling law and subjected to approval by the Parliament."[4]

[1] According to the article 84 from *Regulamentul Camerei Deputaților* and to the article 66 paragraph (2) from *Regulamentul Senatului*, the draft laws submitted by Government and the legislative proposals submitted by deputies, senators or citizens must be accompanied by a statement of reasons and written in the required form for the draft laws. This prescripted provision is equally about the draft laws for the approval of an ordinance.

[2] Law no. 24/2000 *regarding the law-making technique rules for drafting normative acts* (republished in the Official Journal of Romania, Part I, no. 260/21 April 2010).

[3] The ordinances that must be submitted to Parliament for approval, according to the enabling law, and the emergency ordinances are communicated to the Parliament accompanied by the statement of reasons for its approval draft law.

[4] The exposures of reasons, the substantiation notes, the submission reports and the impact studies represent both presentation instruments, and also reasoning instruments for the new proposed regulations.

For the draft laws for which the Government assumes its responsibility, the reasoning documents accompanying these drafts are *the exposures of reasons* and, respectively, for the draft codes or other complex laws, submitted to the Parliament or, where appropriate, to the Government, to start the legislative procedure, *the report regarding the preliminary theses.*

The normative acts with impact on social, economic and environmental areas, on the general consolidated budget or on the legislation in force, are elaborated on the basis of some ***public policy documents*** approved by the Parliament or by the Government[5].

The public policy documents[6], defined and structured according to the dispositions of the Government Decision no. 870/2006 regarding the approval of the Strategy for improving the elaboration, coordination and planning system of the public policies for the public central administration[7] and of the Government Decision no. 775/2005 for the approval of the Regulation regarding the elaboration, monitoring and evaluation procedures of the public policies for the central level[8], are:

a) *the strategy*;

b) *the plan*;

c) *the proposal of public policies*.

The documents of public policies are initiated, adopted and applied according to the dispositions of Law no. 90/2001 regarding the organization and the functioning of the Romanian Govern and of the ministries[9], with the subsequent amendments and supplementations[10], of the

[5] The Government defines the types and the structure of public policy documents.

[6] *The public policy documents* are decision-making instruments through which the possible solutions to the public policy problems are identified, as they are defined in the Government Decision no. 870/2006 *regarding the approval of the Strategy for improving the elaboration, coordination and planning system of the public policies for the public central administration.*

The public policy documents include also information regarding the impact evaluation, the monitoring, the evaluation and the implementation measures of the identified solutions.

[7] Government Decision no. 870/2006 2006 *regarding the approval of the Strategy for improving the elaboration, coordination and planning system of the public policies for the public central administration* (published in the Official Journal of Romania, Part I, no. 637/24 July 2006).

[8] Government Decision no. 775/2005 *for the approval of the Regulation regarding the elaboration, monitoring and evaluation procedures of the public policies for the central level,* (published in the Official Journal of Romania, Part I, no. 685/29 July 2005).

[9] Law no. 90/2001 *regarding the organization and the functioning of the Romanian Government and of the ministries* (published in the Official Journal of Romania, Part I, no. 164/2 April 2001).

[10] Law no. 90/2001 was completed and modified through the following acts: Law no. 161/2003 *regarding some measures to ensure the transparency in the exercise of the public dignities, the public functions and in the business environment, and to prevent and punish the corruption* (published in the Official Journal of Romania, Part I, no. 279/21 April 2003); The Emergency Ordinance of the Government no. 64/2003 *to establish some measures regarding the establishment, the organization, the reorganization and the functioning of some structures from the units of the Government, of the ministries, and of some other special bodies of the central public administration and of some other public institutions* (published in the Official Journal of Romania, Part I, no. 464/29 June 2003); Law no. 23/2004 *for amending and supplementing of the Law no. 90/2001 regarding the organization and the functioning of the Romanian Government and of the ministries* (published in the Official Journal of Romania, Part I, no. 187/3 March 2004); The Emergency Ordinance of the Government no. 11/2004 *regarding the establishment of some reorganization measures in the central public administration* (published in the Official Journal of Romania, Part I, no. 266/25 March 2004); Law no. 194/2004 *regarding the approval of the Emergency Ordinance of the Government no. 64/2003 for the establishment of some measures regarding the establishment, the organization, the reorganization and the functioning of some structures from the units of the Government, of the ministries, and of some other special bodies of the central public administration and of some other public institutions* (published in the Official Journal of Romania, Part I, no. 486/31 May 2004); The Emergency Ordinance of the Government no. 17/2005 *for the establishment of some organizational measures for the public central administration* (published in the Official Journal of Romania, Part I, no. 229/18 March 2005); Law no. 117/2005 *for the completion of the article 19 from Law no. 90/2001 regarding the organization and the functioning of the Romanian Government and of the ministries* (published in the Official Journal of Romania, Part I, no. 389/9 May 2005); The Emergency Ordinance of the Government no. 76/2005 *for the amending of the article 26 paragraph (3) from Law no. 90/2001 regarding the organization and the functioning of the Romanian Government and of the ministries* (published in the Official Journal of Romania, Part I, no. 618/15 July 2005); Law no. 250/2005 regarding the rejection of the Emergency Ordinance of the Government no. 76/2005 *for the amending of the article 26 paragraph (3)from Law no. 90/2001 regarding the organization and the functioning of the Romanian Government and of the ministries* (published in the Official Journal of Romania, Part I, no. 734/12 August 2005); Law

Government Decision no. 870/2006 regarding the approval of the Strategy for improving the elaboration, coordination and planning system of the public policies for the public central administration, of the Government Decision no. 775/2005 for the approval of the Regulation regarding the elaboration, monitoring and evaluation procedures of the public policies for the central level, with the subsequent amendments, and also of the Government Decision no. 561/2009 for the approval of the Regulation regarding, on the Government level, the elaboration, the approval and the presentation of the drafts for the public policies documents, of the draft normative acts, and of some other documents for adoption/approval[11].

Law no. 24/2000, by the legislative amendments aiming, in particular, the quality improvement of the legal standards, introduced dispositions that regulates the elaboration of the *impact studies* for draft laws of major importance and great complexity, for draft laws about which the Government assumes its responsibility, for the approval draft laws of the ordinances emitted by the Government under an enabling law and subjected to approval by the Parliament, and also *the preliminary evaluation of the draft normative acts' evaluation*, as an analysis method of the implications of some existent or proposed regulation[12].

These impact studies[13] and preliminary evaluations represent an essential stage in the substantiation of a state's legislation, detailed procedures in this regard existing since the late 90s in the European Union[14].

[12] Law no. 49/2007 *for the amending and the supplementing of* Law no. 24/2000 *regarding the law-making technique rules for drafting normative acts* (published in the Official Journal of Romania, Part I, no. 194/21.03.2007)

[13] First reflections on the imperative of the impact studies had as a starting point the Mandelkern group's works, established by the European Commission, named so after the name of its leader - Dieudonné Mandelkern, who, on 13th of November 2001, published a report about the regulation of the quality (Better Regulation). Based on this report, the European Commission worked out a communication on the impact analysis, document which mentions that the applications of the impact studies were in the energetic field, in the environment protection field and in the chemic industry field. In this document, the European Commission insists on the necessity to undergo an impact analysis in order to achieve the communal objectives, namely the economic growth and the competitiveness. However, it is stated that the impact studies elaboration process has been a little modified from what the documents from 2002 were predicting, but the Commission kept the general approach, which consists in the necessity to realize a Road Map preliminary impact study and then an in-depth impact study. According to this document, all the Commission's proposals and the Commission's work program are analyzed in these impact studies, studies that aim to see which are the economic, environmental and social consequences of the envisaged measures (S. Popescu and V. Țăndăreanu, "Modificările aduse Legii nr. 24/2000 privind normele de tehnică legislativă pentru elaborarea actelor normative", in *Aspecte practice de tehnică și evidență și legislativă*, edited by S. Popescu,, C. Ciora and V. Țăndăreanu (Bucharest : "Monitorul Oficial" Publishing House, 2008), 96.

The impact study. The elaboration scope of the impact study is, according to the dispositions of the article 33 from the republished Law no. 24/2000, to estimate the costs and the benefits brought in economic and social field by the adoption of the draft law, and also to highlight the difficulties that might appear in the implementing process of the proposed regulations.

The impact study is usually made by the speciality structures of the central public administration, at the Government's request. For the legislative proposals initiated by the deputies or by the senators, the impact studies are prepared by line ministries, at the request of the parliamentary committees.

The impact study is referred to:

a) the status quo existing at the time of the new regulation elaboration;

b) the amendments proposed for the existing legislation;

c) the objectives persuade by amending the existent legislation;

d) the available means to achieve the proposed goals;

e) the difficulties that might be encountered in applying the new dispositions;

f) the assessment of the costs imposed by the adoption of the draft law and any budgetary savings generated by it, the reasons underlying this assessment and how to calculate the costs and the savings;

g) the benefits derived by implementing the draft law, other than the economic ones;

h) the comparative analysis of costs and benefits involved in the draft law, showing whether the benefits are justified by the costs.

The preliminary evaluation of the draft law impact, of the legislative proposals and of the other draft normative acts. This represents, according to the article 7 from the republished Law no. 24/2000, a set of activities and procedures with the purpose to ensure an adequate foundation for legislative initiatives. The preliminary evaluation of the impact assumes the identification and the analysis of the economic, social, environmental, legislative and budgetary effects produced by the proposed regulations.

This instrument represents, at the same time, a fundamental prerequisite for improving the legislation quality in each regulation field, being necessary to implement *the Strategy for improving the elaboration, coordination and planning system of the public policies for the public central administration*[15].

Evaluation is also a monitoring and management instrument for the normative acts, which offers the possibility of improving the relations between the legislator and the society, the degree of cooperation and coordination between various public and private institutions and also the stability of the legal system[16].

The necessity of a better substantiation of the legislation is reported by both public institutions and organizations in the intern field, and also by the reports from the last years elaborated by the recognized international bodies[17].

---

[14] *Ibidem*, 88-96.

[15] Approved by Government Decision no. 870/2006.

[16] S. Popescu and V. Țăndăreanu, *quoted work*, 98.

[17] In *Raportul de monitorizare al Comisiei Europene din mai 2006*, in the chapter about "The public administration reform", it is mentioned the fact that the legislation is still transmitted to the Parliament without an evaluation of all the implications or of the necessary administrative capacities to implement it, being recommended the introduction of some measures to allow the facilitation to realize the impact analyses for the central public administration.

Also relevant from this point of view were the recommendations formulated in *Raportul Grupului Mandelkem*, whose content includes a set of concrete conclusions on the need for proper grounding of the proposed normative acts.

Specifically, the main problems identified in the drafting normative acts are:

a) the improper grounding of the normative acts;

b) the lack of preliminary evaluation of the impact regarding the proposed measures by the public policy or by the respective draft normative act;

Preliminary assessment of the impact of the draft normative acts is considered to be the foundation for the proposed legislative solutions and must be realized before the adoption of the normative acts.

The substantiation of the new regulation must take into account both the evaluation of the specific legislation in force impact at the time of the normative act draft elaboration, and the evaluation of the public policies impact that the draft normative act implement.

The preliminary evaluation of the impact is realised by the initiator of the draft normative act. In the case of some complex normative acts drafts, the impact evaluation can be performed under a services contract, by scientific research institutes, by universities, by companies or by non-governmental organizations, in accordance with legal provisions in force regarding the public acquisitions.

In order to prepare the preliminary impact of the legislative proposals initiated by the deputies and the senators, as well as those based on citizens initiative, the Parliament members can request to the Government the assurance of the access to the data and information necessary to accomplish it[18].

The content of the presentation and reasoning instruments of the draft laws

The presentation and motivation instrument includes, according to the article 31 paragraph (1) from the republished Law no. 24/2000, the content of the impact evaluation of the normative acts, having the following sections:

a) *the reason for the issue of the normative act* – the requirements that need the normative intervention, with special reference to the inadequacies and inconsistencies of the regulations in force; the basic principles and the end of the proposed regulations, outlining the new elements; the results of the studies, of the research papers, of the statistical evaluations; references to the documents of public policies or to the normative act for whose implementation the respective draft is elaborated. For the emergency ordinances will be presented distinctly the objective elements of the extraordinary situation which imposes the immediate regulation, not being sufficient to use the emergency parliamentary procedure, and any consequences that might occur lest no legislative measures would be taken;

b) *the socio-economic impact* – the effects on the macroeconomic environment, on the business, social and environmental fields, including the evaluation of costs and benefits;

c) *the financial* impact *on the general consolidated budget, both in the short term, for the current year, and for long term (on 5 years), including information regarding the expenses and revenues;*

d) *the impact on legal system* – the implications of the new regulation on the legislation in force; the compatibility with the communal regulation in matter, their exact determination, and if necessary, further required harmonisation measures; decisions of the European Court of Justice and other relevant documents for the transposition or implementation of those legal provisions; implications for domestic legislation, the ratification or approval of some treaties or international agreements and the necessary adaptation measures; concern in the harmonization legislative matter;

e*) consultations undertaken for the drafting normative acts, the consulted* organizations *and experts, the essence of the received recommendations;*

f) *public* information *activities regarding the drafting and the implementation normative act*;

g) *implementation measures* - institutional and functional changes in the central and local administration.

---

c) normative acts that do not present detailed information regarding the involved costs of the respective measures promoting or of the necessary administrative capacities to implement;

d) legislative and institutional overlaps;

e) poor strategic approach in setting priorities.

[18] The preliminary evaluation of the impact is not compulsory for the legislative initiatives of the deputies and senators, as well as those based on citizens' initiative.

We note that among the explanatory memorandum, the substantiation note, the approval report and the impact study, according to Law no. 24/2000, there are no differences in content, each of them will comply with the dispositions of the article 31 paragraph (l) of the law. As a consequence, all the 4 documents are presentation and reasoning papers of a normative actand their name varies depending on the normative acttype they are about[19].

Since for the ordinances and for the decisions of the Govern, the substantiation note that is both the base of their adoption in Government, and of the presentation of the ordinances before the two Chambers of Parliament, professor I. Vida wonders whether it is necessary or not that an exposures of reasons should accompany the draft law for approval of ordinance, knowing that the answer to this question is, by law, affirmative. This legal solution - underlines I. Vida - is more than formal, since the draft law for the approval of the ordinance shall be made after its approval by the Government and it contains a single sentence: "The Government Ordinance no. … from … is approved, published in the Official Journal of Romania, Part I, no. … from …", not being necessary, in his opinion, of a exposures of reasons to justify this sentence. In this case, the reasoning of ordinance results from its introductory formula, which will state its ground, respectively the enabling law or the requirements of the article 115 paragraph (4) of the Romanian Constitution. In such cases, the exposures of reasons is void in the event that a first notified Chamber rejects the approving draft law of the ordinance and sends to the other Chamber a rejecting draft law of the ordinance, accompanied by a exposures of reasons for approval of the ordinance. Taking into account the previous facts, I. Vida opines that, de *lege ferenda*, it should be exclusively taken into consideration the option of accompanying the draft approval law of the substantiation note ordinance[20].

In the situation in which the proposed regulation is elaborated when executing a normative act, the reasoning should content, according to the article 31 paragraph (2) from the republished Law 24/2000 references to the document based on and in execution of which it is emitted.

The final form of the presentation and reasoning instruments for the draft normative acts must contain, according to the article 31 paragraph (3) of Law no. 24/2000[21], references to the notification of the Legislative Council[22] and, where appropriate, notification of the Supreme Defense Council, the Court of Auditors or the Economic and Social Council[23].

---

[19] *The exposures of reasons* is a document accompanying a draft law; *the substantiation note* accompanies a Government decision or an ordinance; *the approval report* is required for other draft normative acts (orders, instructions etc) and *the impact study* is necessary for important and great complexity draft laws, for draft laws for which the Government assumes its responsibility, and also for the approval draft laws of the ordinances emitted by the Govern under an enabling law submitted for approval to the Parliament.

[20] I. Vida, *Legistică formală (Introducere în tehnica şi procedura legislativă)*, third edition (Bucharest: "Lumina Lex" Publishing House, 2006), 124.

[21] This disposition [article 31 paragraph (3) of the republished Law no. 24/2000 is, according to professor I. Vida, impossible to be realized in practice, as the reasoning documents are elaborated at the same time with the draft by the drafting committee, commission that stops its activity at the draft elaborating date. The notification of these public authorities is previous to this date and cannot be operated in the exposures of reasons or in the substantiation note (*Ibidem*, 125).

[22] The republished Law no. 24/2000: Article 10 – "(1) The notification of the Legislative Council is formulated and transmitted in writing. It can be: favourable, favourable with objections or proposals or negative.

(2) The favourable notifications which include objections or proposals and also the negative ones are motivated and may be accompanied by the documents or the information that supports them.

(3) The notification of the Legislative Council is a specialized notification and has a consultative character.

(4) The observations and the proposals of the Legislative Council regarding the compliance of the law-making technique rules will be considered in finalizing the draft normative act. Their non-acceptance must be motivated in the content of the presentation document of the draft or in an accompanying note."

[23] The republished Law no. 24/2000: Article 8 – "(1) In the cases provided Regulation, during the drafting normative acts the initiator should seek notification from the authorities concerned in their implementation, depending on the scope of the regulation.

According to the dispositions of the article 2 paragraph (1) from the Government Decision no. 1361/2006 *regarding the content of the presentation and reasoning instruments for the draft normative acts subjected for the approval of the Government*[24], with the subsequent amendments and supplementations[25]; the presentation and reasoning instruments is compulsory[26] both for the draft laws proposed by the Government, for the ordinances drafts and for the emergency ordinances, and also for the decision drafts of the Government, with an impact on social, economic and environmental fields, on the general consolidated budget or on the legislation in force, and must be elaborated according with the following *structure*, including the next *8 sections*[27]:

I. Section 1 "The normative act title".

II. Section 2 "The normative act issuance reason" – which will include:

1. The description of the *present situation*:

a) presentation of the field by indicating the problems to solve through the draft normative act; for the problems regarding the main macroeconomic indicators and socio-economic it will be made a description of the business environment;

b) presentation of the normative acts in force and of the fields insufficiently regulated or not regulated at all;

c) conclusions of the studies, of the research papers, of the statistical evaluations;

d) for the emergency ordinances it will be presented separately the objective elements of the extraordinary situation, whose regulation cannot be postponed, and also the consequences of the non-adoption of the draft normative act urgently;

---

(2) After their elaboration and completion of the notification procedure foreseen on paragraph (1), the draft laws, the legislative proposals and also the ordinances and the decisions with normative character of the Govern are compulsory subjected for approval of the Legislative Council.

(3) The notification procedure and the object of the notification of the Legislative Council are foreseen in its organic law and in its organization and operation Regulation."

[24] Government Decision no. 1361/2006 *regarding the content of the presentation and reasoning instruments of the draft normative acts subjected for the Govern approval* (published in the Official Journal of Romania, Part I, no. 843/12 October 2006).

[25] Government Decision no. 219/2010 *for the amending and the supplementing the annex to Government Decision no. 1.361/2006 regarding the content of the presentation and reasoning instruments of the draft normative acts subjected for the Govern approval* (published in the Official Journal of Romania, Part I, no. 227/12 April 2010).

[26] Article 2 paragraph (2) from the Government Decision no. 1361/2006 stipulates that for the Government decision drafts with no impact on social, economic and environmental field, on the general consolidated budget or on the legislation in force, the presentation and reasoning instruments will be elaborated according to the provisions of the Law no. 24/2000 regarding the law-making technique rules for drafting normative acts, republished, without being mandatory the observance of the structure foreseen in the annex of the Government Decision no. 1361/2006.

For the Government decision drafts, presented at the preparatory meetings of the Government session, along with the presentation and reasoning instrument, elaborated according to the article 2 paragraph (2) from the Government Decision no. 1361/2006, any representative, as secretary of state, secretary-general or similar to these, from the ministries and other from public authorities may require the restoration of presentation and reasoning instrument of the draft, in accordance with the structure foreseen in the annex of the Government Decision no. 1361/2006, in the situation in which, at the meeting, it appears that it has an impact on social, economic and environmental fields, on the general consolidated budget and on the legislation in force. The draft normative act is then forward to preparatory work meeting of the Government session, accompanied by the presentation and reasoning instrument reformulated according to the annex.

[27] If the draft normative act does not refer to a given topic in a given section and in the provisions of this decision, then in that section it will be made clear that "the draft normative act does not address this subject".

e) if the presentation and reasoning instruments is attached to the normative act elaborated according to Law no. 590/2003 regarding the treaties[28], the current section must include the information foreseen in article 23 of this law[29];

f) references to the relevant strategy document on which the draft normative act is based on.

2. Expected changes:

a) brief presentation of the scope and of the content of the draft normative act;

b) complete or partial resolution of the problems identified in section 2 point 1.

3. Other information[30]

III**. Section 3** "The socio-economic impact of the draft normative act" – which will include:

1. The Macroeconomic impact:

a) impact on volume production of goods and services;

b) impact on the prices level;

c) impact on the volume of imports and exports;

d) impact on the employment rate of labor and on the unemployment;

e) impact on the competitive environment.

2. Impact *on the business environment:*

a) direct and indirect expected benefits;

b) simplification of the administrative procedures;

c) direct and indirect costs of the economic operators.

---

[28] Law no. 590/2003 *regarding the treaties* (published in the Official Journal of Romania, Part I, no. 23/12 January 2004).

[29] Law no. 590/2003: Article 23 – "(1) The exposures of reasons accompanying the ratification, accession or acceptance draft law, respectively the substantiation note accompanying the approval, accession or acceptance draft decision of the Government for approval, acceptance or accession or the Government emergency ordinance draft of ratification, accession or acceptance shall include the following ones:

a) the need to conclude the treaty for the Romanian side;

b) conclusion of the treaty for the Romanian side;

c) history of negotiations;

d) for the bilateral signed treaties, subjected to ratification or approval - date and place of the signature, details of the signing person the for Romanian side;

e) in the case of multilateral treaties signed by the Romanian side, subjected to ratification or approval - date and place of adoption and / or opening for signature, date and place of signing by the Romanian side, indicating the signing person, the date of entry into force, if necessary;

f) in the case of multilateral treaties subjected to accession or acceptance - date and place of adoption and / or opening for signature, the date of entry into force, if necessary;

g) presentation of the relevant provisions of the treaty in the light of the interests of the Romanian party, the implications that the treaty has on the international legal obligations and other commitments previously undertaken by the Romanian side, namely regarding the intern legislation, including in terms of compatibility with the communal law, and also the necessary adaptation measures;

h) presentation of the provisions that are intended to ensure the coordination of the intern legislative framework with the provisions of the treaty which are referred to paragraphs (6) and (7) of the article 22;

i) presentation and reasoning of the reservations or of the declarations to the treaty, if any, contained in the ratification, approval, accession or acceptance draft normative act;

j) in the exceptional case foreseen in the article 19 paragraph (3) and in the article 21 paragraph (2), a thorough justification of the urgency of ratification, accession or acceptance by the Government emergency ordinance, reference to the affected public interest in the absence of the ratification, accession or acceptance, and also the obtaining of the express approval of the President of Romania.

(2) For the treaties signed at state level, to the exposures of reasons ratification draft law is attached, in copy, the memorandum for the signing approval".

[30] Any other information about the content of the draft normative act, which are not required in the decision, but one wants them presented in the presentation and reasoning instrument, can be included under "Other information" rubric within each section.

3. Social *impact:*
a) target demographic and social affected groups;
b) direct or indirect effects, short or long term;
c) impact on income levels, changes in the social and working environment;
d) improvement, development, efficiency and quality of the network service;
e) expected impact on short and long term after the adoption.
4. Impact on the environment[31]*:*
a) impact on the use of the natural resource;
b) impact on protected species, natural habitats, protected areas and landscapes;
c) impact on the environmental quality, detailed on each of the environmental factors.
5. Other information.

IV. Section 4 "The financial impact on the general consolidated budget, both short term, for the current year, and long term (5 years)"[32] – which will include:
1. Changes in revenues, plus/minus, from which:
a) state budget, from it:
(i) profit tax;
(ii) income tax;
b) local budgets:
(i) profit tax;
c) social state security budget:
(i) insurance contributions.
2. Changes of the budgetary expenditure, plus/minus, from which:
a) state budget, from it:
(i) personnel costs;
(ii) goods and services;
b) local budgets:
(i) personnel costs;
(ii) goods and services;
c) social state security budget:
(i) personnel costs;
(ii) goods and services.
3. Financial impact, plus/minus, from which:
a) state budget;
b) local budgets.
4. Proposal to cover the increasing of the budgetary expenditure.
5. Proposals to offset the reduction of the revenues.
6. Detailed calculation regarding the amendments' substantiation of the revenues and/or of the budgetary expenditure.
7. Other information.

[31] For the draft normative acts aiming the adoption of plans and programs, including of those co-financed by the European Union, or of some amendments of them, it is required to refer to the completion of the procedure of execution of an environmental evaluation provided by Government Decision no. 1.076/2004 *regarding the determination of the procedure of environmental evaluation execution for plans and programs* (published in the Official Journal of Romania, Part I, no. 707/5 August 2004).

[32] Points 1, 2 and 3 of section 4 will be completed for all the component budgets of the general consolidated budget, as it is defined in Law no. 500/2002 regarding the public finances, with the subsequent amendments, where there are influences.

V. Section 5 "The effects of the draft normative act on the legislation in force"[33] – which will include:

1. Supplementary normative acts drafts:

a) normative acts that are modified as a consequence of the entry in force of the draft normative act;

b) normative acts that are repealed as a consequence of the entry in force of the draft normative act;

c) normative acts that follow to be elaborated for the implementations of the dispositions.

2. The compatibility of the draft normative act with the communal legislation in the matter:

a) the type, the title, the number and the date of the communal act whose requirements are implemented or transposed by the draft normative act;

b) the objectives of the communal act;

c) the degree of conformity of the normative act draft with the communal act in this field, indicating whether the provisions of these acts are totally or in part transposed; in case of the partial transposition, it will be specified the reason, the term and the way of the total transposition of the communal act;

d) the deadlines for the transposition or for the implementation of the concerned communal acts – the deadline for adopting the draft normative act and the justification of this term.

3. Decisions of the European Court of Justice and other documents (references to the legal doctrine) can be mentioned, indicating the Court's interpretations, relevant to the transposition or to the implementation of those legal provisions.

4. The conformity evaluation with the communal legislation:

a) normative acts and other communal documents; it is necessary to be indicated the number, the adoption and the publication date;

b) the conformity degree (complies/does not comply);

c) any comments.

5. Other normative acts and/or international committing documents, making reference to a certain agreement, resolution or international recommendation or to another document of some international organization:

a) the conformity degree of the draft normative act with the obligations arising from the normative act and/or the international document;

b) if the draft normative act complies with the commitments, it will be indicated the way in which the implementation of the draft normative act fulfils these commitments;

c) if the draft normative act partially complies with the commitments, the reason will be explained and it will be specified when and in what way a full compliance with the commitments is reached.

6. Other information.

VI. Section 6 "Consultations conducted to elaborate the draft normative act" – which will include:

1. Information on the consultation process with nongovernmental organizations, research institutes and other involved bodies[34]*:*

a) consultations that took place;

b) names of the consulted experts;

c) amendments proposed by the consulted organizations;

d) amendments included in the draft normative act.

[33] The section will be completed for compliance also by the integrator chapter ministry.

[34] It will be indicated, in short, the recommendations received from the consulted organizations, indicating if these recommendations were taken into account and if the appropriate amendments were made to the draft normative act.

2. Choice substantiation of the consulted organizations and of the way of working with these organizations which is related to the object of the draft normative act

3. Organised consultations with the public local administration's authorities, in situation in which the draft normative act has as an object activities of these authorities, in the Government Decision no. 521/2005 conditions regarding the consultation procedure with the associative structures of public local administration authorities in elaborating the draft normative acts[35].

4. Consultations within the inter-ministerial councils, according to the provisions of the Government Decision no. 750/2005 regarding the constitution of the permanent inter-ministerial councils[36].

5. Taking into account the dispositions of the Law no. 24/2000 *regarding the law-making technique rules for drafting normative acts*, republished and the dispositions of the Government Decision no. 561/2009 for the approval of the Regulation regarding the procedures, at the Government level, for the elaboration, the notification and for the presentation of the public policies documents, of the normative acts drafts and also of some other documents, for adoption/approval, must be noted such as *information*[37] *regarding the necessity of the draft normative act's notification* by the following institutions:

a) the Legislative Council;

b) the National Defense Supreme Council;

c) the Economic and Social Council;

d) the Competition Council;

e) the Court of Auditors.

6. Other information.

VII. Section 7 "Public information activities regarding the drafting and the implementation of the normative act" – which will include:

1. The information of the civil society on the need to drafting normative act.

2. The information of the civil society on the eventual impact on the environment as a consequence of the draft normative act implementation, and also the effects on health and *on the* safety of *the* citizens or *on the* biological diversity.

3. Other information.

VIII. Section 8 "Implementation measures" - which will include:

1. Implementing measures of the draft normative act by the authorities of the central public and/or local administration – the establishment of some new bodies or the competences' expanding of the existing institutions:

a) institutions that are about to be found, reorganized or abolished;

b) possibilities to obtain the wanted result, using the existing institutions (if this is possible, the reasons will be specified);

---

[35] Government Decision no. 521/2005 *regarding the consultation procedure of the associative structures of the local public administration's authorities in drafting normative acts* (published in the Official Journal of Romania, Part I, no. 529/22 june 2005).

[36] Government Decision no. 750/2005 *regarding the establishment of the permanent inter-ministerial councils* (published in the Official Journal of Romania, Part I, no. 676/28 July 2005), amended and supplemented by the Government Decision no. 13/2009 *regarding the establishment of the inter-ministerial Council "Council for promotion the information society in Romania"* (published in the Official Journal of Romania, Part I, no. 100/19 February 2009) and by the Government Decision no. 98/2010 *regarding the establishment of the inter-ministerial Council "The Council for the application of the state aid policy"* (published in the Official Journal of Romania, Part I, no. 108/17 February 2010).

[37] Detailed information is required only where there were significant objections to the mentioned institutions, which were not taken into account.

c) the financing source of the institutions that are about to be found, and whether they can be financed on the basis of tax services;

d) functions of the existing institutions that are about to be modified or extended;

e) functions of the local public administration's authorities that will be modified or extended;

f) the specification of whether the functions that must be modified or extended are about to be met by the authorities of the public central and/or local administration or by their structures;

g) the specification of whether the implementation of the draft normative act may take place after its adoption or if a further period and a transition period is required for its implementation.

2. Other information.

The drafting and signing of the presentation and reasoning instruments

According to the dispositions of the article 32 paragraph (1) from the republished Law no. 24/2000, the reasoning documents are drawn up in an explanatory, clear style, using the terminology of the draft normative act they are representing.

Although in the content of the reasoning instruments are presented the basic ideas of the regulation, these must not represent a summary of the law, but to explain *ratio legis*[38].

The reasoning must be about the final form of the draft normative act; if along the way there have made some changes of the draft, as a result of the proposals and observations received from the advisory bodies, the initial reasoning should be properly reconsidered.

The exposures of reasons of the draft normative acts for which the legislative initiative is exercised by the Government, and also the exposures of reasons of the approval draft laws for some ordinance or emergency ordinances are signed, according to the article 34 of the republished Law no. 24/2000, by the prime minister after the adoption of the final form of the project in Government session.

The exposures of reasons of the legislative proposals made by deputies or senators are signed by the respective initiators.

If the legislative initiative is exercised by citizens, the exposures of reasons will be accompanied by the documents drafted according to the article 74 paragraph (l) from Constitution[39], republished[40], and also by the point of view of the Constitutional Court, established according to the provisions of the article 146 letter j) from Constitution[41], Law no. 189/1999 regarding the exercitation of the legislative initiative by the citizen[42], stating in article 3 paragraph (l) that the exposures of reasons that accompanies the legislative proposal must be signed by all the initiative committee's members, committee that must be composed from at least 10 citizen with the right to vote[43].

The substantiation notes of the ordinances and Government decisions drafts are signed by the minister or by the initiators ministers, and also by the ones who notified them.

[39] Constitution of Romania, republished: Article 74 –"(1) The legislative initiative belongs to, where appropriate, the Government, the deputies, the senators, or to at least 100,000 citizens entitled to vote. Citizens who exercise their right to legislative initiative must come from at least a quarter of the country's counties and each of those counties, respectively in Bucharest, must be registered at least 5.000 signatures in support of this initiative".

[40] Constitution of Romania (republished in the Official Journal of Romania, Part I, no. 767/31 October 2003).

[41] Constitution of Romania, republished: Article 146 – "The Constitutional Court has the following attributions:

.....

j) verifies the execution of the conditions to exercise the legislative initiative by the citizens;

[42] Law no. 189/1999 regarding the exercise of the legislative initiative by the citizens (republished in the Official Journal of Romania, Part I, no. 516/8 June 2004).

[43] The legislative proposal is elaborated by this committee in the required form for the draft laws.

The exposures of reasons of the laws and of the substantiation notes of the ordinances and Government decisions, elaborated by the initiator, are published together with the normative act in question in the Official Journal of Romania, Part I, or are featured on the Internet by the issuing authority[44].

If during the parliamentary debates the draft law or the legislative proposal has been changed in substance, the exposures of reasons will be remade, after the promulgation of the law, by the initiator, upon the notification of the general secretary of the Chamber of Deputies.

Conclusions

The presentation of the reasons that are on the basis of the adoption of a draft normative act represents an integrated part of the law-making process. The one who initiates a draft law must know that, through his actions, he will disturb the normative balance of the society or, more precisely, the right balance between the static and the dynamic of law. This legislative balance disorder is not without practical effect in terms of human existence, for the relations established between public authorities and citizens, and even for the human relationships, in general.

Therefore, the reasoning of the draft normative acts as an intellectual operation with the purpose to persuade the issuer of the normative act for the need of its adoption. It must present the reasons behind the new legal regulation, its configuration, the expected social impact and the costs involved in applying the new normative act.

The reasoning of the draft normative act plays a historical role too. Over the time, the reasoning will provide arguments for those who apply the law, for the understanding of the will of the legislator or of any other governing body issuing of the normative act.

POLITICAL IMPACT ON THE OBSERVANCE OF PENSION RIGHTS IN ROMANIA

MĂDĂLINA TOMESCU*

Abstract
The beginning of 2011 brought some questions for all the persons-romanian citizen – beneficiaries of the pension rights , but also for the middle age persons, which feel a threat for their right to pension. I propose to research the way that the pension right is influenced by the political decision taken by the party temporary governing. Also, I propose to identify the possible effects of these decisions.

Keywords*: political impact; pension; right; observance*

Introduction

This study talks about the problem of the impact that the decision taken to the political level, regarding the respecting of the pension rights has upon us.

We started this measure from the fact that human dignity is very imporant for every person, and we are all equal in dignity and rights. Dignity as a value recognized by all the international documents regarding human right, unfortunately it might be in the situation of being violated by wrong political decisions. Also, the equal rights is not the equalization of rights, however, because everyone of us is unique.

From this point of view, the present world society confronts to many and various cases of violating the human dignity, especially for of age persons. For this category/class to provide a decent livin, an financial independence, and involvement conditions in social activities that would bring satisfaction, represent a very important aspect. In this context, pension and pension rights after a work life, contributing to society's developement in this domain, constitute the essentil issue I want to discuss about. Also, when ordaining the pension amount is necessary to take into consideration all the reasons: social and intellectual value of carried out work, the minimum subscription period, special character of working, etc.

Me together with my colleagues, lawers consider that the pension represents an own right that was violated in Romania, by taking some political decisions of recalculation of these in a negative sense. Therefore, I have decided to demonstrate this miscarriage of justice, as well as the society (not only the Romanian society) needs trained and professional stimulated public servants, as well as servants with special status that must secure our public safety, order and peace that are needed/essential to create, to contribute to society's developement.

1. Human dignity

The 20th century was witness to propagating the idea of democracy from the political class towards the most of the domains of social life. The belief that **people are equals in dignity and rights** was confirmed by the institutions of mass societies, especially by the diversion industry that develops the ordinary person's ability of placing itself instead of others and watching the life as they would watch.

Dignity represented from 1948 an often treated subject, situated between theory and practice, sometimes with sympathy, other times disdainfully.

* Associated Professor, Ph. D., "Dimitrie Cantemir" Christian University (e-mail: madalina.tomescu@ gmail.com).

Human dignity is guaranteed by the two important principles of international law that governs the object of human rights, **equality and undiscrimination.** Those principles postulate the right to exercise all the established rights and the ensuring of protection to every person when facing the possible abuses of the authorities. On the contrary , the unequality and discriminationare a negation of fundamental rights and liberties of the human person. *"If discrimination and its incontestably the most flagrant manifestation- the rasism- continue, it is shown in a ONU document, we will not hope to to build up* ***an international society founded on human being's dignity and value"***. Or, this 0bject is connected with the Nations' purposes and its constitutive act satates this triptych : equality, undiscrimination, dignity- in its many articles. The peoples from United Nations- shown in the second line from the preamble of the Chart- declare themselves decided to be reaffirmed "a) the belief in fundamental human rights, in dignity and value of human person, in equal rights of men and women as well as of large and small nations". Under Art.13, The General Meeting is authorized to initiate studies and to recommend in order to "b) promote human rights achievement and fundamental liberty for all, without discrimination of race, sex, language or religion". The principle of undiscrimination is enunciated in art.55 point c) and 76 point c).[1]

The transpotion of these priciples in daily life constituted one of the major concerns of te World Forum in New York and of some specialized institutions from its system, finding its materialization both in legal and diplomatic instruments and in various declarations and resolutions. In their synthetical formula they are found in **Universal Declaration of human rights** on 10 th of December 1948, which in the 1st article provides: ***"All the human beings era born free and equal in dignity and rights, they are gifted with intellect and conscience and they must behave one to each other in a fraternity spirit"***, and the 2nd article disposes that ***„every man can avail himself of all the rights and freedoms proclaimed in the present Declaration without any difference, for example of race, sex, language or religion, public opinion,or ay other opinion, of national or racial origin, of property, of birth or resulting from any other situation"***[2].

Regarding the definition of the concept of human dignity, this realised mostly approaching the fundamental human values, as well as through the discovery of the rapport between dignity and the right to a decent life.

The dignity shows the value, the honesty, the moral merits, the degree of appreciation as well as the achieved rank by a person in society. In the Christian teaching, human dignity in a divine gift, that irrespectue of the conditions in which the individual lives, he has the God's image as an aexample. Within society we understand dignity as the self-sufficincy and freedom of thinking and also the individual's behaviour[3].

The **human dignity** considered as fundamental and the sum of all the rights, it has been defined as **the sum of all the human values and of the respect towards the individual**, characteristics which man receives from the moment he is born and lasts tilll after his death. It is not and it cannot be considered an object irrespective of race, origin, etc. In the presence of "human dignity" as a fundamental right of freedom of the press and the right o f liberty itself, the propety rights, to life, the right of expressing opinions, of religious believes, the right to a decent life, the right to correspondence and all the pther rights are built on human dignity, the corner stone of the civilisation and the entire society[4]. Not by chance the dignity is considered **a right that protects the individual and the image of the individual** even after a person passed the limit between life and death.

Also, it can be said that the human dignity constitutes the keystone that puts together the right to exist, the right liberty and the social right of the community that are mentioned in the Universal

Declaration of Human Rights. Thus we find in this document affirmations according to whivh the human being is unique, irreplaceable, meant to a transcedent life, and not just a unity in a social entity. Thus, human destiny, the vocation of human being can fulfill only within society to all its levels: family, group, ethnicity, nation, etc. It has to be mentioned that the Universal Declaration of Human rights from 1948 recognises not only the individual rights of the human being, but the rights witih various human collectivities. The definition of the person as a being in communion, as a solidary entity, loving the neighbours, determines us not to dissociate the human rights by its duties or responsibilities. The art.1 of the Declaration of Human Rights states that all the human beings that are born free and equal in dignity and rights must behave one to each other in a fraternity spirit. And the art.29 of the same Declaration talks about the fact that "any person has duties towards the collectivity, because only within it the free nad absolute developement of his personality is possible."

So, the formal right on the other hand must be completed with the moral-spiritual dimension of human dignity. The dignity of freedom is conditioned by its ethic fondation, respectively of responsibility. From this point of view the person's rights corroborate with those of the neighbours'. The respect for our neighbour has to be at least equivalent to that we want for ourselves.

2. The aged persons' rights and protection

The problem of the person's rights and protection has represented a concern for various organs of the United Nations[5] even since 1948 when the Argentine Government proposed to the third Session of General Meeting of O.N.U. a project of the Declaration on aged persons. This project referred to the art.55 from United Nations' Charta, according to which the member states commited themselves "to create stability and welfare conditions necessary to a peaceful and friendly relation between nations..." favoring "the rising of living standards, total manpower utilization and conditions for economical am social progress and developement"[6].

The project of the Declararion was taken on agenda by the Committee for social problems and by the Committee of human rights, being under discussin till 1971, when this problem was retaken on the occasion of the debates concerning the application of the Declaration on progress and developement in the social domain. Also, the study on the aged persons' problems came into notice to the World Health Organisation and the Intenational Labour Organisation ans with other specialized institutions they got involved in this activity of attaining a rapport that contains guiding principles of nations politics and of international actions that must be carried on.

So, on the 16th of May 1973, the Economic Council recognized by Resolution no 1751/LIV "that an adequate social security is the most important for eged persons" and that " the aged persons' protection in an important item of any general system of social protection". In the same time , the Council recommended to Governments to assure to old persons sufficient allowances of social security, to create a sufficient minimum of institutions to provide medical attendance for these persons and to oversee by all means that the persons included in the social preotection programme to participate (according to their capacities) to creative activities that would moraly satisfy them[7].

On the 14th of December 1973, the General Assembly of U.N. adopted, after examining both a rapport of the General Secretary on the problem of the aged person and the old persons, and a Note of OMS, Resolution no. 3137/XXVIII[8] by which it attentioned the members states "*on the necessity of elaborating some politics and programmes on short and long term for eged persons.*"

Therewith it recommended that when they elaborate national politics and programmes to be respectful of the following principles:

---

[5]This problem was a study object both of General Assembly of U.N. and ECOSOC, Human Rights Committee and Social Problems Committee.

[6] I.Cloşcă, I.Suceavă – *Tratat de drepturile omului*- (Ed. Europa Nova, Bucureşti, 1995), p. 200

[7] Ibidem

[8] Ibidem

- To edit programmes for the sged persons' welfare, health and protection, including measures to assure them to the utmost extent economical independence and social integration;
- To elaborate measures of social security to assure them a sufficient income;
- To intensify aged persons' contribution to economical and social developement;
- To dismay discriminating attitudes, politics and measures founded exclusively on age that the employment practices;
- To encourage the conclusion of cooperation agreements on social security for the aged persons;
- To encourage the creation of employment possibilities for eged persons, according to their needs.

Between the 26th of July and the 6th of August 1982, in Vienna, took place the World Meeting dedicated to aged persons and convoked in order to constitute a tribune destined to start a programme for an international activity meant to assure economical and social security in their own country for aged persons. This because the Meeting estimated that the numaber of these kind of persons would increase spectacularly in the following 20 years[9], but that these persons represent an important human resource, both in the economical- social domain and in what concerns the transmission of cultural patrimony[10].

3.The ensuring to respect the human dignity through pension rights

The pension represent the most important performance of social insurance given within the public system. Any type of pension is given to the person entitled to the requested of the entitled person, of the designated representative by this with special delegacy , of the tutor or of his curator[11].

It can thus be said that because of the contributions paid by every person employed during his active life, pension in constituted in a gained right, Thus the citizen exerts a property right on the pension and the pension right. Also, **pension both as right and element of private property, represents a claim of the state which forces it to pay and to protect[12]**. From this perspective the quantum of tehe pension is considered that it cannot be negatively modified, because it is a gained right. Even in the Criminal law domain there is the principle of criminal law more favorable, all the more so in the domain of constituting the quantum on person's pension, if a recalculation is effectuated the more favorable pension is kept with the bigger amount). It is natyral to be so, because it is proper for the society to be thus thankful to those who contributed to the society developement , in their way.

But in the same time , respecting the Resolution 3137/XXVIII from 1973 (Romania was member of O.N.U. in that moment), the obligation of the sate is that to assure the aged persons, on one side, a decent pension-to assure a financial independence and a decent living, and on the other side , the employment opportunity according to needs with the discouragement of the discriminating politics and measures.

These measures are meant to promote and to assure **the respect for dignity of aged persons**, because their brutal removal from the work system and the neglect or their creative capacities, because of the age has dramatical efects on the entire society.

---

[9] Sice 1982 till nowadays (2011), third age population really multiplied, according with present statistics.

4.The impact of the political decision of recalculating negatively the special pensions

In the Romanian Official Gazette, Part 1, No. 527, from 28th of July 2010 was published the Government Decision no.735/2010 **to recalculate the established pensions according to the legislation regarding military state pension, police state pension and civil servant's pensions with a special statute in Prison Administration System,** according to Law no 119/2010 regarding the fixing of some masures in the pension domain.

Also, in the Romanian Official Gazette, Part 1, no 528 from 29th of July 2010 was published Government Decision no. 737/2010 regarding the methodology of recalculating the service pension categories provided in the art.1 points c)-h) from Law no 119/2010 regarding the fixing of some measures in the pensions domain.

The desicion regulates the recalculating methodology fo servive pensions provided by Law no 119/2010 regarding the fixing of some measures in the pensions domain. The envisaged categories of pensions are the following:

-service pensions of staff in the courts and of prosecutors' offices attached to them;
-service pensions of diplomatic and consular staff;
-service pensions of parliamentarian civil servants;
-service pensions of deputies and senators;
-service pensions of civil aviation professional stuff from civil aviation;
-service pensions of Accounts Court stuff.

According to those two normative documents, fixed under special laws, rightful, the service pensions **are recalculated by determining the annual average score and the quantum of every pension,** using the calculation algorithm provided by the Law no 19/2000 regarding the public pension system and other social insurance rights and respecting the methodology fixed by the decision[13].

This decision taken to a political level had an undeclared purpose-the pension reduction for the persons that activated in domain with a special character. The special character because of some special work conditions, that limitated the rights that they would in their civil life. In the case of militaty and police, as in that of the persons from the National Prison Administration, they made an allegiance to the Romanian people, so they were available all their active period. **I have to specify that the oath of allegiance was made in front of this people, not for those who have the power in the state temporary.** Also, it ia very important to consider the danger they faced during their activity, as military, policeman or civil servant in National Prison Administration.

Another specific and very important problem is that, acording to work legislation, military state pension, police state pension and civil servant's pensions with a special statute in Prison Administration System, **they didn't contribute in the Social Assurance System**! For all that, the law no. 119/2010 specifies in art. 3 alin.2 that „in the situation of the pensions (…) established based on special laws, the pension in public system makes considering carried out all the conditions specified by the Law no. 19/2000. In other words, even the legislator sanctions a lie, only for seeing made their political interest, meaning reduction the incomes of these categories of persons.[14]

Here's why, in my opinion, who I am not situated in none of these categories of persons, considering the fact that their work not only that was very important , but extremely dangerous, the Government should not even think of recalculating these pensions, especially negatively.

The inmates' reaction to sue the system is justified, a proved fact by the decision in the courts. **These decisions based on the reason that the pension is a gained right, with a patrimonial character.** Hence, the actual Government violates the property right, violating abusively, not only the Romanian Constitution that in the art.44 provides that *the property right, as*

[13] http://www.juridice ro/115777/metodologia-de-recalculare-a-pensiilor-speciale html

[14] **At the end of January 2011, Romanian Government adopted a new Government Order changing the methodology for calculate again these pensions. The law 119/2010 is still in force, so, the lie is still in force!!!**

well as the claims on state, are guaranteed, and the private property is equally guatanteed and protected by law, regardless the titular, and also the purviews of the Fundamental Rights Charta of European Union: art. 25, art. 17, 91), art. 41 line (2) point a), art. 34 line (1).

The position of international documents which Romania is part to, Lisbon Treaty from 13th of December 2007 specifies in the art. 45[15] the fact that the property right of member states will not be altered.

We also remind that the practice of the European Court of Human Rights (ECHR) in Strasbourg, as well as that of the Justice Court of European Union in Luxembourg stated that the pension represents a patrimonial right, and its reduction would injure this right and would be equivalent with an expropriation[16].

Thus, in situation gaygusuz vs Austria[17] (1996), The Court (ECHR) decided that *" the pension represents a patrimonal right as it is provided by the art. 1 from Protocol 1 of the Convention for the human rights and it is observed a discrimination as it is provided in the art. 14, if it is missing a reasonable objective justification for the diminuation of the complainant's patrimony"*.

In the famed situation of Akdeejeva vs. Letonia[18](2007), the European Court of Human Rights forced the Lettonian state to pay indemnities, fixing that the art. 16 from the Human Rights Convention was violated and the art.1 from the Protocol 1, in the case which the pension is diminuated by recalculation, being a gained right.

In the situation of Muller vs Austria, as well as in various cases like that, was decided that a reduction of the pension would affect the property right and the right to benefit by the insurance social system in the old age[19].

Besides, the high Court of Cassation and Justice appreciated by its decision from 7th of January 2011 that **"The pension is a patrimonial right and it cannot be recalculated by a Governmental Decision.[20]"**

The Romanian Government motivated this decision like any other measures regarding the inmates and budgetaries, relying on the art. 53 from Constitution : *the exercise of some rights or some indulgences might be restricted only by law and only if necessary, after case, for : defending the national security, of order, of health or of civil ethics, of the citizens' rights and indulgences; conducting a criminal investigation; preventing the consequences some natural calamities, of some disaster or of a very grave catastrophe.* Civil society considers that this motivation has no foundation, because the romanian state is not in any of these situations and, thus does not justify the annulation of a gained right. The social security right is violated also the priciple of law supremacy.

The motivation of restriction of the right as a measure for the national security is contrary to the concept of national security as in art. 1 from law no. 52 from 1991. According to this normative act, *" by Romanian national security is understoof the legal, equilibriumcand social stability state, economical and political necessary to living and Romanian national state developement, as a sovereign, unitary, independent and indivisible state, to maintain rule of law, as well as the climate to exert the rights, the indulgences and the citizens' fundamental duties, according the principles and the democratic norms settled by Constitution."* So, **the national security refers to the entire population and not only to inmates and budgetaries.**

Romanian state makes thus a discrimination, violating the Amsterdam Treaty that accord a great importance to undiscrimination principle.

None of the state that reducted the people's income did not invoked reasons as national safety and ssecurity[21].

The inmates' reaction situated in special categories of celebrating the Unification Day protesting seemed natural as long as their rights were brutally violated by receiving some drastically diminuated pensions in January, without accounting for all the considerations that were basis for the real calculation of the pension.

5. Conclusions

We agree that the pension system and the social insurance system needs a refor. This reform must not outline n a political decision without coverage in real life. In our opinion, it has to regard a direct connection between the contribution that every active person deposits during his life and his pension. Also, it is important the fact that some categories, whose activity is extremely important not only for the citizens, but for the entire country, must benefits of a special abidance, because of the fact that their rights are not limited during his active life as employee. I personally consider, as a citizen, taht my safety is very important. The safety of every citizen from this country is also very important, because only in safe conditions and stability we can create, so we can contribute to society developement. Thus, one of the most important duty provided by Romanian Constitution- the fidelity to the country- would be solved from all the citizens' opinion. Here's why we need civil servants with a special status!

OANA-MĂRIUCA PETRESCU[*]

Abstract

“The continues changing of the European Communities [presently European Union, as resulted from the amendments brought in the last 16 years, and especially via the Treaty of Lisbon] has determinate the changing of the judicial system. The accession of the EU to the Convention will complete the EU system of protecting fundamental rights. The Declaration of Berlin on the occasion of the fiftieth anniversary of the signature of the Treaties of Rome, as it was signed on 25th of March 2007 by all 27 members of European Union, is providing among others the principles and values based on respect of fundamental rights, common traditions of the member states, as well as promoting the variety of languages, cultures and regions within the EU. European Union stresses out again its intention to protect the freedoms of citizens and their civil rights by all possible means, including in front of the courts. The reassessment, via the Treaty of Lisbon, of the role of European Charter of Fundamental Rights and the accession to European Convention of Human Rights highlight the importance that each of them have separately, but as a whole in a complex legal system of the protection of human rights”.

***Key words**: treaties, rights, legal protection, European system*

1. Introduction

Although it has not been legally regulated by means of the European Unions’ treaties, the principle of human rights protection has become since its regulation under the Treaties of Maastricht (1992), Amsterdam (1997) and Nice (2001), one of the most important principles.

The important value of the fundamental rights has been reiterated in 2007 in the Conference of Berlin, when the *“Berlin Declaration*[1]*”* was signed by the 27 member states of the European Union (including the last two states acceding to the European Union as of January 1st, 2007, namely Romania and Bulgaria), on the occasion of 50 years anniversary from the signing of the Treaty of Rome by the 6 countries founding the European Union (EU)[2]. This declaration occurred in a crisis moment faced by the European integration process, whereas the Constitutional Treaty had been rejected by France and Holland in 2005, as a result of the referendums performed in the said countries on the 29th of May 2005 with 69%, and 1st of June 2005 with 62% respectively.

The mentioned declaration reiterated principles and values of special meaning for the European Union and for the member states, among which we can mention as examples: freedom, democracy, rule of law, mutual respect, tolerance, justice etc, and also its undertaking of ensuring, respecting and protecting such, prohibiting any individual or member state from breaching them.

Also, Europe is reunified under the sign of European fundamental values, written in the EU Treaty, namely: freedom, democracy and respect for human fundamental rights and freedoms, as well as the rule of law.

---

[*] Ph.D. in European Union Law, Councilor for European Affairs, Ministry of Justice – European Affairs Directorate, 17 Apolodor Street, Bucharest (e-mail: oanapetrescu27@yahoo.com).

[1] The Conference was organized in Berlin by the German presidency, held between 1st of January – 30th of June 2007.

[2] France, Germany, Italy, Belgium, Luxembourg and the Netherlands.

Thus, the three Treaties by means of which the former European Communities (presently, European Union) were established[3] did not stipulated provisions regarding the human rights protection throughout the former Community's business, such that before the Court of Justice of the European Union (CJEU) numerous matters have been raised regarding the observance and application of the human rights on a European level, by referral to *"the general principles existent on a national level in the common European juridical patrimony"*[4].

Initially, the European Union did not have a catalogue of fundamental rights, the main sources being represented by the constitutional principles common to the member states and by the European Convention for the Protection of Human Rights and Fundamental Freedoms (ECHR)[5], the importance of which arises from the fact that being ratified by all member states[6], it represents the expression of their common values.

Although, the protection of the fundamental rights had not initially been a matter of specific concern for the European Union, presently bearing in mind the new economical, political, social, cultural and legal realities within the EU, this protection became one of the most important issue that concerns the main European institutions, the Court of Justice of the European Union[7] and not least, the Member States of the EU.

As concern the issue of the EU's accession, Viviane Reding, the Vice-President of the European Commission responsible for Justice, Fundamental Rights and Citizenship said during the Hearing of the European Parliament's Constitutional Affairs Committee, that took held in Brussels, 18 March 2010 that *"the accession of the EU to the Convention will complete the EU system of protecting fundamental rights. Also, the constitutional significance of this accession was already noted by the European Court of Justice in 1994.* […] *The Lisbon Treaty makes it clear that accession is not only an option, it is the destination*[8]*"*.

2. Enlarge on the matter

2.1. General aspects. The first referral on the *"human rights"* concept was introduced in the Preamble to the Single European Act signed on February 17th, 1986 and entering into effect as of July 1st, 1987, without stipulating the competency of the European Court of Justice (ECJ), in this respect. Subsequently articles 2 and 6 paragraph 1 of the Amsterdam Treaty (the former article F.2 of

[3] The Treaty creating the European Community of Coal and Steal of April 18th, 1951, signed in Paris and coming into effect on the January 1st, 1952, and the Treaties of Rome creating the European Community for Atomic Energy, and the European Economic Community, respectively, signed on the date of March 25th, 1957 and coming into effect on the date of January 1st, 1958.

[5] Websites: http://www.echr.coe.int/NR/rdonlyres/D5CC24A7-DC13-4318-B457-5C9014916D7A/0/ENG_CONV.pdf and http://www.echr.coe.int/NR/rdonlyres/E7126929-2E4A-43FB-91A3-B2B4F4D66BEC/0/ROU_CONV.pdf.

[6] Presently, 47 states ratified the European Convention for the Protection of Human Rights and Fundamental Freedoms in accordance with their constitutional procedures.

[7] According to art.1 paragraph 1 of TEU (former art.1 of TEU) *"*[...] *The HIGH CONTRACTING PARTIES establish among themselves a EUROPEAN UNION* [...]*"*, which *„substitutes the European Community and succeeds it"* (art.1 paragraph 3 of TFEU). Moreover, on occasion of ruling judgment in Case C-345/08 Krzysztof Peśla / Justizministerium Mecklenburg-Vorpommern (published in OJEU, C series no.260 of 11.10.2008), the Court of Justice of the European Union used for the first time the phrase *„Union law"*, thus replacing the phrase *"community law"*. Taking into account the fact that it has not made a statement yet in respect of the courts of the CJEU, we think that by extrapolation the phrase *„community courts"* can be renamed as *"European Union courts"*.

[8] http://ec.europa.eu/commission_2010-2014/reding/pdf/speeches/speech_20100318_1_en.pdf.

the Treaty on European Union of 1993) consecrated the ensuring and protection of the fundamental rights within the European legal system[9].

Initially, the EU Charter on fundamental rights proclaimed at Nice in December 2000 which represents a catalogue of fundamental rights applicable within the European Union, was not an integrant part of the primary law. However, starting with 1st of December 2009 it becomes an integrant part of the Treaty of Lisbon, having legally binding status.

Through this document, the European Union confirms its commitment to one of its basic principles, namely protection and respecting the fundamental rights. EU Charter brings together for the first time, within a single text, the main rights (political, civil, economic, social etc.) for the *ressortissants* of the European Union, giving them greater visibility and highlighting the importance of the rights. Moreover, the Union must respect the fundamental rights guaranteed by the European Convention on Human Rights and resulted from constitutional traditions common to the Member States, as general principles of Union law[10].

The Treaty of Lisbon marks an important moment in the evolution of the European Union, because revises substantially article 6 of Treaty on European Union (TEU), as concern the legal status of the Charter by giving it the same legal value as the Treaties (art.6 para.1). Also, the article clarifies that *"the provisions of the Charter shall not extend in any way the competences of the Union as defined in the Treaties"*. Furthermore, it stipulates that the Charter rights are to be interpreted in accordance with the *"horizontal"* provisions[11] of the Charter and with *"due regard"* to the Explanations prepared by the Bureau of the Charter Convention.

An important provision of the Treaty of Lisbon is the accession of EU to the European Convention for the Protection of Human Rights and Fundamental Freedoms, whilst the legal basis for the accession of the EU to the ECHR is art.6 para.2 of TEU[12] and Protocol No.8 relating to article 6 para.2 of the Treaty on European Union[13] on the accession of the Union to the European Convention on the protection of human rights and fundamental freedoms, which is annexed to the Treaty on European Union, according to which *"the Union shall accede to the European Convention for the Protection of Human Rights and Fundamental Freedoms[14]. Such accession shall not affect the Union's competences"* […] *"or the powers of its institutions"*. Moreover, the accession "[…] *shall ensure that nothing therein affects the situation of Member States in relation to the European Convention, in particular in relation to the Protocols thereto* […]".

Further to this, the Stockholm Programme[15] calls for a *"rapid"* accession to the ECHR and invites the Commission to submit a recommendation to the Council *"as a matter of urgency"*. Thus,

---

[9] Paul Craig and Grainne de Burga, *EU Law, text, cases and materials*, third edition (Oxford University Press, 2003, US) p.317; Thus, according to former art. 2 – The Union sets out its objectives "[…] *of enhancing rights protection* […]", former art. 6 para.1 of the EC Treaty – "*The Union is grounded on the principles of freedom […] human rights and fundamental freedoms protection […]* whilst par 2 of the same article stipulates that: "*The Union protects fundamental right as they are ensured by the European Convention on protecting the human rights and fundamental freedoms […]*". Website: http://www.venice.coe.int/docs/2003/CDL-DI(2003)001-e.pdf.

[10] Article 6 para.2 of TEU.

[11] Articles 51 to 54 of the Charter clarifying the Charter's scope and applicability.

[12] Ex - article 6 of TEU.

[13] http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:C:2010:083:0201:0328:RO:PDF.

[14] The Treaty was signed on 4th of November 1950, in Rome, Italy. On 8th of December 2009 the European Commission issued a working paper in order to analyze the Agreement of EU accession to this Convention.

[15] In this context, point 2.1. "*A Europe built on fundamental rights"* from the Stockholm Programme stipulates that "[…] *After the entry into force of the Lisbon Treaty, the rapid accession of the Union to the European Convention for the Protection of Human Rights and Fundamental Freedoms is of key importance* […]". "*The European Council invites*:

- *the Commission to submit a proposal on the accession of the Union to the European Convention for Protection of Human Rights and Fundamental Freedoms as a matter of urgency,*

- *the Union institutions and the Member States to ensure that legal initiatives are and remain consistent with fundamental rights and freedoms throughout the legislative process by way of strengthening the application of the*

the EU would become the 48th Contracting Party of the Convention, without becoming a member of the Council of Europe (CoE).

The Treaty presents also the procedure for the accession to ECHR, namely "[…] *the Council shall also act unanimously for the agreement on accession of the Union to the European Convention for the Protection of Human Rights and Fundamental Freedoms; the decision concluding this agreement shall enter into force after it has been approved by the Member States in accordance with their respective constitutional requirements*" (article 218 of TFEU[16]). Also, the accession to ECHR and the provisions of the Charter shall not enlarge the competences of the EU establish by the treaties en forced.

The advantages brought by the EU's accession to the Convention[17], which have a high political and legal significance, are as follows:

- **From the perspective of the citizens**, accession will guarantee that any person claiming to be a victim of a violation of the Convention by an institution or body of the Union can bring a complaint against the Union before the Strasbourg Court under the same conditions as those applying to complaints brought against Member States;
- **In political terms**, accession means that the European Union reaffirms the pivotal role played by the Convention system for the protection of human rights in Europe, beyond the borders of the 27 Member States
- **In legal terms**, accession will be important before:

- it complements the introduction of a legally binding Charter of Fundamental rights. Accession to the Convention will ensure that the case-law of both Courts evolves in step. It is therefore an opportunity to develop a coherent system of fundamental rights protection throughout the Europe;

- it opens the way for the Strasbourg Court to attribute acts adopted by the institutions or bodies of the Union directly to the Union instead of attributing them to 27 Member States collectively;

- the Union will have at its disposal all rights that the Convention gives to the Contracting Parties to defend the human rights conformity of its acts before the Strasbourg Court. The Union will also be able to be represented in the Strasbourg Court with **an EU judge**.

2.2. Principle elements of the EU's accession to ECHR. Starting with January 2010, the Spanish Presidency of the European Union[18] together with the European Commission and the representatives of the Member States of the EU and those of the Council of Europe (working group CDDH[19]) started the negotiations for the EU's accession to the European Convention for the Protection of Human Rights and Fundamental Freedoms, including the debates on the agreement on the mandate gave by the Council to the European Commission in order to sign the treaty on EU accession to the ECHR.

After a public debate, the Council adopted a negotiating mandate for the EU's accession to the Council of Europe's Convention for the Protection of Human Rights and Fundamental Freedoms and

[18] Spain held the rotating presidency of the European Union during 1st of January – 31st of July 2010. http://www.consilium.europa.eu/uedocs/cms_data/docs/pressdata/en/jha/114900.pdf.

[19] Steering Committee for Human Rights (CDDH) is composed of representatives from all forty seven member States and a number of observers (from other countries, International Organisations and Non-Governmental Organisations).

on 17th of March 2010 the Commission tabled its recommendation for a negotiating mandate[20]. Different Council working-groups have discussed the proposal since then.

The aforementioned mandate was adopted within the JHA Council that took place between 3-4 June 2010.

Regarding the principal elements of the negotiations, these are:

- *The institution which will act as a negotiator*

During the negotiations, the opinions of the Member States were different as regards the *institution who will act as a negotiator*, having regard to the various interpretation of article 218 of TFEU[21], according to which the rule is that the negotiations are conducted by the European Commission, unless the case when the agreement refers to, exclusively or predominantly, on issues of foreign policy, in which situation the negotiations are conducted by the High Representative of the Union for Foreign Affairs and Security Policy. Also, according to other opinions, the representatives of Member States should be involved in the negotiations process in a grater manner.

- *Principles of negotiation*

Regarding the paragraph from the principles of negotiation to which Romania has expressed its concern (which provided that the Strasbourg court shall not interpret the EU law not even *"indirectly or incidentally"* and, especially, the rules on separation of powers between the EU and Member States), it was filled with a phrase stating that this principle cannot be interpreted in order to prevent the evaluation of the conformity of EU law with human rights by the European Court of Human Rights (ECtHR).

- *The mechanism of "co-defendant"*

The purpose of the mechanism of *"co-defendant"* is to ensure that when a complaint is lodged to the ECtHR by citizen against a Member State on issues of law of the European Union, the Union shall have the possibility to become party in that case, as *"co-defendant"*. Also, the mechanism allows Member States, as well, to intervene in a situation where an action is brought against the EU on issues of primary law (which are beyond the control of the Union, as these treaties concluded between Member States).

Although some states have opposed to the provision of establishing a special mechanism, in the final phase of negotiations the question of the mechanism of *"co-defendant"* has not raised any special problems. The reason is a new paragraph included in the negotiation directives providing for the need to introduce this mechanism.

The agreement of the parties was that the mandate will include only what the EU will have to agree in relation with the Member States of the Council of Europe (namely *the possibility* that the EU should become part of the case), whilst the internal mechanisms (i.e. *the obligation* for EU to intervene or the modality for allocating the compensations in relation to the applicant) shall be determined by *binding rules of procedure adopted within the EU*. According to a statement attached to the negotiating mandate, these rules will be discussed in the same time with the negotiation process and will be adopted unanimously, when signing the accession treaty.

[20] http://europa.eu/rapid/pressReleasesAction.do?reference=IP/10/291&format=HTML&aged=0&language=EN&guiLanguage=en

[21] Ex-article 300 of Treaty establishing the European Community (TEC).

➢ *Competency of the Court of Justice of European Union*

The involvement of the Court of Justice of EU caused the most intense negotiations, the positions of the States being substantially opposite. Thus, one of these positions[22] considered that it is necessary to introduce a mechanism in order to bring a case before the Court of Justice of European Union *by suspending the procedure started before the European Court of Human Rights*.

Another element refers to keeping the Court of Justice of EU as a supreme court of a distinct legal system, which is not subject to any external control according to the international law (this provision shall be no longer a prerequisite after the accession to the ECHR)[23].

Another provision included in the final phase of the negotiating mandate referred to stipulating of certain provisions according to which the accession shall not affect a series of dispositions of TFEU[24] (especially art.275[25] of TFEU or 263 para.4[26] of TFUE), as well as to ensuring, through a separate declaration, that the mechanism for involving the European Court of Justice shall not modify the treaties.

Regarding **Romania** and taking into consideration the issue of EU's accession to ECHR, we want to highlight the following:

- during the negotiations, the Romanian's position was coordinated by the Ministry of Foreign Affairs and Ministry of Justice;

- regarding the principal elements of negotiations, the Romania has the following principles, namely:

a) the EU's accession to ECHR shall increase the respect for human rights *by the Union and its institutions* (as regards the Member States, they are already parties to the European Convention on Human Rights);

b) the EU's accession to ECHR shall serve the citizens and not necessarily the EU institutions so that the citizens can, in an efficient way, to file a petition before the Court in Strasbourg;

c) the mechanism requested imperative by France (at the suggestion of the EU institutions - the Court of Justice and the European Commission) regarding the involvement of the Court of Justice of EU, in the cases when this court did not have the occasion to rule upon a case brought already in front of ECtHR, shall be made without any procedural delays, which would be a disadvantageous to citizens;

d) as regards the mechanism of *"co-defendant"*, Romania considered that it is necessary the mechanism could be triggered *not only by the European Union, but also by the Member States*, Romania being very interesting about this issue;

---

[22] The opinion of France was supported by the Czech Republic.

[23] This point of view was expressed by France, which supported the position of the judges of the Court of Justice of the European Union. This opinion have been presented both by the Court's representative within the FREMP working-group and by non-paper containing a proposal for a mechanism submitted by judge Timmermans. The compromise was to include the phrase *"without causing unreasonable delays"* (starting from the formulation of the ECHR relating to implementation of article 6 - right to a fair trial).

[24] Treaty on the Functioning of the European Union.

[25] Article 275 of TFEU: *„The Court of Justice of the European Union shall not have jurisdiction with respect to the provisions relating to the common foreign and security policy nor with respect to acts adopted on the basis of those provisions. However, the Court shall have jurisdiction to monitor compliance with Article 40 of the Treaty on European Union and to rule on proceedings, brought in accordance with the conditions laid down in the fourth paragraph of Article 263 of this Treaty, reviewing the legality of decisions providing for restrictive measures against natural or legal persons adopted by the Council on the basis of Chapter 2 of Title V of the Treaty on European Union"*.

[26] Art. 263 para.4 of TFEU stipulates that *"any natural or legal person may, under the conditions laid down in the first and second paragraphs, institute proceedings against an act addressed to that person or which is of direct and individual concern to them, and against a regulatory act which is of direct concern to them and does not entail implementing measures"*.

e) as *the involvement of the Court of Justice of the European Union* is concern, Romania accepted a mechanism to involve the court in Luxembourg, but insisted that the proceedings before the ECtHR should not be suspended because of the inconveniences for the citizens. In this context, the procedure should be conducted in a reasonable time[27].

2.3. Other technical details. At the level of the Council of Europe a working-group composed of 14 states has been established (7 Member States of EU *which includes Romania*, and 7 third countries to the EU), which assists CDDH[28] ("delegation" of the Council of Europe) in negotiating process with the EU.

The compromise provided that the negotiation of the EU's accession to ECHR by the European Commission and the establishing a special committee (in this case being appointed the working - group FREMP) which the Commission is obliged to consult it during the negotiations.

As concern the EU, during these negotiations the Commission informs and consults the working party on Fundamental Rights, Citizens Rights and Free Movement of Persons (FREMP)[29], as the special committee appointed by the Council, in accordance with article 218 para.4 of TFEU[30]. Also, the Commission shall report regularly to the special committee on the progress of the negotiations and shall forward all negotiating documents without delay to this special committee.

In order to establish the working program, on 23 of June 2010, the first meeting of FREMP working-group took place at the request of the Belgium presidency of the European Union, situation in which the presidency asked the negotiator (the European Commission) to present a project to be send to the CoE *before starting the negotiations*. Also, after each meeting the Commission shall report and discuss all the elements of the negotiating mandate for the next meeting.

During July 2010 - February 2011 several meetings took place between the representatives of European Commission and the CoE, whilst the first formal meeting of the FREMP Working-Group for analyzing the future policy on this topic took place in September 2010. The representative of the European Commission informed the Working Party FREMP that the next meetings of the CDDH-UE will take place on 15-18 March 2011.

As regards Romania, the presence of the Romanian representative in the working – group composed by 14 states for assisting CDDH can be very valuable, both in terms of knowledge by Romania the proposals sent by the Commission and the dissemination of the information to other Member States.

3. Conclusions

EU's accession to the Convention is one of four key components of an ambitious and comprehensive fundamental rights policy at the level of the European Union.

With the entry into force of the Lisbon Treaty, the EU's Charter of Fundamental Rights is legally binding for 27 countries and represents the most modern codification of fundamental rights in the world. This legally binding Charter represents a major step forward in terms of our political commitment to fundamental rights. It entrenches all the rights found in the Convention.

The Charter goes further, enshrining other rights and principles, including economic and social rights that come from the common constitutional traditions of the EU Member States, the case law of the European Court of Justice and other international instruments. In the Charter, we also find

[27] This aspect was proposed by Romania during the JHA Council that took place between 3 – 4 May 2010.
[28] Steering Committee for Human Rights (CDDH).
[29] This group is composed of counselors of justice and home affairs.
[30] According to art.218 para.4 of TFEU (ex-article 300 of TEC)*"the Council may address directives to the negotiator and designate a special committee in consultation with which the negotiations must be conducted."*

the so-called "third generation" fundamental rights, such as data protection, guarantees on bioethics and on good administration.

Furthermore, the matter of human rights is of extreme importance and has been reiterated upon the Conference organized by the in force German presidency of the European Union in the document of strong political and juridical value – the Berlin Declaration, signed and undertaken by the 27 member states of the European Union. In this context, "*peace and freedom*", "*democracy and the (ideal) rule of law*", "*mutual respect and shared responsibility*", "*tolerance, justice and participation*", "*equality in rights and social solidarity*" are some of the principles and values of the EU listed in the anniversary Berlin Declaration.

In the end, we want to highlight the fact that the promotion of fundamental rights is one of the priorities of the Stockholm programme setting the strategic guidelines for developing an area of freedom, security and justice in Europe.

The European Commission is seeking a smooth insertion of the European Union into the system of the Convention of Protection of Human Rights. The accession should therefore preserve the substantive and procedural features of that system also with respect to the Union as a new Contracting Party.

Protecting fundamental rights is about upholding human dignity and the full enjoyment of rights. In view of the strength of the EU Charter – which is in many instances more ambitious than the Convention – the European Union will not find it difficult to meet the standards required by the Convention. The accession of the European Union to the Convention is an incentive to develop the policies that strengthen the effectiveness of the fundamental rights that people enjoy in Europe.

REVOCATION OF ADMINISTRATIVE ACTS - THEORETICAL AND PRACTICAL CONSIDERATIONS

ELENA EMILIA ŞTEFAN[*]

Abstract
Revocation is a method of terminating the legal effects of an administrative act.
Just like the general theory of law admits that any subject of law, author of a manifestation of will, is able to withdraw it, in the administrative law there is also possibility for the authority that issued the administrative act to abrogate its own act under certain circumstances.
Thus, this study aims at making a presentation of the legal regime of the revocation of administrative acts, starting from aspects such as terminology, legal grounds, reasons, term, and ending with the analysis of the applicable legislation on revocation, particularly of the law on administrative disputes, and much more. Hence, revocability appears to be the fundamental principle of the legal regime of administrative acts, in close connection with the principle of stability of legal relationships.

Keywords: *administrative act, revocation, principle of stability of legal relationships, Constitutional Court, principle of legality*

Introduction

This study purposes to present the institution of revocation of administrative acts in the Romanian legal system, both as a theoretical and practical approach.

Before the actual analysis of the proposed subject, the first part of this study will provide an overview of the legislative framework that justifies the existence of this method of terminating the effects of an administrative act in the Romanian administrative law.

We begin treating this subject by quoting a fragment from the Constitution of Romania that sanctions, in its article 1 par. (5), the principle according to which "in Romania, the observance of the Constitution, its supremacy and the laws shall be mandatory".

The principle of legality is sanctioned in any legal system, therefore the Romanian legislation is also generous from this point of view, thus establishing, according to the fragment quoted above from the fundamental law of the country, a general obligation imposed to all subjects of law, public authorities or not, to observe the law while conducting their activities.

The general principles of law, as the professor Nicolae Popa[1] used to say, are the substantiated regulations that channel the creation of law and its application.

The principle of legality[2], which is a constant of the modern system of administrative law, is currently the fundamental principle of organization and operation of the public administration in any democratic rule of law.

It is important to emphasize that, in the western political acceptation[3], the mandatory observance of the law refers equally to the individual and to the public authorities, including the State. In other words, all the authorities of the State must observe the law, just like any citizen.

[3] Cristian Ionescu, *Comparative Constitutional Law*, (Bucharest, C.H. Beck Publishing House, 2008), p.36.

The content[4] of legality includes three essential requirements, which correspond to three fundamental coordinates, namely: legality is the limit of the administrative action, legality is the foundation of the administrative action, and legality is the administration's obligation of acting so as to effectively observe the law.

From this[5] last requirement derive certain obligations devolving upon the administration, such as: the administration's obligation of advertising legality, of informing everybody about the rules of law, by means of publication or by any modern form of communication; in the event the administration itself impinged on legality, it must immediately put an end to the illegal situation that it created, either by abrogating the administrative act or by revoking it... etc.

An important complement of subjecting the administration[6] to the law was born, in time, from the development of certain principles of law, such as equality of citizens before the law, legal certainty, and protection of individual rights by independent courts of law.

The principle of legal certainty refers not only to the lawmaking operation that must observe certain strict rules[7], but it also refers to the "possibility offered to any citizen of evolving in a certain legal environment, protected from the vagueness and sudden changes that effect the legal standards"[8].

Section 1. General considerations; terminology used in case of a revocation of administrative acts

André de Laubadère defined the administration as being the "assembly of authorities, agencies and bodies having the duty, under the impulse of political power, of ensuring multiple interventions of the modern state"[9].

Since the process of issuing administrative acts may also contain errors, there must be a possibility of correcting them, which was indeed succeeded by introducing the principle of revocability of administrative acts in the activity of the public administration bodies.

Seeing that[10] the administrative authorities act under time pressure, the solution of social needs must be prompt.

Whereas the administrative act is the main legal form of action of the public administration, it goes without saying that the rules of the legal regime can only be established based on the rules underlying the organizational structure of the public administration. This way, we come to understand revocability of administrative acts as a rule (a principle) of the functional structure of the public administration.

The administrative acts cause legal effects until they are rescinded, which is usually ordered by the issuing authority or by the higher authority in the hierarchy or by a court of law. As the public administration[11] is organized according to the principle of hierarchy, it also features the possibility of revoking administrative acts in order not to prejudice the system itself.

[9] André de Laubadere, *Traité de droit administratif*, 6ème édition, vol. I (Paris, L.G.D.J., 1973), p.11

[10] Ion Corbeanu, *Administrative Law)*, 2nd Edition revised and supplemented, (Bucharest, Lumina Lex Publishing House, 2010), p.107.

[11] Ion Corbeanu, *op.cit.* p.107.

In terms of cessation of the legal effects of the administrative act, some authors[12] treat revocation jointly with rescission. Thus, it is said that: "in the legislation of our country, administrative acts are, as a general rule, *revocable, which means that they can be rescinded or revoked*".

Professor Antonie Iorgovan[13] believes that revocation is a particular case of nullity.

The author Dana Apostol Tofan[14] is also of the opinion that revocation is a particular case of nullity but also a rule, a fundamental principle of the legal regime of administrative acts.

On the contrary, other authors[15] definitely reject the assertion that revocation is a kind of rescission, believing that the two methods are different kinds of the abrogation of administrative acts, being seen as two independent methods.

In cases when the revocation was ordered by the issuing body, the term of *retraction* has been used, which is unanimously adopted by almost all the theoreticians of law.

Section 2. Legal grounds; reasons of revocation, time limit

Subsection 2.1. Legal grounds of revocation of administrative acts and time limit

This principle of revocability of administrative acts derives from the Constitution and from the Law nr. 554/2004 on administrative disputes[16]. Although the Constitution of Romania does not make express provisions in this respect, this principle results from several articles read together, i.e. 52, 21, 126, etc.

This survey does not aim to deal also with the categories of irrevocable administrative acts, as their number varies depending on the author who analyses them.

According to article 7 of the Law on administrative disputes, before approaching the competent administrative litigations court, the person who considers that its right or legitimate interest has been violated by an individual administrative act must ask the issuing public authority or the superior authority in the hierarchy, if applicable, within 30 days as of receiving the document, *to revoke it, in full or in particle*

Also, even the right of the public authority who issued the document to challenge it before the administrative litigations court in view of acknowledging its nullity, has been sanctioned in situations when *the document can no longer be revoked because it has entered the civil circuit and has caused legal effects*, according to article 1 par. (6) of the same law. The action must be brought within one year as of the issue date of the document.

It is worth mentioning that the one-year time limit for the legal action observes the principle of certainty of legal relationships that derives from the provisions of article 6 of the European Convention on Human Rights (Convention), ratified by Romania by Law no. 30 / 18 May 1994. This principle requires, among others, the observance of the finality of an act that has not been challenged in court within the time limit of a common law action in the field or, failing such time limit, within a reasonable time – before being construed as "final".

The possibility to challenge, without having to observe a time limit, a unilateral administrative act referring to an individual endangers the legal order, meaning that the legal relationships and the social ones ordered by the former ones may be changed at any time, thus affecting the social order itself. However, any social relationship and any legal relationship must dispose of a sufficient time

[16] Law no. 554/2004 on administrative disputes, published in the Official Gazette no. 1154/2004 (with its last amendment by Law no. 202/2010 on certain measures for accelerating the solution of trials).

limit in order to be, if necessary, sanctioned in justice, a time limit beyond which no changes are allowed, by checking the legality or other aspects characterizing that legal relationship.

It is also worth mentioning that the same considerations are valid also for the possibility of revoking the administrative act by its issuer, therefore this measure cannot be taken at any time, but within a time limit that observes the principle of certainty of legal relationships, a principle already detailed above.

Subsection 2.2. Reasons of revocation of the administrative act

If in the introductory part of this survey we mentioned "legality", another term is worth mentioning as well, namely "opportunity"[17], both terms being closely connected to the principle of revocability of administrative acts.

The opportunity[18] of the administrative act derives from the capacity of the issuing body of choosing, among several possible and equal solutions, the one that best suits the public interests that must be satisfied.

Thus, it indicates the quality of the administrative act of satisfying both the strict rigors of the law and an especially determined need, at a given time and place. Whereas legality evokes the fact that the act complies exactly with the law, opportunity is the conformity of the administrative act mainly with the spirit of the law, without identifying the two notions.

Hence, revocation intervenes for all reasons of illegality, but particularly for reasons regarding opportunity[19].

In terms of the moment they intervene after the issue of the administrative act, regardless of whether they are due to its illegality or to its inopportunity, the reasons of revocation can be anterior, simultaneous or subsequent to the issue of the administrative act, as follows:

1) anterior reasons, causing the legal effects of revocation to be *ex tunc*, for the past, as if the act had never existed;

2) simultaneous reasons, causing legal effects of the same nature (*ex tunc*);

3) reasons subsequent to the issue of the act, causing legal effects in the future (*ex nunc*), having as consequence the termination of the legal effects caused by that act upon its revocation.

Section 3. Examples of revocation, regulated in the Romanian legislation

In the following, we are going to make some references to the legislation with regard to revocation and we shall start by nominating those in the Constitution of Romania; however, there are many other examples besides the ones we shall mention here:

- Article 64 par. 2 regarding the internal organization of the Parliament: "Each Chamber shall elect its Standing Bureau. The President of the Chamber of Deputies and the President of the Senate shall be elected for the Chambers' term of office. The other members of the Standing Bureaus shall be elected at the opening of each session. The members of the Standing Bureaus *may be dismissed* before the expiry of the term of office."
- Article 85 par. 2 regarding the appointment of the Government: "(2) In the event of government reshuffle or vacancy of office, the President shall *dismiss* and appoint, on the proposal of the Prime Minister, some members of the Government."
- Article 107 par. 2 and 3 regarding the Prime Minister:

"(2) The President of Romania *cannot dismiss* the Prime Minister.

(3) If the Prime Minister finds himself in one of the situations stipulated under Article 106, *except for him being dismissed*, or if it is impossible for him to exercise his powers, the President of

[17] In the doctrine, the term "opportunity" has also been analysed in connection with the excess of power.

[18] Verginia Vedinaş, *Administrative Law*, 4th Edition revised and updated (Universul Juridic Publishing House, 2009), p.91.

[19] Antonie Iorgovan, *op.cit*, p.334.

Romania shall designate another member of the Government as Acting Prime Minister, in order to carry out the powers of the Prime Minister, until a new Government is formed. The interim, during the Prime Minister's impossibility to exercise the powers of the said office, shall cease if the Prime Minister resumes his activity within the Government."

- Article 110 par. 2 regarding the end of the term of office of members of the Government: "(2) The Government shall be dismissed on the date the Parliament withdraws the confidence granted to it, or if the Prime Minister finds himself in one of the situations stipulated under article 106, *except for him being dismissed*, or in case of his impossibility to exercise his powers for more than 45 days."

Other examples:

- *revocation* and abolishment of the patent of invention[20],
- *revocation* of the administration right[21]
- *dismissal* of the Ombudsman[22], as a result of violating the Constitution and the laws
- *revocation* of the right of abode[23]
- *revocation of the authorization for tax warehouse*[24]
- *revocation* of the right to hold weapons[25] etc.

By the examples given above, we tried to highlight that the term of "revocability" is expressly used in the Romanian legislation.

Section 4. Revocation of administrative acts reflected in the ECHR case law

As regards the projection of the principle of legality in the European legislation, we would like to mention that, at the European level, there is a right to good administration[26] in the operation of the public authorities.

The right to good administration is set forth in the Charter of Fundamental Rights of the European Union[27], promulgated at the Summit of Nice of December 2000, as well as in the European Code of Good Administrative Behaviour[28], approved by the Parliament on 6 September 2001, and currently it serves as a guide and source of information[29] for the personnel of all the institutions and bodies of the Community.

Therefore, in the light of the recent evolutions within the Community, one can distinguish a special interest for the protection of rights, legitimate interests, and civic liberties, the leverages for their factual accomplishment having been created. We would also like to mention the procedure of

[29] For full details, refer to http://www.ombudsman.europa.eu/activities/home faces.

the prior complaint which, besides the principle of legality and of stability of legal relationships, is an efficient means of fighting bad administration and was created in order to offer the interested parties the possibility of solving their complaint within a shorter period of time and more effectively, as the notified administrative body is able to revert to the act it has issued and to issue another one, accepted by the claimant.[30]

The author Ovidiu Podaru[31] analyses several decisions of the Strasbourg Court, connected to the principle of certainty of legal relationships, cases in which the solution of the Court was against Romania, and so does another author[32], as follows:

- case Păduraru[33] versus Romania
- case Brumărescu[34] versus Romania
- case Viaşu versus Romania, of 09 December 2008
- case Beian[35] versus Romania

After an analysis of these decisions is follows that legal certainty involves the same dimensions: clarity of the right and stability of the right. These decisions do not explicitly refer to the issues regarding the revocation of administrative acts.

The Constitutional Court of Romania has acknowledged the European trend of punishing the violation of this principle and, to that effect, we would like to mention two decisions:

1.) In its Decision no. 404 of 10 April 2008, it asserted that: "the principle of stability of legal relationships, although it is not expressly sanctioned by the Constitution of Romania, is inferred both from the provisions of article 1 par. (3), according to which Romania is a State of law, a democratic and social State, and from the preamble to the Convention on Human Rights, as interpreted by the European Court of Human Rights in its case law. "

2.) In its Decision no. 1352 of 10 December 2008, the Court decided that: "The European Court of Human Rights, by its decision given in the case of Brumărescu versus Romania, 1999, ruled that: The right to a fair hearing by a court, guaranteed by article 6, 1st paragraph of the Convention, must be interpreted in the light of the preamble to the Convention, which asserts the supremacy of law as an item of the joint patrimony of the contracting states. One of the fundamental elements of the supremacy of law is the principle of certainty of legal relationships, which claims, among others, that the final solution given to any dispute must not be subject to a new judgment."

Conclusions

In this study, we have tried to highlight the fact that the activity of the public administration is based on an entire range of principles, that the revocability of administrative acts was born from the need of limiting the damages for the administration and from the need of not prejudicing the system itself.

Towards the end of the study, our analysis referred to the ECHR case law in the field, bringing to attention certain aspects connected to the principles of operation of the public administration and insisting on the fact that a sustainable administration relies on laws.

[34] On this subject: Iuliana Rîciu, *Theoretical Examination of Judicial Practice regarding the Actions Brought before the Administrative Litigations Court by the Public Authority that issued the Illegal Administrative Act*, Bucharest, RDP no. 1/2008, p.131.

[35] Published in the Official Gazette, Part I, no. 616/21 August 2008.

Unlike[36] other legal systems, the Romanian system contains an imbalance in this respect: the very short timeframe in which the administrative authorities may revoke their illegal acts clearly favours the principle of legal security as opposed to the principle of legality.

In conclusion[37], at the European level there is a concern for the revocation of administrative acts, considering the dynamics of the administrative phenomenon and the importance that the administrative appeal may have as a procedural means of prejudicial solution of administrative conflicts.

WOMEN'S RIGHTS VIOLATION: HONOUR KILLINGS

CRISTINA OTOVESCU FRĂSIE *

Abstract
In this study I have presented the domestic violence concept and the situation regarding the observing of woman's rights in Syria. We have also evidenced the juridical aspects regarding the honor killing directed against women after the modification of the article 548 from the Penal Code changed by the President al-Asad on July the 1st 2009. The data offered by NGOs have been of great help for the elaboration of the study as also the statistic data presented in Thara E-Magazine regarding the cities where had been done the honor killings and their number, the instrument of the murder, the age of the victim, and the motives for the murders. It must be noticed that, lately, the Government fought for the observing of the woman's rights and promoted the gender equality by appointing women in leading positions, including the vice-president one.

Keywords*: human rights, domestic violence, honor killing, Penal Code, woman's rights*

1. Introduction

In the Arab world, women have no rights and are perceived as "the property" of the man. The legislation from these countries is starting to change, adapting to the occidental system. A recent example is represented by some Islamic Sunnite laws (fatwa), though which women gain the right to hit their husbands. Actually, the wife aggressed in the family have the right, from this date on, to hit their husband if they are in self defense. "Any person has the right to defend himself/herself, either man or woman, because all the human beings are equal in front of God", said the sheik Abdel Hamid al-Atrach, the president Al-Azhar, the highest authority of the Sunnite Islam. He declared that women have the right to respond in the same way they are treated by men. The Turkish leader Fathallah Jouloun added that women "can even answer with two hits for one received", in the situation of conjugal violence. The legislative changes that took place after it was ascertain a high rate of mortality among the Arab women. For example, in Egypt, 35% amongst women are killed by their husbands every year[1].

In Syria there isn't a legislation made especially to forbid the domestic violence[2]. According to a study made in 2006, one of four women who participated on an interview had been a victim of the domestic violence. Most of the cases, women don't announce the domestic violence acts because they are excluded from the society. The observers noticed that when certain women had been the victims of abuses and tried to make a complaint at the police, the policemen didn't answer to their declarations in an active way or they didn't answer at all. In the police stations, women faced situations of sexual harassment, verbal abuses and slapping in the face from the police officers when they made the complaint; these situation happened in the department Bab Musallah from Damascus. Few victims of the domestic violence sought their justice in the court, having as a consequence the social stigma of this action[3].

According to the legislation in force, the legal age for marriage is 18 years old for men and 17 years old for women. But, there is also the situation when a 15 years old or even more men and a 13

[1] The source: www.Antena3 ro, (Oct 29th 2008).

[2] The domestic violence is mostly met in the rural areas.

[3] The source: US Department of State – Syrian Arab Republic (2009): *Country Report on Human Rights Practices*, 11.III.2010, apud http://www.portal-ito ro/.

years old or more woman can get married if they both agree in the presence of a judge and if they are considered "physically mature"; they have to have the consent of the father or grandfather. In the last period of time, the number of minors' marriages decreased but there still are some regions, such are the rural, less developed areas[4]. In Syria there aren't any civil laws regarding the marriage, inheritance and divorce. The problems regarding the status of a person are judged by the sharia courts for Sunnites and Shiites Muslims that represent almost 75% of the population and other religious courts for the Christian, Jewish and Druze communities[5].

2. INTRODUCTORY NOTIONS REGARDING THE DOMESTIC VIOLENCE AND THE WOMAN'S RIGHTS IN SYRIA

November 25th is the International Day for the Elimination of Violence Against Women. Therefore, it is desired for every woman not to be discriminated, not to be the victim of violence and to live in an environment proper for their development, without fear or constraints. Violence against women can be avoided though the instrumentality both of the community where she lives and of the families because the attitudes, the behavior and the social norms can't be modified. It is very important for the state to help the communities in which the violence is widely spread through the adopting and applying of stricter laws. Through the establishing of the international agencies that promote the human rights is wished to be stopped the violence against women and they benefit by the rights (for example: the right to education, to health, to work an equal remuneration as the man for the same job etc.) and equal chances in society and the aggressors to put under accusation.

According to Pangelow, "the interfamilial violence is referring to any act committed or omitted by the family members and any consequences of these actions or inactions, through which other members of the family are deprived by their equal rights or freedoms and/or which infringe upon their optimal development and upon the exercising of the freedom to choose"[6]. "The strategies on which depend the development of programs and services that are centered on the problems regarding the domestic violence are determined by the actual tendencies in the internal and international social policies. The ways of approaching the domestic violence follow two major tendencies such are: the promoting of the human rights model and the redefinition of the domestic violence as a public health problem.[7]"

The marital violence refers to any act or behavior, aggressive manifestation against husband/wife, with the purpose to:

- enforce the control and the power into the relation;
- reaffirm the rolls and the responsibilities in the family;
- discharge, in the case of a crisis created by external or internal factors;
- fulfill certain expectations created through the model of socialization;
- hurt/injure the partner.

The forms of manifestation of the marital violence are diverse: physical, psycho-emotional, verbal and sexual[8].

During the last period of time, the Government fought for the observing of the woman's rights and promoted the gender equality by naming the women in leading positions, including the vice-president position. We must notice that Syria has the highest rate of parliamentary women from the

Arab world. As regarding the observing of the right to education, the Government offers to women equal access, but there are also many discriminatory laws that are in force. If the women wish to travel in another country together with their children without having the proof of the husband's agreement, he can ask to the Ministry of Interior to stop her leaving. The person accused of rape can be discharged if he will marry his victim. It must be taken in that the law isn't so drastic and stipulates reduced sentences for "the honor killing" committed by men against the feminine relatives for alleged infidelities. An important Syrian mufti declared "the honor killing" as non-Islamic in 2007 and, with the help of the Government, was opened the first shelter for the abused women in September 2008. The sharia law governs the law of the personal quality for the Muslim women and it is discriminatory as regarding the marriage, the divorce and the heritages; the church law governs the personal statute for Christians, leading sometimes to the forbidding of the divorce[9].

"The Government condemned to prison several important members that promoted the human rights among the communities and in the civil society. The Government infringed the citizens' right to the private life and imposed significant restrictions for the right to free speech, the freedom of the press, the freedom of reunion, association and travelling. A corrupt atmosphere spread into the Government. The violence and the discrimination against women continued, and so did the sexual exploitation, more and more heading towards the Iraqi refugees, including the under age children. The Government practiced the minorities' discrimination, especially against the Kurds and the Ahvazians and restricted the worker's rights"[10].

3. THE HONOR KILLING IN SYRIA

Nowadays, the domestic violence takes also the shape of the honor killing.

„An *honor killing* or *honour killing* (also called a *customary killing*) is the murder of a member of a family or social group by other members, due to the belief of the perpetrators (and potentially the wider community) that the victim has brought dishonour upon the family or community. Honour killings are directed mostly against women and girls. The perceived dishonor is normally the result of one of the following behaviors, or the suspicion of such behaviors: (a) dressing in a manner unacceptable to the family or community, (b) wanting to terminate or prevent an arranged marriage or desiring to marry by own choice, (c) engaging in heterosexual sexual acts outside marriage, or even due to a non-sexual relationship perceived as inappropriate, and (d) engaging in homosexual acts. Women and girls are killed at a much higher rate than men. The United Nations Population Fund (UNFPA) estimates that perhaps as many as 5,000 women and girls a year are murdered by members of their own families. Many women's groups in the Middle East and Southwest Asia suspect the victims are at least four times more"[11].

The killings for defending the honor (honor killings) are often met in the east and south-east of Turkey, practically in the entire Mediterranean space, in the Near East, but also in Asia and Africa. In these spaces there are communities where the families kill their daughters if they lost their virginity, if the dare to have an affair, if they wish to break the marriage with a partner that they don't love or if they escape from an arranged marriage, even if they don't leave their husband for another man, but also even if they were sexually abused or they were raped. Rarely, it might happen to be excluded from the family, most of the time they are killed. By killing the victims of the abuses, from the traditional point of view, the authors of the murder reestablish the honor of the family. The way they do the murder varies: the victims are shot, stabbed, drowned, sprinkled with gas and set of fire, driven over (by the men from the family) or poisoned (by their mothers of mothers-in-law, the victim

couldn't rely on the support of the other women from the family because they too must contribute to the reestablishing of the honor). Sometimes, these "tainted" women are compelled to get married quickly, but even in the new family the life of these young women is endangered if it is revealed that they had been "dishonored"[12].

In the south-eastern Anatolian area, two thirds from al the marriages are arranged by the family, even if in the actual period most of the young people choose their partner. The sum of money they have to pay for buying the bride it is very important for the prestige of the family. In most of the cases, this sum is too large for many young people, who would have to save money for many years in order to afford to get married. Thus, the young girls have to marry older men who they accept without loving them. As a consequence, the young people migrate towards the big cities for not respecting the tradition anymore[13].

"In April 2008 it came to light that a woman had been killed in Saudi Arabia by her father a few months before for "chatting" to a man on the social networking Internet site Facebook. The murder became public only when a Saudi cleric referred to the case to criticise Facebook for the strife it caused[14]. A June 2008 report by the Turkish Prime Ministry's Human Rights Directorate said that in Istanbul alone there was one honor killing every week, and reported over 1,000 during the previous five years. It added that metropolitan cities were the location of many of these, due to growing Kurdish immigration to these cities from the East. In 2009 a Turkish news agency reported that a 2-day-old boy who was born out of wedlock had been killed for honor. The maternal grandmother of the infant, along with six other persons, including a doctor who had reportedly accepted a bribe to not report the birth, were arrested. The grandmother is suspected of fatally suffocating the infant. The child's mother, 25, was also arrested; she stated that her family had made the decision to kill the child[15]. A girl in Turkey was killed after her family heard a song and thought she had a boyfriend. In 2010 a 16-year-old girl was buried alive by relatives for befriending boys in Southeast Turkey; her corpse was found 40 days after she went missing[16]. Ahmet Yildiz, 26, a Turkish physics student who represented his country at an international gay conference in the United States in 2008, was shot leaving a cafe in Istanbul. It is believed Yildiz was the victim of the country's first gay honour killing[17]. There are no exact official numbers about honour killings of women in Lebanon; many honour killings are arranged to look like accidents, but the figure is believed to be 40 to 50 per year. A 2007 report by Amnesty International said that the Lebanese media in 2001 reported 2-3 honour killings per month in Lebanon, although the number is believed by lawyers to be higher. Most killings in the Gaza Strip and the West Bank are carried out by villagers; honor killing is extremely rare in Palestinian cities and larger towns. The Palestinian authority uses Jordanian law, which gives men reduced punishment for killing a female relative if she has brought dishonour to the family. Due to Palestinian protests, Mahmoud Abbas, President of the Palestinian Authority, promised to change the discriminatory law by the year 2010, but As of November 2010 this has not happened. According to UNICEF two-thirds of all murders in the Palestinian territories are honor killings"[18].

In Syria, the article 548 from the *Penal Code* was modified by the president al-Asad on the 1st of July 2009. Through this article was allowed to instances to reduce and to renounce the punishments for the authors of the honor killings. The new dispositions of the article stipulate a punishment of maximum two years of prison for any person condemned for the honor killing. It can be mentioned that the minimal sentence is less severe than the sentences stipulated for other forms of homicide. The Government doesn't have an official statistics of the honor killing. Most of the times there weren't offered the complete names because it was desired the protection of the victim by the groups that defended the human rights. According to the provided data, the Ministry of Interior estimated that a number of 38 honor killings took place between June 2008 – June 2009, while the Syrian Women Observatory (SWO) estimated that actually 200 to 300 killings took place every year. It is known that the number of the honor killings is very big, but the reporting of these murders is rare; the exact data of the honor killings were difficult to obtain. The families or the friends who were willing to discuss the cases refused to say any name motivating the wish for intimacy or the fear for revenge[19].

Case studies[20]

1. According to the information held by the Syrian Women Observatory on the 2nd of February, two men killed their sister (a married woman) in Aleppo, because she wore a hijab, in concordance with the tradition of her husband, instead of a burka, which she wore formally according to the desires of her family.

2. The group SWO, according to a report from July the 20th of IWPR[21], reported that a man killed his sister, Soad, mother of two children, who lived in Damascus, after he suspected that she worked as a prostitute, having the permission of her husband. Later, there were no information regarding the catching of the author or if the police investigated the case.

3. The data from a report registered on December the 12th, made by the observers of the human rights, point out that two brothers from Aleppo killed their sister, Khadija, because she married a man from Homs to work in a tavern. In the next period no information appeared that would concern the investigation of the case or if the two brothers had been caught by the police.

<<**The situation of media monitoring of the crimes committed under the pretext of honor in Syria** (2010)[22]

- *Data monitoring:*

The total number of crimes: 61 crime 62 victim of a "crime of which claimed the lives of two girls together,"

- *Distribution according to provinces:* Aleppo: 17 crime; Idlib: 13 crimes; Homs: 6 crimes; Hasakah: 5 crimes; Damascus Suburb: 4 crimes; Hama: 4 crimes; Lattakia: 4 crimes; Al Raqaa: 2 crimes; Al Swida: 2 crimes; Daraa: 2 crimes; Damascus: 2 crimes;1 crime that has never been documented.
- *Degree of relativeness between the killer and its victim:*37crime committed by brother; 7 crimes carried out by the husband; 5 crimes carried out by the father; 4 crimes carried out by the uncle of the victim; 3 crimes carried out by siblings or family together; 2 crime carried out by the mother; 2 crime to force or push to suicide; a crime carried out by the son.

• *Instrument of crime:* 17 crime by firing squad; 17 crime stabbing with a knife;12 crimes strangled; 8 mixed crimes committed with more than a tool such as stabbing and then shooting , or stabbing and then strangling or by using a hammer, or another tool; 3 crimes where the head were separated from the body; 2 crimes forced to commit suicide; 1crime electrocuted;1 crime of burning fire; 1 crime of poisoning the victim.

• *Age of the victim:* 13 victims were under the age of 18; 33 victims between the ages of 18 to 30; 16 victims over the age of thirty.

• *Causes of death:*14 crimes because the victim is absent from the home of her parents; 12 crimes because of the rumors and suspicions morality of the victim; 10 crimes due to marriage without parental consent; 10 crimes because of suspicion of a sexual relationship for the girl with a man; 5 crimes because of the mishandling of suspicion of immoral acts; 3 crimes by forcing incest and then killing her; 2 crimes because of pregnancy illegally; 2 crimes because of the divorce; 2 crimes of rape; 1 crime is not clear why.>>

4. Conclusions

The militants for the human rights promoted, during the last period of time, the shifting of the problems regarding the personal statute to the jurisdiction of the civil instances. Through the numerous petitions and campaigns of making people aware in media and on the field, the groups regarding the human rights wished the mobilization of the Syrians against the legislation, because it is repressive against woman. In the opinion of the legal experts, the new law regarding the personal statute in not accordingly to the international law because it breaks all the treaties concerning the women and children's rights that Syria ratified. "They say that the bill maintains most of the restrictive articles from the legislation about the personal statute, in force since 1953 that is based on the Islamic law. For example, the propositions keep an existent stipulation according to which can be taken the children of the divorced women if they work without the permission of their ex-husbands and also one which stipulates that the violator who would agree to marry their victims can be exonerated from penalty. The bill also keeps the amnesty for the men accused with honor killing. In some rural communities from Syria, it is considered legal that the mail members of a family to kill their female relatives in case of adultery or pre-marriage sex. More than that, the bill interdicts to the married women to travel without a previous approval from their husbands – a stipulation that lacks from the law in force. According to Younes, the proposals represent a radical interpretation of the Islamic legislation.[23]"

There are no certain data regarding the number of the honor killings, by the Syrian Women's Observatory, an unofficial group, discovered at least 12 such murders in 2009. In August 2009, a father killed his 18 years old daughter because a neighbor tried to rape her[24].

THE LEGISLATIVE CONSTRUCTION OF REALITY. A SHORT REFLECTION

RAMONA DUMINICĂ*

Abstract

In today's Romanian society, characterized by radical economic and political changes, we are witnessing a veritable „law crisis" mainly generated by the inadequate manner in which the law is devised. The law no longer seems necessary to regulate reality and to ensure the protection of the individual and his rights, rather it has become an easy solution amongst so many others, an element of the policies imposed by the ruling party or parties.

The enactment of law no longer seems based on the two conditions considered essential to the drawing up of legislation: knowledge of reality and an adequate application of the legislative technique so that the social reality matches the reality reflected by the law. The law is no longer created to regulate a certain reality, rather through laws most often a parallel reality is created. The legislator no longer makes decisions concerning reality itself, but becomes a simple „fabricator" of reality.

All these assessments constitute the fundamental reason that has determined us to reflect in this study upon what we call „the legislative construction of reality". Thus, in this present article we try to bring forward for discussion no only the causes of this phenomenon, but also to propose solutions to remedy the problem.

Keywords: *law crisis, legislative construction, social reality, juridical reality, real sources of law*

Introduction

If traditionally the law was placed at the top of the legal hierarchy, as in the XIX century when it was considered the "holy ark", at present it seems to have lost its key role within the framework of the internal legal order. The law has become less and less accessible to the citizens and more difficult for the legal practitioners to apply. We therefore appreciate that the law is in a significant and growing crisis.

The intelligible quality of the law, the negative influence of emergency governmental ordinances, the growing role of other sources of law, the pressure applied by European and international law, the legislative inflation, the current parliamentary crisis, but especially the violation of the fundamental rules in the process of elaborating legal acts are only a few of the causes that have led to the declining authority of the law that we are witnessing at present.

In the present study, we seek to bring up to date the role that the social, economic and political factors play within the legislative construction, by starting from the assessment that in contemporary Romanian society the laws are created regardless of what reality requires, given that reality is forced to assimilate more rules than it is capable of absorbing or that these rules contravene social realities, thus seriously endangering not only the stability of the legislative system, but even its own foundation.

We consider that the process of elaborating laws should be, at the same time, both an intellectual as well as a determined operation, since creating laws without any scientific knowledge of the social realities can only lead to the creation of an unjust and arbitrary legal norm.

* Assistant Ph.D. Candidate, Faculty of Law and Administrative Sciences, University of Pitesti (e-mail: duminica ramona@yahoo.com).

1. The relation between reality and the regulated reality

Naturally, in the theoretic approach of the relation between reality and the regulated reality we must start by defining the concepts, to which we make reference. We discuss daily the social, economic, political and juridical realities, but what do these actually represent?

Obviously, throughout time the concept of reality has represented the main theme of reflection in philosophy, which has tried to find elaborate explanations for it, and has sketched out two generally accepted views: according to the first, everything that is independent of the consciousness is "real", and according to the second, everything that is active and acts and interrelates with everything else is "real".

When we say that something exists, what we understand is that it really exists. More precisely, we consider reality as a fundamental form of existence. The concept of reality describes "everything that exists in itself, independent of another's thoughts. Reality exists regardless whether it is perceived or understood by anybody."[1]

By analyzing the notion of reality, we distinguish between two types: objective reality and subjective reality.

Objective reality consists of all the areas of existence, independent of the human consciousness and will. It covers the entire sphere of material existence outside the consciousness and it is completely independent of the actions of humans and nature. Therefore it is exterior and previous to humanity.[2]

As for subjective reality, it consists of all the cognitive, affective, voluntary and attitudinal processes, the states of mind, concepts and theories and so forth, which form the human consciousness. This form of reality exists only through the activity of the human brain and it derives from the objective reality.

Looking beyond these two "pure" forms of reality, we can identify realities that do not belong to either category as they contain both objective and subjective elements, such as social reality. Simply put, social reality describes everything that happens in society from an economic, political, moral, spiritual, demographic, technological and juridical point of view.

All these social realities closely interrelate with what we call the "regulated reality". Speaking for ourselves, simply put, by regulated reality we understand all the aspects of existence conveyed or reflected in the law. Legal norms are either processed from social rules or regulations conceived outside the law or they are created or developed through the express will of competent public bodies.

The law does not define reality, it does not proclaim any general or abstract norm wherefrom we deduce that "this thing" is real and the "other thing" is not. The law distinguishes only what is social in reality, it can only perceive reality in terms of persons and things: on one side we have the existence of persons, and the relations between them, and on the other side we have the existence of things – private property, public property and objects without owners, etc.[3]

From a historical point of view, if in the initial stage of conceiving the law the predominant form of borrowing was either integral, either through adaptation or sanction of certain rules from the social reality, such as moral, economic, religious, familial rules, in modernity and in the present times, the norms of positive law are almost exclusively the result of legislative development activity by the authorities invested with lawmaking prerogatives.

Ideally, the elaboration of legal norms should be founded on two conditions, which one must always meet: knowledge of reality and the necessity to regulate, identifying the priorities by using scientific criteria and subsequently, the adequate application of the legislative technique. The relation

[1] Peter K. McInerney, *Introducere în filosofia dreptului* (Bucureşti: Ed. Lider, 1998), 43.
[2] C. Stroe, *Compendiu de filosofia dreptului* (Bucureşti: Ed. Lumina Lex, 1999), 36.
[3] Bernard Edelman, *Quand les jurists inventent le reel* (Paris: Éd. Hermann, 2007), 170.

between these two conditions is formed through the interdependence between reality and the regulation of reality. Thus, the elaboration of normative solutions by the legislator appears conditioned by complex realities – social, economic, spiritual, domestic or international realities.

Evidently, in contemporary society these two conditions that we consider essential for the creation of a proper legislation, are not always met and practically, we are witnessing the creation through legislature of another reality, a parallel reality, thus current discussions focus on the legislative "fabrication of reality".

2. Normative Construction – an action conditioned by complex relations

As we have previously shown, the creation of law must be visualized as an action conditioned by complex realities of a social, economic, political, spiritual, domestic or international nature that constitute the so-called "given", which determines the "constructing".

All of these realities constitute the real sources of law, which determine the object, the subjects, the content, the ends and to some extent even the form of the law. Considering these aspects, their role must not be exaggerated, nor overlooked because, as M. Djuvara stated "the entire history, the entire past, all social forces, language, the economy of the respective country, industry, commerce, agriculture, politics, moral and scientific concepts, compete to exert a strong influence over the evolution of law, just as the law exerts a strong influence over their own evolution."[4]

As the law lies at the centre of the legal reality, it has a complex foundation, characterized without a doubt by multi-foundationalism.

When criticizing mono-foundationalism, H. Rottleuthner distinguished between logical and epistemological fundaments; moral and historical fundaments; the naturally extra human, economic, political, extralegal, and proposed the safeguarding of unity and identity, explaining the law through different dimensions and connections with external variables, but also pleading for coherence and a systematic approach of the fundaments of law.[5]

Starting from these assessments, we further will discuss some of the relations considered by us and others, as the real sources of law, meaning those objective or subjective factors that determine the appearance and evolution of law and whose role must always be observed by the legislator.

2.1. The role of the natural environment in the creation of law

The natural environment, in which people live, represents a complex factor that influences the socio-economic and political activities and behaviours of people, which are regulated in their turn by legal norms.

The diverse juridical, philosophical or sociological systems have highlighted the importance of one of the elements of the natural environment: the geographic environment, biologic, physiological and demographic factors and so on.

For example, Hegel shows us that there are "two types of law: natural laws and positive law". The natural laws "are absolute and valid as they are". It is necessary to learn to recognize them because "the measure of these laws surpasses us."[6]

Montesquieu also grants the geographical factor a prevalent role in the political and legal organization of society and in the development of legal norms that must match some of the particularities of the area: "the laws must be in accordance with nature, the geography of the country,

[4] Mircea Djuvara, *Teoria generală a dreptului. Drept raţional, izvoare şi drept pozitiv* (Bucureşti: Ed. All Beck, 1999), 300.

[5] Enrico Pattaro (edit.) et al, *A Treatise of legal Philosophy and General Jurisprudence*, (teoretical part) Vol. 2, Foundations of law, vol. 2 (Springer, 2005), 1-7, 31-161.

[6] G. W. F. Hegel, *Principes de la philosophie du droit ou droit naturel et science de l'état en abrégé* (1821), 9.

the cold, warm or temperate climate, its quality, its size, the type of life of the people, the ploughmen, the huntsmen or shepherds (…)."[7]

We will not exaggerate the role of this factor in the development of law and history, demonstrating that an exaggeration of demographic and biological factors have led to the passing of preposterous laws, with a racist quality, retrograde or anti-humanistic, yet still, the law cannot avoid being influenced by the physical environment since it is in this space that people exercise their rights and assume responsibilities.

The natural environment has manifested its influence and continues to exercise it on the legislation, for example by creating laws that combat pollution and the degradation of nature, by establishing certain laws to protect the land, the territorial waters, airspace or to fight against nuclear radiation. For example, in our country laws have been sanctioned that establish the juridical system of the Danube Delta Biosphere Reservation (Law 82/1993); the Law of the Land Fund (Law 1/1991); as well as other legislative acts for the protection of the waters, the hunting and fishing fund, for the exploitation of natural deposits etc. Today there are talks about a new branch of law, environmental law.

In the literature[8] it is shown that in the process of creating the law, the biological and physiological factors gain a particular relevance in point of the repercussions that the natural qualities of people, both biological and physiological, have on their states of consciousness and their attitudes in society. The well-known distinction in law between the capacity to use (to have rights and obligations) and to exercise (to exercise the subjective rights and to assume responsibilities through proper legal acts), is based just on the existing relation between the physical development of the human being and the development of his mental faculties. Another fundamental juridical institution, namely the legal liability, is configured by the relevance that the physiological and biological qualities of people obtain. The idea of legal liability is founded on the discernment that people use when they act. The biological and physiological qualities of people are imposed upon the legislator and on other levels, for example, children, the infirm and disabled persons require a special legal treatment, thus special laws are created, whereby these groups are protected.

Legislative measures concerning the stimulation of demographic growth, the protection of married couples, have also been created and regulations meant to limit the growth of the population have been adopted, wherefrom originates the influence of the demographic factor exercised on the creation of regulations.

The profound changes generated by biological progress and the medical sciences have given the law new challenges, such as human cloning, eugenics, medical interventions meant to modify the lineage, thus both the international and domestic legislative authorities have promptly reacted and condemned such experiments. Such an example is the Romanian New Civil Code, which thorough article 62 prohibits any type of genetic modification that might result in encroachments upon the human species, or article 63 that prohibit any intervention that might result in cloning human beings or creating human embryos for research purposes.

In conclusion, the manifestation of the force of these factors does not appear as an inevitable negative circumstance, their presence does not automatically produce legal consequences. It is precisely for this reason that certain opinions[9] are well-founded, opinions according to which the action of these factors is always correlated with a social interest, and is present only to the extent to which a social necessity requires that it be taken into consideration.

In the same way, doctrine also shows us that "by acknowledging this double meaning, namely determining the object of the regulation and influencing the solutions adopted within the framework

of these regulations, the regulating force, at times coercive, of factors that constitute the natural environment wherein social interactions take place, cannot be comprehended except to the extent to which the mentioned factors are considered related with social interests."[10]

2.2. The influence of the national and international socio-political environment on the legislative process

The social-political factor refers to the complexity of life in the community, the concrete components of society: the economic environment, the political, ideological, cultural and even religious environment.

As the law is a product of society, it must also be in a permanent and constructive relation with the social interests.

The economic component of the social environment is an active force in the development and modification of any objective right.

The law is imposed by the economic environment with certain conditions of the material life, dimensions that finally ensure its normative essence. The economic factors influence or determine the elaboration of certain legal norms, by exerting their authority on every component of the social system. These factors allow the law to adapt to economic requirements, depending on the social ends and interests. Economic phenomena such as: production, reparation, circulation and consumption, economic reforms, the change to the market economy take shape through the law, through adopted laws, and create the framework of development of the economy. In this sense, W. Lippman said that "no man can own property, nor openly and securely enjoy its benefits, if it is not by virtue of the fact that the state is disposed to have his legal right respected.

Without a legal title man has no property, he is nothing but a possessor deprived of possibilities to fight against those powerful enough to appropriate what is his."[11]

Within any type of society the economic component is decisive and it bears the mark of the ideologies typical of the respective period.

For example, Marxist ideology, materialist-dialectic in essence, as exemplified by totalitarian socialist and communist societies, considers that the law should correspond to the general economic situation and the economic model imposed by this ideology and also that the economy constitutes the decisive factor of the law.

On the other hand, liberal and neo-liberal ideologies sanction the thesis according to which the law must acknowledge the economic rights and liberties (the right to accumulate riches and capital, the freedom to produce and to commercialise what is produced etc.), it must guarantee contractual economy and create an adequate framework for this type of development.

The Romanian revolution of 1989 has generated radical changes in Romanian society. The economy has shifted from the old, excessively centralized economy to the market economy, whose main driving force is the free initiative of manufacturers and the autonomy of economic agents. All these principles have been sanctioned by the country's Constitution and special laws.

The transformations that have occurred in these last years have led to the advent of certain fundamental laws meant to regulate commercial relations and to guarantee: freedom of trade, loyal competition and the stimulation of foreign investments.

The current economic crisis plaguing Europe and the rest of the world is also an example of how the economy exerts considerable influence over the development of not only domestic but also community and international law: laws have been passed to limit the effect of this crisis. For example, the Law for a Sustainable Economy has been passed in Spain, while in Romania there is Law 118/2010 concerning certain measures, which are necessary for reestablishing the budgetary

[10] Anita Naschitz, *Teorie şi tehnică în procesul de creare a dreptului* (Bucureşti: Ed. Academiei, 1969), 66.
[11] Walter Lippmann, *The Good Society* (New York: Grossef s Universal Library, 1943), 278.

balance. Therefore, all these efforts made to create and perfect the legal framework of the economic reform constitute clear evidence of the connection between the law and the requirements of the economic transformations.

Last but not least, we must not neglect the role of the financial and banking environment in the development and functioning of the objective law currently in force. "No society has any chance of success if it does not combine the interests and the credit enjoyed by the wealthy with those of the state. A national debt, if not an excessively large one, will be a true blessing for the nation." As such, starting from these statements, it is clear that not any positive law, but also public and private international law depend to a subtly assessable extent on the interests of internal and international financial and banking groups.[12]

The political environment is another component that exerts influence over the law, on which we shall focus our discussions further. The relation between this factor and the law is remarkably emphasized by Professor Gheorghe C. Mihai who states: "The legal language is in a particular relation with the political language; thus, there is no one single truth for one or the other but many truths, from which one can choose and decide by majority of the vote. (…) There is no love in the political language and in the case of positive law it means something completely different (loyalty in legitimate sexual relationships, solidarity between citizens, between members of a syndicate) to "surpassing oneself". In the case of positive law, the church (institutionalized religious faith) is the one acknowledged to work, even though, on the other hand, it acknowledges the right to choose one's religion. In the case of politics, the church has no relevance if it does not serve its ends. In the case of positive law, marriage represents the institutionalized family, in which the partners can be: mature persons of different sexes. In the case of politics, the family, even an institutionalized one, is an outdated entity."[13]

The problem posed by the influence of the political factor over the creation of law is an old one, but it is just as pressing and current today as ever.

Speaking for ourselves, any legal norm shall be protected from the supremacy of the political as long as it relates to its own criteria of value that make it more stable and credible as a reflection of the social reality, however without understanding thereby an isolation of the law from the political, wherefrom it claims its paternity and with which it exists in a inter-dependence, but only that the law must keep its own essence.

The concept of political power, simply but relevantly put, designates the power of the polis, in the sense of power "of the community of members of the community that are conscious of belonging to it."

Lato sensu, political power implies besides the power exercise by the state, i.e. the institutionalized part, the characteristics of the political power.

It is clear that exercising political power is not possible without passing certain laws to regulate the organization and functioning of the authorities.

At the same time, the development of state law is the responsibility of a national body, as a component of the institutionalized part of the political power in society, and it is owed to the initiatives with a political under-layer of the existent political parties. The limitation of restituted agricultural properties to ten hectares, through Law 18/1991, the current regulations concerning the acquisition of Romanian citizenship or the electoral law in force in Romania, the decriminalization of homosexuality etc., all of these have a political side, given by the political variety of the parliamentary majority at a certain moment in history. However, the form of the regulation and its application is greatly relieved by the partisan political interest, because thus it cannot impose itself as

a general obligation. At the same time, the authority of the positive law ensures the law of the political force, which values it and adjusts its legitimacy.[14]

The positive law is also influenced by interest groups, meaning "those group structures that on the basis of a common attitude can transmit to other social structures the intention to reach certain ends that aim to stabilize, maintain or intensify the forms of behaviour that involve common attitudes. Such groups, based on a system of stable interactions, which respect the general and balanced distribution of interests (for an organized reaction to the external pressures on these interests), and act for a maximization of the interests of its members. They make the causes that they defend, public and they support or reject the candidacies in elections, debate law projects, influence the legislative through lobbying etc."[15]

The pressure groups play an ever more important role in the political game besides the political parties. Depending on their legal status, there are compulsory groups (e.g. administrative councils of territorial communities in districts, cities, counties) or voluntary groups, pertaining to the private law (e.g. industrial and commercial societies, syndicates and others). As a rule, the practices of these groups are: propaganda, influence games (corruption is the limit of this practice) as well as through direct actions: strikes, street blockades and so on.

One must not neglect the power of the minorities, defined as "a group inferior in number to the rest of the population of a state, which possesses certain ethnic, religious or linguistic characteristics that set it apart from the rest of the population and which manifests, in an implicit manner, a feeling of solidarity, in order to preserve its culture, traditions, religion and language."[16]

In some states, such groups are organized in political parties, unions or associations legally registered and recognized by the state authorities and fight through a great diversity of means and methods to force the state to adopt the requested legal regulations (the use of the mother tongue in schools, the administration and in justice, the increase of autonomy of settlements where they form a majority etc.).

People's lives take place not only within the national socio-political framework, their existence involves their belonging to the members of a regional and international communities.

The relations formed at the level of the international community, consisting mostly of relations between states, create a certain international climate, which materializes in different categories of laws and principles, which form the international legal system. The principles at the foundation of the contemporary international law are a relevant example of the power to influence the domestic law by the existing human particularities at the level of the international structures, by the forms of organization of the relations at this level as well as the specific characteristic of the social ideology. These principles include the principle of cooperation between states, the principle of a peaceful solution of international differences; not resorting to force or threats to use force; noninvolvement in the domestic matters of other countries; the right of the peoples to lead themselves; the equal sovereignty of all nations; the inviolability of national boarders; territorial integrity; the respect for basic human rights and liberties and last but not least the respect in good faith for the obligations assumed in accordance with international law.

It is indisputable that in contemporary society the structure of the national legal systems is influenced by the international and European socio-political environment.

Thus, the status of Romania as a member state of the European Union and as a part of the great family of the states of the world (the United Nations) generates the obligation to harmonize Romanian law with the international and UN law.

[16] A. Lajoie, *Quand les minorites font la loi* (Paris: P.U.F., 2002), 23.

At present, the creation of domestic legislation involves not only an effort to achieve technical organization, national correlation, but also one to achieve community and international correlation. In this sense, article 12 from Law 24/2000 concerning the norms of legislative technique for the development of normative acts, republished in 2004, established that the normative act must be organically integrated into the legislative system, for which purpose: a) the bill must be correlated with the stipulations of laws of the same or a higher level, with which it is connected; b) the bill, drawn up on the basis of a higher level act, cannot surpass the limits of competence instituted through this act and cannot contravene its principles and stipulations; c) the bill must be correlated with the community regulations and the international treaties, of which Romania is a signatory.

Therefore, the development of a legal project involves the harmonization of the stipulations from international treaties, of which our country is a signatory and intervenes on the basis of the principle of respecting international treaties. There can be no discrepancies between a domestic law and an international treaty, because in such a case the domestic law would render the stipulations of the treaty inoperable, which would lead to breaking the obligations assumed and of the principle *pacta sunt servanda* stipulated in the Romanian Constitution. Also, the correlation of a law project with the international treaties intervenes on the basis of the principle of priority of international treaties concerning human rights, as sanctioned by article 20 from the Romanian Constitution.[17]

More than that, as a consequence of the adherence and finally of the integration of Romania in the European Union, from a legal point of view, a new interference was created between the national and community law. As any other member of the European Union, Romania has assumed the obligation to correlate the national legislation with the community legislation through the translation and implementation of the community acquis into the domestic legal system. This acquis consists of domestic laws that must be in accordance with the regulations of community law.

2.3. The human factor in the process of developing of the law

At present, the promotion and protection of the fundamental human rights and liberties, the regulation of the human conduct, in the effort to sustain the integration of the individual in society and the attempt to respond to the social realities and human necessities constitute desiderata of the legislative process.

The legal norms, which represent the substance of law, have not only a role to regulate, but also to regularize the human conduct and the socializing role, to shape and stimulate the behaviours corresponding to the values defended by the law.

In modern law, the human factor constitutes or should constitute the main area of interest for any legislator.

Regulating human behaviour within the framework the diverse categories of social relations, the law permanently relate to the presence of man in society, his capacity to influence and even transform society. Since birth, man goes through a long and complex process of socialization, a concept that signifies his integration in society, learning the social way to coexist, subordination to the conduct-type, prescribed by the social etiquette. Socialization involves the process whereby the individual becomes a human (the assimilation of the rules of social coexistence) and forms his system of response to different social requirements. The law represents an important factor of socialization, by shaping and stimulating those behaviours that are adequate to the respective values. The law exists in a wholly social and human framework. As such, nothing that is social can escape the law, because the law perceives human actions within a given system of relations.[18]

---

[17] Mihai Grigore, *Tehnica normativă* (Bucureşti: Ed. C. H. Beck, 2009), 286.

[18] N. Popa, "Consideraţii privind dimensiunea socială a dreptului şi factorii de configurare a acestuia", *Revista de Ştiinţe Juridice nr. 2* (2007): 13.

The regulation of human conduct involves the analysis of the human factor in the dynamism and complexity of the features and relations, to which are added knowledge of needs, interests and goals of the actions of humans observed in different situations: citizen, hunter, worker, owner, teacher and others. At the same time, the regulation of human conduct clearly involves the adaptation of certain laws that discourage or punish antisocial actions and to diminish lawbreaking. The legislator is supposed to keep in mind that fact that whoever breaks the law is still human and for this reason there are institutions with legal responsibilities to reestablish the order of law, on one hand, and on the other to re-socialize the lawbreaker.

We appreciate that before anything else the human dimension of the law concerns the fundamental rights of a person, the rights guaranteeing complete equality for all people, the right to manifest themselves in an unhindered manner on the basis of their dignity and freedom, because humans, by their nature, are free and dignified beings. It is precisely these rights that should constitute the final purpose of any regulation.[19]

Discussing the relation between the authority and the individual, Professor Dan Claudiu Danisor appreciates that "The human person must be instated as the centre of the state and the judicial structure, a person that is understood as a universal entity, deprived of all the particular features that result from its allegiance to a primary identification group and who is free to develop their personality without the abusive intervention of authority."[20]

As such, the human factor is the one that determines the development and adoption of some of the most important international documents for promoting, defending and guaranteeing human rights and liberties: the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights.

Thus, modern national and international law is influenced, as regards its whole structure, by the problem of respecting the fundamental human rights by the state authorities. The European Court of Human Rights in Strasbourg, founded in 1954, is the first European jurisdiction for the protection of the fundamental human rights.

Therefore, humans represent the most active force in the development, modification and the evolution of positive law. The legislator, by regulating certain types of conduct must not ignore the fact that they are destined for people who must assimilate and respect them on the basis of certain values, ideals of coexistence, hopes and beliefs.

Humans will accept to have their freedom limited only in favour of an order necessary to them and others and under the condition that the law not deform the interests and values, they will submit only to the law, who consider it just.

Conclusions

The social reality is characterized by extremely fast transformations. It seems like a mosaic, in which every element has a different genesis, development and evolution, which correlates with a specific dynamics, in order to form a whole.

The law, as a constitutive and functional element of any society is influenced by the social changes and transformations, which it tries to regulate through legal norms.

At present, in our country, the legislator tends to devaluate the role of these factors, thus, the creation of legislation does not seem to be founded on the two conditions that we consider essential for the development of a law: knowledge of realities and their adequate application of the legislative technique so that there is a correspondence between social reality and the reality reflected through the

[19] In this sense: Dan Claudiu Dănişor, *Drept constituţional şi instituţii politice*, vol. I (Bucureşti: Ed. C.H. Beck, 2007), 540-620; Ioan Muraru, E. S. Tănăsescu, *Drept constituţional şi instituţii politice* (Bucureşti: Ed. All Beck, 2005), 172-253.

[20] Dan Claudiu Dănişor, *Drept constituţional şi instituţii politice*, vol. I (Bucureşti: Ed. C.H. Beck, 2007), 551.

legal act and to finally bring reality to order and to protect the individual and his rights. We are witnessing a true "law crisis", generated amongst other things by the fact that in the legislative activity does not begin with through scientific research of social realities. We can easily observe how, instead of regulating reality, we are witnessing the legislative construction of a parallel reality.

Speaking for ourselves, we consider that the role of the social realities in the legislative activity must not be ignored, nor overlooked. That is why, we appreciate that the creation of law should be, simultaneously, an intellectual and a determined activity. We must not lose sight of the complexity of the social given reality, of the fact that it comprises of numerous elements that pertain both to the material as well as the spiritual world, since creating law without acknowledging the existence of the social "given reality" can only lead to the creation of an unjust and arbitrary law.

On the other hand, the development of the law must not be reduced to its social determining only because then we reach a wrongful and mistaken understanding of the relation between social conditioning and the rational creation of law, thus hiving us the impression of a passive legislator, who does nothing but copy the social realities, without being capable of accounting for his regulating activities.

COLLECTIVE BARGAINING – WAY OF PREVENTING LABOR DISPUTES

ADRIANA ELENA BELU[*]
ANDREEA DIANA PAPA[**]

Abstract
Labor disputes are triggered, in most cases, by claims of economic or professional interests. Employees may have the belief that they are frustrated due to the granting of rights, ensuring optimal labor conditions or compliance with the terms of the collective agreement, becoming thus concerned about claims or even the onset of labor disputes. Through collective bargaining, these conflictive guidelines can be prevented or resolved at the optimum time.

Keywords*: collective bargaining, labor disputes, employees, rights*

Introduction

Economic and professional motivations (incentives) include: salary, bonuses, profit sharing, lending, the existence of a health insurance system, facilities for career development, ensuring compatibility between the qualifications, skills and abilities of the employee and the job characteristics etc.

- Why should the manager get involved in the knowledge and materialization of his own employees' motivation?

The answer to this question has been given from totally opposed points of view. Therefore, according to the theory of D. Mc Gregor[1], the manager has to use the motivational lever because in the employees' personality structure there are negative traits that have to be correlated. For example: people do not like work; people are reluctant to work, if possible; people are less ambitious; people prefer to be led, directed; people are selfish and indifferent to the needs of the organization they belong to; people do not take responsibilities; they are concerned about their safety in work processes; people are opposed to changes; people must be controlled and, if appropriate, punished; people only want to maximize their material gains, neglecting the psycho-social needs.

Paper content

1. Identifying organizational priorities

Labor disputes can be prevented if the manager tries to systematically identify priorities established to meet organizational objectives through the practical use of the following guiding principles or ideas[2]:

1. labor division – specialization of functions and separation of powers which allow each person to work in a particular area and thereby increase efficiency;

2. authority and responsibility – right to give orders and responsibility for using this right;

3. *discipline* – understood as submission, diligence, respect; it is practiced by subordinates only if their bosses exercise their roles in a competent way;

[2] See Gazier, B., *Strategiile resurselor umane*, (Institutul European, Bucureşti, 2003), p. 79.

4. unit of command and action – embodied in what is called "linear hierarchical management", according to which a subordinate doesn't receive orders from more than one boss;

5. direction unit –people engaged in the same type of activities should be reported to the same objective, under a single plan that special programs can be derived from; in a more direct way, as Fayol's own words: "one boss and one program for an amount of operations having the same body ... a body with two heads is a monster ";

6. the staff's rightful remuneration – is a highly important motivational factor, although there is not a perfect remuneration system;

7.centralization and decentralization – decided by the type of company and the quality of its employed personnel; their aim is „the best possible use of the whole staff's knowledge";

8. hierarchy – the same hierarchical level but belonging to a different hierarchical line necessary to ensure unity; important is also the presence of cooperation or bridging ties between the departments / individuals from the same hierarchical level but belonging to a different hierarchical line;

9. order – concerns the rational use of materials and human resources and is achieved by means of plans for using time and materials or by selecting and organizing people; "a place for each person and each person in his place";

10. equity – involves a combination of goodwill and spirit of justice in the treatment of subordinates;

2. Avoiding authority abuse in favor of harmony

Normally, managers are assigned a degree of formal authority by the top echelon of their leaders. In the spirit of this authority, the manager can make decisions and employ the organization's resources. However, the authority over personnel is relevant to the granting of rewards and imposing of penalties. Because the authority is officially sanctioned by the organization through labor disputes, it is very important for managers to substitute to the formal authority an authority derived from personal competence. In this sense, Max Weber has become an author recognized for contributions to the development of management, one of the reference names for organizational psychology, his contribution to the foundation of a formal type of organization, "bureaucratic organization", being essential. What causes people to obey orders, do what is required? – Weber asked himself. In this context, he operates the distinction between *power* (the ability to force people to obey in spite of their resistance) and *authority* (voluntary fulfillment of orders received by people under consideration of their superiors' legitimacy). Based on how the authority is recognized, Weber described three types of authority, organization and default organization. The first type was called *charismatic* authority - from the Greek *charisma* which means grace, exceptional personality traits - accepted and respected by people because of their faith in the supernatural, extraordinary powers of a certain person. The second type of authority is the *traditional* one, based on the common past, tradition and customs. The third type is the *rational-legal* authority, founded on the belief in the value of laws and regulations. The practice of one or other of these types of authority determines the appearance of distinct forms of organization and management. For example, charismatic authority relationships usually lead to organizational hierarchies based on leaders and their followers or disciples, lack of orders and commands, which are the inspiration of the leader, irrational decisions are frequently met, the subordinates' behavior is dependent on the leadership.

Organizational efficiency and optimum climate in which conflicts of interest can be avoided are ensured in Max Weber's conception by meeting the following general principles of management:

- *express principle of division* of work between members of the organization which allows each person to know their responsibilities and specialization as a result of their enforcement;

- *principle of authority's hierarchy* in the virtue of which authority is given by position, each inferior position being under the control and leadership of the superior one;

- *principle of formal rules and regulations rationally established* (laws, decrees, regulations) which ensure the transformation of the authority's legitimacy into the legality of the general rule ;

- *principle of impersonality and impartiality* derives from the fact that the relationships between the members of organization and those between them and clients or beneficiaries are formal, official and based on rules unlike the impersonal activity, where the hatred and lack of passion, affection or enthusiasm derive not from a person's qualities, but from the hierarchical position and the system of formal rules;

- *principle of promotion* ensures the career ladder, the promotion being made according to the criterion of age, competence proved during the activity's performance or by combining these two criteria;

- *principle of efficiency* appears as a corollary of all the others, the efficiency of bureaucratic organization resulting from, as Weber himself says, its technical superiority versus any other kind of organization.

Compliance with these principles of bureaucratic organization leads to the emergence of numerous *positive effects*: increasing focus from the members on short segments of activity, but clearly demarcated between them, fact which fosters accurate and quick decisions; disciplining the organization's members (through the establishment of official contacts); reducing conflicts (if formal rules are respected); protecting the organization's members against abuse of authority (by prescribing behaviors); creating a feeling of safety (by anticipating behaviors regulated by rules, norms and not by intuition, improvisation); promoting objectivity (through impartiality).

3. Use of economic and professional motivation

Meeting the organization's strategic objective implies making a positive motivation for all employees, i.e. performing successful management concerning human resources[3].

Motivation is achieved through participatory management, knowing that major management decisions taken only in an authoritarian manner are subject to critical comments, generate dissatisfaction and are disputed.

A manager is efficient if he uses the interaction and masters the science of motivating the personnel.

Motivation is the sum of internal and external energies that initiate and direct human behavior towards a goal which, once attained, will result in satisfying a need. The reasons which animate people are an expression of their needs and expectations. Needs are defined as deficiencies that an individual feels at a time, and expectations are individual beliefs in the existence of opportunities that can be obtained by a certain level of effort and performance.

Primary internal energies that determine the motivation are simple: basic or primary needs (food, sleep, shelter), need for security and the need for recognition and belonging to the group; the internal energies are psychological self-esteem, self-affirmation and self-determination. These needs are highly variable in type and intensity, they are incentives for group work, though people don't always aware them and are strongly influenced by the environment in which individuals operate. External energies that influence motivation are the result of the manager-employee connection and are characterized by a pronounced dynamism that both "sides" can and should seize. On the other hand, social conditions and processes in general, the influences of friends, family, particularly natural and cultural factors, including organizational ones, can determine the magnitude of motivation for professional achievements of each employee.

In practice, people are characterized by very different levels of aspiration, what motivates one employee may not be sufficient for another.

[3] See also Stanciu, Șt., *Managementul resuselor umane*, 2001, p. 160 and the following.

Therefore, the motivation process must be strictly personal, which represents an important effort for the employer. Typically, basic needs, once satisfied, leave open the expression of the higher-order needs that are the real means of affirming the human personality.

It was concluded that motivating factors, exclusively pecuniary, which could increase the subjective value of work, taking into account the particularities of situations and persons to whom the successful business managers focus, are: appreciating the employees' success, the permanent information about the organization's performance, establishing professional goals which should incite, encourage initiative, the statutory teamwork climate, increasing the degree of autonomy and decision of the working teams, attract gifted staff etc. Among these factors, recognition of individual success and encouragement of communication in the workplace are critical in obtaining the successful participation of employees.

Negative motivation was based on threats, punishment, blame, financial penalties etc. Applying these tools should be limited, because there are a number of issues that reduce their efficiency:

- the sanctions have low motivational effects because they are considered by employees to be exaggerated;
- the sanctions cannot be applied in an objective way with the same intensity for individuals being in different situations, but having made the same mistake;
- the frequently application of sanctions induces a state of tension;
- the organization cannot be developed on a culture with negative valences.

It was demonstrated that the application of negative motivational factors led systematically to reduced job performance of individuals; the expected results have been obtained only by applying the means of positive stimulation.

In C. Lane's opinion[4], factors determining job satisfaction can be classified as: economic and professional motivations; social reasons; motivations related to self-realization; psychological motivations; psycho-social reasons.

Economic and professional motivations (incentives) include: salary, bonuses, profit sharing, lending, the existence of a health insurance system, facilities for career development, ensuring compatibility between the qualifications, skills and abilities of the employee and the job characteristics etc.

- Why should the manager get involved in the knowledge and materialization of his own employees' motivation?

The answer to this question has been given from totally opposed points of view. Therefore, according to the theory of D. Mc Gregor[5], the manager has to use the motivational lever because in the employees' personality structure there are negative traits that have to be correlated. For example: people do not like work; people are reluctant to work, if possible; people are less ambitious; people prefer to be led, directed; people are selfish and indifferent to the needs of the organization they belong to; people do not take responsibilities; they are concerned about their safety in work processes; people are opposed to changes; people must be controlled and, if appropriate, punished; people only want to maximize their material gains, neglecting the psycho-social needs.

Same D. McGregor leaves this slightly fatalistic theory and encourages the manager to use, however, work motivation if he wants performance and to prevent conflicts because: people are not lazy; people do not dislike working; people have the ability to automotive; people are stimulated by responsibilities; people are involved in changes, having the ability to imagine and create; people do not like to be controlled; in addition to basic needs and security, individuals also need self-determination and self-improvement; physical effort and intellectual effort at work are just as necessary as recreation and entertainment.

[5] See also Mc Gregor Douglas, *Leadership and Motivation*, (M. I. T. Press, 1966), p. 76 and the following.

Another opinion (Gelenier)[6], considers that motivational procedures of the employed staff must be determined by knowing the following principles: employee performance is dependent on job satisfaction; people prefer to work in autonomous groups; people prefer to take decisions by consensus; people accept participatory management; people prefer informal associations.

These findings have established a distinct theory called the theory of expectations (V. H. Vroom is one of its representatives), which received two types of modeling:

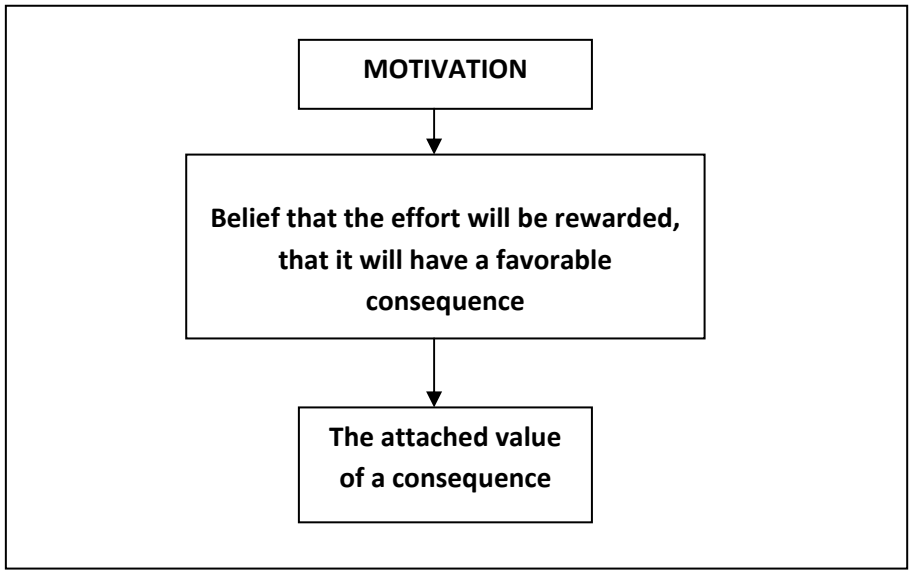

Fig. no. 1 – Adapted after Variant no. 1 regarding the "Waiting modeling" in the opinion of V. H. Vroom, quoted by Gelenier in *Strategie de l enreprise et motivation des hommes, p. 183*

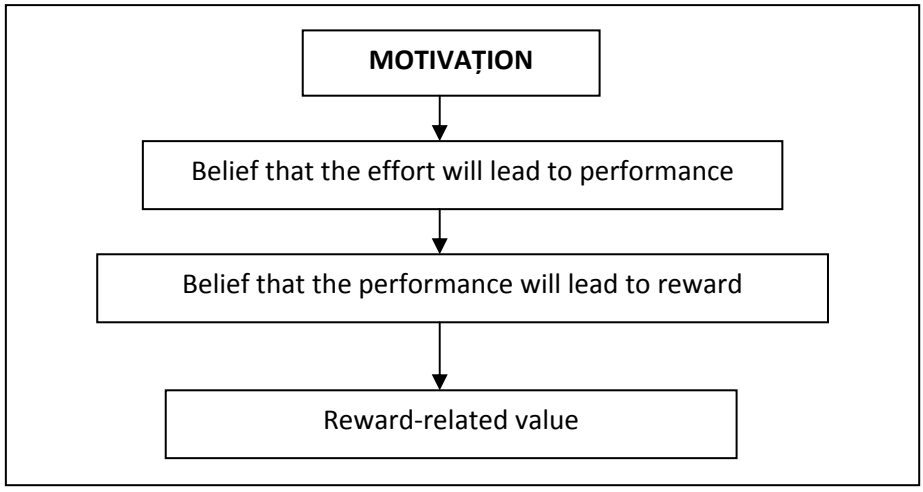

Fig. no. 2 – Adapted after Variant no. 2 regarding the "Waiting modeling" in the opinion of V. H. Vroom, quoted by Gelenier in *Strategie de l enreprise et motivation des hommes, p. 185*

[6] See also Gelenier, O., *Strategie de l'entreprise et motivation des hommes, (*Edition Hommes et tehniques, Paris, 1984), p. 171

In contrast, in a theory of efficacious conditioning, along with objective stimuli, the subjective ones were also highly appreciated, leading the assessment model to be expressed by the following causal relationship:

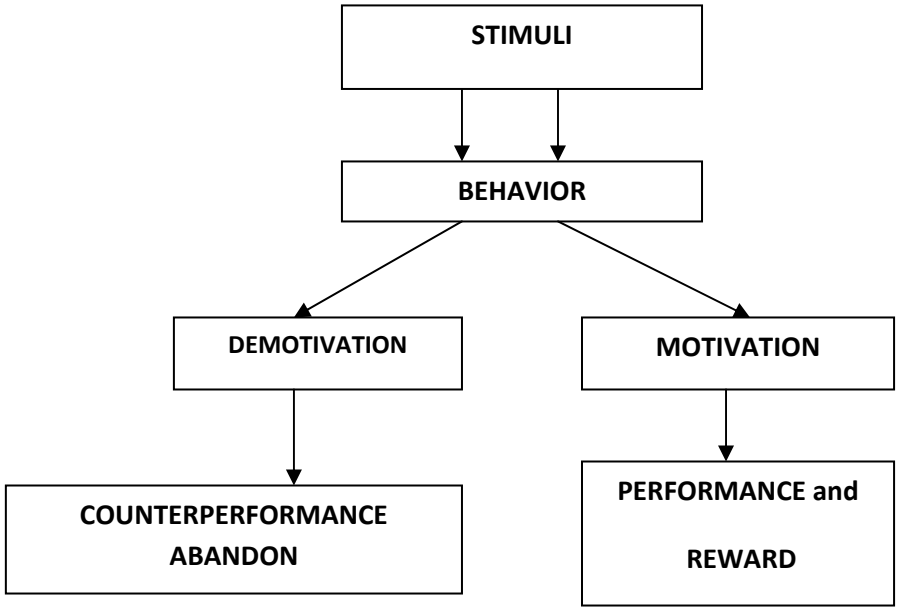

Fig. no. 3 – Waiting modeling according to the efficacious conditioning by Mc Gregor Douglas, *Leadership and Motivation, p. 172*

The equity theory[7] operates with input quantities (qualifications, skills, abilities, experience, talent, leadership, productivity etc.) and output values (rewards, recognition, prestige, esteem etc.).

According to the employees, the output has to be consistent with the input as a measure of their own activity, but also compared to the balance of other employees. The stability of their own balance (input quantity – output values) is the premise of the positive motivation, and the stability of the others' balance represents the equity confirmation in the personnel policy practiced by the organization - which reinforces positive motivation.

4. Negotiation efficiency

Negotiation involves a series of discussions and talks, a verbal communication between two partners with equal rights and correlative obligations.

The manager achieves by means of negotiation a series of operations: obtaining information, claims or demands, giving information and solutions, developing proposals, expressing opinions, accepting compromises. In order to make the negotiation efficient, the manager has to master the art of verbal communication[8], as resulted from the following specifications.

Triggered communication process gives hope to the discussion partners who achieve the following goals[9]: the received message is correctly received; the content of the message is understood and integrated to their own information sphere; the proposals made in the message are

[7] See Nothstine, W. L. , *Arta convingerii*, CODECS, (Bucureşti, 1998), p. 161

[8] See Voiculescu, D., *Negocierea – formă de comunicare în relaţiile interumane*, (Editura Ştiinţa, Bucureşti, 2002), p. 24

[9] See Belu, C., Belu A., *Negocierea contractului colectiv de muncă*, (Editura Reprograph, Craiova, 2002), p, 34-49

reported to the "landmark" data of the field and eventually accepted; the partner reacts as to the anticipated direction: changes point of view, position, attitude etc.

Each social dialogue partner can make use of a range of strategies to win the adherence of the other and hence the transformation of his own goal into a common one:

a) how he summarizes and argues the message in order to gain the partner's confidence ;

b) to ensure the partner that his interests are not affected by the content of the proposed message, there are no disadvantages that would mark his socio-economic balance but, on the contrary, he only has to gain through peace and social harmony which condition the economic performance;

c) depending on the stage reached in the communication process he should know when to say: "I wish to inform you," I wish to consult you"," want to work with you" or "want you to be convinced".

d) Communication style and strategy determine with certainty the success or failure, disappointment or fulfilling within the complex process of negotiating the social dialogue. The talent to negotiate inevitably implies two capabilities: the ability to know the man and the ability to use information. Taken in interaction, these capabilities mean "can" and by solving the equation of negotiation we do not except anything else rather than "want."

Under the first landmark, participants in the negotiations must take into account the following:

- formulate a correct view on the level of knowledge, sphere and depth of information of your partners on the issue that is the object of the negotiation;
- establishing an order, a logical sequence in presenting ideas statements, proposals, avoiding the mixture of words, the chaos of ideas;
- the clarity of statement or proposal must be accompanied by a coherent argument and approval;
- avoid staining the language or using neologisms that are difficult to understand.

Communication must take place within the time limits and by respecting the partner who is expected to provide "something." This requirement includes the following:

- each partner must know that there is a certain way to tell a word, to use a particular formula or expression and that is called common sense or civility, and 'civility is not money that enriches him who receives it, but he who gives it';
- tone, speech, expression, irony can result in a state of tension and anger and can thus transform the negotiating into an unnecessary and messy discussion;
- argument and demonstration through various means to induce the partner into a state of appreciation and fair assessment of his social position when negotiating;
- consistency in carrying out the negotiation, trust in the communication process, so that the partner feels the want to end the discussion with a common target and not stop in a spontaneous way the social dialogue.

The series of discussions and negotiations, proposals and counter-proposals, interruptions and reversals, justify the understanding of the term negotiation as a "transaction whose terms have not yet been fixed, but are due to be fixed[10]".

Negotiation technique includes the following requirements as well, which the partners have neglected at the moment of triggering the conflicts of interest within the health organizations we have studied:

- social dialogue, namely negotiation, must start in a moment considered optimal by both partners, that is, when social and economic context does not disturb by nature of the problems the content of negotiations, when partners were relieved of other tasks that could mark the availability for negotiation, when the legal norms of negotiation work through disposition and coercion;

[10] See S. Ghimpu, Al. Țiclea, *Dreptul muncii, (*Editura All-Beck, București, 2001), p. 761

- at the negotiating table all documentation relevant to matters subject to negotiation must be provided. Collection and submission of complete and accurate information is a prerequisite for concluding the agreement and particularly for its observance;

- because the conduct of negotiations may cause changes in the content of ideas, proposals and arguments, each partner must set a realistic limit of possibilities, depending on which they may or may not accept the compromise;

- differences in views and meanings in an argument are inherent during a negotiation, therefore, in such cases, the following methods are recommended: using an objection to bring into question the argument used by another partner in a different meaning; reformulating the objection by means of a gradual analysis and approach, trying in this order to get a punctual settlement as well; postponing the resolution of disagreements for another time or for a later stage, when other tangential proposals will be cleared and accepted; predisposition to reward, i.e. providing equivalent benefits, which otherwise would not have been obtained.

Mayer has elaborated a model of trust moderators[11]. Thus, he considered that when a person assumes the risk of investing confidence and the result is positive, then each other's appreciation increases, while if the result is negative, the conclusions are clearly unfavorable to the person who invested in that trust.

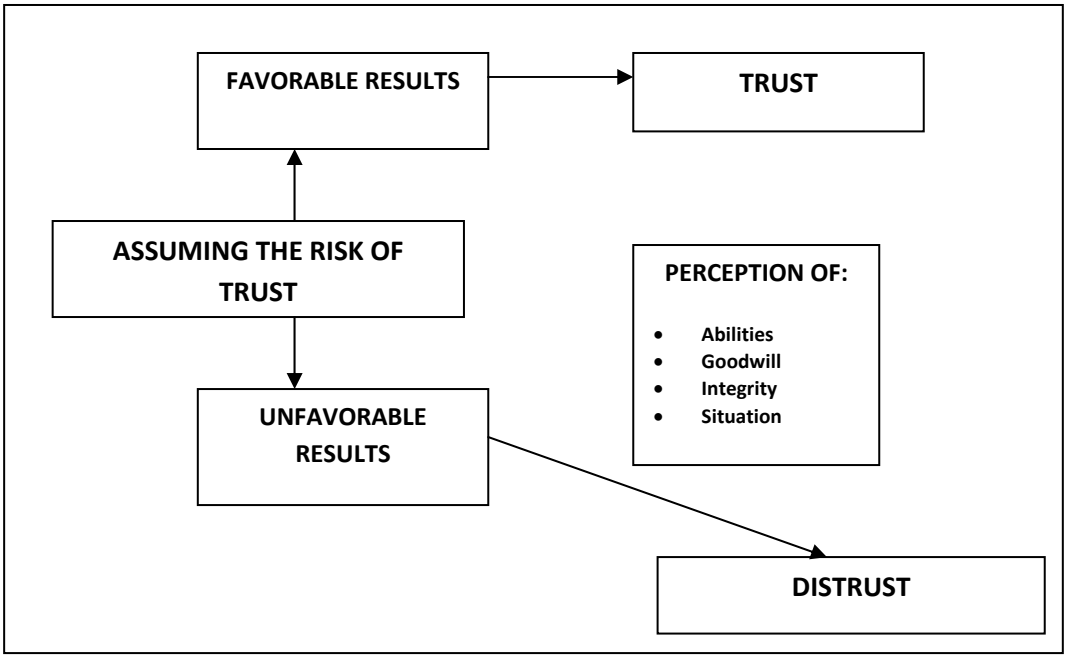

Fig. no. 4. – Adapted after ***Model of trust moderators*** (by Mayer, Davis and Schooman, in the paper *"An integration model of organizational trust"* vol. 20, p. 547)

Trust is an inherent result of communication and interpretation processes being a known fact that in the context of confidence the manager and employees are likely to negotiate and accept apparent compromises.

[11] See Mayer, R. C., Davis J. H., Schoorman F. D., *„An integration model of organizational trust" The Academy of Management Review*, (Briarcliff Manor, vol. 20, 1995), p. 709-835

Bargaining laws in this matter – By means of art. 2 of Convention no. 154/1981 of the International Labor Organization, collective bargaining is a term applicable to all negotiations which take place between a person who employs, a group of persons who employ or more organizations of employers, on the one hand, and one or more workers' organizations, on the other hand, in order to: fix the working conditions and employment setting, and / or regulate the relations between those who employ and / or regulate the relations between employers or their organizations and those engaged in one or more workers' organizations.

The collective bargaining agreement to which I refer requires measures adapted to national circumstances, in order to promote collective bargaining for achieving the following objectives (art. 5):

- the collective negotiation has to be possible for all those who employ and for all categories of workers engaged in the targeted branches of activity;
- the collective bargaining has to be progressively extended to all fields covered by this term's definition;
- to encourage the development of procedure rules agreed by both employers and employees organizations;
- the collective bargaining should not be impeded by the inexistence of some regulatory rules or the insufficiency or improper character;
- regulatory bodies and procedures of labor conflicts should be conceived in such a manner that would allow them to contribute to the promotion of collective bargaining.

Moving from the bipartite system was done by means of the regulation contained in art. 7 of the Convention: "The measures taken by public authorities to encourage and promote the development of collective bargaining will be subject to prior consultation and, whenever this is possible, to agreements between public authorities and organizations of employers and workers".

Stages of collective bargaining - Collective bargaining process is complex and can be analyzed on separate stages: preparation of negotiations, the initiative and start of negotiations, progress and conduct of negotiations, completion of collective bargaining.

a) *Preparation of negotiation* - is a step that must stand out in the mind of each participant in collective bargaining, being achieved through a thorough documentation and information relating to: external developments (if possible) and the internal structure of the economic or social life, which relate to the subject of negotiation; the techniques and procedures for conducting the communication and negotiation process; the clause terms upon which has been decided to be carefully changed (if they existed in the old contract in an inconvenient text, which is disadvantageous) or inserted (ascertained over time that their presence could be beneficial); the objectives that might concern the employer and their compatibility with his own interests; the frame in which the negotiations take place, the component of the negotiators' team, the evidence that could be invoked in support of proposals etc.

b) *Initiative and start of negotiations* – According to the text art. 3 par. 1 of Law. 130/1996 which states: "Collective bargaining at enterprise level is compulsory unless the unit has fewer than 21 employees", we deduce: collective bargaining is binding at one level, between the four levels at which collective agreements can be concluded: establishment level (not the branch level, or national group of units); mandatory collective bargaining is required by units law, and at their level, only those units that have a flock of more than 21 employees can make use of it; collective bargaining is possible - not required - at the level of professional branches, group of units, as well as at the level of a unit with a flock of less than 21 employees.

c) *Commencement of collective bargaining*. The start of collective bargaining, meaning the first meeting of the parties, seeks to define the immediate benefit: the information which the employer must provide the union delegates or employees and when he will meet these obligations; the information required has to enable a comparative analysis of the employment situation, the classification of occupations and professions, the salary level, the length and organization of working

time (we consider that the comparative analysis referred to in Art. 4 par. 2 letter A of the Act targets the already existing 'variables' and the estimated ones concerning the employer); the place where meetings will take place and a schedule of these meetings (i.e. dates and times agreed for dialogue). Running of negotiations is the dialogue core, the essential part of the negotiation process. According to the schedule established during the first meeting, each party attempts to synchronize their views, to present their arguments in a favorable atmosphere for the negotiation, to create a "plan" of the clauses, to confirm their availability for mutual understanding.

After a phase of probing and exploring, each side "dares" to submit their application or claim, after which they 'surrender' themselves to the negotiation, demonstrating from time to time that they can give up as well, seeking compensatory options or raising awareness towards the "subjective areas" with really optimistic and realistic promises.

Deferrals of sensitive issues are not excluded nor arrangements between partners, so that every one should be able to achieve at least one goal (the one which is thought to bring maximum benefits). The effort of persuasions is materialized in clauses.

Conclusions:

Negotiation necessarily involves meetings, consultations and negotiations between partners, which can not be held otherwise than through communication.

The agreement, convention or understandings as purposes of negotiation within the social dialogue involve the cooperation of social partners, i.e. a process of communication.

The language used in negotiation must be reported to two landmarks: the correct use of information and the avoidance of ambiguity; civility and respect towards your partner.

VALUES OF THE EUROPEAN FINANCIAL SPACE

NICU DURET[*]
MONICA POCORA[*]
GINA LIVIOARA GOGA[*]

Abstract
This paper aims to analyze the perspective of the European financial space which should allow the professional intermediaries – the credit establishments, the insurance companies or investment services, to propose their services to the entire community of customers. Actually, here are considered the traditional banking services, such as those that provide insurance, especially those relating to life insurance.
The access to regulated markets, it takes place in the perspective of this financial space, especially after coming into circulation of Euro coin. It should be insight, that the access to these markets, often requires the using of intermediaries. We can not speak about the existence of the financial space, without the freedom of action of these professional intermediaries. Concerning the freedom of these services, we can say that they depend on the movement of capital, and the movement capital is engaged since the directive of May 11, 1966, and subsequently is required after the June 24, 1988 and was confirmed by the Maastricht Treaty. Thus, we can discuss about the liberty of movement of capital, through angle the coordination of national legislation in matters of banks, the insurance and the investment services through a significant number of directives adopted. Nowadays, the European financial space is overtake, the EU borders and the internationalization of operations is require the extensive possible legal framework of application, also all the directives issued in matters of banks and insurance are covered by Annex VIII of the Agreement on the European Financial Space. The agreement also provides the interdictions of restrictions or discrimination concerning the movements of capital.
As a consequence, the study is approach both to aspects concerning the European financial space and the interdictictions of restrictions or discrimination concerning the movements of capital.

Keywords*: Financial Space, European Union, rights, investments, capital*

Introduction

The unprecedented development of international trade, growing mobility of capital and people, remarkable progress of science and technology and adaptation, by almost all villages of the world, the market economy system, generated starting and accelerating regional and global integration. A feature of modern market economy is the continued opening of outward and in those circumstances, national economies and, consequently, public and private finance in each state can not occur in a closed, is increasingly dependent on context International.

The fund finances the study of the internationalization of markets has expanded continuously, international finance, representing today a complex and highly topical. They include taxation as an essential component, which is based on two key levers: one such policy - fiscal policy (as a set of decisions that define and determine the sampling requirements) and other, legal - tax law (as a whole the legal rules of the tax).

Fiscal policy is so important for all countries, but it becomes essential when it comes to a group of countries (like the European Union) which aim to acționaze and develop together. This is

[*] Goga Gina Livioara, PhD, Assistant Professor, „Danubius" University of Galati, (e-mail: ginagoga@univ-danubius ro).

because under such circumstances, action in a country usually have effects that propagate in other states, which requires that each country's tax system is as simple and as neutral as possible.

The major objective of the work and proposed was to show that there was need to remove barriers to the free movement of goods and services, capital and presoanelor to ensure proper functioning of the single market.

EUROPEAN FINANCIAL SPACE

Noting the existence of numerous and profound heterogeneity in some areas of public actions taken in tax measures were based on subsudiarității principle, under which taxation is an area of Community competence in tax matters and allocation policies will override national decisions. However, European Uniiunea could not ignore the tax for the simple reason that the tax measures taken by Member States may hamper the mobility of goods, capital and people and create economic distortions incompatible with the establishment of a unified economic space.A common market can be defined as a unique geographical area, substitute the diversity of national markets that have merged and is governed by the same rules of market economy (Tinca 2003).

It involves the disappearance of all barriers to free movement of goods within this unique geographical area and unique application of competition rules. Suppression of customs barriers and tariffs and the implementation of a national common customs tariff in relations between Member States and third countries differ fundamentally specific customs union common market free trade zones. In these latter products circulate freely, but each state retains its own customs regime, which we apply to sovereign import or export products. Eliminating all taxes and contigentarilor with protectionist measures and eliminating all discrimination by public or private nature, based on nationality are characteristic of the Common Market.

All this and attracted to establish the four freedoms within the common market: free movement of persons, services, capital and goods, freedom to ensure real and effective economic integration (Augustin 2006, p.160).

We conclude by stating that the common market is the essential component of international economic integration and also the primary means of achieving the common goals of countries that compose. The economic benefits that justify the existence of a common market are: fostering productivity growth and the general level of life, being more intense competition, consumers benefit from lower prices, as well as a greater variety of goods, superior quality, allows a production large numbers, leading to lower production costs, may help to optimize capital investments, allowing more rational and efficient use of manpower.

Therefore, both the EEC and other economic organizations integrationist, on other continents have placed in the center of the single market concerns and their actions that they consider the main unifying element for progress. European financial space beyond, today's EU borders and the internationalization of operations require the broadest possible legal framework of the scope, as well as all directives issued to banks and insurance matters are covered by Annex VIII of the Agreement on the European Economic Area. The agreement also provides for restrictions or discrimination in terms of capital movements.

Also it should allow profesioanisti intermediaries, respectively, credit establishments, societatatile insurance or investment services, to propose their services to the entire community of customers. Are taken into account traditional banking services, such as those that provide insurance, especially those relating to life insurance (Catherine 2000).

Access to regulated markets takes place in perspective the financial space, especially after the entry into circulation of euro. It should be borne in mind that access to these markets requires the use of intermediaries often.

We can not speak of the existence of the financial space without the freedom of action of these professional intermediaries. Regarding the freedom of these services we can say that they depend on the movement of capital and capital movement is engaged since the directive of 11 May 1966, and subsequently is required after the 24 June 1988 and confirmed by the Treaty of Maastricht. We can talk this through the coordination of capital movement libertatatea national legislation for banks, insurance and investment services through a significant number of directives adopted. Freedom of movement shall entail the abolition of capital controls on capital transactions. It should go up to ensure fair competition between countries with low tax and high tax ones. Liberalization of capital movements, while the rest was done faster than freedoms stipulated by the EEC Treaty, it is still partial, primarily due to different modes of taxation adopted by Member States. Treaty of Rome was inspired by the Bretton Woods agreements and made the difference between current payments and capital movements. Since the movement of capital may affect the traditional sovereignty of the state and can upset the economy, it has not been liberalized only gradually (Anghel 1993).

The acceptance date of a decision of the Court of Justice, current payments are transfers of foreign currency which is under consideration Underlying transaction. Must fit as distinguish between the circulation of capital, which represents the financial operations whose main purpose is to invest or make investments and current payments. Thus, the payment of insurance premiums in the event of liability or damages are paid current, while life insurance premiums paid is a capital change. Upon expiration of the transition period, current payments were liberalized, but states can check to see if the transfer is not a disguised capital transfer operation.

Transfers that have a connection with an investment capital are displacements, their diversity is uncertain, examples being the purchase-sale or subscription of securities, long-term investments or capital transfers in the execution of insurance contracts. Freedom of establishment includes the right of the investor community to have shares in a company established in a Member State. Similarly, freedom of performance involves liberalization in sensitive sectors in the short term movements and transfers, in order to undertake investments.

This Directive seeks to free movement of capital. This involves the removal of all permits for transfer between states. It is produced in this way, the unification of exchange markets.

Member States are free under specific laws, to take measures to regulate bank liquidity, even if they may affect the transfer of capital. Also, actions are allowed and administrative control, especially to deter tax fraud and to comply with the prudential banking. Moreover, the legislation contains a specific safeguard clause. When disturbances affect one or more Member States (there are high value transfers affecting domestic markets and the evolution of money) are permitted to limit measures the transfer of capital. Erga omnes liberalization of capital transfers was made by the Maastricht Treaty.

The principle does not only liberalization between EU Member States but also in relations with third countries. Capital transfers are free, provided not to mask money laundering operations or produce tax fraud. Union may, if public interest so requires, restrictions on capital movements. Over time, creating the single market has produced remarkable economic and social effects, for shaping the single market that has a vocation of becoming more pan-European Commission proposes that priority actions: preparing for the enlargement of the EU single market to new countries States, completing the legislative framework and improving his tighter tracking of how the application of Community law in Member States, strengthening the PU as the Economic and Monetary Union; improving the social dimensions of PU and adapt it to changes in technology (Favret 2000) (Information Society, Networks trans).

This paper aims to analyze the regulation of free movement of capital between Member States. Are envisaged abolition of transfer of all permits, even those who intervened automatically drive leading to the exchange markets: capital movements should be possible under the same conditions as the current payments. Also the work is meant to show spatiulului European financial perspective should allow professional intermediaries - credit establishments, insurance companies or

investment services, to propose their services to the entire community of customers. Considered here are traditional banking services, such as those that provide insurance, especially those relating to life insurance.

The international insurance market is characterized by a high degree of heterogeneity due to the diversity of events and activities causing damage that may affect them. As a consequence, practically no one can delineate the insurance and reinsurance market, each being characterized by the preponderance of certain types of insurance, the existence of certain companies insurance and reinsurance, specific rules and regulations, covering larger or more extensive exclusions.

The European level can be characterized by the fact that the world has seen an evolution of security as a whole, with certain common characteristics, but with considerable differences from one country to another (Muraru 2001).

To mention first is that Europe is the appearance of modern security remains a critical global market, with particularly rapid growth in the branches of life insurance and savings, but it occupies second place after the United States. We appreciate the fact that, currently, we are witnessing a maturation process of the single European insurance market, with accomplishments, but also its difficulties, still unsurpassed. Developing a single European insurance market has been a gradual process that lasted several years. European Union Directives on insurance is generally accepted principles in the European Community in order to standardize the rules for insurance and to facilitate international trade, referring primarily to the insurance business, but also the insurance. Today, there really is not a homogeneous pan-European insurance market, although France, Germany and England continue to hold this sector both in terms of number of insurance companies, as well as the income derived from insurance premiums. You can not talk about reconciliation of the legislative framework at EU level, as member countries, as well as those who join their national character keeps some laws that depend on cultural and financial markets of the country. The pan with the basic principles of the Treaty of Rome them, namely free circulation of people, goods, and services of the capital between Member States.

To constitute a single insurance market in the European Union, several directives have been promulgated within 35 years, cumulating with the introduction of the single European passport in the insurance sector. Application of these measures was extended by agreement with the countries forming the European Economic Area, and on Iceland, Liechtenstein and Norway, because the rules stipulated in the agreement include all directives that are based on the European insurance market (Schappira j,Le Tellec, Balisa j 1994).

Since Switzerland has withdrawn from the European Economic Area agreement, she signed an agreement with the European Union on 1 ianuarie1994 A in terms of property insurance. This agreement guarantees them non-life insurance companies in the EU and Switzerland, each entitled to one another and create a branch or agency to the other under conditions identical to those which, before July 1, 1994, were applied between EU member countries according to the first European directive on non-life insurance. If we refer to the smaller territories of Europe, Gibraltar is part of the European Union under the Treaty of Rome, so the insurance directives will apply in its territory. Isle of Man, Jersey Guersney and not part of a single European insurance market. Directives do not apply to insurance and insurance companies wishing to operate in this area will require obtaining a permit from the appropriate local institutions.

Construction of single insurance market has been achieved in three stages from the early 1970s. The first set of directives was to the right of establishment in non-life insurance (1973) and life (1979). The second generation of directives has considered issuing of conditions for free supply of non-life insurance services (1988) and in the life (1990). The last set of directives to refer, in essence, to establish a single licensing system, pine insurance companies admitted by a Member State, is authorized to operate both the establishment (agencies and branches) and through the free provision of services (activities occasional or temporary) in the entire space community. They were both apoB in 1992 for insurance and came into force in 1994. This has created a framework for

action insurance European directives regarding insurance constituted a unique example of integration. Nowhere in the world, even in a federal state like the United States, formulated no freedom of establishment and provision of services or a single license system, comparable to those achieved at the European scale. CEA (European Insurance Committee) is one of the prestigious institutions with interests in insurance.

It was established in 1953 and currently has 29 members, based in Paris. The purpose of founding this institution is to be Europe's insurers, and to promote their interests by providing qualified opinions of European or international organizations, public or private insurance or reinsurance, to facilitate exchange of information and experience between markets, developing studies in the interests of European insurance companies or to respond to their needs (Cosmin Costas Flavius, Minea Mircea 2009).

CEA periodically publishes various studies and statistics aimed at informing the issue in the context of the European single market, in parallel with the phenomenon of globalization increasingly stronger and more visible in recent years.

This notice some changes in several directions: between insurers, reinsurers and insured: large multinational companies tend to raise the threshold and to transfer risks autoasigurarii and some of them directly or reinsurers; choice is increasingly on the principle overall financial management between state and private sector, given its reduced share in the insurance field, opens up new opportunities for private sector insurers and bankers from the so-called "bancassurance", which gets more than an extension, so that before long we see that, without using the bank as a distribution channel for insurance products, neither of the two types of institutions will not survive.

Of course, of paramount importance in the present and certainly in the next decade, globalization of financial services will continue to mark the entire evolution of the insurance and reinsurance.

In Europe, the single insurance market covering 27 countries forming the European Economic Area (European Economic Area). With economic growth, insurance continued to grow in 1997, differences between life insurance, which increased by 14.1% and non-life that it grows slower by 8.8% over 1996. EU insurance market recorded a growth of 8.8% in 1997 compared to 1996, total insurance premiums accounting for more than ECU 543.7 billion GDP growth (2.7% in 1997 compared to 1996). In 1998, the CEA said that the three largest insurance markets in Europe (France, Germany, United Kingdom) accounted for 67.1% of total life insurance and 64.9 of the total non-life insurance. Seven other markets are in total 87% of each second type of insurance (Italy, Netherlands, Switzerland, Spain, France, Germany, United Kingdom). Even if there was more of an increase in life insurance, there was interest and other types of insurance, taking into account the damage of disasters (industrial risks, liability and damage to property, credit). Insurance is a key sector of the European economy, whose influence is felt both in the protection against economic and social risks in the member countries, the idea of stimulating role of medium and long term savings, as well as providing funds for financial markets. Moreover, another role is fulfilled by ensuring the development of asset management techniques and risk management. An important distinction must be made between life insurance and life insurance is not. Insurance is not traditional sectors of life insurance cover for damage and ensure accountability. These forms of deposit insurance does not affect the public, they are not a form of investment or plasamanet. Moreover, the community market in these branches of insurance is relatively saturated, not the same thing can be said about life insurance. In other news, presumes need insurance and reinsurance business, which can occur only in a professional manner. Reinsurance market is growing throughout Europe and even worldwide. We need to specify the bank and insurance are two distinct materials in the production. Also, even if common principles translate directives, let arminizare term substitute difference between credit establishments and insurance companies also prudential rules are clearly differentiated.

Thus, credit institutions may, in principle, operators provide insurance services, while insurance companies can not do this than banks. A decompartimentare is thus established between

the two types of activities: "bancasusurance" is not, possible within the same company. Distribution operators bank or insurance is separate from the main exercise of these activities. You can talk here, according to national laws about mixing a so yis the distribution.

Very schematically, the directives issued, whether in banking or insurance sector, is based on the sole control of the state authorities of the establishment of a bank or an insurance company. This is the principle of Home Country Control, as opposed to that of Country Risk Control. Place a headquarters location has become so very important, because this is the place to be centralized administrative controls. Even if there is harmonization in particular the prudential rules, it is not total.

Conclusions

In conclusion, we can say that within the European Union (EU) has intensified the debate on budgetary constraints due to the policies of globalization, as it is expected a further increase in real and financial capital mobility.

In these circumstances, we consider the liberalization as a threat to domestic policy goals, especially on social security. In response to these developments, some advocates for international coordination in the field of taxes, including weighing the possibility of creating the prospect of a World Tax Organization, while others pronounce to impose restrictions on international capital mobility. On the other hand, the findings of recent empirical studies (based on experience in OECD countries since 1970) show that while globalization shrinks the space for maneuver for national budgetary policy, but is still plenty of room for individual national policies.

SOME ASPECTS ON THE CITIZEN'S RIGHTS. FREEDOM OF EXPRESSION AND PRESS (ARC OVER TIME: 1866 - 1991)

ANDREI TINU[*]
CĂTĂLIN BOBOC[*]

Abstract
The enuntiation principles of the French Revolution of 1789 , equality , liberty and fraternity , have penetrated all the European countries of the nineteenth century, and continue to be the basic principles of all democratic societies even now, more than two centuries after the fall of the Bastille (July 14, 1789), symbol of the old regime , obtuse and dominating the world , with reminiscence of medieval Europe. Declaration of Human Rights and Citizen, developed and edited on 26 of August 1789 , provides in its preamble that "... ignoring, forgetting or disregarding human rights are the only causes of public evils and corruption of governments ...", thus showing that man and his rights were to become the center of the universe.
It is necessary to start the analysis of political, cultural and constitutional life of Romania of the nineteenth century from these principles, because only thus will we will understand how the modern Romanian state formed , developed and evolved , first under the scepter of „The beloved prince of the Union", Alexandru Ioan Cuza and then ,during the great reign of King Carol 1st, during which , it was adopted on 1st of July 1866, the first deed with the status and name of the Constitution.
Over the years, exactly two hundred years after the French Revolution, Romanians cried their desire to live free in a country where human rights are respected and where access to information and freedom of expression must be met by fundamental Law . Our study comes to show the developments in the Romanian press of the two crucial moments in the historical development of Romania, respectively the first decade after the Constitution was adopted in 1866 and the first decade after December(1989).

Keywords*: history, law, Constitution, freedom, press*

Introduction

The enuntiation principles of the French Revolution of 1789, equality, liberty and fraternity, have penetrated all the European countries of the nineteenth century, and continue to be the basic principles of all democratic societies even now, more than two centuries after the fall of the Bastille, symbol of the old regime, obtuse and dominating the world, with reminiscence of medieval Europe. Declaration of Human Rights and Citizen, developed and edited on 26 of August 1789, provides in its preamble that "...ignoring, forgetting or disregarding human rights are the only causes of public evils and corruption of governments..."[2], thus showing that man and his rights were to become the center of the universe.

It is necessary to start the analysis of political, cultural and constitutional life of Romania of the nineteenth century from these principles, because only thus will we will understand how the modern Romanian state formed, developed and evolved, first under the scepter of Alexandru Ioan Cuza and then, during the great reign of King Carol 1st, during which, it was adopted on 1st of July 1866, the first deed with the status and name of the Constitution. The 1866 Constitution shows interests to civil rights, freedom of expression and, especially, freedom of the press. In this context we have to look at the huge number of publications that have appeared in the first decade after the

adoption of the Constitution, and to the emergence of writers as well, who would contribute to the affirmation of the Romanian spirit, if we think only Mihai Eminescu.

Over the years, exactly two hundred years after the French Revolution, Romanians cried their desire to live free in a country where human rights are respected and where access to information and freedom of expression must be met by fundamental Law. Our study comes to show the developments in the Romanian press of the two crucial moments in the historical development of Romania, respectively the first decade after the Constitution was adopted in 1866 and the first decade after December (1989).

The questions, justified, are related to similarities and differences between the two important moments of our national history - Alexandru Ioan Cuza's departure and the arrival of Prince Carol of Hohenzollern (Singmaringen branch)[3], respectively the fall of the Ceausescu regime and the establishment, after more than four decades, of a democratic regime.

As a result of the blood tribute given by the young generation in December 1989 due to the courage and determination of young people dead in Timisoara, Brasov and Bucharest, the Romanians could manage to talk, meet and freely express themselves in free writing.

Undoubtedly, though hard to believe, there are strong similarities between the two important moments of the Romanian historical evolution , similarities related to the causes that led to the *outbreak of the need for freedom*, either if we talk about anti-democratic drift of the beloved prince of the Union, Alexandru Ioan Cuza, or if we refer to those 70 years of dictatorship of the last century (Royal dictatorship, between 1930 and 1940, military dictatorship of Antonescu, between 1940 and 1944, and especially the communism one ,that ended in a brutal and bloody way , in December 1989). Both regimes have wanted - and managed more or less - to eliminate any obstacle, any barrier, any critical voice.

Prohibition of the three editorials in the last years of the reign of Alexandru Ioan Cuza and pressures to which journalists were subjected between 1864 and 1866 have found correspondence especially in the years of communist dictatorship, where any grind against those in power were simple night dreams .

It is true that dictatorial abuses of colonel Cuza are insignificant comparing to the communist totalitarian regime, just as it's true that, keeping the proportions (historical time, population, social and technical developments) the similarity is very high. Therefore, the will of freedom, the desire to be informed and to express yourself freely were equally legitimate both in the second half of the twentieth century, and in the panel's final of the second Christian millennium.

Because the freedom refers to spirit, and the spirit refers to God. Talking about civil liberties and freedom of the press at the time of 1855, Mihail Kogălniceanu said that "the press is the extended echo of the human speech, is the tribune of the voice of the crowd resounded to the ends of the civilized world; everything is done, everything they say, in the press, all that is discovered in any part of the world it is spreaded throughout the world and it is owned by the extent of mankind"[4]. In 1859, Dimitrie Bolintineanu considered that "freedom of thoughts it is a right that man is born with, it is for the spirit what is the free movement for the body, and the nation and the laws established by the men adjust the course and sets its limits"[5].

1.1. CONSTITUTION OF 1866 AND PRESS FREEDOM

Constitution of 1866 it is considered as one of the most democratic and visionary fundamental laws of Europe in the second half of nations, inspired by the Belgian Constitution of 7 February

1831.[6] Entry into force of the Constitution on 1 July 1866, introduces for the first time the provision according to which "Romanians enjoy freedom of conscience, freedom of education, press freedom, freedom of assembly"[7]. That was the evidence of the fact that European and reformist spirit of the nineteenth century entered the Romanian territory too, through the Constitution of the new state, which hasn't gained its independence yet, but that acts independently.

Constitution of 1866 enshrines the Romanian national state, proclaiming a constitutional monarchy on the grounds of separation of powers as well as the rights and freedoms of the citizens. By means of its content and form, it can be considered the first Constitution of Romania. By means of its essence, it is a modern, democratic constitution.[8] The emergence of the two major political parties - the conservative and liberal - was a consequence of the fundamental ideas of the French Revolution and guaranteed by the fundamental act of the new state until the development of the Constitution of 1923.

The most sensitive areas of constitutional amendments were undoubtedly those of freedom of opinion and freedom expressed especially through the press.

Evolution of the daily press would highlight the ascendant trend of Romanian society, although attempts to suppress freedom of expression, due to political passions have existed even after 1 July 1866.[9] However, we cannot say that abuses were widespread and that freedom of expression of Romanians was restricted. As a result of the Constitutional provision, the Romanian press was becoming one of the power of the young state, freedom of the press being inspired "by the formula of Thiers, who qualify the intention of undermining press freedom as a <<murder>> because <<the civilization is its creation>>"[10]. Constitutional guarantees were given by the provisions of Article 24 according to which “the Constitution guarantees to all citizens the freedom to communicate ideas and options and publish them through speech, through writing and through the press,"[11] each citizen being responsible for his actions before the law, but "no censorship or other preventive measure for the development, sale or distribution of any publications will be able to re-establish it"[12]. Therefore, the right to free speech was guaranteed by the Fundamental Law. These provisions were put into practice by the emergence of an impressive number of publications; approximately 250 magazines and editorials made their appearance on the Romanian market in the period 1866-1877, even if it was a change of name or recurrence of the same title.[13]

At first shy appearances only in Bucharest and Iasi, and shortly, to expand in most major cities in more than 26 centers.[14] Also during this period, some major national periodicals have come on the market with provincial editions, such as "Informatia Bucurestiului" newspaper published between 1869 and 1872, which had editions in Iasi and Galati. In 1872, appears the first evening editorial at Focsani, entitled "Patria". Some periodicals have had a short life, being published between half a year and, in the happiest situation, few years, depending on the quality of journalists and the interest or potency of their owners. There have been few publications that have resisted and had continuous appearances. Political press demanded their rights of suzerain power, especially as a result of crystallization of the two major political poles: conservative and liberal.

Political struggle moved in a short time in press area not just on the political scene but in the street as well. Thus, the main editorial of the radical liberal became the newspaper "Romania", reappeared after 1866, a redoubt against the power, either liberal-moderate or conservative.[15]

"Romanul" was followed in the support of the liberal ideas by the "Perseverenta" appeared between 1867 and 1869, and "Democratia" liberal newspaper appeared, in Ploiesti, between 1869-1871. Both newspapers were edited by Al. Candiano - Popescu.[16] Political conservatism was served by the "Pressa", published between 1868 - 1881, "Terra" (1867 - 1870) and, especially, "Timpul", edited from 15 March 1876 where pillars of the Romanian culture went to journalism school - Slavici, Caragiale and Eminescu, who was editor of "Timpul" between 1880 and 1883.[17] "Trompeta Carpatilor", edited by Cezar Bolliac, "the Telegraful de Bucuresti" of I.C Fundescu, or "Reforma" of Valentineanu were left-wing newspapers. Also on the left wing were the workers periodicals "Analele tipografice", "Uvrier", "Lucratorul roman" or "Lucratorul", with sporadic appearances between 1869 and 1872. In 1877, the year when Romania declared its independence from the Ottoman Empire, appeared on the Romanian press the newspaper "Socialistul", the first socialist newspaper, but after just three numbers, had ceased operations. The newspapers belonging to national minorities have been published due to the freedom of expression guaranteed by the Constitution of 1866, in Bucharest and small Romania there were newspapers in French, German, Hungarian and Italian, Hebrew newspaper, three titles published by the Greek minority and 23 titles of the Bulgarian media. Scientific media, cultural and humoristic had a great evolution. Thus, by courtesy of the legislature, were found over 30 titles of humorist newspapers and 80 cultural and scientific newspaper, among which has been noted "Convorbiri literare", a journal published on 1 March 1867, in Iasi, under "Junimea" and that will dominate for two decades, the entire Romanian cultural press.

Ancient Mother of the Romanian people-as Mihai Eminescu called the Orthodox Church-could not stand aside to express herself through the written word; At 1 / 13 October 1874 it began its long existence, "the Romanian Orthodox Church", newspaper of our national Church.

But political power, either conservative or moderate, could not sit idly by, expressing itself, apart from periodicals which supported one or the other political poles, through 30 newspapers official and unofficial as well.[18] As a conclusion of the first period analyzed, we may say that press freedom has played an important role in the crystallization of national consciousness of the Romanians in the second half of the nineteenth century, in the foundation of the national state, in gaining the state independence, which was earned due to the brilliant writers that have served their apprenticeship in the press emanating as a result of the Constitution of 1866.

Because the spirit of a nation and, especially, the educating of this spirit , is given by mass culture and mass culture can be done only through the media, for "periodical press, which in democratic countries is called the fourth power of the state, and in all over the world, even in the places ruled in the most despotic way, came to be a need for governments and peoples"[19], being a manifestation of the spirit, which "came to be such great power and sometimes more terrible than any other".[20]

2.2. ELEMENTS OF THE RIGHT TO FREEDOM OF EXPRESSION AFTER THE 1989 REVOLUTION

After 123 years of the adoption of the Constitution of 1866, which allowed the explosion of the number of newspapers and magazines, another important moment in Romanian history was to come. Gorbachev's Glasnost and Perestroika brought the debate of the very existence of the Soviet Union and Communist Bloc. The year 1989 was to produce, one by one, the change of the socialist regimes in Eastern Europe and the fall of the Iron Curtain, about which Winston Churchill talked about in 1946. Romania was part of the trajectory of change imposed by those times, too.

Revolutionary events of December 1989 would end 45 years of communist dictatorship, would break ties with a past that has meant, at least in its first part, an era of destruction of Romanian values, an era of national culture harvest peak. The causes that led to the outburst of feelings of freedom and democracy, to the blast of the end of the year 1989 in Romania, were even more widely, the same as those which have led to the forced abdication of Cuza, to the foreigner coming to the throne and Constitution adopted in 1866. A relevant and objective analysis of the Revolution may not yet be made, requiring the passing of the time, the emergence of yet secret documents, the exchange of generations ... What we can do however is to note that the Revolution (by some), or coup d'etat (by others), contributed decisively to change the course of history of the Romanian people. An important aspect of the revolutionary conquests was the right to liberty.

Romanians fought in December 1989 not only for bread, cola or chewing gum, but especially for DEMOCRACY and FREEDOM. The 2-hour television program of the only existing television, the tributes to the dictator's couple and the amputation of any nerve of resistance were the decisive elements of triggering events in the late '80s. Among the freedoms gained by the Revolution, freedom of expression was perhaps the most important gain of all.

Since the days of the events of December 1989, the power legitimized by the revolutionars - the National Salvation Front - issued legally binding provisions, which provided, inter alia, "the promotion of a humanistic and democratic ideology, the true values of humanity. Remove the untruth and the imposture, deciding the criteria of competence and justice in all spheres of activity"[21], especially "freedom of press, radio and television, shifting it in people's hands"[22], provisions which were taken after from the Constitution then validated by referendum on 8 December 1991.[23]

Under Article 80 of Decree - Law no. 92/1990, the Parliament elected in Romania on May 20, 1990 had an important task to develop the new Constitution of Romania after the removal of the communist regime. The new Parliament, elected on 20 May 1990 in the Constituent Assembly was formed and preceded to editing the new Constitution which was approved by referendum on December 8, 1991. 1991 Constitution is the Constitution of a democratic and social state of law, in which the dignity of human personality, the rights and freedoms, the development of human personality, the justice and political pluralism represent supreme values and are guaranteed.[24]

Through the development, adoption and entry into force of the Constitution, Romania broke the connection with its past, whether the democratic interwar period, or its Communist period. Despite appeals and sometimes confusing provisions, the Constitution of 1991 brought a new pulse in Romanian life, especially concerning freedom of expression. Freedom of expression is the ability of citizens to express through speech, writing, pictures, by sounds or other means of public communication, thoughts, opinions or beliefs and creations of any kind. However, the formulation of broad constitutional matters covered expresses the impossibility of all spiritual creations of the

[21] Decree – Law no. 2/1989.
[22] *Ibidem.*
[23] Focşeneanu, *Constitutional History of Romania*, 148.
[24] 1991 Constitution.

inquisitive human mind can imagine and realize.[25]1991 Constitution forbids censorship of any kind; this prohibition is not applicable to professional censure, which remains desirable to educate the nation.

However, freedom of expression is not absolute and as such is subject to restrictions relating to defamation of the country and the nation, any instigation to a war of aggression, hatred, racial, class, religious incitement to discrimination, separatism or territorial public violence and obscene contrary to morality.[26] Thus, Article 30 and 31 of the post-revolutionary Constitution were fully dedicated to freedom of expression[27] and right to information[28]. Paragraphs (a),according to which "freedom of expression of thoughts, opinions or beliefs and freedom of any creation, by words, writing, pictures, by sounds or other means of communication in public are inviolable" (2), which stated that the censorship is prohibited, both in Article 30 and paragraph (a) of Article 31, which stated that "the right person to have access to any information of public interest can not be restricted "are considered to be legislative instruments related to the development of unprecedented post-revolutionary Romanian media.

Long expected freedom was to find in the first decade after 1989 the largest manifestation in the pages of the newspapers, and since 1990s, newspapers gave away its place to the TV, observing in the same time, a collapse of the newspapers. Now, the only publications capable to support themselves are the tabloids. Thus, in 1990 or 1992 media provided broad social and political spaces to analysis, cultural differences, the debate between the old and the new generation, among poets and anticommunists, in a word, the space was intended for discussion of substantive journalism. Soon, however, the freedom was to go, either from economic interest or the desire to create the rating into filthy areas of pseudo-journalism, turning now into an instrument of stupidity that Sartori was talking about.

Evolution of the Romanian press, in the titles and circulation, would know a winding course from the 1468 titles in 1990, at 1205 in 1992, to reach, in 1994 to 967 titles, then climbed in 1997 to 1855 titles, but with continuing declines in the circulation of material media ("The Truth" - from 2 million copies in 1990 to about 200,000 in 1992, while "Romania Libera" went down from 1, 5 million to just over 100,000 copies, and all other newspapers as "Dreptatea", "Azi" or "Tineretul liber" collapsed from over half a million copies a circulation below 100,000 copies).[29]The important names of the daily press are: "Adevarul", "Libertatea", "Evenimentul Zilei", and the weekly will remain "Academia Catavencu", "Formula AS", "Romania Mare" (with over 1 million copies in the period 1990 - 1992), names that remain today, despite the economic pressures imposed by the taste of the reader.

A special segment of the Romanian press was the post-revolutionary audio-visual media. Shy at first, the appearance of private television at the national and local level were to change completely the need for informing and educating the population. Thus, TVs like Pro TV, Antena 1, OTV, Prima TV or B1 TV will be imposed, assuming control of Romanian media. It is noteworthy that the Junimea generation and the epigones of Eminescu of the nineteenth century is now the generation PRO or generation "From Love".

A major chapter of the written press since December 1989 is for confessional media, especially those published by the Romanian Orthodox Church, whether we talk about newspapers and magazines of the Holy Synod of the Romanian Christian Church, or those issued by the Metropolitan, Archbishops and Orthodox Bishops in the country or abroad - a total of 50 titles. Since

[26] 1991 Constitution.
[27] 1991 Constitution.
[28] 1991 Constitution.
[29] Pasailă, *Press*, 266.

December 29, 1989 comes the periodical of the Church, theology and spirituality "Vestitorul Ortodoxiei" published by the Romanian Patriarchy.[30]

Other titles that have been noted were: "Ortodoxia", journal published by the Romanian Patriarchy, whose new series was published from January to March 1990, "Tomisul ortodox", published by the Archdiocese of Tomis from April 1990 "Glasul adevarului", which appears in Buzau, "Candela Moldovei", publications of the Metropolitan Archdiocese of Moldova and Bucovina and Suceava and Radauti, occurring in Science, since 1992 and Suceava, in 1991, "Renaissance" of the Archdiocese of Vad, Feleac and Cluj, which occurs in 1991, or "Christian fortress", edited since 2002 by the Archdiocese of Craiova, etc..[31]

Conclusions

Discussions related to freedom in general and freedom of the press, in particular, will continue without to exhausted the subject. Through this study, with its good and bad, we try to mirror two worlds, two basic stages of historical evolution of the Romanian people. Although separated by more than a century, the two Constitutions are guided by the same principles that have their origin in the principles of the French Revolution enuntiation of 1789 - equality, fraternity, liberty.

We can easily see that freedom is the fundamental need, regardless of time and space, regardless of age group or social class from which these freedom seekers come. On two conditions: that the informant is honest and informative (container) to be educated and know what to choose, because, otherwise, both will become tools of manipulation.

THE INDIVIDUAL RIGHTS AND THE STATE

DANA TITĂ*
CEZAR TITĂ*

Abstract
The concept of man's individual rights appeared a long time ago as a means of the individual's protection in relationship with the others. Living in a society, man interacts with other people, and these relations are regulated by certain rules. Once the state was formed, these rules become increasingly powerful while the concept of freedom is differently acknowledged.
What actually lay at the basis of individual rights' development was the concept of natural right which appeared in ancient Greece, and which can be traced throughout history like Ariadne's thread, guiding different thought schools. Human's fundamental rights are sanctioned only after being put down in the constitutions of different states, and once regional and international protection instruments are created. Nevertheless, in countries controlled by totalitarian regimes, human rights were infringed, the individual having to obey the collective community.
These regimes having collapsed, individual rights underwent a change for the better, but they also came to a standstill due to 9/11 or Ground Zero. After this event, and in the context of the fight against terrorism, individual freedom was limited in the name of freedom itself, and individual rights are currently regressing as to the possibility of being exercised.

Key words: *individual rights, fundamental rights, state, terrorism, private life*

Introduction

The fundamental human rights are an expression of the tremendous effort made to achieve the highest ideal of justice and good for everybody. Those rights came into being basing on the concept of natural law as a form of eternal truth, spread all over the universe and perceptive by the help of the reason of the human minds like the axioms in geometry.

Legal protection of human rights, a central idea to many current legal systems, has experienced a long and sinuous process of evolution throughout history, its purpose being that fact that today no one can deny their existence and their need for their defense.

From a historical perspective, "the human Rights (...) emerged as a tool to protect the individual in his relations with the community, whose primary function was the restriction of the political power in order to allow a free and full expression of the human being."[1]

The individual lives in the society by establishing relationships with its peers, due to either natural aspects or forced by circumstances. Wherever people met, there have always been conflicts among them, resulting from the opposition of the ideas that people have, or the rivalry of desires. Therefore people reached the conclusion that there must be a sort of a moral code and some generally recognized rules followed by everybody, even by those who violate them and that those rules should represent both an impulse and a compulsion. These "rules" were originally various taboos, beliefs and practices, all gathered under the name of tradition, later on established through a powerful tool designed to protect the rules and to punish those who violate them - namely the State.

The state is an indispensable tool to serve as an arbitrator, which must ensure compliance with the rules and punish violations. The state has an "historic mission"[2] to produce the right, then being itself subject to.

The State, as well as the law, is the product of an evolution in time and space, the individual giving up its own initial freedom in exchange of a body of laws that would ensure peace and its legal status. As society was divided into classes, the ruling minority was the one who took the prerogatives of designing and enforcing the law.

Paper content

It is said that, both the right, and the state, were born in the Ancient East, specifically in the region between the Tigris and the Euphrates rivers, nearly 6,000 years ago.

In fact, there were found the first written records of decrees carved on clay tablets by priests, found in the ruins of Ur.

Here, there was also discovered the first comprehensive body of law known in history, proclaimed by King Ur-Enguri (2112 BC-2095 BC), in the great Sumer, which regulates the habits of Ur. This code prepared the material from which Hammurabi, king of Babylon (1730-1686 BC), inspired in drawing of his more famous code.

Then the ancient Egypt, Babylon, Israel, the Persian Empire, the Ancient India and China followed, with various forms of state organization and also with the regulations, which revealed the fact that the state as well as the law depend on the social– historical changes.

In Europe, the first states and law based communities are in Sparta - The Laws of Lycurg (The Spartan code), in Greece - Dracon and Salon's Laws, in the Roman Empire - The Law of 12 slates.

In The Ancient Greece, by the help of its great thinkers - Aristotle and Plato - for the first time the natural law is mentioned and the fact that people have rights, they are free, of course not all concepts in the sense that we know today. Influenced by their thinking, Roman jurists develop ideas on human rights, an important step in the process of their establishment, being a creation of jus gentium as a system of rules by which certain rights are acknowledged to all people.

Subsequently, the ideas about existence and the need to protect the fundamental human rights are taken up by the School of the natural law thinkers (H. Grotius, Pufendorf S.) which implement them into the people's consciousness, grafted on the fight against the monarchical absolutism.

The crystallization of the idea of fundamental human rights and its legal recognition were obvious after the French Revolution, whose ideals were based on the concept of natural law, social contract and on the same necessity of resistance against the absolute monarchy and its arbitrariness.

Ideas about the fundamental rights were then taken over by the fighters for independence in North America, these ideas being at the basis of the struggle to establish and develop the United States of America.

Subsequently, the concept of fundamental rights was accepted and reproduced in most of the systems of law.

Even if the human rights exist and act as such, in a natural way, the legal, political or economic mechanisms, cannot be created, through which their protection to be ensured. A first step in solving this problem is to put these rights into national and international legal documents as an effective protection is only where there are legal mechanisms of protection and enforcement against their violation.

"Their establishment (n n. of the essential rights) at the normative constitutional, level, guarantees them the most effective legal insurance, since they benefit both of the mechanisms of

[2] Kelsen, H., *Pure Theory of Law*, (Humanitas Publishing House, Bucharest, 2000), p. 339.

ensuring the supremacy of the constitutional standards and the legal mechanisms specific to the subjective rights protection".[3]

By signing the Constitution, the essential (fundamental) nature is acknowledged to these rights and guaranties are created as regards their exercise and protection.

As a definition, we call the fundamental rights as "those subjective rights of citizens, essential to their life, liberty and dignity, indispensable to the free development of the human personality, rights established by the Constitution and guaranteed by the Constitution and laws."[4]

What is worth mentioning about them is that both the national laws and the international instruments are recorded as "recognitions" or "statements", the concept of human rights being beyond their recognition through the texts.

As regards the two source – statements of the fundamental human rights protection (The Declaration of Independence of the United States of America, 1776 and The French Declaration of Human Rights and Citizen, 1789), it "deeply imbued with the ideology defined by Locke and Rousseau , ascertain the inherent rights of the human being and previous to the establishment of the society: they recognize <<rights to>> (live, movement, have an opinion) and not <<rights to>> (employment, social protection, a satisfactory standard of living) <<rights of resistance>>, which involve freedom of choice and individual action and abstention of the state, and not <<claim-rights>>, involving a claim of the individual against society and the positive allowance of the state."[5] These rights cannot consist of debts from the state because they are pre-existent to the state.

The fundamental human rights are classified into several categories according to certain criteria. Thus, depending on the coverage, there are systems and hence regional rights (which apply in a given territory) and the rights of universal application (in the whole world). Depending on the recipient of their essential rights, they are classified into general (applicable to all individuals) and specific (applicable only to certain groups - women, children, employed persons). According to the same criterion, one can distinguish between individual rights (of every individual) and collective rights (which protect people communities, such as the minorities). As regards these latter rights we should specify that " the collective rights holders do not have mechanisms enabling them to guarantee their exercise, and on the other hand, it is no less true that by following the collective rights, such as the right to peace, the right to development, the right of peoples to a healthy environment, the essential premises of observing the individual rights are ensured".[6]

According to the criterion of content, the human rights are classified as civil and political rights and economic, social and cultural rights. From a historical perspective, the civil and political rights are those which imposed in the fight against the absolutism, being considered first generation rights, while the economic, social and political rights are considered as being part of the second generation.

Depending on the criterion of content we can also distinguish several categories, a first class being the one of inviolabilities[7], which are those powers ensuring life, the possibility of free movement, physical and psychological safety and that of home safety, being part of the first generation of fundamental human rights. Besides these, depending on the chronological establishment through instruments of protection of the human rights, we can speak of first, second or third generation.

Although well known, established and individualized by protection instruments whose legitimacy is beyond doubt, there are many cases of restriction or infringement of individual rights, even in these circumstances.

[7] Muraru, I., Tănăsescu, E., S., [3], pp.156-158;

In this context the communist and fascist regime should be mentioned and a new situation known by the generic name of fighting against terrorism.

Paradoxically, fascism and communism are antagonistic but similar and complementary movements. We believe that the analysis of the fascist regime and especially the communist one should be remade, taking into account the new data provided by the Soviet archives becoming public.

There are situations in human history, events that are not only exceptional but seem completely incredible and incomprehensible. Such events as the Holocaust or the Gulag have been maintained in a current of consciousness, the living memory of mankind, to prevent their repetition. If, in the case of the horrors of fascism, the infringement of individual rights is unanimously recognized, the crimes of Socialism in the Eastern European countries are far from acknowledging the negative role of the communist ideology and even further from recognizing the murderous nature of the communist regimes in Europe, the fact that these regimes turned terror into a method of government[8].

While Fascism and especially the so called Nazism are characterized by a lack of ideal, Communism was very generous in this regard. The Communist discourse, from the early period of the Soviet Union, appears as one supporting the popular or socialist democracy describing itself as a regime that respects the individual rights and freedoms. The Communist totalitarian regimes proclaim the individual rights and freedoms without providing the means of protection, without creating those tools to provide effective legal protection. Although all the constitutions issued during the communist era, proclaimed the freedom of conscience, freedom of expression and choice of religion, the right to privacy and due process, many acts of lower legal force sanctioned any event of this type and the practice of the state institutions was towards this goal. Thus, the protection of the fundamental individual human rights and freedoms provided by the Constitutions adopted by communist regimes is a formal one, purely declaratory and contradicted by the actions of the state, having only a propaganda purpose. The totalitarian regimes defy all the positive laws going to those which it had promulgated itself or those that had not been taken the trouble to abolish[9].

Beyond the particularities of each totalitarian system, there are common elements whose identification is required in order to characterize a regime as being considered totalitarian. What are the mechanisms helping a totalitarian party to gain the power, to hold the power in spite of the installed terror regime, what causes the collapse of these regimes, are all questions that we try to find answers. The formulation of these responses depends on preventing the recurrence of such phenomena, and consequently on ensuring the individual rights and freedoms.

The ideologies are not a sufficient explanation to determine the causes triggering the totalitarian passion. All in all the totalitarianism - in this case the fascism and the communism - have in common the priority given to the local communities against the individual, his rights and freedoms. The totalitarian regimes gain power and maintain it by the help of the masses. Hitler's coming to power was made possible by the help of the majority of population and he could not have kept this authority, neither him nor Stalin, if he would not have enjoyed the confidence of the masses. Theoretically, there are masses in every country and they make up the majority of those neutral people, seemingly indifferent, without the conscious of a common interest or of some specific objectives, a system of values. The mass individual is not a mere unskilled beast; it just lives in isolation without the normal social relationships, without belonging to a class consciousness.

Each totalitarian regime has its favorite victims. The Communism eliminated the “exploiters”, in the Nazi regime “blood and race” prevails. What is characteristic is the lack of a strict doctrine or ignoring it so that a totalitarian regime can always change the criteria by which it identifies the victims without thereby alter the doctrine.

[8] Furet, F., Nolte, E., *Fascism and Communism*, (Art Publishing House, Bucureşti, 2007), p. 23;
[9] Arendt, H., *The Origins of Totalitarianism*, (Humanitas Publishing House, Bucharest, 2006), p. 569;

The totalitarian regimes use propaganda to access the power, propaganda being replaced by indoctrination, as soon as a regime reached for the hoarding power, and violence being replaced by fear. The totalitarian movements, before conquering power, create a false and coherent world, in agreement with their doctrines, which is more responsive to the needs of the human mind than the reality itself[10].

Regarding violence, it always accompanied the rise to power of the totalitarian movements and what is even more incomprehensible is that this violence was accepted. After coming to power the totalitarian forms of government establish a regime of terror where murders, hints and threats were present. These are the tools by which a totalitarian regime achieves and maintains power.

Currently, a new form of "totalitarianism" marks its presence, the Muslim one. Beyond the specific features, we can identify in its actions those elements characterizing such a system, its effects still being a restriction of the fundamental rights and freedoms of the individual.

Currently, a universal standard of time is predicted: before and after Ground Zero - World Trade Center destruction. Starting from this point we need to adjust our watches to see it as a new Greenwich meridian, which must adjust our mental pendulum. After September 11th, freedom became a sine qua non for peace and the protection of the future of humanity. Freedom became an international imperative, the coexistence pivot of peoples in the era of borderless terrorism. If you want to get rid of it, we should unite the world and not let it die.

In the name of freedom, each state tries to take the best steps to protect its citizens and their property. In the name of freedom different measures are taken in order to limit the fundamental rights recognized by international instruments of protection. In the name of freedom, freedom itself is limited. The entire process of recognition and standardization of the individual rights seems to know a setback, due to the invisible and impossible to locate danger of terrorism.

The international organizations are powerless in the face of the danger, being unable to protect the people against terrorism, coming from the fact that the war is not against a state, but against individuals, located anywhere in the world, communicating each other via the Internet, with all the benefits of democracy, to destroy it

The United States of America established a national security strategy, with the purpose of fighting and winning the war against the terrorism, of promoting and defending freedom, as an alternative to dictatorship and despair. "The idea - force that comes out of the contents of this document is thus formulated:" America is now before an alternative of choosing between fear and confidence, America chose the path of trust".[11]

This excludes the isolationism and protectionism, the withdrawal, and limitation of the budget; this means taking over of the leading helms instead of isolation, a continuous encouragement and the development of the free trade and leading the fight against all the major challenges, primarily against terrorism".[12]

In the area of the human rights protection, all this fight against terrorism is grafted on the limitations of the exercise of certain recognized options the human being: the right to life, freedom of movement, freedom of conscience and expression, right of privacy.

As regards the European Convention on Human Rights, in Article 2, § 2, it contains an exception clause that is not included in the similar general agreements according to which" the use of force “that became absolutely necessary "to protect the public order (in some cases) and which caused death, is not a violation of the Convention."[13] This exception was used in practice, checking

[10] Arendt, H., [11], p. 438;

[11] Voicu, C. *Terrorism and Globalization*, in the volume “Globalization and National Identity”, (Editura Ministerului Administrației şi Internelor, Bucharest, 2006), p. 302;

[12] Idem, pp. 302-303;

[13] Sudre, Fr., [7], p. 215;

whether the use of force was excessive, but strictly proportionate to achieving the authorized purpose:[14] the terrorists suspected of planning to commit an attack were killed by the security forces during the actions of arresting them.

As regards restrictions on the right to freedom of movement, each state has the possibility to regulate how and to whom they apply, but "these restrictions must be" necessary in a democratic society "and to satisfy the requirement of proportionality."[15] In the area covered by this law there are the restrictions and limitations which are subject to the citizens of certain countries that wish to enter the territory of another state, the imperative of getting an entry visa before leaving the national territory, the ban for certain people to enter the territory of another State.

The right to privacy and family is also marked by a series of violations and limitations, in the same context of the fight against terrorism. Knowing that the terrorists use the most updated means of communication, the legal tapping made on mobile phones, the interception of pager messages, of the messages sent over the Internet or the conversations of prisoners through the speaker, are considered as legal. All these violations and limitations must be firstly subject to the principle of proportionality and secondly, the need of doing all these for the sake of the national security to be established with certainty. Also, "national authorities are positively obliged to take steps in order to prevent their disclosure (by the mass- media)."[16]

Conclusions

The terrorism, the one imposing the states such measures as limiting the exercise of the fundamental rights of its citizens is an important issue as regards the following of the individual's legal sphere. As long as the terrorist - who deliberately kill civilians, relying on the defense of a cause - cannot be precisely identified in order to maintain the safety and security of each and every citizen, the states limit the rights and freedoms of the latter one, those rights and freedoms established before.

Given the purpose for which these limitations are imposed, namely the dismantling of the terrorist networks and regaining of freedom, we consider them as necessary, with the only amendment that the principle of proportionality between the measures taken and limited right should always be respected in taking these measures,. The fight against terrorism seems to have two phases: a short term one, the fight involves using the military force and other instruments of national power "to kill or capture the terrorists." On the long term, winning the war is conditioned by winning the battle of ideas."[17]

This battle of ideas, of imposition those man centered ones, with its fundamental rights and liberties, coming from the natural law, cannot be fully won but in democracy and "the democracy cannot be imposed by the help of guns ..." it does not rise from the ashes of the war and a history of endeavors, civic action and economic development. It is unlikely that democracy can be built with materials exported by a conquering, liberating, American army, or in the shadow of the American private sector companies and U.S. nongovernmental organizations. Democracy grows slowly and needs indigenous endeavors, the cultivation of local civil institutions and a healthy citizenship, which mainly depends on education."[18]

FREE MOVEMENT OF EU CITIZENS: LIMITATIONS ON GROUNDS OF PUBLIC POLICY, PUBLIC SECURITY AND PUBLIC HEALTH

OTILIA-EVELINA RISTEA*

Abstract

Free movement of persons represents one of the four essential freedoms of the internal market. At the beginning the rights attached to this freedom were granted only to economically active persons. Nowadays, according to Article 21 of the Treaty on the Functioning of the European Union (former Article 18 of the Treaty establishing the European Community), all Union citizens are entitled to move and reside freely within the territory of the Member States "subject to the limitations and conditions laid down in the Treaties and by the measures adopted to give them effect". The purpose of this study is to analyze the distinct category of limitations on the free movement of persons based on grounds of public policy, public security or public health. The main objectives pursued to this end consist of outlining the legal basis for these derogations, including primary and secondary legislation of the European Union, describing the circumstances in which Member States may legitimately impose restrictions on free movement rights, as well as presenting the safeguards provided for individuals when such measures are taken against them. In order to achieve the above mentioned aim the important role of European Court of Justice's case-law will be considered, emphasizing the fact that most of the principles held in its decisions concerning this topic are presently incorporated in the secondary legislation in force.

Keywords: *free movement of person, restrictions, public policy, safeguards, serious threat*

1. Introduction

Although they enjoy stipulation in EU primary law, becoming, by successive amendments to the Treaty establishing the European Economic Community[1], rights of "constitutional" nature of all EU citizens[2], from rights of "economic nature" of certain restricted categories of persons, the right to free movement and the right of residence on the territory of EU Member States are subject to Treaty and secondary legislation limitations and conditions.

The object of this paper is represented by the exceptions to the principle of free movement of persons, consisting of restrictions grounded on reasons of public policy, public security and public health, that can be determined by Member States, originally provided in the Treaty of Rome, and kept in the modified versions of the above mentioned treaty, including in the Treaty on the Functioning of the European Union.

The importance of our scientific study lies in revealing the balance that the primary and secondary law of the European Union, and especially the jurisprudence of the Luxembourg Court

* Counselor at Legislative Council, Ph.D. candidate, associated teaching assistant at Faculty of Law, University of Bucharest, (E-mail: evelinaristea@yahoo.co.uk).

[1] The Treaty establishing the European Economic Community was signed at Rome in 1957 and came into force in 1958. Throughout this paper, the references made to the Treaty of Rome, the EEC Treaty and the TEEC Treaty concern the originating treaty, above mentioned. After the entry into force of the Treaty of Maastricht (the Treaty on the European Union - TEU), the name of the same treaty was changed into the Treaty establishing the European Community, abbreviated in this paper as the EC Treaty and TEC Treaty. From December 1st, 2009, the date of entry into force of the Treaty of Lisbon, TEC was renamed the *Treaty on the Functioning of the European Union* (TFEU), under article 2, paragraph 1 of the Treaty of Lisbon. The Treaty of Lisbon amending the Treaty on the European Union and the Treaty establishing the European Community, signed on December 13, 2007 is also known as the *Reform Treaty*.

[2] See A. Iliopoulou, *Le nouveau droit de séjour des citoyens de l' Union et des membres de leur famille : la directive 2004/38/CE,* Revue du Droit de L'Union européenne, no.4/2003 p.525.

were able to establish between the exercise, by EU citizens and their families, of the right to free movement and the limitations that Member States would want to impose[3] in order to hold back the excessive flow of foreign nationals on their territory.

We shall approach the issue of derogations based on grounds of public policy, public security and public health aiming, mainly at: synthesizing the legal framework and clarifying the meaning of some terms and phrases, such as "justified restrictions" or "public policy"; analyzing the reasons for which Member States would be entitled to restrict the freedom of movement; presenting the material and procedural safeguards established in favour of holders of entry, exit and residence rights, as well as highlighting the role of the European Court of Justice, whose principles formulated in some of the decisions on the free movement of persons have been, in time, incorporated in the secondary legislation.

To get a clearer picture of restrictions arising from the limitation of public policy, public security and public health, we intend, in the present work, to capitalize on the doctrine related to the topic, presenting analyses and points of view expressed in the studied specialized literature.

1.2. The legal framework. Rights covered by derogation. What are the *justified restrictions*?

2.1. The legal framework for derogations from the free movement of persons justified on grounds of public policy, public security and public health is represented, in terms of primary law, by the provisions of the Treaty on the Functioning of the European Union - article 21 paragraph (1) (former article 18 TEC) targeting all EU citizens, as well as article 45 paragraph (3)[4], article 52 paragraph (1)[5] and article 62[6] - keeping the same wording of rules previously contained in articles 39, 46 and 55 TEC, and initially in articles 48, 56 and 66 TEEC.

Under article 21 TFEU, the right to free movement and to reside on the territory of another Member State knows exceptions and may be subject to limitations and conditions provided by Treaties and by the secondary legislation adopted in order to implement them.

N. Foster[7] noticed that the restrictions and their scope need to be determined, because the Treaty makes reference to limitations, without expressly formulating them. For the author, it is clear that the provisions on restrictive measures for reasons of public policy, public security and public health contained in article 39 TEC (now article 45 TFEU) are applicable to limitations referred to in article 21 TFEU. We agree with the previously expressed view and we appreciate that the scope of exceptions under consideration can be correctly determined, only by the corroborated reading of articles: 21 paragraph (1), 45 paragraph (3), 52 paragraph (1) and 62 TFEU.

C. Barnard reported that the "derogations list", the same for free movement of workers, freedom of establishment and free movement of services, "is exhaustive and the Court is not prepared to add any further headings to it". However, "derogations will not apply where Community directives provide for exhaustive harmonization of the field"[8].

The notions of public policy, public security and public health being insufficiently clear, were therefore, susceptible to divergent interpretations, which could vary, depending on the time or place.

---

[3] Usually for economic reasons or for reasons related to social protection.

[4] „3. It shall entail the right, subject to limitations justified on grounds of public policy, public security or public health ….".

[5] "1. The provisions of this Chapter and measures taken in pursuance thereof shall not prejudice the applicability of provisions laid down by law, regulation or administrative action providing for special treatment for foreign nationals on grounds of public policy, public security or public health."

[6] "The provisions of Articles 51 to 54 shall apply to the matters covered by this Chapter."

[7] In *Foster on EU Law*, second edition, Oxford University Press, 2009, p. 344.

[8] In *The substantive law of the EU. The four freedoms*, Oxford University Press, 2007, p.461.

The Council adopted Directive 64/221/EEC[9] in order to specify the scope of those derogations. Currently, its text was repealed by Directive 2004/38/EC of April 29, 2004 on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States[10], in order to ensure a more strict definition of conditions and procedural guarantees established for Union citizens and their family members in cases of refusal of rights of free movement in another Member State.

Therefore, as for the secondary legislation, the essential texts are currently to be found in Chapter VI[11] of Directive 2004/38/EC entitled *Restrictions on the right of entry and the right of residence on grounds of public policy, public security or public health.*

2.2. Concerning the field of **rights covered by the derogation** under review, the Court of Justice stated that it is composed, among others, from rights of entry and residence on the territory of a Member State, and from their inherent rights, such as the right to respond to real offers for employment and the right to travel freely for that purpose[12].

In this context, it is necessary to remind the preliminary ruling delivered at the request of Dambovita Tribunal, in *Jipa* case[13]. From the analysis of the reasoning expressed in paragraph 18[14] of the decision according to which "the right of freedom of movement includes both the right for citizens of the European Union to enter a Member State other than the one of origin and the right to leave the State of origin" and "the fundamental freedoms guaranteed by the EC Treaty would be rendered meaningless if the Member State of origin could, without valid justification, prohibit its own nationals from leaving its territory in order to enter the territory of another Member State" it results that the provisions of the secondary legislation contained in Chapter VI of Directive 2004/38/EC shall also apply to the right of exit from the home state, in order to exercise the fundamental freedom of movement on the territory of another Union State, even if the title of the chapter mentioned is drawn up differently.

In order to support our statement, we bring the Advocate-General Ján Mazák' opinion from *Jipa* case, who, at point 40, shows that "the provisions of Chapter VI of Directive 2004/38 … regulate the circumstances in which Member States may restrict the right of Union citizens to move and reside freely within the territory of the Member States. While the title to Chapter VI of Directive 2004/38 does not specifically refer to the right to leave, and indeed many of the provisions of that chapter address questions relating to the right of entry … and the right of residence, … it is clear from the wording of Article 27(1) and the 22nd recital in the preamble to that directive that Chapter VI thereof regulates restrictions on the 'freedom of movement of Union citizens', a matter which undoubtedly relates to both the right to leave the territory of a Member State to travel to another Member State and the right to enter another Member State".

Thus, we see that at this moment, within the European Union, restrictions on the freedom of movement of persons, justified on grounds of public security, policy and health can target the right to entry and the right to reside in another Member State, the right to exit from one's own state, but also other rights that are consequences of the principle of free movement.

---

[9] Council Directive 64/221/EEC of 25 February 1964 on the co-ordination of special measures concerning the movement and residence of foreign nationals which are justified on grounds of public policy, public security or public health (OJ 56, 4.4.1964).

[10] Entered into force on the date of its publication in Official Journal of European Union (OJ L 158 / 30.04.2004, p. 77-123) and having as final date of transposition 30.04.2006.

[11] Art. 27 -33.

[12] Judgment of 04/12/1974, *Van Duyn / Home Office*, C-41/74 *(ECR.1974, p.1337)*, para.21.

[13] Judgment of 10/07/2008, *Jipa*, C-33/07, (*ECR 2008 p. I-5157*).

[14] Reiterating paragraph 35 of the Advocate-General Jan Mazák's opinion. The Court calls for an analysis, by analogy with the freedom of establishment and free movement of workers sending to Case 81/87 *Daily Mail and General Trust* [1988] ECR 5483, paragraph 16; Case C-379/92 *Peralta* [1994] ECR I-3453, paragraph 31; and Case C-415/93 *Bosman* [1995] ECR I-4921, paragraph 97).

Regarding the persons against whom measures may be ordered, they can be both EU citizens - employees or service providers, inactive persons or students – as well as their family members.

The restrictive measures can take various forms, such as: the prohibition of leaving the home state, the prohibition of getting visas (in the case of family members that are citizens of third countries), denying the entry, refusing to issue the registration certificate or residence permit or expulsion.

2.3. What do "justified restrictions" mean?

The meaning of the expression *justified restrictions* from article 45 paragraph (3) TFEU[15] has been clarified by the Court of Justice, through the preliminary ruling delivered in the *Rutili* case[16]. The Court stated[17] that "only limitations which fulfil the requirements of the law, including those contained in Community law, are permissible with regard, in particular, to the right of nationals of member states to freedom of movement and residence. In this context, regard must be had both to the rules of substantive law and to the formal or procedural rules subject to which member states exercise the powers reserved under article 48 (3) in respect of public policy and public security".

Also in the *Rutili* case, the Luxembourg Court stopped upon the meaning of the phrase *"subject to limitations justified on grounds of public policy"* from the beginning of paragraph 3 of article 48 TEEC[18] (18), and appreciated that it applied not only to the legal provisions (regulations) adopted by each Member State in order to limit the freedom of movement and residence of nationals of other Member States, on its territory, but also to individual decisions (issued individual acts) delivered in the application of such legal provisions[19].

3. Grounds for restricting the right to free movement.

The Treaty of Rome provided three grounds that might legitimize the restrictions on the free movement of persons, namely: public policy, public security and public health[20] which also became the object of Directive 64/221/EEC[21], adopted to harmonize the laws of Member States. Although those reasons received express provision for all forms of free movement of persons, both in the Community primary law and in the secondary law, the absence of clarification on the meaning of the notions of public policy, public security and public health has allowed the national authorities to use them sometimes, abusively, by extending their scope. We mention that the infringements of public morals[22] have not been accepted as a justification for restrictions on the right of free movement within the Union.

3.1. Public policy and public security.

Of the three reasons, **public policy** was considered the most sensitive aspect on which both the Community legislator[23] and the Luxembourg Court bended, with great caution, for an obvious reason: to prevent abuses in claiming the limitation provided under the Treaty.

Thus, given the characteristics of each act of the Community institutions - in particular, the scope of addressees or the completeness of rules - at Community level, the regulation of the exception of public policy, public security and public health, through a directive, was chosen, and not

[20] Stipulated also in article 12, paragraph 3 of the International Covenant on Civil and Political Rights.
[21] Council Directive 64/221/EEC on the co-ordination of special measures concerning the movement and residence of foreign nationals which are justified on grounds of public policy, public security or public health.
[22] Although provided for in article 12, paragraph 3 of International Covenant on Civil and Political Rights
[23] Initially the Council, and then the Council and Parliament.

its provision into a regulation or decision. Directive 64/221/EEC, as it clearly results from its title, was meant to coordinate the invocation of reasons that could justify restrictions on movement and residence of foreign citizens; the assessment of situations that might be considered prejudicial to the public policy was left to Member States, under the condition that they respect the criteria set out in the Community Act, in order for restrictive measures taken by national authorities to be legitimate.

A definition of the concept of *public policy* was included neither in Directive 64/221/EEC, nor in Directive 2004/38/EC; establishing its meaning, in a manner appropriate to internal realities, remained an attribute of each Member State.

For measures taken by national authorities not to be discriminatory, the Court of Justice was given the mission to clear the concept of *public policy*. The first occasion was the decision delivered in *Van Duyn* case[24], when the Court stated that, "in the context of the Community and where, in particular, it is used as a justification for derogating from a fundamental principle of Community law", the concept of *public policy* "must be interpreted strictly, so that its scope cannot be determined unilaterally by each member state without being subject to control by the institutions of the Community". Unfortunately, further arguments did not lead to shaping the defining elements of *public policy*, the Court finding that, they will be analyzed, from case to case by the national authorities to which the Treaty has left an area of discretion, because "the particular circumstances justifying recourse to the concept of *public policy* may vary from one country to another and from one period to another".

W. Cairns criticized the Court's wording that he appreciated as inconclusive, and too little useful to national jurisdictions which addressed a preliminary question to the Community Court, as long as the Community law, even at that time (December 1974, when the decision was delivered), contained a number of indications regarding the meaning and scope of the concept of public policy[25]. Thus, the author continues, article 3, paragraph (1) of Directive 64/221/EEC provides that measures taken on grounds of public policy and public security must be based exclusively on the personal conduct of the individual concerned, and according to paragraph (2); the existence of previous convictions can not be a justification in itself for the adoption of such measures.

The concept of **public security**, although used by Directive 64/221/EEC, and now, by Directive 2004/38/EC, also does not receive a legal explanation for its meaning. C. Barnard noted that, although the text of the Treaty suggests that public policy and public security constituted distinct derogations, "the Court's case law has largely subsumed, public security under the heading of public policy"[26].

In this regard, decisions of the Union's judicial institution do not provide too many elements of differentiation between the concepts of public policy and public security, especially since, no national law of Member States separates them clearly, and the Community regulation on restrictions to the free movement of persons determined for reasons of public security and order sets that they will be grounded on the individual's *personal conduct.*

A. Fuerea[27] considered that "the notion of public security is ambivalent" because it can be "understood as national security and also as national defence".

The relation between public policy and public security was synthesized by S. Deleanu as it follows: "Although in the texts of Community provisions, there are references to public policy and also to public security, the European Court of Justice generally prefers to consider these concepts together. It could be argued that public policy concerns the foundations of society, freedom and personal security, and public security concerns the foundations of the state and its security. Drawing

a dividing line between these two concepts is, however, difficult because of the connections that exist between them. A person who disregards the rules of public policy may also affect the public security, and vice versa. Just remember that if public peace and social harmony are seriously affected or if laws or legitimate decisions of the public authorities are violated, both the system organized upon relationships between persons who constitute the population of a state, as well as the foundations of the state can be affected" [28].

3.2. Public health. Public health reasons that may justify the restriction of the right to free movement are the object of article 29 of Directive 2004/38/EC[29], under which the only diseases that may ground such measures are the diseases with epidemic potential as defined in the relevant documents of the World Health Organisation, as well as other infectious or contagious parasitic diseases if they are the subject of protective provisions applied to nationals of the host Member State. Compared to those aspects under Directive 64/221/EEC, the number of diseases as reasons for restriction has been substantially reduced.

Under paragraph (2) of article 29, diseases occurring after a period of three months from the date of arrival shall not constitute grounds for expulsion from that territory. The repealed text from which it is inspired - article 4, paragraph (2) of Directive 64/221/EEC - refers to the first residence permit, the release of which could have been refused if public health reasons had been identified. Under the regulation in force, the right of residence can not be challenged anymore, after three months, for reasons pertaining to public health protection; diseases referred to only justify a measure for restricting the right of entry and the right of residence for a period up to three months.

The last paragraph of article 29 was introduced in order to stop the practice of certain Member States to submit beneficiaries of the right of residence to medical checks. Medical examinations proving that people do not suffer from any of the diseases referred to in paragraph (1) can be freely carried, under three conditions:

a) if there are serious indications that this is necessary,

b) within three months from the date of arrival,

c) the examinations must not acquire a systematic character which would compromise the effectiveness of provisions related to the release of the registration certificate or of the residence permit, as appropriate. This last text is similar to that contained in article 27, paragraph (4) on the request for information about the person's criminal record only when the information is absolutely necessary for justifying the refusal to allow entry or stay on that territory.

In the *Gül* case[30], the Court of Justice stated that the possibility for Member States to restrict freedom of movement on public health grounds could not justify the exclusion of the public health sector from the scope of economic sectors, but it could only substantiate the refusal to access or residence on their territory for people whose access or residence in itself would constitute a danger to public health[31] (31).

4. Material guarantees. Features of a restrictive measure under EU law

Partially provided for previously in Directive 64/221/EEC, highlighted and interpreted by the Luxembourg Court, the defining elements of restrictive measures compatible with Community law can be now drawn easily from the provisions of article 27 of Directive 2004/38/EC, dedicated to the general principles that must be taken into consideration by Member States authorities when they want to limit free movement of persons within the country.

[29] Which is based on the provision contained in article 4 of Directive 64/221/EEC, now repealed.

[30] Judgment of 07/05/1986, *Gül / Regierungspräsident Düsseldorf*, C-131/85, *(Rec.1986, p.1573)*.

[31] C-131/85, *Gül*, above mentioned, paras. 15-17.

a. The measures may be taken against EU nationals and their family members, Union citizens or not.

b. The measures may be based solely on grounds of public policy, public security and public health.

c. The reasons listed above, stipulated by the primary provisions and initially reiterated by Directive 64/221/EEC - can not be relied upon or used for the safeguard of some economic interests or purposes of Member States[32].

d. The measure will respect the principle of proportionality[33].

The reference to the principle of proportionality, which the Court of Justice applied in its numerous decisions, was inserted into the final text of the Directive[34]. "A measure restricting one of the fundamental freedoms guaranteed by the Treaty may be justified only if it complies with the principle of proportionality" meaning that the "measure must be appropriate for securing the attainment of the objective which it pursues and must not go beyond what is necessary in order to attain it", stated the Court in *Olazabal* decision[35]. On the same occasion, it was appreciated that for the given situation, the principle of proportionality would have been respected if a measure of territorial limitation of the residence permit validity had been taken, instead of a deportation decision[36].

Applying the principle of proportionality in relation to restrictions on the free movement can be summarized as: "the obligation imposed to national authorities to analyze the overall situation of the person concerned"[37]. To this end, Directive 2004/38/EC dedicated article 28, with innovative character, to the protection against expulsion.

Since the expulsion of Union citizens and their families, for reasons of public policy or public security is a measure that can seriously affect people who, by using the rights and freedoms conferred by the Treaty, were effectively integrated into the host Member State before that state disposed such measure, it would be compelled to restrict its scope, in accordance with the principle of proportionality. Under the provisions of article 28, paragraph (1), the host Member State is required to examine issues aimed at cultural and social integration of the person concerned in the host Member State, the duration of their stay in the host country, age, state of health, family and economic situation and their connections with their country of origin[38].

Therefore, the degree of integration of Union citizens and their families in the host country will also determine their degree of protection against expulsion.

For EU citizens, holders of the right of permanent residence in the receiving state, Directive 2004/38/EC[39] provides additional guarantees relating to the right to free movement. No expulsion decision can be delivered against them or their family members, regardless of nationality; only in cases where there are imperative reasons of public policy or public security, such measure can be taken.

In addition, an expulsion measure against Union citizens who have lived many years in the host Member State and, in particular if they were born and have resided there their whole life, should be taken only under exceptional circumstances, for imperative reasons related only to public security[40] and that are defined by Member States.

[39] Art. 28 (2).

[40] Directive 2004/38/CE preambles, recital 24.

As provided in article 28 paragraph (3), it is the case of Union citizens who (a) have resided in the host country in the previous ten years, - and therefore their degree of integration in the host country is high - (b) are a minor, except if the expulsion is necessary for the best interests of the child, according to United Nations Convention on the Rights of the Child of 20 November 1989.

Paul P. Craig and Gráinne De Bùrca[41] pointed out, in this context, one of the innovations of Directive 2004/38/EC, namely, the introduction of three levels of protection against expulsion on grounds of public policy, public security and public health, as it follows: "(i) a general level of protection for all individuals covered by EU law; (ii) an enhanced level of protection for individuals who have already gain the right of permanent residence on the territory of a Member State; and (iii) and a super-enhanced level of protection for minors or for those who have resided for ten years in a host state".

e. The restriction will be based **solely** on the **personal behaviour**, but previous convictions - although, obviously, constituting an important factor in determining the personal behaviour – can not justify the limitation of the right to free movement[42].

The danger represented by the individual's behaviour towards the Member State concerned must be established, in order for the measure to be legitimate, before being ordered. Thus, if only by analyzing the personal conduct, it is found that this **constitutes** "a genuine and sufficiently serious threat to the requirements of public policy affecting one of the fundamental interests of society"[43], the measure is justified. In the *Rutili* case, the Luxembourg Court stated that restrictions on the right of a citizen of any Member State to enter, stay and move on the territory of another Member State could not be imposed, unless his presence or conduct constitutes a genuine and sufficiently serious threat to the public policy[44].

The wording was reiterated and developed in the decision delivered in *Bouchereau* case[45]. The French citizen Bouchereau was a worker in Great Britain, since 1975. Having earlier been convicted in the United Kingdom, for illegal possession of narcotics in 1976, Bouchereau recognized that he was guilty, again, of committing the same offence, punishable by English law. In that context, the Court was asked to interpret the concept of *public policy*, since the procedure for expulsion from Great Britain, against Bouchereau had started. The Court stated that "In so far as it may justify certain restrictions on the free movement of persons subject to community law, recourse by a national authority to the concept of public policy presupposes, in any event, the existence, in addition to the perturbation of the social order which any infringement of the law involves, of **a genuine and sufficiently serious threat to the requirements of public policy affecting one of the fundamental interests of society**"[46].

In *Adoui and Cornuaille* case[47], the Court attempted[48], on the one hand, to clarify the notion of *serious threat* and, on the other hand, to ensure the principle of equal treatment for nationals of other Member State s in relation to their own citizens. Thus, the decision of the Court shows "although Community law does not impose upon the Member States a uniform scale of values as regards the assessment of conduct which may be considered as contrary to public policy, it should nevertheless be stated that conduct may not be considered as being of a sufficiently serious nature to justify restrictions on the admission to or residence within the territory of a Member State of a national of another member state in a case where the former member state does not adopt, with

respect to the same conduct on the part of its own nationals repressive measures or other genuine and effective measures intended to combat such conduct".

f. Considerations of general prevention or reasons that are not directly related to the case can not constitute grounds for restricting the freedom of movement[49].

The best illustration of this material guarantee for free movement of persons is "the retreat from *Van Duyn*", as the Court's decision in *Bonsignore*[50] case is being called in the doctrine[51]. The Italian citizen Carmelo Angelo Bonsignore who was working and had the residence in Cologne, Germany, accidentally killed his brother while cleaning his gun. Although he was found guilty both of the offence of manslaughter and of illegal possession of a weapon, he was sentenced only for the last, to pay a fine. As for the offence of manslaughter, the German court did not consider that it would impose another sentence, since it would not have served any purpose under the given circumstances, moreover, it would have caused additional distress unnecessary for the person who already had lost his brother. However, the German authority for foreigners decided Bonsignore's expulsion, arguing that the illegal possession of a weapon was circumscribed in the sphere of *personal conduct* referred to in article 3, paragraph (1) of Directive 64/221/EEC. The Luxembourg Court noticed[52] that the Directive provisions had to be interpreted like this: the measures taken for reasons related to maintaining the public policy and public security against nationals of Member State s of the Community **could not be justified** through **reasons apart from the case**; only **the personal conduct** of those affected by these measures should be considered as conclusive. In addition, the concept of *personal conduct* gives substance to the requirement that expulsion could be imposed only for violations of public policy and security by the individual affected by the measure of restriction. Therefore, the correct interpretation of article 3, paragraphs (2) and (3) of Directive 64/221/EEC is the one according to which the decision for expulsion can not be delivered if it is only based on considerations of general prevention[53].

Unlike the above interpretation given to the expression of *personal conduct*, earlier, in the *Van Duyn* case, the Court of Justice had stated that the membership of a person in an organization considered to be dangerous in the host country, fell under the concept of *personal conduct*, within the meaning of Directive 64 / 221/CEE, entitling the national authorities to invoke the exception of public policy or security in order to expel that person.

With regard to **previous criminal convictions**, their mere existence is not the equivalent of an individual threat against public policy and security. There should not be any direct connection between previous conviction and expulsion, and the conclusion of the threat represented by the individual must result from an overall assessment of his facts and personality[54].

To check the degree of danger, posed by a particular individual, to the public policy or public security, the text of article 27 paragraph (3) of Directive 2004/38/EC provides to the host Member State, a legal instrument, consisting of legitimizing the request for information on previous convictions.

Thus, at the issuance of the registration certificate or in the absence of a registration system, not later than three months after the person concerned has entered its territory or from the date the person has reported her presence on its territory, under article 5, paragraph (5) of the Directive or when issuing the residence permit, the host Member State can, if deemed indispensable**,** request the Member State of origin or, if necessary, other Member States, to provide information concerning any

previous police record the person concerned may have; the consultation can not have a systematic character. The response of the Member State consulted must be sent within two months.

5. Procedural requirements in order for the measure to limit the right to free movement not to be contrary to European Union law

Restrictions that Member State s can apply to the free movement of persons may be subject to judicial review[55] which is intended to guarantee to persons affected by measures of limiting the right to free movement that they were not improperly taken or if they were illegal, that they can be cancelled. The control covers regulations adopted, as well as individual ones given in the application of restriction measures[56].

Directive 2004/38/EC simplifies the procedural requirements of Directive 64/221/EEC referred to above, and ensuring the access to judicial or administrative means of questioning the decision delivered against a person on grounds of public policy, public security and public health becomes an obligation for the host Member State and previous references to comparable national procedures are eliminated[57].

5.1. Notification of decisions

Under the provision contained in article 30 paragraph (1) of Directive 2004/38/EC, those persons concerned must be informed in writing of any decision on the restriction of the right to free movement, for reasons of public policy, public security or public health so that they could understand its content and implications. The text takes as its starting point the provision of first sentence of article 7 from Directive 64/221/EEC that was referring to the notification of any decision on the refusal of the issuance or renewal of the residence permit and to those decisions concerning expulsion. In addition, the provision in force mentions **the way** the notification will be made - **in writing**, so that courts could exercise an effective judicial review if it is necessary - and it integrates[58] considerations that constituted the basis for delivering the decision in *Adoui and Cornuaille* joined cases[59]. The Court stated that, "the notification of the grounds must be **sufficiently detailed and precise** to enable the person concerned to defend his interests. As regards the language to be used, it appears from the file on the case that the plaintiffs in the main proceedings are of French nationality and that the decisions affecting them were drawn up in French … It is sufficient in any event if the notification is made in such a way as to enable the person concerned to comprehend the content and effect thereof"[60].

In a similar manner, paragraph (2) of article 30 incorporates, starting from the wording of article 6 of Directive 64/221/EEC, the principles drawn from the Court's decision in *Rutili* case[61] and has the following wording: „The persons concerned shall be informed, precisely and in full, of the public policy, public security or public health grounds on which the decision taken in their case is based, unless this is contrary to the interests of State security".

Therefore, the Member State must communicate to the person, immediately or at the moment of notifying the restrictive measure taken against her, the accurate and complete reasons that grounded the decision, in order for her to be able to prepare the defence.

At the same time, the same notification lets the person against whom the sentence was given know the court or administrative authority where the decision may be appealed, the time limit for the appeal, and if it is the case, the time allowed for the person to leave the territory. The latter can not be less than one month from the notification date; exceptions are admitted only in cases of emergency,

properly motivated[62]. (62) The stated rule amends the text of article 7, the final thesis of Directive 64/221/EEC, which stipulates that the deadline for leaving the territory shall not be less than 15 days if the person has not yet received a residence permit and can not be less than a month, in other cases.

5.2. Procedural guarantees

Jean-Yves Carlier[63] observed that "whatever the reasons for expulsion would be, procedural guarantees[64] must be respected" and that "the Court of Justice has already stopped on this issue[65] and stated that both for the expulsion of a citizen of the Union and for the expulsion of a Turkish citizen, beneficiary of an association agreement, in the absence of a notice given by an independent tribunal, previously to the expulsion, the legal appeal must be suspensive and can not be limited to a legality control that would exclude the control of opportunity"[66].

A.Iliopoulou showed[67] that through the new Community provisions contained in article 31 of Directive 2004/38/EC, substantial changes were made to the system created by the provisions of articles 8 and 9 of Directive 64/221/EEC for ensuring a "comprehensive and effective" judicial protection. "The very nature of the right to free movement of persons" determines the regulation of a judicial control of legislative measures that restrict it. Given its character of fundamental freedom, the freedom of movement must be accompanied by "strong guarantees against arbitrary interferences". Moreover, an effective control corresponds to requirements of the general principle of Community law on effective judicial protection of individuals. This principle was judicially established[68], being inspired by the constitutional traditions" of Member States "and by articles 6 and 13 of the European Convention on Human Rights. Its recognition in the Community legal order was achieved by article 47[69] of the Charter of Fundamental Rights" of the European Union.

The first procedural safeguard covered by article 31 of Directive 2004/38/EC consists of *the right of redress* against a restrictive measure. "The persons concerned shall have access to judicial and, where appropriate, administrative redress procedures in the host Member State to appeal against or seek review of any decision taken against them on the grounds of public policy, public security or public health"[70].

It results from this wording, that a person has **always** guaranteed the access to a legal appeal, and moreover, if the law of the receiving Member State provides it, to an administrative appeal.

When challenging an expulsion measure is accompanied by a request for suspension of the decision, the person's effective expulsion from the territory can not be pursued before the delivery of an ordinance on the provisional measures of suspension. Exceptions are the situations when: the decision of expulsion is based on a previous judicial decision or the person affected had previous

[69] Art.47, *Right to an effective remedy and to a fair trial*:

„Everyone whose rights and freedoms guaranteed by the law of the Union are violated has the right to an effective remedy before a tribunal in compliance with the conditions laid down in this Article.

Everyone is entitled to a fair and public hearing within a reasonable time by an independent and impartial tribunal previously established by law. Everyone shall have the possibility of being advised, defended and represented.

Legal aid shall be made available to those who lack sufficient resources in so far as such aid is necessary to ensure effective access to justice.".

[70] Art.31 (1) of Directive 2004/38/CE.

access to a judicial way of appeal or the expulsion decision is based on imperative grounds of public security, under article 28, paragraph (3)[71].

The legal review of the measure to restrict the right to free movement will concern the legality of the decision, the facts and circumstances that have grounded the measure and the principle of proportionality[72].

Another procedural safeguard is introduced by the provision contained in paragraph (4) of article 31. Although Member States can deny the concerned individual's presence on their territory during the appeal procedures, they can not prevent him from personally formulating his defence, unless his presence could seriously cause troubles to public policy or public security or when the appeal regards the denial of access on that territory. In this way, **the right to a fair trial is guaranteed**[73], because, even if during appeal proceedings, the person concerned is denied the presence on the territory from which she was expelled, her right to personally present evidence can be restricted only when her presence on the territory of the host Member State would endanger the public policy and safety or when the measure aimed at restricting the right of entry.

5.3. Duration and effects of the prohibition of entry on the territory of a Member State.

After a reasonable period of time, related to circumstances, but in any case not earlier than three years after the enforcement of the final decision of prohibiting the entry, validly sentenced in accordance with European Union law, persons affected by a decision that prohibits the access on a territory may submit a request to suspend the prohibition. To this end, they will present evidence for effective changes in the circumstances that led to the decision of prohibiting the entry, sentenced against them. Within six months from the moment of submitting the application, the competent authorities of the Member State concerned shall deliver a decision on the possibility of suspending the prohibition[74].

Article 32 paragraph (1) of Directive 2004/38/EC gives legislative character to a consideration from a decision of the Court of Justice[75], through the prohibition of permanent interdictions of entry on the territory from which a person was expelled, on grounds of public policy and public security. However, people have no right to enter the territory of the Member State concerned while their application is being considered[76].

In the event of expulsion on grounds of public policy, public security or public health from the territory of a Member State, a Union citizen has the right to re-enter the Member State which issued his passport or identity card, without having to fulfil any formality, even if the document is no longer valid or if the holder's citizenship is disputed. This provision of article 27 paragraph (4) of Directive 2004/38/EC resumes the text of article 3, paragraph (4) of Directive 64/221/EEC and constitutes the Community expression of the principle of international law, under which a state can not refuse their own citizens the right to access and the right of residence on its territory[77] .

Conclusions

At present, the benefit of rights of free residence and movement within a Member State may be denied to the nationals of another Member State, for reasons expressly and exhaustively covered by the Treaty on the Functioning of the European Union - public policy, public security and public health - developed in Directive 2004/38/CE, and broadly interpreted in Luxembourg Court's rulings.

[71] Art.31 (2) of Directive 2004/38/CE.

[72] A.Iliopoulou in *„Le nouveau droit de séjour ..."*, op.cit., p.554.

[73] Judgment of 05/03/1980, *Pecastaing / Belgian State*, C- 98/79, *(Rec.1980,p.691)*.

[74] Art.32 of Directive 2004/38/CE

[75] Judgment of 18/05/1982, *Adoui and Cornuaille*, para.12.

[76] Art.32 (2) of Directive 2004/38/CE. The provision was inspired by de Judgment of 18/05/1982, *Adoui and Cornuaille* and included in the directive's text in order to avoid abuse of rights.

[77] Judgment of 04/12/1974, *Van Duyn*, para.22.

Our analysis revealed the dual nature of the limitation based on grounds of *public policy, public security and public health*. First, the limitation has Community nature, meaning it is specific to European Union law, because: (a) has been explicitly provided in its texts - primary and secondary; (b) its limits are set specifically under the form of material and procedural guarantees through derived rules, (c) its scope was restricted through the interpretative jurisprudence of the Court of Justice. Secondly, the limitation has also national character, because it aims at safeguarding the fundamental values of society, closely connected to national sovereignty and the concepts are defined through the national legislation.

Measures restricting the right to free movement must comply with certain material and procedural requirements in order to be in accordance with EU law. Thus, the exception cannot be invoked for economic purposes. The restrictive measures based on reasons of public policy and public security must comply with the principle of proportionality and can be taken only after having considered the behaviour of the person concerned, which should represent a present threat, sufficiently serious and real to the fundamental interests of society. As for the grounds of public health, national authorities may refuse the entry or stay on their territory, but only for a limited number of diseases. Member States may require beneficiaries of the right of residence to undergo a free medical examination, but only if there are serious indications about its necessity and only in the first three months from their arrival on the territory of the receiving state.

From a procedural perspective, we mention that the person concerned must be informed in writing and in a manner that would allow the understanding of the decision that restricts her freedom of movement and residence in a Member State, and she has the right to appeal against or seek review of any decision taken against her in front of the competent judicial or administrative authorities of that state; she may be required to leave the territory, with some exceptions, not earlier than one month after the notification. In addition, the prohibition to enter the territory of a state can not be permanent. The interested persons are entitled to request its suspension, after a reasonable period of time, but after at least three years from the execution of the final decision through which it was ordered.

Summarizing, we see that the European Union legislation in force, valuing the relevant jurisprudential *acquis*, allows Member States to adopt, for reasons of public policy, public security and public health, measures that restrict the movement and residence of nationals of other Member States on their territory, but at the same time, it establishes a complex system of guarantees conceived to protect the holders of rights.

Since our study aimed to approach the limitations of the free movement of persons on grounds of public policy, public security and public health, mainly from legal and theoretical perspective, we consider that the theme may be subject to further research focused on the analysis of concrete ways through which Member States would comply with the provisions of EU law, in this area.

THE UNITED NATIONS'NEW SYSTEM FOR SETTLEMENT THE DISPUTES BETWEEN ORGANIZATION AND ITS EMPLOYEES

LAURA MAGDALENA TROCAN[*]

Abstract
In accordance with the Resolution of the UN General Assembly A/RES/61/261 in 30 April 2007 within the United Nations was established a new system in order to settle the internal disputes and disciplinary matters between Organization and its employees designed to meet the current needs of the Organization and which became operational on 1 July 2009. The establishment of this system was based on the conclusions of several reports of the UN Secretary - General, of the Panel on the Redesign of the UN system of administration of justice, of the Advisory Committee on Administrative and Budgetary Questions what pointed out that the old system of administration of justice at UN became a slow, heavy, ineffective and lacking professionalism and that the system of administrative review has no longer corresponded to current needs of this important international Organization. Given these considerations and based on the premise that a transparent, impartial, independent and efficient system of administration of justice is essential for each of the employees of the Organization to be guaranteed a fair and equitable treatment in the performance of professional duties and taking into account the need to reform the management of human resources at the UN, the Organization has decided to establish a new, independent, transparent, professionalized, adequately resourced and decentralized system of administration of justice who comply the rules of International Law and the right to a fair trial and to ensure the implementation of rights and obligations of the employees but also to establish the liability for their actions. Taking into account those mentioned above this study goals are to present the organization and functioning of this new system for settlement disputes between UN staff and administration and to make a brief comparative analysis with the old system.

***Keywords**: international litigations, international employees, international jurisdictions, rights and obligations of the employees, United Nations*

Introduction

The diversification of the international relations and, at the same time, the increase of their complexity degree has necessarily led to a proliferation of the international organizations whose number has exponentially increased[1]. The efficient operation of these international organizations, according to the constitutive act and to the orientations of the member states, also imposes a permanent activity, material, but also some human means to accomplish it. Considering these aspects, after the second world war, there was registered a spectacular increase of the number of persons working for these organizations[2].The term designing the persons working in frame of the international organizations is international employee by means of which we understand any person having targets given by an international organization to exert determined functions[3] in the interest of

[2] Beşteliu, R. M., *International Law – Introduction in Public International Law*, (Bucharest, All Beck Press, 1997), 128.

[3] The staff of the international organizations consists of permanent employees recruited based on a contest, contractual employees employed for a determined or undetermined time and employees detached from the member states.

the ensemble of the member states of the respective organization[4]. The most important international organization (both by its universal feature – containing almost all the states of the world, and by the purposes that were offered to it, by the extent and the multitude of its activity) – the United Nations Organization[5] - counted in frame of its Secretariat, on June, 30th 2010, 44134 employees[6] representing 187 states. The Secretariat of the United Nations Organization[7] includes both the international employees working at the central headquarters of the organization (New-York), and the ones employed at UNO subordinated organs, including the regional economical commissions[8]. But, no matter the location of the activities development, in any organization, inclusively in frame of UN, the existence of certain harmonious work conditions is essential for productivity. Therefore, the institution of certain systems, norms and procedures meant to provide a climate necessary for the development of the employees' activity in good conditions contributes to the efficient reaching of the organization purposes and objectives. At UN level, there is a series of regulations, like the ones contained in UN Charter, in UN Regulations and Staff Status, regarding the employees' behaviour and actions and that define the exertion of their essential rights. Also, there are regulations regarding deontology, gender equality, policies referring to human resources. Other aspects following the providing of the employees' integrity, equity and equality are established by means of the circulars of UN General Secretary[9] allowing the organization to accomplish its current attributions in the most efficient way. However, the work litigations that may appear between the organization and its employees are about the same as the ones that may appear in every work place and that may regard aspects related to contracts renewal, to an equitable treatment, to promotion, discrimination, harassment or institution of disciplinary measures. But, this time, in UN case, we must add an additional size, namely the cultural and geographical diversity. In this context and considering the fact that both UN and its employees, according to art. 105 of UN Charter, benefit from the privileges and immunities needed for the accomplishment of the organization purposes, at its level it was created an intern justice system[10] in order to be responsible for those situations where the UN

(http://www.diplomatie.gouv fr/fr/ministere_817/emplois-stages-concours_825/70.-mission-fonctionnaires-internationaux_4338/travailler-oi_20037/votre statut_20420/fonctionnaireinternational_61828 html#sommaire_1).

[4] In other words, the international employee must work for the organization, its activity must have a certain permanence and continuity and he must obey the rules resulting from "his international status". (Beşteliu, R. M., Intergovernmental International Organizations, Bucharest, All Beck Press, 2000, 97-98). An extended definition of the international employee may also be found in the Notice of the International Justice Court since April, 11th 1949 – CIJ, reparation des dommages…, avis du 11 avril 1949, Rec. 1949, p. 177- where it is shown that the international employee is a employee waged or not, employed for an indefinite time or not, employed by an organ of the organization in order to exert or to support the exertion of its functions, shortly any person by means of which the organization acts in accomplishing its purposes. (Combacau, J., Sur, S., Droit international public, Paris, Montchrestien, 2006, 738).

[5] Bolintineanu, Al., Năstase A., Aurescu, B., Contemporary International Law,(Bucharest, All Beck Press, 2000), 104.

[6] Considering all the employees, no matter the type of employment: for an indefinite or definite time or for a stage time and no matter the type of recruitment (local or international). For the year 2010, at the mentioned number we add 1450 employees who activated in frame of the United Nations Development Programme (UNDP) unregistered in the integrated administration system. At the same time, to these numbers we must add 189 more employees in leave without pay and 60 employees detached from other international organizations. (The Report of the UN General Secretary regarding the composition of the Secretariat: demographical data referring to the staff since September, 8th 2010 - A/65/350- http://www.un.org/french/documents/view_doc.asp?symbol=A/65/350)

[7] Further, we will refer to the United Nations Organization by using the abbreviation UN.

[10] http://www.un.org/fr/oaj/unjs/why.shtml

employees consider their rights were disrespected and the organization regulations were not complied with. This system is considered to be the angular stone of the global effort meant to reinforce the principle of responsibility and of providing the fact that everybody is responsible for the way of accomplishment of the entrusted targets[11]. At the same time, the access to this system is a fundamental right of all the UN employees.

Presentation of the new United Nations' system for settling the litigations between the organization and its employees.

In accordance with the Resolution of the UN General Assembly A/RES/61/261 in 30 April 2007 within the United Nations was established a new system in order to settle the internal disputes and disciplinary matters between Organization and its employees [12] designed to meet the current needs of the Organization and which became operational on 1 July 2009. The establishment of this system was based on the conclusions of several reports of the UN Secretary - General[13], of the Panel on the Redesign of the UN system of administration of justice [14], of the Advisory Committee on Administrative and Budgetary Questions [15] what pointed out that the old system of administration of justice at UN became a slow, heavy, ineffective and lacking professionalism and that the system of administrative review has no longer corresponded to current needs of this important international Organization. Given these considerations and based on the premise that a transparent, impartial, independent and efficient system of administration of justice is essential for each of the employees of the Organization to be guaranteed a fair and equitable treatment in the performance of professional duties and taking into account the need to reform the management of human resources at the UN, the Organization has decided to establish a new, independent, transparent, professionalized, adequately resourced and decentralized system of administration of justice who comply the rules of International Law and the right to a fair trial and to ensure the implementation of rights and obligations of the employees but also to establish the liability for their actions. The way the new system was thought follows both the improvement of the UN employees' performances and the ones of the reports between them and the organization administration[16].

According to the current regulations, within UN there are two procedures operating in relation to the management of the internal litigations and the disciplinary matters: an informal one and a formal one.

Therefore, UN employees are encouraged to try, at first, to settle the litigation by using the informal procedure, considering the fact that the litigation settlement by negotiation, mediation and other methods of this kind has a shorter extension and it is much easier than an informal procedure[17]. Considering that the amicable regulation of the litigations is a basic element of the system of justice administration, it proceeded to the reorganization of the Ombudsman Office for UN Secretariat that

[11] http://www.un.org/fr/oaj/unjs/why.shtml

[12] In the reports between the states, and also in the reports between other international law subjects, there may be contrary interests, misunderstandings or litigious problems. In order to design different states of misunderstanding that may appear in the international relations, the special literature and the documents in matter use a varied terminology, namely: legal dispute, litigation, crisis etc. in report to the seriousness of the misunderstanding state and its implications on the reports between the respective subjects.

(Popescu, D., Năstase, A., Public International Law, Bucharest, "Şansa" Publishing House, 1997, 320). The creation of the international organizations has determined the creation of the specific procedures of settling the legal disputes that may appear in the relations between the member states, between a member state and the organization as such, or between the organization and its employees. (Bolintineanu, Al., Năstase, A., Aurescu, B., Contemporary International Law, Bucharest, All Beck Press, 2000, 207).

[13] A/61/342

[14] A/61/205.

[15] A/61/815.

[16] http://www.un.org/french/documents/view_doc.asp?symbol=A/RES/61/261

[17] http://www.un.org/fr/oaj/unjs/informalres.shtml

also serves all the UN funds and programmes, having three locations: Geneva, Vienne and Nairobi. Also, for the efficient materialization of the informal procedure, the organization considers, at the same time with the implementation of the new system of settling the litigations, mediation – as an important component of this type of procedure – that should be opened to all the parties placed in litigation.

In this sense, within the Ombudsman Office, it was instituted a Department of mediation in order to provide mediation services both to the UNO Secretariat[18], and to the organization funds and programmes[19].

The formal procedure of justice administrative contains a double degree of jurisdiction: a basic court named The United Nations Dispute Tribunal and an appeal court named The United Nations Appeals Tribunal, jurisdictions preceded, in some cases, by the existence of a prior procedure, namely the one of the hierarchical control.

Thus, if a UN employee considers he is prejudiced in one of his rights by an administrative decision and the litigation could not be settled amicably, he may contest the respective decision, by appealing to the formal procedure with the strict respect of the stags and the terms stipulated in this sense.

In a 60-day term from the date he was notified regarding the administrative decision by means of which he considers he was prejudiced, the employee must require a hierarchical control[20]. This hierarchical control that lasts maximum 45 days (30 days for the headquarters in New-York) wants to identify if the contested decision was emitted with the respect of the regulations incident in the field. Within the UN General Secretariat, the hierarchical controls are made in the Hierarchical Control Group placed under the coordination of the Office of the Under-Secretary-General for Management, and the UN funds and programmes exert the hierarchical control in frame of their own administrative structures. The objective of this prior procedure is to give the administration the possibility to rectify certain errors when their existence is found or to suggest acceptable remediation measures and also to reduce the number of cases submitted to the formal contentious procedures.

A hierarchical control is not required if the contested decision regards the imposing of a disciplinary measure or if this decision was taken by the administration based on the notice of an expert or of a consultative body such as the Consultative Committee regarding the compensating requirements. In this case, the action may be directly submitted to the United Nations Dispute Tribunal[21].

If they fail to reach an amicable agreement and the conclusions of the hierarchical control are not satisfying for the employee, he may submit an action the United Nations Dispute Tribunal[22].

The solution of the United Nations Dispute Tribunal may be attacked by appeal at the United Nations Appeals Tribunal that is competent to judge the litigations for which the United Nations Dispute Tribunal crosses its competence, did not correspondingly exert the competence it was invested with or pronounced wrongly on a factual, legal or procedural element[23].

---

[18] Mediation is an alternative for the judicial procedures, having the purpose to help the parties to amicably settle the litigation by means of mediation within the Department of mediation. It is a voluntary process involving the consent of the parties that, even if the process is at the jurisdictional courts, may require sending the cause to mediation, a situation where the process is suspended during the mediation development. There is also the possibility for the judge to suggest to the parties the use of the mediation, but he cannot impose this. (http://www.un.org/fr/oaj/dispute/faq.shtml#faq6)

[19] http://www.un.org/french/documents/view_doc.asp?symbol=A/RES/61/261

[20] This term may be suspended during the appeal to the services of Ombudsman Office and of the Direction of mediation.

[21] http://www.un.org/fr/oaj/unjs/formalres.shtml

[22] According to the new system of the United Nations of settling the litigations between the organization and the employees – the UN Administrative Contentious Court will replace the consultative bodies of the old administrative system, the par appeal commissions and the par disciplinary committees and also other organs, if it is needed.

[23] http://www.un.org/fr/oaj/unjs/formalres.shtml

A new element brought by the changes regarding the system of settling the litigations between the organization and its members is given by the fact that an Office of Administration of Justice managed by an executive assigned by the UN General Secretary that will have the mission to coordinate the UN administration system of the intern justice[24] and to compete for the equitable, efficient and transparent functioning of the system[25].

Short comparison between the new and the old system of the United Nations litigations settlement between the Organization and its employees.

A comparative analysis of the two systems of justice administration spotlights the following aspects:

- if the old system was mainly financially administrated by the Management Department improved by taking decisions regarding the matters related to the human resources and the disciplinary questions, the new system is independent, being coordinated only by the Office of Administration of Justice[26].

- if, in the past, there was the United Nations Administrative Tribunal – established by Resolution 351 A (IV) of the UN General Assembly from November, 24th 1949, consisting of seven members of different nationalities assigned by the UN General Assembly for a four-year mandate renewable only once – that worked like an independent organ settling the complaints for disrespecting the stipulations of the work contracts of UN employees and whose decisions were definitive and with no appeal right[27], nowadays, there is a judicial system with two degrees of jurisdiction: the United Nations Dispute Tribunal and the United Nations Appeals Tribunal, in whose frame the judges act[28]. The United Nations Dispute Tribunal [29] is the first instance court of the new internal system of justice administration in whose competence there are the actions introduced by UN active employees or by former employees against the administrative decisions[30] related to employment or against the decisions contracting the rights involved by the employee's quality in the United Nations system (for example, the lack of promotions or of selections, matters related to the job attribution, the refusal to renew the mandate, non-granting benefits and rights, firing and other disciplinary measures etc[31].). The court may be announced only after the requirement addressed to the General Secretary (actually, to the Hierarchical Control Group of the UN Secretariat or to the office that received such an attribution delegation for the UN funds or programmes) in order to accomplish a hierarchical control for those decisions that cannot be attacked directly at the Court.

[24] http://www.un.org/french/documents/view_doc.asp?symbol=A/RES/61/261

[25] Circular of the UN General Secretary regarding the organization and the mandate of the Office of justice administration - ST/SGB/2010/3 since April, 7th 2010.
(http://www.un.org/french/documents/view_doc.asp?symbol=ST/SGB/2010/3).

[26] http://www.un.org/fr/oaj/unjs/oldnew.shtml

[27] However, according to art. 12 of the Status of the Administrative Court of the United Nations, one of the parties could require the review of a decision if it was discovered a fact able to exert a decisive influence and that, before the pronouncement of the decision, had not been known by the Court or by the party demanding the review. The review could be required in a 30 days term since the date when the fact is discovered, but not later than a year since the decision is pronounced.
(http://untreaty.un.org/unat/FAQ_French htm)

[28] http://www.un.org/fr/oaj/unjs/oldnew.shtml

[29] The UN Dispute Tribunal works at Geneva, Nairobi and New-York, having binds in all these locations.

[30] In the absence of an express definition of the phrase of administrative decision and by means of it we will understand any decision taken in the United Nations system, wither it is taken by the UN General Secretariat, by a UN mission, by a UN fund or programme, by a UN specialized institution or by other organism accepting the jurisdiction of the UN Dispute Tribunal.
(http://www.un.org/fr/oaj/dispute/decisions.shtml)

[31] Art. 2 and 8 of the Status of the UN Dispute Tribunal.
(http://www.un.org/french/documents/view_doc.asp?symbol=A/RES/63/253)

The court consists of five permanent judges, 3 of them with full-time jobs[32] and 2 of them with part-time job[33]. The UN General Assembly temporarily decided to assign three more temporary judges in order to support the settling of the causes taken over from the old system of justice administration[34]. The candidates for the judge job are nationals of different member states of UN that should enjoy a high moral consideration and justify at least ten years of experience in the administrative law field. The judges are assigned by the UN General Assembly from the list of the candidates recommended by the Council of the internal justice for a seven-year mandate, without the possibility to renew it. At the same time, at the expiring date of the mandate for a five years term they are forbidden to have a non-judicial job in the United Nations system[35]. The employees and the administration may contest the decision of the United Nations Dispute Tribunal at the United Nations Appeals Tribunal [36]. Beside the competence to pronounce regarding the decisions of the United Nations Dispute Tribunal, this also has the competence to pronounce regarding the decisions taken by the permanent Committee acting in the name of the Joint Committee of the Common House of Pensions of the United Nations staff and the leaders of other organisms and entities acknowledging its competence[37]. The United Nations Appeals Tribunal consists of seven judges[38] working in panels of 3 judges. The decisions of this court are final and binding for both of the parties. The main headquarters is in New-York, where there is also the bind, but it also has secondary headquarters in Geneva, Nairobi.

- if, in the past, the par appeal commissions and the par disciplinary committees formulated only recommendations that could be considered or not by the UN General Secretary, now the decisions pronounced by the two courts are binding for the parties[39].

- if, according to the old system, the employees could attack the decisions of the General Secretary at the UN Administrative Tribunal, now the UN employees and administration may attack a decision of the United Nations Dispute Tribunal at the United Nations Appeals Tribunal [40].

- in the past, the General Secretary could impose a disciplinary measure only after a recommendation formulated by the Par Discipline Committee, a situation totally different from the current one, when it directly has this possibility[41].

- if, in the past, legal assistance was provided to UN employees wanting to contest an administrative decision or a disciplinary by volunteer appearing on the Counsellor List, juridical counselling is currently provided by jurists with acknowledged professional competences working within the Office of Juridical Assistance of the UN staff settled within the Office of Administration of Justice on July, 1st 2009 by the materialization of the Resolution of the General Assembly from December, 24th 2008[42]. But we should say that the appeal to the juridical assistance provided by the

[42] http://www.un.org/fr/oaj/unjs/oldnew.shtml. Willing to support the UN employees (including the former employees) who have the intention to contest an administrative decision or a disciplinary measure taken against them, the UN General Assembly settled the Office of juridical assistance of the UN staff formed of qualified jurists full-time

jurists of the Office is not mandatory for the UN workers contesting a certain disciplinary measure or decision, as they have the possibility to require juridical counselling also outside UN but this time there is the mandatory feature of personally supporting the costs. Also, there is the possibility for the personal representation in the procedures within the internal system of justice administration. The juridical counselling requirement may be accomplished at any moment of the litigation, even before the litigation occurs, and the juridical assistance consists of granting notices regarding the juridical validity of the employees' pretentions and indicating the options offered by the legal regulations. If an employee decides to announce the formal justice system, the Office will determine whether there is the possibility to support and represent it during the entire time of the procedures[43].

- if, in the old system, the Ombudsman Office worked only in New-York, according to the new regulations it was reorganized, being offered several locations and including a Department of mediation[44].

- if, in the past, the judges of the UN Administrative Tribunal were assigned by the member states and chosen by the General Assembly without going through a special selecting procedure, nowadays, in order to be a judge at the United Nations Dispute Tribunal and the United Nations Appeals Tribunal, one must prove a professional experience of 10, respectively 15 years and the candidatures are evaluated by the Internal Justice Council, an independent organism[45], before being recommended to the General Assembly in order to be assigned[46].

- if, in the past, an employee wanted to officially contest a decision, in the first place he had to demand a review of the administrative decision that was entrusted to the Administration Office of the human resources, nowadays the employee wanting to contest an administrative decision has to demand, at first, a hierarchical control made by the Hierarchical Control Group within the Office of the Under-Secretary-General for Management [47].

- if, in the past, the procedure of reviewing the administrative decisions was criticisable based on the existence of a long time, nowadays the hierarchical control is accomplished in strict terms[48].

---

employee who develop their activity both at the central headquarters of the organization in New-York, but also in Addis-Abeba, Beirut, Geneva and Nairobi. The office works independently from the syndicates of the UN staff and administration. In exerting their attributions, the employees of this Office must respect the legal, deontological and professional stipulations and they have to respect a behaviour code review on March, 10th 2010, and they can claim or accept no kind of material compensation or no other type of payment (in addition to the wage received for the activity they performed in frame of the Office) from their clients or from other parties in exchange for the services of juridical counselling.

[46] http://www.un.org/fr/oaj/unjs/oldnew.shtml

[47] http://www.un.org/fr/oaj/unjs/oldnew.shtml

[48] http://www.un.org/fr/oaj/unjs/oldnew.shtml. The hierarchical control must be demanded in a 60-day term since the employee was notified regarding the decision he contests, the answer of the UN administration to the demand of accomplishing a hierarchical control must be accomplished in a 30 days term for the employees developing their activity at the UN central headquarters and a 45 days term for the employees not developing their activity at the UN central headquarters, a 90 days term – since the employee received the answer for the requirement of accomplishing the hierarchical control or since he should have received this answer – for introducing the action on the role of the UN Dispute Tribunal, the contestation of the decision of the UN Dispute Tribunal at the UN Appeals Tribunal must be accomplished in a 45 days term since the employee received the decision.

(http://www.un.org/fr/oaj/unjs/timelines.shtml).

Conclusions.

Created in 1945 and applied in a time when UN counted only a few hundred employees, its system of internal justice has been often criticized and made the object of several reforms, across the years. Being governed by the principle of depleting the internal appeals, the system of internal justice that worked until 2009 contained two permanent bodies – the Par Appeal Commission and the Par Discipline Commission with headquarters in New-York, Vienne and Nairobi – and the Administrative Tribunal of the United Nations with the headquarters in New-York and it crossed, with no doubt, a legitimacy crisis.

The litigations were solved by the two par commissions formed of employees activating on volunteering principles and that owned neither the expertise nor the impartiality needed for the settling of the entrusted cases. Also, the appearance of the interest conflicts was frequent. The cases presented to the par commissions were tergiversated also up to four years, getting to situations where the plaintiffs left the UN system for another work place even before being given the final decision. The legitimacy crisis had got so far that they spoke about the existence of an apparent system of internal justice administration within UN. A general climate of scepticism often encouraged the UN employees to elude the organization system of settling the litigations[49].

At the same time, they got to a paradoxical situation: while UN gave lessons to some countries for the way of respecting the civil rights, it was proved that the Organization did not apply its own principles in the matter of the human rights at the internal level, as there were no independent judicial courts or appeal courts at its level[50]. No doubt, all of these spotlighted the need to reform the system of justice administration within UN, a change that would be accomplished in the context of the ensemble reform of the entire organization. Being initiated in 1997 by the former General Secretary of UN, Kofi Annan, the UN reform – that was necessarily imposed considering the fact that the organization was settled in 1945 in a historical and political context totally different from the one at the end of the 90s – it refers to major changes at the institutional and operation level in order to increase the organization efficiency, considering the numerous challenges faced by the world in the 21st century. In this context, at the World Summit of the United Nations in 2005[51] the world leaders decided to develop many analyses on the UN operation and organization.

As a consequence of this decision, there were elaborated several considered reports – historical reports – that outlined a modern vision reforming on the administration of the UN intern problems. Regarding the examination of the justice administrating way in UN, in July 2006, the Redesign Group formed of judicial experts outside the Organization presented its conclusions regarding this problem that spotlighted the fact that the system was old, had different dysfunctions, was inefficient and had deficiencies regarding its independence. Considering these aspects, the Group recommended the creation of a completely new, professional, independent and decentralized system.

The UN General Secretary received with satisfaction this report that was presented at the first session of the General Assembly in 2007, after tight consultations with the Secretariat staff and after doing some math regarding the total cost of implementing a new system[52]. The way the current system was thought creates the premises for implementing a real system of justice administration in UN and contributes to the creation of a new culture of responsibility, proceeding to the removal of the par commissions and containing two procedures regarding the administration of the internal litigations and disciplinary matters: an informal one and a formal one. The informal procedure is

[49] http://www.ledevoir.com/societe/justice/150315/repenser-la-justice

[50] http://www.ledevoir.com/societe/justice/150315/repenser-la-justice

[51] Developed between September, 14th – 16th 2005 at the UN headquarters in New-York. (http://www.amosnews ro/2005/Summit_ul_Mondial_al_Natiunilor_Unite_cea_mai_mare_reuniune_a_liderilor_lumii-109039)

[52] http://www.un.org.sn/spip.php?rubrique4

reinforced around the ombudsman and the mediation[53], and the formal one contains a double degree of jurisdiction, being distinguished by the settlement of an appeal court for reviewing the decisions pronounced firstly by the UN Dispute Tribunal.

The new system of internal justice offers a rare occasion of reinforcing the employees' rights[54], being at the same time meant to allow the organization to accomplish its missions as efficiently as possible, respecting at the same time its staff's rights. At the same time, we must say that the analyses of some famous specialists accomplished on the way the current system was thought also determined the formulation of certain opinions supporting that, if there is a response as it is expected and the system pertinently responds to the current needs of the organization, in ten years the new system of justice administration within UN will have a larger sphere regarding the competence, that will not be limited only to the work litigations and administrative relations, but it will extend towards the civil litigations and, in time, there is the possibility to transform it in a supreme world court[55].

How much this fact will be expressed is something that remains to be found out in the future, but it is certain that the system of justice administration in UN will not be able to operate efficiently in the absence of a real reform of the entire international institutional edifice, quite hard to accomplish, considering significant organizing and financing problems[56]. Although, the creation of this system has become imperative, considering the UN decisive actions for elaborating, promoting and developing the international norms in the field of human rights and of the realities of the 21st century[57].

THE CHALLENGES OF THE NEXT EUROPEAN UNION ENLARGEMENT

DAN VĂTĂMAN*

Abstract
After nearly six decades of evolution marked by five successive waves of enlargement, today's EU with 27 Member States, totaling a population of close 500 million people, is a prosperous and powerful entity that exercises a growing influence on the international arena. The EU's commitment to the enlargement process reflects the Member States' conviction that it is in the mutual interest of the Union and the aspirant countries, thereby contributing to stability, development and prosperity throughout Europe. Under these conditions, the EU's enlargement process has gained new momentum, the entry into force of the Lisbon Treaty ensures that the EU can pursue its enlargement agenda, while maintaining the momentum of European integration. Starting from the fact that the EU's current enlargement process takes place against the background of a deep and widespread recession, this study aims to analyze the main challenges facing countries in the process of enlargement and also to highlight their progress with political and economic reforms as well as their capacity to assume the obligations of membership in accordance with the Copenhagen criteria.

Keywords: *accession, enlargement, European integration, negotiations, candidate countries.*

1. Introduction

The European Union today is the result of integration and enlargement process evolving continuously, process that has contributed to stability, development and prosperity throughout Europe and thus represents one of the most important phenomena that the European continent has known.

If the initial integration process aimed at preserving peace and eliminate the danger of another war, there were later identified many benefits of increased cooperation between European states. By establishing a common market and the gradual approximation of economic policies of Member States aimed to promote a harmonious development of economic activities, sustainable and balanced growth, increased stability, accelerated growth in living standards and closer relations between Member States. Thus, increasing cooperation between Member States of the European Communities resulted in significant benefits, not only in terms of security, and prosperity.

The success of the EU construction has determined other European countries to want to get integrated, the prospect of integration helping them to engage in comprehensive reforms to fulfill conditions imposed by pluralist democracy and market economy.

As a result, since 1990, following the major changes occurring in Central and Eastern Europe, the countries of this region have seen in the European Union a foothold, and in the process of European integration, an opportunity for reviving their economy. On the other hand, being consistent with the ambitious objectives promoted in the Treaty of Rome and the Single European Act, the European Union was concerned about the deepening of integration, this being evident throughout the '90s. In this respect, European policymakers have expressed a genuine consensus on the possibility of European Union enlargement, of course in a time frame and after the candidate countries have completed well-defined criteria.

* Lecturer Ph.D., Law Faculty, "Gheorghe Cristea" University, Bucharest (e-mail: danvataman@yahoo.com).

2. History of European Union enlargement

As it is known, the founding members of the three European Communities were six (Belgium, France, West Germany, Italy, Luxembourg and the Netherlands), but the possibility of extension of the new community construction by including new members was provided in the instituting Treaties[1]. As a result, over time, the six founding members were joined by another twenty-one countries in five waves of enlargement: Denmark, Ireland and the United Kingdom (January 1st, 1973), Greece (January 1st, 1981), Portugal and Spain (January 1st , 1986), Austria, Finland and Sweden (January 1st , 1995), Cyprus, Estonia, Latvia, Lithuania, Malta, Poland, Czech Republic, Slovakia, Slovenia and Hungary (May 1st , 2004), Bulgaria and Romania (January 1st 2007)[2].

The five waves of extension of the Community construction required a series of amendments to the Treaties, each time a reform being necessary to allow absorption of new members and ability of the institutions of the Union so that they can continue to function properly. Also, since in most cases the states that had joined, had a development level lower than the EU average, every enlargement of the Union, required financial efforts from both the Union and the countries that have joined.

These difficulties have not prevented successive enlargements of the Community construction since the new EU Member States were consistently pursuing its objectives.

Thus, at the accession of Portugal and Spain, the European Commission led by Jacques Delors has developed a White Book which set out a timetable for steps to complete the single market by 31 December 1992.[3] Moreover, in the second half of 1985 were held the Intergovernmental Conference which finalized the Single European Act (signed in February 1986) by which the European Communities have committed to adopt measures for the internal market as a central element of building a strategy to revive the community. Also, the adoption of Single European Act has been a crucial step in shaping EU environmental policy, economic and social cohesion, research and technological development or social problems.[4]

In the early '90s, along with the completion of the internal market and in line with ambitious ideas promoted by the Single European Act, European policymakers have considered that revisions to the treaties were necessary to meet the priorities and challenges facing the European Community. These concerns were reflected in the Treaty of Maastricht (Treaty on European Union - TEU), which summed up the efforts made in the two intergovernmental conferences aiming to finalize the text of a Reform Treaty, namely "political union" and "the economic and monetary union".

Given the fairly significant costs of previous enlargements and the costly experience of Germany reunification[5], the EU has maintained the policy of opening to other countries (developed in art. 49 TEU), but imposed some conditions that a State had to meet to join the Union. Consequently, the Copenhagen European Council (June 1993), defined the criteria that candidate countries must fulfill to become EU members; they are referring to: the stability of institutions guaranteeing democracy, rule of law, human rights, respect for and protection of minorities (political criterion), the existence of a functioning market economy and the ability to cope with competitive pressure and market forces within the European Union (economic criterion), the ability to assume

[1] This situation was provided both in ECSC Treaty (Article 98), EEC Treaty (Article 237) and EAEC Treaty (Article 205).

[2] The accession of Bulgaria and Romania to the European Union is not considered as a separate wave of enlargement, but a complement to the fifth wave which began in 2004.

[3] Completing the Internal Market - 14/6/1985, COM (85) 310.

[4] Dan Vătăman, *History of the European Union* (Bucharest: Pro Universitaria Publishing House, 2011) 38-39.

[5] On 28th April 1990, it was held a special European Council in Dublin (Ireland) where they agreed upon a common position on German unification and the Community relations with countries in Central and Eastern Europe. Following the reunification of the two German states, the German Democratic Republic was included in the European Communities on 30th October 1990, without being regarded as a new member, but only as a result of unification.

obligations of EU membership, including the aims of political, economic and monetary union (criterion concerning adoption of the *acquis communautaire*)[6].

Even if these conditions were imposed, the EU commitment to enlargement is demonstrated by the fact that alongside with the efforts to refocus and restructure the community construction, there were ongoing negotiations for the fourth EU enlargement, concluded with Austria, Finland and Sweden (January 1st, 1995).

To implement the decisions taken at Copenhagen and to maintain the momentum of the integration process, it was needed to outline a realistic strategy that will help interested states to join the European Union to prepare for accession and to strengthen their capacity to assume the responsibilities of a Member State. As a result, the Essen European Council (December 1994) reaffirmed the need for a multilateral framework for dialogue and consultations, and in this regard, adopted a pre-accession strategy designed to prepare countries which had signed an association agreement with EU to obtain membership.

Given that in the following period a number of countries have applied for accession to the European Union, the prospect of an unprecedented scale of expansion generated discussions about the entire configuration of European integrationist approach, both in terms of institutional structure and the other Community policies, which required amendment of the Community Treaties. To adopt the changes to be made on 29th March 1996 in Turin, it was opened an Intergovernmental Conference, its negotiations focusing, among other things, on reforming EU institutions in order to make them more democratic and more efficient in terms preparations for EU enlargement that would include countries in Central and Eastern Europe, as well as Malta and Cyprus.

Also, the Dublin European Council (December 1996) adopted a new improved pre-accession strategy, addressed to all the candidate countries of Central and Eastern Europe that exploited both instruments existing at that time (the Europe Agreements, the White Book on the internal market, structured dialogue and PHARE program) and a new instrument representing the cornerstone of the strategy - the accession partnerships.

With the adoption of the Treaty of Amsterdam, it was conducted a reform of the EU in light of EU enlargement. Moreover, based on the Commission views on the expansion and the readiness of each candidate, contained in Agenda 2000[7], the Luxembourg European Council (December 1997) outlined the task for the coming years, namely preparing candidate countries for EU membership and the Union Enlargement.

Given the dynamics of community building, the Helsinki European Council (December 1999) confirmed the importance of the enlargement process to ensure stability and prosperity in Europe and decided to convene an intergovernmental conference as early as February 2000, to raise questions on further enlargement of the Union, namely: the size and composition of the distribution of votes in the Council, a possible extension of qualified majority decisions and other aspects of the Community institutions resulting from the Treaty of Amsterdam. The European Council also reiterated that the fulfillment of the Copenhagen political criteria is a precondition for opening accession negotiations.

By the adoption of the Treaty of Nice (considered essential for enlargement) it was performed an institutional reform aimed at ensuring the proper functioning of an enlarged Union of 27 Member States; the three-pronged institutional reform aimed at: the composition and functioning of European institutions, the decision-making by the Council of Ministers and the strengthening of cooperation between institutions. Thus, the Treaty of Nice has prepared future EU enlargement, the implementation stake of such process consisting in reforming the functioning of the Union.

---

[6] Conclusions of the Presidency - Copenhagen, June 21-22 1993, SN 180/1/93 REV 1

[7] "Agenda 2000" was published in July 1997 and relates to future EU policies, EU enlargement, and the EU's financial perspectives for 2000-2006. The document is attached to the Commission's views, based on the Copenhagen accession criteria, the applications for membership made by Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia and Slovenia.

The next important step towards European integration was made at the Copenhagen European Council meeting (December 2002), on which occasion were concluded accession negotiations with Cyprus, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Republic Slovakia and Slovenia, these countries being invited to join the EU on May 1st, 2004. On the same occasion, the European Council stressed that the successful conclusion of accession negotiations with ten candidate countries leads to a new dynamism to the accession of Romania and Bulgaria as part of the same inclusive and irreversible enlargement process and also showed that, depending on future developments in the application of membership criteria, the objective is to welcome in 2007 Romania and Bulgaria as EU members.

After the fifth enlargement of the Union (held in two stages: May 1st 2004 and January 1st , 2007) the number of Member States increased to 27, which caused the need for a new amending treaties which will provide the European Union modern institutions and optimized working methods to tackle effectively the challenges today. This was the objective of the Treaty signed at Lisbon on December 13th 2007. Thus, taking into account the political, economic, social changes and desiring the same time, to meet the aspirations and hopes of the Europeans, the Lisbon Treaty established the EU's powers and means that can be used and modified the structure of institutions and their operation.

3. The current enlargement of the European Union

In an enlarged European Union of 27 Member States, convinced that the successive enlargements have been a success both for the European Union and the Member States which acceded to it, thus contributing to stability, development and prosperity throughout Europe, the leaders of Member States considered that this process must continue, ensuring the success of future enlargement of the Union, for a better response to the many challenges they face.

Currently the EU enlargement process is ongoing, with five candidate countries: Croatia, Former Yugoslav Republic of Macedonia, Iceland, Montenegro, Turkey and four potential candidate countries: Albania, Bosnia and Herzegovina, Serbia and Kosovo.

3.1. The main challenges in the process of European Union enlargement

3.1.1. Overcoming the economic crisis

The economic crisis has affected all countries involved in the enlargement process. However, the impact was different according to each country's economic structure. Albania, Kosovo and the Former Yugoslav Republic of Macedonia were the least affected, because their economy depends to a lesser extent by exports and domestic markets faced their crisis. By contrast, Croatia, Serbia and Turkey, which are more integrated on the global market, were heavily affected. Montenegro was severely hit, due to its dependence on external financing and few sectors. In Bosnia and Herzegovina the impact of the crisis has been exacerbated by pro-cyclical fiscal policies with a high share of subsidies and social transfers in the budget.

Although the Western Balkan countries have implemented fiscal austerity measures, including rebalancing the budget, they were not sufficient to prevent a widening of budget deficits; Iceland, Serbia, Kosovo and Bosnia and Herzegovina were forced to rely on support from International Monetary Fund (IMF). In these circumstances, the Union has provided support to mitigate the impact of the crisis, the IPA[8] assistance being reprogrammed to support investment in infrastructure and competitiveness.

[8] Financial assistance under the Instrument of Pre-accession Assistance (IPA) is designed to help candidate countries and potential candidates in their efforts to meet accession criteria, to align with EU policies and standards and to foster socio-economic development.

According to the enlargement strategy presented by the European Commission[9] to achieve sustainable growth rates and real convergence, there will be required further structural reforms and prudent fiscal policies. Internal sources of growth should be exploited more effectively, in order to improve productive capacity, job creation and competitiveness, being necessary to increase the volume of domestic and foreign investment in new projects ("greenfield"), particularly in export-oriented activities. To increase the volume of domestic and foreign investment, governments must improve the business environment, this means increasing the efficiency of public administration and the independence of judiciary, removing informal barriers to trade and strengthening the rule of law. Ensuring sound and sustainable public finances is crucial for the countries involved in the enlargement process, which is an essential part of preparation for accession to the European Union. Recent experience has demonstrated the interdependence of European economies and the destabilizing potential of major macroeconomic imbalances, even in the small economies.

3.1.2. Social inclusion

The economic crisis had a negative impact on social welfare in the countries involved in the enlargement process, vulnerable groups, including minorities, disadvantaged communities and persons with disabilities, were particularly affected.

Therefore, the European Commission is committed to assisting countries involved in the enlargement process in efforts to improve the living conditions of vulnerable groups, including the economic and social inclusion of gypsies. In this regard, the Commission provides substantial support of IPA assistance for vulnerable groups through education and employment services to strengthen employment and social services in order to integrate disadvantaged people into the labor market. The Commission also finances the modernization of gypsies living in camps. This support will be strengthened to improve living conditions in the countries most affected, helping them to adopt a comprehensive approach to issues of social inclusion. In the case of Croatia, it has already been signed a Joint Inclusion Memorandum, thus offering a framework for action in this area.

The countries involved in the enlargement process have adopted some measures to address the problems outlined above, but further efforts are needed in this regard, those States must consider the establishment of explicit and ambitious goals in terms of employment, education and poverty reduction in disadvantaged communities, particularly in the case of gypsies.

3.1.3. Strengthening the rule of law and public administration

Strengthening the rule of law, particularly the judiciary system, and combating corruption and organized crime is a crucial challenge for most countries involved in the enlargement process. Thus, tangible results that will provide lasting improvements in the rule of law are an important element to move to the next stages of the process of the EU accession process.

The renewed consensus on enlargement, on which the European Council agreed in December 2006, requires that the rule of law issues to be addressed in an early stage of the accession process. Therefore, full priority has been given to the treatment of these issues and to the use of all the instruments available; the use of benchmarks in the accession negotiations are an important catalyst for reform and sending a clear message regarding the need to address seriously, issues of rule of law before accession. Given the importance of strengthening the rule of law, the EU has closely monitored the progress of the candidate or potential candidate, particularly through joint bodies established by the Stabilization and Association or Interim Agreements and evaluation missions.

3.1.4. Freedom of expression and media

Freedom of expression and of the media, which is an integral part of any democratic system, remains a concern in most countries involved in the enlargement process. Therefore, this issue requires an urgent solution; emphasis should be put on areas such as legal framework and its conformity with European standards, especially with regard to defamation, the appropriate

[9] Communication from the Commission to the European Parliament and the Council - COM (2010) 660 final, *Enlargement Strategy and main challenges 2010-2011*, Bruxelles, 9.11.2010.

prosecution of all cases of attack on journalists, creating self-regulatory bodies and their contribution to enhance professionalism, public service broadcasting role in pluralistic democracies, cross-border networks to improve the flow of reports throughout the region, thus contributing to better mutual understanding.

3.1.5. Reconciliation, regional cooperation and bilateral issues in the Western Balkans

In the last decade, Western Balkan countries have made substantial progress in terms of stability and regional cooperation, however, a number of problems stemming from conflicts in the region remain unresolved and affect both the internal workings of states and the relations between them. Therefore, the European Union is working with parties in the region to overcome these problems, with the conviction that lasting reconciliation requires efforts at all levels (of government, the judiciary and civil society), reconciliation is linked also to solving problems related to poverty and social exclusion.

Reconciliation is closely related to regional cooperation, which helps to maintain good neighborly relations and an environment ready to address outstanding bilateral issues. Also in the Western Balkans, regional cooperation is crucial for economic development and to identify solutions to common problems, such as organized crime, border management, climate change and environmental pollution. Moreover, regional cooperation is essential to record progress towards EU accession in areas such as public safety, energy, transport. Regional cooperation has been hampered by differences over Kosovo, which affected, in particular the functioning of CEFTA, the extension of the Pan-Euro-Med system of diagonal cumulation and the signing of the Transport Community agreement. Also, a number of other bilateral issues remain unresolved, such as the problem between Greece and the Former Yugoslav Republic of Macedonia on the name of the country.

3.2. Progress in countries involved in accession to the European Union

3.2.1. Candidate countries

a) Croatia

Croatia has made steady progress towards meeting the accession criteria for the accession negotiations have reached the final stage. As regards economic criteria, Croatia is a functioning market economy which should be able to cope with competitive pressure and market forces within the Union, provided that it vigorously implements its comprehensive reform program to reduce structural weaknesses. Regarding the *acquis* criteria, Croatia has made good progress, of the 33 chapters opened for accession negotiations it provisionally closed 25.

Croatia has had positive results as regards the conditions for concluding the negotiation chapters with financial implications[10], however, efforts are still needed to fully establish the necessary administrative structures to manage and control funds. Also, Croatia has to meet the benchmarks that need to be met in order to close a chapter, in particular as regards the judiciary and fundamental rights, including combating corruption, as no longer necessary for the EU to consider imposing any cooperation and verification mechanism after the accession.

b) Former Yugoslav Republic of Macedonia

Former Yugoslav Republic of Macedonia continues to meet sufficiently the political criteria and, as a result of reforms in 2009, there were further progress, albeit in an uneven pace in the reform of Parliament, the police, the judiciary system, public administration and protection of minorities. Former Yugoslav Republic of Macedonia must continue to make progress on the dialogue among political actors to reform the judiciary and public administration, fighting corruption, freedom of expression and to improve the business environment. It is also essential to maintain good neighborly relations and finding, under the UN umbrella, a negotiated solution accepted on both sides of the

[10] Agriculture and rural development, Regional policy and coordination of structural instruments, Financial and budgetary provisions.

country's name issue[11]. Since the Former Yugoslav Republic of Macedonia has continued to fulfill its commitments to its obligations under the Stabilization and Association Agreement (SAA) in October 2009, the Commission proposed to move to the second stage of association, namely the opening of SAA accession negotiations, but so far the Council had not yet taken a position on the Commission's recommendation.

c) Iceland

Considering that Iceland has a long tradition in terms of democracy and good governance, and the fact that this country is a member of the European Economic Area (EEA) of 1994 and the Schengen Area in 2001, was launched in 2010 the accession process with Iceland. Thus, following the Commission's recommendation made in its opinion of 24 February 2010, the European Council decided on June 27th, 2010, the opening of negotiations with this state, the first intergovernmental conference on Iceland's accession to the European Union taking place in Brussels on July 27th, 2010.

The first progress report from Iceland confirms the information contained in the opinion of Iceland in February 2010 according to which Iceland fulfills the political criteria, being a functioning democracy with strong institutions and deep-rooted traditions of representative democracy. The judiciary system in this country is strengthened, and the magistrates have a very high level. As regards human rights and minority protection, Iceland continues to respect fundamental rights and ensure a high level of cooperation with international mechanisms aimed at protecting human rights. The opinion, however, identified a number of problems, but the report confirms the fact that Iceland has taken measures to solve them.

Also, progress has been satisfactory in terms of further improving the legal framework on conflicts of interest and political party financing. Have been modified the norms for the appointment of judges, to a greater consolidation of judicial independence. Important steps have been taken to stabilize the economy. There has been progress in terms of enhancing the recovery of public finances and financial system. The International Monetary Fund programme is on track. However, there remains uncertainty and economic challenges. Iceland will have to meet its obligations, such as those identified by the EFTA Surveillance Authority (ESA) under the European Economic Area Agreement. Significant efforts are needed as well, to ensure that citizens of Iceland are adequately informed on the implications of EU accession.

d) Montenegro

Montenegro has made progress towards meeting the political criteria set by the Copenhagen European Council in 1993 about the stability of institutions guaranteeing democracy, rule of law, human rights and respect for and protection of minorities and on the conditions of the Stabilization and Association, however, further efforts are needed.

As regards economic criteria, Montenegro has achieved a certain degree of macroeconomic stability. However, to become a functioning market economy, Montenegro needs to eliminate internal and external imbalances and weaknesses, particularly in the financial sector and in the functioning of markets, and strengthen the rule of law. To cope with competitive pressure and medium-term market forces within the Union, Montenegro needs to strengthen its physical infrastructure and human capital and to continue implementing structural reforms. Overall, the balance of Montenegro regarding the implementation of its obligations under the Stabilization and Association Agreement (SAA) is positive, which is why, on 9th November 2010; the Commission adopted its Opinion on the request of Montenegro Accession to the European Union. In this opinion, it shows that Montenegro would have an overall limited impact on EU policy and would not affect the Union's ability to maintain and deepen the development, which is why the Commission recommended the Council to grant candidate country status of Montenegro. On

[11] The name issue, on which there are differences of opinion with Greece, remain unresolved. The two countries under UN had talks to solve this problem and held a series of bilateral contacts, including the level of prime ministers, but the momentum created by taking these actions has not yet led to concrete results.

December 14th, 2010 Council submitted a number of conclusions on enlargement, which were adopted at the European Council meeting of 16-17 December 2010, an occasion on which was agreed to grant Montenegro the candidate country status.

e) Turkey

Although Turkey has long been involved in the process of accession to the European Union, the pace of progress in meeting the requirements of membership is very low. Accession negotiations have moved on, even if slowly, reaching a demanding stage in which Turkey should intensify its efforts to meet the established conditions.

As regards political criteria, according to reports on Turkey's progress, constitutional reforms adopted on 12th September 2010, there have been created the necessary conditions for progress in a number of areas, such as the judiciary system and fundamental rights. These changes correspond to the Accession Partnership priorities; however, drafting and adoption of constitutional reforms were not preceded by a consultation process which will be attended by political parties and civil society in general. It is therefore essential to implementing this package of amendments in accordance with European standards and in a transparent manner with participation of all stakeholders.

As regards economic criteria, the European Commission found that Turkey is a functioning market economy, which should be able to cope with competitive pressure and medium-term market forces within the Union, provided they continue to implement its comprehensive reform program to eliminate structural weaknesses. Overall, Turkey has improved its ability to assume the obligations of membership, making progress, sometimes uneven, in most areas. Thus, alignment is advanced in some areas, such as free movement of goods, intellectual property, antitrust, energy, enterprise and industrial policy, consumer protection, statistics, trans-European networks, and science and research. Efforts to align must be continued in such areas as environment, company law, public procurement, establishment and free movement of services. It is also very important for Turkey to improve in most areas, the administrative capacity for implementing the *acquis* criteria.

Regarding regional issues and international obligations, Turkey has continued to publicly express their support to the negotiations taking place under the UN between the Greek and Turkish Cypriot community leaders to address global Cyprus problem, however, there have not been achieved progress in the normalization of bilateral relations with Cyprus. Despite calls launched by the Council and the Commission, Turkey has not complied with their obligation to implement fully and without discrimination to the Additional Protocol to the Association Agreement and has not removed all obstacles to free movement of goods, including restrictions on direct links transport to Cyprus. For this reason, the Commission recommended continuation of the measures adopted in December 2006 the EU Council, which decided not to open eight relevant negotiating chapters[12], and not to close temporarily any other chapter, so long as Turkey will not meet their commitment[13].

3.2.2. Potential candidates for membership

a) Albania

Albania has made progress towards meeting the criteria set by the Copenhagen European Council in 1993 about the stability of institutions guaranteeing democracy, rule of law, human rights and respect for and protection of minorities, and on the conditions of the Stabilization and Association , however, considerable efforts are still needed.

As regards economic criteria, Albania has achieved a certain degree of macroeconomic stability. However, to become a functioning market economy, Albania should continue to strengthen governance, improve labor market performance, to ensure recognition of property rights and strengthen rule of law. To cope with competitive pressure and medium-term market forces within the

[12] The eight chapters are: free movement of goods, right of establishment and freedom to provide services, financial services, agriculture and rural development, fisheries, transport policy, customs union and external relations.

[13] COM (2010) 660 final

Union, Albania needs to strengthen its physical infrastructure and human capital and make further structural reforms.

Overall, Albania's balance sheet in terms of implementing its obligations under the Stabilization and Association Agreement (SAA) is positive, which is why, on 9th November 2010, the Commission adopted its Opinion on the application Albania Accession to the European Union. This opinion shows that Albania would have limited overall impact on EU policy and would not affect the Union's ability to maintain and deepen the development. Accordingly, the Commission considered that it should open negotiations with the European Union in Albania when the country will have reached the required degree of compliance with membership criteria, particularly the Copenhagen political criteria which require stability of institutions guaranteeing especially democracy and the rule of law.

b) Bosnia and Herzegovina

Bosnia and Herzegovina has made limited progress in addressing the political criteria, and recorded some progress on the rule of law, mainly in areas such as border management and migration policy as a result of reforms to meet the requirements for visa liberalization. Also, important steps were made to promote reconciliation and regional cooperation, particularly with regard to refugee return. However, overall, the application of reforms was insufficient and internal political climate of pre-election period was dominated by nationalist rhetoric. The lack of a shared vision of political leaders regarding the direction to which the country is heading, blocks key reforms and prevents further progress towards European Union.

Consequently, Bosnia and Herzegovina should speed up its efforts to achieve a satisfactory balance on the implementation of the provisions of the Interim Agreement. Also, Bosnia and Herzegovina should immediately take the first steps to align its constitution to the European Convention on Human Rights (ECHR) and to improve efficiency and functioning of its institutions. However, this country should be able to adopt, implement and enforce EU laws and standards. Overall, the implementation of the Interim Agreement has been uneven.

Bosnia and Herzegovina were in violation of the agreement as a result of non-compliance with the European Convention on Human Rights regarding the right to equal treatment without discrimination and failure to establish a monitoring authority on state aid. As a result, the Commission stressed that further strengthening of administrative capacity is needed in order to achieve satisfactory results in applying the Stabilization and Association Agreement (SAA).

c) Serbia

Serbia has made progress towards meeting the Copenhagen criteria and also has made further progress in fulfilling its obligations under the Stabilisation and Association Agreement (SAA). Regarding regional issues and international obligations, Serbia has made great strides in terms of reconciliation in the region, particularly with Croatia and Bosnia and Herzegovina.

Serbia has continued to participate actively in regional initiatives such as Process of Cooperation in South-East Europe Cooperation Process (SEECP), the Regional Cooperation Council (RCC) and the Central European Free Trade Agreement (CEFTA. However, regional cooperation was affected by lack of agreement between Serbia and Kosovo in connection with regional meetings. As a result it must be agreed as soon as possible on an acceptable and viable solution for the participation of both Serbia and Kosovo in regional fora, this thing being essential for a functional Regional cooperation.

As regards the economic criteria, further progress to establish a functioning market economy was limited, which is why Serbia should make more efforts in restructuring its economy in order to meet the medium term, competitive pressure and market forces EU market.

d) Kosovo

With regard to paragraph 17 of resolution 1244 adopted by the UN Security Council, where the Council welcomes the work of the European Union and other international organizations to adopt an integrated approach to economic development and stability in the region affected by the crisis in

Kosovo, the European Council in Brussels on 14th December 2007 stressed that the EU is ready to play a leading role in strengthening stability in the region in accordance with its European perspective, and in the implementation of a solution to define the future status of Kosovo. After Kosovo declared its independence (February 2008), the EU Council took note of the declaration of independence and stressed that each EU member state will decide whether to recognize the new state[14]. However, the EU Council Joint Action 2008/124/CFSP[15] adopted by the European Union mission was set up a Rule of Law Mission in Kosovo - EULEX KOSOVO, designed to assist the Kosovo institutions, the judicial authorities and the law enforcement bodies in their progress towards sustainability and accountability and to continue developing and strengthening an independent multiethnic justice system and a multiethnic police and customs system, ensuring that these institutions are free from political interference and adhering to internationally recognized standards and best European practices.

European Council in Brussels on 19th -20th June 2008 reaffirmed the European Union leading role in ensuring stability in Kosovo, recalling its readiness to assist economic and political development of Kosovo through a clear European perspective, in accordance with the European perspective of the region. On the same occasion, the Heads of State or Government of EU Member States have welcomed Kosovo's commitments on the principles of democracy and equality of all citizens, protection of minority Serb and other minorities, religious and cultural heritage conservation, and international presence.

As it is evident from the enlargement strategy presented by the European Commission[1], Kosovo has made progress lately in terms of political criteria. It has strengthened its commitment to European policy, the reform agenda and it established a ministry for European integration. However, important challenges remain in terms of public administration reform and the rule of law, including the judiciary system. Additional efforts need to be done to combat corruption, organized crime and money laundering. Dialogue and reconciliation between communities and the protection and integration of minorities, particularly Kosovo Serbs continue to be areas on which there are persistent concerns.

As regards economic criteria, Kosovo has made limited progress towards establishing a functioning market economy, so there must be carried out reforms and investments to enable the country to cope with long-term competitive pressures and market forces within the Union. Progress in aligning the legislation and policies in Kosovo, to European standards continue to be uneven. The legal framework was further developed in the fields of customs, taxation, and free movement of goods, statistics, migration, education and combating terrorism. Approximation is in its infancy as regards competition, intellectual property, environment, agriculture and food security, integrated border management, asylum, money laundering and protection of personal data. Alignment to European norms remains limited in the field of employment and social policies, financial control, drug trafficking, human trafficking and organized crime.

4. Conclusions

After nearly six decades of evolution marked by five successive waves of enlargement, the European Union today is a successful model based on values of respect for human dignity, freedom, democracy, equality, rule of law and respect for human rights, values were common to the Member States in a society characterized by pluralism, nondiscrimination, tolerance, justice, solidarity and equality between women and men.

[14] Kosovo unilaterally declared independence was not recognized by five European Union member states: Cyprus, Greece, Romania, Slovakia and Spain.

[15] Official Journal of the European Union L 42/92 of 16.2.2008.

Significant benefits in terms of security and prosperity that flow from EU member states have determined over time a number of European countries to want to get integrated, the prospect of integration helping them to engage in comprehensive reforms to fulfill conditions imposed by pluralistic democracy and market economy.

Convinced that the extension also serves the interests of the Union and those of the countries wishing to join, thus contributing to stability, development and prosperity throughout Europe, European policymakers have considered that the enlargement process must continue, but not in any conditions. In this regard, states involved in the accession process should take political and economic reforms, the goal being to bring these countries to the European standards in all areas covered by the treaties on which the EU, which would support the Union in achieving their objectives in a number of key areas for economic recovery and sustainable growth, such as energy, transport, environmental protection and efforts to tackle climate change.

Thus, the European Union showed openness to the idea of joining of any democratic European country, which has a market economy and administrative capacity to manage the rights and obligations arising from membership. For the future EU enlargement to be successful, the candidate and potential candidate applies a rigorous set of conditions, their possible accession date depending on progress in political and economic reforms, each country being judged on its own merits. Moreover, success depends on winning the enlargement policy support from citizens of both the EU Member States and of the candidate and potential candidate countries being essential for the public to have confidence that future accessions are well prepared and that they are subject to rigorous conditions.

Overall, the future enlargement of the European Union depends mainly on the demonstrated ability of countries wishing to accede to assume obligations of membership, requiring sustainable reforms, and legislative and credible and convincing institutional adjustments.

As a result, the transition to the next stages of the accession process will be achieved when the countries concerned will meet established standards, including those related to democracy, the rule of law and fundamental rights and freedoms.

CONSIDERATIONS UPON ASSIMILATED ADMINISTRATIVE ACTS

MARTA CLAUDIA CLIZA *

Abstract
Although the classic administrative courts know as object the acts against classic administrative acts, it should not be lost sight of the assimilated administrative acts, which also may be subject to acts in this litigation. Taking in consideration this category of acts, this study will examine the documents falling into this category and the impact that such acts have on public authorities. Given the significant increase of administrative cases that have as object assimilated administrative acts and the way the public authorities acts with power abuse, violating the rights of citizens, the importance of the juridical control over assimilated acts can not be denied any more.

Keywords*: administrative acts, assimilated administrative acts, unjustified refusal, Administrative Court Law.*

1. Introduction

This study intends to draw attention upon the administrative court act subject to assimilated administrative acts, as a species of administrative acts. If as regards the administrative court acts aiming at administrative acts we find a lot of information on the theoretical level, but also at the jurisprudential level, acts subject to assimilated administrative acts are less approached and analyzed by the doctrine, for which reason we consider as appropriate a study on this subject. Because, why should we not admit it, the government inaction in responding to citizens must be penalized in the same way as the illegally issued document, both being dimensions of violating the principles of administrative acts legal regime, as well as of legality and opportunity.

2. Theoretical and practical considerations on assimilated administrative acts

In the specific language of the administrative court, when we talk about assimilated acts, we originally consider the unjustified refusal to settle a claim, which would represent an explicit expression, with abuse of power, of the will not to solve the request of a person; it is assimilated to the unjustified refusal and non-enforcement of the administrative act issued as a result of the favorable resolution of the request or, where appropriate, of the prior complaint [art. 2, paragraph 1, letter i) of Law no.554/2004 of the administrative court]. As non-settlement of an application within the legal deadline, it is part of the assimilated administrative acts, a result of assimilating an administrative deed, by the consequences produced to an administrative act due to the effects of injury to a subjective right or legitimate interest. In the theory, these two forms of assimilated administrative act are also treated by the phrase administrative silence and lateness.

3. Special mentions on Law no. 554/2004, as amended, regarding the concept of administrative act

In our legal literature, discussions on administrative act are old and varied, beginning with issues of terminology and ending with content elements of the applicable legal regime. For example, in an essay substantiated by Prof. Tudor Draganu, in his monograph of 1970[1], the concept of

* Lecturer Ph. D., Faculty of Law, "Nicolae Titulescu" University, Bucharest, ROMANIA, (e-mail: cliza_claudia@yahoo.com).

[1] T. Drăganu, *Administrative acts and assimilated deeds subject to judicial review, according to Law no.1/1967*, (Dacia Publishing House, Cluj-Napoca, 1970).

administrative act is to be used to evoke the express manifestation of will in order to produce legal effects, while refusing to settle, i.e. unjustified refusal, as well as the administration silence would have only the meaning "***assimilated deeds to administrative acts***". Other theorists, opinion to which has also been rallied one of the authors of this paper (Prof. Antonie Iorgovan), prefers to speak of typical administrative acts and atypical administrative acts, the essays being attested by the regulations issued in recent years[2]), which, according to Western models[3], assimilates the public administration silence with tacit approval.

In this context, we mention that ***French administrative law stipulates***[4], in principle, that ***silence of administration is equivalent to a refusal***: at the expiry of a two months period[5], the silence of administration notified by a request silence is assimilated with the issuance of a default refusal decision, against which it is possible to promote an appeal for abuse of power[6]. That period of two months - a common- law term - may be also replaced with other terms. Moreover, in a certain number of situations, silence is assimilated to a default acceptance decision[7].

French Constitutional Council estimated that the rule of administrative silence, which amounts to a tacit rejection, is a general principle of law, while the Government Council has refused such quality[8].

Compared to these legislative realities, the new Administrative Court Law in our country gives a ***broad definition*** to the notion of an administrative act, introducing in its scope, along with the specific unilateral manifestation of will (***typical administrative act***) and silence, which is the unjustified refusal (***atypical administrative acts***) .

Moreover, the commented law assimilates, as regards the legal nature of the dispute, administrative acts and certain ***administrative contracts***, expressly mentioned, being a matter of contracts signed by public authorities dealing with the evaluation of public assets, the execution of public works, provision of public services, public procurement.

In addition, Art. 2, 1st paragraph, letter c) of Law no. 554/2004, as amended, states that by special laws may also be provided other administrative contracts subject to the administrative courts jurisdiction.

4. The notion of unjustified refusal and the concept of power abuse.

In our legal literature it has been often used the concept of "unjustified refusal", but it has not been outlined a clear definition of it. Since the legislator did not dared to perform it, a specific meaning has been required in the practice of the administrative courts. Instead, the notion of "abuse

of power", it appears in our doctrine as a key- concept in a monographic research, only in the last decade.[9]

Law no. 554/2004, as amended, understood to relate the notion of unjustified refusal of the power abuse concept.

The abuse of power occurs when the administration has assessment right, when the law allows it to adopt a solution from several possible ones, issue discussed in our literature since the Second World War under the form " opportunity of administrative acts". Hence, the known dispute between the Cluj School of Prof. Tudor Drăganu and Bucharest School of Professor Romulus Ionescu on the idea "opportunity is a condition of validity of the administrative act, along with legality, or is it a dimension of legality?"

Beyond the theoretical disputes, compared to the principles established by art. 16 2nd paragraph of Constitution, it is not conceivable to exercise the right of assessment beyond the law. As government seeks to provide more efficient public services for "those administered", it is inherent that the limits of its assessment right are given precisely by the limits of the rights of citizens, provided by Constitution and law. Where the right of the citizen begins is the point where it finishes the assessment right of administration. Issuance of an administrative according to the assessment right, but by infringing one right, for example, ownership of a citizen, is, of course, an abuse of law, which is an excess of power.

On this direction of ideas, the High Court of Cassation and Justice held that[10] in a constitutional state, the discretionary power granted to public authority can not be regarded as an absolute and unrestrained power, whereas the exercise of assessment right by violation of the rights and freedoms of the citizens, provided by the Constitution or law, constitutes abuse of power, in accordance with the provisions of art. 2 of the Administrative Court Law. Concurrently, the Supreme Court noted that the opportunity expresses an element of legality, which derives from the ability of the issuing authority to choose between several possible solutions the one that best matches the will of the legislator. Therefore, even if the legislator uses phrases meaning the discretionary power of the administration (for example: "is able", "is allowed", "it should"), it can not be interpreted as a freedom beyond the law, but one within its limits[11].

Both national and community courts do not exclude the control of judicial power over administrative acts issued within the margin of freedom granted to public authorities, often the error showed by the assessment or non-reasonableness being used by judges within a minimum control of discretionary power held by the Authority.

---

[10] Decision no. 4868 of 14.12.2007 pronounced by ICC] - Department of Administrative and Fiscal Court (unpublished).

[11] In the test case subject to trial, it was considered the existence or not of a granting right of a professional rank. On this issue, the Constitutional Court ruled that the text of art. 73 paragraph (3) of Law no. 360/2002 provides that, upon termination of employment, in case of cumulative fulfillment of several conditions, the police chief commissioners should be granted the professional rank of police quaestors. The constitutional court considered that such commissioners have only a vocation and not a right which they automatically enjoy and competent public authorities are entitled, not obliged to grant such professional rank. The same Court noted that obtaining and providing superior military or professional rank is not a fundamental right provided by the Constitution and does not require a corresponding obligation for the authorities. Based on these considerations, the administrative court considered that following the interpretation of the legal text under discussion, there is no any right to benefit those in the area of its addressability. On the other hand, the High Court pointed out that the interpretation given to the phrase "it may be granted" means exactly the discretionary power of the public authority, which, as previously stated, may not exceed the limits of legality. In other words, the managed people have the legitimate vocation and interest in the fair application of the assessment right of administration and may, in their turn, require the punishment of the misuse or misapplication of discretionary power. In this case, the High Court considered that the court of first instance had to obliged the authority to motivate its option within the legal permissiveness provided by art. 73 paragraph (3) of Law no. 360 / 2002 and to show whether the appellant-plaintiff meets or not the legal requirements materialized in order to be proposed.

However, in order to perform an audit of the administrative act issued within the margin of freedom granted by the legislator to the issuing authority, such act must contain the reasons for choosing one of the options allowed by the legislator.

A breakdown of reasons is also required when the issuing authority has a broad assessment power, as motivation gives transparency to the act and that individuals can check if the document is fundamentally correct.

Not every refusal to favorably resolve a request is an unjustified refusal; the refusal is unjustified only when it is based on the excess of power.

A simple letter from the issuing authority, by which the petitioner is notified that his request was not favorably resolved, is not "proof" of unjustified refusal. However, "the proof" must result from reasoning, if it is communicated to the applicant. Moreover, these notices related to the position of public authority is to be subject to the rules of evidence to be given before the administrative court.

We remember, however, that in case of an unjustified refusal, we must face an express statement of the position of public authority to which the request was addressed, so in the presence of an authentic notification, on the one hand, and on the other hand the refusal to settle favorably the request should be based on overcoming the limits of assessment rights, which is the excess of power. It is understood that only the court will ultimately decide, following the settlement of substance of administrative proceedings, whether the refusal to settle favorably the applicant's request was really an unjustified refusal; until now, that refusal appears as unjustified only in the opinion of the petitioner, the rule outlining this definition helping him to make an assessment as close to reality as possible. However, the existence of this concept is not without practical relevance, because once the unjustified refusal has been proven, the action is to be admitted in whole or in part. Motivation of court decision must state the reasons for which the refusal of the administrative authority appears unjustified, according to the competent court. Proof of the unjustified refusal is the evidence of the administration guilt and (legal nature of contested act when action is subject to an individual administrative act, being a matter of the unjustified refusal to revoke or amend the contested action. In such cases, practically, it is attacked a proper administrative act (typical act) and not an atypical administrative act (unjustified refusal).

If the object of application to administration is represented exactly by the request for issuing an administrative act, for example, an authorization and the public authority unjustifiably refuses to issue such act, in the administrative court, logically, it will be attacked only the atypical administrative act (refusal). The court, if it considers that the refusal is unjustified, by a disposition it shall require the defendant authority to issue the administrative act (authorization), possibly within a certain deadline and with the sanction of a fine for the head of the administrative body for each day of delay.

Last, but not the least, it should be noted that Law no. 262/2007 has extended the scope of the concept of "abuse of power", since it has provided that it means to exercise the assessment right of the public authorities, by violating the limits of competence provided by law or by violation of the rights and freedoms of citizens[12].

Therefore, we must stress the idea that any right or freedom of the citizens, stipulated by law, should be considered when reviewing an excess of power and not just a fundamental right or freedom, as was stated in the previous regulation.

On the other hand, the novelty brought by Law no. 262/2007 in defining the analyzed concept is represented by the inclusion within its scope of the exercise of assessment right of public authorities by violating the limits of legal competence.

In addition, the Romanian legislator has changed its optics as regards the concept of "unjustified refusal to settle a claim" by inserting therein the situation of non-enforcement of

[12] See art.2 paragraph.(1) letter n) of Law no..554/2004, as amended.

administrative act issued following the favorable resolution of the application or, where appropriate, of the preliminary complaint. [13]

Consequently, the assumption of non-enforcement of an administrative act issued by the public authority, in response to petitioner's request, was classified in the notion of unjustified refusal.

In addition, we can detach the two sides of the unjustified refusal, which are also maintained under the new administrative court law, namely the unjustified procedural refusal (namely the refusal to reasonably respond to the citizen's request) and substantially unjustified refusal (namely refusal to favorably resolve the citizens request). The problem of the relationship between unjustified refusal, subjective right and the excess of power appears only in this latter situation.

From the practice of the High Court of Cassation and Justice Decision, it draws the attention Decision no. 4096 of 13th November 2008[14], in which this court has shown to be unjustified refusal, within the meaning of art. 2, 1st paragraph, letter i) of Law no. 554/2004, the fact that the competent authority refuses to issue to the entitled person the standardized certificate provided by the rules of implementation of the Emergency Ordinance no. 36/2003, arguing that the position of permanent representative is not a diplomatic or consular position. So, by not issuing this certificate, which attests a seniority in the labor activity, the individual is directly injured.

Another issue resulted from the practice of courts on the unjustified refusal, can be drawn from the application of Law no. 290/2003 as regards the grant of indemnities or compensations to Romanian citizens for their own property goods, seized, retained or remained in Bessarabia, Northern Bucovina and Herta region, following the war situation and the application of the Peace Treaty between Romania and the Allied and Associated Forces, signed at Paris on 10th February 1947.

Thus, the application of this law led to two situations, in practice: if the refusal of execution of the administrative act by which that person has been established right to compensation is assimilated as unjustified refusal to settle a request addressed to a public authority, which in its turn is assimilated to the administrative act and which would be the competent courts to rule on such requests, to the extent that such refusal derives from a public authority located at the central level.

Thus, in the decision no. 1030 of October 21st, 2009, Pitesti Court of Appeal stated the following: by sentence no.152/CA/30th April 2009, Arges Court ignored the action filed by the plaintiff L.M. by which it obliged the National Authority for Property Restitution to pay damages based on Law no. 290/2003.

In order to pronounce in the meaning of the above, the Court considered that pursuant to decisions no.178/19th December 2006 and no. 264 / 6th July 2007, the defendant is to pay the plaintiff the amount of 192,006.71 lei for the outbuildings and related land and the amount of 429.057,28 lei for the area of 50 ha., property that belonged to its authors.

It has also been considered by the first court that the provisions of art. 18 of Government Decision no. 1120/2006 on approving the Methodological Norms for applying Law no. 290/2003 regulating the payment scheduling during two consecutive years are applicable only in the event that sufficient funds are allocated from state budget for the payment of damages established under Law no. 290/2003.

In the case, it was considered that by paying the first installment of compensation set by the decision no. 278/2007, the defendant has fulfilled its obligations. Failure to pay the first installment representing 40% of the amount established by decision no. 264/2007 is not attributable to the defendant, because there were not allocated sufficient funds from the state budget for this purpose, on the other hand, by an eventual acceptance of this action, the plaintiff would create two titles for the same debt, which is inadmissible.

[13] See art.2, paragraph.(1) letter i) of Law no.554/2004, as amended.

[14] See, I.C.C.J.,s. administrative and tax accounts., dec. no. 4096 of 13th November 2008, in J.S.C.A.F. semester II/2008, (Hamangiu Publishing House, Bucharest, 2010), p. 84

Against the sentence within the statutory term, an appeal was lodged by the plaintiff, by which it has been asserted that the action was rejected by an unlawful interpretation of the provisions of article 18, paragraph 5 of GD 1120/2006, as the retention of existence of sufficient funds is equivalent to the undertaking of an obligation under a mere potestative condition of the debtor, which is absolutely void. Even in this assumption, there has not made any test to certify that the necessary funds have not been allocated but, on the contrary, by notice of 26th May 2008 it was notified by the Ministry of Finance that the amounts claimed paid by the National Authority for Property Restitution had been paid.

Moreover, it received 40% of compensation set by the decision no. 278/2007 even in 2007, not for decision no.264/2007 decision and this action has been introduced to obtain a writ of execution.

On October 8th, 2009 it was recorded the statement of defense motioned by the National Authority for Property Restitution, by which it was requested the rejection of appeal as unfounded, with the main motivation that it has not available the necessary funds for paying installments.

On the hearing of 14th October 2009, the Court of Appeals invoked ex officio and put into the discussion of the parties the objection of material incapacity of the court in the settlement of actions based on the provisions of Law no.290/2003 and the Government Decision no. 1120/2006.

Examining this exception prevalently (which makes useless the investigation of the other grounds of appeal), the Court finds the following: according to provisions of article 8, paragraph 5 of Law no.290/2003 on granting compensations or damages to Romanian citizens for their property assets which have been seized, retained or remained in Bessarabia, Northern Bukovina and Herta region, due to a belligerence condition and applying the Peace Treaty between the Allied and Associated Force and Romania, signed at Paris on 10th February 1947, updated (regulation on which the plaintiff's right is based), the decisions of the National Authority for Property Restitution shall be subject to judicial control and can be brought before the administrative court in terms of Law no. 554/2004, as amended. By the methodological rules for the application of this law, approved by GD no.1120/2006, amended by GD no.57/2008 (in force at this time) it was established that the resolutions of authority, as well as decisions issued by the Vice President for certain situations, are subject to means of appealing to the tribunal in whose jurisdiction resides the petitioner.

Provided that the application object, as indicated therein, does not aim any resolution or decision of the Vice-president of the National Authority for Property Restitution – Department for enforcing Law no. 290/2003, but exclusively regards the obligation to pay compensation (subsequent operation of the administrative act, by which it has been admitted the right to compensation), obviously the provisions of law relating to the competence of the tribunal are not incidental and the rules of jurisdiction laid down by Article 10, 1st paragraph of Law no. 554/2004 are to be applied-framework-law in the matters of administrative court.

Refusal to execute administrative act by which that person has been established the right to compensation is treated as unjustified refusal to settle a request submitted to a public authority, which in its turn is assimilated to administrative act under art. 2, 1st paragraph, letter i), second sentence and 2nd paragraph of administrative court law. As a consequence, the trial actions to follow is that of administrative court.

In consideration of the special law, of administrative court no. 554/2004, the jurisdiction of settling this case is incumbent to Pitesti Court of Appeal, considering the central rank of such sued public authority.

5. Conclusions

This study desired to emphasize the importance of the assimilated acts, along with the proper administrative acts - in censoring the abuses committed by the administration. Therefore, starting from the idea of power abuse, it has been analyzed the impact of unjustified refusal to settle a request

on the individual, who may be thus injured in a right or interest recognized by law. Once the conditions of an unjustified refusal are met, the individual is required to sanction the defendant authority by taking legal action before the administrative court, by which this refusal should be penalized and the authority should be obliged to issue the document.

Also, it was considered the other side of the unjustified refusal, namely the refusal of execution of the administrative act, also prosecuted by the court.

The conclusion that emerges is that the individual confronted with an attitude arising of excessive power of authority needs to go to court in order to censor this type of behavior, because the activity of public authorities should be primarily subject to the legality principle.

AMENDMENTS TO LAW NO.47/1992 REGARDING THE ORGANIZATION AND THE FUNCTIONING OF THE CONSTITUTIONAL COURT - IMPLICATIONS REGARDING THE DISPOSITIONS OF THE CONSTITUTION OF ROMANIA

MARTA CLAUDIA CLIZA[*]
ELENA EMILIA ŞTEFAN[*]

Abstract
In 2010, Law no. 47/1992 regarding the organization and the functioning of the Constitutional Court has suffered some amendments, some of which we believe indirectly affect the provisions of the Constitution of Romania of 1991, revised and republished in 2003. This survey aims at expounding these modifications and at presenting their implications on the constitutional text, raising some legitimate questions for law professionals. Therefore, we will approach the question of suspension from office of the President of Romania, a procedure stipulated in article 95 of the Constitution, as well as the ways in which the stages of the suspension procedure provided therein suffer an alteration because of the amendments to Law no. 47/1992.

Keywords: *Constitutional Court, suspension, referendum, unconstitutionality, revision of the Constitution*

Introduction

This study aims at presenting certain aspects regarding the procedure of suspension from office of the President of Romania, in accordance with the provisions of article 95 of the Constitution.

Thus, in its two sections, this study will deal with the theoretical notions of the proposed subject matter and will provide interpretations as a result of the recent legislative modifications in the field caused to the organic law of the Constitutional Court.

Also, in the final part of this study, we aim at making a synthesis of the relevant conclusions as a result of the analysis we are going to conduct.

1. Procedure of suspension from office of the Romanian President, according to the provisions of the Constitution of Romania

The President of Romania, according to article 84 par. (2) phrase I of the Constitution, "the President of Romania shall enjoy immunity". By interpreting this text, we can say that the President of Romania, unlike the members of the Parliament, cannot be held responsible for any acts other than the opinions he expresses while executing his commission.

The Constitution expressly establishes two exceptions from the immunity rule, detailed in terms of substance and procedure in article 96 on *"suspension from office"* and article 96 on *"impeachment"*.

Also, in this context, we notice an indirect regulation of the liability of the President of Romania for his legal acts, based on article 21 on the "free access to justice" and on article 52 on the "right of a person aggrieved by a public authority".

[*] Marta Claudia Cliza, Lecturer, Ph.D., The Faculty of Law *"Nicolae Titulescu"* University, Bucharest, 185 Văcăreşti Blvd., **(**e-mail: cliza_claudia@yahoo.com).

[*] Elena Emilia Ştefan, Assistant, PhD Candidate, The Faculty of Law *"Nicolae Titulescu"* University, Bucharest, 185 Văcăreşti Blvd., **(**e-mail: stefanelena@gmail.com).

However, for the purpose of this survey, we are interested in the content of article 95 of the Constitution that regulates what the administrative law doctrine calls the "administrative-disciplinary liability of the President of Romania or his political liability".

There are authors[2] who believe that the political liability of the President of Romania actually consists of two distinct phases.

The first phase could be called the *political liability per se*, that the head of state assumes according to article 95 par. (1) of the Constitution, towards the Chamber of Deputies and the Senate.

The second phase materializes into liability towards the people, completed through the referendum organized for the dismissal of the President.[3]

This type of liability is connected to the parliamentary initiative, to the position of the authority exercising the constitutional jurisdiction, and finally to the vote of the people.

The procedure of holding accountable for grave acts by which the President infringes upon the constitutional provisions may be initiated by at least 1/3 of the number of deputies and senators, which means, according to the Constitution, a "proposal of suspension from office". This proposal must be well-founded since the President is suspected of having committed grave acts by which he infringed upon the constitutional provisions.

Considering the wording of article 95 par. (2), it follows that the one third of parliamentarians who are entitled to initiate the procedure of holding the President politically accountable relates to the total number of parliamentarians, not to the members of one of the chambers. The list of parliamentarians shall be lodged with the secretary general of the chamber and the lodging date shall officially mark the initiation of the procedure for impeaching the President in view of his suspension from office. The Secretary General shall submit a copy of the list and the reasons of intimation to the President. The chamber with which the proposal of suspension from office shall be officially recorded shall be determined based on the weight the deputies or senators have on the list.

In any case, the Secretary General of the chamber the proposal was recorded with must inform the other chamber, as soon as possible, about the content of the proposal of suspension from office, since the competence of debating and voting on this proposal devolves upon both chambers reunited in a joint session.

The following step in this procedure is to notify the Constitutional Court to issue the consultative opinion. The administrative law theoreticians classify this opinion into three categories, namely: facultative, consultative and compliant. In our case, it would be a consultative opinion, whose features are as follows: the issuing body must request the opinion, but is not forced to give in to it.

Only after receiving the opinion of the Constitutional Court one may pass on to discussing the proposal of suspension from office, the content of the opinion being a substantial reference criterion. Please note that the opinion of the Constitutional Court is consultative in nature, as the Parliament is forced to request it; however, upon casting their votes, the Parliament may decide differently than the Constitutional Court. Therefore, the Constitutional Court may find that the acts of the President of Romania are not serious infringements upon the Constitution, thus issuing a negative opinion; however, the Parliament may decide to suspend the President, despite of the Constitutional Court's opinion. The basic idea is that we are under a form of political liability, so that the Parliament has its

[2] Refer to Claudia Gilia, *Manual of Constitutional Law and Political Institutions*, (Bucharest, Hamangiu Publishing House), p. 212 et seq.; Verginia Vedinaş, *Administrative Law*, 4th Edition revised and updated, (Bucharest, Universul Juridic Publishing House, 2009), p. 317-320; Dana Apostol Tofan, *Administrative Law*, Vol. 1, 2nd Edition, (Bucharest, C.H. Beck Publishing House, 2008), p.143 et seq.; Ion Corbeanu, *Administrative Law. Part I*, (Bucharest, Pro Universitaria Publishing House, 2010, p.106-111. etc.

[3] Ioan Alexandru, Mihaela Carausan, Sorin Bucur, *Administrative Law*, Lumina Lex Publishing House, Bucharest, 2005.

own political filter when it comes to qualifying the President's acts as serious infringements upon the Constitution and when they cast their vote for or against.

However, the wording of the Constitution leaves it up to the President to appear before the Parliament or not, as it provides for no obligation to that effect. The consultative opinion of the Constitutional Court must be notified to the President, who may be invited to provide certain information before the Constitutional Court before issuing the opinion.

The Parliament debates the proposal of suspension from office of the President according to the procedure established in the Regulation of the joint sessions, and the majority[4] of the deputies and senators must vote for the proposal of suspension from office.

We may wonder why in this situation the majority of parliamentarians must vote, and not 2/3 of the parliamentarians (as for the criminal liability set forth under article 96). The explanation consists in the different nature of the facts with regards which one form of liability or the other is engaged. The political liability is engaged for generic acts qualified as a serious infringement upon the constitutional provisions, whereas criminal liability is engaged for a particularly grave act which is generically established by the criminal legislation and which determines the final conviction of the President, which makes the procedure of dismissal by referendum to become useless.

In legal terms, the acts for which the suspension procedure is triggered are administrative defaults of the President while executing a political commission. That is particularly why the suspension measure, which triggers the interim, must be subject to approval by the people by means of referendum, as the President is elected by casting of a universal, direct vote.

The referendum[5] for the dismissal of the President must be organized within 30 days after the vote of the Parliament and the obligation to organize it devolves upon the Government.

Since the referendum evokes the idea of direct democracy, a potential refusal by the people to vote the dismissal of the President would equate to a withdrawal of the trust placed in the Parliament, and such a withdrawal of the trust[6] should entail the election of a new Parliament.

The 3-month period set forth under article 63 par. 2 of the Constitution for the election of a new Parliament should start on the referendum date. On the contrary, if at the referendum the people voted for the dismissal of the President, then the position will become vacant and within 3 months the Government will organize presidential elections.

The referendum is the primary legal form of manifestation of the national sovereignty, it evokes direct democracy, and in case of article 95 of the Constitution it will also appear as a means of solving the political conflict between the Parliament and the President, both being authorities legitimated by popular vote. [7]

2. Considerations on the amendment of the Law on the Constitutional Court, caused by Law no. 177/2010

According to article 142 par. (1) of the Constitution, the Constitutional Court is *"the guarantor for the supremacy of the Constitution"*.

Title V of the Constitution[8] is dedicated to the Constitutional Court, regulating its structure, the qualification for appointment of the judges of the Court, their statute, the powers of the

[4] Meaning an absolute majority.

[5] The referendum conducting procedure is detailed in Law no. 3/2000 on organizing and conducting the referendum, published in the Official Gazette no. 84/2000, updated.

[6] In this case, we are witnessing a void in the regulation of the Constitution of Romania because one could consider dissolving the Parliament *de jure*; however, according to article 89 of the Constitution, this is subject to very restrictive conditions counting to six.

[7] A. Iorgovan, *Treatise of Administrative Law*, vol. I, 4th Edition (Bucharest, All Beck Publishing House, 2005), p. 334.

[8] Ioan Deleanu, *Constitutional Justice*, (Bucharest, Lumina Lex Publishing House),p.183.

Constitutional Court and the decisions issued based on such powers. Law no. 47/1992, the organic law of the Constitutional Court, was enacted based on this constitutional regulation.

According to the provisions of article 146 point c) of the Constitution, the Constitutional Court has the following powers, among others: *"to adjudicate on the constitutionality of the Standing Orders of Parliament, upon notification by the president of either Chamber, by a parliamentary group or a number of at least 50 Deputies or at least 25 Senators"*.

Recently, Law no. 177/2010 amended and supplemented Law no. 47/1992 on the organization and operation of the Constitutional Court, of the Civil Procedure Code and of the Criminal Procedure Code of Romania, published in the Official Gazette no. 672 / 04 October 2010.

The last[9] amendment of the organic law of the Constitutional Court brought **two essential changes** with regard to this public authority:

a) the measure of the *de jure* suspension from office, which used to be triggered while settling the plea of unconstitutionality and which was regulated by article 29 par. (5) of Law no. 47/1992 was eliminated by abrogating this piece of legislation;

b) the competence of the Constitutional Court was supplemented with the power of adjudicating on the constitutionality of the decisions issued in the plenary sessions of each Chamber of the Parliament and of the decisions issued in the plenary sessions of the two Chambers reunited, by amending article 27 par. (1) of Law no. 47/1992.

Thus, article 27 par. (1) establishes the Constitutional Court' power to adjudicate also on decisions issued in the plenary sessions of the reunited Chambers of the Parliament, having the following content:

"The Constitutional Court adjudicates on the constitutionality of the regulations of the Parliament, of the decisions issued in the plenary sessions of the Chamber of Deputies, of the decisions issued in the plenary sessions of the Senate, and on the decisions issued in the plenary sessions of the two Chambers reunited of the Parliament, upon notification by the president of either of the two Chambers, by a parliamentary group or a number of at least 50 Deputies or at least 25 Senators."

For the purpose of this survey, we are going to look into this legal text and analyze it in terms of its implications on the procedure regarding the political liability of the President of Romania, a procedure set forth in article 95 of the Constitution.

This addition to article 27 par. (1) aims at subjecting all the decisions of the Parliament of Romania, namely of the plenary session of the Senate, of the Chamber of Deputies and of the Reunited Chambers to a check in terms of constitutionality.

The difference from the procedure applied until the publication of Law no. 177/2010 in the Official Gazette is that, before this amendment, only decisions dealing with the Regulations of the Chambers were subject to a check in terms of constitutionality, whereas from now on all the decisions of the Parliament are to be subject to such check.

As regards the impact of the amendment[10] of Law no. 47/1992 on the procedure for the suspension from office of the President of Romania, there are several aspects to bear in mind:

- Until the amendment in 2010, the Constitutional Court was only checking the reasons why the President of Romania was suspended from office, having the duty to establish whether they were grave acts of infringement upon the Constitution or not. In such case, the opinion was a consultative one, as we have already specified in the first part of this survey. Regardless of the findings of the Constitutional Court, the reunited Chambers may suspend the President without any restraints, as this is a political kind of decision upon which the Constitutional Court could not intervene. We would

[9] Verginia Vedinaş, *Several Considerations on the Unconstitutionality of Law no. 177/2010 enacted by the Senate on 24 August 2010* (RDP no. 3/ 2010, Bucharest) p.100.

[10] Elena Emilia Ştefan, *Manual of Administrative Law. Part I. Seminar Exercise Book*, (Bucharest, Pro Universitaria Publishing House, 2010) p.77.

like to remind our reader that earlier, in 2007[11], the opinion of the Constitutional Court was negative).

- The recent amendment allows the Constitutional Court to also check the compliance with the constitutional procedures, after the issue of a decision to suspend the President from office. More specifically, in terms of the suspension procedure, the check in terms of constitutionality shall consider both the substance of the issue (i.e. the reasons) before the vote of the reunited Chambers, for consultation purposes – since, as we all know, the Constitution of Romania was only amended in 2003 –, and the procedural aspects *per se* (e.g. the number of deputies who initiated the procedure, the majority qualifying for the cast of votes, etc., according to article 95 and article 67 of the Constitution), however, in the latter situation, only after the vote of the reunited Chambers.

- This second check, which regards only the procedure itself, can be performed by the Constitutional Court upon the request of one of the parties concerned (that we will list below), following the vote for the suspension from office.

The holders of the right to request the check of the decisions of the Parliament in terms of constitutionality are the following:

1) presidents of the two Chambers,
2) a parliamentary group, or
3) a number of at least 50 deputies or at least 25 senators, thus keeping the three categories of holders as set forth in the Constitution, making no addition to or elimination from them.

Considering the above, we believe that this amendment of Law no. 47/1992 is unconstitutional because this piece of legislation actually dissimulates an attempt to revise the Constitution of Romania.

It is true that there are theoreticians of the constitutional law asserting that a constitution can be revised according to the revision procedures or implicitly[12]. According to this theory[13], the case we are now analyzing would be the second case, i.e. the implicit revision of the Constitution.

Thus, the revision[14] of the Constitution consists of its amendment by rewording or abrogating certain articles, or by adding new text.

The implicit revision of the Constitution may result from the adoption of a judicial norm whose content derogates from the constitutional provisions. In such case, such norm must not have been adopted by a law amending the Constitution, but by a simple ordinary law or even by an organic law.

In conclusion, the implicit amendment[15] of the Constitution consists of the change of some of its provisions, without resorting to the revision procedure set forth in the fundamental Law itself, but to some other procedure. Virtually, the implicit revision, whatever the reasons and the procedure used, results in the infringement upon the Constitution.

It is well known that any law system establishes the principle of legality, therefore the Romanian legislation is also generous from this point of view, thus establishing, at constitutional level, a general obligation for all the holders of a right, public authorities or not, to observe the law while conducting their activity.

Also, it is important to underline that, in the western[16] political mentality, the compulsoriness of the law refers both to the individual and to the public authorities, including the State. In other words, all the State authorities must observe the law, just like any citizen.

---

[11] In 2007, Romania witnessed the first attempt to engage the political liability of the President of Romania, which failed as a result of the vote of the population, cast by referendum, although the Parliament had decided to suspend the President from office.

[12] Cristian Ionescu, *Treatise of Comparative Constitutional Law*, 2nd Edition, (Bucharest, C.H. Beck Publishing House, 2008), p. 915.

[13] This is a personal theoretical opinion

[14] Cristian Ionescu, *op.cit.* p.203

[15] Cristian Ionescu, *op.cit.* p.204

[16] Cristian Ionescu, *Comparative Constitutional Law*, (Bucharest, C.H. Beck Publishing House, 2008), p.36

Conclusions

In close connection with the principle of legality, the principle of the stability of legal relationships is consecrated at the European level. Thus, the principle of legal certainty refers not only to the lawmaking operation that must observe certain strict rules[17], but also to the "possibility offered to any citizen of evolving in a certain legal environment, protected from the vagueness and sudden changes that effect the legal standards"[18].

Returning to the provisions of Law no. 177/2010 amending the organic law of the Constitutional Court, we believe that the principle of legal certainty is violated, thus creating a general uncertainty at the level of the public perception of the trust put in the political life of a country.

Moreover, the procedure of suspension of the President from office, as recently amended, has virtually become almost impossible during the same commission, thus giving the possibility both to the governing parties and to the opposition to "bother each other" by this constitutionality questioning game.

In conclusion, we believe that the recent amendment of Law no. 177/2010, considered in terms of the procedures of suspending the President of Romania from office, is an "unconstitutional solution due to its wording and an anti-constitutional solution due to its effects" and we subscribe to the opinion of the reputed author Verginia Vedinaş[19] recently expressed in a specialized study.

ECOLOGICAL EDUCATION

GABRIELA GYONGY MIHUT*

Abstract
While in most emerging and developing countries, the population has a lower ecological footprint in the developed countries have a larger footprint.
There is also an alarming contrast between a person perception of her liability for damages to its environment and its actual size. These misconceptions may have their source in the absence of awareness of risks from climate change, culture or religion.
The purpose of this study is to analyze the situation at the international and Romanian level and to draw attention on the necessity of un ecological education.

Keywords: *environment, sustainability, ecology, education, liability*

I. Introduction

If the life of our ancestors left few footprints on the nature, contemporary prints have become dangerously large. [1]

National Geographic published the study "Greendex Study 2009"[2] regarding the sustainability behavior of consumers, *Globe Scan Research Institute.*

The study finds that while in the emerging and developing countries the population has a lower ecological footprint, in developed countries the footprint is larger. The explanation lies in the fact that consumer behavior is affected not only by people's choices but also by external factors such as income, climate and infrastructure from that country.

For example, consumers in developed countries often decide to buy their own car, travels alone in the car, buy bottled water, etc.

It was also found that there is an alarming contrast between the perception of liability for damages to their environment and the real dimension of it.

For example, the population of India is feeling the most responsible for the damages brought to the environment (52 %) and believes that their life style is harmful (47 %), while only 14% from Germans consumers and 23% Americans are feeling responsible and only 9-10% believes that their life style is harmful.

These misconceptions can originate from the lack of awareness of risks resulted from the climate changes, in culture or religion.

In other words, technical innovations, public policy and state regulations can be effective only if people are aware of the risks and participate in their quality as polluters, producers or consumers of goods, citizens and voters in decisions regarding the society.

The role of consumers, related to the rapid evolution of climate and environment changes, was never properly taken into consideration.

Although the moral consumption is fashionable, most consumers lack the will to adjust their shopping habits and lifestyles to the climate changes.

But why is there so often a gap between the mind and behavior in everyday life?

---

* University Lecturer PhD, Faculty of Law, "Nicolae Titulescu" University, Bucharest, ROMANIA, (e-mail: gmihut@mihut ro).

[1] Kofi Annan .

[2] http://blog.goethe.de/climate-worlds/categories/3-Sustainability- and - Ethics.

What are the cultural and moral premises for sustainable consumption and which are the common strategies of the companies and consumers that are confronted with the impact of climate changes?

All these questions are answered by Ecology, part of civic education.

II. Paper Content

1.1. Education / Ecological Culture

The idea of correlation between ecological education and civic education has its foundation in Frederic's Mayor Statement performed at the World Congress of Natural Sciences.

According to him, „ Humanity's future is tied to global environmental protection systems and we do not have a better way to achieve this, than through science - science for peace, development and a democratic society based on equal opportunities ".

It requires the creation of an ecological culture that would have the effect of stimulating the type of ecological consciousness and behavior that lead to ecological sustainability.[3]

This will be achieved only by acquiring knowledge related to: composition, structure, function and evolution of natural populations, biocoenosis, ecosystems, biosphere, the principles of interaction between the individual and society, on one hand and nature, on the other hand , according with the requirements for durable development (sustainable).

The keywords for environmental education [4]are: material and intellectual ecological culture, responsibility, global ecological problems, ecological balance, ecological crises, skills, knowledge, competences and, ultimately, durable development (sustainable).

We will talk only about few of them:

- *Ecological culture of the individual* is a combination of ecological knowledge acquired consciously and its views regarding interaction between all forms of life and environment, regarding the place and the role of the human as bio-social being. This determines the rules of interaction between man and nature both as individual and on community level or globally.

- *Ecological material culture* includes technological developments that lead to ecological sustainability of industrial production (for ex. equipment for controlling environmental pollution, for purifying the environment or that leads to producing less wastes)and the "friendly" products for environment as household appliances, cleaning products, clothes, etc.

- *Ecological intellectual culture* includes : knowledge of events and environmental issues, laws, opinions, beliefs, prudence, intentions, theories, assumptions and hypotheses which aim to create social development and sustainable balance between humanity and nature.

- *Ecological responsibility* is based on strong belief in the objectivity of environmental rules and awareness of environmental rules prohibiting their violation.

The culture and responsibility are in a strong connection that leads to the issuance of appropriate rules.

---

[3] Ecological sustainability is defined as the capacity of ecosystems to maintain essential functions and processes and to retain biodiversity in full measure over the long term - http://www.businessdictionary.com/ definition/ecological-sustainability html

[4] Environmental education is a learning process that increases people's knowledge and awareness about the environment and associated challenges, develops the necessary skills and expertise to address the challenges, and fosters attitudes, motivations, and commitments to make informed decisions and take responsible action (UNESCO, Tbilisi Declaration, 1978) – http://en.wikipedia.org/wiki/Environmental_education

The Ecological News is given by the major problems that human civilization globalize is confronted lately especially those connected to exponentially increasing human population and the increasing environmental impact produced by an economy increasingly higher.

The problem of finite resources, raw materials and fossil energy accessible, the pollution problem of diverse types, like climate changes, global biodiversity decline, desertification and the decreasing of the surfaces covered by forests, all this are fundamental issues in the debate on the future of our civilization.

In a first conception of environmental education, there must be an overlap between the theoretical and practical activities that need to support each other and individual can quickly progress in understanding the nature and in rethinking the approach to nature and society.

The formal and non-formal ecological education must be grounded in the compulsory education system but it should continue throughout the individual existence.

The diversity of the ways to achieving this is extraordinarily high: from the compulsory education classes to transferring the information through mass-media, classes, trainings, artistically activities, ecotourism, etc.

In another opinion , [5] the ecological education should be carried out over the entire life, non-formal, through a series of practices in different cultures, transmission of knowledge about different practices in communities or educational practices.

In this conception, the ecological education shouldn't be seen as a new science but as a long practice of lifelong learning and social transmission of knowledge in all spheres of life.

This concept belongs to the experts of UNESCO who have developed several continuing education programs of Alpha 94 and Alpha 97 that relate to sustainable development.

ALPHA 94 is developed on the crisis in rural areas of several regions in Europe and USA, and explores local initiatives for cultural development. Among the solutions offered by the program are: social assistance to those remaining in these areas, resistance to not forgetting the culture (environmental component) and the mobility of regional natural resources .

ALPHA 97 is centered on the development of adult education policy according with the demands of communities.

It is found that the participation of all individual in taking decision that regards their lives is central.

2. Ecological Education in Romania

In Romania, the ecological education is done through school programs, through introducing the Ecology and Environmental Law as a compulsory subject in university education, through extracurricular actions, by mass-media, giving the public the access to environmental information and last but not least, the development by the Ministry of Environment and Forests to some strategies and eco-guides having the purpose to educate target subjects to adopt eco-responsible behavior.

The concept of durable development (sustainable development), which is the central pillar of environmental education, stipulated in art.2 p.23 and art.3 let. g from OUG.195/2005[6] regarding environmental protection, establishes the principle of sustainable use of natural resources and in regional legislation.

The principle of sustainable development implies respect and care for living organisms, life saving and biodiversity on Earth, a reduced use of non-renewable resources, participation in actions to awareness of environmental hazards and participating to action of saving it.[7]

---

[5] Jean –Paul Hautecoeur – " Ecological Education in Every Day Life " - Unesco Institute of Education-http://www.unesco.org

[6] Framework Law was published in Official Gazette, *Part I nr. 1196 din 30/12/2005*

[7] Planting trees, ecological environment (ex. " Let's Do It Romania "), establishment of protected areas, respecting the regime of hunting and fishing and the regime built, ordering the owners to expand the line of hedges, controlled waste disposal , recycling of waste and water,etc.

2.1. Plans, Programs, Strategies and Daily Information Regarding the State of The Environment

Ministry of Environment and Forests adopts every 4-5 years, strategies, programs and action plans for protecting the environment and to remedy its damage.

The strategies and programs establish the objectives that central and local public institutions have to meet (for ex. reducing the pollution in agglomerations in which they exceeded the permissible values)[8] either in cooperation with civil society or by empowering / determination to respect the objectives established. The plans indicate the means that will be used to reach these objectives, for ex. adoption of rules setting emission limit values or standards.

These strategies, plans, programs and information are adopted taking into account the specific problems encountered in Romania and the local culture and are published daily on the website of the Ministry of Environment and Forests[9] in order to inform, educate and make it aware of the environment problems, for the measures that have to be taken for protecting the environment and for sustainable development.

As an example we mention:

- *National Strategy and National Plan for Environmental Protection in 2004-2013;*
- *National Strategy and National Plan for Atmosphere Protection;*
- *National Program for Reducing Emissions of Sulfur Dioxide, Nitrogen Oxides and Dust from Large Combustion Plants;*
- *National Program for Combating Climate Warming;*
- *Master - Flood Risk Reduction Plan in Prut- Barlad river basins;*

2.2. Eco- Guides and Codes of Practice

Eco- Guides and Codes of Practice addresses to a target group and contain a series of recommendations, without the power of law that aim to educate regarding the group behavior that must be adopted to protect the environment.

Through this is established the intellectual ecological education and the ecological responsibility.

If the code is adopted by a law, decision or order, it gets the power of the law and the violations of conduct set forth in this, often attracts sanctions (ex. Code of Good Agricultural Practice).

Among the eco-guides prepared by the Ministry as: Citizen Eco-Guide, Eco-tourists Guide, Public Servant Eco-Guide, Guidelines on Access to Environmental Information, Guidance on rules for Detergents. [10]

2.2.1 Citizen Eco-Guide is aimed at attracting attention, promotion and awareness of major importance to the environmental protection by presenting eco-instructions to every citizen . It is divided into four main chapters in which the main daily activities of the citizens are offered eco-instructions .

In the first chapter entitled "**Eco-Instructions for Home**" the citizens are educated on : reducing water consumption and avoid wastage, reducing energy consumption and avoid wastage, reducing and selecting removal of quantity waste, action against noise pollution,etc. They are advised to act to prevent further leakage of tap, to consume preferably tap water to avoid creating waste in the form of PET and save energy, to the use of equipment with low power consumption, to make thermal rehabilitation works, to using biodegradable detergents and cleaning products, to not discharge toxic products in the drains, to evacuate waste selectively, to preserve peace, etc.

[8] Gabriela Gyongy MIHUT- "Environmental Law "-course for students from ID, (Ed University, 2010), p.38
[9] http://www mmediu ro
[10] http://www mmediu ro

The chapter entitled **"Eco-Instructions for the Job/Place of Work"**, along with the instructions in the previous chapter includes instructions for submitting electronic documents to avoid the consumption of materials, maximum use of natural light, etc.

The third chapter entitled **" Eco-Instructions for Shopping ",** aims to educate citizens as consumer. It is recommended to purchase eco-labeled products, agricultural products and foodstuffs from ecological farming, to avoid buying disposable products which rapidly increase the quantity of waste, avoid buying plastic bags and buying those from material or paper or avoid purchasing products based on aerosol or sprays and avoid going shopping by car.

The last 2 chapters entitled "**Eco-Travel and Eco-Instructions Instructions for Leisure" ,** urges to drive at moderate speed allowing emission reduction, to ride by bike or by foot, possible use by others of the same car, parking in spaces specially designated, hunting in permitted periods, garden design, immediately inform the authorities in case of environmental accidents, etc.

2.2.2.As a result of awareness of tourism development in Romania and the increased number of tourists, Public Policy Unit of the Ministry of Environment and Forests developed "**Eco-Tourist Guide"** includes instructions on how the tourists have to behave on mountain vacations, to the sea, in urban and rural environment and instructions on transport.

The Guide includes instructions similar to those mentioned but according to custom tour. Tourists are taught to protect species of plants, animals, birds and fish, to consider the signs, get rid of garbage in special places, to use boats that do not pollute, to participate in activities with environmental impact, to use, preferably a single car, etc.

2.2.3.Public Servant Eco-Guide includes mostly the same custom instructions to the work of public servant. It is worth mentioning that these instructions have begun to be implemented by both the population and the administrative authorities. Thus some Romanians private individuals or companies had developed a project to go to work with the same car several people from different families, actions of replanting trees, setting up the parks and green spaces, ecological actions in which the most famous remains the action "Let's Do It Romania " that had its purpose to clean the environment of waste. This action done on an international level has attracted people from different backgrounds : corporate, police, education.

2.2.4.Guidelines on Access of Environmental Information

The Guide drafted in the HG.878/2005[11] by the Ministry of Environment and Forests in collaboration with the National Environmental Protection Agency and its purpose is, to educate population regarding their rights to have access to information related with the environment and to formulate opposition, requests or requires the introduction of additional condition to protect the environment in projects that asked for permit or environmental authorization.

It contains :

- list of normative acts which gives the right to citizens to have access to any environmental information without justifying the purpose and without paying any tax, in order to protect the right to a healthy and ecologically balanced environment[12] ;
- the concept of environmental information and exceptions;
- indication of institutions that hold this information and that will be required to provide the form that is needed to be taken requesting the term for its solution;

[11] HG.878/2005 regarding the public access to environmental information - Published in Official Gazette, Part I no. 760 of 22/08/2005

[12] Aarhus Convention (1998) on access to information, public participation in decision taking and access to justice in environmental matters - ratified by L.86/2000, Directive 2003/4/EC on public access - to environmental information, OUG.195/2005 environmental protection, L.554/2001 on access to public information and HG.878/2005

- teaching the applicant to take court action in case of failure, refusal or rejection of his request.

The information provided aims condition and quality of external elements of Human organism(air, atmosphere, soil, landscape, biological diversity, genetically modified organisms, etc.) factors that affect or may affect the environment (chemicals, energy, noise, radioactive waste, etc.) human health (e.g. effects of air pollutants coming from industry on human health).

Information providers are the National Agencies, Regional and Local Environmental Protection, National Environmental Guard and other institutions with competence in the field such as : Ministry of Agriculture and Rural Development, National Institute of Statistics, local governments, etc.

Through this guide, people are empowered ecologically being achieved a component of environmental education : responsibility.

2.2.6. Guidance on rules for Detergents

It was adopted under Regulation (EC) nr.648/2004 and includes information on the composition and effect of detergents, information that the manufacturer must provide to the health professionals, to the state institutions and consumer in writing, through labels and websites.

2.2.7.Codes of Best Practices

By Order nr.1270/2005, Ministry of Agriculture and Rural Development adopted "**Code of Best Agricultural Practice for Waters Protection against Pollution with Nitrates from Agricultural Sources** "[13] which aims to recommend the most useful practices, measures and methods possible to apply by each farmer or agricultural producer in order to protect water against pollution caused by fertilizers (especially nitrates), coming from agricultural activities and promote sustainable agriculture.

This is a set of scientific and technical knowledge regarding the effect of various fertilizers on water, soil, subsoil and atmosphere and on agricultural management, knowledge that properly implemented leads to obtaining higher quality productions and environmental conservation restriction on its adverse consequences .

The Order identifies the areas with problems and educates people whom it is addressed to the pollutant nature of agriculture.

In the Order it is shown that ,,In terms of agricultural intensification, crop production growth and rural development, agriculture can not be considered as sustainable for farmers and society to which they belong, it is not beneficial." .

In December 2005, were also adopted "**Guidelines for Good Hygiene Practice and Production in Bakeries and Confectionery.**" [14]

The guide contains instructions of major importance for confectionery operators which has to act by optimal hygienic practices of production and distribution and to ensure the reduction and even cancellation of biological contamination physical and / or chemical which could affect the safety of the products, health and even lives of consumers.

The Guide is useful also to the official inspectors because details problems and difficulties that require basic hygiene rules and food safety procedures in all phases of production activities specific to the bakery and confectioneries, with protective effect of life and health of consumers.

[13] Published in Official Gazette, Part I no. 224 from 13/03/2006

[14] http://www.anamob ro/ghidpat.shtml

2.2.8.EcoWeb and Green Package[15]

EcoWeb is a project conducted by the National Environmental Protection Agency (NEPA) with the U.S. Embassy and Peace Corps Romania, which consists in un interactive website for scholars's education as far as waste .

Currently Ministry of Environment and Forest together with the Ministry of Education is working on the program called Green Package will introduce concrete measures to protect the environment in schools .

According to Minister of Environment, Laslo Borbely, the most important are not the books but actions that teachers do in school to demonstrate the importance of maintaining a clean environment.

3. Conclusion

Finally, it would be good to remember Albert Einstein words „We need a dramatically different way of thinking for humanity to survive.". If humanity will not be aware of the devastating effect and the serious consequences that its behavior has on the environment, will not feel responsible and will not take measures will have to bear the disastrous consequences of the disappearance process of life and economic resources, a planet of hunger and unbearable.

Memorable remains in the memory of humankind M.K.Gandhi's words:„The planet produces enough resources to satisfy human needs but not enough to satisfy every man's greed. "

DEFINING THE CONCEPT OF FUNDAMENTAL HUMAN RIGHTS IN THE LIGHT OF JURIDICAL VALUES THEORY

NICOLAE PAVEL[*]

Abstract
We find relevant for this study to highlight the general trend that the evolution of the concept of fundamental human rights approach and implicitly that of human rights in light of the values theory in general and juridical values in particular, established by the general principles both of the Romanian Constitution-republished, and those set out in the Preamble to the universal and European standards for human and citizen rights, on these values. By the expression citizen rights we refer to the European standard, namely Charter of Fundamental Rights of the European Union.
This is why the study begins with the justification of the scientific approach by identifying the general principles by which the documents referred to proclaim the rights of supreme values, universal values, European values and common values for countries that have ratified the universal or European document on human rights or fundamental rights. Following a key-scheme, conceptual demarcation in the field of values knowledge study, the establishment of three levels of genesis in their valuation process and, finally a systematic hierarchy of juridical values, and determining the place of supreme values in this hierarchy are analyzed successively. The final part of this study is devoted to the diachronic approach to the concept of fundamental rights and exploitation of this approach to establish the concept of fundamental rights in the light of legal values theory.

Keywords: *(f) fundamental rights, (v) values, (j) juridical values, (s) supreme values, (u) universal values*

Introduction

Taking into account K. Mbaye's assertion according to which **human rights history is similar to human history,** in our opinion, the first legal regulation of human rights can be identified in the statements of rights and in the content of the first written constitutions in the world, followed by their enshrining in the constitutions of the states, and much later their integration and protection at universal and regional level.

The subject of the scientific approach will be circumscribed to establish the concept of **fundamental rights** discussed in terms of values theory and finally, values positivitated as juridical values. In formulating this concept we hold the classic component element of the Romanian constitutional doctrine and of the theory of fundamental rights that is addressed in a general sense of **rights and freedoms of citizens proclaimed and guaranteed by the Constitution**, which can be considered similar to the concept of **public freedoms** enshrined in the French constitutional doctrine. Also, in our opinion the establishment of the concept of **fundamental rights** is suggested by the title of the Chapter II of Title II, entitled Rights and Fundamental Freedoms.

The usage of the subsumated concept **fundamental rights** provides that **the rights and freedoms of citizens** have the same juridical status, meaning that both components are subjective rights. These components of the concept will be seen as **constant elements of the concept and elements of continuity in its diachronic evolution.**

In our opinion, the subject of the study is important for the constitutional doctrine in the matter and for the fundamental rights theory because, through this study we aim **to establish a correlation between the constitutional principle established in the paragraph 3 of the article 1 of the Constitution of Romania**-republished, which proclaims that**:**...**the rights and freedoms of**

[*] PhD, Lecturer, Constitutional Law and Political Institutions, Faculty of Law and Public Administration, Spiru Haret University, 4 Berceni Street, Sector 4, Bucharest, (E-mail address: nicolaepavel0@yahoo.com).

the citizens are supreme values,… and **are guaranteed** and **subsuming a new component of the concept of fundamental rights,** that highlights their **supreme value**, established by the fundamental law.

The discussion of this correlation leads us to the field of **values**, an extra-juridical field studied by the philosophy of values, and by transforming them in positive values they become **juridical values, which means binding normative values, dealt with as formal phenomena, imposed by the state** and which, in our opinion, are subject of the science of law, being linked to all manifestations of the individual's behaviour in society by effective use and exercise of fundamental rights.

However, in establishing the concept of fundamental rights it is necessary to mention that they are **subjective rights**, **essential for citizens** and for the supreme values selected and protected by the paragraph 3 of article 1 of the fundamental law, among which we mention: **human dignity and free development of human personality.**

To achieve this goal, we intend **to analyze the general theory of knowledge of the values and knowledge of formal judicial values applying the following formal scheme**: - the study of knowing values in general and in the legal field in particular, - approaching the theory of knowing the judicial values subsumed by three levels of genesis; - based on the idea that the values of positive law form a system of values, we will determine their hierarchy system, which will include **the position of supreme values** in that hierarchy.

Moreover, on the components of the concept of fundamental rights discussed in terms of judicial values, we aim to propose the introduction of **a new component, which subsumes four relativity determinations of the concept** as, in our opinion, they result from the relativization of the provisions in the paragraph 1 and paragraph 2 of the article 20 of the Constitution which essentially establishes two constitutional rules: the first rule establishes that the constitutional provisions regarding **the rights and freedoms of the citizens** shall be interpreted and applied in accordance with the Universal Declaration of Human Rights, the covenants and other treaties to which Romania is party, and the second states that if there is any inconsistency between the covenants and treaties on fundamental human rights to which Romania is party, and domestic laws, the international regulations have priority, except where the Constitution or national laws contain provisions more favourable.

Even if the theory of fundamental rights, addressed as the rights and freedoms of citizens points to the adoption of the first written constitution, the theoretical interest for its discussion is determined by the fact that the studies in the field has not always paid sufficient attention to some theoretical aspects of the fundamental rights approached in the light of the values and legal values in particular. The studies in the field generally refer to the world of values, without extending and deepening this research, and the determinations of relativity mentioned are limited at the state level without being extended to universal or European level.

1. The justification of the scientific approach

The approach of the judicial values knowledge in the field of human rights in general and that of fundamental rights is particular will be motivated for this study by identifying the principles in the matter established by documents have symbolic value for these rights up to the current standards, and those set by the Constitution of Romania-republished in 2003 as follows:

1.1. In the preamble to the Declaration of Independence of the United States of America[1] it is expressed the belief that the following truth are considered self-evident: all men are created equal,

[1] Elena Simina Tănăsescu and Nicolae Pavel, Constituția Statelor Unite ale Americii/Constitution of the United States of America (Bucharest: All Beck, 2002), 32;

they are endowed by their Creator with certain **unalienable rights**, among these rights are life, freedom and pursuit of happiness;

1.2. In the article 1 of the French Declaration of Human and Citizen Rights[2] it is stated that **humans are born and remain free and equal in rights.** Social distinctions may be based only on common utility;

1.3. In the Preamble of the Universal Declaration of Human Rights[3] are enshrined the following principles: **a.** the recognition of the inherent dignity of all memebers of a family, **and their equal and inalienable rights which is** the foundation of freedom, justice and peace in the world; **b.** U.N. peoples have reaffirmed their faith **in *the fundamental human rights,*** in the dignity and **worth of humans**, in the equal rights of men and women and that they are determined to promote social progress and to create better conditions of life, ensuring a larger freedom;

Also, the article 1 states the philosophical postulate to which the Declaration addresses: **All human beings are born free and equal in dignity and rights.** Thus the fundamental ideas that inspired the Declaration are defined: **a. the right to liberty and equality is an acquired right from birth** and could not be alienated. **b.** as man is a moral being and endowed with reason, he is different from other creatures of the earth and therefore **can claim certain rights and freedoms that other creatures do not enjoy**.[4]

Moreover, the article 2 of the Declaration states the essential principle of equality and non-discrimination regarding **the exercise of human rights and fundamental freedoms,** thus developing the provisions of the United Nations Charter, according to which the United Nations should encourage the **exercise of these rights and freedoms for all,** irrespective of race, sex, language or religion.

The preamble to the International Convention on Civil and Political Rights and that to the International Convention on Economic, Social and Cultural Rights adopt and develop the content of the principles stated in the United Nation Charter and in the Universal declaration of Human Rights, representing **universal values universally accepted by the international community.**

1.4. In the third paragraph of the Preamble to the Convention on the Protection of Human Rights and Fundamental Freedoms it is proclaimed the principle according to which the aim of the Council of Europe is to achieve a closer collaboration between its members **and that one of the ways to achieve this goal is the protection and development *of human rights and fundamental freedoms.*** Also, the provisions of the article 1 of the Convention set the obligation of the Council of Europe member states **to respect the human rights established by the Title I of the Convention**.[5]

1.5. We consider it necessary for this study to remember the concept of **human dimension** that **subsumes the respect for all human rights and fundamental freedoms,** and those on human contacts and other humanitarian issues, as defined in the Section ***The Human Dimension of C.S.C.E.*** in the *Final Document of the 1986 meeting of the representatives of the states participating*

[3] Nicolae Pavel, Drept Constituțional și Instituții Politice/Constitutional Law and Political Institution,Vol. I, Teoria Generală/General Theory. (București: Fundația România de Mâine, 2004), 222. Art.1 All human beings are born free and equal in dignity and rights. They are endowed with reason ans conscience and should act towards one another in spirit of brotherhood. Art.2 : paragraph. (1) Each individual is entitled to all rights and freedoms set forth in this Declaration, without distinction of any kind, especially of race, color, language, religion, political or other opinion, national or social origin, property, birth or other status**. paragraph. (2)** In addition, there will be no distinction based on the political, juridical or international status or the territory of the country whose citizen is a person, whether that country or territory is independent or non-autonomous or subject to any limitations of sovereignty.

[4] *Activité de l´O.N.U. dans le domaine des droits de l´homme***.** (New York: Nation Unies, 1998), 10.

[5] Nicolae Pavel**,** Drept constituțional și instituții politice/Constitutional Law and Political Institutions, vol.I, Teoria Generală/General Theory. (București: Fundația România de Mâine, 2004), 264. Art. 1 of the Convention for the Protection of Human Rights and Fundamental Freedoms proclaims: ***The high contracting Parties shall secure to everyone within their jurisdiction the rights and freedoms defined in Title I of this Convention.***

in the Vienna Conference on Security and Cooperation in Europe, held under the provisions of the Final Act relating to the consequence of the conference.[6]

We also believe that it is necessary to present other components of the **human dimension** which in our opinion results from the Seventh Principle of the Decalogue of the CSCE Final Act of Helsinki in 1975[7], and includes the following components: a. **the respect *for human rights and fundamental freedoms***, including freedom of thought, religion or belief for all without distinction as to race, sex, language or religion; b. **universal recognition for human rights and fundamental freedoms** and the commitment of participating states to respect them in their mutual relations and to strive individually and jointly, including in cooperation with the United Nations to promote universal and effective respect for them;

In this context, in our opinion, we must note the principles of human rights, democracy and the rule of law enshrined in the Charter of Paris for a New Europe[8], as follows: a. Heads of State and Government of participating States undertake to build, consolidate and strengthen democracy as the sole way of government of these states and nations, and for this purpose shall comply to: **a.1. *Human rights and fundamental freedoms* are inherent to all people, inalienable and guaranteed by law. a.2. Democracy is founded on respect for the human person** and the rule of law. a.3. Participating countries are ready to join all States and each of them in an effort **to protect the community and to determine the progress of the fundamental human values.**

1.6. In the Preamble to the Treaty on European Union[9] it is confirmed the commitment of the member states representative to the **principles** of freedom, democracy **and respect for human rights and fundamental freedoms** and the rule of law, principles which are common to the Member States (as amended by the Treaty of Amsterdam in 1997). It also expressed willingness **to deepen the solidarity between their peoples to respect their history, culture and traditions.** Moreover, in the article B of the Title I, among the Union's objectives it was introduced that of **strengthening the protection of rights and interests of nationals of Member States through the introduction of a citizenship of the Union**. Text mentioned is reiterated in the article B of the Treaty of Amsterdam amending the Treaty on European Union, the Treaties establishing the European Communities and certain related acts of 1997. In addition, the article F paragraph (2) states that "**The Union shall respect fundamental rights as guaranteed by the Convention for the Protection of Human Rights and Fundamental Freedoms** signed in Rome on 4 November 1950 and **as they result from constitutional traditions common to the Member States as principles of Community law.**

1.7. The second paragraph of the Preamble to the Treaty of Lisbon, December 2007[10] - regarding amendments to the Treaty on European Union and the Treaty Establishing the European Community enshrines the following principle on universal values: Inspired by the cultural, religious

[8] *Charter of Pars for a New Europe*, Published in the Official Gazette, Part I, no. 181 of 9 September 1991;

[9] *Traite sur L'Union Européenne, Le texte integral, Signé à Maastricht le 7 février 1992*, amended by the Treaties of Amsterdam in 1997 and Nice in 2001**,** *Journal L'Humanite*, Paris, 1992, p. 12;

[10] *Official Journal of the European Union, C30612*, of 17 December 2007; In addition, we must observe the general principle of Union's action on the international level which is based, among other principles, on the **principle of promoting the universality and indivisibility of human rights and fundamental freedoms** proclaimed in the paragraph 1and paragraph 2.a of the Chapter I of the Treaty, that sets states: **paragraph. 1** Union's action on the international scene **is based on the principles that inspired** the creation, development and its expansion and which it intends to promote to the wider world: democracy, rule of law**, the universality and indivisiblity of human rights and fundamental freedoms,** respect for human dignity, the principles of equality and solidarity and the respect for the principles of the United Nations Charter and international law. **Paragraph 2b consolidation and support** for democracy, rule of law, **human rights** and the principles of international law.

and humanist heritage of Europe from which the **universal values** were developed and that are **the inviolable and inalienable rights of the person**, and the freedom, democracy, equality and the rule of law. Also in the article 1 of the General Provisions of the Treaty is enshrined the principle that the **Union is founded *on the values of respect for human dignity, freedom, democracy, equality***, rule of law and **respect for human rights,** including rights of persons belonging to minorities. **These values** are common to the Member States in a society characterized by pluralism, non-discrimination, tolerance, justice, solidarity and equality between women and men.

Furthermore, we observe the principle of **promoting the values that contribute to the protection of human rights** stated in the paragraph 5 of the article 2 of the General Provisions of the Treaty: In its relations with the wider world, the Union **upholds and promotes its values** and interests and contributes to the protection of its citizens. **It contributes** to peace, security, the sustainable development of the planet, solidarity and mutual respect among peoples, free and fair trade, eradication of poverty and **protection of human rights** and especially child rights and the strict observance and development of international law, including the respect for the principles of the United Nations Charter.

1.8. The proclamation in the Preamble to the Charter of Fundamental Rights of the European Union,[11] of the following principles: **a)** the Union is founded on **the indivisible, universal values of *human dignity, freedom, equality and solidarity***; **b)** the Union places the individual at the center of its actions, ***establishing UE citizenship and creating an area of freedom, security and justice.*** **c)** The Union shall contribute to the preservation and development of these **shared values. d)** For this purpose, it is necessary ***to strengthen the protection of fundamental rights***;

1.9. The Title I of the Constitution of Romania, amended in 2003, entitled General Principles enshrines **the rights and freedoms of the citizens**, human dignity, free development of human personality, justice and political pluralism as **supreme values and guarantees theme,** article 1 paragraph 3;[12]

1.10. Multiplying the state and conventional constitutional laws at the regional and universal level by inserting, recognizing and allowing **protection to the moral values,** an idea supported by the doctrine of natural law;

1.11. We can find in Europe today, and this finding can be extrapolated to the international society that **all the values are transformed and their quintessence is determined**.

At least these considerations have led us to approach the concept of fundamental rights in the light of **supreme values** enshrined in the paragraph 3 of the article 1 of the Constitution of Romania, republished in 2003, in the light of common **European values, universal values** and the **components of human dimension**.

2. Conceptual demarcations in the field of value learning

The word axiology in Romanian comes from the Greek word **axios = value + logos = study.** In essence, we should note that axiology is a branch of philosophy which has as object of study the study of values.

On the other hand, the Romanian word for epistemology comes from the Greek word **episteme = knowledge + logos = study.**

In its substance, epistemology is part of gnoseology which has as object for study the **process of knowing** as it works within the sciences in general and the theory of scientific knowledge.

---

[11] *Official Journal of the European Union*, (2007/C 303/01);

[12] Romanian Constitution, revised in 2003, was published in the Official Gazette of Romania, Part I, no. 767 of October 31, 2003, article 1 paragraph (3) Romania is a state of law, democratic and social, in which human dignity, rights and freedoms, free development of human personality, justice and political pluralism represent supreme values, in the spirit of the Romanian people's democratic traditions and ideals of the Revolution of 1989, and are guaranteed;

By using the compound word **axiological-epistemological approach** we wanted to use in the scientific approach the study of value knowledge in the field of law.

We must point out the complexity of the study and its location in a condominium belonging to the philosophy of law, gnoseologiei and the field of law.

Referring to the time of all values transformation, Nicholas Râmbu[13] considered that now a new objective spirit, ie a new way of thinking and being, to value on and create, a new sensitivity are about to be set.

Moreover, **the reflection on values is a constant of the philosophical spirit**, but it becomes central in crucial moments of history. Besides that, people live in the world of values without being aware of them, as not aware of the air they breathe. In this respect it seems self-evident what is the truth, good, beauty, happiness, freedom, etc.

We consider that the author cited addressed an exhortation to becoming aware of the values and learning their content.

We can also say that the philosophy of value and knowledge of legal values has become more than ever a cardinal problem of the contemporary world. In addition, quantification of the values and their positivation became **a part of human society at national, regional and universal level**, thus tending to confirm Hegel's assertions according to ***which laws must, on one hand, to be an all over, closed, on the other hand, the continuing need for new legal determinations still remains.***[14]

We noted for this study the following concept of value, considering it general enough, comprehensive and sufficient to cover the research and its application in law, in particular in establishing the concept of fundamental rights in the lights of juridical values theory.

The concept value, in a philosophical, general sense, includes **the acquisition of certain things, events and actions to which a human society grants appreciation under their correspondence with its needs or necessities and the ideals generated by them.**[15]

The studies in the field support the idea that **values are related to all manifestation of social relations and human behaviour.**[16]

Regarding the criteria according to which the values were grouped, they are:[17] a. the validity of values; b. their quality; c. their subject; d. the reasons that have determined the values; e. their object; f; mental faculty from which these values arise; g. their scope.

We use the fifth criterion of classification, namely the object of values, according to which the values can be classified as economic, legal, ethical, political, etc. and the seventh criterion, their scope, according to which values can be individual, social and universal.

Starting from the idea enshrined in the philosophy that **man knows reality to use it we consider that between knowledge and value** there is a bi-univocal correspondence.

It follows that the foundation of value should be based on the science of logic and value theory. As the studies in the field have shown, **the object of value is value as a phenomenon, or as a given fact exterior to human.**

[17] Petre Andrei**,** *Filosofia valorii/Philosophy of Value*, ed. cit. p. 47; The autor considers that the following values are part of the social values: a. economic values; b. judicial values; c. political values; d. ethical values; e. historical values; f. aesthetic values; g. religious values; h. cultural and social values;

Referring to the philosophy of value, Petre Andrei[18] considers **philosophy as the science of the ultimate values of truth and life**, highlighting the subjective nature of philosophy, since we do not know realities, but the values we ascribe to psychological and logical datum which we objectivate.

Consequently, the great problems of the philosophy of values can be summarized in three main categories of research: that of reality, that of knowledge and that of action.

Given the above, we believe that we can study the universal, regional and constitutional theory of values structuring it on two generally accepted levels of genesis:

a. knowing the reality and the configuration of the social values to which a human community gives appreciation based on their correspondence with the essential requirements or needs determined by society's objectives and goals and its general ideals;

b. the recognition of values or valuing the social values for creating a table of values or their hierarchy;

The two levels of value genesis are generally applied not only in the study of philosophy and sociology of value, but they have the same application in the study of social reality in different fields, such as: economic, political, legal, ethical, historical, aesthetic, religious, social, cultural, etc.

It follows that interdisciplinary approaches to the theory of values is a constant of the modern science, a study condominium in contemporary sciences.

We conclude that in the national, regional and universal society today there are many values in the fields mentioned above, which have an open content.

As Petre Andrei[19] said, the **judicial values could be the object of a science of law**, a legal sociology or a philosophy of law, as we study them as formal, rational phenomena, imposed by the state as social regulatory phenomena or abstract concepts of social reality of practical life.

Through the law, the individuals' behavior is subject to rules or mandatory rules in the social life. These mandatory rules or rules of conduct are general, impersonal and apply iterative when the reality or the fact circumscribed to it appears.

Also on the legal values, another author makes the following statement: **judicial value** is thus a **normative value**, from a special point of view which is that of the justice of an action. It is not a normative value of existence, as it is about obligations, we say it is true that a person is required or not to do something, and not that it is true that his action exists or not[20].

It follows that the dyad of the value genesis above is not sufficient for judicial values.

c. Therefore, it requires a third level of the genesis called the **realization of the value by its positivation, which means passing a value from the non-legal, moral or customary field in the field of law.**

Starting from the idea that **values are social phenomena, legal values are related to all manifestations of individual behavior in society.**

Human rights as value are rooted in the historical development of human society, as theorized by both natural law doctrine and the doctrine of positivism.

We must point out that the first two levels of value genesis have a social character, they are outside the law and only after positivation they become judicial values.

Positivation implies a shift in the value from non-legal field to the legal field, thus becoming a value in positive law.

---

[18] Ibid, p. 13;

[19] Ibid**,** p. 128

[20] Mircea Djuvara**,** *Teoria generală a dreptului(enciclopedia juridică), Drept rațional, izvoare și drept pozitiv/General Theory of Law, Rational Law, Sources and Positive Law* Editura All, Bucharest, 1995, p. 439 – 442; on the same line of thought the author adds: **The legal rules are thus violated, by their very definition and nature,** they can not claim to ascertain facts, ie if they are broken or not, also the **laws of science say what is and can be seen, but will never lay down in the final analysis what we are rationally obliged to do based on ideas of justice,** as a rule of practice sets.

The values of positive law form a system of values. As the system of law has a hierarchy of rules and its branches, it follows that the value system of positive law also experiences such a hierarchy.

In essence, taking into account the above, in our opinion, in this field there is the following system of hierarchy of values, but we do not consider it comprehensively approached:

2.1. Absolute values, as determined by the philosophy of law as a science of the ultimate values of reality and life that can not be challenged, of which we mention: the truth, good, beauty, happiness, right, justice, life, liberty, equality, dignity , good faith, the rule of law, etc.

2.2. Universal values, universally accepted by the international community at the United Nations level or European regional community at the European Union level and proclaimed expresis verbis in the preamble or normative content of international or European documents of which we mention: **the inviolable and inalienable right of individual**, freedom, democracy, equality, human dignity, solidarity, the worth of human person, etc.

2.3. Supreme or fundamental values, superior to legal order of a state, proclaimed expressis verbis by the general principles of the State Constitution, for which the Constitution is the supreme law or the law of laws. For example, the 1991 Constitution, revised in 2003, declares expressis verbis in the article 1 paragraph 3, entitled General Principles, the following **supreme values**: human dignity, **rights and freedoms of citizens**, development of human personality, justice and political pluralism.

2.4. Relative values enshrined as judicial values and related to other values or other reference system of values against which they define. For example, protection of judicial values by the other fields of law, of which we mention: the protection of human rights by means of criminal law, civil law, labor law, financial law, etc.

2.5. Moral values are required to be discussed in the theory of value in law. If legal values are imposed by the legislature, ie outside the will of the individual, moral values or moral law is an externalization of the individual personality and is imposed by the interior, because, as Ihering says, the moral man is the product of social evolution. In essence, we must remember that both values are rules of conduct for the individual except that for non- complying with the moral values can not be applied the coercive force of the state. Finally, we must remember that absolute values should also be subject to positivity in law in order to be realized, but only as part of universal or regional documents or in the content of the fundamental laws.

Moreover, **moral values** must be discussed in the context of this study taking into account the constitutional provisions of article 11, paragraph 1 that proclaims that: The Romanian State pledges to fulfill **in good faith** the obligations deriving from the treaties it is party. We noticed the following definition of morality: **a set of concepts and rules of right or wrong, just and injust, allowed or disallowed**[21]. Good faith is a moral concept deriving from international customary law of compliance by states with their obligations in treaties concluded by the will of their agreement.

In our opinion, **the set of values of the European Union** should build a condominium with the **set of national values** so that the **European peoples to feel part of the same Union**, thus defining a set of values that can be called the **Union's ethics.**

Finally, we must observe that absolute values can be subject to their positivation in law, but only as part of universal or regional standards or normative content of the fundamental laws of the states.

[21] Ioan Ceterchi, Momcilo Luburici**,** *Teoria generală a statului şi dreptului/General Theory of state and Law,* Tipografia Universităţii din Bucureşti, Bucharest, 1983, pp. 104 – 106;

3. A diachronic approach to the concept of fundamental rights and its consequence in approaching the concept of fundamental rights in light of the theory of judicial values-selective aspects

In our opinion, through the diachronic approach to the concept of fundamental rights we can establish the first determination of relativity on the development of criteria under which some rights are considered fundamental and others, not at different times that accompany a state constitutional development and terminology evolution under which these rights are identified. It is also why we kept for this study K. Mbaye's statement that **human rights history is identical with the history of mankind.**[22]

Defining fundamental rights of citizens has been a constant concern of legal doctrine.

In a diachronic approach to defining the fundamental rights of citizens, we find that the first Romanian constitutionalists have perceived the ideas and principles of the French Declaration of Human Rights and Citizen and the theory of natural law. We believe that in general, the content of the definition refers to the normative constitutional document come in force or its evolution over time.

Thus, Constantin G. Dissescu[23] entitled the Chapter IV Rights of the course Romanians Rights, but defining the law as regulatory of the liberties and retaining that the fundamental problem of social organization lies in the harmonization of freedoms, it concludes that the fundamental law regulates these freedoms and guarantees them in the article 5-30.

They form, according to this consideration the Rights of Romanians proclaimed in the Title II of the Romanian Constitution of 1866.

Finally, it is mentioned that the **Rights of Romanians** are the common freedoms of Romanians and foreigners on the Romanian territory and he names them names **public freedoms.**

Starting from the theory of natural law the author refers to the close link between human rights and freedoms by stating that **the right derives from liberty**. On the other hand **freedom is conscious exercise of will, the will in contest with life, intelligent being is entitled to develop in his order by reason.**

Defining **freedom** legally as **human faculties and powers of human beings, it results that each faculty or power is a right or privilege. For these reasons it confuses right and freedom, so freedom is a right as a right is a freedom.**

We can thus see that the idea of freedom was not known by the ancient city.

In the Middle Ages appears the doctrine of natural law, establishing one of the fundamental principles according to **which man as a human being is endowed by nature with rights specific, previuos and opposable to the state.**

Starting from the idea of individual freedoms proclaimed by the French Declaration of Human Rights and Citizen, Paul Negulescu shows that **public rights, also called public freedoms, or the rights of man and citizen, are faculties, opportunities recognized by the constituant legislature for all members of society, apart from special restrictions, in order to help improve and preserve the individual himself.**[24]

We conclude that in terms of legal nature between law and freedom there is no difference, these opportunities, these faculties recognized by the legislature to human being are guaranteed to each and to other individuals and to the community in which the human being lives.

---

[23] Constantin G. Dissescu, *Dreptul constituțional/Constitutional Law*, Editura librăriei SOCEC & Co., Societate anonimă, 1915, p. 440 et seq.

[24] Paul Negulescu, Curs de drept constituțional român/Romanian Constitutional Law Course, Edited by Alex. Th. Doicescu, Bucharest, 1927, pp. 512-513.

It is also considered that these freedoms **are subject to restrictions only because one's freedom is limited by another's** freedom and because of the need for conservation and development of the state itself. As proclaimed in the article 4 of the French Declaration of the Rights of Man and Citizens**, freedom is the power to do anything which does not harm another: therefore, the only limits to the exercise of each person's natural rights are those which ensure that the other members of the community enjoy those same rights**.

From the above, we must accept the idea that although the Constitutions of Romania of the years 1866, 1923 and 1938 constantly proclaim in the Title II the **Rights of Romanians**, they are called in the studies in the field either **public liberties** or **public rights** or **rights of man and citizen.**

Romanian Constitutions of 1948, 1952 and 1965 enshrine the **fundamental rights of Romanian citizens**, and the Romanian Constitution of 1991 proclaims the **rights, freedoms and fundamenta duties.**

Given the constitutional considerents in our legal field, many authors have defined the concept of fundamental rights.

Nistor Prisaca, from theoretical considerations, suggests the following definition: **fundamental rights of citizens are those powers of the citizens to perform certain actions, essential to ensure its existence and socio-political and cultural development that are enshrined in the constitution and guaranteed through economic base and the coercion of the state.**[25]

The definition includes the following components:

a) Fundamental rights are those powers of the citizen to exercise certain actions;

b) Performing these actions is essential to ensure his existence and socio-political and cultural development;

c) Fundamental rights are provided in the Constitution and are guaranteed through the economic base and the coercion of the state;

d) State coercion is exerted against those who try top revent citizens to exercise their fundamental rights enshrined in the Constitution and other laws.

Tudor Drăganu, referring to the **Fundamental Rights of Citizens** states: **the concept of fundamental rights of citizenship designates those rights of citizens, essential for the physical existence and psychological integrity, for their material and intellectual development, as well as to ensure their active participation to the leadership of the state and are guaranteed by the Constitution itself.**[26]

In an axiological approach, the author emphasizes that the fundamental rights of citizens are fundamental social values, being essential for the phisical existence and psychological integrity, for material and intellectual development of the citizens and to ensure their active participation in state lidership.

Because of their overriding importance, they are guaranteed by the Constitution of Romania itself.

Ioan Muraru and Elena Simina Tănăsescu, following scientific arguments, propose the following definition: **Fundamental rights are those subjective rights of citizens, essential to their life, liberty and dignity, essential to their free development of human personality established by the Constitution and guaranteed by the Constitution and laws**[27]. Regarding the establishment of criteria by which certain rights are considered essential or not the authors noted that **this criterion leads to world of values** and the most important problem is the selection of the values and their

special legal protection. The author also states that **certain subjective rights, because of their importance, are selected on a value criterion and are considered fundamental rights.**

In order to define the concept of **fundamental rights** the following were taken into account:

a) fundamental rights are subjective rights of the citizens;

b) these rights are essential for citizen's life, freedom, and dignity, indispensable for the free development of human personality;

c) fundamental rights are set by the Constitution and guaranteed by Constitution and laws.

Ion Deleanu, referring to the **rights of citizens** or **public freedoms'**, states: We called them **fundamental not only because they are enshrined and essentially guaranteed by the basic law, but – especially – because they are the nucleus around which revolve all the other subjective rights**. [28]

This definition highlights the fact that fundamental rights are enshrined and essentially guaranteed by the fundamental law and they are the nucleus around which revolve all other subjective rights.

The French constitutional work consulted studies the **human rights, public freedoms, the rights and freedoms of citizens and fundamental freedoms.**

We note that the terminology used is not uniform. The synonym of the Romanian concept of **fundamental rights** in French terminology is the concept of **public freedoms**.

A general definition of this concept states that **public freedoms are human rights recognized, defined and protected by law.**[29]

Starting from the fact that freedom should not be reduced to a single meaning, Jacques Robert[30] considers that it should have at least two senses:

a) the first sense, freedom is the absence of constraint, which he names actual freedom, which is the same as guaranteeing a private sphere where every human being is master of his own;

b) the second sense, the freedom is the power to act and have the right or power to achieve this or that act, which is considered normative freedom or protected freedom.

According to the first sense, the public freedom is a freedom granted to all individuals, so that its exercise by anyone should not result in any case to a harm to exercising the same freedoms of another.

According to the second sense, **the public freedom** is defined broadly and narrowly.

In a narrow sense, **the public freedoms** are freedoms enshrined in the Declaration of Rights or the Preambles, the essential rights and freedoms being specifically mentioned.

In this sense, not every public freedom should be a freedom constitutionally declared.

In a broad sense, **the public freedoms** are any right recognized by law; this obviously includes constitutional texts and that of declaration of rights.

These public freedoms will be referred to as recognized freedoms.

The fundamental freedoms are placed, in author's opinion, among the public freedoms, declared and recognized. Approaching axiologically the issue of fundamental freedoms, **fundamental freedoms** are considered to be the rights having a certain social importance, meaning that they are considered to have a fundamental character. They do not represent a immutable list, being always subject to revision.

Claude Albert Colliard[31], states that the expression **public freedoms** comes from the article 34, paragraph (2) of the French Constitution of 1958 which reserves the field of **public freedoms** to be regulated exclusively by the Parliament. Moreover, the law lays down rules on: civil rights and

[30] Jacques Robert, Droits de l'homme et libertés fundamentales, Edition Montchrestien, Paris, 1993, pp. 13-22.

[31] Claude Albert Colliard, Libertés publiques, Septieme édition, Edition Dalloz, Paris, 1989, pp 21-29.

fundamental guarantees given to the citizens to exercise public freedoms... Constitutional Advisory Committee has proposed to define by law the exact content and meaning of the concept of **public freedoms** as the definition of doctrine is never very precise, always founded on excesses of exegesis or refinements of subtlety.

The author states from the beginning that **public liberties** exist only in positive law and by positive law, which leads to the result that they vary in space and time. It follows that legal rules can only protect the natural rights of human beings, and that positive law is the only real legal framework of public freedoms.

Following these considerations it is necessary to propose a general definition of **public freedoms** which **are rights that individuals benefit from and that are analyzed by recognizing them for individuals in a certain field of autonomy**.

This general notion can be clarified if it is successively applied to the following three fields:

a) the relationship between individual and public power;

b) public freedoms and their collective character;

c) public freedoms and positive obligations from the state.

Regarding the relationship between individual and public power, public freedoms are rights belonging to individual and that constitute limitations of state power or negative obligations of the state.

Regarding the collective nature of civil liberties, this means that public freedoms are individual, but when an individual acts without constraint and the action takes place in a social context in relation to other humans it can acquire a collective character.

Also, positive obligations from the state were classified into two broad categories:

a) obligations provided and organized

b) set or virtual obligations.

Positive obligations, separated by public liberty itself may give in reality its full sense.

Set or virtual positive obligations generally refer to economic and social rights that are considered public freedoms.

They are known as set or virtual because their framework is established by the constituent but the legislature is not required to meet them.

Given the general definition applications in the three fields mentioned, we propose the following definition is strictly legal sense: **public freedoms are legal situations and those established** by acts issued by the competent executive authorities in which the individual is granted the right to act without constraint within the limits set by positive law in force and may determine, under judicial control, the police authority obliged to maintain public order.

Jean Rivero,[32] referring comparatively to **human rights and public freedoms, shows that public freedoms have at least the benefit of being a reality in the legal sense, through public liberties the State recognizes the right of individuals to exercise, away from all external pressures, a number of specific activities.**

This recognition implies, in a variable manner according to legal systems, a relatively solemn formulation and the existence of real guarantees, most often national and jurisdictional but equally nonjurisdicțional or supranational.

The definitions observed for this study reveal a diversity of terminology in addressing fundamental rights, and a variety of views on the establishment of the concept proposed by the authors over time.

The research on these views allows us to deepen the individual's development in society, both in relation with state power and in relation to other individuals and the group to which it belongs.

[32] Jean Rivero, Les libertés publiques, Tome 1, *Les droits de l'homme*, Presses Universitaires de France, Paris, 1991, p. 12. and p. 109.

From the analyze of the diachronic approach on the fundamental rights presented above and the observations formulated, in our opinion, the conclusion emerges that it can be regarded ***as a first determination of relativity which can be subsumed to the concept of fundamental rights.***

A definition of fundamental rights includes the identification of its components on the basis of scientific criteria that achieve a more complete picture of the legal dimensions and capture their essential features.

Regarding the terminology adopted, that of **fundamental rights**, it is suggested by the Title II of the Constitution entitled **Fundamental Rights, Freedoms and Duties.**

Given that between **right** and **freedom** there is no difference in terms of legal nature, we proceeded to the above generic definition. This terminology was also suggested by the **Universal Declaration of Human Rights** and the two covenants, namely the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights. Certainly, in terms of terminology, we can also define the **fundamental rights and freedoms** by taking strictly the constitutional text.

From the considerations above, **we observe a current trend in the general use of values criterion and legal values in particular to identify the fundamental rights and to determine their essential or primordial character for citizens**.

This current trend is determined as mentioned above by the universal and European regional documents on human and citizen rights that **proclaim those rights as universal, European or common values** in their preamble.

We must remember that, in our opinion, the fundamental law of Romania has used these principles by enshrining them in the general principle set in the paragraph 3of the article 1 as the **supreme values of human and citizen rights, human dignity and free development of human personality and guaranteeing them by the Constitution of Romania.**

These **three components proclaimed supreme values together with the component of human dimension will form the constant or primordial core of the concept of fundamental rights.**

Also, for this study it is necessary to take into account the **criterion according to which the human being, man, is always in the space of a sovereign state.** The citizen, because of its constitutional relationship to citizenship, benefits from the universality of rights and freedoms enshrined in the Constitution and other laws and has the obligations set by them.

According to this criterion, in our opinion, it can be subsumed **a second determination of relativity, which relates to the economic, social, political and cultural context of a society organized as a state** and that determines the use and exercise of fundamental rights guaranteed by the constitution and laws.

From the justification of the scientific approach observed in the first part of the study, in our opinion, it is required that in establishing the concept of fundamental rights we must take into account the international community, in terms of the normative standards both universally represented by the UN and at European regional level represented by the European Union's system, which is also concerned with protecting and promoting the human rights and fundamental freedoms. We can talk about a **universalization of basic human rights.** Gaining universal recognition, the human rights are indivisible and inalienable, inherent to human being.

In this regard we must subsume to the concept of fundamental rights **a third determination of relativity** on the criterion of **the synchronism between internal law and treaties on fundamental human rights, to which Romania is party.**

This criterion of relativity is suggested by the provisions of the paragraph 2 of the article 11 of the Romanian Constitution, republished, which establishes the following constitutional rule: **Treaties**

ratified by Parliament, by law, are part of the internal law. This process involves an analysis of simultaneity for the process of valorisation and positivation of human and citizen rights on the three levels, namely: universal, regional and state or national level. But in the case of positivation a lack of synchronism can occur on the three levels mentioned. To support this theory, we mention as argument, the provisions of the Constitution of Romania, revised, referring to the **International Treaties concerning human rights** which proclaims that: **if there are inconsistencies between the covenants and treaties on fundamental human rights to which Romania is party and internal laws, the international regulations shall prevail, unless the constitution or domestic laws contain provisions more favorable.**

In our opinion, the **diversity of approaches to the issue of human and citizen rights** on the three levels, namely: universal, regional and state or national, can be explained by the **heterogeneity of the international community**, part of which will be subordinated to the fourth determination of relativity.

Summarizing the above considerations, from the perspective of judicial values we define **fundamental rights as being those subjective rights of individual and citizen, components of the human dimension, which in an axiological approach are primordial to their dignity and freedom and for the free development of human personality, universal values, common European values and Romanian supreme values, enshrined and guaranteed by the universal and European standards and by Constitution of Romania and which subsumes four determinations of relativity: the first determination of relativity relates to addressing human rights developments over time; the second determination of relativity relates to the approach in the economic, social, political and cultural context of a society organized in a state; the third determination of relativity concerns the lack of synchronism between the regulations at universal or regional level and at state or national level; the fourth determination of relativity relates to the diversity of approaches in human rights issues explained by the heterogeneity of the international community.**

Conclusions

The objective to define the fundamental rights in terms of values in general and judicial values in particular, in our opinion was achieved. The foundation of this concept was suggested to us by the constitutional principle enshrined in the paragraph 3 of the article 1 of the Romanian Constitution, republished, which proclaims human dignity, rights and freedoms of the citizens and the free development of human personality, supreme values and their guarantee, and the general principles contained in the Preamble to the universal and European standards on human and citizen rights, that proclaims those rights as values. From these documents, we identified and noted the enshrinement of the following values for the concept of fundamental rights: **the supreme values, common European values, universal values,** and **components of the human dimension.**

Establishment the concepts in the field of values in general and judicial values in particular, we examined the learning and study of values on three levels of genesis and their systemic approach, an approach that involves their hierarchization, **setting the place of supreme values** in this hierarchy. In logical order, we identified the four determinations of relativity that have been subsumed to the concept.

The proposed concept can be considered a contribution to the expansion of research on constitutional law and human and citizen rights, in line with the current trends in the field.

Also, the proposed concept opens a complex and complete vision, but not exhaustive in this field.

The scheme-key proposed to justify the scientific approach, the scheme-key proposed to study the field of learning values and the determination of relativity can be replicated and extended to other fields such as justice, political pluralism, human dignity, etc.

DEATH ON REQUEST

LAURA-CRISTIANA SPĂTARU-NEGURĂ*

Abstract
The topics of euthanasia and assisted suicide are of profound importance in terms of law, ethics, religion, and social values. The question whether assisted dying should be legalised is often treated, by judges and commentators alike, as a question which transcends national boundaries and diverse legal systems. In this article we seek to examine the ECtHR's approach, the different legal routes by which attempts are made to legalise assisted dying and improvements in end of life decision making. In this article, we shall try to answer the question of whether or not voluntary euthanasia and assisted suicide are morally and legally acceptable.

***Keywords**: euthanasia, assisted suicide, assisted dying, right to life, ECHR*

1. Introduction

The first substantive right proclaimed by the European Convention on Human Rights (the "*Convention*") is the right to life, set out in Article 2[1]. The right to life is listed first because it is the most basic human right of all: if one could be arbitrarily deprived of one's right to life[2], all other rights would become illusory. The fundamental nature of the right is also clear from the fact that it is "*non-derogable*": it may not be denied even in "*time of war or other public emergency threatening the life of the nation*".

The Convention does not otherwise clarify what "*life*" is, or when it *begins* or *ends*. Indeed, in the absence of a European (or worldwide) legal or scientific consensus on the matter, the Commission (when it existed) and the Court were unwilling to set precise standards in these regards. As the Court put it in the case of Vo v. France[3]:

(…) the issue of when the right to life begins ***comes within the margin of appreciation*** *which the Court generally considers that States should enjoy in this sphere, notwithstanding an evolutive interpretation of the Convention, a "living instrument which must be interpreted in the light of present-day conditions" (…)* ***there is no European consensus on the scientific and legal definition of the beginning of life***.

Rather than imposing a uniform standard, the Commission and ECtHR thus assessed and assess matters relating to the beginning of life only in a marginal way, ***on a case-by-case basis***, while leaving considerable freedom to States to regulate the matters in question themselves, as long as they approach them in an appropriate way, in particular by giving appropriate weight to the various interests at stake and by carefully balancing those interests. This can be noticed from the case-law of the Convention organs on abortion, euthanasia and assisted death. The term of "*abortion*" is well known, but the terms of "*euthanasia*" and "*assisted suicide*" are controversial.

[1] (*1) Everyone's right to life shall be protected by law. No one shall be deprived of his life intentionally save in the execution of a sentence of a court following his conviction of a crime for which this penalty is provided by law. (2) Deprivation of life shall not be regarded as inflicted in contravention of this Article when it results from the use of force which is no more than absolutely necessary: (a) in defence of any person from unlawful violence; (b) in order to effect a lawful arrest or to prevent the escape of a person lawfully detained; (c) in action lawfully taken for the purpose of quelling a riot or insurrection.*

[2] "*Life*" here means *human life*: neither the right to life of animals, nor the right to existence of "*legal persons*" is covered by the concept;

[3] Vo v. France, Application no. 53924/00;

Hippocrates mentioned *euthanasia* in the Hippocratic Oath, "*To please no one will I prescribe a deadly drug nor give advice which may cause his death*". "*Active euthanasia*" refers to a deliberate act to accelerate the death of a dying patient. Euthanasia comes from the Greek word "*eu*" which means "*goodly*" or "*well*" and "*thanatos*" meaning death[4].

"*Assisted death*" is a model that includes both what has been called *physician-assisted "suicide"* and *voluntary active euthanasia*. It suggests a difference in the degree of involvement and behaviour. "*Physician-assisted suicide*" entails making lethal means available to the patient to be used at a time of the patient's own choosing (*at the patient's autonomous request*). By contrast, *voluntary active euthanasia* entails the physician taking an active role in carrying out the patient's request, and usually involves intravenous delivery of a lethal substance. Physician-assisted suicide is seen to be far easier emotionally for the physician than euthanasia as he or she does not have to directly cause a death; he or she merely supplies the means for the patient's personal use[5].

Despite the fact that *autonomy* has been used in many distinct senses, it seems that in biomedical ethics there is a common core understanding of the meaning of this notion. According to this idea, autonomy means self-government[6]. If a person's decisions, beliefs, desires are due to such external influences as unreflected socialization, manipulation, coercion, and brainwashing, they are not autonomous but heteronomous. If a person's beliefs concerning some matter are false, inconsistent with each other, or she is insufficiently informed about that matter without realizing it, then she is not autonomous with respect that matter. Similarly, if a person's behaviour results from such things as compulsion and weakness of will, then it is not autonomous but heteronomous.

Thus, is there a right to die according to the Convention? Could we interpret that the suicide, assisted suicide and euthanasia are allowed by the Convention?

2. Paper content

2.1. Does the jurisprudence of ECtHR acknowledge the existence of a *"right to die"*?[7]

Article 2 of the Convention requires that everyone's "*right to life*" be "*protected by law*". Apart from the death penalty, it envisages only limited circumstances in which a person can be deprived of this right; none of these relate to suicide or euthanasia. This raises **several difficult and overlapping sets of questions**. *First* of all: when does life – and therefore the right to protection of life by law – end? *Secondly*: is it acceptable to provide palliative care to a terminally ill or dying person, even if the treatment may, as a side-effect, contribute to the shortening of the patient's life? And should the patient be consulted on this? *Third*, may or must, the State "*protect*" the right to life even of a person who does not want to live any longer, against that person's own wishes? Or do people have, under the Convention, not just a right to life, and to live – but also *a right to die* as and when they choose: to commit suicide? And if so, can they seek assistance from others to end their lives? And *fourth*: can the State allow the ending of life in order to end suffering, even if the person concerned cannot express his or her wishes in this respect? Perhaps surprisingly, the first, second and fourth of these sets of questions have not (*yet*) been put to the Commission or the Court – but the case-law on abortion and on the third question does provide some indications of the probable approach of the Court.

The first issue could arise, in particular, in a case in which the authorities in a member State of the Council of Europe had decided to switch off life-support machines at a certain moment when

[4] Goodman James, *The Case of Dr Munro: Are There Lessons to be Learnt?*, Medical Law Review, 18, Winter 2010, p. 564;

[5] Available at http://www.worldrtd net/taxonomy/term/475;

[6] Jukka Varelius, *Voluntary Euthanasia, Physician-Assisted Suicide, and the Goals of Medicine*, Journal of Medicine and Philosophy, Vol. 31, No. 02, February 2006, p. 122 – 123;

[7] Available at http://www.coe.int/t/dghl/publications/hrhandbooks/index_handbooks_en.asp;

they deemed the person attached to the machines was no longer alive, but where this was disputed by relatives. However, as with the beginning of life, there is no European (or wider) legal or scientific consensus on when this moment is – except perhaps that death is not a moment, but *a process*, which suggests that it is scientifically, and thus arguably also legally, impossible to provide a clear-cut answer to the question. The Court would leave the answer to the question of when life ends – like the question of when life begins – primarily to the States. In practice, in the member States, the issue tends to be whether life-support machines can be switched off even before a person is "*clinically dead*" (whenever that may be), in order not to unduly extend the dying process[8]. The question that arises under the Convention in such cases is whether the law in a member State which allows the switching off of the life-support machines still adequately "*protects*" the right to life of the person concerned. However, even in these terms the issue has not yet come up in the case-law. In view of the case-law on demands for assisted suicide, discussed below, it is likely that the Court, if and when it is faced with this issue, will leave a wide margin of discretion to the States. The issue is closely linked to, indeed shades into, the second question: whether it is permissible to provide palliative treatment to a terminally ill or dying person, if this treatment has the side effect of hastening the patient's death. On this issue, the Parliamentary Assembly of the Council of Europe recommends that the member States should:

ensure that, unless the patient chooses otherwise, a terminally ill or dying person will receive adequate pain relief and palliative care, even if this treatment as a side-effect may contribute to the shortening of the individual's life[9].

It is notable that the Court, in the case of Pretty discussed below, expressly referred to Recommendation 1418 (1999). In view of the apparently wide consensus on this matter, and the express recognition of freedom of choice for the individual in this recommendation and in State practice, the Court is likely to accept that such an approach does not contravene the Convention. The fourth issue – whether euthanasia can be in accordance with the Convention even in the absence of a clear expression of the will of the person concerned – has also not been determined by the Convention organs. Here, too, there is somewhat clearer ground, in the sense that such "*mercy killings*" are clearly not regarded as acceptable in Recommendation 1418 (1999), and in that there are no Council of Europe member States that allow for active termination of life, other than at the request of the patient. Because of this apparent consensus, and given the emphasis which the Court places on "*personal autonomy*" it is possible that the Court, if confronted with this question, would feel that States that would depend on the circumstances of the case. The only cases in this field so far have concerned the third set of questions: whether a seriously physically ill but mentally fit person has a right to choose to die by committing suicide rather than to go on living, and whether, if so, that person can seek assistance from others in the taking of his or her life, or whether the State has the right, or the duty, to intervene to prevent this. The Court has assessed these questions at different times, in different contexts, and by reference not just to Article 2, but also to other articles of the Convention. It has, in particular, linked its considerations under Articles 2, 3 and 8 in a way that is illustrative of its holistic approach to the rights protected in the Convention. The 1984 case of *X v. Germany*[10] concerned a prisoner who had gone on a hunger strike and who was forcibly fed by the authorities. X complained of this treatment, arguing that it constituted inhuman and degrading

[8] An example is a case before the High Court of England in August 2005, in which most of the medical experts argued in favour of withdrawal of life support from a patient, Mr. A, but relatives, backed by one doctor, argued against this. The Judge, Mr Justice Kirkwood ruled against the relatives, on the basis that: "*It is in [Mr A's] best interests that he be allowed a peaceful and dignified death. Everything should be done to support him in that, including hydration and nutrition, but it's not in his best interests that he should continue to be subjected to painful and undignified medical processes which do nothing to improve his terminal condition.*"

[9] Recommendation 1418 (1999), paragraph 9, at (a) (vii); available at http://assembly.coe.int/main.asp?link=/Documents/AdoptedText/ta99/EREC1418 htm;

[10] *X v. Germany*, Application no. 10565/83;

treatment, contrary to Article 3 of the Convention. However, he did not argue that, under the Convention, he had a right to choose to die by starving himself. The Commission dismissed the application in the following terms:

In the opinion of the Commission forced feeding of a person does involve degrading elements which in certain circumstances may be regarded as prohibited by Article 3 of the Convention. Under the Convention the High Contracting Parties are, however, also obliged to secure to everyone the right to life as set out in Article 2. Such an obligation should in certain circumstances call for positive action on the part of the Contracting Parties, in particular an active measure to save lives when the authorities have taken the person in question into their custody. When, as in the present case, a detained person maintains a hunger strike this may inevitably lead to a conflict between an individual's right to physical integrity and the High Contracting Party's obligation under Article 2 of the Convention – a conflict which is not solved by the Convention itself. The Commission recalls that under German law this conflict has been solved in that it is possible to force-feed a detained person if this person, due to a hunger strike, would be subject to injuries of a permanent character, and the forced feeding is even obligatory if an obvious danger for the individual's life exists. (…) The Commission is satisfied that the authorities acted solely in the best interests of the applicant when choosing between either respect for the applicant's will not to accept nourishment of any kind and thereby incur the risk that he might be subject to lasting injuries or even die, or to take action with a view to securing his survival although such action might infringe the applicant's human dignity.

It is notable that the applicant in this case was a prisoner, and that he did not claim a "*right to die*". Prisoners are under stress by nature of their confinement, which may make them suicidal even if they would not normally be, while the State authorities are under a special duty of care towards them.

More pertinent to the general question about the existence of a "*right to die*" are therefore two cases, *Sanles Sanles v. Spain* and *Pretty v. the United Kingdom*. The first of these concerned a man, Mr Sampedro, who had been a tetraplegic since the age of twenty-five and who, from 1993, when he was about fifty, had tried to obtain recognition from the Spanish courts of what he claimed was his right to end his life, with the help of others (including, in particular, his doctor), without interference by the State. However, he died before the proceedings in Spain had come to an end, and the relative he appointed as successor to this claim, Mrs Sanles Sanles, was held by the Spanish courts and by the European Court of Human Rights to have no standing in the matter, i.e., in the latter forum, not to be a "*victim*" of the alleged violation of the Convention.

The issues raised in the *Sanles Sanles* case did at last come directly before the Court in the subsequent case of *Pretty v. the United Kingdom*[11]. The case was brought by a 43-year-old married woman, Mrs Dianne Pretty, who was suffering from a degenerative and incurable illness, motor neurone disease (the "*MND*"), which was at an advanced stage. Although essentially paralysed from the neck down, and incapable of decipherable speech, her intellect and capacity to make decisions were unimpaired. Frightened and distressed at the suffering and indignity she would have to endure if the disease were to run its course, but unable to commit suicide by herself, she wanted her husband to assist her in this. In the United Kingdom, committing suicide is not a criminal offence, but encouraging or assisting someone else to commit suicide is (under the Suicide Act 1961). However, prosecutions can only be brought with the consent of the Director of Public Prosecutions (the "*DPP*"), a senior law officer, who can exercise discretion in the matter. Mrs Pretty therefore sought an assurance from the DPP that he would not prosecute her husband if he were to assist her to commit suicide in accordance with her wishes, but the DPP refused. The United Kingdom courts upheld the DPP's decision not to give the undertaking, after detailed analysis of the case-law of the European Commission and Court of Human Rights. Mrs Pretty then turned to the European Court of Human Rights.

[11] *Pretty v. the United Kingdom*, Application no. 2346/02;

The Court admitted the case and, apart from receiving submissions from the applicant and the respondent Government, also allowed third-party interventions by the Voluntary Euthanasia Society[12] and by the Catholic Bishops' Conference of England and Wales. The Court also quoted parts of paragraph 9 of Recommendation 1418 (1999) of the Parliamentary Assembly of the Council of Europe, already mentioned, in which the Assembly recommends:

(…) that the Committee of Ministers encourage the member States of the Council of Europe to respect and protect the dignity of terminally ill or dying persons in all respects: (…)

c.by upholding the prohibition against intentionally taking the life of terminally ill or dying persons, while:

i. recognising that the right to life, especially with regard to a terminally ill or dying person, is guaranteed by the member States, in accordance with Article 2 of the European Convention on Human Rights which States that "no one shall be deprived of his life intentionally";

ii. recognising that a terminally ill or dying person's wish to die never constitutes any legal claim to die at the hand of another person;

iii. recognising that a terminally ill or dying person's wish to die cannot of itself constitute a legal justification to carry out actions intended to bring about death[13].

The Court was quite dismissive of the claim that Article 2 of the Convention should be read as granting individuals a right to commit suicide. It noted, with reference to earlier case-law on various issues under Article 2, that, "*in certain well-defined circumstances*", the article may impose a positive obligation on State authorities "*to take preventive operational measures to protect an individual whose life is at risk*", and that this also applied to "*the situation of a mentally ill prisoner who disclosed signs of being a suicide risk*". However, as the Court pointed out:

The Court is not persuaded that "the right to life" guaranteed in Article 2 can be interpreted as involving a negative aspect. (…) ***Article 2 cannot, without a distortion of language, be interpreted as conferring the diametrically opposite right, namely a right to die; nor can it create a right to self-determination in the sense of conferring on an individual the entitlement to choose death rather than life****. The Court accordingly finds that no right to die, whether at the hands of a third person or with the assistance of a public authority, can be derived from Article 2 of the Convention. It is confirmed in this view by the recent Recommendation 1418 (1999) of the Parliamentary Assembly of the Council of Europe (…)*[14].

However, the Court was careful to stress that this ruling did not mean that if a particular State does recognise such a right (as does Switzerland, for instance), that would ipso facto be contrary to Article 2; nor did it mean that if a State that did recognise a right to take one's own life were to be held to have acted in accordance with Article 2, that would imply that the applicant, too, should be granted that right:

(…) even if circumstances prevailing in a particular country which permitted assisted suicide were found not to infringe Article 2 of the Convention, that would not assist the applicant in this case, where the very different proposition – that the United Kingdom would be in breach of its obligations under Article 2 if it did not allow assisted suicide – has not been established[15].

The Court clearly felt that the matter should be examined under different articles, and the ultimate decision based on the interplay between them. The Court therefore went on to carefully consider the claim to a right to commit suicide in the face of terrible suffering under Article 3, which prohibits torture, inhuman or degrading treatment or punishment in absolute terms, and Article 8, which guarantees, among other things, respect for "*private life*".

[12] An United Kingdom organisation favouring voluntary euthanasia;
[13] Pretty judgment, § 24;
[14] Pretty judgment, §§ 39 - 40;
[15] Pretty judgment, § 41;

The applicant had claimed that the suffering to which her illness would inevitably lead was so severe as to amount to "*degrading treatment*" in terms of Article 3; and that the State had a positive duty to take steps to protect her from this, by allowing her to obtain assistance to commit suicide[16]. However, the Court held that "*Article 3 must be construed in harmony with Article 2*", which "*does not confer any right on an individual to require a State to permit or facilitate his or her death*"[17].

Therefore, Article 3, also, did not impose on States a duty to allow actions to terminate life in cases such as hers[18]. The Court took a much more positive approach to Mrs Pretty's case under Article 8. In a way, this became the provision under which the difficult and sensitive issues involved were addressed in the greatest depth and detail.

The Court reiterated, first of all, with reference to earlier case-law on a variety of different issues, that the term "*private life*" in Article 8 "*is a broad term not susceptible to exhaustive definition*"[19]. It then took an important new step, by recognising a new principle of "*personal autonomy*" or "*self-determination*":

Although no previous case has established as such any right to self-determination as being contained in Article 8 of the Convention, the Court considers that the notion of personal autonomy is an important principle underlying the interpretation of its guarantees[20].

The Court accepted – or rather, was "*not prepared to exclude*" – that Mrs Pretty's wish to "*exercise her choice to avoid what she considers will be an undignified and distressing end to her life*" was covered by the concept of "*personal autonomy*", and that the law preventing her from exercising this choice thus constituted an "*interference*" with Mrs Pretty's right to respect for private life as guaranteed under Article 8 § 1 of the Convention[21].

Recognition of the principle of "*personal autonomy*" enabled the Court to address the issue at the heart of the case: whether this principle protects the right of mentally fit individuals to choose death (if needs be with the assistance of others), or whether "*the principle of sanctity of life*" should – or can be allowed to – override such "*self-determination*". The Court held that it was "*common ground [between the parties] that the restriction on assisted suicide in this case was imposed by law and in pursuit of the legitimate aim of safeguarding life and thereby protecting the rights of others*". The only issue to be determined was therefore whether the interference was "*necessary in a democratic society*"[22].

On the margin of appreciation to be accorded in making this assessment, the Court recalled that this margin "*will vary in accordance with the nature of the issues and the importance of the interests at stake*"[23]. However, the Court disagreed with the applicant that the margin had to be narrow, in line with the Court's case-law in other cases involving intimate personal matters, such as sexual life[24]. Rather, the focus was on the issue of proportionality and prevention of arbitrariness:

It does not appear to be arbitrary to the Court for the law to reflect the importance of the right to life, by prohibiting assisted suicide while providing for a system of enforcement and adjudication which allows due regard to be given in each particular case to the public interest in bringing a prosecution, as well as to the fair and proper requirements of retribution and deterrence. Nor in the circumstances is there anything disproportionate in the refusal of the DPP to give an advance undertaking that no prosecution would be brought against the applicant's husband. Strong arguments based on the rule of law could be raised against any claim by the executive to exempt

[16] Pretty judgment, §§ 44 - 45;
[17] Pretty judgment, § 54;
[18] Pretty judgment, § 55;
[19] Pretty judgment, § 61;
[20] *Pretty* judgment, § 61;
[21] Pretty judgment, § 67;
[22] Pretty judgment, § 69;
[23] Pretty judgment, § 70;
[24] Pretty judgment, § 71;

individuals or classes of individuals from the operation of the law. In any event, the seriousness of the act for which immunity was claimed was such that the decision of the DPP to refuse the undertaking sought in the present case cannot be said to be arbitrary or unreasonable. The Court concludes that the interference in this case may be justified as "necessary in a democratic society" for the protection of the rights of others and, accordingly, that there has been no violation of Article 8 of the Convention[25].

The crucial issue is therefore *one of balance*. Of particular importance is the fact that the law in the United Kingdom which makes it a criminal offence, in principle, to assist another person in committing suicide, can be applied with flexibility and restraint – or even not applied – in individual cases. That flexibility, that legal responsiveness to the specific circumstances, more than anything else, led the Court to its finding of "*no violation*" of Article 8. It would appear that an inflexible law would have been disproportionate and thus contrary to Article 8. After this, the Court quickly dismissed the remaining arguments of the applicant, under Article 9, which protects the right to freedom of thought, conscience and religion, and Article 14, which prohibits discrimination in the enjoyment of the Convention rights. On the former, it held that Mrs Pretty's "*claims do not involve a form of manifestation of a religion or belief*"[26]. On Article 14, it ruled that:

(…) there is, in the Court's view, objective and reasonable justification for not distinguishing in law between those who are and those who are not physically capable of committing suicide. (…) The borderline between the two categories will often be a very fine one and to seek to build into the law an exemption for those judged to be incapable of committing suicide would seriously undermine the protection of life which the 1961 Act was intended to safeguard and greatly increase the risk of abuse. Consequently, there has been no violation of Article 14 of the Convention in the present case[27].

A few days after the judgment, Mrs Pretty started having breathing difficulties and was moved to a hospice. There, following palliative care, she slipped into a coma and died, on 11 May 2002, twelve days after the ruling.

2.2. Assisted dying in different legislations

The question whether assisted dying (i.e. euthanasia and assisted suicide) should be legalized is often treated, by judges and commentators alike, as a question which transcends national boundaries and diverse legal systems. Greater caution is needed before relying on the experience of one jurisdiction when discussing proposals for regulation of assisted dying in others, and the possible consequences of such regulation.

Assisted suicide is currently illegal in ***Australia***, but was for a time legal in the Northern Territory under the Rights of the Terminally Ill Act 1995[28]. As professor Suzanne Ost mentions[29], a well publicised example of partially *de-medicalised assisted death* occurred in Australia in 1996, during the short period in which assisted suicide and euthanasia were lawful in the Northern Territory. *Dr Philip Nitschke* devised a process of computerised assisted death. He provided patients with intravenous access and connected the infusion tubing to a laptop computer. The patients then had to answer three questions which appeared on the computer screen by pressing certain keys. The final question was as follows: "*If you press this button, you will receive a lethal injection and die in 15 seconds— Do you wish to proceed?*" If the patient answered all the questions affirmatively, the computer automatically switched on a previously prepared solution of a fatal dose of the sedative

[25] Pretty judgment, §§ 76-78;
[26] Pretty judgment, § 82;
[27] Pretty judgment, §§ 88-89, reference to other paragraph in the judgment omitted;
[28] The Rights of the Terminally Ill Act 1995 was passed by the Legislative Assembly of the Northern Territory in July 1995 and repealed by the Australian Commonwealth Parliament in March 1997;
[29] Ost Suzanne, *The de-medicalisation of assisted dying: is a less medicalised model the way forward?*, Medical Law Review, 18, Winter 2010, p. 504;

Nembutal[30]. The use of modern technology might make this example of partially de-medicalised assisted death seem somehow dehumanised.

However, Nitschke stated in an interview that the process allowed him "*to leave the immediate personal space of the patient, so that the family could enter and be closest to the patient when the button was pushed*". Thus, arguably, far from removing the human element, de-medicalising-assisted death in this way can remove the external presence of a doctor and enable the act of dying to be a more personal and private experience for the person to share with those she or he is closest to. This is at least one reason that can be given in support of calls for the de-medicalisation of assisted death.

The "*Euthanasia Act*" legalized euthanasia in ***Belgium*** in 2002, but it did not cover assisted suicide. In 2006, Belgium legalized partial euthanasia with certain regulations. Similarly to the Netherlands, in Belgium, a doctor who performs euthanasia does not commit a crime if he or she ensures that "*the patient is in a medically hopeless situation of persistent and unbearable physical or mental suffering that cannot be alleviated, resulting from a serious or incurable disorder caused by illness or accident*"[31].

In ***Canada***, the debate on euthanasia peaked in 1994 when Sue Rodriguez[32] publicly campaigned for the right to an assisted suicide[33]. However, suicide is not a crime in Canada, but physician-assisted suicide is considered illegal. The Criminal Code of Canada states in section 241(b) that:

Every one who (….) (b) aids or abets a person to commit suicide, whether suicide ensues or not, is guilty of an indictable offence and is liable to imprisonment for a term not exceeding fourteen years.

The reason behind its illegality is due to prevent people from "*assisting in suicide*" of those that are not mentally capable of making the decision and because of the "*value that society place on human life*" which "*in the eyes of the law makers, might easily be eroded if assistance in committing suicide were to be decriminalized*".

An article in *People's Daily* reported that nine people from Xi'an City in ***China*** made news when they "*jointly wrote to local media asking for euthanasia, or mercy killings*". These people had *uremia*, a disease due to the failure of the kidneys, and expressed their "*unbearable suffering and [an unwillingness] to burden their families any more*". The article stated because it is illegal for doctors to help their patients die, all that could be done for them was to ask the doctors to ease their pain.

In May 1997, ***Colombian*** courts allowed for the euthanasia of sick patients who requested to end their lives. This ruling came about due to the efforts of a group that strongly opposed euthanasia. When one of their members brought a lawsuit to the Colombian Supreme Court against it, the court issued a 6 to 3 decision that "*spelled out the rights of a terminally person to engage in voluntary euthanasia*". Though physician assisted suicide is legal, the country has no way to document or set

[32] She suffered from the MND (just like Mrs Pretty). For more than two years, Rodriguez captivated the attention of Canadians during her legal challenge for a constitutional right to assisted suicide. The Supreme Court of Canada ultimately denied her this right in a narrow 5-4 ruling in favour of the protection of the sanctity of life *(Rodriguez v. British Columbia,* 1993). Nevertheless, aided by an anonymous physician, she took an overdose of barbiturates and morphine and died in the company of an outspoken Member of Parliament, Svend Robinson. Subsequent to Rodriguez's death, a Special Senate Committee on Euthanasia and Assisted Suicide held public hearings and eventually produced a report recommending that euthanasia and assisted suicide remain criminal offences. In addition to the thousands of written submissions received by the Committee, hundreds of groups and individuals presented oral testimony;

[33] Ogden Russel D. and Young Michael G., *Euthanasia and Assisted Suicide: A Survey of Registered Social Workers in British Columbia*, *Br. J. Social Wk.* (1998) 28, p. 162;

rules and regulations for doctors and patients that want to end their lives. Though it is opposed on religious grounds by many Colombians, many patients have still been able to find doctors to assist them in ending their lives.

In ***France***, the controversy over legalizing euthanasia and physician assisted suicide is not as big as in the United States because of the country's "*well developed hospice care program*". However, in 2000 the controversy over the uncontroversial topic was ignited with Vincent Humbert. After a car crash that left him "*unable to "walk, see, speak, smell or taste*", he used the movement of his right thumb to write a book, "*I Ask the Right to Die" (Je Vous Demande le Droit de Mourir)* in which he voiced his desire to "*die legally*". After his appeal was denied, his mother assisted in killing him by injecting him with an overdose of barbiturates that put him into a coma, killing him 2 days later. Although his mother was arrested for aiding in her son's death and later acquitted, the case did jumpstart a new legislation which states that when medicine serves "*no other purpose than the artificial support of life*" they can be "*suspended or not undertaken*".

Killing somebody in accordance with their demands is always illegal under the German criminal code[34] (section 216, "*Killing at the request of the victim; mercy killing*"[35]). Assisting with suicide by, for example, providing poison or a weapon, is generally legal. Since suicide itself is legal, assistance or encouragement is not punishable by the usual legal mechanisms dealing with complicity and incitement (German criminal law follows the idea of "*accessories of complicity*" which states that "*the motives of a person who incites another person to commit suicide, or who assists in its commission, are irrelevant*"). There can however be legal repercussions under certain conditions for a number of reasons. Aside from laws regulating firearms, the trade and handling of controlled substances and the like (e.g. when acquiring poison for the suicidal person), this concerns three points:

- Free v. manipulated will

If the suicidal person is not acting out of their own free will, then assistance is punishable by any of a number of homicide offences that the criminal code provides for, as having "*acted through another person*" (section 25, par. 1 of the German criminal code). Action out of free will is not ruled out by the decision to end one's life in itself; it can be assumed as long as a suicidal person "*decides on his own fate up to the end (…) and is in control of the situation*". Free will cannot be assumed, however, if someone is manipulated or deceived.

Apart from manipulation, the criminal code states three conditions under which a person is not acting under his own free will:

1.if the person is under 14 years;

2.if the person has "*one of the mental diseases listed in §20 of the German Criminal Code*";

3.a person that is acting under a state of emergency.

Under these circumstances, even if colloquially speaking one might say a person is acting of their own free will, a conviction of murder is possible.

- Neglected duty to rescue

German criminal law obligates everybody to come to the rescue of others in an emergency, within certain limits (section 323c of the German criminal code, "*Omission to effect an easy rescue*"[36]). Under this rule, the party assisting in the suicide can be convicted if, in finding the suicidal person in a state of unconsciousness, they do not do everything in their power to revive them.

- Homicide by omission

---

[34] Available at http://bundesrecht.juris.de/englisch_stgb/englisch_stgb html#StGB_000P216;

[35] *(1) If a person is induced to kill by the express and earnest request of the victim the penalty shall be imprisonment from six months to five years.*

(2) The attempt shall be punishable;

[36] Whosoever does not render assistance during accidents or a common danger or emergency although it is necessary and can be expected of him under the circumstances, particularly if it is possible without substantial danger to himself and without violation of other important duties shall be liable to imprisonment not exceeding one year or a fine;

German law puts certain people in the position of a warrantor for the well-being of another (e.g. parents, spouses, doctors and police officers). Such people might find themselves legally bound to do what they can to prevent a suicide; if they do not, they are guilty of homicide by omission.

Until recently, death and dying were considered taboo or inappropriate subjects for discussion in ***Japan***. Attitudes have changed primarily due to a recent case in which a doctor admitted to helping some of his cancer patients die by "*switching or turning off their respirators*". Even though the Yokohama District Court established, in a 1995 ruling, guidelines under which a "*mercy killing*" (active euthanasia) would not be considered murder, it appears that the doctor in this case met some of the guidelines but not all.

According to the ruling, a mercy killing would not be considered a crime if:

- "*the patient was suffering from unbearable pain*";
- "*the death of the individual was inevitable and imminent*";
- "*all alternative measures have been taken to relieve the pain*";
- "*the patient makes a clear statement of his or her desire to shorten his or her life or hasten death*".

The problem that arose from this, in addition to the problem faced by many other families in the country, has led to the creation of "*bioethics SWAT teams*". These teams will be made available to the families of terminally ill patients in order to help them, along with the doctors, come to a decision based on the personal facts of the case. Though in its early stages and relying on "*subsidies from the Ministry of Health, Labour and Welfare*" there are plans to create a non-profit organization to "*allow this effort to continue*".

After failing to get royal assent for legalizing euthanasia and assisted suicide, in December 2008, ***Luxembourg***'s parliament amended the country's constitution to take this power away from the monarch, the Grand Duke of Luxembourg[37]. Euthanasia and assisted suicide were legalized in the country in April 2009[38].

In the ***Netherlands***, assisted dying on request[39] is permissible only where the *"patient's suffering was unbearable, and (...) there was no prospect of improvement"* and both doctor and patient were convinced that *"there was no reasonable alternative in light of the patient's situation'*[40].

South Africa is struggling with the debate over legalizing euthanasia. Due to the under-developed health care system that pervades the majority of the country, Willem Landman, a member of the South African Law Commission, at a symposium on euthanasia at the World Congress of Family Doctors, stated that many South African doctors would be willing to perform acts of euthanasia when it became legalized in the country. He feels that because of the lack of doctors in the country, *"(legalizing) euthanasia in South Africa would be premature and difficult to put into practice (…)*".

It is believed that in the not so distant future ***more countries in Africa***, including Nigeria and Ethiopia, will find reason to follow the laudable examples of Belgium and the Netherlands in legalising active euthanasia[41].

[42]In ***Switzerland***, although euthanasia is illegal, assisted suicide is not an offence in its own right and there are several groups who assist suicide. The most publicised of these is *Dignitas*[43],

[42] Dyer Karen, *Raising Our Heads Above the Parapet? Societal Attitudes to Assisted Suicide and Consideration of the Need for Law Reform in England and Wales*, The Denning Law Journal 2009 Vol 21, p. 42;

whose motto is "*to live with dignity, to die with dignity*". Swiss members of *Dignitas* are able to die in their own homes, but obviously this is not possible for "*suicide tourists*"[44].

Though it is illegal to assist a patient in dying in some circumstances, there are others where there is no offence committed. The relevant provision of the Swiss Criminal Code refers to "*a person who, for selfish reasons, incites someone to commit suicide or who assists that person in doing so will, if the suicide was carried out or attempted, be sentenced to a term of imprisonment of up to 5 years or a term of imprisonment*".

A person brought to court on a charge could presumably avoid conviction by proving that they were "*motivated by the good intentions of bringing about a requested death for the purposes of relieving suffering*" rather than for "*selfish*" reasons. In order to avoid conviction, the person has to prove that the deceased knew what he or she was doing, had capacity to make the decision, and had made an "*earnest*" request, meaning he/she asked for death several times. The person helping also has to avoid actually doing the act that leads to death, lest they be convicted under Article 114: *Killing on request*[45]. For instance, it should be the suicide subject who actually presses the syringe or takes the pill, after the helper had prepared the setup. This way the country can criminalise certain controversial acts, which many of its people would oppose, while legalising a narrow range of assistive acts for some of those seeking help to end their lives.

The status of healthy individuals seeking to end their own lives remains unresolved under Swiss law. As of 2009, *Dignitas* was pursuing the case of a Canadian couple, Betty and George Coumbias, who wished to *end their lives simultaneously*. In July 2009, British conductor Sir Edward Downes and his wife Joan died together at a suicide clinic outside Zürich "*under circumstances of their own choosing*". Sir Edward was not terminally ill, but his wife was diagnosed with rapidly developing cancer.

In March 2010, a television in the United States showed a documentary called "*The Suicide Tourist*" which told the story of Professor Craig Ewert, his family, and *Dignitas*, and their decision to commit assisted suicide using Sodium Pentobarbital in Switzerland after he was diagnosed and suffering with ALS.

Several attempts to legalize assisted suicide have been rejected by the ***UK*** Parliament. In the meantime the DPP has clarified the criteria under which an individual will be prosecuted for assisting in another person's suicide.

Assisted suicide is legal in the three ***American states of Oregon*** (via the Oregon Death with Dignity Act[46]), ***Washington*** (by Washington Death with Dignity Act), and ***Montana*** (through the 2009 trial court ruling *Baxter v. Montana*). There are relatively substantial barriers to the use of some of these provisions.

For instance, in Oregon[47], assisted suicide is available only to those with an imminently terminal illness, which is defined as "*an incurable and irreversible disease that has been medically confirmed and will, within reasonable medical judgement, produce death within six months*". The person must be a "resident" of Oregon. A written request for prescription and two oral requests from the patient are also needed to escape criminal liability, plus written confirmation by doctor that the act is voluntary and informed.

---

[43] Founded in 1998 by the Swiss lawyer, Ludwig Minelli, Dignitas is a nonprofit organisation set up to assist those with "*medically diagnosed hopeless or incurable illness, unbearable pain or unendurable disabilities*";

[44] For non-Swiss residents, *Dignitas* once rented a flat in an apartment block in the residential suburb of Wiedikon in Zurich. Unsurprisingly there were complaints and they were evicted from the flat. At one point, whilst looking for new accommodation, they assisted the death of a German "*suicide tourist*" in a car park. The organisation currently operates in a business park in the village of Schwerzenbach;

[45] *A person who, for decent reasons, especially compassion, kills a person on the basis of his or her serious and insistent request, will be sentenced to a term of imprisonment*;

[46] Available at http://egov.oregon.gov/DHS/ph/pas/ors.shtml;

[47] The Oregon Death with Dignity Act 1994;

Neither the Romanian legislation recognizes the right to die, the **Romanian** Criminal Code stipulating that:

• *The deed to induce or facilitate a person's suicide, whether suicide or attempted suicide took place, is strictly punished by imprisonment from 2 to 7 years*[48].

• *The abandonment, relegation or leaving without help, in any way, of a child or a person who is not possible to take care of herself by the person who has it in her custody or care, putting in immediate danger, her life, health or physical integrity, is strictly punished with imprisonment from one year to three years or with a day-fine*[49].

Listed below are some major organizations that support assisted suicide: Dignitas, Exit International, Euthanasia Research & Guidance Organizationent, Death with Dignity National Center, Compassion & Choices, World Federation of Right to Die Societies, Final Exit Network, Dying with Dignity, Dignity in Dying, Dying with Dignity Victoria, Dignity New Zealand.

It should be noted that there are many health care professionals, especially those concerned with bioethics, who are opposed to assisted dying due to the detrimental effects that the procedure can have with regard to vulnerable populations and to the fact that *it transforms a healing profession into a killing profession*. This argument is known as the "*slippery slope*" argument[50]. This argument encompasses the apprehension that once assisted dying is initiated for the terminally ill it will progress to other vulnerable communities and may begin to be used by those who feel less worthy based on their demographic or socioeconomic status. In addition, vulnerable populations are more at risk of untimely deaths because, patients might be subjected to assisted dying without their genuine consent. However, recent studies show that the available evidence suggests that the legalisation of physician-assisted suicide might actually decrease the prevalence of involuntary euthanasia.

Also, prejudices against disabled people may be enacted with regards to end of life care. For example, do not resuscitate orders are more frequently issued for those who become hospitalized and previously suffer from severe disabilities. In addition, many people who suffer from lifelong disabilities suffer from "*burn out*", which is a general feeling of depression and sadness that comes as a result of years of intolerance and prejudice. Naturally, those individuals suffering from "*burn out*" are more likely to want to refuse treatment and end their fight for life prematurely.

2.3. Improvements in end of life decision making

Currently only a small fraction of patients, about 15% have clear directions in the form of a living will or a health care proxy in place to advise family members or physicians of their end of life wishes. This leads to uncomfortable questions if the patient suddenly no longer has the ability to speak for themselves when answers are needed to important medical questions. Even if a patient has selected a proxy they may, "*be guilt ridden, wondering whether they acted to hastily or if their decision was inconsistent with the patient's desires*".

In order to preempt some of the difficulties that are associated with end of life care many medical schools and nursing programs now stress the importance of early discussions with the patient about their wishes and planning for the future. Unfortunately, since the views concerning physician assisted suicide are so polarizing, many doctors are reluctant to discuss withholding and withdrawing life sustaining treatment. In fact, in a recent study of 58 physicians, 19 admitted that they did not feel comfortable discussing end of life care with their patients.

In an effort to change the apprehension that is associated with end of life care new techniques are being explored to ensure more *doctor to patient* communication including:

• analyzing the cognitive ability of the patient to make their own decision regarding end of life care;

[48] Article 182 (1) of the Romanian Criminal Code;
[49] Article 198 (1) of the Romanian Criminal Code;
[50] Available at http://www nytimes.com/2009/09/07/opinion/07douthat html;

- encouraging doctors to initiate end of life conversations;
- making sure that the patient is made fully aware of all options regarding their personal medical treatment;
- providing counseling and support for families of patients especially in situations where a decision to remove life support and/or stop treatment is involved.

In short there are two major ways in which the physicians can more easily be made aware of the wishes of their patients. The first of which simply involves participation in the informed consent process or, "*engaging competent patients in comprehensive discussions of treatment options and likely outcomes*". The second of these methods involves advance care planning which ensures that patients tell their doctors exactly what they wish to be done in case a medical emergency arises in which they are not able to speak for themselves.

3. Conclusions

The topics of euthanasia and assisted suicide are of profound importance in terms of law, ethics, religion, and social values[51].

Should we defend the right of each individual to live by her/his own personal values, and the freedom to make decisions about her/his own life so long as this does not result in harm to others? Currently, the needs and autonomy of patients are often disregarded. Compassionate doctors, who follow the wishes of their terminally ill patients by assisting them to die, risk being charged with assisting suicide or murder. The current system sometimes also results in close relatives being faced with immensely difficult choices: *whether* to assist a loved one who is begging for help to put an end to their suffering knowing that it is unlawful, *or* to deny their loved one the death they want. Is it right that anyone should be put into the position of having to make such choices, or indeed into a position where they believe that they have no other option but personally to end the life of someone they love?

After all, who can say for sure that assisted dying is good or bad? We know what a respectable life means, but we can hardly imagine what means a respectable death. That is the reason why assisted dying provokes in us different reactions.

As regards the religious perspective, it may be of interest to observe here that the late Catholic Pontiff, Pope John Paul II, in spite of his avowed stand against euthanasia, expressed a wish at the terminal days of his life, and which was respected by the College of Cardinals, as widely reported in the news media, to be allowed to die peacefully in the Papal home at the Vatican. Could his pains, suffering and imminent death not have been prolonged by advanced medical technology if he was taken to the hospital? The only reasonable response at that point in time is that prolonging his death has no utilitarian value. By respecting his wish, the Cardinals had either advertently or inadvertently assisted the Pope to die[52].

The domestic policies may merely succeed in encouraging people to seek help abroad, because no meaningful help is available at home[53]. This approach may also encourage people to seek an assisted suicide *sooner* than they might otherwise because of the need to travel abroad to Switzerland whilst they remain able to do so. Unlike other jurisdictions where assisted dying is permitted, certain Swiss cantons allow non-Swiss residents to avail themselves of the services of Swiss assisted suicide organisations such as *Dignitas*.

Within the social and legal debate surrounding assisted death, the focus in recent times appears to have moved away from a doctor's involvement in a clinically assisted death to "*suicide tourism*" and particularly, the matter of relatives "*assisting*" by making travel arrangements and

[51] Ogden Russel D. and Young Michael G., *op. cit.*, p. 161;
[52] Nwafor Anthony O., *op. cit.*, p. 191;
[53] Mullock Alexandra, *op. cit.*, p. 450;

accompanying their loved ones to a country in which, according to local law, they can receive assistance to die. Of course, the question of whether an individual must be suffering from a medical condition in order for assisted death to be legitimate is increasingly being raised.

Ultimately, if a practice judged by many to be undesirable is, in any case, occurring, even those opposed to it may recognize that rather than merely having the opportunity for retrospective appraisal and possible punishment, control through legalisation is a more satisfactory approach[54].

Definitely, the assisted dying is a very delicate subject and a painful problem. Analysing it with freedom and responsibility does not mean to blame its supporters[55]. Whatever the outcome is, it is clear that this area needs much more open debate from all levels of society, not just those groups who hold steadfast but extremist views on either side of the argument.

Finally, we should try to find in ourselves the answer to the first question of this article: *is it possible that human rights are limited to life or can they be extended also to death*?

„FRAMES OF TRANSITIONAL JUSTICE: SOME APPLICATION IN INTERGENERATIONAL JUSTICE AND RETROACTIVITY"

GABRIEL RADU*

Abstract
The article attempts to evaluate the concept of transitional justice in the sphere of public and academical debates, in different social environments during the transition period in the recent history. The approach will include an overflight over some definitions and interpretation of that concept and an assessment of possible applications of this concept in the reparative (corrective) theories during the political transition. The evaluation of operational dimension of transitional justice will focus primarily the moral grounds invoked in political and juridical debates, and will pursue some applications of the transitional justice in intergenerational justice realm and at the level of the institution of retroactivity. Also, the assessment will focus the moral core of the motivation of judicial decisions in the space of positive law debates, concerning the constitutional and normative dimension.Examination of particular aspects of the transition has raised particular interest in the public agenda of romanian political change. Reparation issues in dealing with the past had always occupied a privileged role in public debate, in social and political problems. Justification for corrective measures during transition period were presented on various occasions in different points of view, but tools and proper institutions in generating legitimate formal-political obligations were absent, threatening the strength of the the political stability. Requirements for application of a corrective, reparative justice, appeared as a consequence of subjective awareness of rights and liberties that positive law of the communist system ignored or assign them like law infrigement. An approach of such rights, with their features should be evaluated in the context of both totalitarian and democratic state. A dialogue with the past becomes more necesary and will contribute to the success of any public policy designed for any possible reparation in the future. Transitional justice could also be a frame for testing the theoretical outcomes of an analytical justice which could bring normative results in intergenerational justice. One of the most important issues which requires an approach in transitional justice perspective remains the institution of retroactivity.

Keywords: *transitional justice, intergenerational justice, reparations, moral grounds, retroactivity*

I. Introduction

The paper attempts an overview of the concept of transitional justice in an intergenerational perspective, an assessment of the moral debate about transitional justice issues in situation generated by changes in political regimes. Arguments will be tested also in an intergenerational view by examination of the institution of retroactivity. We consider that the importance of this approach lies in the moral assessment of controversial issues in the area of intersection between political philosophy and science of law, clarifying possible opportunities in the evolution of positive law.

As a main objective we attempt a critical approach of the studies on this issues and a systematization of some operational dimensions of transitional justice in its relations with the past.

II. The concept of transitional justice: an intergenerational perspective

Transitional justice represents an area of interest in actual research in the field of positive law, but also in political philosophy. The importance of the transitional justice literature is given by the possible applications of this concept in intergenerational justice issues. Intergenerational justice itself has a particular importance mostly in the points of historical discontinuity, in changing the political system, both in Romania and in other places in Eastern European states. An explanatory overview of

* Ph.D. candidate, SNSPA, Bucharest, Romania (e-mail: gabradu@gmail.com).

political reparations makes necessary an intergenerational approach during the political transition period.

The main difficulty could be taking into account a "dialogue" with the past in conditions of a different constitutional and legal orders. Every political and legal order can be regarded as a historical evolution of a previous order. Intergenerational relations will have to overcome this difficulty by providing relevant moral arguments. Analogies with similar problems in history would be acceptable only if arguments will prove their moral relevance. Extending possible generalization to contemporary situations might be assessed only regarding all particular circumstances (local and historical) requiered in any theories of justice.

For example, if we intend to appeal to different substitutions in the lines of morality in a relevant context and compatible with the situation in which we relate. We could consider therefore that there may be a permissible substitution in the domain of reparations in present day compatible to that of the reparation due to the moral descendants of slaves in America, for example[1] (method known as *empirically informed normative argument*).

Normative political philosophy and social science explanations of social inequality have contributed to the formulation of arguments of reparative justice.

Whether we refer to redress historically injustice by means of transitional justice, we have to refer to:

- Who is entitled to compensation?
- who pays for repairs?
- under which procedural principle the due amount must be calculated?

Requirements in any frames of transitional justice will be found in theories of intergenerational justice, but they have to complete conditions of demonstrable and measurable arguments.

Also, corrective justice arguments, in any historical epoch, would have to include a retrospective analysis of eventual injuries circumstances and must bring them under the „microscope" of rational public debate, concerning the nature of historical injustice, moral motivations and procedures for repair.

Essential to any initiative for repairing was a public conscience that activated the collective memory. Any legal initiative for reparations arose from moral intuition concerning the restorative justice. *Prima facie* obligation[2] for the perpetrator is to restore the situation in conditions of a *status quo ante.*

A philosopher of law as Jeremy Waldron (1992, 2002) opened a new perspective on the obligation to rectify the historical injustice based on compensation through applying principles of justice. Waldron warns of the danger of neglecting the "double edge" of justice in the process of repair, by potential conflicts of interest outlined by the resources in question. Waldron proposed to rank priorities of injustice on an axis of time, requiring first the resolution of recent issues and then an extended process in time.

Methodological difficulties in dealing with the past are often amplified by an ambivalent quality of the state in transitional situation. On the one hand, the state appears as an active and responsible political actor, but on the other hand the state itself acts as a deliberative and reflective agent. In a strong argument for restorative justice, the state is considered to be primarily responsible both directly and indirectly, for his role in facilitating and supporting a system of

[1] A similar methodology was used in the assesment for the treatment of racial .inequality in a 2010 article, *"Racial Inequality and Reparations*" byDerrick Darby, University of Kansas, published in PhilosophyCompass 5 / 1 (2010), p.55-66.

[2] A *prima facie* duty can be suggestive defined as a "specific circumstances that can be presented on the basis of its moral relevance, " according to Ross, WD "What Makes right right Acts, " in The Right and the Good, (Oxford, Clarendon Press, 1930), p.21.

subordination to the groups that had been injured, especially after passing a period of time in a constitutional system. In any theory of law, stronger that the obligations for justice enforced between individuals, are the obligations of the state, espacially in restoring injustice and unjust exploitation. A moral obligation of the state is to recover the visible signs of injustice produced by the policy of the state institutions in the past. State acknowledgment could be formulated only by public policies in demonstrable and quantificable manner. An eventually state inaction would constitute a further enhancement of the effects of injury.

Specific to intergenerational relations is the fact that time is „continous, linear, unidirectional and irreversible"[3]. The fact that time cannot intervene on what happened in the of the last generation exclude any contractual relationship possibility with the past. Including arbitrarly the last generation in a contractual relationship *sui generis*, it opens, according to Bell, the path of counterfactual reasoning, very difficult to be admitted even at an intuitive level. But a formal exclusion of the past generations cannot ignore in a moral analysis their posthumous interests[4]. Intergenerational justice as a subspecies of justice, is a culturally determined concept, with a significant contribution even in classical theories of justice. Nozick asks "How far in the past we have to wipe the injustice?" Difficult as well is answering how to change things, if both the beneficiaries and losers are not directly engaged in the historical wrong, for example, the case of their descendants[5] ?

The concept of intergenerational justice can refer, in some specific approaches for example, from general to particular, to an ethical problem of distribution of resources available in insufficient quantities between different age groups in society. Intergenerational justice can act as controversial stake in allocation of resources for educating young generation vs. resource allocation for protecting the elderly[6]. In some situations intergenerational justice argument concerns in the very existence of rights and obligations between the present and the past generation or the next generation, as well as the admission of the existence of such rights in the application of theories of justice in issues concerning relationship between different generations.

III. Transitional justice and restoring issues

Issues of transitional justice seems to be a complex task in the assessments of the legal consequences generated by regime change. Restoring democratic regime in conditions of transition from a "monolithic" past to a "plural" present, represents a fertile ground for debates in the general theories of law. Restitution issues were limited in public debate only to discussions about legislative acts with applicability in real estate claimings of the injured persons in their property rights, in romanian courts or European laws[7]. Restitution itself represent an important side of intergenerational justice, the complex of such problem could not be simplified only by reducing the concept of intergenerational justice to a simple restitution. The restitution problem is also an applied ethics matter that require an ethical perspective approach. An ehical similarity in the case of regime change brings another types of historical shortcomings of those who have fulfilled their obligations imposed by the totalitarian regime and as a „reward" for their social status became disastrous without having any restitutional problems. The issue of reparations is required to be approached under different angles of moral relevance starting a debate in legislative bodies, academic or media space. We will try to draw some explanatory models that could shape certain patterns in the matter of reparations.

[7] Socaciu, Emanuel-Mihail,"Restituția imobilelor naționalizate: preliminarii ale unei evaluări morale", Sfera Politicii, nr.128, 2007

In literature was suggested that one of the possible techniques to address the issue of restitution could be a counterfactual approach to the issue[8]. There are numerous difficulties in determining the facts, historical context or the complexity of analyzed cases. In the absence of possibilities in counterfactual approach, were propositions of direct return of natural resources, goods, etc.The solution of physical return is not accepted from the point of view of the teories of justice because arises problems like the current market value of the property, either the temporal possesion or *time preference*[9] (Rawls, 1971)

An utilitarian approach to intergenerational restitution policy cannot be achieved in a cost-benefit analysis because of the impossibility of setting a time preference agreement. Without a well defined set of preferences it cannot be a formulated a cost-benefit analysis because it would lose the strength of normative and practical applicability.

A counterfactual analysis based on what would have happened if the theft would not exist requires strong moral intuitions[10]. Another possible approach would be an imposition of an external rate of time preferences in order to compare the value of assets over several generations. To implement a positive rate of time preference across generations, an analyst should opt for an explicit moral reasoning on how the price of the object of restitution was formed, grown and diminished in the time (*restitution liabilities*). Ethical constraints that requires time preference approach gives us a satisfactory solution of justice. In these circumstances, the restitution process over generations is not only a matter of transfer of resources from past to present value, using for this purpose only a positive economic analysis. Restitution policy becomes more complex when deals with pecuniary value judgments. Based on this assumption we have to answer about how much money must afford the state to pay to the victims, why, and whether this policy could be admitted as morally considerable effort made by the state for his own past injustices.

Restitution issues in the perspective of Ackerman (1995, cited by Fishkin, the "Boundaries of justice") have an interest not only in the technical approach, but also for the status of the participants at a moral debatre, in a context of a neutral dialogue.

IV. Moral considerations on reparations

In intergenerational perspective, the restitution argument is strengthened when the effects of nationalization were very negative and it generated a persistent injustice. Arguments are built on intuitions, current practices and moral injustice by studying history, even some authors believe that the restitution argument claim lies in the context of intergenerational justice more than in historical injustices[11].

Once the frameworks of post-totalitarian political regime were established in the new democratic order, public debate on social demands were focused on moral repairs, proposing different solutions. Whether it was a case of goods or real estates, the repair has been alleged in its pure form, strictly speaking a "turning back the watches" to the *status quo ante*. Experience has shown that this is an ideal that can not be put into practice. For injuries to individuals, physical or mental demages, finding an equivalent for compensation could not be stated as a principle. No any precise criterion was managed for compensation for moral right that a person is entitled to receive in order of confiscationed property or for life years lost in prisons during the dictatorial regimes. It has been argued that a nonmonetary injury can not be perfectly equated in terms of symbolic repair.

[11] Lyons, David (1981), „The New Indian Claims and Original Rights to Land", în „*Reading Nozick*" , (Oxford: Blackwell), p. 355–379.

General theories of law have revealed that the application of retributive justice by criminal justice retribution and a subsequent repairing process, have the virtue of refocusing society in a moral space. Punishment and reparing has the virtue of restoring social relationship between the offender and the injured. Mechanisms of reparative justice, aimed at offsetting are the key in rebuilding the moral core of a society. The moment for initiate a corrective justice overlap with the regime political change, on condition that free political debate can take place, the moral evaluation is operational in the sense described by Kierkegaard "history can be lived only forward and assessed backward". Where victims of political injuries (including ethnic or racial persecution on grounds of political motivations) are no longer alive, moral reparation could to be made only with moral means, honoring the memory of victims in the official acts of the state. Reparation, whether pecuniary or moral status, has a strong legitimacy given by systematic presence of the political repression. Assuming that most citizens of Eastern European states would be freely chosen socialism and expropriation, does not make the totalitarian transformation to be a legitimate policy. Moral significance of a democratic decision that most citizens choose to put their wealth to be shared and managed by the state, cannot be extended to everyone, proclaming same moral situation, when it is clear that any person represents an authority in the matter of his/her own fortune.

Communist totalitarian state, no matter how legitimate would have been its foundation cannot claim legitimacy in the historical process where his raw power confiscated the wealth of families, farms and the means of production, turning abusively the owners into state tenants. Affirming that the process of expropriation was just a simple wrong side of a good socialist transformation, it results then that all its victims are in position of main candidates prima facie to damages compensation. Legitimating the expropriation by arguing that social revolutions do not happen at the polls can not be accepted as a final outcome. Even if by democratic processes may result social class or political groups that are inadequate compensated iit requires a legitimate remedy. The legitimacy of a regime is not just about how he comes to power. The Nazi regime, for example, came to power through free elections, but its illegitimacy came from the policies that profoundly affected the human dignity.

A theory of retrospective moral evaluation would be the key to understanding intergenerational justice in conditions of regime change. A moral evaluation of history would be a very complex endeavor, so we try to offer just a preview of a narrowly defined context, whose nature and character can be morally judged.

A historical normative theory of property as lockeanis consider that any title of property is sufficient that any legislative changes that aim an expropriation would be excluded on grounds of moral justification. A moral theory applied during totalitarian period tried to defeat lockean argument by claiming that ownership is given also by the quantity of work submitted as a production factor, been able to convert the worker in a collective owner of a share. Collective property would thus become stronger through a new element merged in ownership, the amount of work. Marxist theory neglects that the amount of work was remunerated under an employment contract and can not merge in property right.

In the explanatory introduction of the romanian nationalization law from 1950, what disturbed the regime was the very existence of the property title, which have been considerred a potential "*exploatator*" („exploiter"), attribute admitted only in the benefit of the state.

If the case of communist expropriation from GDR, between the years 1945 to 1949[12], the justification for confiscation of large enterprises and agricultural areas exceeding 100 hectares has been made under the so-called "denazificaton". The meaning of "denazification" was punishment,

[12] Mark Blacksell, "The Reality of Property Restitution in Central and Eastern Europe," Material prezentat la „Conference on Political Transformation, Restitution, and Justice", la Jagiellonian University, (Cracovia, Polonia, 6–8 iunie 2002).

from a retributive point of view. Property contains, in the eyes of the totalitarian legislative, a dangerous potential behavior of the material property owner.

IV.1. On monetary compensation

If the repair by in-kind compensation is objective, repairing in financial equivalent raises several issues of justice, considered to be a subjective compensation. As a starting point, the total financial compensation is known as a "maximalist" one. A maximalist approach considers the value of the expropriated property at a market value during the expropriation, adding the possible lost income while the property belonged not to the rightful owner. In a moral evaluation of compensation, maximalist approach is unsustainable given that the owner could had acces to a form of use, like possession, or the case in which the State has offered some form of material compensation.

Moreover, even assuming that we could calculate a market price in its historical context, it is difficult to determine the income generated by exploitation of these assets in uncertain conditions. Here we are in the presence of a similar argument, with the same force as Jeremy Waldron's argument, speaking about the rights to compensation claimed by aboriginal peoples. The calculation would be made in an ideal context revenue management, fact hard to be accepted even in the counterfactual approaches[13]. Also, in case of maximalist approach to compensation, the victims of expropriation would be in a best-off situation and nonvictims of expropriation, from the same period would be in an unfair position, because they had suffered other kind of losses during totalitarianism, like their life plans that have been altered by a brutal authoritarian state[14]. A fundamental difference that characterized the discontinuity between the two regimes was property regime, although not alone. When trying to evaluate the restitution process in time, we may find connection with new political context, social and legal issues. For example in the cases of reparations applicants could be the heirs of victims. And a compensation given to the heirs of victims could exceed the maximum amount decided by the testator to be inherited. Also in any moral evaluation must be take into consideration that heirs would have been best-off in case they would have enjoyed all the assets, but any unfavorable situation were possible too and could affect the value of heritage. In other situations we can not ignore the potentiality variations of tax provisions.

The heritage problem lies in the moral intergenerational context. There are some streams of opinion against the "Death Taxes" (for ex. in the U.S.), population of many countries been affected by significant inheritance taxes, taxes that are present in almost all legislations. A state law can be set to any level of inheritance taxes, but taxing the surviving spouse or descendants are morally questionable, especially when they have suffered through expropriation and deprivation[15]. It is morally difficult to sustain a charge of family members in this context. Those who are entitled to inherit cannot claim a right to the whole legacy as long as any state can fix their fiscal policy, fact bring into question the correctness of monetary compensation. Clearly, legislative instability on legacy strongly affect the maximalist position.

A second important issue that brings into question the maximalist position is that it treats victims of expropriation in a normative isolation, separating them from other victims of the communist period, without restitution entitlements. Suffering caused by expropriation is only a simple issue on the state's limited resources, but not an exclusive priority on the political agenda. Also it cannot be overlooked those citizens who were not owners of real estate, but are entitled to compensation from numerous other reasons, having no access to economic or social capital, nor bequests. Random distribution of wealth has, according to Rawls, no moral significance[16]. Moreover,

some authors consider that until the expropriation moment the owner could fully enjoy of his property. Then he was removed from the benefits of his destiny, but this removing exceeded his moral predictible expectations. In this case we are getting out from transitional justice frameworks that we have proposed. But the problem of allegedly withdrawing a lucky destiny cannot be accepted as a expropriation principle, morally permissible.

V. Arguments against restitution

1. It was argued that expropriation itself was more moral acceptable than dubious historical conditions in which property was acquired: unjust feudal traditions,: economic exploitation, gender discrimination, etc. In this intergenerational perspective, the argument in favor of reparations would be weak, if the "nationalization" may be able to produce acceptable moral arguments.

2. If the owners of real estate property planned their lives around the exploitation of their assets, the same legitimate expectations had those who had not property at all and were also deprived of their own capital - human capital - which could be exploited in other circumstances, if the communist regime would not came to power. And as the number of the latter was undoubtedly much higher than applicants for restitution. There were some opinions issued that property owners would be charged to bear the repair costs for other members of society, less favored by fate.

Non-owners of real estates were already in the worst-off position even before the expropriation of the rich ones, and so they would suffer a double injustice by worsening their position again by the paying the reparations only rich people[17]. In a moral line of thinking those without any property are entitled to compensation for spending their working capital, justifying their claim for compensation as long as they remained in the worst-off position. We cannot accede such an opinion as long as the "nationalization" was not completely dematerialized. This unjust legal act produced however profitable legal effects to different social classes and categories of population, and in many cases even the previous owners had access to his ex-propriety in conditions of mere material use, only *usus*.

3. For some authors restitution is an exercise of sentimentalism, because over time the market value of assets could decrease by the fluctuation of the market system, or of the tax policies could change and the transmission business to the next generation could be affected. Summarizing it can be seen that the requirements of restitution cannot be limited only to expropriations, but also must be extended to all those who fulfilled their duties in a manner of *bona fides* during the communist systems and they have been injured and so they have legitimate moral claims on state resources. The moral problem of reparation after a totalitarian regime was formulated by those who opinated against the restitution in a simple way: rewarding the favored ones of the fate at the expense of the disadvantaged ones. Reparation is a powerful argument, but is not decisive. According to some authors, the reparation is only a preference for a particular social policy and cannot be considered as a solution to social justice.

4. Another moral reason for rejecting the ideea of reparation was the identity the entitled holders. Regime change was treated as an end of a war and moral controversy scheme is identified as that by which citizens that were involved in war without their consent, had to bear the costs of war compensation, if their country was defeated. This obligation stands as well for those who were not even involved in the war. A social group included by force in the redress process who had no role in the formation of injustice will bear the costs of repair. Some opinions have emphasized that restitution process is not grounded only on suffering, but on the existence of conflicting interests between the victim and perpetrator[18]. In reparative moral requirements an important shift is made

[17] An argument of Jon Elster, in "On Doing What One Can: An Argument Against Restitution and Retribution as a Means of Overcoming the Communist Legacy,"East European Constitutional Review 1, 1992, p. 15–17.

[18] Kutz, Christopher „Justice in Reparations: The Cost of Memory and the Value of Talk”

when subordination of power is replaced by that of justice. A restorative acceptable model seems difficult because it requires strong correlation with the degree of public awareness. While victims of injustices seek their inclusion in a community of political and moral agents, aiming reparations, the holders of reparative obligations tend to separate morally from political institutions responsible for damages, requiring a fair assessment of each relevant case, hoping that general evil could be mitigated by justificative particularization.

5. The superseding thesis of historical injustices accepts a reduction of the force of ownership right. The reduction of entitlement for property rights is accepted in the case of changing circumstances, theory expressed by David Lyons and Jeremy Waldron. The core argument of weakening the entitlement by separating people from their land represents a form of prescription. As Waldron argues, justification of property must comply with a set of requirements regarding the rights, liberties and privileges, requirements characterized as "circumstantially sensitive". But in a same line of argumentation, if legitimate entitlement is sensitive to changes in circumstances, then the effects of illegitimate purchases or other infrigement of rights of some to become legitimate in changing circumstances. This represent the main argument in Waldron's thesis of superseding the historical injustices. The thesis regards only past injustices and it does not mean that past violations have been fair. For example: a community that used fraudulently the water source of another community forced by an ecological disaster. The act of injustice was morally superseded by the new circumstances. (Waldron 2004, op.cit).

But if compensation is possible, then it depends on „moral relevant circumstances and their evolution" (Waldron). Superseding argument is identified by the concept of *force majeure* clause, in the positive law.

V.1. Distributive justice vs. corrective justice

Even admitted in Eastern European legislation, reparatory policies often lost ground against other public policies, even in the sphere of justice. In ranking priorities in terms of distributive justice, the requirement for access to public resources for repairs was below the requirements for political actions in reducing the poverty, below the need for health care or the state pension problems or other policies relating to investment in human capital, education, etc.

Some analysis consider distributive justice itself as a priority of application to the criteria of reparative justice. Distributive justice contains the principles for establishing a public policy framework, including management issues of property litigation against the state or other individuals, the economic and social needs. Priorities of distributive justice are given by government institutions, including the tax system, health or education, institutions managed by the distributive process system.

Corrective justice concerns the principles of justice that aim to rectify any intrusion in the individual rights, to preserve physical and spiritual integrity of property, principles that contained within the institution of tort-law in the Anglo-Saxon legal system[19]. The restoring of a lost property is a matter of corrective justice, but we have to introduce a distinction between the expropriation made under totalitarian political pressure and the expropriation made for reasons of urban architectural necessities in the political transition process.

Central and east European countries have experienced both the requirements for distributive and corrective justice. It appears as problematic a conflict of priority between the two, when it appear a problem in choosing between them. By its nature, distributive justice establishes the entitlements, corrective justice protects from possible violations. Corrective justice impose the restoring of the *status quo ante* principle. If the principle of *status quo ante* is regarded as illegitimate, then state institutions are no more justified in their moral status and a transitional justice is required. Difficulties in dealing with reparations requirements will impose a stronger conception of distributive

[19] Stephen Perry, "Responsibility for Outcomes, Risk, and the Law of Torts," in Philosophy and the Law of Torts, ed. Gerald Postema (New York: Cambridge University Press, 2002).

justice. Strict theories of distributive justice, egalitarian or utilitarian, requiere a total subordination of principles of corrective justice in order to achieve their distribution purpose.

If Lockean legitimacy approach is binary (justice can be compatible or incompatible with a set of principles), a complete liberal vision have to answer to corrective statements in non-ideal circumstances. According to Rawls, the beneficiary of distributive justice is the „basic structure of society". Taking into account their different spheres of interest, distributive and corrective justice can relate in different shape[20]. First, corrective justice can appear as tool of distributive justice: the principles of corrective justice seek to maintain fair distribution of goods. On this ground, restorative justice emphasizes its normative force by the difference between the present unfair context and fair desirable distribution. Second, restorative justice can be seen as independent from normative distributive justice: corrective justice must resolve the turmoil of property, obstructing the illegally distributive approach, for example, in terms of a reasonable institutional expectations.

Even if it concludes that the East European socialism has failed because the scheme of distributive justice, imposed in opposition with individual choices, we just think that accumulation of citizens during this totalitarian political system - cars, apartments and other properties - worth in turn to be protected in case of an arbitrary illegitimate usurpation, whether direct or indirect. On this grounds, the strength of corrective justice requires the protection of legitimate expectations as an auxiliary of distributive justice.

None of these criteria is entirely satisfactory. In the absence of a fair distributive criterion it is hard to foresee a significant regulatory power of the corrective justice. If principles of distributive justice are sufficient to evaluate the distributions of post-expropriation, any corrective requirement should be determined solely by a distributive way. Conversely, if the principles of distributive justice applies only to basic social institutions, (Rawls's argument), so that the current distribution is only a matter of consensual transaction in an institutional framework, it should be difficult to foresee any moral force for arbitrary models involved in the modification of the private property. In this argumentation, the principles of distributive justice have insatisfactory relevance in corrective context.

A third possibility, more plausible in the sense of some authors (e.g. C. Kutz), would be full integration between distributive justice and restitution. Reparative justice principles represent a distinct normative basis as long as it express an ideal of interpersonal behavior and responsibility, but the force of those principles is effective only in a scheme of distributive justice.

So we could distinguish two possibilities:

- An inability of a state to ensure a minimum living standard, with a strong corrective bias, but neglecting its distributive liabilities. With limited financial resources cannot be ensured the minimum functioning of the basic structure of society. Once assured the basic needs, including the management and functioning of democratic institutions, granting compensation for injuries may proceed.

- Second, correlation between corrective justice and distributive justice is more profound. Injuries caused by expropriations are relevant facts evan for a distributive justice process, from the point of view of relative position of the victims and the degree to access to compensation.

It should not be neglected the view claiming that that imposition of reparation in kind was prefered by the state for reasons of economic efficiency of state administration, the cost of maintenance of assets was a hard financial burden for the state, fact that would have affected the distribution process.

V.1.1. The problem of cultural property restitution

The most restrictive form of compensation is considered the restitution of the community property of churches, synagogues, museums, universities, other cultural places, because of its public good indivisible structure, its importance in community life. Requirements for reparation in this case

[20] Stephen Perry *"On the Relationship Between Corrective and Distributive Justice,"* in Oxford Essays in Jurisprudence, Fourth Series, ed. Jeremy Horder, New York: Oxford University Press, 2000, p. 237–63.

be expressed in a money ammount. The value of these institutions is given by their cultural tradition in community. The seizure of these institutions give priority for allocation of resources in order to restore the previous situation. The requirement derives from the contribution they make to the cultural life of those communities[21].

Loss of common culture is considerated a greater loss than that of the property, even if the members of society have adapted their life to the imperatives of political and social commandments of the time. A stronger argument in favor of refunds is the need of traditional institutions, as future sources of culture. This is the argument of intergenerational justice of Rawls, the moral necessity of strengthening the right institutions.

If the properties may not be returned in kind, a subsidiary of compensation requirement is fully justified to reconstruct traditional infrastructure elsewhere, but fully accessible to the community. The argument for reparations lies both in the corrective and distributive justice in the case for the restoration of cultural life, and it is mandatory in the case of the massive dislocations of population.

Although common pool resources is limited, the necesity for repair has a moral justification in the same way like satisfying the need or interest for distribution.

In ordering the priorities for reparations Jon Elster[22] considers that reparative justice requirementsă for cultural groups take precedence over all other repair requirements.

V.2. Mainstreams in Romanian restitution debate

The romanian legislative debate has enumerated several visions for restoration of the totalitarian state injustice. Thus, some guiding ideas could be highlighted.

Restitution of property has never been discussed as a reverse political measure of nationalization, although therestitution was qualified in various parliamentary debate as a "political moment of truth and justice, for the resolution of economic issues"

Restitution in kind has been seen in some political positions as preferable in terms of efficiency, but not in terms of justice, the repairing process by restitution in kind was considered preferable than compensation with money from the public budget. Pecuniary compensation was admitted only as an exception to repairation. Arrangements for refund in cases of exceptions provided three modes of compensation: equivalent goods or services, government bonds and shares. The advantage of this project was considered by its promoters to avoid the encumbrance for many years of the state budget. The draft law also covers both the housing estate, which formed the subject of the controversial Law no. 112 and the destination other than residential buildings, like the economic buildings. Besides reparations any draft law was concerned for dealing with the concept of legal stability, trying to achieve continuity in the rule of law. Restoring justice issues were focused on some aspects of language that generated questionable interpretations. Parliamentary debates have varied between concepts like "return of the equivalent" or "the equivalent remedies."

Often, some parliamentary moral evaluation revealed that restitution had a negative character negativ by its utilitarian aspect. Moreover, in lacking moral landmarks, during certain debates there was not dificult for some of them to justify the uselessness of a remedial legislation. Thus, in a cost-benefit analysis, restitution would have costs an amount that exceeded the benefits, that would be received only by a small part of the population. In an opinion, the reparation policy would be destinated only to 5% of the population, the rest of 95% of the population would not have suffered any damages at all. The moral problem that intervenes here, according to parliamentary studies information, is whether 92% of the country's wealth must be transferred to 5% of the population. As it could be seen, a matter individual right is reported, even after 1989, quantitatively, configuring a new issue, the absence of this concern for the great mass of the population. Any ethical principle

[21] Jeremy Waldron, *"Minority Cultures and the Cosmopolitan Alternative*," in The Rights of Minority Cultures, (ed. Will Kymlicka Oxford: Oxford University Press, 1995, p. 93–119.)

[22] Elster, Jon, *Retribution and reparation in the transition to democracy*"....

would be sacrificed under such circumstances of absence of a great number of similar cases[23]. There have also been made moral judgements on neglecting any other disscutions outside the refunds of historical injustices, althogh "the injustice was done to all other members of past generations, who - under the old totalitarian social arrangements - have lasted for decades[24]."

Out of totalitarianism and during the political reform the debates had not exhausted the inventory of the ethical grounds for refund due to the vast particularization.

A comparative approach for integration of accepted practices of civil society in matters of intergenerational justice, would increases the interest in an "original position" of applying principles, either in the establishment of communist totalitarianism or a liberal democracy. A "time zero" for post-war German states, was considered in some papers as a moment of a „state choise", either for economic prosperity in terms of capitalism, or a social justice state (the former GDR)[25]. Administration of a real social justice was considered as the result of state intervention in the former GDR. Intervention of the socialist states in the organization of the social life had shown a poor management in dealing with a social justice in a communist state, shaping a stronger criticism of the founding principles of communist authoritarianism. Admitting that justice could not be fully identified with the legitimacy, at least its intergenerational dimension of justice must have an important part as a constituent of it.

Following retrospectively some relevant behaviors of actors engaged in moral debate over repair issues during the transition period it could be foreseen dominant aspects of this context. Thus, a controversial issue which has not received a definitive answer, was whether the repair requirements of the victims of abuses and injustices can accept a state response in delaying the fulfilling of their claims on the grounds that the repair would compete with other types of requirements that the state must face[26].

In Romania, the fact that the repair is not fully carried out, so it could not be considered as *corrective justice* policy, is announced from the title of the decree-law no. 118 of the 30th. of March 1990, as: "Decree-Law on the granting ***some rights*** to persecuted persons for political reasons by the dictatorship starting March 6, 1945, and for persons deported abroad or in prison…." In terms of intergenerational justice, reparation was realized by compensation for injured survivors (article 4 of the law), but under condition that it shall not be remarried later.

Motivation for remedy in the case of regime political regime is reflected in the normative acts issued on this purpose. In this respect, the Law 341 of 2004, shows even in the title called "law of gratitude for the heroes and martyrs, fighters who have contributed to the Romanian Revolution in December 1989", indicating also that beneficiaries of rewards are those who have helped the political change of regime "popular uprising in Timisoara, Bucharest and in other cities that were transformed into antitotalitarian revolution, backed by the army, who led to the fall of the communist regime and to the establishment of democracy".

Moral justifications for gratifications are set out in the principles which are governing the application of this law, as follows:

a. *Respect and gratitude* to the heroes and martyrs from December 1989, and care for the heroes survivors;

b. *Respect* for *historical truth* by deepening the research and documentation on the Revolution of 1989;

c. *Differentiation of stages* of the Revolution ;

d. *Defining the categories* of fighters, by distinguishing the commitment and participation in revolutionary activities;

---

[24] Miroiu, Adrian *„Filosofie fără haine degală"*, (Ed. All Educational, Bucureşti, 1998)

[25] Marshall, Gordon *"Was Communism Good for Social Justice?*: a Comparative Analysis of the Two Germanies", The British Journal of Sociology, vol. 47, no.3, sept. 1996, p. 397-420

[26] Kutz, Christopher *„Justice in Reparations: The Cost of Memory and the Value of Talk*"

e. *Differentiate between civilians and soldiers* on the stages and forms of participation in actions undertaken for Revolution;

f. *Equity* in the granting the rights under this law.

A distinctive and importantant aspect of the legal nature of the rights granted to participants is not considering them as *income*. In art. 5, paragraph 2 states that "the rights granted under this law are not considered income, nor taxed and do not affect the granting of other rights."

Delimitation of those who can not benefit from the provisions of this law (art. 8) might be regarded as a sign of moral accountability in terms of efficient factors of injury caused by the totalitarian political regime. In this position are mentioned "civilians and soldiers, who are proven to have been involved in the former Securitate forces as political police activities, and those who organized, acted, instigated and fought, in any form, against the Revolution of 1989 .

VI. Retroactivity challenges

VI.1 The concept of intergenerational justice in the case of non-retroactivity. Case reparation issues

A dificult argument faced by the intergenerational justice, especially in present-past relationships was the argument of *non-retroactivity*. In favor of a mandatory rule of non-retroactivity of the law, regardless of cause, have opined authors in different historical periods. In Hobbes's Leviathan[27] is stated that "any law passed after the consummation of a fact cannot turn this fact into crime. A similar principle is postulated in the U.S. Constitution (Article 1, sect 9 (3)) which prohibits any *ex post facto* action. Similarly, the European Convention on Human Rights bans in art. 7 that anyone can be found guilty retrospectively, if the facts were not violating the general principles of law recognized by civilized nations, at that time. The purpose of these provisions is formulated synthetically by Friedrich Carl von Savigny: ".... confidence in the rule of law in force is important and desirable. This does not mean we have the same confidence in the permanence of that law, but as long as the law is in force its effectiveness is indisputable"[28]. Our interest here rests only in matters of principle and their moral relevance.

If it is real that time initiates legal relationships, in intergenerational justice we can not speak of absolute opposition to non-retroactivity, because intergenerational justice itself contains the essence of retrospective approaches. The problem of non-retroactivity in some cases served only as a "political buffer"[29], the legal responsibility of non-retroactivity is often protected by legal institution of the prescription. There can not been invoked the non-retroactivity when assessing the moral nature of the facts from the past, but relevant to transitional justice. Often, the post-totalitarian regime, by invoking the principle of non-retroactivity as a technical legal argument, tried to oppose the attempted repairs satisfaction (either economic or moral). Indeed, all modern democratic constitutions recognize unanimously that the law cannot look to the past. Sure, morally could be accepted the non-retroactively when speaking about a juridical sentence as long as it was not envisaged in the legislation of another legal order. Moreover, some political facts were not criminalized, even more, these facts were widely accepted as public service obligations to be performed in accordance with the requirements of that time. In the case of the totalitarian regime, the horrors discovered by retrospective examination of the past is the moral argument itself which requires democratic measures in order to safeguard the future democratic state. It is therefore morally

[27] „No law, made after a fact done, can make it a crime ... For before the law, there is no transgression of the law.(Hobbes, Leviathan (1651), Cap. 27-28)

[28] von Savigny, Friedrich Carl, „Private International Law, and the Retrospective Operation of Statutes", 1880, p. 344.

[29] Letki, Natalia „*Lustration and Democratisation in East-Central Europe*", în Europe-Asia Studies, 2002 University of Glasgow.

accepted, for example, that a public servant of the totalitarian state has no longer a social capacity to respond to special conditions required for a democratic state, as a way of protection for future democratic institutions. In some Central and Eastern European countries, lustration was applied only when the public official has lied about his past. In a case like this institution of non-retroactivity couldn' be moral relevant in a case of consciously deliberate alteration of the official truth. An argument of political revenge in case of administrative removal from office cannot be sustained, as long as *transitional justice* expects honest answers to clarify the relationship with the past. In supporting the concept of retroactivity, was formulated an argument that could be described as one of the symmetry. Totalitarian regime itself has often acted retroactively regarding the political past of its citizens, so its entire existence of the totalitarian regime should be reviewed retroactively. Political transitions in East European areas were conducted with different intensity regarding the legislative changes. From a certain perspective any legislative change can be seen as a microtransition itself, which produced political effects even at a small scale. Legislative power, manifested in the form of a legislative will, had to justify any new passed law on grounds of efficiency or on a higher moral grounds. However, an important distinction must be stated. The institution of retroactivity required in a transitional justice political process must not be confused with a basic human right, argument that often was invoked misty, especially in the public debate.

VI.2. Arguments of the retroactivity of law

1. Adherents of doctrine of retroactivity of law recognize the validity of this principle only in exceptional circumstances, where the negative moral consequences remain strong, through legal action or inaction, where a natural right was transgressed. As such it was widely considered that the Nazi laws could not be evaluated in a perspective of an active principle of non-retroactivity. On this line of reasoning, the legal approach of retroactivity sustained the Nuremberg trial.

2. Was argued also that retroactivity should be understood as a temporal range of options and not as a binary construct strictly based on acceptance or refusal. So retroactivity is seen as a possible recourse to stability in particular cases where the new law is unclear, in a kind of rawlsian reflective equilibrium, setting a kind of dialog with the previous legislation.

3. Also, a retroactive regression was considered and the use of judicial precedent, a source of law in Anglo-Saxon legal system, and by moral extension, moral precedent is used in moral dilemmas solving.

4. Theoretically, legislation is prospective and general, but the sentence is retrospective and particular. An acceptance of the moral argument of retroactivity is compatible with the argument set out by the U.S. Supreme Court, who stated in some of its decisions that the legislative changes, often defeat expectations based on the priority of the rule of law. Legislative initiative in this case is analitically regarded as a feature limit, tolerable but hardly acceptable in a democratic state. Of course, a reference like this has a strong libertarian political connotation, where the process of formal legislation is considered as non-necessary. The character of the libertarian society that has no bias in laws changing, it is morally a pro-retroactive attitude.

5. In U.S. legal practice the institution of retroactivity had prevailed even in civil contracts. Non-retroactivity principle was often cited in courts in contractual clauses interpretation, but the practice had recognized numerous exceptions to this principle.

6. Another argument that favours the admission of retroactivity in the reparation approach is based on the concept of "private rights" of individuals, that are naturally inherent to people rights, with pre-political origin. Also, "private rights" or "absolute rights" inherent to every citizen is a natural result of the freedom that cannot be sacrificed for the public interest sake. The fundamental purpose of any just legislation is to maintain and regulate the absolute rights of individuals, action that requires a regressive retroactive approach. The appeal itself to legislation is considered, within

certain limits, as a retroactive approach, developing the explanatory power of the categories of "public rights" and "private rights"[30].

VI.3. The argument of non-retroactivity

The principle of non-retroactivity was controversed, but its moral grounds were oftenly ignored. Being invoked in judicial trials, the principle of non-retroactivity could be morally assessed derivating the evoluate form of a juridical solution on its moral bases, the core of any juridical decision containing particles of moral entitlement.

The main accusation of the principle of retroactivity is that it couldn't be morally accepted a punishment of an *ex-post fact.*

The moral efficiency and the legal impact in the constitutions of democratic states, makes the principle of non-retroactivity to be employed in the *universalist* paradigm.

VI.4. To a reconceptualization of the retroactivity

Practitioners and modern doctrines of law consider the delimitation prospectivity-retroactivity as purely illusory. Retroactivity has manifested in its material form, in fact, by changing the legal consequences of acts from the past, but the concept of retroactivity has been insufficiently morally assessed. Retroactivity in reparation process required by the collapse of totalitarian legal system was only a transitional feature for appealing to the old legislation with the purpose of configuring moral intuitions a remedy approach. At least some features of retroactivity could be morally permissible for the need to qualify and clarify the nature of past historical deeds. Subjective rights that were violated imply a moral dialog which need a reconceptualization of retroactivity. Recognition of these infringed rights determines the possibility of effective retroactive procedures in a *transitional justice* process. In essence, the moral debate is not only the conflict between legal provisions, current or past, but, ultimately, between the positive law and natural law.

Under the legal doctrine of the U.S. legal system was admitted a concept of *mild retroactivity*, in the case of taxation, arguing that in states with conflicting administrative regulations, traditional opposition to the retroactivity cannot be accepted[31]. Thus, retroactivity cannot be rejected purely axiomatic. It was considered that retroactivity may work for safeguarding social values, when are involved individual rights or public welfare. It is recognized in some doctrinal views that these categories of public rights and private rights may be part of a coherent scheme, in which retroactivity can become formally constitutional.

VII. Conclusions

Emerged recently, "*transitional justice*" was originally called "*retroactive justice*". This field of study has outlined some specific problems of the states recently emerged from totalitarianism, in which liberal justice had proved ineffective in developing solutions[32]. Retribution and redress measures generated by the functioning of totalitarian systems are difficult to achieve solely through classical legal steps. In a historical plan, the last event where was upheld retroactivity in a case of a totalitarian regime was the case of the Nuremberg Trials. The essence of the concept of non-retroactivity in a state of law is the protection against abuse. Putting the problem of intergenerational relations, in terms of relations with the past, in a transitional space, it requires moral analytical approach. The constraints of non-retroactivity principle cannot deal with a totalitarian past, being difficult to accept the presence of a structurated moral injustice, subject of interest for transitional justice.

We consider that if the problems of relationship with the past cannot be solved, then at least could be simplified by moral assessments, in an interdisciplinary approach of the intersection of philosophy of law and political science. We cannot avoid some examinations of existing injustice, revelead by analytical moral evaluation inside the society, only accepting that a law has been declared constitutional. This can lead us through a rational approach of *reflective equilibrium* type to the idea that, perhaps, it would be required a constitutional revision, at least in some specific area, concerning *transitional justice*.

THE VIRTUES OF AN ACCELERATORY REMEDY IN THE FIGHT AGAINST THE EXCESSIVE LENGTH OF JUDICIAL PROCEEDINGS

CATRINEL BRUMAR[*]

Abstract:
According to the established case-law of the European Court of Human Rights, the Contracting Parties the Convention for the Protection of Human Rights and Fundamental Freedoms have the obligation to provide an effective remedy to the person that pretends that his right to a fair trial has been violated. Such a remedy must include a compensatory component; the European Court, in its judgments relating to Italian Pinto Law, underlined the essential character of the compensation in cases of excessive length of proceedings; still, the same Court encouraged States Parties not only to compensate, but also to offer an acceleratory remedy, in order to reduce the length of the procedures, as well as the amount of the compensation once the proceedings have been finalized. Following several major judgments pronounced by the European Court, some European States reacted by implementing such remedies: most solutions combine elements of acceleration with elements of compensation. The experience of such countries allows the institutionalization of a form of remedy that could be implemented also in Romania where, although there are some legal provisions stipulating some form of redress, we cannot talk of an authentic effective remedy. The present paper will focus on the acceleratory remedy, seen not only as a demarche at the disposal of the individual, but also as an interesting measure allowing for the reduction of length of procedures and thus limiting the effect of a violation of the right to a fair trial. [**]

Keywords*: acceleratory, remedy, excessive, length of procedures.*

Introduction

In 2001, overwhelmed by the number of cases enrolled on the docket of the European Court of Human Rights (herein the Court), alleging the violation of the right to a fair trial within a reasonable time, recognized in article 6 of the Convention for the Protection of Human Rights and Fundamental Freedoms (herein the Convention), Italy adopted the famous now *Pinto Law*. The piece of legislation was intended to offer to those complaining about the length of the judicial proceedings a domestic remedy allowing for compensation, thus reducing the number of complaints before the Court and alleviating its docket. The redress was welcomed by the European jurisdiction, which underlined the importance of a national compensatory recourse. Still, five years later, in a series of Great Chamber judgments on the question of the effective character of the Pinto remedy in cases of unreasonable length of judicial proceedings, although the Court maintained the important nature of a compensatory redress, it underlined the essential need for prevention and remarked: "The best solution in absolute terms is indisputably, as in many spheres, prevention. (…) Where the judicial system is deficient in this respect, **a remedy designed to expedite the proceedings in order to prevent them from becoming excessively lengthy is the most effective solution**. Such a remedy offers an undeniable advantage over a remedy affording only compensation since it also prevents a finding of successive violations in respect of the same set of proceedings and does not merely repair the breach *a posteriori*, as does a compensatory remedy of the type provided for under Italian law, for example."[1]

[1] *Cocchiarella v. Italy*, judgment of 26 March 2006, par. 74 .

This remark of the European Court on one hand encouraged the efforts already made by some States like Poland and Slovenia towards the implementation of a preventive domestic remedy but also draw other States attention (including Italy) on the fact that a compensatory redress was not going to be sufficient in the future in order to fight the excessive length of judicial procedures.

Although the subject was present in the preoccupation of the European Court from the beginning of the 2000, and Romania started in 2003 to see the judicial procedures before the domestic courts challenged before the international jurisdiction in term of unreasonable length, it was only in 2009, with the release of the *Abramiuc* judgment[2], that the need for a national remedy at the disposal of those alleging the violation of the right to a fair trial within a reasonable time was expressly affirmed by the European Court.

Still, two years later, such a remedy is not yet in place and the law on the Small Reform does not introduce such a redress at the disposal of individuals and entities discontented with the duration of the judicial proceedings they were involved in.

In the search of a pattern for such a remedy, which is necessary and will be requested in the case-law of the European Court against Romania, we will research the past experiences of other countries; their reaction to the excessive length of judicial procedures in term of prevention will be studied only as it refers to domestic remedies. Although the systemic reforms are the best solutions, from the European Court perspective, only national recourses can be evaluated in terms of exhaustion of domestic remedies.

Given the technical nature of the subject, our references will mainly consist of the case-law of the Court. It serves both to identify the problem and to evaluate the solutions found by different States.

The goal of this research is to sketch a possible acceleratory remedy that could be implemented in Romanian legal order, to combat, from the individual perspective, the unreasonable length of judicial procedures.

Past experiences: lessons learned?

Several States were confronted with the need to implement a domestic acceleratory remedy in order to avoid future complaints before the European Court challenging the length of national judicial procedures. The paper will only focus on five such experiences, as some countries like Italy still appreciate the compensatory redress as being not only effective but also sufficient to fight unreasonable duration. The presentation of States legislation will limit itself to acceleratory remedies or elements. It is to be noted that all five countries accompany the acceleratory remedy with the compensatory one.

The judgment that marked the begging of Polish quests for such a remedy is the one pronounced in *Kudla* case[3]. This case, concerning among other alleged violation the length of a criminal procedure already in place for 9 years at the moment the Court examined the complaint, offered the European jurisdiction the perfect occasion to draw States attention on their obligation to create in their respective national legal systems a remedy designed for hypothesis of excessive length of procedures.

The reaction of Poland, although delayed some four years, consisted in the adoption of legislation creating such a remedy; any party in a judicial procedure (including the enforcement ones or the preparatory criminal proceedings) unsatisfied with the speed of settlement of the affair was entitled to file a complaint, seeking ascertainment of the fact that the proceedings were pending longer than needed to establish the facts and resolve the case. The complaint was lodged before the superior court of the tribunal examining the main proceedings and was examined in the light of the Court's case-law.

[2] *Abramiuc v. Romania*, judgment of 24 February 2009.
[3] *Kudla v. Poland*, judgment of 26 October 2000.

The proceedings examining such a complaint were considered as incidental ones and the superior court hade to deliver its evaluation in two month from the date of lodging the complaint. As to the outcome of the proceeding, in the situation were the conclusion was affirmative and the reasonable time was exceeded, the superior court may give recommendations to the court conducting the main proceedings on appropriate measures to be carried out in a fixed time-limit. Accompanying such recommendations, the national tribunal could grant satisfaction to the author of the complaint. The allowance of such a partial compensation did not deprive the interested party of his or her right to seek further compensation after the closing of the main proceedings.

In its case-law after the adoption of this remedy, the European Court expressed its confidence in the potential of the redress; *Charzynski*[4] and *Figiel*[5] judgments applauded the demarche of Polish authorities, although some aspects relating to the actual implementation of the legislation did not permit the access of all interested individuals and entities to the new remedy or offers only limited satisfaction.

The Czech Republic was first confronted with a conclusion regarding the inexistence of a remedy to allow the allegation of a violation of the right to a fair trial within a reasonable time to be examined before the domestic courts in *Hartman*[6] case. The European Court in that case examined two potential acceleratory remedies against the excessive length of judicial proceeding put forward by the Czech Government: the first one indicated was a hierarchical recourse lodged before the superior court to the one conducting the main proceedings. It was rejected by the European jurisdiction as it did not recognize an individual right to seek and obtain the cooperation of state organs in the enforcement of the conclusion, but a mere right to be informed on the potential conclusions and recommendations made to the national tribunal. The second remedy invoked by the Government concerned a complaint before the Constitutional Court, which could indicate to the national judicial organ the measures to be adopted in order to stop the violation of the right to a fair trial. Still, the European Court found itself unsatisfied by the fact that the recommendations of the Constitutional jurisdiction could not be enforced if ignored by the national tribunal and by the fact that no compensation was granted to the interested party.

In reaction to the *Hartman* judgment, the Czech Republic reformed its legislation in order to introduce an acceleratory remedy, consisting in a complaint to be lodged before the president of the court examining the main proceedings. The president has one month to decide on the merits of the complaint; if the complaint is well-founded, he or she will indicate some measures to be carried out by the court. Still, the president could not decide on the re-allocation of the file, fix strict time limit for the court to complete procedural acts or put the file on the docket of priorities. Thus, the European Court refused to consider this remedy more than an extension of the hierarchical remedy already considered inadequate and in a later decision in *Vokurka*[7] case the Court suggested that the examination of the complaint be made by the superior court to the court involved in the main proceedings. Despite such a recommendation, the amendments brought in 2009 to the law on the judicial system transfers to the very instance dealing with the main proceedings the competence to examine the complaint.

Croatia developed the most rich and adaptable acceleratory remedy; after the first judgment on the infringement of the reasonable length of judicial proceedings[8], The Constitutional Court reacted and through case-law and reform in legislation, developed an acceleratory remedy offer the constitutional jurisdiction the competence to determine a time-limit within which the competent court shall decide the case on the merits. Still, the growing number of constitutional complaints attracted

[4] *Charzynski v. Poland*, judgment of 1 March 2005.
[5] *Figiel v. Poland*, judgment of 16 September 2008.
[6] *Hartman v. Czech Republic*, judgment of 10 July 2003.
[7] *Vokurka v. Czech Republic*, decision of 16 September 2007.
[8] *Rajak v. Croatia*, judgment of 28 June 2001.

delays in theirs examination, jeopardizing the reasonable time for the decision in a certain case and, more worrying, some decision of the Constitutional Court were not respected by the national tribunal, raising questions on the enforcement of constitutional decisions.

The latest reform adopted by the Croatian authorities introduced essential changes in the competence of the Constitutional Court; from that point forward, the complaints about the length of judicial proceedings would be examined by the superior court of the tribunal conducting the main proceedings. The justification of the reform underlined the need to respect the urgency of the procedure. The court thus requested can indicate a time-limit for the adoption of a decision on the merits, the procedure is very speedy. The decision on the incidental complaint can be appeal only by the party, but not by the Attorney's office.

After the *Lukenda*[9] judgment, Slovenian authorities adopted at their turn a legislation to address the question of effective acceleratory remedies. The Act on the Protection of the right to a trial without undue delay of 2006 opens for the interested party two possibilities of action: the supervisory appeal before the president of the court examining the case and the motion to set a deadline.

The supervisory appeal allows the president of the court, after requesting a report from the judge of the case, to indicate a time-limit not exceeding six month for the performance of certain procedural acts, to put the case on the priority list or to reallocate the file.

The motion to set a deadline can only be lodged after the exhaustion of the supervisory appeal, before the president of the court competent to exercise appellate jurisdiction over the court conducting the main proceedings. The president of the appellate court can also set a deadline or decide to put the case of the priority list.

The new legislation has already been examined by the European Court in its *Grzincic* judgment of 3 May 2007. The Court favorably noted the celerity of the incidental proceedings and the measures at the disposal of the judicial authority in cases of undue delay.

He last experience that it is worth mentioning is the Slovakian one; after a total vide in legislation concerning a domestic remedy against unreasonable length of judicial proceedings, noticed by the European Court in its *Havala* decision of 13 September 2001, amendments were brought to the Constitution and the Law on Constitutional Court, to introduce the possibility of lodging constitutional complaints against the alleged violation of the right to a fair trial without undue delay. The Constitutional court, in well-founded cases, would order the court conducting the main proceedings to speed up the examination of the case or to perform specific procedural acts. The Constitutional jurisdiction could also offer satisfaction for the violation of the reasonable length requirement. The new amendments were already in 2002 evaluated by the European Court that expressed satisfaction for their adoption and appreciated their effective character[10].

The possible model of an acceleratory remedy

After reviewing the experiences of countries challenged with the need to identify and implement a remedy for cases of excessive length of judicial proceedings, certain conclusions can be drawn.

The first that comes to mind, in light of Court's case-law, refers to the fact that any acceleratory remedy must be accompanied by a compensatory one. It is the legislator' choice were in the economy of the remedial complex it places the compensation element – a partial one going hand in hand with the acceleratory procedure or a final compensatory redress after the closure of judicial proceedings – but it must exist to complete and provide full effectiveness to the acceleratory elements. This conclusion is logical if we take into account the fact that the mere recognition of the

[9] *Lukenda v. Slovenia*, judgment of 6 October 2005.
[10] *Andrasik v Slovakia*, decision of 22 October 2002.

violation of the right to a fair trial, not followed by just satisfaction, does not lift the victim status to the individual or the entity affected by the unreasonable length of proceedings.

This paper only follows the characteristics and benefits of the acceleratory remedy, but does not loose sight of the whole economy of the right to an effective remedy, that the Convention proclaims in article 13 and that requests both recognition of the violation but also granting of just satisfaction.

The first limitation of the acceleratory remedy is given by its scope: it can only be used if a procedure is still pending. Once the main proceedings are closed, only a compensatory request could be lodged. However, in order for the remedy to be in line with the conclusions already stated by the European Court, it should be applicable to all stages of proceedings, including the administrative preliminary stage or the criminal investigations, as well as the enforcement stage of a civil procedure.

If the scope is large, the sphere of beneficiaries should be constructed in a manner to allow for a full protection of the right to a fair trial without invoking the acceleratory remedy against the individual or the entity whose right is affected. The Croatian provision forbidding the attorney to use the complaint for undue delay was the consequence of such a practice, where the attorney challenged all the decisions concluded on the violation of the right to a fair trial.

As far the competent court or authority are concerned, the possible solutions adopted by different States do not suggest a certain pattern; it is true that most of the practices seem to support the complaint lodged before the hierarchically superior court (or its president) the most important issue is the functional one: if the president of the main court can adopt effective measures, e.g. reassignment of files, placement on the list of priorities, mandatory time-limit, then the choice of such a incidental procedure is favorably appreciated by the European Court.

Still, within the domestic system, accurate attention must be paid to situations were the measures adopted in the framework of the acceleratory remedy are misused; for example, the reallocation of files is a measures that theoretically is beneficial to the interested party, but can also be a way for over-loaded judges to see their docket alleviating. Another problem could be the inadequate balance between the boldness of measures that could be indicated and the enforcement options or the inexistence of alternatives in case the main court is ignoring or unable to perform the procedural acts or to reach a solution on the merits in the fixed time-limit. In this light, the solution put forward by the Slovenian legislator seems to be the most balanced, although in other cases, like Slovakian one, the fact that the decision of the Constitutional Court are followed by the main court is also a positive sign.

To complete the functional criterion, the above exposed experience indicated that this procedure should imply with necessity, at least at a later stage, the access to a judicial form of control; the complaint before the president of the main court, although effective, in order to be more than an hierarchical supervision, must be doubled by the possibility to present a complaint to the appellate court (or at least its president).

Irrespective of the choice made as to the competent court or authority, the incidental procedure must be a speedy one, offering an evaluation and a decision in a maximum four month. The evaluation should always follow the Court's case-law, the criteria the Court developed regarding the behavior of the individual or entity invoking the violation of the right, the behavior of competent authorities, the complexity of the case, the moment in the procedure when the complaint is being lodged.

Where does Romanian domestic legal order stand?

As stated in the introductory section, in 2009 Romania faced the need to introduce in the domestic legal order an effective remedy in cases of alleged violation of a right to a fair trial within a reasonable time. Still, two years from the *Abramiuc* judgment, the only legislative remedy existing is to be found in the new Code of Civil Procedure, that was adopted in 2010 and is still to enter into force.

The acceleratory remedy can be lodged by any party to the main proceedings, including the prosecutor participating in the case, with the goal of requesting a decision on measures to be taken in order to eliminate such a situation of disrespect for the right to a fair trial, but only they consider to find themselves in one of the following situations: the time-limit stipulated by law for the performance of a certain procedural act, for the delivery of a judgment or of its considerations elapsed without the compliance to the legal requirement; the court has indicated a time-limit for a participant in the main proceedings to perform a procedural act, to present a document or certain information and the indication was ignored, but still the court did not adopted the measures provided by law, or when the court disregarded its obligation to solve the case in a predictable optimal time-limit.

According to the new legislation, the complaint will be examined and decided upon within 5 days, by the judges conducting the main proceedings. If they consider the complaint to be well-founded, the court will immediately take all the necessary measures to eliminate the situation that cause the undue delay and notify the measures adopted to the author of the complaint. The decision admitting the complaint can not be appealed; the decision rejecting the complaint can be appealed in 3 days from the notification. The decision on the appeal must be taken within 10 days from the receipt of the file. In case of well-founded appeal, the court will decide on the measures to be taken by the main court and, when appropriate, it will also fix a time-limit for the performance of the procedural acts or legal measures. The whole procedure is taking place without notification of the parties.

Some preliminary remarks on this acceleratory remedy, in the light of the abovementioned experiences of several States, as evaluated by the European Court, will cast more shadows than light on it.

We should begin by mentioning that the provisions are part of the Civil Code thus inapplicable to criminal proceedings. Or, an effective remedy must also be offered for those complaining about the length of this kind of proceedings.

As far as the substance of the mechanism is concerned, we deplore the fact that the same court conducting the main proceedings, in fact the same judges, will examine the acceleratory complaint. As justice must not only be done, but must be seen to be done, this element will affect the perception on the impartiality of the decision. It is a good point the fact that an appeal is provided in case the complaint is rejected. Still, an acceleratory remedy before the appellate court, without an appeal of the decision would have offered a more impartial appearance of the mechanism. But, even when the same judges reach the conclusion of an undue delay, they will indicate themselves the measures to be taken. Or, given the active role of the judge, it would seem to us that they already are aware of the measures to be adopted in order to assure a reasonable length of proceedings.

The third remark is targeting the grounds for lodging such a complaint: in great part, the disrespect of legal and judicial deadlines. The criteria enshrined in the case-law of the Court would become useless and still with the respect of all legal and judicial time-limits sometimes the proceedings are excessively long, as the provisions are permissive or the disrespect is not accompanied by sanctions.

Another remark concerns the absence of any compensatory element; furthermore, penalties are provided in case of abuse of the right to complaint. Taking into account the fact that the examination of the complaint does not have a suspensive effect and the short time –limit for the adoption of a decision, the sanctions imposed have a discouraging effect on the interested party.

Conclusions

The acceleratory remedy, as part of the effective remedy stipulated in article 13 of the Convention, is essential as it offers the possibility to reduce the already length of a judicial proceeding. It is also a fact that its preventive role is limited: in fact, it can and should be used an

instrument to evaluate on a regular basis the length of a given proceeding, in order not to extend the reasonable requirement. Still, its regulation and its functioning suggest that it intervenes at a stage where already there are some signs of undue delay. In this hypothesis, it is too late to prevent the excessive length, but still it can play a useful role in limiting its unreasonable character.

If we were to create a sketch of a theoretical acceleratory remedy, we would support an acceleratory remedy that be lodged before the appellate court (for cases of criminal investigation, the court competent to deliver the judgment on the merits in first instance or the court in which jurisdiction the enforcement procedure is taking place). The court should, in well-founded cases, fix a certain time-limit or decide to place the case on the priority list. It is true that a possible measure is thus being left aside: the reassignment of the case. Still, we expressed already certain doubts on the implications of such a measure and we consider that the gain of the involvement of the superior or appellate court is more consistent then the loss brought to the picture by the renunciation to this measure. In our view, the involvement of the appellate court would eliminate the perception, although unsubstantiated, that the main court is judge in its own case.

It is in the advantage of celerity that the procedure be a non-contentious and mainly written one; some measures preliminary to the examination of the case could be useful, such as the request of a report from the judge of the case, the request of the file or of a copy of the file, the notification to the other parties to the main proceedings on the lodging of an acceleratory complaint.

A deadline must be set for the adoption of the decision in the incidental proceedings, and this deadline should not exceed four month. In the evaluation of the well-founded character of the complaint, the criteria already enshrined in the case-law of the European Court should serve as guidance to the instance: the whole length of the proceedings, the time elapsed since the past acceleratory complaint, the complexity of the case, the nature of the case requesting special diligence from the part of the authorities, the behaviour of the interested party as well as the behaviour of the authorities and also the repercussions of the case on the personal situation of the interested party.

In case where the well-founded character of the complaint is established, the measures directed to accelerate the procedures could imply, *inter alia*: fixing a time-limit for the performance of certain procedural acts, placing the case on the priority list, eventually the reallocation of the case to a different court or taking over the case by the appellate court. Although possible in theory, the last measure is not very recommendable, as it deprived the individual or the entity of an appeal. In any event, the appellate court will not offer any indication on the factual elements of the case nor suggest any solution to be endorsed by the main court.

Once the length of the proceedings evaluated as excessive, the main court should benefit of a limited time to perform required procedural acts and to deliver a decision on the merits. For this reason, a new acceleratory complaint should only be admissible after a certain period; a six to twelve month term is in our view a reasonable and allows for the proper decision to be adopted in the main proceedings. The actual prohibition limit should be established by the appellate court, after due consideration of elements like the whole length of the proceedings, the stage of the proceedings in the moment of the evaluation and the realistic chances of a solution.

For the sake of celerity, the points of a possible appeal to a decision in acceleratory proceedings should be strictly listed by the legislation. This would avoid a ¨process about the process¨; moreover, the appeal in the acceleratory proceedings, given the other elements, would not justify on the grounds of guaranteeing impartiality.

In our view, this is the model that should be followed by the Romanian authorities. The specific provisions concerning the partial of final compensation, the source of this compensation are the legislator's choice. Still, the Romanian legislator needs to make a choice, in order to provide the effective remedy and avoid complaints before the European Court. Complaints that, in the end, will only lead to the same requirement: the creation in the domestic legal order of an effective remedy, combining elements of acceleratory and compensatory nature.

THE NECESSITY OF ENSURING PERSONAL RELATIONSHIPS WITH THE MINOR. GUARANTEEING THE BEST INTEREST OF THE CHILD IN TERMS OF THE JURISPRUDENCE OF THE EUROPEAN COURT OF HUMAN RIGHTS

CARMINA ALECA[*]
ANDREEA DRĂGHICI[**]

Abstract
We can not ignore, concerning the regulation of relationships between parents and children, a real assessment of the child's best interest, this being left to the courts or competent authorities' decision. An issue that needs to be clarified is the divorce situation, when the court entrusts the child to one of the parents, who prevents the other one to have contact with him. Although the legal text refers only to acts committed after the pronouncement of the sentence of entrusting custody of minor, however the judicial practice stated that it is also about those situations in which these acts are committed before pronouncement of the judicial sentence. In this regard, assessing the child's best interest is also a sensitive issue and extremely important by the fact that the court must maintain a balance between the need to ensure a child's growth and harmonious development and respect for privacy and family, as it is covered in Article 8 of the European Convention on Human Rights, even if it is about the right of the child or of one of his parents.

Keywords: *personal relationships, child's best interest, entrusting custody of minor, parents rights, ECHR*

Introduction

Taking into consideration the complexity and variety of situations wherein each child finds him/herself, the legislator intentionally allows the courts a free hand in deciding what is in the child's best interest, starting with a concrete assessment of the specific circumstances of every case. The necessity of ensuring the personal relationships with the minor is included among these desiderata. This is a sensitive and extremely important problem in terms of the fact that the court has to maintain a balance between the necessity to ensure the upbringing and harmonious development of the child and the respect for the child's right to a private life and a family, as it is stipulated by article 8 from the European Convention of Human Rights, whether it concerns the rights of the child or of either of the parents.

We are of the opinion that the best interest of the child is a criterion that must govern every decision or action of every person, public institution or authorized public institution and which involves the child directly. This is the reason why we proceed to an *in extenso* interpretation of the text of the law with direct applicability to the problems that arise in the factual reality. Precisely because the field of children's rights has substantially grown and even though the regulation of these rights is considerably evasive, we have proceeded in this study to analyse the decisions of the European Court of Human Rights, the more so as the decider does not establish by law any reference points in accordance with which the best interest of the child should be arranged.

1. The problematics of ensuring the personal relationships with the minor in case of non-compliance with the measures concerning the custody of the minor. A premise situation.

As stipulated in the text of article 307 of the Criminal Code the keeping a minor without the consent of the other parent, may constitute the offence of non-compliance with the measures concerning the custody of the minor, if through this action the upbringing and the development of the child is jeopardised. The parent to whom the child was not entrusted retains, the non-custodial parent retains, as we have mentioned, the right to watch over the upbringing and the education of the minor. Taking the child from the custodial parent must be well-grounded, meaning that it must be determined by reasons that demonstrate that entrusting the child to that parent would have negative consequences on the child's physical and emotional development[1]. Consequently, this is the situation, in which the parent granted custody can no longer ensure the conditions necessary for an appropriate development, in which case the said action no longer constitutes an offence. In the assessment of such a situation both material possibilities as well as emotional relationships formed between the minor and the non-custodial person are taken into consideration. In this instance, it has been established that the request of the parent for the return of the child from any person that keeps him/her without the right to do so shall be rejected, if the return is contrary to the interests of the child[2].

At the same time, the repeated prevention of the person entrusted with the minor, or of either parent from having a personal relationship with the child may present certain elements that constitute an offence as stipulated in article 307 of the Criminal Code. This is the case, in which for sound reasons the child is entrusted to another person to be brought up and educated. Such a decision may be made by the court when it judges that the parents are guilty of negligence, without constituting a grave offence or without abusing their parental rights and responsibilities, and thus still jeopardising the health and development of the child. In this situation, one must guarantee the parents the right to maintain a personal relationship with the minor, as they have the obligation to raise the child without making any decisions concerning the child's person. The duty to protect and watch over the child rests in such a case with the person entrusted with the child's upbringing and education.

Among the cases adjudicated by specialized legal bodies, situations may arise, in which the custodial parent is guilty of negligence and abuse. In this case the non-custodial parent may contact the police to investigate the danger such an attitude may cause the person of the minor. This is the ideal situation in which emergency protective measures may be taken by the social service. However, there are situations in which one intervenes on one's own authority, as we say, by giving the child to the non-custodial parent without receiving the permission of the custodial parent. This action seems completely justified, as long as it does not endanger the development of the child.

The existence of court decisions whereby the court entrusts the minor to another person to be raise and educated, as well as denying the parents the right to have a personal relationship with the child, within the terms set by the respective parties or by the judicial body, may be the focus of criminal investigations. Criminal investigative authorities are responsible for classifying the conditions, in which the child's upbringing and development are endangered, and for ascertaining whether such an action has been perpetrated.

In this sense, throughout the investigation, the respective authorities must keep establishing the circumstances of every case, the material and moral conditions that each parent offers, but also the best interest of the child.

2. The special situation of ensuring the personal relationship with the minor in case of divorce. The lato sensu interpretation of article 307 paragraph 2 of the Criminal Code

In legal practice, a special case has been recorded: when by a court decision in a divorce case a minor is entrusted to the mother to be raised and educated, with the obligation to allow the father the right to visit on predetermined dates. Despite all the father's attempts, the mother has repeatedly prevented him from making contact with the minor within the terms set through the decision of the court.

Concretely speaking, it concerns a court decision whereby the minor is entrusted to another person and the abusive violation of its terms, by preventing any contact between the child and his parents. Foreseeing such a situation is determined by the gravity of the action, whereby a minor is abusively estranged from one or both parents and which can weaken the family relationships and endanger the upbringing and education of the minor[3].

A problematic situation is the one in which, in case of divorce, the court may entrust the minor to one of the parents, who then prevents the other parent from making contact with the minor. Although the legal text is concerned only with the actions of prevention perpetrated after the court entrusted the child, the judicial practice states that it concerns those situations, in which the preventative actions are perpetrated before the court rules on the matter, every time the court establishes the residence of the minor with one of the parents and before the divorce is pronounced[4].

This text has been criticised for expressly specifying only the hypothesis of entrusting the minor through a court ruling to be raised and educated by one of the parents or by another person, and not the cases of establishing the residence of the child with one of the parents, until the divorce is settled. This means that the other parent is considered deprived of parental rights and the child is deprived of the protection of both his parents, which implies that the stipulations are interpreted in the aforementioned sense[5].

Speaking for ourselves, we consider, along side other authors, that the text of article 307, paragraph 2 from the Criminal Code should be interpreted lato sensu, and with respect to the situations that may arise before the court's final ruling whereby entrusting one of the parents with the upbringing and education of the child.[6] Consequently, in case the divorce proceedings have not concluded yet, if the court decides to temporarily establish the residence of the minor with one of his parents and this parent prevents the other from having contact with the child, then the court must ascertain, through an extensive applicability of the text of the law, the existence of the offence stipulated by article 37, paragraph 2 from the Criminal Code.

Therefore, the action of the parent, with whom the minor resides until the divorce proceedings end, to prevent repeatedly the other parent from maintaining a personal relationship with the minor, within the terms set by the court ruling, constitutes the offence of violating the terms of the custody agreement.

Throughout the criminal investigation, the judicial authorities need to ascertain to what degree the action of preventing contact with the non-custodial parent represents a danger to the child. Obviously, the parents' separation results in a change of the way their rights and obligations to the child are exercised or fulfilled[7]. The researched situations differ depending on whether the child was entrusted to one of the parents, a relative or any other person or protective institution.

Therefore, even in case of a divorce, the rights of the parents remain, the non-custodial parent retains the right to exercise his/her rights as he/she is still responsible for the child's upbringing[8]. In other words, the non-custodial parent will continue to exercise the parental rights acknowledged by law (the right to watch over the child's upbringing and education and the right to guide the child in all respects). We must also mention that the non-custodial parent has not been assimilated by the parent deprived of parental rights. The law recognizes and grants the former, in virtue of his / her quality, a series of rights with regard to the child's person, rights that practically represent a guarantee to respect the constitutional right to a family and a private life.

3. Concrete ways of exercising the right to have a personal relationship with the minor

Pursuant to article 43 of the Family Code, the non-custodial parent is guaranteed the right to have a personal relationship with the minor, as well as to watch over his/her upbringing, education, teaching, and professional training, retaining also the right and the duty to contribute to raising the child. In case this parent is prevented by the custodial parent from exercising this right, the former is granted the possibility to address the court, which will establish the practical ways of exercising this right, which the custodial parent must honour. Therefore, only the court has the power to decide whether the personal relationship with the minor poses a danger to the child. Consequently, the court has the possibility, as expressly regulated by law, to limit or prohibit the non-custodial parent from maintaining a personal relationship with the minor, if there are justifiable causes that endanger the physical, mental, emotional, moral and social development of the child.

With regards to the ways in which the parent's right to have a personal relationship with the child, these are extremely diversified and involve any form of contact with the child, and namely[9]: meetings between the child and the non-custodial parent, visiting the child at his/her home; living with the non-custodial parent, for a predetermined period of time; correspondence or any other form of communication with the child; sending the child updates about the non-custodial parent; sending the non-custodial parent updates about the child, including recent photographs, medical or school evaluations; also visiting the parent at their home or visiting the child at their school etc.

According to legal practices, the right of the parent to have personal relationships with the child may not be limited except if that right was abusively exercised. If this is not proven, the exercise of this right cannot be disturbed by the mandatory presence of the other parent, communication between the non-custodial parent and the child shall take place in a natural manner, without any restrictions[10]. Therefore, only in special cases, when it is ascertained that exercising this right by the non-custodial parent is not in the child's interest, the court may prohibit visitation. This right may be removed for serious reasons, for example, anything that could severely trouble the child (alcoholism, inappropriate conduct towards a child)[11].

We must also mention the fact that, in case the parents cannot come to an understanding concerning the way, in which the parental rights and obligations are to be exercised or fulfilled, the court has the authority to decide on the conditions whereby ensuring the parents' right to have a personal relationship with the child[12]. The child has a right to know his/her parents and to be raised by them, therefore it is necessary that personal relationships be formed and maintained between the child and the non-custodial parent, in case the child cannot benefit equally from the protection of both parents. The best interest of the child must be observed twofold in this case. Firstly, the court must establish whether the interest of the child dictates that this right be acknowledged or whether it

prohibits such a relationship, following the fact that there are clear and well-grounded reasons for this: the life and physical and mental health of the minor are jeopardised by the parent's condemnable behaviour. Secondly, the court must decide not only on the matter of granting custody of the child, but also on more precise aspects concerning the exercise of this right, as it is necessary to find the best practical means of maintaining the parent – child relationship.

4. The Jurisprudence of the European Court of Human Rights in matters of ensuring the personal relationships with the minor

It is obvious, that after the divorce, the child can no longer live with both parents. The law thus grants one parent the chance to exercise their parental rights. The law must find a balance between the parents' desire for freedom and the exercise of their parental responsibilities. Notwithstanding all of these, every law, every court ruling remains without effect, thus depriving the child of his/her parent's love[13]. According to the European Court of Human Rights, the court rulings concerning the custody of the child must keep in mind aspects pertaining to equality.

Not even in the case of entrusting the child during divorce proceedings, does the ascertaining of the child's best interest have any legal criteria, and thus the courts decide on this matter. We consider that in the court ruling, whereby the child is entrusted to either parent, the right of the child to maintain their relationship with the other parent as well as a visitation schedule and the practical ways of exercising this right must be well established. Therefore, in case of divorce, article 8 stipulates the right of the non-custodial parent to visit, in order to maintain contact with the minor[14], if the child's best interests do not prohibit it. Such being the case, any parent that does not live with their child has the right to maintain contact with the child. The European judges condemn any difference of treatment with regard to the right of divorced fathers or fathers of children born out of wedlock to visit their children. In this situation, the state has a positive obligation not to impede the father from forming a personal bond with the child, as long as both of them want to.

With regards to the carrying out a court ruling whereby a child is entrusted to either parent after the divorce, the court has decided that the obligation of the national authorities to take certain steps to reunite the child with the non-custodial parent, in case the child resides with the other parent[15]. The national authorities must make every effort to maintain cooperation among all the persons and institutions involved, in order to reunite the child with his/her parent, and the right of these authorities to resort to coercive measures is limited by the rights and the interests of all the persons involved and especially the best interest of the child. Therefore, in case contact with the parents would risk to threaten these interests or to encroach upon the child's rights, the national authorities have the duty to ensure an equitable balance of all interests[16].

Taking into consideration the best interest of the child, the case of Sahin v. Germany, the European Court of Human Rights has established that the refusal of national jurisdictions to grant the claimant the right to visit his/her child, born out of wedlock, was completely justified by the serious tensions between the parents, which have constituted pertinent reasons for this ruling. The Court admitted that the rulings in question were made in the child's best interest, as there is a risk that the respective parental visits may affect the child's normal development within the family, with which the child resides, especially if the agreement between the parents to have family therapy had failed. With regards to the possibility of establishing contact between the child and the claimant, the Court decided that subsequent psychological expertise in this case is at the discretion of the national

courts[17]. Therefore, we do not consider it crucially necessary to request the advice of a psychologist in the matter of granting the non-custodial parent the right to visit, keeping in mind in this point every circumstance of the case.

Not carrying out the rulings of the court with regard to visitation and the custody of the child may pose certain problems, in applying article 8 of the European Convention of Human Rights, as proved also by the ruling in the case of Ignaccolo-Zenide v. Romania[18]. The criterion consists in knowing whether the authorities have taken all the necessary measures that could be reasonably taken in the circumstances of the respective case in order to carry out the terms of the ruling. By underlining the fact that coercive measures are generally undesirable in cases involving children, the Court has accepted that resorting to sanctions is allowed in such a case, where the behaviour of the custodial parent is illegal.

Conclusions

An interesting issue which really affects the future of education and raising a child in case of divorce is related to child custody to one of the parents. The problem of ensuring personal relationships with the minor can not be treated otherwise than in accordance with the principle of best interests of the child, providing the exercise of conventional fundamental rights. The court must once again consider the best interests of the child, without benefit of legal criteria. It must decide not only on child custody, but also about practical matters related to the exercise of this right, in order to find the best practical means of maintaining these relationships. We believe that the judicial decision of custody should determine the child's right to maintain personal relationships with the other parent, but also the program of visiting and the concrete ways of exercising this right. It should be borne in mind in this respect, for a better functioning of the legal system in Romania, an interweaving of national jurisprudence with ECHR jurisprudence in which concerns the assessment of child's best interest in custody matters.

[18] European Court of Human Rights decision, 25 ianuarie 2000 in the case of Ignaccolo-Zenide v Romania.

THE RESULT OF THE TRANSPOSITION OF EU DIRECTIVES INTO NATIONAL LEGISLATION. THE FIRST CASE AGAINST ROMANIA REGARDING THE IMPLEMENTATION OF THE RACIAL EQUALITY DIRECTIVE (2000/43/EC) AND OF THE EQUAL TREATMENT DIRECTIVE (2000/78/EC)

CRISTIAN JURA*

Abstract

The purpose if this research paper is to analyze how the two directives, The Racial Equality Directive (2000/43/EC) and of The Equal Treatment Directive (2000/78/EC), were transposed into national legislation. One objective of the paper is to present and analyze some outcomes of the transposition: the national legislation on combating discrimination and the national institutions in this field. The second objective is to present and analyze the first case against Romania regarding the transposition of The Racial Equality Directive (2000/43/EC) and of The Equal Treatment Directive (2000/78/EC) into national legislation: preliminary ruling C-310/10 (Agafiței and Others, Romania) and the possible impact of this case. Council Directive 2000/43 is implementing the principle of equal treatment between persons irrespective of racial or ethnic origin. Directive 2000/78/EC is establishing a general framework for equal treatment in employment and occupation. The case stems from a salary dispute Agafitei and others, staff of the national anti-corruption board and management research to fight organized crime and terrorism. There is a reward past circumstances arise system with two tracks: one that is followed by the 'attorneys' and by other staff. For the first track counts along the length of service for the second. Since there is no (additional) qualification requirements for the group of prosecutors, according to defendants pay equal. In a national procedure Agafitei others (defendants in the national procedure) in the right, and their employers to pay the lost wages. The respective employers, however, did not agree and make cassation.

***Keywords**: transposition, discrimination, National Council for Combating Discrimination, European Court of Justice, preliminary ruling*

Introduction

In 2010 there was introduced Reference for a preliminary ruling from the Curtea de Apel Bacău (Romania) lodged on 29 June 2010 — Ministerul Justiției şi Libertăților Cetățeneşti v Ştefan Agafiței and Others[1].

This is the first case first case against Romania regarding the transposition of The Racial Equality Directive (2000/43/EC)[2] and of The Equal Treatment Directive (2000/78/EC)[3] into national legislation: Preliminary ruling C-310/10 (Agafiței and Others, Romania).

In order to have a clear picture of this case, there must be analyzed a series of institutions, most of them used for the firs time since Romania became member of European Union.

The research will be structured based on four main themes:

- European Union and discrimination;
- The national institutions in the field of combating discrimination;
- The preliminary ruling in front of Court of Justice.

* Lecturer, Ph.D., "Dimitrie Cantemir" Christian University; State Secretary, Member of the Steering Board of The National Council for Combating Discrimination, (e-mail: cristianjura@yahoo.com).

[1] OJ C234/27 from 28.08.2010

[2] OJ L180/22 from 19.07.2000

[3] OJ L303/16 from 02.12.2000

Based on the four analyzes we could draw same conclusions related on possible impact of this case on Romania.

European Union and Discrimination

It is well known that the combating discrimination legislation lies at the level of European Union in three distinct Directives. The three Directives are:

- Council Directive 2000/43/EC – Racial Equality Directive: establishes a framework against discrimination based on racial or ethnic origin inside and outside the labour market;

- Council Directive 2000/78/EC – Employment Equality Directive: establishes a framework for equal treatment in employment and occupation, and in Article 1 lays down a general framework for combating discrimination on the grounds of religion or belief, disability, age or sexual orientation as regards employment and occupation;

- Council Directive 2004/113/EC[4] – Gender Directive (and Gender Recast Directive 2006/54/EC): establishes a framework for equal treatment between men and women in access to and supply of goods and services.

In addition to the Council Directives, European Union considers combating discrimination one of the top priorities. In 2008 was issued another proposal for a new Directive, so called Horizontal Directive, on implementing the principle of equal treatment between persons irrespective of religion or belief, disability, age or sexual orientation.

There are another two documents important for this issue, both Communications From The Commission To The European Parliament, The Council, The European Economic And Social Committee And The Committee Of The Regions: 2008 Non-discrimination and equal opportunities: A renewed commitment[5] and 2008 Renewed social agenda: Opportunities, access and solidarity in 21st century Europe[6].

Recently, February 2011, was published a study called: EU – MIDIS European Union Minorities and Discrimination Survey - Data in Focus Report – Multiple Discrimination[7].

The referring court, Curtea de Apel Bacau, refers to only 2 EU directives out of the three mentioned above. The referring court refers to Directive 2000/43/EC – Racial Equality Directive and to Directive 2000/78/EC – Employment Equality Directive: establishes a framework for equal treatment in employment and occupation.

More precise Curtea de Apel Bacau refers to the art. 15 of Directive 2000/43/EC – Racial Equality Directive: establishes a framework against discrimination based on racial or ethnic origin inside and outside the labour market and to art. 17 of Directive 2000/78/EC – Employment Equality Directive

The content of the two articles mentioned are very much similar.

The art. 15 of Directive 2000/43/EC is named "*Sanctions*" as has the following content: "*Member States shall lay down the rules on sanctions applicable to infringements of the national provisions adopted pursuant to this Directive and shall take all measures necessary to ensure that they are applied. The sanctions, which may comprise the payment of compensation to the victim, must be effective, proportionate and dissuasive. The Member States shall notify those provisions to the Commission by 19 July 2003 at the latest and shall notify it without delay of any subsequent amendment affecting them.*"

The art. 17 of Directive 2000/43/EC is named "*Sanctions*" as has the following content: "*Member States shall lay down the rules on sanctions applicable to infringements of the national provisions adopted pursuant to this Directive and shall take all measures necessary to ensure that*

[4] OJ L373/37 from 21.12.2004

they are applied. The sanctions, which may comprise the payment of compensation to the victim, must be effective, proportionate and dissuasive. Member States shall notify those provisions to the Commission by 2 December 2003 at the latest and shall notify it without delay of any subsequent amendment affecting them."

The National Institutions in the Field of Combating Discrimination

The National Council for Combating Discrimination (NCCD) was established in august 2002[8].

The National Council for Combating Discrimination was established pursuant to the adoption of Government Ordinance no. 137/2000[9] and Government Decision no. 1194/2001 on organization and function of NCCD. These legal acts represented the transposition of the community legislation in the field at national level. At European level there are institutions assigned to human rights protection and combating discrimination but NCCD is unique, its activity combining 14 discrimination criteria, no other institution having such a vast sphere of action, including sanctioning.

The National Council for Combating Discrimination (NCCD) is the autonomous state authority, under parliamentary control, which performs its activity in the field of discrimination[10].

The main Competences and responsibilities of the NCCD are[11]:

a) prevention of discrimination deeds through information and awareness campaigns regarding human rights, discrimination effects, the principle of equality, formation and informing courses, projects and programmes at local, regional and national level, studies realization, reports etc

b) the mediation of discrimination acts is the way to solve the discrimination deeds on friendly terms of the parts implicated in the discrimination case, in the presence of the National Council for Combating Discrimination representatives. The National Council for Combating Discrimination aims to reduce and eliminate the discrimination acts and by no means to penalize.

c) the investigation, ascertainment and sanction of discrimination acts. For the proper analyze of the cases and decision making about petitions received or internally generated complaints, the Steering Board has means at its disposal in order to investigate the cases, from which it establishes the existence of any discrimination act and penalizes it accordingly.

d) the monitoring of discrimination cases as a result of the ascertainment of discrimination cases by NCCD, through subsequent supervision of the involved parts.

e) granting specialized assistance to the victims of discrimination. The NCCD juridical advisers explain the legislation to those interested through assisted guidance regarding the activity of filing a petition and additional information that results from this.

Following the receiving of your petition, it will be registered and forwarded to the Steering Board, in order to be solved. The NCCD could be notified within one year from the date the discrimination took place or the date a person took cognizance of its commission[12]. The discriminated person may demand the annulment of the discrimination facts' consequences and the re-establishment of the situation that existed before the discrimination deed[13]. The term for solving your petition is of 90 days[14]. The Steering Board will ascertain the existence of the discrimination

deed by compulsory summoning of the parts, that is realized by any means that ensures the confirmation of receive. The absence of parts involved at the hearings does not affect the petition's solving. In order to take a proper decision, NCCD can perform additional investigation, or NCCD can call the parts involved (you and the person you accuse of discrimination) at our headquarters for hearings[15].

The persons considered discriminated have the obligation to prove the existence of facts from which it may be presumed that there has been discrimination and the person you accuse has to prove that these deeds do not constitute discrimination[16].

The Members of the Steering Board may apply sanctions when they ascertain discrimination has taken place. The sanctions can be warnings or fines of between 400 to 4.000 lei, if the discrimination affects a natural person, and of between 600 to 8.000 lei, if the discrimination affects a group of persons or a community[17].

The solution (The Decision of the Steering Board) is transmitted in writing to the discriminated persons and the person accused of discrimination within 15 days from its adoption in the Steering Board meeting. In another 15 days' time from the receiving of the Steering Board Decision, the parts can dispute it in instance if they are not pleased with the solution of the case. The judicial stamp value is free for both parts[18].

For all discrimination cases, the victims are entitled to claim damages, proportional to the act, as well as the restoration of the situation prior to discrimination or to the cessation of the situation created by discrimination, in accordance with common law. Upon request, the court can order that the competent authorities withdraw the licence of legal entities that significantly prejudice society by means of a discriminatory action or have repeatedly violate the provisions of the Government Ordinance no. 137/2000. Human rights non-governmental organizations can appear in court as parties in cases involving discrimination pertaining to their field of activity and which prejudice a community or a group of persons[19].

The prevention of discrimination deeds is a priority among the Council's functions and prerogatives and the correlation and observance of the guidelines with the objectives and priorities established in the National Strategy implementing the measures of preventing and combating discrimination (SNIMPCD) 2007 -2013 is essential in achieving the objectives of this field.

In order to enforce the guidelines in preventing and combating discrimination, on the basis of policies which promote equality of opportunity, mutual understanding and respect, the National Council for Combating Discrimination sought to strengthen cooperation with civil society and institutions of public administration and local government, increasing knowledge and awareness of the population with regard to the non-discrimination principles.

In the last years, NCCD conducted campaigns which had well established target groups, such as: pre-school children, pupils, students and Master students, kindergartens, schools, high schools and university teachers, clerks, policemen, gendarmes, judges, lawyers, members of non-governmental organizations, doctors and health personnel, representatives of national minorities, etc, both in Bucharest and across the country. We wish to underline the significant fact that these activities pursued the objectives of the National Strategy implementing the measures of preventing

and combating discrimination during 2007 -2013, drawn up by the National Council for Combating Discrimination in 2007.

Also, some of the activities have pursued and fallen under the scope of the specific European issues 2008 – European Year of Intercultural Dialogue, designated as such by a joint decision of the European Parliament and the European Council, at the end of 2006.

The preliminary ruling in front of Court of Justice

The procedure of preliminary ruling is based on the Chapter 9 Preliminary Rulings and other References for Interpretation, art. 103 – 104 from Consolidated Version of the Rules of Procedure of the Court of Justice (2010/C 177/01)[20] and on Information Note on References from National Courts for a Preliminary Ruling (2009/C 297/01)[21].

Under the preliminary ruling procedure, the Court's role is to give an interpretation of European Union law or to rule on its validity, not to apply that law to the factual situation underlying the main proceedings, which is the task of the national court. It is not for the Court either to decide issues of fact raised in the main proceedings or to resolve differences of opinion on the interpretation or application of rules of national law.

8. In ruling on the interpretation or validity of European Union law, the Court makes every effort to give a reply which will be of assistance in resolving the dispute, but it is for the referring court to draw the appropriate conclusions from that reply, if necessary by disapplying the rule of national law in question.

Under Article 267 TFEU, any court or tribunal of a Member State, in so far as it is called upon to give a ruling in proceedings intended to arrive at a decision of a judicial nature, may as a rule refer a question to the Court of Justice for a preliminary ruling

All national courts must therefore refer a question to the Court when they have doubts about the validity of such an act, stating the reasons for which they consider that that act may be invalid.

A national court or tribunal may refer a question to the Court for a preliminary ruling as soon as it finds that a ruling on the point or points of interpretation or validity is necessary to enable it to give judgment; it is the national court which is in the best position to decide at what stage of the proceedings such a question should be referred.

A reference for a preliminary ruling calls for the national proceedings to be stayed until the Court of Justice has given its ruling.

Base on these rules of procedure Curtea de Apel Bacău introduced Reference for a preliminary ruling:

1. Do Article 15 of Council Directive 2000/43/EC implementing the principle of equal treatment between persons irrespective of racial or ethnic origin (1) and Article 17 of Council Directive 2000/78/EC establishing a general framework for equal treatment in employment and occupation (2) — both transposed into national law by OG (Ordonanta Guvernului (Government legislative decree)) No 137/2000, as republished and amended — preclude national legislation or a judgment of the Constitutional Court (Constitutional Court) prohibiting the national judicial authorities from awarding to claimants who have been discriminated against the compensation for material and/or non-material damage which is considered appropriate in cases in which the compensation for the damage caused by discrimination relates to salary rights provided for by law and granted to a socio-professional category other than that to which the claimants belong (see, to that effect, judgments of the Constitutional Court No 1325 of 4 December 2008 and No 146 of 25 February 2010)?

2. If the answer to Question 1 is in the affirmative, are the national courts required to await the repeal or amendment of the provisions of national law — and/or a change in the case-law of the

[20] OJ C177/1 from 02.07.2010
[21] OJ C297/1 from 05.12.2009

Constitutional Court — which are, ex hypothesi, contrary to the provisions of Community law, or are the courts required to apply Community law, as interpreted by the Court of Justice of the European Union, directly and immediately to the proceedings pending before them, declining to apply any provision of national law or any judgment of the Constitutional Court which is contrary to the provisions of Community law?

Basically the question asked is Do Article 15 of Council Directive 2000/43/EC and Article 17 of Council Directive 2000/78/EC preclude national legislation or a judgment of the Constitutional Court prohibiting the national judicial authorities from awarding to claimants of the Constitutional Court prohibiting the national judicial authorities from awarding to claimants?

The provisions of the Government Ordinance no. 137/2000 were interpreted by Constitutional Court of Romania[22] by several decisions: Decision No.818 of July 3rd 2008 on the objection of unconstitutionality of the provisions under Article 1, Article 2 paragraph (3) and Article 27 of the Government Ordinance no.137/2000 on the prevention and punishment of all forms of discrimination[23], Decision No.819 of July 3rd 2008 on the objection of unconstitutionality of the provisions of Article 1, of Article 2 paragraphs (1) to (3), of Article 6 and of Article 27 paragraph (1) of Government Ordinance no.137/2000 on the prevention and punishment of all forms of discrimination[24], Decision No.820 of July 3rd 2008 on the objection of unconstitutionality of the provisions of Article 1, of Article 2 paragraph (3) and of Article 27 paragraph (1) of Government Ordinance no.137/2000 on the prevention and punishment of all forms of discrimination[25], Decision No.821 of July 3rd 2008 on the objection of unconstitutionality of the provisions under Article 1, Article 2 paragraphs (1), (3) and(11) and Article 27 of the Government Ordinance no.137/2000 on the prevention and punishment of all forms of discrimination[26] and Decision No.997 of October 7th 2008 on the objection of unconstitutionality of the provisions under Article 20 of the Government Ordinance no.137/2000 on the prevention and punishment of all forms of discrimination[27].

The important Decision of Constitutional Court in the analyzed case is Decision No.997 of October 7th 2008.

As grounds for the objection of unconstitutionality the Constitutional Court shows that, as from the interpretation of the criticized legal text, results that the decisions of the Steering Board of the National Council for Combating Discrimination are given only with a view to investigate and prosecute wrongdoing facts or acts of discrimination, acts construed as illegal actions or omission that violate the individual right rules, causing damage to a person. Nothing contained in Government Ordinance no.137/2000 empowers the College to issue resolutions in the exercise of the power of harmonization of legislation. This conclusion is required by several aspects, such as the need for referral to the Council within one year after the act was committed or within one year after the date on which the same could get to his knowledge, the burden of proving the act by the one who considers to be discriminated, the opportunity the use as evidence also audio and video recordings, application of fines, the enforceability of the Council decision as regards pecuniary penalty and the possibility of restoring the previous situation. A contrary interpretation, which would legitimize the National Council for Combating Discrimination to apply fines for the adoption of certain normative acts, would be a nonsense. Likewise, it is impossible to restore the situation preceding the discrimination „created" by a statutory provision by a resolution of the National Council for Combating Discrimination, the provisions of laws and ordinances enjoying, until proven otherwise, the presumption of constitutionality and those contained in an administrative act of the presumption

[22] www.ccr ro

23 Published in the Official Gazette (Monitorul Oficial) of Romania, Part I, no.537 of July 16th 2008

24 Published in the Official Gazette (Monitorul Oficial) of Romania, Part I, no.537 of July 16th 2008

25 Published in the Official Gazette (Monitorul Oficial) of Romania, Part I, no.537 of July 16th 2008

26 Published in the Official Gazette (Monitorul Oficial) of Romania, Part I, no.537 of July 16th 2008

27 Published in the Official Gazette (Monitorul Oficial) of Romania, Part I, no.774 of November 18th 2008

of legality. Therefore, it considers that Article 20 of Government Ordinance no.137/2000 is unconstitutional insofar as it is interpreted in the sense that it gives the Council the power to ascertain the breach of the principle of equality before the law by examining and censoring the solutions contained in regulations and administrative acts of normative type.

Examining the objection of unconstitutionality, the Court finds that, in essence, the author challenges the constitutionality of the judicial powers of the National Council for Combating Discrimination, which, according to Article 20 paragraph (3) of Government Ordinance no.137/2000, may order „the removal of the consequences of discriminatory acts and restoration of the situation preceding such discrimination", to the extent that discriminatory situations arise from the content of certain normative acts.

The decision issued by Constitutional Court decided to Allow the objection of unconstitutionality raised by the Ministry of Justice in the File no.7,604/99/2007 of Iaşi Court of Appeal – Contentious Administrative and Tax Division and holds that the provisions of Article 20 paragraph (3) of Government Ordinance no.137/2000 on the prevention and punishment of all forms of discrimination **are unconstitutional**, insofar as they can be interpreted as granting to the National Council for Combating Discrimination, as part of its jurisdictional activity, the power to cancel or refuse the application of certain normative acts with force of law, considering that they are discriminatory, and to replace them with rules established by means of the judiciary or with provisions contained in normative acts.

Conclusions

It is difficult to reach a conclusion because any conclusion could interfere with the judgment of Court of Justice in the case of a preliminary ruling, because I am a member of a Steering Board of the National Council for Combating Discrimination and because National Council for Combating Discrimination is one of the Intervening parties in this case.

But still there are some aspects that must be underline. In order to invoke a possible discrimination, there must be a case brought to National Council for Combating Discrimination and solved by Decision of Steering Board of NCCD. Only in the case that Steering Board decided there was an act of discrimination the victims are entitled to claim damages, proportional to the act, as well as the restoration of the situation prior to discrimination or to the cessation of the situation created by discrimination, in accordance with common law.

On the other hand National Council for Combating Discrimination, as part of its jurisdictional activity, has no the power to cancel or refuse the application of certain normative acts with force of law, considering that they are discriminatory, and to replace them with rules established by means of the judiciary or with provisions contained in normative acts. In this particularly case NCCD received no complain from a person or from an authority, not to forget that NCCD is the only the autonomous state authority, under parliamentary control, which performs its activity in the field of discrimination and which could ascertain a fact of discrimination.

THE REQUIREMENTS FOR PROTECTION OF THE COMMUNITY DESIGN

PREP. UNIV. DRD. ALINA MIHAELA CONEA[1]

ABSTRACT

This paper aims at showing the key issues underlying the requirements for protection of the community design. According to the Council Regulation (EC) No 6/2002, a design must satisfy two main conditions to be protected by a Community design: novelty and individual character. A further consideration is the requirement of visibility, but only when it comes to register component parts of a complex product. Three main types of subject matters are excluded from protection: first, a Community design cannot relate to characteristics of the appearance of a product that are exclusively dictated by its technical function; second, the situation referred to as "must fit" and "must match" cases and, third, a design applied to or incorporated in a component part of a complex product if the component part does not remain visible during the normal use of the complex product. Also, Community designs contrary to public policy or to accepted principles of morality are excluded from protection.

One special interest of the paper is the recent jurisprudence of the community design courts in this field. A core element of the protection system is the role of the community court's jurisdiction in matters of community design. These are courts of Member States that have been designated by them as community courts, which have exclusive jurisdiction to decide on cases of breaches of rights of community designs. The evolving and contradictory decisions of the national instances implies that with respect to the evolution of a homogeneous case law on unified Community industrial property, the European Court of Justice has had and still has to fulfil its exclusive mission of informing national courts as to the direction, in which European Union law is to develop.

KEY WORDS: *community design, individual character, informed user, solely dictated by technical function, European Court of Justice*

I. INTRODUCTION

The Community Design Regulation (CDR)[2] states, in articles 4 to 9, that a design shall be protected by a Community design to the extent that it is *new* and has *individual character*. A further consideration is the requirement of *visibility*, but only when it comes to register component parts of a complex product. In addition, Community designs contrary to *public policy* or to accepted principles of *morality* are excluded from protection. The requirements for protection of community design mentioned above are circumstantiated using notions that entail further consideration and analysis. The present paper highlights, in the context of community design, these concepts and attempts to clarify them

The significance of the studied matter is relevant in outlining the protection conferred for the community design. The requirements for protection regarding novelty and individual character, actually, constitute absolute grounds for invalidity[3].

The paper illustrate that there are conflicting views over the clarification of this legal norms in the jurisprudence of the national instances, designated as European design courts and in the decisions of the Board of Appeal of the Office. Therefore, depending on the understanding of the notions mention above the validity of design will be established.

To clarify the concepts of novelty and individual character, it will be carry out an examination of the legal norms governing the issue, art 4-9 of the Regulation 6/2002. The attempt is to compare

and study these terms in light of the programmatic documents of the European Commission, the opinions of scholars, the recent decision of the Office for Harmonization in the Internal Market and the few existing judgements of the European General Court. One special attention is grant to the jurisprudence of the European design courts.

The issue of harmonization and unification of the legislation on design law, at the European Union, is a constant concern of the doctrine. Since the planning stage, proposals for a directive on the harmonization of national legislation on the design and the creation of the Community Design Regulation enjoyed an in depth comparative analysis, in an attempt to anticipate the possible interpretations of legal text (Mario Franzosi, 1996), (David Musker, 2002). It is recognized that design protection crosses all aspects of intellectual property rights (Uma Suthersanen, 2000; 2010)[4] and advantages and drawbacks of community design is consider (Massa and Strowel, 2003). The coverage of the legal norms governing the community design is present in the Romanian doctrine (Viorel Roş, 2003)[5], (Constantin Duvac and Ciprian Paul Romiţan, 2009)[6], (Alice Mihaela Postăvaru and Gheorghe Bucşă)[7]. Access to the decisions of competent national law courts is not simple. Some court decisions are published in annual collections, receiving annotations. (Henning Hartwig, 2007, 2008, 2009).

II. Novelty

Under article 5(1) of the Regulation"a design shall be considered to be new if *no identical design* has been made available to the public". Novelty is identified with the absence of identical designs publicly disclosed prior a reference date. Designs are considered identical if their features differ only in *immaterial details*[8]. In other words, according to Massa and Strowel, novelty consists in an objective non-identity exceeding immaterial details.

In the case of the protection of community design, the Commission did not intend to adopt the system of "novelty" within the meaning of patent law protection, although the drafting norm displays similarities, but to create a specific concept[9].

In this context, the Green Paper[10] indicates a two-step test presented below. In the first stage of the test, the design must not to have been anticipated by a design which appears as identical or substantially similar *to the circle of specialists* in the field and in the second stage, must be distinguished from other designs commonly known *in the eyes of an ordinary consumer*. The result of this first stage of the test would, therefore, be that designs which are not known by experts operating within the Community would be eligible for protection either because they are completely different from anything known by them at the specific point in time, or because they present, according to the assessment by an expert eye, sufficient differences from known designs to constitute creative independent development.

The second stage involves the evaluation of the test indicated by the "relevant public". While the Commission acknowledges that the differences can be less perceptible to an ordinary consumer, it

[10] Commission of the European Communities. Green Paper on the Legal Protection of Industrial Design: Working Document of the Services of the Commission, Brussels, 1991. parag. 5.5.5.4

points out the design rationale protection, which must be perceived as something different at the market level, where it plays its role in competition between products, and not at the more sophisticated level of the world of the experts.

As regards the interpretation of the expression *immaterial details*, the Board of Appeal of the Office considered, that as the only difference is ”a slight variation in the shade of the colour pattern in the contested design, this amounts to no more than a hardly noticeable difference in a detail”[11]

A recent decision of the OHIM Board of Appeal of 2 November 2010, in Case R 1086/2009-3, *Erich Kastenholz*, concern a contested RCD registered for ‘watch-dials’(represented below in grey scale). The invalidity applicant claimed that the RCD was not new since an identical design of a clock-face with the technique of overlapping coloured foils had been shown and published by an artist in exhibitions and catalogues between 2000-2005.

The board held that in the case of the RCD ”the intensity of the colours does not change gradually with the change of time” and that, ”by contrast, the clock-face of the earlier design is able to produce a wide spectrum of colours”

The differentiating features mentioned have a significant impact on the overall impression produced by the two designs and lead to a different perception by the informed user. The contested RCD, therefore, possesses individual character.

The two designs are not identical. It is clear that novelty and individual character, although presented as separate requirements in Articles 4 to 6 CDR, overlap to some extent. Obviously, if two designs produce a different overall impression on the informed user, they cannot be identical for the purposes of Article 5 CDR.[12]

It is considered that for establish novelty, the specific elements that confers the design its particular character should be taken into account, and not the general ones. A design should be considered new if its specific matter are different from the status quo of *"the existing design corpus”* (prior art).

The reference date for novelty is stated in article 7(a) of the Regulation no. 6/2002. A design shall be deemed to have been made available to the public if it has been published before the date on which the design for which protection is claimed *has first been made available to the public*[13] (in the

[11] OHIM, Decision of the Third Board of Appeal of 28 July 2009 In case R 921/2008-3 Věra Šindelářováv. Blažek Glass s r.o (Nail files)**,** parag. 25

[12] OHIM, DECISION of the Third Board of Appeal of 2 November 2010, In Case R 1086/2009-3, Erich Kastenholz v. qwatchme a/s (Watch-dials), parag. 25-27

[13] Articles 5(1)(a) and 6(1)(a) of the Regulation

case of an unregistered Community design) or before *the date of filing of the application for registration* of the design for which protection is claimed, or, if priority is claimed, *the date of priority*[14]. Publication can be achieved as a result of registration, or exhibited, used in trade or otherwise disclosed[15].

However, a design is not considered publicly disclosed where these events could not have become known in the normal course of business to the *circles specialized*[16] in *the sector concerned*, operating within the Community[17]. Sherman and Bently point out that this is a "safeguard clause" aimed at preventing a design form being unregistrable on the basis of prior obscure disclosures. The precise impact of this clause is difficult to predict, not at least because its wording presents a number of ambiguities[18].

As regards the interpretation of this provision of the regulation, can be reported the decision of the British courts in the case *Green Lane Products v PMS International*[19]. The case concerned infringement of a Community Design, registered for products indicated as "flatirons and washing, cleaning and drying equipment" by Green Lane Products and the trial was on a preliminary point: namely, which disclosures constituted prior art. The question here was, which was the "sector concerned": the sector of the prior art (i.e. massage balls) or the sector of the design (i.e. laundry balls). The judge held that the design would be infringed whatever the product, so that the registration did not merely cover "flat irons and washing, cleaning and drying equipment", but any product whatsoever. The judge concluded that the "sector concerned" was the sector of the prior art.

The Hamburg District Court held, in the case *Gebäckpresse I*[20] that

"an unregistered Community design acquires protection by being made available to the public for the first time within the territorial borders of the Community. A design registration of the same object published by the holder in a foreign country (China) prior to the disclosure of the unregistered Community design is not detrimental to novelty"[21].

Also is not considered to have been made available to the public a design that was disclosed only to a third party in explicit or implicit conditions of confidentiality. A disclosure shall not be taken into consideration for the purpose of applying Articles 5 and 6 and if a design for which protection is claimed under a registered Community design has been made available to the public by the designer, his successor in title, or a third person as a result of information provided or action taken by the designer or his successor in title; and *during the 12-month period preceding the date of filing of the application or, if a priority is claimed, the date of priority.*

In the case *Gebäckpresse I*[22], Hamburg District Court decided that:

"The presentation of the design in the context of contractual negotiations is subject to confidentiality even without explicit agreement on this point, and therefore does not constitute a fact detrimental to novelty".

In the Case R 608/2009-3, *Reinhold Gerstenmeyer* AB, the Board of Appeal of the Office[23] stated that"since it has been established that the prior design, which is identical to the RCD, was

disclosed in 2004 well before the 12-month period preceding the date of priority claimed of 7 December 2006","it is of no relevance who the designer of the prior design was".

The rationale for the existence of this warranty clause is contained in the Preamble, which specified that the author should have the opportunity "to test the products embodying the design in the market place before deciding whether the protection resulting from a registered Community design is desirable"[24].

The same applies if the design has been made public following *abusive conduct*[25] against the author or his successor in title. The characteristic of an *abusive* conduct is underlined by the OHIM Board of Appeal in the decision of 8th March 2010, in Case R 1775/2008-3, *European Citizen's Band Federation* where it concludes that

The objection about the ineffectiveness of disclosure of the RCD under Article 7, paragraph 3, is unfounded. Disclosure is not the consequence of any abuse and does not, therefore, in this case described in paragraph 3 of Article 7 CDR[26].

III. Individual character

Article 6(1) provides that "a design shall be considered to have *individual character* if the *overall impression* it produces *on the informed user* differs from the overall impression produced on such a user *by any de*sign which has been made available to the public". It is specified that in assessing individual character, *the degree of freedom of the designer* in developing the design shall be taken into consideration[27].

As explained in the preamble "the assessment as to whether a design has individual character should be based on whether the overall impression produced on an informed user viewing the design *clearly* differs from that produced on him by the existing design corpus, taking into consideration the nature of the product to which the design is applied or in which it is incorporated, and in particular the industrial sector to which it belongs and the degree of freedom of the designer in developing the design".

Individual character is thus a difference in the overall impression on the informed user. Individual character seems to be more demanding than novelty as it refuses protection to overall *déjà vu*. In practice, individual character is likely to absorb novelty[28].

The approach used to implement the trademark test of distinctiveness appears more appropriate than the patent approach, in view of the stated intention to protect the marketing functions of designs. In each case, the test is based on the reaction of the consumers to the design relative to the prior art, whereas the patent test of inventive step is based on a peer review approach by designers rather than consumers[29].

[27] Article 6(2) of the Regulation

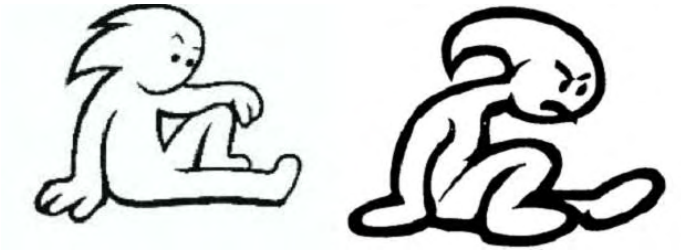
[28] Massa, Charles-Henry, and Alain Strowel. "Community Design: Cinderella revamped." *EIPR* (2003): 68-78.

[29] Musker, David. *Community Design Law: Principles and Practice*. London: Sweet & Maxwell, 2002, pag. 29

The Office admitted[30] the existence of some criticism, expressed when the Community Design Regulation came into force, because it does not require a Community design to "clearly differ"[31] from the prior art in order to have individual character as a pre-requisite for protection. In fact, all it specifies is that the Community design produces a different overall impression on an informed user than any prior design.

In the case R 860/2007-3, *Wuxi Kipor vs. Honda Motor*, the Boards had to compare the subject matter of the contested Community design RCD 171178-0004 concerning inverter generators with a prior design Despite the many differences between the two opposing designs, the Boards found that "the differences are not sufficient to affect the overall impression that the two designs produce on the informed user", because "*the informed user* is more likely to be impressed by *the overall aspect* of the generator rather than *the various details* that characterise mechanical devices in general." The Board held that, "according to the case-law of this Board, *the informed user is identified on the basis of the class of products* within which, according to the application for registration, the design itself is intended to be incorporated. (...) The informed user against whom individual character of the contested RCD should be measured is therefore whoever *habitually purchases* such an item and puts it to *its intended use* and has become *informed on the subject by browsing* through catalogues of such generators, visiting the relevant stores, downloading information from the internet". The Board underlines that the two designs concern products having a high technical content and, consequently,"are products for which technical characteristics and safety considerations – ease of use, protection against hazards – are of such importance that the informed user's overall impression of the aspect of the product is more likely to be *influenced by the general appearance* (arrangement of component parts, size, overall shape of components) *than by relatively immaterial details*"[32]

In its recent decision, from 16 December 2010, in Case T-513/09 *José Manuel Baena Grupo, SA v. OHIM*[33], the European General Court considered a dispute against the validity of a registered Community design (RCD 426895-0002, on the left) brought on the basis of an earlier Community trade mark (CTM 1312651).



Whilst the Board of Appeal (and before it the cancellation division of OHIM) considered the registered design to be sufficiently close to the Community trade mark so as to decline individual character to the design, the General Court held that it did produce a different overall impression on the informed users and, therefore, that it did have the necessary individual character. As regards *the*

[31] The Office mentions that "during the drafting process of the CDR the term "clearly" has been deleted in the definition of individual character. The fact that it was forgotten to delete the term in the preamble of the Regulation has led to some confusion"

[32] Decision of the Third Board of Appeal of 17 April 2008, Case R 860/2007-3, *Wuxi Kipor Power Co., Ltd. vs. Honda Motor Co., Ltd*, emphasis added

[33] Case T-513/09, Judgment of the General Court of 16 December 2010 - Baena Grupo v OHIM - Neuman and Galdeano del Sel (Seated figure)

identity of the informed user, the General Court considered it to be teenagers who were presumed to be the consumers of the T-shirts, stickers and other items for which the design was registered. The Court also emphasis the *different facial expressions* depicted in the two competing character designs and consider that

In this case, it should be noted that the overall impression created by the two conflicting figures on the informed user is determined largely by the facial expression of each thereof.[34]

It is, however, controversial the fact that the different facial impression is sufficient for considering the contested design as having individual character.

Bently and Sherman believe, however, that the elaborated definition of ”individual character” does not demand a ”personality” of its own of the design, and merely focuses on the difference of impression[35].

This view was confirmed in case the national design courts. The Court of Appeal of Berlin, in the case *Sal de Ibiza*[36], said that

”contrary to section 1(2) German design act- former version-, there is no minimum ”particular individuality” required for the Community design. In particular, it does not necessarily have to demonstrate any aesthetic content. Therefore, a high degree of originality is not required. Primarily, distinctiveness is determining, not creativeness”.

As regards interpretation of the concept of "informed user", the Court held recently in *Shenzhen Taiden* [37]decision, issued on 22 June 2010 that

”With regard to the interpretation of the concept of informed user, the status of ‘user’ implies that the person concerned uses the product in which the design is incorporated, in accordance with the purpose for which that product is intended. The qualifier ‘informed’ suggests in addition that, without being a designer or a technical expert, the user knows the various designs which exist in the sector concerned, possesses a certain degree of knowledge with regard to the features which those designs normally include, and, as a result of his interest in the products concerned, shows a relatively high degree of attention when he uses them.”[38]

Competent national courts have had occasion to rule, before the above decision of the Court, on the interpretation of the term *"informed user"*.

In the first case concerning the registered Community design that has come before the Court of Appeal in England and Wales, *Procter & Gamble Company v Reckitt Benckiser (UK) Ltd*[39], Lord Justice Jacob, by decision of 10 October 2007, stated that ”the informed user is not the same as the "average consumer"[40] of trade mark law”[41], so ”is alert to design issues and is better informed than

[40] For the purposes of that global appreciation, the average consumer of the category of products concerned is deemed to be reasonably well-informed and reasonably observant and circumspect (see, to that effect, Case C-210/96 *Gut Springenheide and Tusky* [1998] ECR I-4657, paragraph 31). However, account should be taken of the fact that the average consumer only rarely has the chance to make a direct comparison between the different marks but must place his trust in the imperfect picture of them that he has kept in his mind. It should also be borne in mind that the average consumer's level of attention is likely to vary according to the category of goods or services in question.

[41] Procter & Gamble Company v Reckitt Benckiser (UK) Ltd [2007] EWCA Civ 936, parag. 24

the average consumer in trade mark law"[42]. "The "informed user" will have more extensive knowledge than an "average consumer in possession of average information, awareness and understanding" in particular he will be open to design issues and will be fairly familiar with them".

In *Bailey & Anor v Haynes & Ors* the enquiry on the informed user focuses on "those having a practical interest in the use to which the *product* incorporating the design is to be put"[43].

In its decision of 21 December 2007, the High Court of Ireland, in the case *Karen Millen Ltd.* v *Dunnes Stores & Anor*[44],follows the decision *Procter & Gamble Company v.Reckitt Benckiser (UK) Ltd* (2007) and considers that the informed user is "an "end user" of the products to which the design relates", "is aware of similar designs which form part of the relevant design corpus", "he will be alert to design issues and better informed that the average consumer in trade mark law", "he must be considered to be familiar with the functional or technical requirements of the design or, perhaps more precisely, the product for which the design is intended", and "he is not considered to have extensive technical knowledge appropriate to a manufacturer of the product".

An additional factor in assessing the individual character is, under Article 6 (2) of Regulation no. 6/2002, *the degree of freedom of the designer* in developing the design. This provision must be considered in the context of the Preamble, which along with the degree of freedom of the designer in developing the design., evaluation takes into " consideration the nature of the product to which the design is applied or in which it is incorporated, and in particular the industrial sector to which it belongs"[45]

The test of the "degree of freedom of the designer 'indicates that where the possibility of differences is small, the smallest difference from the previous drawing will be sufficient to give an individual character[46].

Court stated in its Judgement of 18 March 2010 in Case *Grupo Promer Mon Graphic* that in this respect,

"it must be noted that the designer's degree of freedom in developing his design is established, inter alia, by the constraints of the features imposed by the technical function of the product or an element thereof, or by statutory requirements applicable to the product. Those constraints result in a standardisation of certain features, which will thus be common to the designs applied to the product concerned"[47].

Massa and Strowell notes that the requirement of individual character could be interpreted as "unconfessed original novelty" and that, in theory, there is no oxymoron in associating novelty and originality as both standards may perfectly well supplement each other. In law the conjunction"or" separating novelty and originality in article 25.1 of the TRIPs constitutes an insuperable obstacle to associate them[48].

IV. Visibility of the constitutive elements

Article 4(2) of the regulation provides that ”a design applied to or incorporated in a product which constitutes a *component part of a complex product* shall only be considered to be new and to have individual character: if the component part, once it has been incorporated into the complex product, remains *visible* during *normal use* of the latter; and to the extent that those visible features of the component part fulfil in themselves the requirements as to novelty and individual character”[49].

As regards the visible character, OHIM Board of Appeal has ruled that

”The Board concludes none the less that the requirements of Article 4(2)(a) CDR are satisfied. That provision does not require a component part to be clearly visible in its entirety at every moment of use. It is sufficient if the whole of the component can be seen some of the time in such a way that all its essential features can be apprehended.”[50]

"Normal use" shall mean use by the end user, excluding maintenance, servicing or repair.

Musker underlies that the notion of *normal use* could imply that even an attractive component, perhaps visible at point of purchase, can be denied protection if invisible in ”normal use”. The issue is apparently not whether the article is bought for its appearance, but whether it is used for its appearances[51].

Issues covered in this article are particularly used parts”for the purpose of the repair of that complex product so as to restore its original appearance”[52], the spare parts.

The debates that took (and still) occur in connection with the opportunity to protect spare parts forced the adoption of a temporary solution for the Community design protection. As stated in the preamble” (...) under these circumstances, it is appropriate *not to confer any protection* as a Community design for a design which is applied to or incorporated in a product which constitutes a component part of a complex product upon whose appearance the design is dependent and which is used for the purpose of the repair of a complex product so as to restore its original appearance, until the Council has decided its policy on this issue on the basis of a Commission proposal”[53].

Regulation no. 6/2002 has, therefore, a transitional provision that "are not granted protection as a Community design to a design that is one part of a complex product, until a later date when is foreseen an amendment to the Regulation, on a Commission proposal. According to Regulation no. 6/2002[54], the proposal from the Commission shall be submitted together with, and take into consideration, any changes which the Commission shall propose on the same subject pursuant to Article 18 of Directive 98/71/EC. In 2004, the Commission submitted a controversial[55] proposal[56] to amend Art. 14 of the Directive that excluded spare parts from design protection afforded by national legislation. To the extent that this proposal will be adopted, it will have a direct impact on the Regulation on Community design.

---

[49] Point (12) Preamble of the regulation” Protection should not be extended to those component parts which are not visible during normal use of a product, nor to those features of such part which are not visible when the part is mounted, or which would not, in themselves, fulfil the requirements as to novelty and individual character. Therefore, those features of design which are excluded from protection for these reasons should not be taken into consideration for the purpose of assessing whether other features of the design fulfil the requirements for protection”.

V. Products that cannot be protected

1. Public policy or morality

Article 9 of the regulation provides that" a Community design shall not subsist in a design which is contrary to public policy or to accepted principles of morality." This is similar to the corresponding provision of the Directive[57]. However, it raises different issues because the Directive does not impose a European level of morality, leaving this to the discretion of each state. Phillips believes that a design may be completely unacceptable in a Member State, although it could be considered a masterpiece in another state[58].

As stressed by Musker, the importance of identifying this problem appears in the context in which, apart from the definition of design, it is the only basis for evaluating formal application for a registered Community design[59]. It is equally a ground for invalidity. It is possible that the protection should be refused if the design is contrary to public order and morality, in no more than in one Member State[60]. Examples brought are a swastika decorating a product or drawing of anti-personnel mines[61].

Duvac and Romițan expressed the opinion that in case the community design should have a unitary character at European level, it is necessary that the notions of public order or morality to be cleared at EU level[62].

2. Technical features

Article 8(1) of the Regulation provides that"a Community design shall not subsist in features of appearance of a product which are *solely dictated by its technical function*". To assess the area of exclusion, clarification is needed on the terms "*technical*" and " *solely dictated"*". The following questions arise: how broad is"technical function" intended to be and how strict is the"solely dictated" link intended to be[63].

This provision excludes from protection certain technical aspects. According to the declared legislative intent[64], the purpose of regulation is to protect both functional and aesthetic designs. Apparently, this provision is contrary to this purpose. Paragraph (10) of the Preamble explains that the exclusion from protection is intended *not to hampered technological innovation* and that *this does not entail that a design must have an aesthetic quality*[65].

---

[64] Commission of the European Communities. Green Paper on the Legal Protection of Industrial Design: Working Document of the Services of the Commission. Brussels:, 1991. Parag 5.4.4.2

[65] Paragraph (10) Preamble of the regulation" Technological innovation should not be hampered by granting design protection to features dictated solely by a technical function. It is understood that this does not entail that a design must have an aesthetic quality. Likewise, the interoperability of products of different makes should not be hindered by extending protection to the design of mechanical fittings. Consequently, those features of a design which are excluded from protection for those reasons should not be taken into consideration for the purpose of assessing whether other features of the design fulfil the requirements for protection."

As observes Bently and Sherman, the term "technical" is not clarified in the context of the Regulation on Community design, although it believes it has become a key concept of European patents law[66]. Although the functionality is a concept known in national law, each state has (had) different standards[67]

The interpretation of Article 8(1) CDR (and of the corresponding provision in Article 7(1) of Council Directive 98/71/EC on the legal protection of designs) is highly controversial. One view holds that a technical necessity exception, such as that contained in Article 8(1) CDR applies only if the technical function cannot be achieved by any other configuration; if the designer has a choice between two or more configurations, the appearance of the product is not solely dictated by its technical function. That theory – known as the multiplicity-of-forms theory – is defended by some German authors[68] and was formerly followed by the French courts.

According to another view ("causal approach"), a design will be imposed by the function depending on whether it was created purely with functional intentions (even if the function could be satisfied through other forms).

Regarding the decisions of national courts, in *Landor & Hawa against Azure Designs*[69], English Court of Appeal confirmed in the decision of 2006, that the design that serve a functional purpose may be protected under European Union legislation on industrial designs. Exclusions from protection on the grounds "dictated solely by technical function" and "method or principle of construction" must be interpreted restrictively so as not to unduly restrict the availability of protection to non-aesthetic designs. Under ancient law of Great Britain, established by interpretation of the decision *Amp against Utilux*[70] [1972], the exclusion was understood in an extensive way: "dictated solely by function" meaning "attributed to or caused by function ".

The Court held, in *Landor & Hawa against Azure Designs* that decisions on the Directive on the Community trade mark cannot be safely relied on in a case involving the community design, invoking Advocate General Colmer, in *Philips v Remington*[71]:

the level of functionality must be greater in order to be able to assess the ground for refusal in the context of designs; the feature concerned must not only be necessary but essential in order to achieve a particular technical result: form follows function.

Recently, the Supreme Court of England and Wales decision, from 29 July 2010, *Dyson Ltd v Vax Ltd*[72], returns to the interpretation given by the decision *Amp against Utilux*, in terms of understanding the concept of "solely dictated by technical function", distancing over the multiplicity

[70] Amp Inc v.Utilux Pty Ltd [1972] R.P.C. 103 (HL)

[71] Opinion of Mr Advocate General Ruiz-Jarabo Colomer delivered on 23 January 2001, Koninklijke Philips Electronics NV v Remington Consumer Products Ltd. Case C-299/99 , *European Court reports 2002 Page I-05475 "The wording used in the Designs Directive for expressing that ground for refusal does not entirely coincide with that used in the Trade Marks Directive. That discrepancy is not capricious. Whereas the former refuses to recognise external features which are solely dictated by its technical function, the latter excludes from its protection signs which consist exclusively of the shape of goods which is necessary to obtain a technical result. In other words, the level of functionality must be greater in order to be able to assess the ground for refusal in the context of designs; the feature concerned must not only be necessary but essential in order to achieve a particular technical result: form follows function. This means that a functional design may, none the less, be eligible for protection if it can be shown that the same technical function could be achieved by another different form".*

[72] Dyson Ltd v Vax Ltd [2010] EWHC 1923 (Pat) (29 July 2010)

of forms theory. The court judgment was based on the decision of the Office of Harmonization in the Internal Market on 22 October 2009, in the case *Lindner Recyclingtech*[73].

In this case, the Board of Appeal of the Office chose not to follow the Advocate General of the Court of Justice in *Philips v Remington* case or the decision of the UK Court of Appeal in the *Landor & Hawa against Azure* and the adoption of the multiplicity of forms theory supported by a large part of the doctrine, adopting instead *the designer's intention theory*. Thus, in the case *Lindner Recyclingtech against Franssons Verkstäder*, Office Board of Appeal stated that the drafting of Art. 8 (a) of Regulation 6/2002,

"do not, on their natural meaning, imply that the feature in question must be the only means by which the product's technical function can be achieved. On the contrary, they imply that the need to achieve the product's technical function was the only relevant factor when the feature in question was selected."[74]

According to article 8 of Regulation no. 6/2002, are the excluded from protection designs of interconnections. The argument presented is that interoperability should not be disturbed by products of different makes [75].

Consequently,"a Community design shall not subsist in features of appearance of a product which must necessarily be reproduced in their exact form and dimensions in order to permit the product in which the design is incorporated or to which it is applied to be mechanically connected to or placed in, around or against another product so that either product may perform its function"[76]. Article 8 of Regulation no. 6/2002 requires exclusion seemingly[77] committed to free market competition by encouraging interoperability of products of different makes[78]. It is considered that the main problem, however, is the automotive industry and automotive spare parts issue.

In article 8(3) of Regulation no. 6/2002 is foreseen an exception to exclusion of protection of interconnections products for modular products. Thus,"a Community design (...) shall subsist in a design serving the purpose of allowing the multiple assembly or connection of mutually interchangeable products within a modular system". The argument presented in the preamble is that"the mechanical fittings of modular products may nevertheless constitute an important element of the innovative characteristics of modular products and present a major marketing asset, and therefore should be eligible for protection".

This provision is similar to the "must-fit" exclusion of British law.[79] It is considered that the term refers to modular product type of LEGO[80] or Duplo. This provision is considered from a part of the doctrine as an exception to principles of free competition[81].

VI. CONCLUSIONS

The key concepts identified as structuring requirements for protection of the community design are: novelty, immaterial details, the existing design corpus (prior art), the sector concerned, the circles specialized, individual character, overall impression, the informed user, the degree of freedom of the designer, a component part of a complex product, to remain visible during normal use, technical features, solely dictated by technical function.

The paper illustrates for each of the terms above that there still are ambiguities and tensions in their understanding from the point of view of the Board of Appeal of OHIM and, more relevant, in the judgement of the competent national courts. As such, the unitary character of the community design is uncertain. This issue is even more significant as the reference is to the absolute grounds for invalidity. Moreover, the rules established by the Regulation 6/2002 seem to establish an exception to the general rule that national courts do not have jurisdiction to ascertain the invalidity of acts of an EU institution. A national court is competent to annul a design conferred by the Office for Harmonization in the Internal Market. Given that these decisions have a European wide effect, the demand for unitary interpretation is compulsory.

A VIEWPOINT ON THE CURRENT STATE OF KNOWLEDGE MANAGEMENT INSTRUMENTS

ANDREEA PAULA DUMITRU*

Abstract

Knowledge management is seeking solutions to harmonize the objectives of organizations of the human group, which need to rationalize, to provide policy makers and to implement. This article aims to provide readers with an introduction to knowledge management basic definitions, theories and concepts such as types of knowledge, the differences between data, information and knowledge, etc, are given. But, why we need a knowledge management ? This article justified the need for companies to focus management efforts on their intangible elements and provides the five enabling conditions for knowledge creation.

Keywords: *knowledge, tacit knowledge, explicit knowledge, data, information, wisdom* .

Introduction

In today's new economy, learning and knowledge have become key success factors for international competitiveness with the result that intangible and immaterial resources have overtaken physical and tangible assets in order of importance. In particular, knowledge has become the primary resource for power, prestige and creating wealth in the modern economy and society. The generation, acquisition and use of knowledge have turned out to be vital in sustaining economic, social and cultural development. This applies equally to individuals, organizations, public sector bodies, companies, whole regions and even states. This is reflected by a dramatic rise to the top of the policy agenda of knowledge-related goals. Hence, the Lisbon Council set the ambitious strategic goal of making the EU the most dynamic, competitive, sustainable knowledge-based economy.

In research related to management a new discipline has appeared – knowledge management, which reflects issues coming from human resources management, organizational learning, information management, change management, brand and reputation management, performance measurement and valuation, innovation management, business process management, etc.

Historically, KM has been aimed at a single group of company managers, and has emerged as an executive information system containing a portfolio of tools such as access to databases, news source alerts, and other information – all aimed at supporting the decision making process of the company managers. More recently, however, KM systems are increasingly designed for entire organizations, thus providing all employees access to information and knowledge, necessary for their work.

1. Basic definitions: Data, information and knowledge

The academic community has spent years discussing and clarifying what constitutes data, information and knowledge. Depending on the background of the author and the specific aims he pursues there emerges variations in the definitions and the basic terminology used.

Data are described as a "set of discrete, objective facts about events… and is most usefully described as structured records of transactions"[1]. The authors further consider that "information has meaning… Not only does it potentially shape the receiver; it has a shape: it is organized to some

* Lecturer Ph.D., Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: pauladumitru@univnt ro).

[1] Davenport T., Prusak L., - "Working knowledge: How Organizations Manage What They Know", Harvard Business School Press, 1998, p. 7.

purpose." Subsequently, knowledge is defined as follows: "Knowledge is a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experience and information. In organizations, it often becomes embedded not only in documents or repositories but in organizational routines, processes, practices, and norms."

From a business practice perspective, the KM terminology is defined in (Bergeron, 2003):

✓ Data are numbers. They are numerical quantities or other attributes derived from observation, experiment, or calculation;

✓ Information is data in context. Information is a collection of data and associated explanations, interpretations, and other textual material concerning a particular object, event, or process;

✓ Metadata is data about information. Metadata includes descriptive summaries and high-level categorization of data and information. That is, metadata is information about the context in which information is used;

✓ Knowledge is information that is organized, synthesized, or summarized to enhance comprehension, awareness, or understanding. That is, knowledge is a combination of metadata and an awareness of the context in which the metadata can be applied successfully[2].

Becerra-Fernandez et al.(2004) provide the following definitions:

✓ Data comprises facts, observations, or perceptions. They represent raw numbers or assertions;

✓ Information is processed data. It could be described as a subset of data, only including those data that possess context, relevance and purpose. Information involves manipulation of raw data;

✓ Knowledge is a justified true belief (Nonaka and Takeuchi). It is different from data and information. Knowledge is at the highest level in a hierarchy with information at the middle level, and data to be at the lowest level. It is the richest, deepest and most valuable of the three. It could be described also as information with direction[3].

Moreover, the authors outline a subjective view on knowledge – as State of

Mind or Practice, and an objective view – as objects, access to information or capability.

Mertins et al. (2003) consider the hierarchy from data to information, knowledge and wisdom[4]. They stress that typical questions for data and information are: who, what, where, when, while for knowledge are: how? and why? From practical point of view they associate knowledge with the scientific knowledge, from one side, and with the experiences knowledge, from the other. Further, while discussing the nature of knowledge, Mertins et al. (2003) point the method for acquiring scientific knowledge, that is developed using scientific methodologies and standards, tested and validated from the research community, and explicitly described in research papers, reports and books.

Coakes (2003) relates data encoded in some medium and transmitted in any form, e.g. waves, electrical current, etc., which we receive trough our senses – vision, hearing, smell, touch, taste.[5]

The difference between data, information and knowledge is considered also in (Herbert, 2000). Data are facts; information is processed data; knowledge represents the collection of events,

experiences and feelings about an organization's business that helps it to rationalize its current situation and develop plans/products for the future[6]. Further, Blumentitt et al. (1999) makes a clear distinction between information and knowledge on the basis that information can be captured, stored and transmitted in digital form, while knowledge can only exist in an intelligent system[7].

As Coakes (2004) summarizes, in Western philosophy knowledge is seen as abstract, universal, impartial and rational. It is considered as a stand-alone artifact that could be captured in technology and which will be truthful in its essence[8]. As Lehaney et al. (2004) stress, this view is evident in the works of the ancient Greek philosophers where the concept of knowledge originates with people[9]. Plato and Aristotle, for instance, were quite concerned about the nature of knowledge and what distinguishes knowledge from belief. Plato put forward the idea that correct belief can be turned into knowledge by fixing it through the means of reason or a cause. Aristotle thought that knowledge of a thing involved understanding it in terms of the reasons for it. In modern terms 'to understand' is to be fully aware of not only the meaning of something, but also its implications.

Gavigan et al. (1999) relates knowledge with learning. Knowledge is defined as "a state or potential for action and decision in a person, organization or a group"[10]. Subsequently, learning is the process which causes changes in this state - change in understanding, decision or action.

People's minds follow a certain pattern of thought – develop knowledge

according to their own pre-set formulae or methods. The experiences give people memories and values which guide them and therefore set up the conditions within which their minds operate. Knowledge is socially constructed as by accumulating new knowledge there is a conscious choice, or discard, of the knowledge of others. It is not a stand-alone artifact or universal truth.

Knowledge is used interchangeably with intellectual capital by Bukowitz et al. (1999), and is defined as "anything valued by the organization that is embedded in people or derived from processes, systems or the organizational culture – individual knowledge and skills, norms and values, databases, methodologies, software, know-how, licenses, brands, and trade secrets"[11].

Knowledge resources vary for particular industries and applications, but they generally include manuals, letters, summaries of responses to clients, news, customer information, competitor intelligence, and knowledge derived from work processes.

Liebowitz (1999) highlights that knowledge can be defined as undeniable facts and objective truths as well as an institutionalized, socially constructed enactment of reality. He further refers to Davenport and Prusak who provide a working definition of knowledge that is extended to include wisdom, the intellectual capital of organizations. Intellectual capital, or organizational wisdom, is the application of collective knowledge within the organization[12]. This projection is depicted in **Figure 1** above.

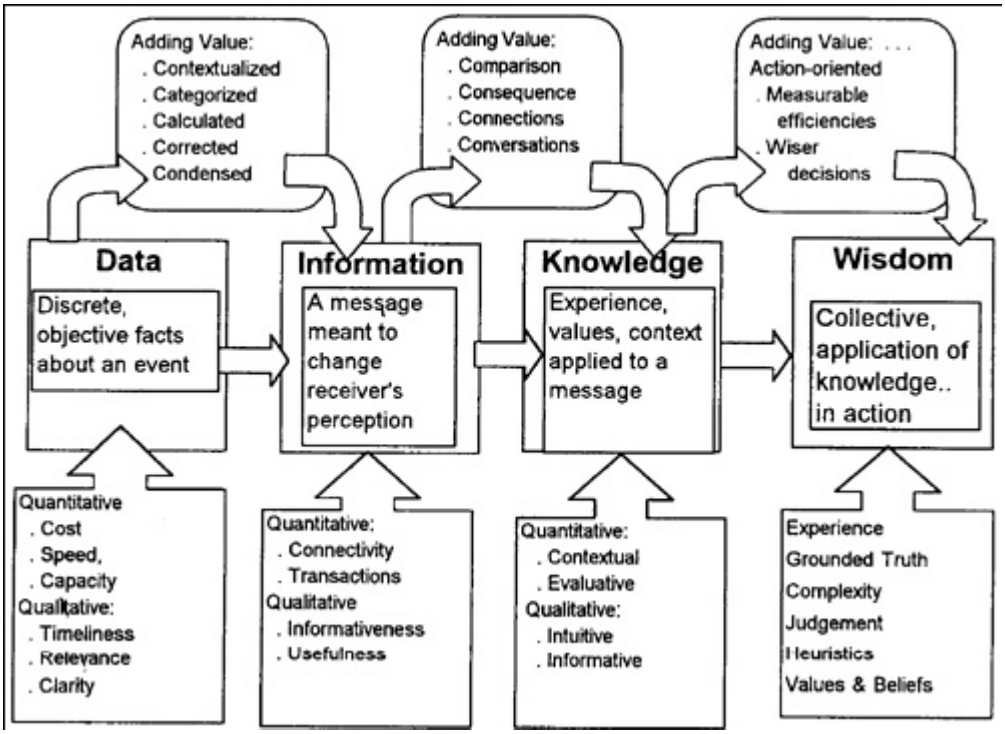
Figure 1: *The knowledge progression*



Bennet et al. (2004) provides an interesting visual understanding of "knowledge" – with a bite of a red apple. He points out that "while all that we are doing in information technology and information management is critically important, it is not until the bite (of information) is taken, chewed, digested, and acted upon that it becomes knowledge"[13].

2. Classifications of Knowledge

While considering knowledge, researchers have distinguished two main categories: explicit and tacit knowledge. For example, in (Polanyi, 1966) they are considered as explicit knowledge, which can be articulated in formal language and transmitted among individuals, and tacit knowledge, personal knowledge embedded in individual experience and involving such intangible factors as personal belief, perspective, and values[14]. Later, Tiwana (1999) specifies that tacit knowledge is personal, context-specific knowledge that is difficult to formalize, record, or articulate; it is stored in the heads of people. The tacit component is mainly developed through a process of trial and error encountered in practice. On the other hand, the explicit knowledge can be codified and transmitted in a systematic and formal language: documents, databases, webs, emails, charts, etc[15].

The idea of different forms of knowledge was considered by two of the most influential thinkers in KM, Nonaka and Takeuchi. They state in (Nonaka et al., 1995) that "tacit knowledge is highly personal and hard to formalize, making it difficult to communicate or share with others. Subjective insights, intuitions, and hunches fall into this category of knowledge. Tacit knowledge is

[13] Bennet, A., D.Bennet – "Organizational survival in the new world. The intelligent Complex Adaptive System", in Butterworth-Heinemann, US, 2004, p.14.

[14] Polanyi, M. – "The Tacit Dimension", London: Routledge & Kegan Paul, 1966.

[15] Tiwana, A. – "The Knowledge Management", Toolkit, Prentice Hall, 1999, p.171.

deeply rooted in an individual's action and experience, as well as in the ideas, values, or emotions he or she embrace"[16]. In a comparison, explicit knowledge can be easily processed by a computer, transmitted electronically or stored in databases. The specific of both type of knowledge is given in the **Table 1**:

Table 1*: Tacit and Explicit types of knowledge*

Tacit Knowledge	**Explicit Knowledge**
Knowledge of experience (body skills)	Knowledge of rationality (mind)
Simultaneous knowledge (here and now)	Sequential knowledge (there and then)
Analog knowledge (practice)	Digital knowledge (theory)

Nonaka et al. (1995) have also considered four models for knowledge conversion (see **Table 2**). Socialization is connected with theories of group processes and organizational culture and is a process of sharing experiences, whereas combination has its roots in information processing and is a process of systemizing concepts into a knowledge system. Internalization is closely related to organizational learning and is a process of embodying explicit knowledge into tacit knowledge, while externalization is the opposite – a process of articulating tacit knowledge into explicit concepts.

Table 2: *Knowledge conversion models*

Knowledge Conversion	**To:**	
From:	**Tacit Knowledge**	**Explicit Knowledge**
Tacit knowledge	Socialization (Sympathized K)	Externalization (Conceptual K)
Explicit knowledge	Internalization (Operational K)	Combination (Systemic K)

As given in (Bukowitz et al., 1999) "Explicit knowledge" is knowledge that individuals are able to express fairly easily using language or other forms of communication – visual, sound, movement. "Tacit knowledge" is knowledge that an individual is not able to articulate and thereby convert to information[17]. Tacit knowledge is more useful to an organizational system if it can be transferred to others so they too can use it. However, tacit knowledge cannot be communicated or passed onto others easily since it is acquired primarily through experience and is not easily expressed in words. Transfer of explicit knowledge is relatively straightforward. Transfer of tacit knowledge can be achieved either by first converting it into explicit knowledge and then sharing it, or by using approaches in which it is never made explicit.

In Lehaney et al. (2004) explicit and tacit knowledge are considered as the boundaries of the continuum of communication. It is stated that the communication process may incorporate a variety of techniques ranging from reports, visual identity, correspondence, and electronic communications, but there is no guarantee that the intended message has been received and understood. Social conditioning, cultural differences, and other external influences will always impact to convert the

[16] Nonaka, I., H.Takeuchi – "The knowledge creating company: How Japanese Companies create the Dynamics of Innovation", Oxford, Oxford University Press, 1995, p.62.

[17] Bukowitz, W., R.Williams – "The knowledge management", Prentice Hall, 1999, p.21.

message into a meaningful translation and context for the individual receiving, or not at all as the case may be[18].

In (Bergeron, 2003) human capital is considered for KM purposes as being composed of three kinds of knowledge: tacit, implicit, and explicit knowledge. Subsequently, the three categories are distinguished as follows:

✓ Tacit knowledge is knowledge that is ingrained at a subconscious level and therefore difficult to explain to others;

✓ Implicit knowledge, like tacit knowledge, typically is controlled by experts. However, unlike tacit knowledge, implicit knowledge can be extracted from the expert—through a process termed knowledge engineering;

✓ Explicit knowledge can easily be conveyed from someone proficient at a task to someone else through written or verbal communications. Unlike tacit and implicit knowledge, explicit knowledge often can be found in a book or operating manual.

Lei (1997) sees tacit knowledge as embedded in the organization's processes, dynamic routines and internal communication paths and provides a firm-specific resource to sustain competitive advantage. Explicit knowledge is often product rather than organizationally embodied. But tacit embedded knowledge is difficult to learn without close interaction and collaboration with the strategic partner[19].

Herbert (2000) considers that explicit knowledge is transparent and can be codified, categorized and stored, while tacit knowledge resides in individuals[20].

Further, Tsoukas (2003) defines the structure of the tacit knowing in three aspects: the functional, the phenomenal and the semantic. The functional aspect consists of "from-to" relations of particulars to the focal target, based on the awareness for attending something. The phenomenal aspect involves the transformation of subsidiary experience into a new sensory experience. Finally, the semantic aspect is the meaning of subsidiaries, which is the focal target on which they bear[21].

According to Coakes (2004), explicit knowledge tends to be considered as anything that can be documented, archived or codified. It can be contained within artifacts such as paper or technology. As a result it is able to be shared. Many authors even argue that explicit knowledge is not knowledge at all, but information or data. Tacit knowledge is retained by people in their head, it is the product of their minds' experiences and learning. It can be shared but in a less tangible form. In some cases it can be shared through the use of e-mail and chat-rooms or instant messaging as people tend to use these technologies informally, like a conversation, but mostly it is shared through story-telling and in conversations. It is very difficult to articulate and very difficult to know what you know in a tacit way - as often you only discover your knowledge when you have a need to apply it. Or it may rely on multiple senses to be expressed and thus is learnt by experience. Organizations need to know what they know and also to identify where their knowledge gaps lay so that they can be addressed. Explicit knowledge is relatively easy to track and develop, tacit is obviously more difficult to track and develop. Tacit knowledge may also involve more than the logical intelligence aspect of our brains and it may be that tacit knowledge is developed through the application of our multiple intelligences, (everyone uses some of, or a combination of) - logical, linguistic, interpersonal, intrapersonal, musical, spatial, or kinesthetic means to absorb knowledge.

[19] Lei D.T. – "Competence-Building, Technology Fusion and Competitive Advantage: The Key Roles of Organizational Learning and Strategic Alliances", in International Journal of Technology Management 2/3/4 (14), 1997, pp 208-237.

[20] Herbert, I. – "Knowledge is a Noun, Learning is a Verb", in Management Accounting 2(78), 2000, pp 68-72.

[21] Tsoukas, H., Vladimirou E. – "What is Organizational knowledge", in Journal of Management Studies, Nov. 2003, Blackwell publishers, Oxford.

Pfeffer et al. (1999) state that tacit knowledge is transferred via social process, e.g. stories, gossip, observation - social interaction. Besides, up to 70% of workplace learning is informal. When knowledge is transferred by stories and gossip instead of solely through formal data systems, it comes along with information about the process that was used to develop that knowledge. When just reading reports or seeing presentations, people do not learn about the subtle nuances of work methods – they learn about failures, tasks that were fun, tasks that were boring, people who were helpful, and people who undermined the work[22].

Quinn et al. (1996)[23] and Nonaka et al. (1995) suggest the following typology of knowledge based on purpose and use:

✓ Know-what - This is the fundamental stage where the organization makes use of IT of some kinds to collect, gather and store the cognitive type of knowledge. In simple words, they just know what they know, but don't mean that they know when and how to apply such knowledge solve their problem;

✓ Know-how - It represents the ability to translate bookish knowledge into real world results. In this stage, they know when to use which knowledge to solve real-world, complex problems;

✓ Know-why - It goes beyond the know-how stage where they can use known rules and apply them well. In addition, they have in-depth knowledge of the complex slush of cause-and-effect relationships that underlie. This knowledge enables individuals to move a step above know-how and create extraordinary leverage by using knowledge, bringing in the ability to deal with unknown interactions and unseen situations;

✓ Care-why - It represents self-motivated creativity that exists in a company. This happens to be the only level that cannot be supported by knowledge management system.

Becerra-Fernandez et al.(2004) differentiate the following types of knowledge - individual, social, causal, conditional, relational and pragmatic; embodied, encoded and procedural.

Hildreth et al., (2000) differentiate two forms of knowledge: domain knowledge, which is relatively easily replaced; knowledge of how work is done in practice, which is not easily replaced. Further, they differentiate between hard and soft knowledge. Hard knowledge is equivalent to domain knowledge. Soft knowledge encompasses experience, work knowledge, tacit knowledge[24].

There is a wide body of literature that suggests that there are "softer" types of knowledge (Hildreth et al., 1999). This knowledge is less quantifiable and cannot be captured, codified and stored so easily. Examples of such knowledge might include tacit knowledge that cannot be articulated, internalized experience and automated skills, internalized domain knowledge and cultural knowledge, embedded in practice. Soft knowledge is acquired through the work practice and consequently when an organization loses staff, the soft knowledge that is lost cannot easily be replaced. As companies have cut out layers of middle management they find that they have lost the people who knew who to approach for specific problems; how to deal with different people and who best to use for different tasks. In short, people who knew how to make things happen. The loss of such personnel creates a problem for organizations as they move to cheaper, less knowledge-rich, workers. Soft knowledge is embedded in the practices of, and relationships within, the group. Secondly, the source of the legitimacy of the knowledge differs from hard knowledge. "Hard knowledge" is accepted as legitimate by virtue of the formal authority of the designer of the system or the author of the procedure. Soft knowledge becomes accepted by virtue of informal authority and

[22] Pfeffer, J., Sutton, R.I. – "Knowing "What" To Do Is Not Enough", in California Management Review 1(42), 1999, pp 83-107.

[23] Quinn, J.B., Anderson, P. and Finkelstein, S. - "Managing Professional Intellect: Making the Most of the Best" in Harvard Business Review. March-April 1996.

[24] Hildreth P., Kimble C., Wright P. – "Communities of Practice in the Distributed", in International Environment Journal of Knowledge Management 1(4), 2000, pp 27-38.

consensus within the group. Although newcomers might have a degree of hard domain knowledge, their soft knowledge only develops as they move from being newcomers to fully-fledged members of the community.

Lei (1997) argues that the knowledge base that lays the foundation of an organization's core competence is comprised of easily replaced domain knowledge and the less easily replaced knowledge of how work is carried out. This first form of knowledge can be called fluid knowledge because it is capable of flowing around an organization. Flow can be achieved even more effectively when the organization's social and technical systems are linked by means of information and communication technologies (ICT). The second form of knowledge can be characterized as sticky knowledge because it is inseparable from knowing how work is carried out and it is related to the processes undertaken. The signifiers fluid and sticky are more appropriate for this application than the descriptors explicit and tacit. Sticky knowledge is glued onto the experiences of individuals and may remain unarticulated formally, but it is characterized by being difficult to replace. The replacement of such knowledge is problematic because it is not easily surfaced in order for it to be codified, stored, or transmitted. It is cumulative to personal experience and thus unique to the individual's understanding. It resides in the social domain of the organization's socio-technical system. Its best form of transfer from individual to individual, tends to be through story-telling and in the practice of communities.

Blumentitt et al. (1999) examines classifications of knowledge and provides 4 categories of knowledge:

- ✓ Codified knowledge = information;
- ✓ Common knowledge = routines and practices - explicit knowledge;
- ✓ Social knowledge = relationships and cultural matters;
- ✓ Embodied knowledge = tacit knowledge - that knowledge deriving from experience, skills, competences, training, practice accumulated during a lifetime.

Another way to look at forms of knowledge, which may be more helpful to organizations than tacit versus explicit distinction, is as follows (Bukowitz et al., 1999):

- ✓ known knowledge: knowledge that the individual knows that she/he knows;
- ✓ unknown knowledge: knowledge that the individual does not know she/he knows because it has become embedded in the way she/he works.

Liebowitz (1999) stresses that organizational knowledge is knowledge that is shared among organizational members. Although organizational knowledge is created via individual knowledge, it is more than the sum of individual knowledge. Complete organizational knowledge is achieved only when individuals keep modifying their knowledge through interactions with other organizational members. Second, organizational knowledge is distributed. Organizational knowledge is created and managed by individuals who act autonomously within a decision domain.

Tsoukas (2001) defines further organizational knowledge to be the capability of members of an organization to draw distinctions in the process of carrying out their work, in particular concrete contexts, by enacting sets of generalizations, whose application depends on historically evolved collective understanding and experiences.

Von Krogh et al. (1995) quoted in (Mertins et al., 2003) propose 7 categories of knowledge that has to be used in management and organizational theory - tacit, embodied, encoded, embedded, event and procedural[25].

Five levels of people knowledge can be distinguished in organizations: individual, teams, geographical units, affinity networks, and enterprise (Boudreau et al., 1999). Above the individual level, the knowledge consists in the collective, meaning structures that exist among the group. These structures include norms, strategies and assumptions that guide how work is organized and

[25] Mertins, K., P.Heisig, J.Vorbeck. – "Knowledge Management – Concepts and Best Practices", in Springer Berlin-Heidelberg, 2003, p. 82.

conducted. The five levels intermingle, and knowledge typically flows back and forth as it is shared, reused, confronted, challenged, rejected and ignored. In addition, everyone has a personal knowledge network that extends outside the organization boundaries. The organizational knowledge network is vast and complex a real "web" by itself.

3. Views about Knowledge Management

There are various definitions of KM in the literature. Some authors [Davenport et al. (1998), Bukowitz et al. (1999), Scarbrough et al. (1999), Mathi (2004)] identify it with a process or set of processes, others [Bergeron (2003), Lehaney et al. (2003), Ackerman et al. (2003)] – with a management strategy, while third [Herbert (2000), Coakes (2004)] associate it with IT and a set of processes related to knowledge, information and data. Generally, all authors consider knowledge management as a way to administer the knowledge assets of an organization, to make them widely accessible and enlarge them continuously [Choo (1998), Bellaver et al. (2001), Sussman et al. (2002), Ackerman et al. (2003); Mathi (2004), Land et al. (2004)]. However, many theorists would argue that knowledge cannot be managed as it is held in the head or minds of people and thus one can manage the human being but not the knowledge that they contain

Additionally, some studies have called for a more holistic, systemic approach to KM. One such example is the division by Lehaney et al. (2004) into the "know-why, know-what, know-who, know-how" questions of KM. Know-how might be seen as technologically focused, know-who as socially constructed and depending on processes of debate, whilst know-why and know-what relate to issues of power and coercion in societal structures.

Various definitions of Knowledge Management are quoted in (Liebowitz, 2003):

✓ KM is the systematic, explicit, and deliberate building, renewal, and application of knowledge to maximize an enterprise's knowledge-related effectiveness and returns from its knowledge assets – Wiig;

✓ KM is the process of capturing a company's collective expertise wherever it resides – in databases, on paper, or in people's heads – and distributing it to wherever it can help produce the biggest payoff – Hibbard;

✓ KM is getting the right knowledge to the right people at the right time so they can make the best decision – Petrash;

✓ KM involves the identification and analysis of available and required knowledge, and the subsequent planning and control of actions to develop knowledge assets so as to fulfill organization objectives –Macintosh;

✓ KM applies systematic approaches to find, understand, and use knowledge to create value - O'Dell;

✓ KM is the explicit control and management of knowledge within an organization aimed at achieving the company's objectives;

✓ KM is the formalization of and access to experience, knowledge, and expertise that create new capabilities, enable superior performance, encourage innovation, and enhance customer value – Beckman.

Bukowitz et al. (1999) gives quite a broad definition for KM, whereas it is considered as "the process by which the organization generates wealth from its intellectual or knowledge-based assets." Wealth results when an organization uses knowledge to create more efficient and effective processes or to create customer value. Subsequently, a top-line impact occurs when intellectual assets are used to boost innovation and promote the development of unique market offerings which command a price premium.

Wiig (1998) considers KM from three perspectives with different horizons and purposes:

✓ business perspective – focusing on why, where, and to what extent the organization must invest in or exploit knowledge. Strategies, products and services, alliances, acquisitions, or divestments should be considered from knowledge-related points of view;

✓ management perspective – focusing on determining, organizing, directing, facilitating, and monitoring knowledge-related practices and activities required to achieve the desired business strategies and objectives;

✓ hands-on operational perspective – focusing on applying the expertise to conduct explicit knowledge-related work and tasks[26].

In (Davenport et al., 1998) knowledge management is the set of processes associated with understanding and using this asset. It is a structured approach that establishes procedures for identifying, assessing and organizing, storing, and utilizing knowledge to meet the needs of an organization. Davenport (1996) has further developed ten general principles of KM:

1. Knowledge management is expensive (but so is stupidity!).
2. Effective management of knowledge requires hybrid solutions involving both people and technology.
3. Knowledge management is highly political.
4. Knowledge management requires knowledge managers.
5. Knowledge management benefits more from maps than models, more from markets than hierarchies.
6. Sharing and using knowledge are often unnatural acts.
7. Knowledge management means improving knowledge work processes.
8. Access to knowledge is only the beginning.
9. Knowledge management never ends.
10. Knowledge management requires a knowledge contract (i.e., intellectual property issues).

According to (Lehaney et al., 2004) knowledge management refers to the systematic organization, planning, scheduling, monitoring and deployment of people, processes, technology and environment … to facilitate …. the creation, retention, sharing, identification, acquisition, utilization, and measurement of information and new ideas, in order to achieve strategic aims.

Similarly, Bergeron (2003) defines that "Knowledge Management (KM) is a deliberate, systematic business optimization strategy that selects, distills, stores, organizes, packages, and communicates information essential to the business of a company in a manner that improves employee performance and corporate competitiveness."

Herbert (2000) argues that KM is driven by IT and is concerned with collecting, rationalizing, codifying, storing and disseminating all knowledge within an organization. A key theme of KM is to transform tacit into explicit knowledge, which requires a change in organizational culture. Thus, organizational learning is the process by which individuals, and the organization as a whole, develop and use their stock of knowledge while a learning organization is one that both teaches and learns from itself.

When talking about KM, Coakes (2004) raises the question whether a system could be created that will capture companywide knowledge and make it widely available to all its members. This is a goal of numerous large and small organizations which are attempting to face the KM challenges putting in place knowledge management systems. A wide range of technologies are being used to implement KM systems: e-mail; databases and data warehouses; group support systems; browsers and search engines; intranets and internets; expert and knowledge-based systems; and intelligent agents.

4. Why we need a knowledge management ?

Knowledge management used to solve specific problems arising in an organization, even when we are dealing with a product or service is an in. Organizations implementing a knowledge management acting decisively on line using the parameters maximum intangible assets at the expense allocation of new funds for investment in intangible assets. With changes in the market, the

[26] Wiig, K. – "Knowledge Management Foundation", in Schema Press, 1998, p. 32.

uncertainty becomes greater, develops technologies, competitors are proliferating, and the products and services is rapidly devalues.

We often face a situation where we do not fully cover what we know, is left uncovered differences that sometimes can be a disaster, and sometimes may be lower. In these circumstances, an organization must be successful to increase the ability to create new knowledge on which to spread quickly and to incorporate them into new products and services.

In my opinion, we need a knowledge management, because:

- ✓ Modern organizations focus on knowledge, not capital (knowledge intensive, not capital intensive);
- ✓ Markets increasingly unstable require "organized abandonment";
- ✓ Knowledge management contain helps you change and not change to dominate you;
- ✓ Only the well informed survive;
- ✓ Knowledge helps in decision-making;
- ✓ Become effective if knowledge is shared with others;

Since "european money" requires value-added, knowledge management helps to increase innovation by valuing human potential in an organization.

Conclusions

Efforts made under the current trends and analysis of literature reveals that became required a radical change in terms of method An organization is not just a warehouse of stored knowledge, but a viable and dynamic environment, within which there are key relationships and interactions that vary with different intensities to ensure transformation of knowledge for the sole purpose of adding value.

We mentioned implanted in a socio-economic context who require complex, asking us to tackle new problems, new behavioral styles. To face the demands, will use its creative potential, in every situation inventing alternative solutions originals.

In these conditions, organizations are put in front redefining own culture through processes of organizational redesign and change of strategy.

" In the symphony orchestra, several hundreds of talented musicians, playing together. This will be the organization to new organization model, based on knowledge.

We see such a radical change from the tradition of performance that was spread primarily by advancing to positions of command in the managerial ranks.

Organizations will have very few such command's positions. We will see increasingly more organizations like jazz quintet, in which management changes within the team after the specific mission to fulfill and is independent of the <<degree>> of each member".

The future belongs to those who will ask hard questions and will dare to dream of a better world. We must dare to do more to reach knowledge. We should seek to find true wisdom and organizational ways to make really the wisest choice.

That's way, the purpose of my approach was to combine theory with practice, thus creating a framework for understanding the concept of knowledge management oriented diversity of activities in which the instrument of change can be applied.

ELABORATING A GLOBAL DIAGNOSIS MODEL OF A COMPANY IN THE CURRENT CONTEXT OF SUSTAINABLE DEVELOPMENT

MONICA VIOLETA ACHIM[*]
SORIN NICOLAE BORLEA[**]
LUDOVICA BREBAN[***]

Abstract
The new economic and social framework in which the business of XXI'th century run , globalization and internationalization of business, changing consumer optics wich become more interested in quality and organic matters incorporated, have developed new priorities for managing a company. Achieving "excellence" in business is the way of survival and development for the entities, in a competitive economy. One of the ways to achieve the excellence is the performance, currently are increasingly talking about overall performance resulting in performances obtained on three pillars: economic, social and environmental. In order to maximize overall performance of the company, investigating various aspects of economic, social and environmental approach is a very necessary step to any manager. In this paper we propose drawing up a comprehensive diagnostic system of a company, developed on the three pillars of sustainable development economy (economic, social and environmental). The model we developed is designed to provide synthetically, efficiently and quickly, the standing of a company in a given competitive environment.

Keywords: *global diagnosis, indicators, economic, social, environment.*

JEL classification: M10 , M14, M21

1. Introduction

In a world of competency that has become more and more pronounced as a consequence of the financial environment mutations and of risk increase once with the emphasizing of the econimic-financial turbulences and with the internatiolization of goods and capital exchange, reaching **„excellence" in business** represents the way of survival and development for the entities, in a competitive economy. One of the ways to achieve the excellence is represented by performance, currently they are increasingly talking about **overall performance**. This new approach to performance is currently known as **sustainable development** that has three objectives: increasing the economic-financial performance of the entity, developing the efficiency of the environment and favoring social development. Therefore, we might say that global performance represents the sum of economic-financial, ecologic (environment) and social performances.

In the current conditions of the international economy's globalization, a performing entity is an entity which creates added value both for actionaries as well as for all the participants to social life (customers, employees, entity etc.). Ellaborating certain models of business global diagnosis that would focus on the performances accomplished by the entity for all the participants to economic life, in the current context of sustainable development, is a challenge and a continuous preoccupation for all users of economic-financial information, that have a certain interest in a society.

2. Literature review

Integrating social performances as an assessment criteria of the entity;s global performances led to the occurence of the concept entitled „Triple Bottom Line" (TBL). This concept consists of

[***] Lecturer, Vasile Goldis University, Arad.

appreciating the entity's global performances through its contribution to accomplishing economic, social and environment prosperity and it was developed by John Elkington in 1997. Subsequently, this idea started being largely sustained by lots of specialists, and we shall remind only some of the remarcable authors: Philip Kotler and Nancy Lee (2005), David Vogel (2005), William B. Werther, Jr and David Chandler (2006), William C. Frederick (2006).

Investigating international and internal specialized literature we could find various preoccupations of specialists to ellaborate models of global diagnosing of a company that would reveal approaches that are more or less tangent to social and environment performances, apart from the economic ones.

Consequently, we can classify the multitude of models that exist in specialized literature that are established, at the same time, by the economic practise in the following categories:

a) According to the issuer of these models there can be distinguished:

► Models elaborated by international organizations:

✓ Global Reporting Initiatives Sustainability Reporting Guidelines (GRI Guidelines), issued by World Commission on Environment and Development which represents the most developed initiative in the field of sustainable references. During time, there have been issued three versions of the guide (2000, 2002, 2006,2007). GRI, apart from. a generally applicable frame of sustainable references, also provides sustainable performance indicators.

✓ UK Reporting Guidelines, United Nation Approach are other approaches of sustainable performance assessment however, less developed than GRI.

► Modes elaborated by banks in the methodology of founding the lending decision. Among the very funamendal bank models in use are those elaborated by Romanian Comercial Bank, Transylvania Bank, Raiffeisen Bank (M. Achim, 2010).

► Models elaborated by rating companies and financial consultation companies:

✓ Models elaborated by international extra-financial rating agencies (Vigeo – France, ELRiS – England, SiRi Company – Switzerland, Ethibel –Belgium, Innovest – USA), that assess and rate the policies of social, environmental and governmental responsibility of the large, marketable companies. Large international extra-financial rating agencies have developed partnerships with the companies that underlie the stock market indexes to create indexes reuniting the companies which obtain the highest scores in the social, environmental and governmental field (Dow Jones Sustainability Indices – DJSI; FTSE4GOOD;ASPI Eurozone).(Mironiuc, 2009).

✓ The CEMMAT model – The Center of Management and Technologic Transfer in Bucharest that makes reference to the following categories of diagnosis: financial, marketing, technology, quality.

✓ The Roland Berger model used by R.B company of foreign consultancy refers to the following components of the general diagnosis: products, competency, distribution, financial, management, using 28 representative criteria for the reminded diagnosis fields.

► Models elaborated by different specialists of the economic field:

✓ The A.G. model (Alexandru Gheorghiu) established eight essential components of the society: financial, market and competency, research – development, products, management, production, commercial and personnel. (Al. Gheorghiu et al, 2002)

✓ The MEFAT model (model of financial assessment by And one -Țugui) is a model of global assessment of the financial diagnosis based on the points rating method and which consists in selecting a number of ten indicators out of the ensemble of economic – financial indicators, to which an importance coefficient is being attributed according to each one's significance (A. Ioan, Al. Țugui, 1999);

✓ The Bărbulescu model groups the appreciation criteria of a company's viability potential into six representative categories: economic – financial, managerial, quality and competitiveness, technical and technologic, social, ecologic, to which it grants various degrees of importance (Bărbulescu, 1999

✓ Models of assesing the financial situation, generically entitled Model "A" and Model "B" (M. Bătrâncea, L-M. Bătrâncea, 2006) are used by authors under the title of analysis models of the financial standing. Both models take into account the perspective of the diagnosis effectuated by banks on their clients being models of the "credit scoring" type and they are based on two qualitative criteria and five quantitative criteria. The difference between the two models consists in the selection method of these criteria taking into account the granted guarantees, lending service, types of clients (producers or traders).

b) According to the used methodology we can distinguish:

➢ Statistic methods based on the technique of multiple discriminant analysis. The most known models of diagnosis of statistic type used internationally are: The Modelul Altman, The Canon Holder model, The model of the Audit Central of France, the Taffle model, the Robertson model). At national level there were elaborated several models of financial diagnosis adjusted to the Romanian economy of emergent type: the Anghel model, the Cămăşoiu-Negoiescu model, the „C" model elaborated by financial analysts of the educational system from Craiova, the Băileşteanu model etc. The hereabove mentioned models reveal only the financial diagnosis angle without making reference to aspects regarding the management of resources or of sustainable performances.

➢ Non – statistic or necessitarian methods:

They use other techniques than the statistic ones, such as: comparison, induction – deduction, analysis – synthesis, rating scores, and assessment grates etc. In selecting the indicators that are representative for a diagnosed field and in granting importance degrees an extremely important role is played by the experience and the professionalism of the financial analyst that would allow the analyst to value the quality and the quantity as realistic as possible, according to the economic reality.

3. The research methodology

In view to reaching our procedures of establishing a global diagnosis of the society, moden approaches regarding the assessing of the entity's global performances will be considered (Triple Bottom Line), through investigating the three domains (components):

- Economic – financial performances;
- Social performances diagnosis
- Environment performance diagnosis.

For each diagnosed field there will be selected representative indicators abiding on a synthesis of specialized literature and economic practice but also on using professional reasoning. There will be given scores to each indicator according to its status and evolution, afterwards there will be given importance degrees to each selected indicator. The results are combined and the final score that is obtained (qualitative and quantitative) will provide information about the global position of a company on the market.

Substantively, the methodology of elaborating a global diagnosis of an entity included an ensemble of methods, teqchniques and procedures that help *establish and assess qualitatively and quantitatively the strong and the weak spots* of the economic – financial and also social management (including social and environment aspects) in view to settle a new strategy of maintenance and development in a competitive, sustainable environment.

Among the methods that techniques that have been used we remind:

✓ ***The comparison method***

✓ ***The points rating method***

✓ ***The S.W.O.T. method:***

✓ ***The method of assessment scales,*** marked with grades from 1 – 5, as in the following tables:

Table no. 1.: Simple form of financial criteria assessment scale

Grade	**1**	**2**	**3**	**4**	**5**
Status	Critical	Poor	Average	Good	Strong
Tendency	Sudden deterioration	Slow deterioration	Preservation	Slow improvement	Sudden improvement

In case both the level (status) and the tendency simultaneously improve, the framing of the indicators will be established according to the following matrix:

Tabel no. 2:Complex assessment scale of financial criteria

Tendincy/status	**Critical**	**Poor**	**Average**	**Good**	**Strong**
Sudden improvement	3	3,5	4	4,5	5
Slow improvement	2,5	3	3,5	4	4,5
Preservation	2	2,5	3	3,5	4
Slow deterioration	1,5	2	2,5	3	3,5
Sudden deterioration	1	1,5	2	2,5	3

Finally, framing in the adequate performance category can be made abinding on the global performance appreciation scale on the three levels (economic, social and environment), according to the following table:

Table no. 3: The scale for founding global diagnosis

General status of global performances	**GLOBAL DIAGNOSIS**	
	Quantitative diagnosis AVERAGE SCORE	**Qualitative diagnosis SWOT SCORE**
Strong	**5**	**Diagnosis SOLID – Category A STRONG POINT**
Very good	**4.5**	
Good	**4**	**Diagnosis GOOD – Category B GOOD POINT**
Satisfactory	**3.5**	
Average - acceptable	**3**	**Diagnosis AVERAGE/ACCEPTABLE – Category C INCERTITUDE**
Insufficient	**2.5**	**Diagnosis PRECARIOUS –Category D WEAK POINT**
Poor	**2**	
Very poor	**1.5**	**Diagnosis CRITICAL – Category E CRITICAL POINT**
Critical	**1**	

✓ **Other methods and techniques**

Other methods include:

- Quantitative methods: reports, structure rates, indices, regression method, extrapolation method;

- Qualitative methods: analysis, synthesis, interpreting the results, generalizing and assessing the results, descriptive methods.

4. Elaborating the entity's economical & financial diagnosis

The starting point in elaborating the economic diagnosis of an entity consists in assigning the components of the economic activity such as it follows:

a) The external component which focuses on the strategic and competitional environment;

b) The internal component which focuses on:

✓ On one hand on the economic environment (human resources management including company management, technical and material resources)

✓ On the other hand on the financial environment (revealed in the financial situations)

For each component we selected ten representative indicators, we granted importance degrees to them and the following synthesis models resulted:

Table no. 4: The model of strategic and competitional diagnosis

Crt. No.	Representative criteria for the strategic and competitional environment	Observations	SWOT Diagnosis	Points rating (1-5)	Ponderosity of importance (pi)	Aggre-gated points rating
1.	**Market position (measured through the market rate)**	The company has a good market position for most products and services provided especially for products of public consumption.	Status and tendency	N1	P1=18 %	N1xP1
2.	**Increase tendencies**	-Company's earnings slowly increasing -Sector is increasing	Status and tendency	N2	P2=16 %	N2xP2
3.	**Competition structure**	- high competitional level - it does not raise problems on the internal market - there have shown up many flexible private companies	Status and tendency	N3	P3=14 %	N3xP3
4.	**Outlet**	- there are traditional relations with beneficiaries - are traditional customers significant? - export earnings increase	Status and tendency	N4	P4=15 %	N4xP4
5.	**Customers' characteristics**	- Constant relations with the customers – increasing the number of customers - preoccupations to modify the customers' structure in view to discover a larger mass of customers	Status and tendency	N5	P5=7 %	N5xP5
6.	**Encouraging customers to become constant**	- After-sale services - Discounts are granted - Promotional advertising activities	Status and tendency	N6	P6=9 %	N6xP6
7.	**Degree of differentiating products/ - diversified range**	- complementarity	Status and tendency	N7	P7=5 %	N7xP7
8.	**Price /quality**	- Price accessiblity - integration in the quality standards required for the company's products	Status and tendency	N8	P8=12 %	N8xP8
9.	**Emplacement/**	- directly from warehouses + own distribution network	Status and tendency	N9	P9=3 %	N9xP9

	distribution organization					
10.	**Brand image**	Is it significant?	Status and tendency	N10	p10=1 %	N10xP10
General diagnosis of the competition environment – total score		**OPORTUNITIES – THREATS**			**100 %**	$\overline{N} = \sum NiPi$

Table no. 5: The management and human resourses diagnosis

Nr. crt.	**Criteria**	**Observations**	**SWOT diagnosis**	**Score**	**Ponderosity of importance**	**Aggregated score**
1.	**Managerial structure**	- training and competency - experience in managerial activity	Status and tendency	N1	P1=20 %	N1xP1
2.	**Quality of managerial team**	- cohesion - collaboration - perspective view - correct combination of responsibilities according to certain fields	Status and tendency	N2	P2=16 %	N2xP2
3.	**Organizational structure**	- specifically adopted - flexible - assignation of attributions and of competences on organizational levels	Status and tendency	N3	P3=6 %	N3xP3
4.	**Informational system**	- equipping with calculation equipment - ensuring personnel that is specialized in informatics - extended to all hierachical levels	Status and tendency	N4	P4=4 %	N4xP4
5.	**Ensuring the proper number of personnel**	- fully ensured - correlated with productivity	Status and tendency	N5	P5=4 %	N5xP5
6.	**Structure of personnel**	- age of the personnel and especially of the working personnel	Status and tendency	N6	P6=4 %	N6xP6
7.	**Work qualification of personnel**	- school education - average qualification - specialized personnel	Status and tendency	N7	P7=18 %	N7xP7
8.	**Permanence of the personnel**	- reduced mobility - low fluctuation - constant increase	Status and tendency	N8	P8=8 %	N8xP8
9.	**Use of work time**	- level of using work time - evolution tendency	Status and tendency	N9	P9=4 %	N9xP9
10.	**Work productivity**	- great and increasing - productivity – remuneration correlation	Status and tendency	N10	P10=16 %	N10xP10
General diagnosis of management and human resources – total score		**WEAK POINTS – STRONG POINTS**			100 %	$\overline{N} = \sum NiPi$

Table no 6: Diagnosis model of technical resources

Crt. No.	Criteria	Observations	SWOT Diagnosis	Score	Ponderosity of impor-tance	Aggregated score
1.	**Emplacement of productive capacities and access pathways**	Access pathway requires transportation means	Status and tendency	N1	P1= 7 %	N1xP1
2.	**Value and structure of body immobilization**	• immobile means are purchased from borrows • structure corresponds with the specific of the respective activity	Status and tendency	N2	1 P2= 16 %	N2xP2
3.	**Ensuring machineries and equipments**	• at the level of requirements • capacitaty surplus	Status and tendency	N3	13 % P3= 13 %	N3xP3
4.	**Condition of machineries and equipments / quality of technologies**	• low depreciation • improved technical level • increased renewal	Status and tendency	N4	P4= 15 %	N4xP4
5.	**Extensive use of machinaries and equipments**	• average degree of production capacities' utilization	Status and tendency	N5	P5= 1 %	N5xP5

5. Elaborating the diagnosis of social and envirnoment performances

Nowadays society is interested both inthe company's financial results and in the way they address the needs of various participants to economic life. One of the corporate social responsibility that ensures a social strategic development is addressing of interests of all participants to economic life (stakeholders) that is (from employees to community, from purveyors to government creditors, from managers to corporate administration and maintaining the focus on the stakeholders).

Given the large number of studies on this subject we consider appropriate, to present proposed indicators for reporting on global performance by the Global Reporting Initiative (GRI) in the context of sustainable development of an organization.

5.1. In what follows we will focus on the **social performance indicators.** According to GRI, these social performances indicators could be:

− performance indicators on ***practices and working conditions:*** the appearance of employment, occupational health and safety issue, issue education and training;

− ***human rights performance*** indicators: nondiscrimination appearance, freedom of association issue, the issue of child labor, rights of indigenous peoples;

− indicators of ***performance*** **on society**: corporate issue, political contributions issue, conformity aspect;

− performance indicators on ***product responsibility:*** consumer health and safety issue, the issue relating to labeling, marketing communication aspect, conformity aspect (Mironiuc, 2009).

5.2. Regarding the **environmental performance indicators,** GRI select the following indicators:

− ***raw material*** aspect: the raw materials used per unit of product, amount of weight in the total amount of recyclable materials;

− ***energy*** aspect: direct and indirect energy consumption, on primary energy sources, energy savings achieved by preserving and increasing its efficiency, products and initiatives to achieve low energy services, initiatives to reduce indirect energy consumption;

− **water** issue: total consumption of water by sources, significant water sources, the percentage of reused and recycled water;

− aspect of ***biodiversity:*** area of owned, leased or managed land in protected areas, describing the major impacts of activities, products, services on protected areas, protected habitats, strategies for managing protected areas, the number of protected species that have habitat in protected areas of the organization;

− aspect regarding ***emissions,*** waste: direct and indirect total emissions of greenhouse gas per unit of product, initiatives to reduce emissions of greenhouse gas and the results achieved, emissions of harmful substances per unit of product, nitrogen dioxide, sulfur and other air emissions per unit of product, wastewater and reuse methods (recycling), ratio of hazardous waste to be imported, exported, transported, treated, fauna, flora and aquatic habitats significant destroyed by sewage and emissions from the organization;

− ***appearance of products and services:*** initiatives to mitigate environmental impacts exerted by products / services of the company, the ratio of products sold and the amount of packaging / materials recycled and reused, by category;

− ***compliance*** aspect: value of significant fines and the number of non-monetary sanctions for failure regarding environmental regulations;

− ***transport*** issue: a significant environmental impact caused by transportation of goods / materials used in each activity of the company and every movement of personnel;

−***general appearance***: Environmental expenditure and investments, by type.

Many important non-financial aspects of performance can't be measured. So, they remain outside the formal performance measurement Contrary to financial performance measures, non-financial performance measures are less appropriate for decomposition, which results in the fact that they are unique to specific business units, whereas financial ones are common to many units.

The economical & financial model of diagnosis, presented at the point 4 of our article (model which is based on financial criteria) have to be adjusted with non-financial aspects consist in exercise of a high corporate social responsibility in relation between the company and stakeholders. In this way, performance of the company will be reflected completely and in a global manner.

6. Conclusions

The model presented above intends to investigate the economic, social and environment settings in which any entity activates and, thus, to outline the performances accomplished at any level and sublevel.

Among **the advantages** of the above presented model we can mention the following:

✓ The model investigates exhaustive aspects on the three pillars of sustainable development, contriving to accomplish a global assessment of an entity's performances

✓ The model is a synthetic and complex one at the same time, as it has both a determining angle of the investigated domains as well as a coercive one (under the form of measures to be taken), meant to ameliorate the future performance of a company;

✓ The model adopts a double vision, both a qualitative one (under the form of a SWOT appreciation) and a quantitative one (under the form of an assessment scale from 1-5) which, as such, offers double informational valences.

Among the model's **borderlines** we could remind:

► In regards to *the ponderosities* of importance given to various indicators, we can appeciate that these are granted abinding on the investigation of a vast specialized literature, they have empirical, subjective value and they are not necessarily based on an own statistic research. Also, these ponderosities of importance depend on the users of economic-financial information and on differential interests that they have in the analyzed entity, for instance:

- Financial creditors will give significant importance to the indicators of will give major importance to the bursary rates (PER,PSR, PBR) as well as to those of value increase (EVA, MBV, TSR);

- Managers will permanently monitor the patrimony management indicators but also the performance ones including those that reflect value increase.

- In the presented model we tried to reveal the informational valences of one indicator or another, through giving higher or smaller ponderosity of importance, taking into account the extent to which this indicators is in the focus of a large number of users.

►In regards to *the non-financial indicators* selected to reveal the entity's sustainable performances, the following borderlines can be mentioned:

✓ They are very little normalized, there is not any homogenous practice/methodology in the field of extra-financial analysis;

✓ The system of sustainable reportation (of social and environment aspects) remaines a volunteer intercession; certain indicators are not clearly defined, therefore, there are differences regarding various entities' approach to them;

✓ The calculation methodology of certain sustainable indicators is very complex and expensive;

✓ Often, there is not any strong motivation of companies for sustainable references if the cost-benefit ratio is taken into consideration;

✓ Communicating the sustainable performances through volunteer references can be a disatvantage to companies, as they can unreveal essential elements of competitive advantage on this occasion;

We can appreciate that as soon as the companies become aware of the need for sustainable reference, the models of the companies' global diagnosis of performances could be further developed and optimized.

THE PAYG VARIANT VERSUS THE FULLY FUNDED VARIANT IN CONFIGURING AN EFFECTIVE PENSION SYSTEM

CIPRIAN PÂNZARU[*]

Abstract
The actual situation is characterized by a major transformation of economical structures, such as: the decrease of population, the increase of participation rate of younger people in higher education and most important, massive retirements and migration. These aspects have generated a drastic decrease in labor force and have brought imbalance in Romanian pension system. Now, the Romanian system of pensions based the principle of social solidarity (support by those who have an income now for the people who worked in the past) known as a „pay as you go" system – PAYG has demonstrated its limits, especially due to the current demographic context. This system is an un-funded one not based on economizing. On the other side, private pension systems, either obligatory or optional, are fully funded and based on process of economizing. PAYG pension systems are more vulnerable to demographic changes than pension systems base on accumulation and capitalization. This paper presents, in comparative approach, these two pension systems and corroborating them with present socio-demographic situation try to disclose whichever is more viable in ensuring sustainability of pension system from Romania.

Keywords: *social security, sustainability, pension systems, demographic risk, transition*

Introduction

Worldwide discussion on the sustainability of pension systems is of utmost interest, especially since, in the current socio-economic conditions, it is undergoing a severe crisis. Thus, factors such as aging, reducing the active population, labor migration, etc., represent major challenges for configuring policies on pension systems. The importance of this aspect is reflected in the allocation of GDP in most countries in Europe and which lies between 8 and 10% for providing minimum pension system's stability.

Given these assumptions, most countries were already engaged in developing policies to reform their pension systems. The main issue raised in most discussions concerning the reform of pension systems has as leitmotiv the dichotomy between PAYG and fully funded type systems.

Typically, the public pension system is founded on the pay-as-you-go (PAYG) idea, meaning current payment of pensions from contributions collected from present incomes of working population.

On the other hand, there are private pension systems based on the accumulation and investment of individual savings, also called fully funded.

Existing pension systems differ considerably between countries mainly due to the specific historical path of each. For example, in countries with an ideological and economic foundation of social obvious type, such as France and Germany, the PAYG type pension schemes are more present. In other countries, like Britain and the United States, with a liberal or neoliberal orientation economically speaking, the emphasis is on fully funded systems. These pension schemes can work mixed, as well. In fact, in most states, the main pillar for the foundation of pension provision consists of a public pension plan, mandatory, completed with a private pension system, either mandatory or optional. This is also Romania's case, which since 2007 has introduced a multi-pillar pension system.

[*] Lecturer PhD, Faculty of Sociology and Psychology, West University of Timişoara (e-mail: ciprian.panzaru@gmail.com).

PAYG Pension Systems. Advantages and Weaknesses

The "pay-as-you-go" pension schemes, or PAYG, are based on a "pay as you get paid" principle. It is a state social security system that functions on the social solidarity principle, which means that those who currently receive income support financially those who have worked in the past, with the promise that, in turn, they will be supported by the incomes of future generations. The "pay as you go" pension system is a system that works on the principle of intra-and intergenerational solidarity.

This system was designed by Bismarck about 120 years ago. In fact, in the history of social security systems, this marks the crucial point of development, representing the first formal pension system in the world. Under the original scheme, devised by Bismarck, the system was financed from contributions, hence the name of social insurance. They were mandatory for employees for which they were created, whether qualified or not, young or old, male or female, regardless of their health. The principle of solidarity was manifested by contributions paid by employees on a regular basis to make bear the socio-economic difficulties, in our case this being determined by the depletion of our working life. Three social partners – workers, employers and the state – had the role, rights and obligations in the management of the system as a whole. The resources mobilized by this method are dependent on the number of working people and taxpayers, the results being related to the balance between the number of those who subscribe and the number of beneficiaries of such services. This makes such systems to encounter difficulties in times of high unemployment rates when the number of those taxpayers is reduced, requiring intervention from the state budget to not get too high the insurance premium.

The PAYG type system is an "un-funded" one, not being based on accumulation funds, in other words not being based on saving. This system was especially successful in the past because it provides a high level of confidence and a reasonable retirement income, at also reasonable contribution rates. At the time of its appearance, the system was profitable because life expectancy was low and almost coincided with the retirement age. The system has expanded in Europe and works today, but socio-economic changes produced in the last 120 years have made it not viable for our times.

The basic principles under which public pension systems operate of PAYG type are[1]:

- *the principle of uniqueness*, according to which the state organizes and ensures the public pension system based on the same rules of law for all participants in the system;
- *the principle of obligation*, under which individuals and legal entities by law are required to participate in the public pension system, social insurance rights correlating with exercising obligations;
- *the contributiveness principle*, under which social security funds are based on contributions from individuals and legal entities participating in the public pension system, social security benefits being due under the social security contributions paid;
- *the principle of equality*, which ensures all participants in the public pension system, taxpayers and beneficiaries, a non-discriminatory treatment between persons in the same legal position in respect of the rights and obligations provided by law;
- *the distribution principle*, under which social security funds are redistributed for payment of obligations of the public pension system, according to law;
- *the principle of social solidarity*, according to which the public pension system participants assume mutual obligations and enjoy rights to prevent, limit or remove the insured risks, under the law;
- *the principle of autonomy*, based on independent management of the public pension system, according to law;
- *the imprescriptibility principle*, according to which the right to pension is not prescribed;

[1] Adjustment by Romanian State Pension System (Law no. 263 from 16 december 2010).

- *the non-transferability principle*, under which the pension right may not be transferred, in whole or in part.

The pay-as-you-go system has primarily the advantage of increased prevention of poverty in the elderly and requires a fairer distribution between generations of inflation and especially of risks caused by potential disasters such as wars, recessions. On the other hand, this system is vulnerable to unemployment and population aging.

The generational solidarity principle, subsumed to the PAYG pension system, works as long as the ratio between the active and inactive population is in favor of the first category.

As life expectancy has increased, an imbalance occurred between these categories, the balance leaning in favor of retirees. Of course, the issue can be corrected by rising the retirement age, but this cannot be done indefinitely. On the other hand, such a measure generates resistance to change in society, because people do not accept the idea of working ever more years before they enjoy the right of retirement. The imbalance induced by this phenomenon in the PAYG type system is doubled also by the reduction of the working population and the decrease in birth rates. Aging modifies the conditions for redistributing income, in general, and the balance of the PAYG type pension system. A decline in the working population influences the income of these systems which, in essence, are based on wage bills (total wages received by employees). An acceleration of retirement increases pension payments so that aging degrades the financial situation of the systems based on the PAYG principle.

Global progressive aging of population stresses the financial difficulties of the PAYG type pension systems, therefore the pension schemes will have to become less sensitive to demographic and social changes.

Advantages and Disadvantages of FULLY FUNDED Type Pension Schemes

In countries with a liberal economic tradition, private pension schemes have developed, either mandatory or optional, based on the accumulation of individual savings and investment. These are the so-called fully funded systems based on a process of saving. As stated above, these pension systems find their origins in the liberal and neoliberal economic doctrine. This philosophical-social and politico-economic concept supports the minimization of the influence of state on economic events. According to this philosophy, the neoliberalism option, in terms of social security, is quite clear: privately held solutions instead of state systems considered to be inoperable because of excessive bureaucracy. State intervention on the social security component should manifest only in case of those who really need social assistance, meaning those who are unable to secure their daily living. From the perspective of neoliberalism, the pay-as-you-go strategy is criticized on the grounds that it would not have a solid foundation.

Fully funded type pension schemes may be mandatory or optional, operating in parallel with systems based on redistribution (PAYG) or they can fully replace them. For example, in countries such as Chile, Mexico, Bolivia, El Salvador, Kazakhstan, this type of pension scheme is used instead of the PAYG type, in countries such as Peru or Colombia the fully funded type private system is a variant of the PAYG type system, and in countries such as Argentina, Uruguay, Eastern European countries, including Romania, this system works in mixed regime together with that based on redistribution. The most advanced private pension systems are in the U.S.A., Australia, Switzerland, and the Netherlands. For that matter, these countries have introduced, with a binding character, a component based on accumulation, managed by private institutions and that is the result of optional pension plans organized by employers. In countries where the mixed regime operates, as is Romania's case, private pension is formed by monthly transfer of a share of the social security contribution paid in the public pension system to a private pension fund.

The most known presence in the area of social security of private pension systems is in the form of the 2nd and 3rd pillars. The 2nd pillar covers occupational pension provisions that are generally

set in advance. Pensions are managed by private, independent, pension funds. The 2nd pillar's features are:

- *requirement*, all those who receive income under an employment contract are required to contribute to a private pension fund;
- *capitalization*, private pension funds are invested in accordance with a series of legal provisions;
- *individualization*, contributions and their results are individually oriented to those who have contributed to the private pension fund.

The extension of the 2nd Pillar is the 3rd Pillar, consisting of voluntary individual savings managed by private insurers, which may be mutual funds, investment companies or even the individuals themselves. Therefore, the specificity of the 3rd Pillar compared with the 2nd Pillar is the optional nature of contributions. The second and third pillar are, usually, of the fully funded type and have as major advantage the fact that they encourage private savings for the retirement period. Pensions financed from an accumulated stock of assets are less vulnerable to demographic changes than those based on the PAYG system. However, they are subject to inherent risks in economic life, such as bankruptcy or devaluation. Yet, some specialists consider that the highest risks to which private pension funds are subjected in the near future are generated, just as with PAYG systems, again by aging. The difference is that with fully funded systems the risk generated by aging is correlated with a possible devaluation of assets[2]. Demographic factors along with economic ones pull with them asset prices and hence affect private pension systems. The idea is that over the past 30 years asset prices have skyrocketed, mainly due to the baby boomers generations who have contributed. When this generation will retire and begin to sell the assets they have, these, according to the above theory and called asset meltdown, will be devalued due to the large number removed from the market at once. The logic on which this theory develops is simple: young people gather easily assets for old age, while the elderly waive assets to finance their old age. When the younger generation is more numerous, prices raise; when the elderly are more numerous, prices are lowered.

Of course, the asset meltdown theory is subject to much criticism that required its treatment with caution. It is true that on the capital markets demographic aging induces a decline in the stock of capital, yet it is also characterized by a decline in the working population. Therefore, the dynamics of capital per capita is thus influenced by two phenomena with opposite effects, which ultimately offset each other.

The PAYG and the Fully Funded System in Romania – Present and Future Prospects

The crisis marking pension systems all over the world is also present in Romania and it affects our country's pension system. In addition, Romania is facing a different situation, generated by policies developed on the pension component after 1990.

Currently, in Romania operates, as basic formula, a public pension system, of a redistributive type based on solidarity between generations, i.e. a PAYG type system. It is also called 1st Pillar. In the public pension system all employees contribute plus any other taxpayers required by law to pay the SSC (social security contributions). For 2010, the social security contribution rates were 31.3% (for the special conditions of employment), 36.3% (for the particular conditions of employment) and 41.3% (for special conditions of employment). From this, the individual social security contribution rate is 10.5%, regardless of the working conditions.

All contributors receive a pension right, but the link between the amount of contributions paid during the lifetime and the pension amount is not proportionate. All contributors accumulate a score according to the amounts paid, and the pension which is calculated is the result of the product of the number of points and the point value. This is a very relative formula because the point value is

[2] Mankiw, N.G. and Weil, D.N, The baby boom, the baby bust, and the housing market, Regional Science and Urban Economics 19 1989, pp. 235-258.

determined politically and therefore subjected to the country's political development and the economic and doctrinal orientation of those in power. This is one of the major flaws of the PAYG type public pension system currently operating in Romania. Currently, there are approximately 4.1 million employees contributing to the public pension system supporting about 4.7 million pensioners. In addition to this type of pensions there is a the pension system for farmers, different from the public system, not contributing, which is supported by resources from the state budget and which provides payment of pensions for about 760,000 former farm workers. Then there are the special pensions of former employees of the defense system, which had a special contribution regime, and we also mention other types of pensions such as those of diplomats, judges, parliamentarians, etc. Also in the latter's case, the contributions' scheme had a special character.

Pension formulas applied in the post-socialist period hoping to solve growing unemployment (including early retirement) have increased the number of retirees. Thus, between 1990 and 2010 the number of retirees increased by approximately 80%. The situation of grave imbalance in which the pension system is found, based on the principle of social solidarity, PAYG specific, is reflected by the dependency ratio between the number of retirees and the number of employees and how it evolved between 1990 and 2010. In other words, we are speaking about the number decrease of those who pay social contributions. If in 1990 there were 8.1 million employees and only 2.5 million retirees, in 2010, statistics show only 4.1 million employees and approximately 4.7 million retirees (not including the farmer retirees). The evolution of this report is shown in the table below:

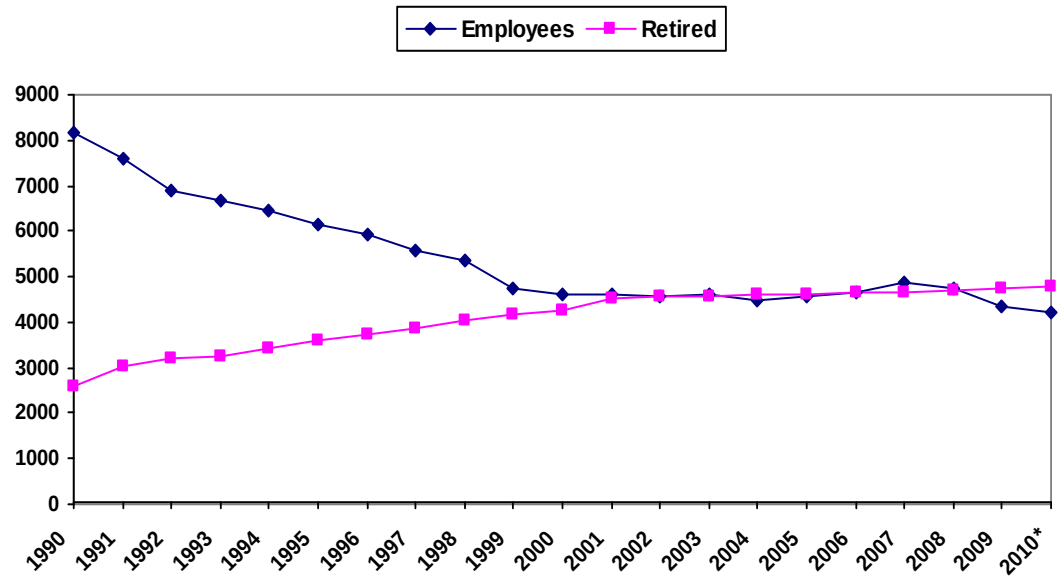

Fig. 1 – Evolution of employees - retirees ratio in Romania during 1990 to 2010 (thousands of people)

Source: National Institute of Statistics and National House of Pensions and Other Social Insurance Rights

This imbalance was produced over time, as I noted above, by pension policies developed and implemented after 1990, by the sinuous economic developments that led to an increase in unemployment and by a series of natural factors such as the population demographic evolution.

Unemployment had generally an upward trend, thus diminishing the mass of contributors to the pension system. Given the fact that the pensions of current retirees are paid from the proceeds of the contributions of current employees, the unemployment factor is obviously one having an impact on the sustainability component of the pension system. The evolution of unemployment in the period 1991 to 2010 is reflected in the chart below and indicates perhaps most accurately, by the sinuous nature, the evolution of Romanian economy after 1990. It must be made clear that 1990 is not included due to lack of data.

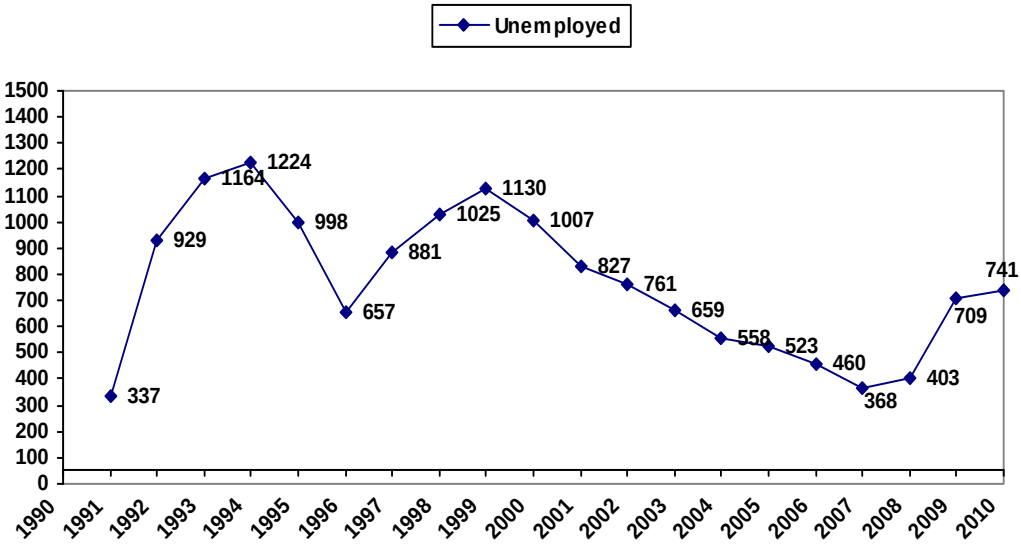

Fig. 2 – Unemployment in Romania during 1991 to 2010 (thousands of people)
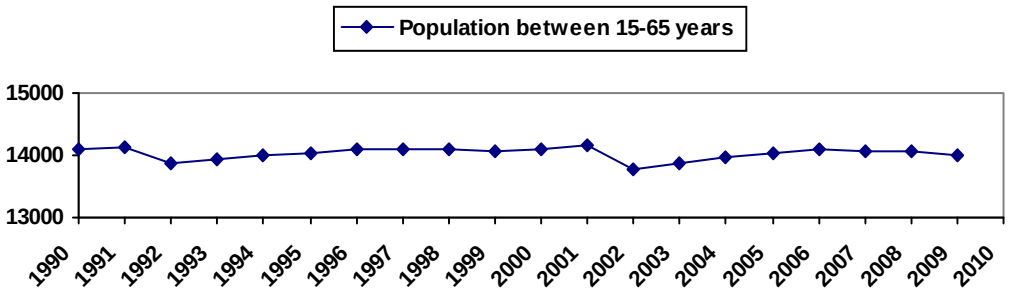
Source: National Agency for Employment

Demographic issues affecting the sustainability of the current pension system in most countries have not spared Romania. The population in Romania is an old one, which affects the sustainability of the pension system. In the past 20 years, the evolution of the active population, i.e. the one aged 15 to 65, has been decreasing compared to the evolution of the population aged 65 and older. Graphically, these developments are highlighted in Figure 4 and 5:



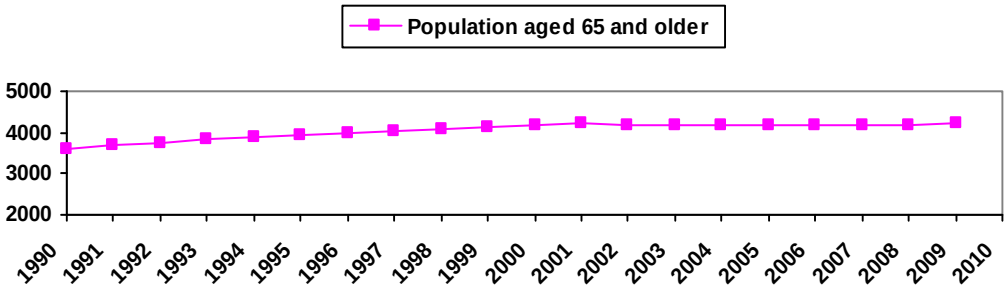


Fig. 3 – Evolution of the population aged 15 to 65 in Romania between 1990 to 2010 and evolution of population aged 65 and older in Romania between 1990 to 2010 (thousands of people)
Source: National Institute of Statistics and own approximations for 2010

Adjustment of these imbalances can be achieved only through a proper reform of the pension system in Romania. A major challenge in terms of sustainability of the pension system is the introduction of mandatory 2nd Pillar of a fully funded type. In 2007 two pillars were introduced that match the private pension system: the 2nd Pillar (regulated by Law 411/2004) and the 3rd Pillar (regulated by Law 204/2006). The 2nd Pillar is binding on all persons up to the age of 35. The contribution is voluntary for those aged between 35 and 45. The 2nd Pillar represents the pre-financed component of the first pillar, a part of social security contributions being directed towards the compulsory pension funds under private management. The contribution rate in the first year was 2% of the gross income and will reach a maximum of 6% by the end of 2016. For 2011, the contribution rate related to private pension funds is 3%[3].

Forwarding a percentage of mandatory contributions to private pension funds is a direct consequence of reducing the funds available for current pensions combined with an increase in deficit on the PAYG system. However, on long term, private pension component insertion will reduce dependence on the state of retirement and could balance the Romanian pension system.

Conclusions

The problem of efficient management of the pension systems and their adaptation to the current socio-economic dynamics is one of the biggest challenges of the 21st century. It is obvious that the risks and vulnerabilities arising from socio-economic dynamics are becoming more entrenched by the application of traditional measures. Viability of pension systems becomes an important issue and which probably will increase as the baby boom generation will reach retirement age. For this reason, policy makers are faced with different options. Of these, controlling public expenditure on pensions by thinking of pension schemes less sensitive to demographic changes through reforms in the PAYG systems or switching to a private system represent the main option.

For example, it is clear that PAYG type pension systems are increasingly inadequate in the current socio-economic context marked by demographic deficit. This situation could not be anticipated when Bismarck devised this formula. On the other hand, it is true that the Fully Funded type system is protected from the aging population risk, but only partially, if we consider the asset meltdown expected by some experts. However the fact that this type system eliminates the conditioning of retirees to the "generosity" of younger generations makes it more adapted to today. Certainly, in terms of philosophy of social security, the fully funded type systems eliminate the idea

[3] art. 17 paragraph (2) of Law no. 287/2010 on the state social insurance budget in 2011.

of solidarity between generations, but establish a deeper connection between personal contributions and the amount of pension received.

The two components, the public namely the private one, are exposed differently to demographic, macroeconomic, namely political risks. The main purpose in devising a pension system should consider opportunities to diversify the protection measures against risks induced by each variant. The risk of bankruptcy of private pension funds and the possible asset meltdown caused by the depletion of active life of the baby boom generations may be mitigated by the parallel existence of a public pension system. At the same time, the risk related to the aging phenomenon and its obvious effects on the PAYG type pension systems can be partially diminished by the existence of fully funded type pension systems. However, it is sure that both systems bear risks, generally determined by the population dynamics. As a matter of fact, the Club of Rome, through the voice of their experts, warn that population aging will affect, at a different pace and with a variable force, both the financing schemes of pensions based on redistribution (PAYG) and voluntary savings schemes based also on investment (fully funded).

In other words, having seen both the advantages and disadvantages of the PAYG type pension systems as well as the fully funded type ones, the best solution seems to be a mixed one that combines the advantages of both types of systems.

THE ROLE OF INFORMATION ASYMETRY IN THE OUTBURST AND THE DEEPENING OF THE CONTEMPORARY ECONOMIC CRISIS

ANDRADA BUSUIOC[*]
RISTIAN RADU BIRAU [**]

Abstract
An analysis of the outburst and deepening of the contemporary economic crisis that takes into account the information asymmetry is highly opportune. This point of view is strongly supported by the latter years' developments regarding this theory, which may be able to explain the current evolutions of the economic and financial markets. Thus, the paper argues that adverse selection and moral hazard played a key role in the evolution of the contemporary economic crisis and that its routs can be detected away in history. In this regard, we analyze the situation prior to the outburst of the subprime crisis in the U.S. and how it developed in a context of asymmetry information, fueled by the government's actions. Given the importance of certitude, quantity and quality of data and information and the way they are interpreted, it becomes crucial to isolate the role of information asymmetry. The paper shows that issues related to all these aspects are instruments of in-depth analysis that can explain the mechanisms of outburst, spread and, mostly, persistence for more than three years of the crisis.

Keywords*: information asymmetry, moral hazard, adverse selection, economic crisis, subprime lending*

Introduction

The difficult situation faced by the world economy since 2008 has been labeled, depending on the economic doctrine of those who have analyzed it, either as a product of markets' deregulation, perceived as an example of "market failure", either as the undoubtedly result of state intervention, through various mechanisms (such as monetary policies) or even through specially created institutions (named Government Sponsored Enterprises – GSE - like Fannie Mae and Freddie Mac). From the same perspective, the subsequent actions of the governments were considered either late, slow and not very harsh, either unnecessary or, worse, resulting in prolonging the agony of such markets. In all those circumstances, both views seem to ignore something that representatives of both major economic doctrines - the socialist and liberal one – agree upon: nowadays information represents a central element for any market (and is even more potentiated in the financial one), but participants performing economic transactions have access to it in varying degrees. This paper addresses the issue of asymmetric information and its contribution in the contemporary economic crisis. Thus, in this paper we argue that the current crisis has "enjoyed" the full effects of this economic reality, by analyzing its roots and the way it evolved. Also, we argue that the measures taken by the authorities in order to counteract it can be placed under the same uncertainty spectrum the asymmetric information theory has developed many concepts about. The paper aims at providing a different approach of the economic crisis, which can explain its violent and unexpected outburst, its domino development and its prolonged existence. Also, by focusing on the long-term effects of the measures taken, we argue that they can actually contain the seeds of a future economic crisis.

I. Contemporary theories regarding the information asymmetry

The theory of information asymmetry refers to the uncertainty caused by the fact that economic agents have private information about their products, information not available evenly and under the same format to third parties. The starting point of these theories is the negation of the first

[**] Ph.D. Candidate - Academy of Economic Studies, (e-mail: cristian.birau@gmail.com.

conditions of perfect competition, namely the transparency or the perfect information deferred to economic agents. Thus, according to traditional microeconomics, price is the one that transmits the information and it fulfills this role when it is flexible and freely created. However, the supporters of the theory of asymmetric information markets argue that there is no perfect information to all individuals. This aspect is reflected with different intensity in the various fields. As a result, there have been identified markets more affected by information asymmetry and others enjoying a higher degree of transparency.

The important influence of these ideas in the contemporary economic thinking is revealed by the internationally received attention, especially in recent history, reflected in the fact that the highest distinction in the field, namely the Nobel Prize, was given to representatives of the theory of asymmetric information markets. Thus, in 1996, the award went to the economists James A. Mirrlees and William Vickrey, who founded their theories on information asymmetry hypothesis. Further on, in 2001, the Nobel Prize winners were George Akerlof, Michael Spence and Joseph Stiglitz, representatives of the same school of thought. The 1996 winners took as a starting point of analysis the fact that the asymmetric distribution of information has important effects on economic behavior of individuals, meaning that those better informed can exploit this strategic advantage in their favor. The two economists, however, focused on how the consequences of information asymmetry can be countered by creating certain types of contracts and institutions.

From this point on, the analysis regarding the theory of asymmetric information targeted more and diverse fields. The presence of this perverse phenomenon has been identified in markets more and more different in terms of structure, actors, manner of organization, ranging from the goods markets to the financial–banking markets. It also has a significant impact on areas like tax systems or economic policies. It is the merit of the 2001 winners of Nobel Prize the identification of the presence of asymmetric information phenomenon in various forms, in almost all economic activity.

Among the most important concepts currently used in the analysis of asymmetric information markets and also necessary in identifying the role that this element played in the gear of the present economic crisis, are the adverse selection and the moral hazard.

I.1. Adverse selection

The effects of information asymmetry are also reflected in the way the products and services are traded in different markets, a situation known in economic theory as adverse selection. The concept was put forward by the 2001 Nobel Prize Winner for Economics, George Akerlof, in an article[1] which argues that the existence of incomplete information regarding the quality of the products traded on the market generates, through the phenomenon of adverse selection, leads to an inefficient allocation of resources on that market. The adverse selection (sometimes referred to as the lemon problem), arises from the inability of traders/buyers to differentiate between the quality of certain products. The example used by Akerlof in order to demonstrate the effects of adverse selection is that of the second hand car market, in which a trader holds product information that the other buyers/sellers in that market lack. He thus operates at a comparative advantage as the other market players cannot tell if their product is a 'lemon' (poor quality car). Consequently, there is a risk involved in purchasing the good based on quality expectations. While the lower price buyers are willingly assuming this risk, traders selling quality cars do not desire to sell at such a low price. There are three components to this theory:

(1) there is a random variation in product quality in the market

(2) an asymmetry of information exists regarding product quality

(3) there is a greater willingness for poor quality car sellers to trade at low prices than higher-quality owners.

[1] George Akerlof, "The Market for Lemons: Quality Uncertainty and the Market Mechanism", *The Quarterly Journal of Economics*, No. 3, Vol. 84 (1970): 488-500.

Insurance, credit markets and financial markets are areas in which adverse selection is also important. These aspects were addressed by D. Jafee and T. Russell, who developed a model[2] that presents the rationalization situation in which all applicants receive loans with a value lower than the one desired, at a given level of interest rate. Two other economists, J. Stiglitz and A. Weiss, have developed another model[3] which shows that rationalization is reflected in the fact that some applicants are rejected even if they do not differ by other applicants who are credited by the lender.

Another paper that constitutes an important basis to explaining how asymmetric information - and, respectively, adverse selection - has contributed to the financial crisis and, more specifically, to the subprime crisis is *"The Allocation of Credit and Financial Collapse"*[4], in which the author, Gregory Mankiw, discusses the chances of government intervention to improve the equilibrium conditions in the credit market.

I.2. Moral hazard

Also known as moral risk, the concept of moral hazard has been identified, initially, in insurance contracts, where it was empirically found that an individual or group, who are insured against risk tend to face more often that risk situation than individuals who are not insured against it[5]. The concept was then expanded, referring more generally to behavioral changes caused by imperfect information regarding subsequent actions induced by a contract[6].

Initially seen as an ethical or moral issue, the concept of moral hazard has evolved precisely from the inability of these views to explain from an economic point of view the consequences of the existence of this phenomenon. Empirical research led to practical conclusions, that allowed defining the concept in a form much closer to tangible reality. Analyzing individual behavior, some economists, such as Mark V. Pauly[7] or Gary Becker[8], concluded that moral hazard represents a situation where the intensity of the actions of the insured to protect themselves against the risk is being reduced. This is due to the difficulty of the insurer to observe this type of behavior and to act accordingly when the value of the contract and the insurance premium are fixed. A definition that describes more accurately the situation created by moral hazard is that regarding the increase in consumption of an [insured] service as a result of reducing the price paid by the insured for that type of service. The insured is basically subsidized by the insurance policy and continues to spend for that service even after the marginal benefit would have fallen below marginal cost. The revenue deficit resulted from such a conduct is covered by the insurance policy[9].

Other researchers have taken this concept further, broadening the application field also outside the insurance market. This way, a complex definition of the phenomenon of moral hazard emerged, namely "that behavior, economically rational, which occurs when there is a risk (hedged by

a third person) that an unforeseen event could occur, resulting in ulterior behavioral changes, not detectable by the third party".

II. The premises and the context prior to the contemporary economic crisis

II.1. Government conduct - element generating moral hazard

The supporters of the classical liberalism, but also many journalists[10] supporters of this thinking current brought into discussion the issue of moral hazard created through states' interventions aimed at saving various financial institutions from collapse or reviving the economy faced to a bearish trend.

The leading economists of information asymmetry theory consider that the coverage by a third person of a particular risk determines subsequent behavioral changes of those who are affected by this risk. More specifically, the existence of negative effects in case of a certain event determines the individual to act in such a way as to minimize the risk of occurrence of that event. When these effects are borne by another person, it is perfectly rational, to economically assume that the person threatened by the risk is no longer interested in avoiding the occurrence of that event. This behavior results in increasing the probability that the event would occur. Under this circumstance the person who took the risk will be affected.

By extrapolating this concept, the governments' intervention in the contemporary crisis, through the numerous aids granted to credit institutions and to large companies working in various industries, such as automotive or banking, altogether with packages for supporting their national economy, create a dangerous precedent. Therefore, the idea that the state will intervene if such a situation occurs in the future is induced in the markets.

Moreover, the phrase "too big to fail" is becoming more and more used, which means, contrary to most expectations, not that the regulations in this area will prevent such situations to occur in the future, but that large corporations, providing constant cash flows towards a country will consider the government as a "safety net" for their actions. This results in alleviating them from a prudential behavior.

Another problem that arises in this case is that not only the one who takes the risk will be affected. It is debatable in this case the complex system that allowed amounts of hundreds of millions of individuals to be channeled to rescue a few thousand and assume their misjudgments. Taxpayers have already had a violent verbal reaction to this fact. The idea that their own money serves the interests of a mass unrepresentative for the segment they are part of is an additional reason for the phenomenon of moral hazard to be brought into question.

Theories regarding moral hazard point out that the behavioral changes are not noticeable by the third person, which is, in fact, the key condition of the occurrence of the moral hazard phenomenon. Indeed, it is difficult to determine the extent to which the credit institutions "guilty" of producing the financial crisis will change their behavior in order to avoid future similar situations. Furthermore, it is impossible at this time and unlikely in the future to determine whether measures taken by various governments of the world are not exactly the germs of a future economic crisis.

II.2. The historical precedent

The concept of moral hazard can be easily illustrated by presenting the situation of the two giants of the U.S. mortgage market, Fannie Mae and Freddie Mac. If we consider the very context in which they came into being, evolved and later reached "the brink", we realize that the government intervention in creating situations of moral hazard is a plausible hypothesis.

In order to support this assumption, we will present the history of the two companies. Federal National Mortgage Association (FNMA) or Fannie Mae, as often called by the public, was

[10] "Basme austriece de succes", Capital (Magazine), January 28, 2009.

established in 1938 as a government agency, as part of the New Deal[11]. The authorities at that time were trying to find a formula for reviving the national housing market, given that the mortgage market was basically frozen after the Great Depression. Fannie Mae would provide liquidity to the mortgage market, lending federal money to local banks, which, in return, would finance housing loans. Fannie Mae allowed, thus, local banks to charge low interest rates for mortgages, favoring the buyers of houses, in an attempt to make housing affordable. Among the positive effects of this interventionist measure of the U.S., we can count the development of the secondary mortgage market, where companies such as Fannie Mae can borrow money from foreign investors at low interest rates, because of the financial support of the government. By doing so, they can provide mortgages with fixed interest and small down payments. The profit was made from the difference between the rates paid by those who own houses and what foreign creditors ask as price for their capital lend.

For 30 years, Fannie Mae had a relative monopoly on the U.S. secondary mortgage market. In 1968, due to fiscal pressures arising from the war in Vietnam, the company is privatized, and thus removed from the national budget. At that time, Fannie Mae began operating as a GSE (Government Sponsored Enterprise), namely a company that is privately owned, generating profits for shareholders, while enjoying benefits such as tax exemption and government support (access to credit lines of U.S. Treasury). In order to prevent monopolization of the market, the second GSE was created in 1970, namely the Federal Home Loan Mortgage Corporation (FHLMC), later called Freddie Mac.

The combination private company - state support was beneficial, the GSEs marking a period of unprecedented financial growth. Thus, in 2008, the two entities owned or guaranteed almost half of all the $ 12 trillion of U.S. mortgage market and they controlled over 90% of the American secondary mortgage market. Their pooled assets are 45% higher than those of the largest U.S. bank. On the other hand, their debt represents 46% of 2008's U.S. national debt. It is this combination of rapid growth and indebtedness that caused concerns in the Congress, in the Department of Justice and in SEC (Security and Exchange Commission), which finally led to their (re)nationalization during the contemporary economic crisis.

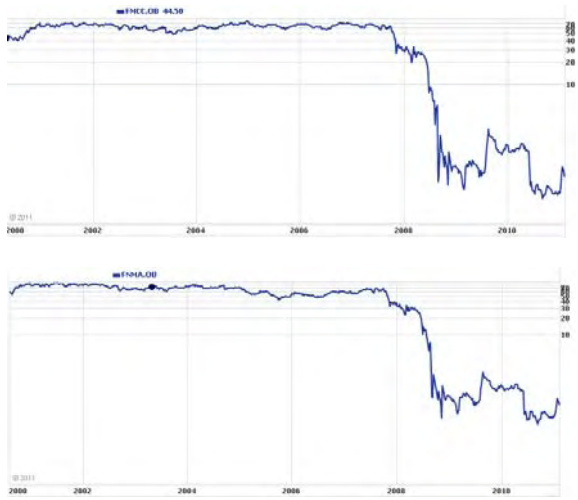
The situation was perceived somehow difficult. It should be noted that Fannie Mae and Freddie Mac are the only two Fortune Top 500 companies which are not required to inform the public about their financial difficulties. But if there had been a financial collapse of one of these companies, the U.S. taxpayers could have been held responsible for the debts of hundreds of billions of dollars. In this context, an investigation of the Justice Department and SEC about the accounting practices of Freddie Mac revealed accounting errors of 4.5 – 4.7 billion dollars and determined the dismissal of three top managers. In addition, Barclays Capital analysts have estimated that Freddie Mac's financial situation would have a negative value of at least 20 billion dollars if assets were valued at current market value. Fannie Mae's irregularities, on the other hand, are amounted to only three billion dollars. Both companies faced their stock dropping with almost 44% in just three days, due to the fact that government intervention became more and more an option, which meant the exclusion of other shareholders.

Hank Paulson, one of the recent secretaries of U.S. Treasury, sought a reversal of the situation, saying that there are significant amounts that can support Fannie Mae and Freddie Mac if necessary and that only by making funds available to them he can be sure they will not be used. The stratagem did not succeed, so Paulson had to prove the veracity of his statements by taking into charge the two agencies. The evolution of the two entities depended and will depend on the management of the U.S. government, but more important are the long-term effects of the decision to place the two institutions under the coordination of the Treasury.

[11] „Interventie comunista sau salvare din criza?", Piata Financiara, nr. 9 (2008).

By applying Bastiat's theory[12], one should take into account not only the visible effects, but especially those that hide behind the obvious. The immediate result of the notice regarding the entrance of the two under the state's tutelage was the revival of the stock exchanges, the investors considering this measure a support given to the mortgage market and, therefore, a guarantee that financial losses will not be deep. What is not seen is the fact that certain expectations were created, that the state will intervene to support the institutions in skidding, when needed, which automatically increases the risk for the situation to repeat itself in the future.

It is hard to predict the future impact of this point of view on investors. Capital might continue to inflow in the U.S. just because of these expectations that the state will intervene in case of a crisis. On the other hand, how many people would invest in a country that has just won a reputation of having dethroned an "increasingly concerned about the massive exposure to dollars"[13] China in terms of interventionism? Moreover, as stated by James Rogers, CEO of Rogers Holding, the one who has compared not so far ago U.S. to China, "this is welfare for the rich. This is socialism for the rich. It's bailing out the financiers, the banks, the Wall Streeters"[14]. Rogers believes that the move will have no effect on homeowners who are facing problems with reimbursements.



Charts 1,2: Stock evolutions of Fannie Mae(left) and Freddie Mac(right) between 2000-2010
Source: http://www nyse.com/

However, it is difficult to imagine how the situation would have developed if the government had not intervened. Some argue that Fannie Mae and Freddie Mac play such an important role in the American economy that the collapse of one of them would have serious effects not only on domestic but also on international financial markets. Even libertarians agree that the takeover is the best alternative, actually condemning government interference in the first place in the mortgage market. Overall, the total costs of supporting Freddie Mac and Fannie Mae transferred to the taxpayers are still unknown, given that the crisis prolonged from 2008 to today. Initially, the government could buy

[12] "What is seen and what is not seen".

up to 100 billion dollars in preferential shares in both companies, but further on the evolution depends entirely on the ability of the companies and hence the market to recover.

The adverse selection is the phenomenon that determined the discrimination in granting financial aid to some companies and not to others. For example, it is the information asymmetry – especially regarding the long term effects of such a decision – that determined the U.S. government not to intervene for saving Lehman Brothers, which resulted in panic on the market. The same phenomenon determined the discriminatory choice of the receiver and the amounts given by the American and the European financial authorities in the past years. To what extent the funds reached their best receivers is an unknown variable, one of the weaknesses of the theory of adverse selection and information asymmetry, in general, being the difficulty to quantify the effects of the results.

III. Information asymmetry and its role in the 2008 economic crisis

If we consider US subprime crisis the starting point of the global economic crisis, than we can name one of its triggering factors, namely the existence of asymmetric information on credit market, which, subsequently, can be found on capital markets.

III.1. Governement's intervention on the real estate market

The credit market is subject to the risk of adverse selection, meaning that credit institutions face serious difficulties in effectively selecting eligible customers for certain types of loans. Economists talk about the phenomenon of credit rationalization, which means that credit institutions set up a certain level of interest rate at which the amount of loans offered cover only a small part of the total demand for credit at that interest rate. Normally, an excess of demand would lead to a price increase, but on the credit market, this thing does not happen. Banks choose to keep interest rates steady and not to meet all debtors' demands. Traditional microeconomics explains this phenomenon by the special creditor-debtor relationship, by the standard risk situations or by different constraints that affect the variation of the interest rate, but it can also be explained through the concept of informational asymmetry.[15]

Specifically, one can assume that on the market there are two types of borrowers - those honest, accepting only those loan contracts that they can repay and they do repay them, and the bad payers, who at the time they take the loan are aware of their inability to repay, but hope to eventually get the resources needed to pay the debts. The bad payer debtors are even willing to pay a higher interest rate only to get the credit, and normally should have priority – and on some markets they do - in obtaining the good. However, on the banking market the situation is different in the sense that banks cannot distinguish between the bad and the good payer debtors before the reimbursement moment, so they choose to rationalize the credit, by setting an interest rate at a level that ensures a maximum return in terms of minimal risk, even as they face an excess demand.

Taking this situation as a state of fact in the early 2000s, we can say that the credit market was facing an excess of demand, unsatisfied both because some applicants were not eligible and because banks had only a certain amount of money available for lending.

Often, the fact that information asymmetry may cause distortion of the mechanisms of allocating on credit and capital markets determines state intervention, in order to improve the balance in these markets. The instruments used can be government guarantees and loans to certain sectors of the economy. Similar methods have been used by U.S., in order to correct the credit market imperfections in the early 2000s, already mentioned above. The main target of such interventions was the a boost of the housing market and economic growth, affected by the "dot-com" speculative bubble. Thus, it is not surprising that free market advocates consider U.S. federal authorities'

[15] George L. Serban-Oprescu, "Contribuții teoretice la dezvoltarea conceptului de informație în știința economică", (PhD diss., Academia de Studii Economice Bucuresti), pg. 156.

monetary policy as the main responsible for the subprime crisis. The reputable publication Wall Street Journal was writing in the mid 2000 on the effect of FED's "easy" money on house prices. Overall, it was admitted, in a tacit way, that the housing boom was unsustainable on the long term, but few were those who foresaw the consequences on credit market. Thus, an initiative meant to help the housing market, along with a strong social component, became at least a spring of the current crisis.

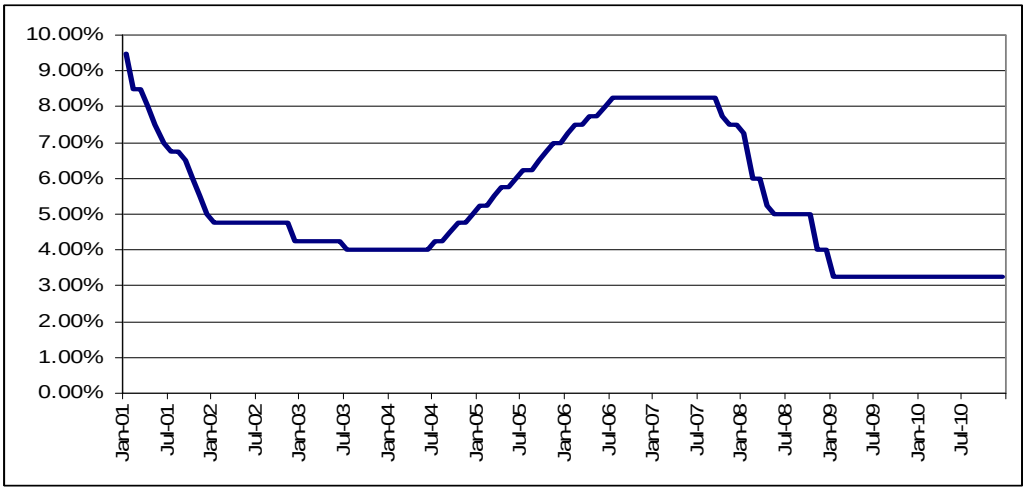

Chart 3: Evolution of FED's Prime Interest Rate between 2001-2010
Source: http://www federalreserve.gov/

The economists are blaming either the Bush administration, which implemented starting with 2004 a program designed to provide access to mortgage also to households with no equity[16], either to Alan Greenspan, the Fed governor during 1987-2006, who kept interest rates extremely low for a long time. Both theories can coexist, given that the fulfillment of Bush administration's "American dream" could not have been achieved without a relaxed monetary policy. Indeed, the conditions created by FED's low interest rates between 2000 and 2005 (a decrease in mortgage interest rate from 8% to 5.5%) enabled granting loans with a lower cost of capital. Commercial banks benefited of extra liquidity - as the U.S. economist Mark Skousen stated "banks needed to lend money to someone so they ended up lending also to those who did not afford a house"[17] – which allowed the phenomenon of selection effects to occur.

The banks also contributed to this situation, through their financial innovations for financing the mortgage market. If 20 years ago it would have been difficult to buy a house with less than 20% down payment, before the current crisis the banks and the brokers lowered the level or even removed it. Another factor that contributed to the crisis was the way the interest rates were set up. Alan Greenspan stated, in the early 2000s, that, given the fact that people keep the houses they buy for about seven years, it is illogical to pay a (higher) fixed rate for 30 years. This way, variable interest rates appeared on the U.S. market (they were called Adjustable Rate Mortgage - ARM). Flexible rates, however, are useful when the monetary policy rate has a downward trend, which was not the case in the U.S., as the level was already at around 1%.

The monetary authorities did also another mistake - although FED's responsibility is to ensure a stable monetary system, on one hand it allowed too lax lending policies, while on the other hand, it destabilized the interests' cycle, by determining a massive drop too fast, followed by a similarly fast increase. In just two years, the rates have increased by about two percentage points, determining reimbursement problems to the debtors who have not foreseen this change of trend and converting them into what we previously defined as "bad payer debtors". The major problem was that the loans could not be covered by mortgages, in many cases their value having fallen under the debtors' balance.

There are a few representative figures that truly place the beginning of the crisis in the first quarter of 2008. Wall Street Journal presented in March 2008 two key barometers of the U.S. housing market - the part of homeowners hold in their own buildings (calculated as the difference between the market value of homes and the mortgage size) and the number of mortgages in foreclosure. The first of them fell at that time to the minimum recorded after the Second World War, respectively 47%. As for the second indicator, according to data from Mortgage Bankers Association, more than 2% of the 46 million mortgage loans were in foreclosure process in the fourth quarter 2007, the highest figure since 1972, when this statistic started. In addition, the rate of nonperforming loans for the real estate sector had risen to nearly 6%, the highest value since 1985. One of five loans from the high risk category was overdue in the last quarter of 2007. So, the problems related to the contemporary economic crises are caused by past actions.

Another argument that supports the idea of informational asymmetry phenomenon being a contributor factor to the crisis is that of "predatory borrowing", Thus, even if the term predatory lending is more frequently used and part of the American public is talking about banks in these terms, experts say that the "prey" were actually the creditors, given that many mortgage brokers and lending institutions have either went bankrupt or lost money due to inefficient customers portfolio selection. This opinion is justified, given that statistics reveal some 70% of those who have borrowed in recent years have lied on loan applications. Moreover, even if the banks were to help the debtors to pay their installments on time, foreclosure being the last resort solution, most of the 90 days overdue debtors wanted foreclosure[18]. In most U.S. states, in case of mortgages, the house is also collateral, so if rates are not paid, the bank takes the property, but cannot pursue the debtor further on. When the debtors realized they were unable to repay their loans, they preferred to give up the mortgaged property, which, amid the events that took place, lost value reaching a level lower than the loan taken for its acquisition.

The adverse selection phenomenon manifested more strongly as the banks had an optimistic view on the situation - they assumed that the debtors who do not have a down payment are as stimulated as those who have invested their own money. However, the down payment is a safety net for banks, customers becoming a kind of partners. In its absence, the bank takes over most or even all the risk. This fact should be correlated with the diversification of banking products, which have a dual purpose: to banks, it meant an increase in turnover and access to potential customers less or not at all banked; while for prospective borrowers it was a way to buy a property they normally could not have afforded. Although apparently these two directions reconcile and are beneficial for both actors, in reality the diversification process, which aimed at finding alternatives for the customers not eligible for loans failed precisely because of the improper information between market realities and those expressed in economic theories.

Another aspect to consider is that, in order to determine an improvement in social welfare, government intervention should be based on information different from that of other market participants. If the government does not have additional information, which are unavailable to others, an intervention that only changes the structure of the market risks can cause negative effects that may equal or even exceed the negative effects that should initially be addressed through the economic

[18] „Once upon a time in America", Revista Piața Financiară, no. 3 (2008): 27 – 30.

policy measures. The situation described above is precisely the one that occurred in the U.S. – given the lack of valuable information on the structure of the demand for housing loans, the government intervention has only made eligible a market segment that in a perfect market would not have had access to crediting. In terms of a definition, a perfect market is a market where no intervention and no information asymmetry exists. Moreover, we can say that the conditions created, facilitated the emergence of adverse selection, meaning that for the bank it become increasingly difficult to effectively discriminate between the eligible and the not eligible loan demanders. Thus, loans that would have been optimal for borrowers with a relatively low risk were given to risky customers, which ultimately were not able to cover their debt obligations.

III.2. The capital market – an informational asymmetrical market

The evolution of the global economy in the past decades is inextricably linked to the development of financial markets, among which the capital market has a special role. The investments play an important part in economic growth and development, but the relations between funders and investors can be often characterized by information asymmetry. This is due to the fact that investors are generally willing to present their current situation and future projects more favorably than they are in reality. Even when the representatives of the capital demand have all the information about the investors, it would be too expensive for them to process and evaluate them accordingly[19].

The reflection in reality of the above statements represent another process that allowed the outburst of the financial crisis, namely the securitization, which stands for "wrapping" of nonperforming housing loans and rating them maximum grade. The information asymmetry manifested this time through the rating agencies, which did not have complete information about the instruments they rated. Further more their scoring activity was shielded by the conflict of interests resulted from the fact that they are paid by those who perform the securitization of the financial instruments, but only if those instruments are sold. The fact that the global market is an oligopoly, 90% controlled of three companies (Fitch, Moody's and Standard & Poor's) and that both in the U.S. but also globally Securities and Exchange Commission (SEC) has exceptional attributes, such as to decide who is assumed to perform the rating, adds further suspicions. For ten years SEC has constantly blocked the U.S. rating market from new competitors and through its influence minimized the importance of other such entities in the world. This has only aggravated the situation. Arguments later given to support their erroneous ratings, such as the one of Lehman Brothers ("the rating agencies act on the rating if the market sentiment becomes reality, trying to avoid the establishment of panic"[20]), only bring forward to "the public's attention the issue of rating agencies' independence in respect to the entities they assess"[21].

Thus, the rating agencies had a strong incentive to provide a high rating, so many banks and investment funds bought these bonds. International contagion was completed when the small investors realized that, instead of the reliable bonds that have been advertised to them, they have an important illiquid part of portfolio, consolidated in junk bonds. The lack of information to enable an informed investment - in this case the existing erroneous information derived from unrealistic ratings - has determined a damaging situation for many investors all over the world. Although the capital market can be characterized by the formula "you invest, therefore you accept the risk of losing", information asymmetry makes the quantification process of risk extremely difficult, or even

impossible to be determined. Such was the case of the subprime economic crises, which converted to a financial crisis and afterwards to a global economic crisis.

Another problem is the mismatch between the goals of shareholders and those of the managers, which indicates the existence of the adverse selection phenomenon in the management of joint stock companies. The lack of information determines the shareholders, as owners, to delegate the control to managers, and the same lack of information makes it possible for managers to pursue their own interests further down the hierarchy. Thus, the managers were stimulated to pursue short-term profit, which brought them huge bonuses, approved by the shareholders who rewarded only the visible results, without access to information on the entire mechanisms of these results.

Conclusions

This paper addresses the problem of information asymmetry and its influence on the contemporary economic crisis. Through it, it is revealed that this phenomenon had its part to play in fuelling one of the hardest economic periods after the Great Depression of the '30s. The article puts in light the fact that information asymmetry is one of the most used concepts for explaining the existence of the current crisis, by analyzing facts and figures related to U.S. economy.

The information asymmetry has strong links to the contemporary economic crises, based upon the fact that the subprime crisis, which has actually triggered the World's recession, was constructed on components deferred to this area. Thus, it is clear the fact that decisions making factors have neglected the basic principles of asymmetric information conducting to the existent situation.

It was revealed that a wide range of actors involved in economics are to be blamed for creating the premises under which asymmetric information was formed. On one hand, the US government, as entity responsible for organizing a certain economic environment, has involuntary supported the perverted effects on the real estate market, through its long term decisions. On the other hand, creditor, intermediaries and debtors have each their guilt part in consolidating this phenomenon, regardless if they relate to lending money too easy, having a conflict over scoring or following just their inducted consumerist behavior.

The main issue that comes out of the study is that governments have had a major part to play in this entire situation. Further more, their actions influenced also third parties which acted under their authority. Adverse selection manifested itself through the fact that countries, investors and intermediaries acted previously and through the contemporary crises with information of different quality and quantity. Moral hazard became synonymous to short term focusing, while neglecting risks. Nowadays, this aspect has proven to be sustained and even fueled by the government bail outs of the contemporary economic crisis.

INVESTIGATION OF FISCAL AND BUDGETARY POLICIES BASED ON ECONOMIC THEORIES

EMILIA CÂMPEANU[*]

Abstract
Empirical analysis of fiscal and budgetary policies cannot be achieved without first knowing how they are viewed in the economic theories. This approach is important to indicate the position and implications of fiscal and budgetary policy tools in the economic theory considering their major differences. Therefore, the paper aims is to investigate the fiscal and budgetary policies based on economic theories such as neoclassical, Keynesian and neo-Keynesian theory in order to indicate their divergent points. Once known these approaches at the economic theory level is easier to establish the appropriate measures taking into consideration the framing of a country economy in a certain pattern. This work was supported from the European Social Fund through Sectoral Operational Programme Human Resources Development 2007-2013, project number POSDRU/89/1.5/S/59184 „Performance and excellence in postdoctoral research in Romanian economics science domain" (contract no. 0501/01.11.2010).

Keywords: *fiscal and budgetary policy; economic theory; neoclassical theory; Keynesian theory; neo-Keynesian theory.*

1. Introduction

Knowledge of economic theories is the first step in deepening the effects of fiscal and budgetary policies on the economy based on empirical analysis. This approach is especially important as they are major differences between the economic theories. These differences should be known so that it can be established a national economy diagnosis through a proper framing in a specific pattern corresponding to the economic economic theories.

In general, there are three main theories in the economic doctrine, namely: classical and neoclassical theory, Keynesian theory and neo-Keynesian theory. Classical theories, neoclassical and Keynesian is also known as conventional theories because they are well known and accepted by theorists. Before proceeding to an analysis is useful to highlight the basic structure and implications of each theoretical paradigm.

If classical economic theory is argued that the state must have a limited role imposing some rationality on government fiscal operations, the neoclassical theory emphasizes the effects of enlargement the government's activities and the state's intervention for assessing economic growth which led to the shaping of a neoclassical growth model that is currently used in recent studies.

This extension is intended to support public financial decisions by both the income tax levy and by state loans. It also continues the idea that classics finance budget deficits by borrowing may adversely affect the economy by using them for purposes in order to stimulate consumption and less productive capital. More specifically, the emphasis is on stimulating the supply of state interventions that do not lead to persistent budget deficits wich have negative effects on private capital accumulation.

It was subsequently developed the Keynesian theory based on increasing aggregate demand. This led to the development of neo-Keynesian theory.

The Keynesian approach considered that a large proportion of the population has a high propensity for consumption over current available income. A temporary reduction of taxes has a

[*] Associate Professor PhD, Bucharest Academy of Economic Studies (e-mail:emilia.campeanu@fin.ase ro).

quantitatively significant and immediate impact on aggregate demand. If the economy's resources are initially underutilized than national income increases lead to negative effects. Since the public financial imbalance stimulate both consumption and national income than saving and capital accumulation are not adversely affected. So, on short-term deficits have beneficial consequences.

In the Ricardian approach, successive generations are linked by voluntary transfers, and altruistic resources. Under certain conditions, they imply that consumption is determined as a function of state's resources (total resources of both taxpayers and their progeny). Since the deficit involves a postponement of taxes that will be supported by future generations, then it does not affect the resources. As a result the deficit is a matter of indifference.

Given the neoclassical and Keynesian paradigms we can say that the Keynesian approach refers to short term variations, while neoclassical is concerned by the long term challegnes. So the public should be split and the gap into two components, namely: a permanent component (long-term average) and a temporary component (deviation from long-term average). Thus, the neoclassical theory studies the effects of permanent deficit, and the Keynesian is concerned about the impact of temporary deficits.

The paper aims to investigate the fiscal and budgetary policies based on neoclassical, Keynesian and neo-Keynesian economic theories in order to indicate their divergent points. Once known this approaches is easier to establish the appropriate policy measures taking into account the countries' classification according to a certain pattern. To achieve this scientific approach, the paper is divided into six sections. Section two indicates general aspects of the classical economic theory, meanwhile section three is devoted to neoclassical economic theory. The basic characteristics of Keynesian and neo-Keynesian economic theories are presented in sections four and five, while section six points the conclusions.

2. Fiscal and budgetary policies in classical economic theory

Classical representatives argue that the state economic role must be limited by requiring some rationality on government fiscal operations. They, including Adam Smith, were first interested by the economic order and then developed the theories regarding the state's role in the economy.

The general peculiarities of classical economic theory of fiscal and budgetary policies are:

– The state economic role must be limited by requiring some rationality on government fiscal operations;

– Government borrowing reduces the disposable income in the economy that could be used productively in the private sector;

– Government deficits contributing to extend the work of public sector growth irresponsible government action;

– Government borrowing creates difficulties in securing future funding through the allocation of part of the increasingly large tax revenues to honor the obligations as debt amortization and interest on debt;

– Increases in taxes;

– Unbalanced budgets lead to monetary depreciation (inflation);

– Balanced budgets are a guide to transfer resources from the private to the public sector.

In view of Adam Smith (1930), the state was wasteful in the sense that he was removing a part of the revenue funds of economic entities, which then redistributed. The budget balance is achieved based on public debt as a result of state loans. These loans were intended to finance the current consumption expenditure and not the production activities that are able to generate added value to ensure the payment of public debt service. Therefore, the public debt extends the political power of the state because there will not be a dependence on the tax revenues collected from taxpayers.

According to Adam Smith (1930), important is the moment when creating public debt and not, specifically, its growth. Also, the existing debt burden is not important. The most important „loss" is recorded when economic agents accepted to borrow the state. In fact, it could not be considered a "loss of interest due to the annual transfer from taxpayers to state creditors. Jean-Baptiste Say (1853) warns that the waste of public money was spent. In this context, the author expresses his disagreement with the promotion of fiscal and budgetary policies that led to budget deficits and hence public debt. In order to balance the budget, Say recommend limiting consumption to ensure industry and trade capital. Public loans were not only unproductive because they were consumed and wasted, but also because the nation was burdened by annual interest payments. He also argued that a moderate level of public debt, which was used wisely in the interest of public investment, could generate positive effects on investment and, therefore, on the gross domestic product.

David Ricardo (1951) argued that fiscal and budgetary policies applied by the state led to increased borrowing that can be perceived as a burden because it is not reflected in the annual transfers from taxpayers to creditors as interest on the state of public credit, but by reducing the country's productive capital. On the other hand, government debt does not affect the country's ability to pay taxes because taxable material was the same with or without public credit. However, the absence of public credit could create problems in the sense that they were satisfied with the general needs of society based solely on tax revenue. The increase in public debt lead to a series of long-term effects include: i) increase tax revenues, the price of labor, ii) no changes to the nation's real capital. As a result, Ricardo has proposed the government to adopt a financial plan as "pay-as-you-go" in order to encourage a high level of current savings. This new level of saving will be able to cope with a temporary higher tax pressure.

Thomas Robert Malthus (1836) believes that additional taxation to finance the interest on state debt would cause some negative effects as the population believes that the loan would be repaid in full for no longer incur additional costs later. Debt also influences the value of money. This disadvantage should be considered in conjunction with the advantages of maintaining unproductive consumer welfare by encouraging the maintenance of balance between production and consumption.

John Stuart Mill (1929) argued that iresponsable fiscal and budgetary comportament had serious economic consequences, and proposed an index to determine such effects. If debt generates an interest rate increase it can be concluded that it would be available in the economy to attract capital to meet the general needs of society and not for productive use. But, if interest rates remain unchanged then these consequences are not obvious.

C.F. Bastable (1922) has made the distinction between debt and debt contracted for non productive loans. If there is not an equivalent income derived from loan contracted than it comes inevitably to a reduction in public spending.

3. Fiscal and budgetary policies in neoclassical economic theory

Neoclassical paradigm aimed at individual consumption plans during its life. In this timeframe the imbalance in fiscal and budgetary policies increased total consumption by shifting the burden of taxes in future generations. If resources are fully utilized than the consumption growth necessarily implies reducing savings which will increase the interest rates in order to restore equilibrium in the capital market. Thus, persistent deficits restrict private capital accumulation.

The standard neoclassical model has three main features, namely:

1.Consumption of each individual is determined as a solution of intertemporal optimization problems where both resources raised through loans and those granted in the form of loans involving interest rates set by the market;

2. Individuals have a limited lifetime, each consumer belongs to a certain generation, and related life overlaps successive generations;

3. Market freedom is assumed in all periods.

Diamond (1965) was the first economist who had studied the effects of budget deficits in the formal context of these models. He argued that a permanent increase in the rate of domestic debt to national income would result from reduced capital-labor ratio. The initial interest rate, consumers are not interested to hold capital and government securities, including new titles. Stimulate additional saving growth rate and reduce investment capital until market equilibrium is restored. Thus, persistent deficits reduce private capital accumulation.

Diamond's analysis focuses on permanent changes to the deficits and not on their temporary effects.

Auerbach and Kotlikoff (1986) were conducted policy simulations in a more complex neoclassical model. Their analysis showed that the impact of a temporary deficit may be very small, but significant negative effect (a temporary deficit may boost short-term savings). This result reflects some consideration. Economic life is relatively high so that the impact of increased wealth on current consumption (wealth effect) is reduced. In addition, if public spending is kept constant then the temporary budget deficits reflect a reduction in tax rates which implies lower marginal tax. Reducing income tax rates for capital directly stimulate saving by increasing profitability after tax. Also, lower rates of income tax wage induce a temporary replacement by increasing current revenue. As a result, neoclassical theories argue that temporary deficits have little or negative effect on short-term economic variables.

4. Fiscal and budgetary policies Keynesian economics

Fiscal and budgetary policy is the result of the election of the state for economic and social porposes. This involves, on the one hand, revenue mobilization, and on the other hand, public expense. By the mid-30s, economic theory has treated more the resource allocation problems than the the juncture regulation through public finances. Keynes view is different from those of the neoclassical analysis because it emphasis on unemployment, its causes and remedies that may apply to public authorities. Keynesian approach rejects the hypothesis of price flexibility in a market economy, the neutrality of money, and the market economy and optimality theorems of welfare redistribution before the exchange economy. Also, they do not disqualify the public financial imbalances.

The redistributive and stability policies result from market imperfections. Two cases allow the demonstration on the fact that in the event of unemployment, government intervention is needed to cover insufficient aggregate demand. For this purpose, first use a simple model and then a complete one.

Keynesian analysis has been improved over time through new models of which stands the model of Bernanke and Blinder (1988) that explains how to coordinate monetary and fiscal policies to alleviate unemployment and budget in a market economy.

From studies conducted by economists it cand be found that economic cycles could increase budget deficits or seizures crises if the state would meet the budget constraint. In addition, public spending will grow faster than sustainable economic activity due to exogenous shocks (war) as revealed Wagner (1911) and Peacock and Weiseman (1967). As a result, the authors recommended, with Myrdall (1933), achieving cyclical budgets based on automatic stabilizers; so the theory of fiscal relaxation. Insufficient findings of these approaches led to the formulation of its argument Keynes deficit through spending resulted in a sustained optimism, between 1950 and 1975, by fine-tuning of economic activity in order to alleviate or eliminate the business cycles.

To summarize, the Keynesian theory can identify the following concerns vis-à-vis the fiscal and budgetary policies:

– it is considered that a large proportion of the population has a high propensity for consumption over current revenue available;

– national income increases if the economy is initially under-utilized resources leading to side effects;

– deficit is caused by maintaining a constant level of expenditure and reducing tax revenues; in this case the household income increases lead to the improvement of the living standards. Thus, the growth of consumers' income increases demand for goods and services;

– temporary reduction of taxes is quantitatively significant and has immediate impact on aggregate demand;

– since the financial imbalance stimulates both consumption and national income then saving and capital accumulation are not adversely affected;

– so short-term deficits have beneficial consequences.

5. Fiscal and budgetary policies in neo-Keynesian economic theory

Unlike the Keynesian theory, David Ricardo suggested that fiscal and budgetary policies do not exert any effect on the national economy. According to Ricardian equivalence government spending on goods and services, and marginal rates of taxation are what counts, while the mix of debt and tax revenues is irrelevant. The reason given was related to the fact that the debt leads to higher taxes in the future while the rational agents known it

Impact on consumer mix - investment alternative methods of financing a given amount of government spending was the subject of debate since Smith (1962) and Ricardo (1962). Currently, debt neutrality conducted to an important debats such as Barro (1974), David and Scadding (1974), Lewis (1974), Carlson and Spencer (1975), Buchanan (1976), Feldstein (1976), Buiter (1977).

Macroeconomic approach provides dramatic new answers to these questions. The effect of government policies is fully measured the size and content of real government spending by way of funding.

Thus, the Modigliani-Miller (1958) theorem from the corporate finance is extended in the households sector (corporate sector) in the public sector. This establishes the conditions, in a firm's case, when the choice between borrowing and financing by issuing new shares is irrelevant. Similarly, Ricardian equivalence argues that the choice between loans and financing the public spending by increasing taxes is irrelevant. An important form of this theorem was issued by Robert Barro (1974).

James Buchanan (1976) referred to the neutrality of public sector funding as a Ricardian equivalence theorem.

David Ricardo first formulated this conclusion considering that the neutrality of public debt, given the volume and content of what today we call exhaustive public spending, reduce taxes, primarily current consumption while domestic loans to lower savings and private capital formation. So, the method of financing public expenditure is irrelevant because there are similar effects. In fact, after he made this proposition, he proceeded to outright denial of its validity. Expresses its reason on the one hand, what we call today "debt illusion" and, on the other hand, fear that expectations of future taxes induce evasive behavior, including even emigration.

Ricardian equivalence theorem is one the neutrality which requires that the state cut taxes without, however, reducing the public spending, which involve, according to conventional analysis, reducing national saving and capital accumulation and long term, restricting the economic activity. However, Ricardian equivalence argues that this policy does not affect consumption or capital accumulation.

Ricardian argument is based on the fact that lower taxes now, and record budget deficits, public expenditure remains unchanged as the level of lead in future to an increase in taxation. Consumers with a forward looking will not reacte to the reduction of taxes and increasing consumption, they will save the surplus. It is recorded an increase in private savings, an amount

equal to the reduction of taxes, that will not change national saving and other macroeconomic variables.

Barro (1974) reformulated the Ricardo's theorem in the sense that intergenerational redistribution of income associated with a shift from financing through taxes and loans can be neutralized by offsetting changes of gifts and legacies between generations.

Barro (1974) found that altruism between generations may extend the time horizon of individuals proposed as a new form for the Ricardian equivalence theorem. Thus, the modern paradigm aimed at families that drive decisions.

The strict irrelevance of fiscal and budgetary policies (Ricardian equivalence) depend on a number of assumptions, namely:

• successive generations are linked by altruistically motivated transfers;

• Capital markets are either perfect or imperfect in certain specific circumstances;

• consumers are rational and seers;

• postponed taxes do not redistribute resources between families with different marginal rates of consumption;

• taxes are not distortionary;

• deficit can not create value;

• deficit financing does not influence political processes.

So, Barro has proposed a different interpretation of the Ricardian argument, namely: for the holders, the government securities are an asset and an obligation to taxpayers that will covereit by taxes. Thus, because the population has not experienced an increase in income, it should not alter the structure of consumption in response to a temporary reduction of duties.

It is important to note that the Ricardian argument does not show all aspects of fiscal and budgetary policy irrelevant. Thus, if the government reduces taxes today, and people expect that this measure is accompanied, in the future, with spending cuts, then increases the permanent income of the population which stimulates consumption and reduces national saving. But it should be noted that expectations for reducing public spending rather than reducing tax revenues are those that stimulate consumption. Reducing public expenditure in the future affect permanent income and consumption because it implies lower tax revenue in a given period, even if current taxes are not changed.

Since Ricardian equivalence considers irrelevant aspects of fiscal and budgetary policy and others as important, testing this approach is doable. Also, most economists, though, believes that Ricardian equivalence does not describe the consumer behavior, however, this approach was particularly important in the debate about the imbalance in public for two reasons:

- Ricardian equivalence actually describes the world or at least it gives a first approximation;

- Ricardian equivalence provides a theoretical basis for many other tests.

In essence, the Ricardian equivalence combines two basic ideas, namely:

– budget constraint that lower taxes today imply its future growth, given that public spending does not change;

– permanent income hypothesis, which concerns the fact that people base their consumption decisions on permanent income, which depends on the present value of income left after paying taxes.

6. Conclusions

Classical theories of fiscal and budgetary policy are based on a series of interrelated economic statements or policy that reflects attitudes toward the role and responsibilities of the sovereign state. These can be summarized as follows:

- government loans used to ensure balance in the fiscal and budgetary policies reduces the disposable income that could be used productively in the private sector;

- deficits extend the government's activities, thus contributing to increased public sector, and lead to irresponsible government action;

- government borrowing creates difficulties in ensuring future funding through the allocation of part of the increasingly large tax revenues to honor the obligations as debt amortization and interest on public debt. Thus, it appears finally to increases in taxes;

- unbalanced budgets lead to monetary depreciation (inflation);

- balanced budgets are a guide to transfer resources from the private to the public sector.

Each of the main characteristics of neoclassical theory has an important role in determining the impact of fiscal and budgetary policies. Thus, if consumers are rational, clairvoyants, and have access to perfect capital markets where capital accumulation, there will be a reduction of the permanent deficit while the temporary deficits will have a negligible effect on economic variables (consumption, savings, interest rates, etc..) If consumers are subject to the liquidity constraints then the impact of permanent deficits remain the same. However, temporary deficits should reduce savings and increase short-term interest rates.

Unlike the Keynesian theory, David Ricardo suggested that tax and fiscal policies do not exert any effect on the national economy. According to Ricardian equivalence government spending on goods and services, and marginal rates of taxation are what counts, while the mix of debt and tax revenues is irrelevant. This reason is related to the fact that the debt lead to higher taxes in the future. We can therefore speak of a theorem of fiscal and budgetary policy of neutrality.

These differences between the economic theories should be known so that it can be established a national economy diagnosis through a proper framing in a specific pattern corresponding to the economic economic theories.

BUSINESS INTELLIGENCE TOOLS FOR DATA ANALYSIS AND DECISION MAKING

DEJAN ZDRAVESKI[*]
IGOR ZDRAVKOSKI[**]

Abstract
Every business is dynamic in nature and is affected by various external and internal factors. These factors include external market conditions, competitors, internal restructuring and re-alignment, operational optimization and paradigm shifts in the business itself. New regulations and restrictions, in combination with the above factors, contribute to the constant evolutionary nature of compelling, business-critical information; the kind of information that an organization needs to sustain and thrive.
Business intelligence ("BI") is broad term that encapsulates the process of gathering information pertaining to a business and the market it functions in. This information when collated and analyzed in the right manner, can provide vital insights into the business and can be a tool to improve efficiency, reduce costs, reduce time lags and bring many positive changes. A business intelligence application helps to achieve precisely that.
Successful organizations maximize the use of their data assets through business intelligence technology. The first data warehousing and decision support tools introduced companies to the power and benefits of accessing and analyzing their corporate data. Business users at every level found new, more sophisticated ways to analyze and report on the information mined from their vast data warehouses.
Choosing a Business Intelligence offering is an important decision for an enterprise, one that will have a significant impact throughout the enterprise. The choice of a BI offering will affect people up and down the chain of command (senior management, analysts, and line managers) and across functional areas (sales, finance, and operations). It will affect business users, application developers, and IT professionals.
BI applications include the activities of decision support systems (DSS), query and reporting, online analytical processing (OLAP), statistical analysis, forecasting, and data mining. Another way of phrasing this is that BI applications take data that is generated by the operations of an enterprise and translate that data into relevant and useful information for consumption by people throughout the enterprise.

Keywords: *Business intelligence, application, decision making, knowledge, data mining, data warehouse*

Introduction

The final decades of the 20th century and the beginning of the 21st have been marked by a staggering proliferation of information and communication technologies throughout the industrialized world. Not only do globalization trends bring a turbulent and most often unequal competitive environment, they also propagate waves of "managerial imperatives" – such as total quality; reengineering and integrated systems – that exert tremendous pressure on organizations wanting not only to survive but to succeed. In addition to performance and effectiveness, global organizations are asked to display ethical, social and environmental responsibility. This entire context makes the task of managing information a formidable challenge.

At present, information management is seen as one of the biggest challenges characterizing today's corporate context. A combination of constant technological innovation and increasing competitiveness makes the management of information a difficult task, one which requires decision-making processes that are built on reliable and timely information, gathered from internal and external sources. Although the volume of information available is increasing, this does not automatically mean that people are able to derive value from it. In the IT field, after years of significant investments to create technological platforms that support all business processes

[**] PhD, Faculty of Economics-Prilep-Macedonia, (e-mail: zigor200@yahoo.com).

(processes that are "reengineered" and "integrated") and that strengthen the efficiency of the operational structure (after undergoing "quality" programs), organizations are supposed to have reached a point where the implementation of IT solutions for strategic decision-making processes becomes possible and necessary. This context explains the emergence of the area generally known as "business intelligence" (BI), seen as an answer to current needs in terms of information for strategic decision-making through intensive use of information technology (IT).

Definition of Business intelligence

The literature review of BI reveals few studies. Most of the articles are conceptual. What's more, throughout the literature, meets the traditional "separation" between technical and managerial aspects, outlining two broad patterns[1]. The technological approach, which prevails in most studies, presents BI as a *set of tools* that support the storage and analysis of information. This encompasses a broad category of applications and technologies for gathering, storing, analyzing, and providing access to data to help enterprise users make better business decisions. Those BI tools include decision support systems, query and reporting, online analytical processing (OLAP), statistical analysis, forecasting and data mining. The focus is not on the process itself, but on the technologies that allow the recording, recovery, manipulation and analysis of information. Sophisticated use of warehoused data occurs when advanced *data mining* techniques are applied to change data into information. Data mining is the utilization of mathematical and statistical applications that process and analyze data. Mathematics refers to equations or algorithms that process data to discover patterns and relationships among variables. Statistics generally shed light on the robustness and validity of the relationships that exist in the data mining model. Leading methods of data mining include regression, segmentation classification, neural networks, clustering and affinity analysis. The synergy created between data warehousing and data mining allows knowledge seekers to leverage their massive data assets, thus improving the quality and effectiveness of their decisions. The growing requirements for data mining and real time analysis of information will be a driving force in the development of new data warehouse architectures and methods and, conversely, the development of new data mining methods and applications.

In short, BI is a wide set of tools and applications for gathering, consolidation, analysis and dissemination aiming at to improve the power to decision process. The components of business intelligence that focus in collect and consolidation can involve data management software's to access data variables, extract, transform and load tools that also enhance data access and storage in a data warehouse or data mart. In the steps of analysis and distribution, each time more different products are launched and integrated with objective to take care of the different use of the information. These products can include the creation of reports, the fine-tuned dashboards containing customized performance indicators visually rich presentations using gauges, maps, charts, and other graphical elements to show multiple results together, the generation of OLAP cubes and the data mining software's to discover information hidden within valuable data assets, using advanced mathematical and statistical techniques, can uncover veins of surprising, golden insights in a mountain of factual data. Figure 1 presents a proposal of BI architecture, distributing the different technologies and applications argued in function of its main contribution in each one of the steps in the BI process.

The managerial approach sees BI as a *process* in which data from inside and outside the company are integrated in order to generate information relevant to the decision-making process. The role of BI here is related to the whole informational environment and by which operational data gathered from transactional systems and external sources can be analyzed to reveal the "strategic" business dimensions. From this perspective emerge concepts such as the "intelligent company": one that uses BI to make faster and smarter decisions than its competitors. Put simply, "intelligence" entails the reduction of a huge volume of data into knowledge through a process of filtering,

[1] Altosoft corporation, Bringing business intelligence to business operations, March 2009.

analyzing and reporting information. The explanation of how companies acquire "intelligence" would lie in the data-information-intelligence transformation. Traditional wisdom emerges here: data is raw and mirrors the operations and daily transactions of a company; information is the data that has passed through filtering and aggregation processes and acquired a certain level of contextual meaning; intelligence elevates the information to the highest level, as the result of a complete understanding of actions, contexts and choices.

Both approaches – technical and managerial – rely on an objective and positive view that "strategic decisions based on accurate and usable information lead to an intelligent company". All the subjectivism inherent in social interactions is evacuated and cultural and political issues are not evoked. Whether the reviewed studies are managerial or technological, they share a common idea:

- the core of BI (process or tool) is information *gathering, analysis and use*, and
- the goal is to support the strategic *decision-making process*.

The Characteristics of a Business Intelligence Solution

Single point of access to information

With BI systems, organizations can unlock information held within their databases by giving authorized users a single point of access to data—a BI portal—in both intranet or extranet environments. Wherever the data resides, whether it is stored in operational systems, data warehouses, data marts and/or packaged applications, users can prepare reports and drill deep down into the information to understand what drives their business, without technical knowledge of the underlying data structures. The most successful BI applications allow users to do this with an easy-to-understand, non-technical, graphical user interface.

Using BI in all departments of an organization

There are many different uses for BI systems. BI systems can be used at every step in the value chain.

Timely answers to business questions

The key to unlocking information is to give users the tools to quickly and easily find answers to their questions. Some users will be satisfied with standard reports that are updated on a regular basis, like current inventory reports, sales per channel, or customer status reports. However, the answers these reports yield, can lead to new questions. Some users will want dynamic access to information. The information that a user finds in a report will trigger more questions, and these questions will not be answered in a prepackaged report.

Making the most of the internet by creating an extranet

You can open up BI system access to users outside the organization through extranet applications with clearly defined security limits. For example, customers may want to consult their ordering history to analyze their buying patterns and identify cost-saving opportunities. Or suppliers may be interested in gathering sales data.

Selection of BI Tools

Selection of a BI tool may turn out to be a difficult task. At present companies offer a wide range of products beginning from simple reporting technologies up to sophisticated BI platforms. While choosing a BI tool, it is necessary – like in the case of purchasing other IS – to take the following criteria into consideration: functionality, complexity of solutions, and compatibility. It is also necessary to remember that organization's informational needs will evolve. Therefore, BI tools should be up-to-date enough to meet enterprise's expectations in a few years to come.

At this stage, good market knowledge of BI is required. Today BI products may be found in different segments of the IT market. Providers of MRP II and ERP systems more and more frequently equip their products with BI modules (e.g. SAP, Oracle or Microsoft), thus wishing to make their products more dynamic and analytical. OLAP techniques and data mining have also been

implemented in database systems (Oracle, Microsoft or IBM)[2]. Planning and budgeting belong to another segment of the IT market that uses BI techniques. Additionally, it has to be mentioned that there is a group of providers that offer BI solutions in a highly specialized area and usually on a very high level of customer need satisfaction. Such products often include best practices for a particular sector along with some future solutions. One cannot forget about open source solutions that are more and more frequently available on the market.

In the BI sector – similarly as in case of other IT sectors – it is possible to observe some processes of consolidating providers - purchasing products or expanding products by means of functionalities that are offered by the best providers in a given category. Hence, it is necessary to consider whether a given enterprise ought to purchase products and technologies from one provider or if such an enterprise should follow a principle of selecting the best products in a given category (e.g. the best tools for OLAP, ETL, etc.) sold by different providers. In the former case, enterprises are guaranteed integration of particular products and a similar interface. However, it has to be taken into account that not all solutions are going to be of the highest possible quality. Package purchase of products frequently involves discounts, which is quite important for enterprises. On the other hand, purchasing products from several providers may lead to delegating responsibility for particular module performance to other providers. It is also more difficult to obtain larger discounts while purchasing technologies that come from different providers. There is also some other possibility – purchase of a ready to use solution instead of a particular technology. In this situation, it is necessary to learn more about capacities of a given application and then consider whether such an application meets enterprise's needs and whether there are some elements that the application in question should be subsequently provided with. Providing an enterprise with BI products of an open source type is another possibility. Examples of complimentary or open source products may be provided by Sygate Analyst (a tool used for data visualization), Agata Reports (a reporting tool), Oracle Application Express (environment for building web applications), and cockpit for the management in open source ERP Compiere, Business Intelligence Reporting Tool for Eclipse or Mondrian OLAP Server. Some providers of BI products use free databases. For instance, Business Objects uses a complimentary database called MySQL. Figure 1[3] represents the largest BI vendors of the world IT market.

[2] www.intelligententerprise.com.
[3] www.informationweek.com.

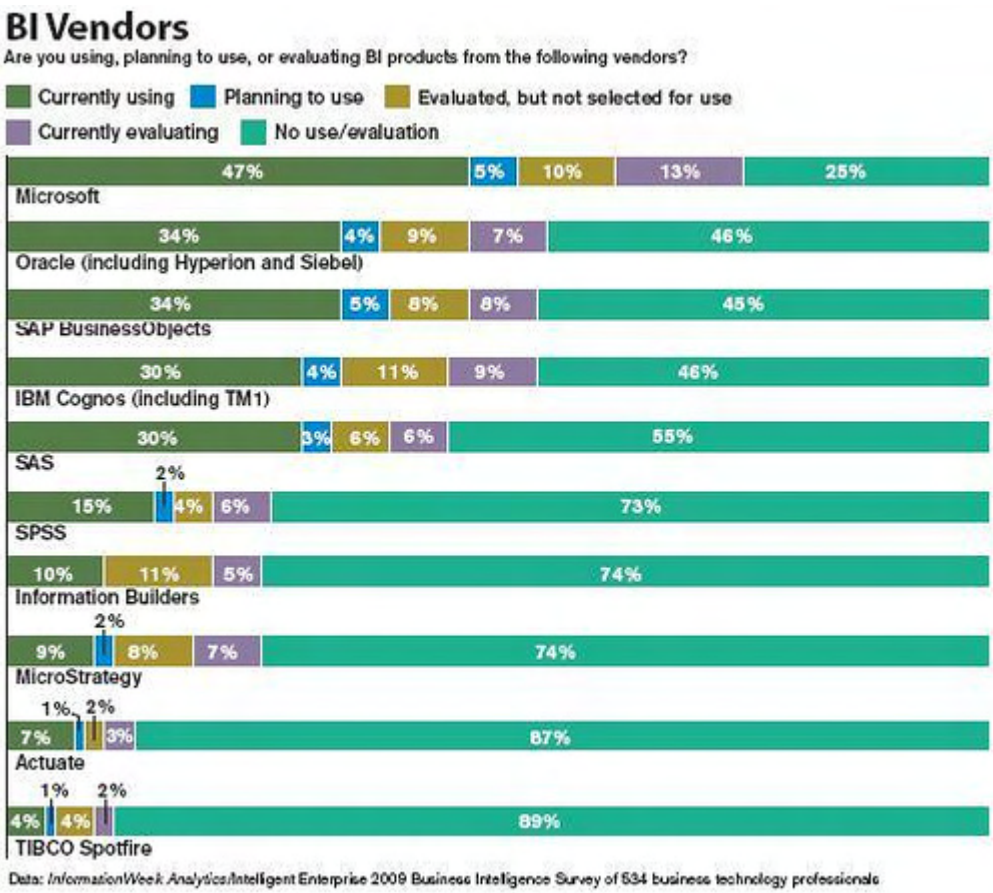

Figure 1. BI vendors
Source, www.intelligententerprise.com

The typical BI 'stack' or architecture can be represented as having a series of layers. The base is usually shown as source data systems from where data is extracted, translated and loaded by extract, transform and load (ETL) software into a data warehouse. Above this is an application layer (or BI layer) and on top of this the presentation or delivery layer which can include executive dashboards, scorecards and other tools that make it easier for managers to find and understand the information and proactively use it in decision making.

As BI has evolved, the greatest challenge has been how to integrate data on different systems accumulated from different vendors over many years. Traditionally, data flows from source systems to data warehouses then to data marts and cubes to be used in BI applications. Source data can now also come from customer facing applications, suppliers and sources of external information. The data warehouse has the potential to become the information hub that distributes data to and from many data sources and applications. Software houses used to specialize in different layers of this BI stack and businesses applied a 'best of breed' approach to assembling their own stacks. For example, a SAP ERP system might feed data to an Oracle data warehouse and the finance function might use an application from Hyperion for consolidation and reports and another from SAS for more advanced analytics. These solutions were developed by independent software houses to meet different businesses' needs.

This integration challenge is being addressed[4].

❖ Service-oriented architecture is promoted as a flexible solution which eliminates the need to develop point-to-point connections between resources. It provides access to data in legacy systems through 'services' which link together and are combined to provide a business intelligence solution.

❖ The major ERP, ETL, data warehouse and customer relationship management (CRM) vendors now offer what are claimed to be integrated BI applications, for example SAP BW, Informatica PowerCenter, Oracle Applications and Siebel Analytics. And BI vendors began to add ETL tools, such as Business Objects Data Integrator and Cognos DecisionStream.

❖ The major vendors, SAP, Oracle, IBM and Microsoft, who already had some BI solutions, have expanded into performance management by acquisition. There has been a feeding frenzy and the big players are still digesting their prey. If they succeed in doing so, they are expected to offer better integrated BI solutions.

❖ Meanwhile, data integration tools, such as those offered by Informatica, already allow data from diverse sources to be integrated into the database layer. This enhances the performance and scalability of BI applications accessing this data.

The Benefits of Business Intelligence

Because of the wide applicability of BI in enterprise and extranet deployments, the business benefits are numerous. These benefits can be grouped into three main categories: lowering costs, increasing revenue, and improving customer satisfaction[5].

Lowering Costs

Improve operational efficiency

❖ By giving internal or external customers access to real-time data over the web, customers can track their own accounts and answer their own questions. As a result, customer satisfaction is improved while reducing support costs. A significant, added benefit to real time data access is that data becomes much cleaner. By reviewing the data themselves, customers can spot errors, and help improve the quality of the information in the data warehouse.

Eliminate report backlog and delays

❖ Business intelligence allows business users to design their own queries and reports, allowing organizations to redeploy the programmers who formerly performed this task. This can generate significant cost savings in human resources, since sought-after staff can be reallocated to projects that add more value to the organization.

Negotiate better contracts with suppliers and customers

❖ A solid grasp of facts and figures is invaluable when it comes to negotiating contracts with suppliers and customers. For instance, by analyzing supplier performance on-time delivery trends, percentage of rejects, and price changes will be in an excellent position to discuss all aspects of the contract as well as possibly negotiate volume discounts. And identifying a customer's spending patterns could qualify him or her for a particular packaged deal.

Find root causes and take action

❖ If one division is doing better or worse than others, identify the root cause and either implement a best practice or fix the problem. With BI, can be found root causes both to problems and to best practices by simply asking "Why?" The process is initiated by analyzing a global report, say of sales per quarter. Every answer is followed by a new question, and users can drill deep down into a report to get to fundamental causes. Once they have a clear understanding of root causes, they can take highly effective action.

[4] CIMA, Improving decision making in organizations, September 2008.

[5] Mark Ritacco and Astrid Carver, The business value of business intelligence, Business object, 2008.

Identify wasted resources and reduce inventory costs

❖ BI can be apply activity-based costing methods to identify hidden costs or missed opportunities. From these findings, resources can be allocated to highly profitable products, customers, and projects, thereby increasing the bottom line. Also, having a clearer understanding of success of promotions can help to effectively monitor inventory levels.

Increasing Revenue

Sell information to customers, partners and suppliers

❖ Leading organizations are using BI to differentiate their product and service offerings from competitors through value added, web-based services. In the past, many departments generated zero revenue, but now with BI extranets, they create a recurring revenue stream by selling information to customers, partners, and suppliers.

Improve strategies with better marketing analysis

❖ With easy access to ordering, accounting, production, shipping, customer service, and even external databases, marketers can find answers to the most detailed of questions such as, "What was the success rate of my direct mail campaign?" or "What was the incremental revenue generated from the new TV ads we just ran?" . With this information, the marketer can precisely tailor product launches and promotion campaigns to the targeted audience. Using BI, companies can micro segment their markets and gain an edge over the competition.

Empower sales force

❖ Better results from sales force can be achieved by analyzing its selling patterns: compare results to targets, to figures from previous years, to other sales staff results, and suggest improvements. Encourage the sales force to focus on high profitability customers and products. The sales force can also use BI to analyze data on brands, clients, and distributors.

Improving Customer Satisfaction

Give users the means to make better decision

❖ With access to information, users can make better decisions faster, without having to escalate standard problems up the management hierarchy. This guarantees pragmatic and effective solutions since the people directly involved in the operations make decisions. In addition, users have the increased satisfaction of controlling their own process.

Provide quick answers to user questions

❖ One of the primary benefits of BI is that you can dramatically reduce the time it takes for internal and external users to get answers to their questions. With fewer delays and faster response time, users are empowered to act quickly, based on the information they receive.

Challenge assumptions with factual information

❖ Almost all businesses rely on assumptions and rule of thumb. However, it is worthwhile to challenge these hunches through detailed analysis of operational data, because assumptions and rule of thumb are frequently incorrect.

Conclusions

The term Business Intelligence may turn out to be a fad. However, the underlying concepts, using information technology to deliver actionable information for decision makers, are essential for managing today's global businesses. BI uses both structured and semi-structured data. The former is much easier to search but the latter contains the information needed for analysis and decision making.

For structured data, many BI tools exist for acquisition, integration, cleanup, search, analysis, and delivery. Further work is needed, however, to integrate these tools and to provide actionable information. BI tools for semi-structured data, on the other hand, are not yet mature.

The development of analytical tools to integrate structured and semi-structured data can benefit from attention by researchers. The BI market is growing, and the proportion of semi-structured data used in daily decisions is growing. Exploring the underlying issues and the development of information technology that provide intelligence to business therefore is a fertile area for research.

Business intelligence could inform better decision making in business. Everyone in management needs to be alert to this opportunity and the threat that early adapters may achieve a competitive advantage. But BI is only a technology enabler. Management accountants have important roles to play if BI is to be of value. The necessary changes will have to be implemented properly. People will have to use it to produce information and that information still has to be applied in decision making and, for those decisions to be effective, they will have to be managed through to impact.

The nature of the management information and analysis required by business has expanded. The range of data to be considered now includes non-financial and external information. The emphasis has shifted from reporting through monitoring to providing information and analysis as appropriate to users' roles. These users may be strategic managers, knowledge workers, people in operational and customer facing roles or external stakeholders and regulators Business intelligence is evolving to meet these information needs. It now encompasses the reporting and analysis tools used for performance management by accountants. Advances in data management and better integration of systems will enable BI to provide better management information to inform decision making.

MEASUREMENT OF HEALTH INEQUALITY

NICOLETA CARAGEA*

Abstract
Health inequality is met everywhere in the world, including in countries with a high level of economic development, or those with strong social protection systems. In this paper I analyzed certain methods to measure health inequalities between population groups and also I presented some empirical results regarding health disparities between European Union countries. My research is focussed on three health areas: health status of population, access to health care services and resource allocation and population spending on health care.

Keywords: *disparities, health, inequalities, life expectance, mortality rate*

Introduction

Health inequality should not be accepted anywhere in the world. One of the main reasons why additional social policies in every country should be drafted would be the reduction of disparities between population groups disadvantaged and the rest of the population; the major objective being improving the health of the population throughout the country.

Because health inequalities are not fortuitous, but are heavily influenced by government, communities, and the individual himself, they are not inevitable. Therefore, the improvement of population health and reduction of inequality should be the main core long-term objectives, in terms of social policies at national and international. European Council (June 2008) stressed the importance of eliminating disparities - in terms of population health status - between and among State Members. EU Health Strategy includes measures and actions to reduce the inequalities between people living in different parts of the EU, but also between people of advantaged classes of society and those from disadvantaged groups, by solidarity, social and economic cohesion, the human rights and equal opportunities.

Starting with January 2011, it was initiated the *European Portal for Action on Health Equity* as a tool to promote health equity amongst different socio-economic groups in the European Union. The Portal provides information on policies and interventions to promote health equity within and between the countries of Europe, by targeting the socio-economic determinants of health.

The information presented is the result of collaboration between a wide range of health and social actors in the EU, who came together in the context of a pan-European initiative that aimed to stimulate action for greater health equity. The initiative was established an EU Consortium for Action on the Socio-economic Determinants of Health (SDH).

The 2008 WHO Annual Report highlights the deepening inequality and inefficiency of the health care systems worldwide. Even in developed countries, inequality in health is increasing, a phenomenon generated by the provision of specialized medical services, high tech, but less accessible, to the detriment of concern for providing basic health services and disease prevention among all populations.

Literature review

Increased global inequality has resulted in a different direction of research in the field: one that compares the health of the population between the various political entities, such as between

* Lecturer, Ecological University of Bucharest, (e-mail: nicolcaragea@gmail.com).

countries or regions. Most studies are presented in numerous reports prepared by UN, ILO, OECD and the WHO.

Since 2005, in the European community, a group of experts reviewed the information on policies and practices in public health and supported initiatives to introduce community action programs to reduce existing inequalities. Research Framework Programmes (currently FP7) also provides a major boost to research in this area and share a variety of programs including health program and the Community Programme PROGRESS Social Solidarity labour and employment, financial studies and examples of good practice.

In Romania, there are few research studies on health inequality. The National Institute of Economic Research has included in the annual research programs projects relating to health, living conditions, which were addressed in the context of some aspects of these components of wealth distribution in different population categories, defined by employment status, education, age and sex, household size and type, environment and region of residence, as well as deciles or quintiles. Research on population health status has been conducted in the Institute for Research on Quality of Life and National Institute of Statistics. The economic dimensions of inequality and social polarization in Romania were the main research issues in the social field in the program research of the Institute of National Economy in the frame of Romanian Academy (Molnar, Caragea, 2010).

Measurement of health inequalities

Measuring health inequality is however a very difficult action because the complexity of the health various determinants. Therefore, any result obtained from the evaluation of differences between different individuals, between social groups, communities or societies, in terms of health, should be viewed with some reservations.

In the following section of the paper there are underlined some of the most representative methods measuring inequality in health:

(1) One of the methods measuring inequality of health in the vision of a research team from the World Health Organization (Mäkinen, 2000), examines the inequality of states in developing or in transition, in terms of resource allocation in health sector. Differences between countries were judged on the following indicators: public spending on health care per capita, number of ancillary medical personnel (nurses) and the number of doctors per 100,000 inhabitants.

(2) A recent health inequality measurement method (Doorslaer and O'Donnell, 2008) is based on the computation of the composite index accounting the cumulative action of determinants of health. The value of this approach is that the index is based on analysis of level and trends of health inequalities and the method can also explain the causes of inequality in health. Concentration index is calculated as the aggregate amount of the contribution of health determinants (demographic, social and economic factors). Wagstaff et al. (2003) demonstrate that the concentration index of health can be written as the sum of the contribution of factors, such as demographics, education, region, etc., to income-related health inequality, where each contribution is the product of the elasticity of health with respect to the factor and the concentration index of the factor. That is, the concentration index can be written as:

$$C = \sum_k (\beta_k \bar{x}_k / \mu) C_k + GC_\varepsilon / \mu \qquad (1)$$

where: μ - is the mean of the health measure y, $\bar{x}_k$ - is the mean of k[th] factor, β_k – is its coefficient from least squares regression of health on all factors, C_k - s the concentration index for the k[th] factor and GC_ε - is the generalized concentration index for the error term of the regression:

$$y = \alpha + \sum_k \beta_k x_k + \varepsilon \quad (2)$$

(3) Measuring health status inequality is based on the life expectancy distribution, by age. This approach seeks to answer several questions, for example, "it may be perfect equality between individuals when the same number of years they live," or when they enjoy the same level of health status? ".

In the next section, it is described the method for measuring health inequalities for a population with individuals born in T. We want to see if, at time T + t there are differences in terms of their health status. In other words, individuals who compose the population have the same level of health when they reached the age of t? In circumstances where there is perfect equality, we make the two conditions are necessary and sufficient:

- All individuals have the same healthy life expectancy;
- All individuals are subject to the same risks in terms of health status (incidence of illness and likelihood of improvement is considered equal for all individuals).

Healthy life expectancy is a function that can be written as:

$$S(x) = p(x) \cdot \sum_{j} p_{jx} \cdot w_{jx} \qquad (3)$$

where:

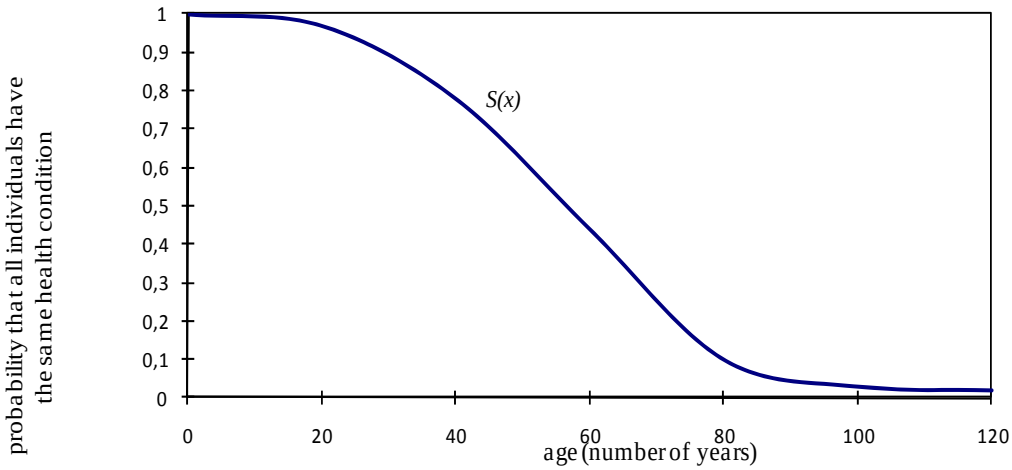
$S(x)$ - is the healthy life expectancy at age *x*,

$p(x)$ - is the probability of being alive at age *x*, $p_{jx}(x)$ - probability to have health status level *j* at age *x* and

$w_{jx}(x)$ - is the severity of disease at age *x*, attributed to the health status level *j* (severity is measured on a scale where 0 corresponds to death and 1 is equivalent to full health).

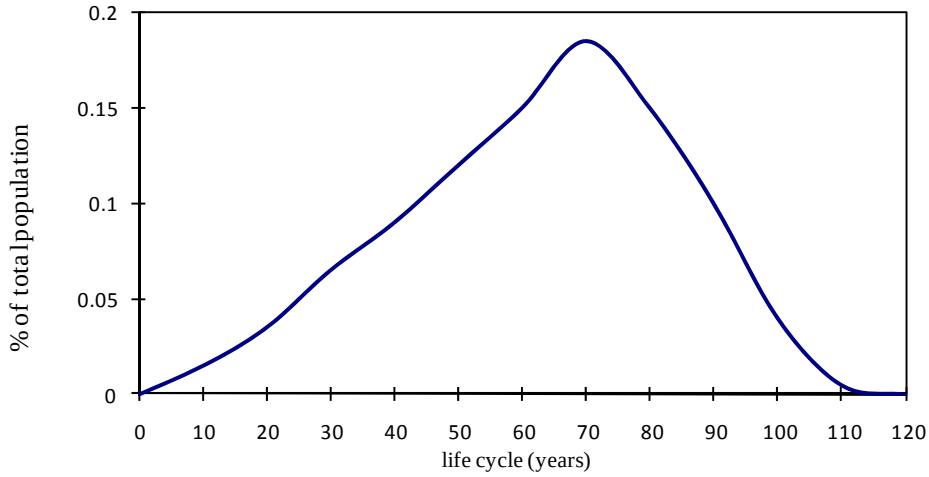
Figure 1a illustrates the healthy life expectancy by age and Figure 1b represents the distribution of healthy life expectancy for a population subject to the same risks in terms of health.

Figure 1a



In Figure 1a, healthy life expectancy - equal for all individuals - is given by the area under the curve *S(x)*.

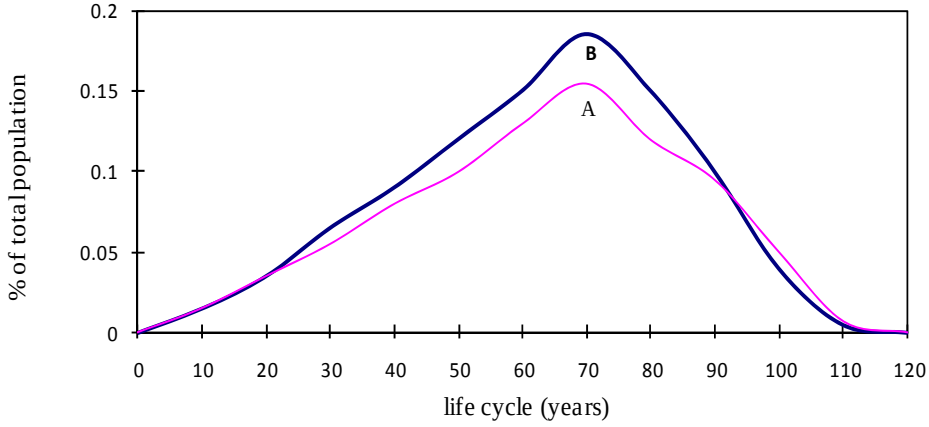
Figure 1b



Each of the individual has the same healthy life expectancy, but do not have equal chances to maintain its good health throughout life. For example, at age 20 years old, the probability of having a good health is 93%. In other words, at this age, because of natural causes (the misfortune), 7 of 100 individuals have a state of full health. Inequality in health should be analyzed, but in terms of risk factors that can damage the health of individuals. For example, if some individuals of the population are subject to risks related to socio-economic conditions in which they live, what is the likelihood that they will have good health for 20 years? Or, on an equal risk, varies as the probability of having a good health according to age?

Consider two populations A and B, characterized by different risk profiles in terms of maintaining good health of individuals who compose them, throughout life. In Figure 3 we can see that there are differences in the likelihood that individuals who constitute the population has to have the same healthy life expectancy compared to the population component B, due to risk factors that can not be avoided.

Figure 2



(4) Other method used to measure inequality in health has to calculate an index of inequality, according to the relation:

$$I(\alpha,\beta)=\frac{\sum_{i=1}^{n}\sum_{j=1}^{n}\left|y_i-y_j\right|^{\alpha}}{2n^2\mu^{\beta}} \qquad (4)$$

where:

y_i, y_j - is the health status of individual *i*, respectively *j*, μ - is the mean of population and *n* – is the number of population. α and β are parameters, which may have the following values: α =1 and β =0 or β =1, respectively α =2 and β =0 or β =1.

By replacing the parameter values α and β, following formulas are obtained:

$$I(\alpha=1,\beta=0)=\frac{\sum_{i=1}^{n}\sum_{j=1}^{n}\left|y_i-y_j\right|}{2n^2} \qquad (5a)$$

$$I(\alpha=1,\beta=1)=\frac{\sum_{i=1}^{n}\sum_{j=1}^{n}\left|y_i-y_j\right|}{2n^2\mu} \qquad (5b)$$

$$I(\alpha=2,\beta=0)=\frac{\sum_{i=1}^{n}\sum_{j=1}^{n}\left|y_i-y_j\right|^2}{2n^2} \qquad (5c)$$

$$I(\alpha=2,\beta=1)=\frac{\sum_{i=1}^{n}\sum_{j=1}^{n}\left|y_i-y_j\right|^2}{2n^2\mu} \qquad (5d)$$

If α =1, β =1, than $I(\alpha,\beta)$ is Gini coefficient often used to measure income distribution inequality.

Results

Analysis data was provided by national health interview surveys (according to European Health Interview Survey methodology), conducted in all Member States. The overall objective of this statistical research has been developing, implementing and achieving population health interview survey on a statistical sample of households to provide information and to describe the health status of the population that are not available from other data sources. In Romania, the investigation was prepared in accordance with the European methodology (European Health Interview Survey), the results being representative at national and regional level.

Perceived health status - is the subjective assessment of the individual's declared health status.

According to EU survey methodology concepts and definitions for the health status of the population, the indicator was calculated based on the choices of answer to the question: "In general,

how would you assess your health?" Very good, good, satisfactory, bad or very bad. For children, health status has been assessed by a parent.

On average, there are relatively small differences between the EU and Romania, in terms of population structure, in terms of the perceived health condition: very good, good, satisfactory, poor, very poor. Most people believe that their health is good (45.5% in the EU, respectively 43.7% in Romania). People who think that they have a very good health are more prevalent in Romania (25.7%) compared with the EU average (22.4%). The people who said they had a very poor health in Romania are 1.8%, very close to the value calculated for the EU-27, 1.9%.

Among European countries there are large variations in the structure of the population by health condition perceived of population. The highest weights of the population with good health status are observed in the Mediterranean countries (Greece and Cyprus 52.2%, 49.5%). On the opposite side are Portugal and Hungary, countries where the percentage of population with a very poor state of health is very high (5.3% and 4.9%). Also, the Baltic Countries are characterized by low values of the rate of people with good health (Latvia, 4.7%, Lithuania and Estonia 6.7%, 7.4%).

Disparities between Member States of the EU-27 - in terms of life expectancy at birth - are very high (7.8 years for the female population, i.e. 12.9 years for male population in 2008). Causes of these differences involve a wide range of factors, from the biological and behavioural socio-economic ones. The lowest life expectancy – for males - is 66.3 years in Lithuania, and the highest is recorded in Sweden (79.2 years). For women, the lowest life expectancy at birth has Bulgaria (77.1 years) and the upper, France (84.9 years). Life expectancy is greatly influenced by infant mortality, very high in countries with low economic development. Also, these countries are characterized by the highest life expectancy spreads to the EU average (e.g., the Baltic Countries: Lithuania and Latvia, but also the latest EU State Members: Bulgaria and Romania). On the opposite side are the rich countries, where values are above the European average.

Economic disparities between EU countries are also reflected in health, through the financing of health systems. Also, funding mechanisms are different from one country to another, especially by specific social protection systems. An indicator that includes all sources of financing health care, developed the methodology of the System of Health Accounts - EUROSTAT / OECD / WHO, is the total health care spending established by aggregating the national expenditure from all public or private funding sources (governmental budgets, the budgets of health insurance funds, health expenditure of private non-profit organizations, and household expenditure for health care). Among EU State Members there are great differences in the level of health care costs, coupled with economic development. For example, in 2008, total health care expenditure, per capita, have a value of more than 16 times higher in Luxembourg than in Bulgaria. Also, significant variations in spending on health care per capita, there are between three blocks of countries, based grouping by the time their integration into European structures. Most of financial resources are allocated to health care by the older EU State Members. Also, we can see between them significant amounts of health care expenditure in the Nordic Countries (Denmark, Sweden, Netherlands), characterized by strong social protection systems, including health protection.

In Romania, the financing of the health system continues to be used in an inappropriate and inefficient. Despite an increase in total health expenditure during the last decade, the financing of the health system in Romania remains low in a European context, especially taking into account the long period of chronic underfunding and lack of investment in health.

Conclusions

Over the last 50 years, there have been impressive social economic and health improvements in this country. People from every class and region are healthier and living longer than ever before. Unfortunately, not everyone is able to share the benefits of these improvements. It is essential that everyone is empowered and encouraged to do so.

Health inequalities are unacceptable. They start early in life and persist not only into old age but subsequent generations. Tackling health inequalities is a top priority for this Government, and it is focused on narrowing the health gap between disadvantaged groups, communities and the rest of the country, and on improving health overall.

Since the twenty-first century, inequality in health has become a constant concern of the social policies of the European community. Empirical studies show that the incidence and prevalence of most diseases is higher in poorer countries, but also in developed countries among people with low education and / or low income, their life expectancy is significantly less. Concerns about reducing inequalities between different socio-economic groups have led to the development of various methods of measurement. In terms of measuring inequality in health, the major problem is to choose the most relevant indicators to reflect the differences between two or more population groups.

The empirical analysis conducted in this study reflects the fact that there are differences between EU State Members in all three directions. In Romania, life expectancy, although is growing, is one of the lowest values in the European Union. Indicator value is the most influenced by infant mortality that is still very high, due to weak and under funded national health system.

Concluding remarks: inequalities are pervasive throughout the world. They are apparent in all developed countries, including ones with highly developed welfare systems such as Norway and Netherlands. Health inequalities can be found in many aspects of health; for example, poor people not only live less long than rich, but also have more years of poor health. Access to health is also uneven.

THE APPLICATION OF OPTIMUM CURRENCY AREA CRITERIA TO EUROPEAN MONETARY UNION

CRISTIAN SOCOL[*]
MARIUS-CORNELIU MARINAŞ[**]
AURA-GABRIELA SOCOL[***]

Abstract
Debt crisis in several Member States of the euro area has reopened discussions regarding the sustainability of European Monetary Union. Adoption of the single currency has proven to be more costly for the economies which are structurally divergent from the core euro area economies (Germany, France, Italy). In this study I analyze the opportunity of a country to be part of the European Monetary Union on the basis of optimum currency area criteria. According to them, the euro area is characterized by an increase in trade and financial integration between member States, by emphasizing differences in competitiveness and lack of automatic fiscal transfers. If monetary union will not be completed by a fiscal union, the European monetary construction will be one vulnerable and benefits of joining to this will decrease.

Keywords*: euro area; monetary integration; fixed exchange rate; trade integration; fiscal transfers*

Introduction

The objective of this study is to analyze the sustainability of European Monetary Union with specific criteria of the optimum currency area theory. At first glance, this theory has played a secondary role when it took the decision of the European monetary integration. The experience of first exchange rate mechanism showed that maintaining fixed exchange rates between trading partners is not the best option in terms of high capital mobility. Therefore, creating a monetary union was a solution to reduce currency volatility risks. However, the theory of optimum currency areas is extremely important now, because it describes accurately the risks of being part of a monetary union and the conditions for its sustainability. According to this theory, the existence of a monetary union in the context of the absence of a fiscal union and political union, as in the case euro area, will lead to the persistence of asymmetric shocks between Member States and some of them might decide to return to its own currency. Probably it would have been the scenario for Greece and Ireland, if these countries would have not been supported through the financial mechanism established within the euro area. Its role was to complete European monetary construction in the context described by the theory of optimum currency area.

The analysis is structured in two parts in which we will provide answers to two specific questions to the topic analyzed. The first question relates to the specific criteria of an optimum currency area, which explain the risks caused by adoption of a single currency. As an element of originality, we present these criteria according to the stages of the theory of optimum currency areas in the economic literature. Thus, in the seventh decade, Mundell, McKinnon and Kenen believed that labor mobility, trade openness and export diversification were the main criteria for the analysis the costs and benefits of common currency. Over the past fifteen years, has been developed the theory of endogenous optimum currency area and were made analysis related to correlations between economic shocks and business cycles of euro area member states. Once identified these criteria, we made their application for European monetary union, to answer the question whether the euro area is

[***] Lecturer at Department of Economics from Academy of Economic Studies, Bucharest; (email: auragabriela.socol@gmail.com.

an optimal currency area. This research allowed us to identify sufficient arguments for the euro area is not an optimal monetary union, in agreement with the theory analyzed in this project. Most studies consider that EMU is too heterogeneous to be characterized an optimal area from monetary point of view – labour flexibility is low, there is not a fiscal discipline at European level, not working the automatic fiscal transfers between countries and the common monetary policy has emphasized the divergence of the peripheral economies. This conclusion must be tempered by launching of the common currency, because increasing trade and financial linkages between countries have contributed to more symmetry of shocks. Thus, according to the approach of endogenous optimal currency area, the economic divergences between countries of euro area will diminish over time. The monetary integration process will boost trade, especially intra-industry trade, which will generate an increase in the degree of synchronization of business cycles. Thus, the sustainability of a monetary union can grow despite the existence of significant divergences between the levels of development and between economic and social systems.

What are the criteria of an optimum currency area (OCA)?

The first approaches of the OCA focused on the choice of exchange rate type, highlighting the economic adjustment mechanisms in the context of shocks induced by economic integration. According to Mundell (1961), increasing the mobility of production factors in a group of countries requires the use of a single currency by them. All other criteria of an OCA arose from the need to explain the costs and benefits associated with the decision to adopt a common currency. If the first researchers believed that a common monetary area should not include extremely heterogeneous economies, recently, other researchers claimed that there are not very important initial conditions – adoption of the same currency will induce an increase of trade and financial exchanges, enhancing benefits and for the most divergent countries.

The main researchers of the optimum currency area criteria are Mundell (1961), (McKinnon, 1963), (Kenen, 1969), Corden (1972), Mundell (1973), Krugman (1993), Frenkel şi Rose (1997), de Grauwe (2005). The optimum currency criteria include: *the mobility of production factors, price and wage flexibility, economic openness, diversification of production and consumption, similarities between inflation rates, fiscal integration, political integration, the correlation of business cycles.*

- *Mobility of production factors*. The choice of this criterion of analysis has been influenced by neo-classical perspective on the effects of economic integration. If there is a perfect mobility of capital and labour, then certain shocks may be reversed immediately. According to Robert Mundell's theory, the problem of asymmetric shocks can be solved if there is a high mobility of production factors between member countries of the monetary union. In general, countries are quite susceptible to such shocks, and their existence compromises the stability of the exchange rate between them. But, a higher mobility of labour and capital factors facilitates such adjustment process, reducing the need for an own exchange rate.
- *Wage and price flexibility*. According to this criterion, prices in the economy (including wages) are flexible, so that the economy will adjust automatically, no need for government intervention. Thus, when the economy is in recession, reducing incomes and rising unemployment will lead to lower prices of production factors and reducing production costs, inducing increase aggregate supply and return the economy to its potential. Therefore, if nominal wages and prices are flexible within an optimal currency area, the manifestation of a shock will not generate a persistent unemployment rate. Their flexibility will reduce the need of flexible exchange rates.
- *The degree of economic openness and country-size*. In 1963 year, Robert McKinnon proposed another important criterion in choosing the exchange rate. He was referring to the economic openness and country size, as factors that facilitate integration in a monetary union. He argues that in open economies, the gain of competitiveness achieved by currency devaluation is reduced, because the price of imported inputs and the final goods will increase immediately. A higher degree of

openness of the economy undermines the real exchange rate changes and increases the benefits of a single currency. Thus, the higher the degree of openness of the economy, then more economic agents will benefits from exchange stability.

• *Diversification of production and consumption.* Peter Kenen (1969) showed that the diversification of production and consumption can also be an important feature of optimal currency areas. Countries whose exports are diversified and have the same structure of production form an optimum currency area. In this situation, there are few risks of asymmetric shocks occur, if indeed occur, would be reduced in size. Although the economy has a diversified structure of production and of exports, however there is the risk of symmetric shocks within the monetary union if its economic structure is divergent from that of advanced economies in that area.

• *Divergence between inflation rates.* Differences in economic policies promoted and different inflation preferences of the countries forming a monetary union affect the terms of the exchange and require the nominal exchange rate adjustments. Substantial differences between the rates of inflation may cause external imbalances. Fleming (1971) has shown that similar rates of inflation ensure stabilization of trade, which sustain the current account balance and reduces the role of the exchange rate. A potential cost of introducing a single currency is determined by the fact that countries may have different preferences for inflation - some countries have a stronger aversion to inflation than others.

• *Fiscal integration.* A monetary union requires the existence of a supranational authority that can make transfers to areas affected by asymmetric shocks. This would eliminate the need for flexible exchange rates. Countries that have a supranational fiscal transfer authority may redistribute funds to a partner affected by asymmetric shocks. This property requires however a high degree of political integration and willingness to accept risk sharing between the states involved. A component of this property can be considered fiscal stability introduced by the Maastricht criteria and strengthened by the Stability and Growth Pact.

• *Financial market integration.* This criterion can be considered a variant of "capital mobility". If financial markets have a high level of integration, then, removing restrictions on the movement of capital, resolve the differences between interest rates and exchange rate fluctuations. Therefore, countries may adopt a common currency. Financial integration allows temporary disruption depreciation of the financial flows, for example by raising loans from surplus areas.

• *Political integration.* This criterion is seen by some economists as being the most important condition for the adoption of a single currency, the history of monetary unions showing that they were preceded by political Union. The success of Monetary Union is dependent on the compatibility preferences for growth, employment and price stability, as well as the ability to achieve compromise between those objectives. In these circumstances where there is political consensus for common goals of economic policy, Monetary Union would suffer. In circumstances where there is not political consensus for common goals of economic policy, Monetary Union will not be a sustainable construction.

• *Correlation between shocks and convergence cycles.* Under a common monetary policy, member countries can only use fiscal policy instruments. Thus, the asymmetry of shocks and business cycles divergences constitute the greatest threats of optimality of currency area. With asymmetric shocks, there must be other mechanisms of adjustment, like labour mobility, fiscal centralization or fiscal transfers to the countries affected by recession. Countries that are exposed to symmetric shocks tend to have more synchronized business cycles and therefore will promote similar economic policies. Not only asymmetric shocks generate costs of the monetary integration. If monetary union member countries must respond to symmetric shocks, the costs may result from the different ways they respond to these shocks.

Why euro area is not an optimal currency area?

Even if the OCA properties have not been taken into account when EMU was achieved, yet they are used when considering the potential manifestation of asymmetric shocks and their capacity of adjustment. However, if there is less progress on the OCA, then the costs of adopting a common currency will be higher. Economic researchers have found sufficient reasons for the euro area is not an optimal monetary union, in agreement with the theory analyzed in this project. Among member countries of the Economic and Monetary Union (EMU) there are sufficient divergences generated by different structural characteristics, by the different national policies promoted or ineffective internal economic mechanisms of shocks adjustment. Also, each rise in the euro area members increases the macroeconomic divergences in monetary union, which negatively influences the development of new entrants. In these circumstances, the most viable monetary area would be composed by economies with similar level of development, which have the same preferences and which are sufficiently interconnected financial and commercial. Although adoption a common currency is a risky option for some economies (eg Romania), however they hope to be validate the endogenous properties of the optimum currency area. A part of the criteria of an optimum currency areas support the sustainability of the euro area, while others deny. Within this study we made a summary of the five reasons why the euro area is not an optimal currency area.

Reason 1.Trading links between the Member States have increased (positive aspect), but persist divergences between commercial structures

The degree of economic integration between the euro area countries has increased from 52% during 1988-1996 years to 63% during 1997-2004 years. Joining to EMU has increased the degree of economic integration, while the share of inter-industry trade has declined. In the context of increasing share of the intra-industry trade, convergence of business cycles in the euro area has increased. Under these conditions, a shock that will affect one economy is transmitted symmetrically toward each other. However, the shares of the intra-industry trade in total trade are very dispersed across countries. Thus, the core of euro area has recorded more than 75% share of intra-industry trade and in addition a high degree of diversification of production (will be affected, therefore, less asymmetric shocks). Comparing the differences between the structures of bilateral trade in the euro area, it was noted that Germany and France had the lowest value of the divergence between trade structures (21%), while Germany and Greece are characterized by the highest divergence (95%). This is because Greece has the largest share of exports of food and beverages, while the proportion of machinery and transport equipment is the lowest. Moreover, the economy recorded six of the highest values of bilateral trade specialization, so that is the most divergent country with the euro area.

Reason 2. The adoption of the euro currency has generated increasing correlation between business cycles (positive aspect), but persist divergences between core and periphery

Joining to the euro area has led to increasing of trade relations, which positively influenced the convergence of business cycles. The adoption of a common currency has a positive effect on intra-industry trade, even if economic structures are not converging. Frankel and Rose (1998) estimated a positive influence of trade intensity on convergence of business cycles, so that the euro will lead to an increase in trade relations, which in turn will induce a greater synchronization of business cycles. Fidrmuc (2004) showed that the relationship described by the two economists is conditioned by the development of the intra-industry trade. It also predicted the existence of close links between Germany and new EU member states on intra-industry trade, which can reduce costs of common currency adoption. Artis and Zang (2001) have studied the properties of the optimum currency area for the euro area, according to criteria that influence the degree of synchronization of business cycles: volatility of real exchange rate, convergence of interest rates, degree of openness, the convergence of inflation rates and the flexibility of the labour market. According to estimates, France, Austria, Belgium and Netherlands are the economies that have the highest convergence

business cycles with Germany, while the northern and southern economies have registered the lower correlations. The difference between these groups of countries is given by the degree of flexibility of the labour market. Thus, the Nordic countries have a more flexible labour market, and it can mitigate the effect of asymmetric shocks, while southern economies cannot achieve an adjustment based on the functioning of the labour market.

Reason 3. The labor market is not flexible, what lead to a limited adjustment of asymmetric shocks

In the first studies on optimum currency area, the labour market flexibility was analyzed in particular in the light of the degree of labour mobility. According to this criterion, the EU is characterized by a reduced integration of national labor markets, given that less than 1.5% of the population had changed residence. In addition, migration process was not the answer to economic shocks (such as Mundell's theory), but was motivated by other factors. Therefore, an increase in unemployment in a particular region/country tends to become persistent, in the absence of interregional migration. Within the EU there is not only a low mobility of workers between countries but within them, at regional level. Thus, interregional mobility is lower in southern Europe compared with central and northern countries. This situation contradicts the new economic geography approaches, according to which the existence of high regional disparities involve migration of a large part of the workforce to the developed regions. On the contrary, according to European reality, economies with lower domestic regional inequality (such as northern countries) are characterized by high mobility of the population.

Differences in the labor market institutions within the euro area are a source of asymmetric shocks. Studies confirm the existence of a very low speed of adjustment in real wages to certain economic shocks. A lower wage flexibility is reflected in a higher price rigidity in the economy. Even in times of recession there is a higher unemployment pressure, which affects the employment rather than wage levels. Therefore the costs of the firms will not lower costs than a smaller extent, and the recovery of those economies will be more difficult. Some causes refer to certain specific labor market institutions such as the degree of strictness of the labour legislation, the power of union or the existence of the minimum wage. If the differences between labour markets are more significant, then both wages and prices will move divergence within the euro area, even in the presence of symmetric shocks. Therefore, countries whose labor market institutions are different (either because they are too flexible compared to average or too rigid compared to it), will consider the decision to adopt a single currency is costly.

Reason 4. There is not fiscal transfers between countries

Even if the theory of optimum currency area has described in detail the main features that generate sustainability of a monetary union, though not all were given equal importance in the literature. For example, the criterion of the existence of a fiscal union has been neglected so long as certain internal vulnerabilities have been underestimated in the context of high rates of economic growth. While there is the EU Community budget, it has no role in stabilizing the European economies, because it has a different role than the federal budget, both in terms of collection of resources and their spending. The main resource of the community budget is equivalent to about 1% of GDP in each economy, followed by a national VAT rate applied to national revenues. Most funds are targeted for cohesion policy and Common Agricultural Policy, resulting that they not have a damping effect of asymmetric shocks in Europe.

Also, funds are allocated for seven year financial program, the allocation being influenced only by the development degree of the region/economy at a time and not by the business cycle phase in which there is. However, there may be situations where funds could support the recovery of regions faced with high unemployment or characterized by a low potential for growth, but in this case, the effects are conditioned by the absorption capacity. Studies show that financial resources are

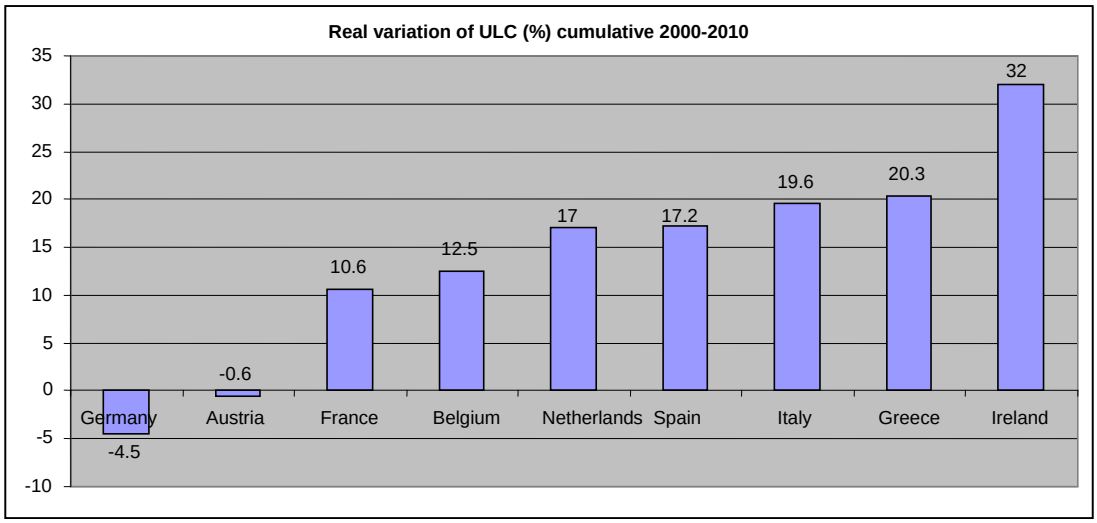
attracted to a greater extent by economic agents belonging to the more developed regions, because these regions have the ability to attract both investment and labour. All these arguments confirm the ineffectiveness of the current EU budget to mitigate the risks of participation in the euro area. Therefore, European monetary union has not one of the essential properties that ensure its sustainability, in Mundell's view. As long as economic growth (even unsustainable) allowed easy payment of state debts, the need for a fiscal union, including transfers between countries, has been neglected. Even if the monetary union was not an optimum currency area, however, it was thought that divergences between countries tend to be less important in context of increasing trade and financial integration (endogenous hypothesis).

Since the entry into the crisis of European economies the previous optimistic vision was denied, because enhancing the economic integration has generated a faster transmission of shocks within the euro area. Thus, the budgetary difficulties of some countries (Greece, Ireland) influencing through the financial system countries less vulnerable which generates a drop in confidence in the sustainability of the euro area. To avoid such a scenario, the European authorities consider that will be necessary of a fiscal Union in the euro area, which oversees more strictly economic policies of the member states. In conclusion, the membership decision is costly without a convergence and a strict regulation of national preferences in the field of taxation or of the labour market.

Reason 5. There are significant divergences of the competitiveness between countries

The member states unable to find internal tools to adjust the economic shocks will record a lower dynamic structural changes and loss of competitiveness in the monetary union. Therefore, the economic recession will extend and will be accompanied by increasing structural unemployment. Studies for the euro area economies have shown that it is composed of a heterogeneous group of economies, both in terms of development level, economic structure or the level of labor market flexibility. Empirical data suggest that the core EMU (Germany, France, Italy, Belgium, Netherlands) evolves symmetrically with the euro area economy and the periphery (Ireland, Spain, Greece) has a custom development in this area compared with the core countries.

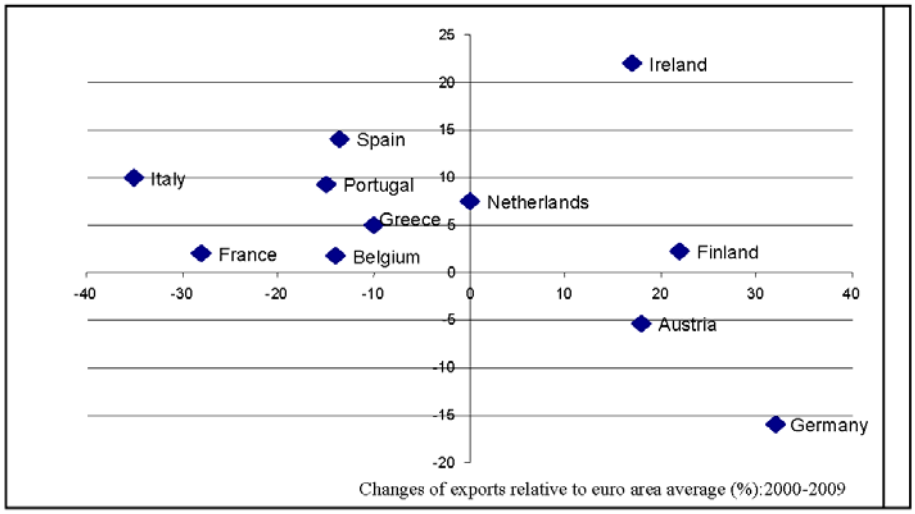
The inflation differential between the euro area countries generate divergences of external competitiveness and of real interest rate. Thus, the economies characterized by a higher inflation rate compared to euro area average recorded both a demand reduction caused by relative loss of competitiveness and an increase in demand due to lower real interest rate (Walter's critique). In the first decade of the euro area existence, countries which currently have problems with debt financing (Spain, Ireland, Greece and Portugal) showed a loss of competitiveness for some 20% compared with Germany. In other words, unit labor costs have increased by approximately 20% less in Germany than in the peripheral countries of the EU. In these circumstances necessary adjustment of this countries require a decrease of labor costs, in direction of regaining competitiveness. Spain and Ireland have recorded the largest reductions in competitiveness after 2003, in the context of the housing boom, while Germany had the largest improvement in competitiveness since 2000, as evidenced by decreasing aggregate real unit cost of labor (Figure 1).



Source of data: AMECO database, 2010

Figure 1. Competitiveness changes in nine of the euro area countries (2000-2010)

Differences in competitiveness are reflected in the divergent evolution of foreign trade. Thus, economies that have experienced a significant increase in unit labor costs relative to the euro area have generally a slower growth of exports compared with the euro area, the only exception being Ireland. The most significant increases of exports were recorded by Germany, Austria and Finland in the context in which the first two economies were characterized by relative gains in competitiveness. The consequence of this development was the increasing trade deficits of the southern countries in relation to Germany, given that before the creation of the euro area, there were close to equilibrium trade balances (figure 2). On the ordinate of the figure 2 is represented the unit labour costs changes relative to euro area between 2000 and 2009 years.



Source of data: AMECO database, 2010

Figure 2. Impactul modificării costului real al forței de muncă asupra exporturilor

The inflation differential in the euro area generates an asymmetric impact of the common monetary policy adopted by European Central Bank, because the real interest rates will be different. Thus, for economies whose real interest rates are lower than the reference value (such as Germany, the figure below), common monetary policy will be expansionary, while for others there is a restrictive effect of monetary policy. If in 2003 year the monetary policy was for all countries more expansionary relative to Germany, the situation was reversed in 2009. Thus, the southern countries were more expansionary relative to Germany until the outbreak of economic crisis, after which there was a tendency of restrictiveness induced by economic downturn.

Conclusions

In this study we demonstrated that European monetary union does not have a specific institutional arrangement of an optimum currency area. This is not a fiscal or political union, so it did not have an automatic mechanism to support the economies with debt financing problems. In accordance with the features of OCA, we believe that now would be considered costs and benefits of remaining within the monetary union. With the emergence of the financial problems in the euro area, participation at monetary union will be more expensive both for economies with financial difficulties (which must take further austerity budget) and for creditors, which must cover the losses of others. But, the decision to renounce the euro currency is costly both for current borrowers and for more stable economies in financial terms. In economies with high outstanding debt, leaving the euro area would lead to financial problems – the cost of borrowing will increase, and some capital will leave the economy – which can cause re-imposing restrictions on capital movements. Their financial difficulties will spread quickly on the financial system in the relatively stable economies, causing losses for them.

ANALYSIS OF ECONOMIC SHOCKS AFFECTING EURO AREA

MARIUS-CORNELIU MARINAŞ*

Abstract
The objective of this study is to explain the causes of economic shocks that are manifested in the euro area countries and to examine the possibilities of their adjustment in the context of a common monetary policy. The member countries of the European Monetary Union can not use its own exchange rate or monetary policy to neutralize the economic shocks. Therefore, they must find new ways to adjust the shocks such increase labor market flexibility and promoting reforms in the areas with significant structural rigidities. Common monetary policy also generates asymmetric shocks, as long as Member States are in different phases of the business cycle. In this study I have demonstrated that the ECB's monetary policy has favored Germany and has disadvantaged the countries confronted in present with problems of debt financing.

***Keywords**: asymmetric shocks; euro area; monetary policy; economic flexibility; optimum currency area.*

Introduction

Within this study I have analyzed the stance of economic shocks which affect the member countries of the euro area, as well as opportunities to neutralize them. This analysis offers a different perspective on the costs of adopting a common currency, avoiding technical analysis of its. For economies that form a monetary Union, the most important cost is giving up monetary policy and exchange rate for its own internal objectives. This cost can be illustrated from the situation of a country that is affected by a restrictive economic shock (for example, increasing internal production costs). If he had not adopted a common currency, the economy would be able to depreciate the currency in order to enhance competitiveness, and neutralization of shock would be achieved more quickly. Therefore, the economy will be affected by economic shocks which it will neutralize more difficult and the cost of adopting a single currency will be higher.

The study is structured in three parts in which I will provide answers to three specific to the topic addressed. The first one concerns the nature of economic shocks in a monetary Union. In light of this, I have identified the optimum solution to their neutralization. Thus, structural shocks (eg. the increases of food prices) can not be solved by policies to increase aggregate demand, but by policies to boost potential GDP and by structural reforms. The second question concerns the rather asymmetric economic shocks affecting the countries of a monetary union. Because these economies have divergent economic, financial and commercial structures, then even shocks symmetrical generates rather asymmetric effects. In this part I have adjusted the analysis of Robert Mundell (1961) to highlight solutions to neutralize the asymmetric shocks in a monetary union. In the economic literature it is considered that labor market flexibility is the most effective mechanism to neutralize the asymmetric shocks. For economies with rigid labor markets, the shocks will be persistent, while flexible economies will offset shocks faster. Therefore, differences regarding the flexibility of labor markets will deepen the asymmetric stance of economic shocks.

A third question concerns the effectiveness of the common monetary policy to counteract the economic shocks in the euro area. The monetary policy of the European Central Bank leads to an increase rather than a neutralization of the asymmetric shocks in the euro area. For example, if the ECB decides to decrease the interest rate in order to stimulate the economic activity in the euro area

* Lecturer, Ph.D., Department of Economics from Academy of Economic Studies, Bucharest; (email: marinasmarius@yahoo fr).

and the country A is in recession, while the country B is in economic expansion, then the common monetary policy will have divergent effects in countries A and B.

In conclusion, this study will explain why the asymmetry is the rule in the case of a monetary Union, while the symmetry of the shock is just random. This statement is consistent with research conducted by two of the economists who have received the Nobel Prize for Economics in recent years – Robert Mundell (1999) and Paul Krugman (2008). The starting point for the analyses pointing to the micro- and macroeconomic costs induced by the abandonment of the national currency is constituted by Mundell's work *A Theory of Optimum Currency Areas* (1961), the one who laid the basis of the theory defining the criteria which are specific to an optimum currency area. Mundell proposed a few factors which allow the adjustment of a few asymmetric shocks if there is no proper monetary policy, such as labour mobility and wage flexibility. Among Paul Krugman's works, I have studied those related to the issues of economic and monetary integration, namely *International Economics. Theory and Policy* (2005), *Integration, Specialization, and Adjustment* and *Lessons of Massachusetts for EMU* (1993). According to the author, the more the commercial and financial relationships between the economic agents which belong to two economies are stronger, the more their impulse to adopt a mutual currency is higher. Moreover, the existence of the same currency will still intensify the degree of economic integration between those economies. However, Krugman endorsed that the increase of the commercial relationships between two economies did not also generate symmetric shocks between them, as each economy will specialize in producing the goods which it can make more efficiently. This correlation is named *the specializing hypothesis* within the theory of the optimum currency area.

What is the nature of shocks in a monetary Union?

The most well-known shocks are those who exercise influence on the demand and aggregate supply. According to economic theory, there are some temporary demand shocks, because they influence only the inflation on the long-run. The supply shocks are permanent because influence both the inflation rate and the production the long-run, due to the potential impact on GDP. Demand and aggregate supply shocks may be the result of both internal policies promoted (for example, increasing or reducing the VAT rate) and of exogenous factors, such as external shocks, those caused by natural factors, etc. Briefly, economic shocks can be classified into four categories:

a) supply and demand shocks;
b) symmetric and asymmetric shocks;
c) *temporary and permanent* shocks;
d) *exogenous and policy-induced* shocks.

Aggregate demand shock causes a change in output and inflation in the same direction, which implies a compromise in the adoption of macroeconomic policies. The European Central Bank's mission is to ensure both price stability and to avoid the volatility of real variables. **Aggregate supply shocks** lead to conflicts between the policies pursued, especially when the ECB and national fiscal authorities have conflicting objectives. Poor flexibility in the adjustment of the European economy induces the persistence of these shocks, which extends the period of macroeconomic recession.

Using a common currency implies a higher difficulty to adjust the **asymmetric shocks**, rather than the **symmetrical shocks**, because the adjustment is more costly in terms of wage and costs. The asymmetric shocks cause different effects between countries or between sectors of activity. A *symmetric shock* can be defined as an economic disturbance that affects all member countries of monetary union simultaneously. An *asymmetric shock* consequently is defined as an economic disturbance that affects the member countries of monetary union to a different extent, e.g. only one country of a monetary union (country-specific shock), only one region of a country (regional shock) or only one industry within a union or country.

The distinction between **temporary and permanent shocks** refers to intensity of an economic shock. A *temporary shock* is an economic disturbance which will be reversed within a relatively short time. A *permanent shock*, by contrast, is a lasting disturbance. Thus, some shocks have only transitory effect - for example an unanticipated fall in aggregate demand - and other shocks which entail a permanent decline of competitiveness. Shocks of the first kind can be corrected by expansive fiscal and/or monetary policy. Shocks of the second kind can be corrected by major long-term restructuring of exporting sectors. The distinction is important because confusion between them can lead to action which aggravates rather than neutralizes the economic shocks. Treating shocks with a permanent effect as if they were temporary may only serve to entrench the underlying loss of competitiveness and make necessary reform more difficult.

The shocks which are caused by outside events over which the authorities in a member state of monetary union have no direct control are *exogenous*, and other shocks arising from *internal policies.* The exogenous shocks can be more difficult offset by macroeconomic policies in a monetary union. For example, the global food price increase will generate an increase in domestic inflation and the national authorities can not short term to alleviate the pressure of rising prices.

Why become asymmetric economic shocks?

Even if macroeconomic policies of countries participating in a monetary union coincides and shocks are exclusively symmetric, problems of asymmetry may arise as a result of country-specific differences in terms of economic, commercial, financial structures. This means that some country specific adjustment is needed on top of the common policy response. For instance, a rise in short-term interest rates may, for example, have differing effects in different areas because they are at different stages in an economic cycle. But they may also be due to long-term differences in financial structure: the relative importance of banking finance and the differences in monetary transmission mechanisms.

The main causes of asymmetric shocks transmission refers to:

- *the heterogeneousness of the national structures and financial systems* – the financial system interferes within the mechanism of spreading the monetary policy over the global demand (the channel of the interest rate, of the credit, of the financial assets);
- *the heterogeneousness of the prices and salaries' reactions to an exogenous shock, which affects the national economy's competitiveness, if there is a centralization of the decisions regarding the salary negotiation*;
- *the evolution of the Euro/Dollar parity,* because the foreign trade of the European economies is not the same in the relationship with the Dollar area.

The asymmetry of the national economic variables within the Euro area, which can be explained, at the same time, by:

- ✓ the action of the national asymmetrical shocks;
- ✓ the national asymmetrical spreading of the symmetrical shocks;
- ✓ the symmetrical spreading of the monetary policy impulses within the Euro area (the asymmetrical shock).

In these circumstances, the euro area must create the mechanisms to effectively neutralize the consequences of asymmetric shocks. Many asymmetries can be suppressed if the EMU promote coordination of economic activities (by aligning the legislation). An example of shocks asymmetry manifestation offers Mundell (1961). In this study, I have adapted this example to situation in which Romania and the euro area forming a monetary union. I have assumed that an asymmetric shock lowers aggregate demand in Romania and increase aggregate demand in the euro area. A demand shift caused by a change in preferences from the goods produced by Romania to the goods produced by Euro area, will lower demand in Romania, raising unemployment and causing a trade imbalance; while inflation will increase in Euro area (see Figure 1).

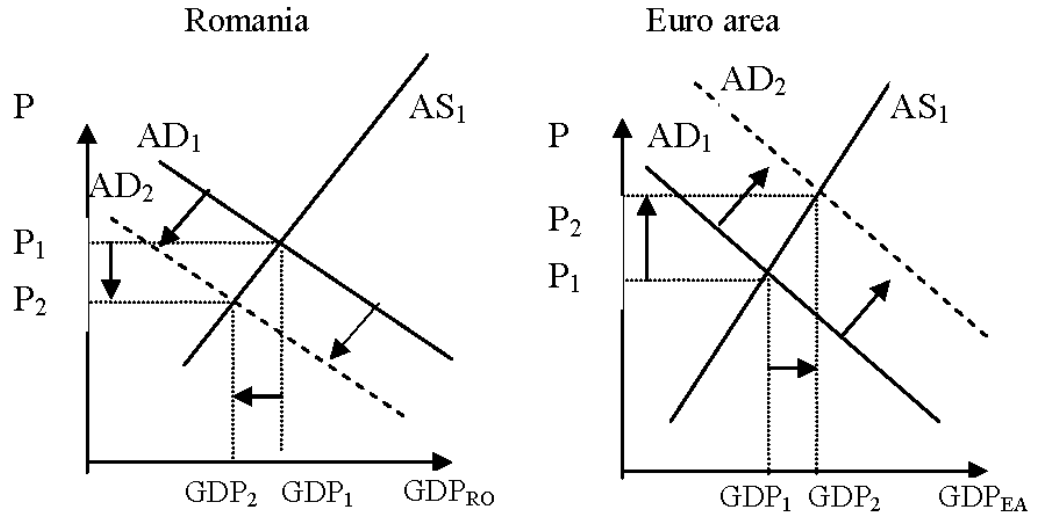

Figure 1.The asymmetric shocks in Romania and euro area

In such a situation, a common monetary policy cannot solve the problems of both economies at the same time. A restrictive common monetary policy might reduce inflation in Euro area, but worsen the unemployment problem in Romania. An expansionary common monetary policy would reduce unemployment in Romania, but worsen inflation in Euro area, because it was already in an inflationary gap. The disequilibrium caused by an asymmetric shock will therefore require a change in relative prices to restore the previous equilibrium. If the two regions have separate currencies, this can be achieved by altering the exchange rates: i.e. by a devaluation of currency in Romania vis à vis euro currency. Romania would then recover its competitive position through lower real wages and prices (though nominal wages and prices would remain constant). Aggregate demand would rise and unemployment fall in Romania.

If, however, the two economies have a common currency, production and employment in Romania must be restored through other means:

- a fall in *nominal* wages and prices;
- an upward shift in the aggregate supply curve of the home-produced good through, for example, labour migration out of the country.
- an expansionary fiscal policy.

Mundell´s analysis therefore suggested that:

- if the impact of shocks on the two countries was symmetric, fixed exchange rates, or a monetary union, was appropriate;
- if the impact of shocks was asymmetric, however, *high labour mobility* and/or *wage flexibility* (more particularly in a downward direction) were the main prerequisites.

Why common monetary policy has an asymmetric impact?

The main cost associated with the decision to join the euro area was a limited potential to neutralize the temporary shocks of the aggregate demand. The supply side shocks become permanent ones, requiring a higher flexibility of the economy for their neutralization. Applying policies to stimulate aggregate demand as cyclical policies may have perverse effects in a monetary union, leading to increased inflation. This causes an increase in relative prices, which leads to loss of

external competitiveness, the final impact on real output being a lower intensity. Thus, the manifestation of a positive demand shock may involve promoting a restrictive monetary policy to counteract inflationary pressures caused by increasing aggregate demand.

In order to outline the consequences of the symmetrical/asymmetrical shocks upon the ECB's monetary policy behavior, a simplified model will be used – aggregate demand and aggregate offer for *n* member countries of the monetary union. It is known that the inflation within the Euro area is controlled by ECB, and the offer shocks affect the national Phillips curves.

The equation of the Phillips curve is the following:

$U_i = U_i^* - a_i \bullet (\Pi_i - \Pi_i^e) + \varepsilon_i + u_i$ (1)

ε_i – symmetrical shock; u_i – asymmetrical shock

U_i represents the rate of unemployment in the country *i*

U_i^* represents the natural rate of unemployment in the country *i*

Π_i represents the effective inflation rate in the country *i*

Π_i^e represents the expected inflation rate in the country *i*

The model's hypotheses refer to:

- $\Pi_i = \Pi$ (the unique inflation rate within the Euro area); actually, there is an inflation heterogeneousness within the Euro area
- $\varepsilon_i = \varepsilon$ (the symmetrical shock has the same impact in all the countries member to the Euro area)
- $u_i \neq u_j$ if $i \neq j$ (the shock is specific to each country). The shocks u_i are purely asymmetrical if their related impact is null. They are asymmetrical if their impact differs from one country to another.
- a_i is the impact coefficient of the inflation upon the rate of unemployment. This coefficient sows, in the case of this model, the spreading of the monetary policy over the real economy.
- $a_i = a$ (there is no asymmetry in the spreading of the monetary policy)

The impact upon the related variables of the Euro area (E) is:

$$U_E = \sum_{i=1}^{n} \mu_i \bullet U_i \; ; \; U_E^* = \sum_{i=1}^{n} \mu_i \bullet U_i^* \; ; \; \Pi_E = \sum_{i=1}^{n} \mu_i \bullet \Pi_i = \Pi \quad (2)$$

μ_i represents the share of the *i* country's GDP in the Euro area's GDP.

The linearity supposed by the Phillips curve allows the outlining of an aggregate relationship in the Euro area, which has the following form:

$$U_E = U_E^* - a \bullet (\Pi - \Pi^e) + \varepsilon + \sum_{i=1}^{n} \mu_i \bullet u_i \quad (3)$$

The conclusions of the previously presented model are as it follows:

- the impact of the symmetrical shocks is outlined at the level of the aggregate relationships within the Euro area;
- the impact of the purely asymmetrical shocks is not caught;
- the bigger the asymmetrical (specific) shocks, the stronger their impact, if that economy's share in the Euro area is high (the case of Germany);
- Euro area's monetary policy does not react upon the purely asymmetrical shocks, but only upon the symmetrical shocks.

The structural harmonization policies, as well as the convergence determined by the introduction of the Euro, should result in lowering the heterogeneousness within the Euro area.

This analysis allows the offering of a possible solution concerning the development of a common monetary policy under the terms of the asymmetrical evolutions for the Euro area economies:

- if ECB is only concerned for the related macro-economic variables within the whole Euro area, then there should not be reactions depending on the disparities between the member countries, these disparities generating asymmetrical shocks;
- if the impact of the promoted monetary policy varies from one country to another and if ECB is concerned for the inflation rate in a certain country, then there must be reactions to the economic evolutions in the country where the monetary policy has the greatest impact;
- for ECB there is a dilemma between taking into account the particularities of each economy within the Euro area and the macro-economic efficiency of the monetary policy within the entire area;
- the dilemma can be solved if dealing with shocks' asymmetry will be in the charge of budgetary policy;
- *the efficiency of the monetary policy in this field* will be the more reduced so as the spreading of the monetary policy interferes with the asymmetrical shocks; the solution consists in integrating the asymmetry of spreading the monetary policy in its development;
- within the Euro area, there must be created the mechanisms which allow the efficient management of some asymmetrical shocks' consequences; several asymmetries can be eliminated if, at the EMU's level, there will be promoted a coordination of the economic activities(by adapting the laws).

At present, the problem of asymmetry does not seem to be directly approached within the decisional process of the European monetary policy, the ECB representatives mentioning that *the monetary policy is conducted by taking into account the situation within the whole Euro area.* Under these terms, it is necessary to promote some budgetary policies which could provide the neutralization of the asymmetrical shocks. Until 2005, The Stability and Growth Pact (SGP) has characterized by rigidity, because the situation of the public finances was not interpreted according to the macro-economic evolution on its whole. Thus, certain negative shocks on the side of the aggregate demand could not have been lowered through an expansionary budgetary policy because it could have generated the exceeding of the 3% target for the budget deficit (according to SGP).

To highlight the asymmetric impact of monetary policy promoted by the European Central Bank, I have analyzed the existing macroeconomic divergences within the monetary union. As these are more significant, the common monetary policy asymmetry is more pronounced. I have measured the asymmetry of macroeconomic variables with dispersion weighted by contribution of each country to obtain the euro area GDP.

$$\sigma_x = \sqrt{\sum_{i=1}^{n} (X_i - X_m)^2 \cdot GDP_i} \qquad (4)$$

Where,

X_i – value of the macroeconomic variable X for countries *i*, member of the euro area

X_m – the average value of the variable X;

GDP_i – share of the country *i* in the euro area GDP.

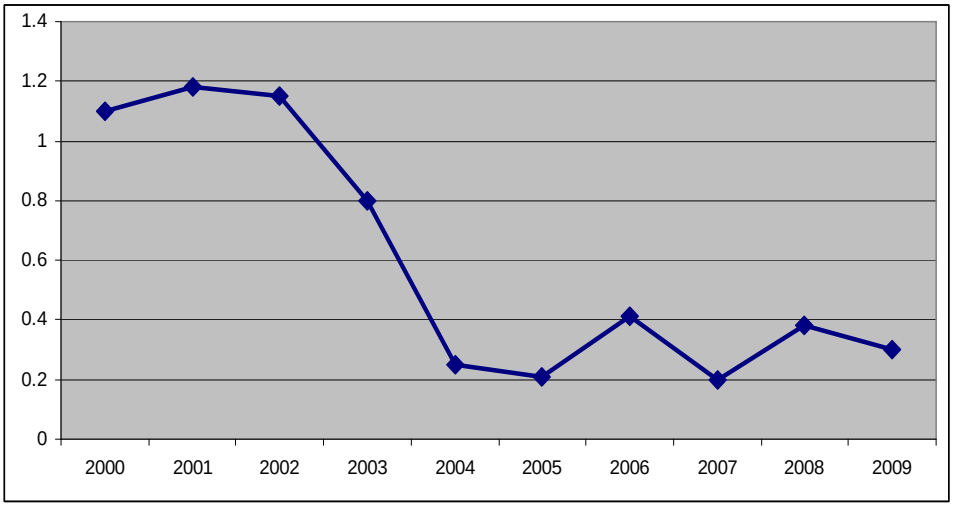
The dispersion of the inflation rates

The existence of the same currency will not cancel the differences between national inflation rates. Mainly, the evolution of the internal costs represents the most important factor of the differences in inflation in the euro area. Another important factor is the productivity differential between regions and sectors of a Monetary Union. One can distinguish two types of factors that may contribute to increased dispersion of inflation in the euro zone - factors related to convergence and European integration and the factors related to the implementation of fiscal policies, structural reforms and national wage. From the viewpoint of the first category of factors, implementing the single European market in the mid 90s and the introduction of the euro in 1999 have reduced the dispersion of price levels increased, especially for tradable goods.

Inflation differential was also generated by the convergence of price levels for tradable goods and services. This effect is often associated with recovery of growth differentials between tradable goods sector and the productivity of non-marketable goods or, more generally, with the convergence of living standards (GDP per capita) between economies. According to the Balassa-Samuelson effect, in countries with pronounced differences between sectors, wage growth and inflation would tend to further increase in tradable goods sector. In a monetary union, where the nominal exchange rate can not appreciate this kind of country would be characterized by a higher overall inflation in relative terms. However, empirical evidences of this effect are mixed.

At the same time, the inflation differential can be caused by differences of the economic structures at national level and by diversity of consumer preferences and exposure of the countries to the euro exchange rate fluctuations and commodity prices. In addition, fiscal policy may lead to inflation differential by inadequate using of the fiscal instruments. Structural policies and the earnings policies are applied at national and regional levels leading to an inflation factor asymmetrical, in the absence of implementation of the single market.

In the figure below I have presented the evolution of the dispersion of inflation rates in the euro area, expressed in percentage points. Between 2000 and 2009 years, the inflation rate has reduced in all euro area countries, except for Ireland and the Netherlands. Therefore, there as been a reduction in the inflation rates of the dispersion of 1.2 percentage points in 2001 0.2 in 2007. Therefore, there has been a reduction in the dispersion of inflation rates from 1.2 percentage points in 2001 to 0.2 percentage points in 2007.

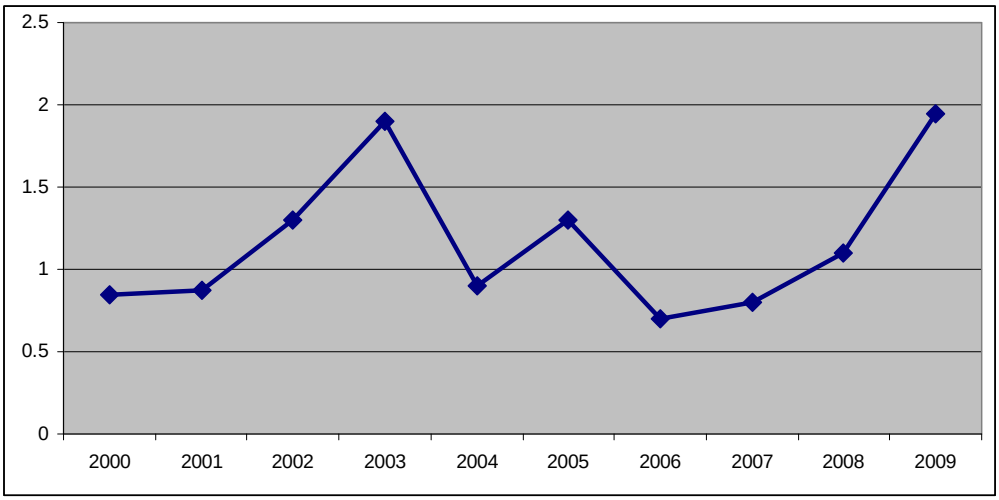


B Source: Eurostat 2010

Figure 2.Dispersion of inflation rate in the euro area

Dispersion of the economic growth rates

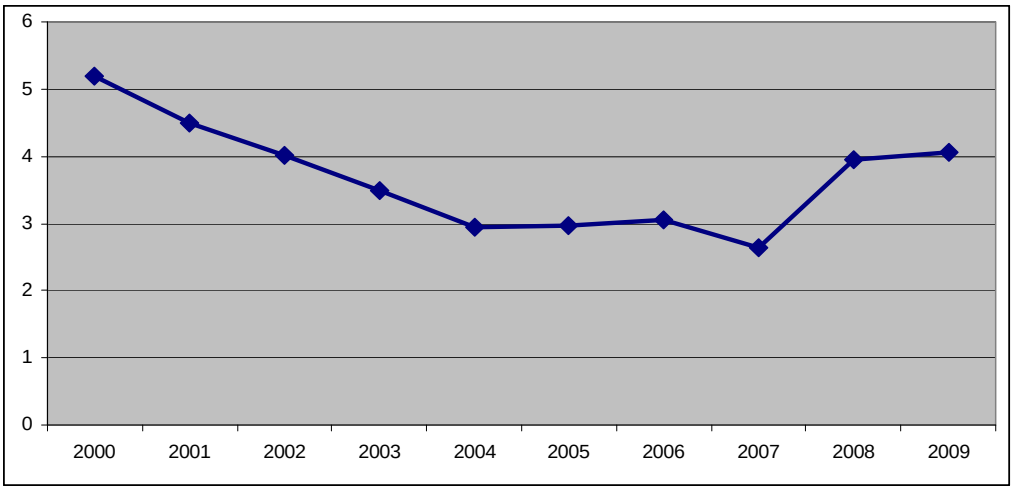
Since the business cycles of euro area countries are different, then there will be significant differences between growth rates and their dispersion will grow. The main causes of differing rates of growth are structural differences between the policies promoted in the euro area, the various stages of development in which they are and macroeconomic shocks that affect them. The dispersion of growth rates increased immediately after the adoption of the euro to around 2 percentage points, then fell to 0.8 percentage points in 2007 (figure 3). It appears that the common monetary policy has generated more asymmetric shocks once there has been an increase in economic growth dispersion.



Source: Eurostat 2010
Figure 3.Dispersion of economic growth rate in the euro area

Dispersion of the unemployment rates

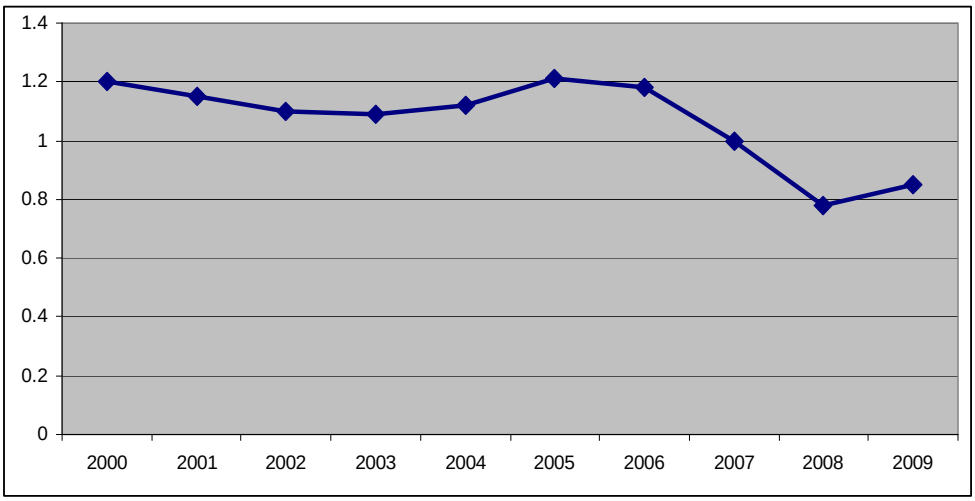
Unemployment rate constitutes one of the macroeconomic variables characterized by a high differential between member countries of the euro area. Unemployment rate dispersion decreased strongly, reaching over 5 percentage points in 2000, at least over 2.5 percentage points at the end of the year 2007 (Figure 4). Subsequently, in 2008 year, as a result of the global economic crisis occurred at the end of 2007, the unemployment rate dispersion has increased sharply, to about 4 percentage points. Differences in unemployment rates are caused by competitiveness gap between the developed countries of the euro area and the peripheral ones. For example, I have considered the case of two states in the euro area, which have been affected by the financial crisis – Germany and Spain. In 2009, Germany had a higher unemployment rate of 7.5% and a trade surplus of 175 billion dollar, while Spain had an unemployment rate of 18% and a trade deficit of 84 billion dollar. Spain could easily lower this deficit if would be able to depreciate national currency, which would have led to an increase in exports (Spanish products would be cheaper for foreign buyers). This increase in exports would bring more benefits to Spain, among which the most important were the decrease of unemployment. In the absence of own currency, member states of the euro area have not one of the most important tool of economic adjustment. Therefore the only possibility of Spain is to increase labour productivity through policies to boost supply aggregates. Because they generate effects in a longer period of time, then the adjustment of differences in competitiveness will be harder, and the dispersion of unemployment rates will increase.



Source: Eurostat 2010
Figure 4.Dispersion of unemployment rate in the euro area

Dispersion of the busgetary deficits

The creation of Monetary Union has generated an ascendant trend of dispersion budget deficit from 1.2% of GDP to approximately 0.8% of GDP in 2009 (figure 5). The higher is dispersion of budgetary deficits, national fiscal policies pursued by the monetary union countries are more different and the common monetary policy will have an asymmetric impact. The main reasons for the differences between budget deficits refers to fiscal policies stance promoted in the framework of the Stability and Growth Pact and to the shares of the spending and of the budgetary revenue. Most euro area member states have promoted restrictive fiscal policies until 2005 year in terms of restrictive rules of the Stability and Growth Pact. Along with its relaxation, fiscal policies became more expansionary and budgetary consolidation efforts in the years of economic expansion were lower.



Source: Eurostat 2010
Figure 5.Dispersion of budgetary deficit in the euro area

Conclusions

The economic shocks which affect the Euro area seem to be rather asymmetrical, because a certain structural divergence persists in the case of the member countries. It determines a lower synchronization of the business cycles, and this can negatively affect the shocks absorption through the ECB's monetary policy. Not even the fiscal policy has constituted an anti-cyclic policy, as a consequence of the strict rules required by the Stability and Growth Pact. Therefore, the macroeconomic policies that an economy uses to neutralize asymmetric shocks are no longer effective in a monetary union, so additional mechanisms must be found to adjust the shocks, like labor market flexibility. Without it, the costs of adopting the euro will increase and become asymmetric macroeconomic shocks and will acquire a permanent character. This conclusion can be developed in other research, whose objective is to determine the degree of labor market flexibility in the Romanian economy, based on indicators such as wage flexibility, the unit labor costs, changes in private investment and labour mobility.

AN ANALYSIS OF THE CHARACTERISTICS OF PUBLIC HEALTH SYSTEM AT REGIONAL LEVEL USING PANEL DATA

CATALINA LILIANA ANDREI[*]
BOGDAN OANCEA[**]
TUDOREL ANDREI[***]

Abstract
Reforming the public health system is a complex and long process, involving different categories of people. To accelerate the process of integration into the European Union, Romania is currently implementing strategies and programs aimed to increase the quality of public services. In the medical field a series of measures have been undertaken aimed at accelerating the decentralization process and optimize the activities of medical institutions. During the transition period a series of measures have been taken to decentralization and privatization of health services. However, currently we are witnessing a fragmentation of the system, which stressed the inequality in the distribution of medical personnel and reduced people's access to certain types of medical services. Please note that the number of doctors per capita in rural areas is only 20% of the urban area. Another major shortcoming of the system is linked to the financing system and its correlation with the strategies of decentralization. Frequently, decentralization has emerged as a way of placing the central tasks in the task of local government. Using panel data from developing regions we highlight a number of implications of the decentralization process.

Keywords: *panel data, regression models, public health care system, decentralization, regional analysis*

1. Introduction

Decentralization of public services is a process that takes place in all European countries, representing a means of increasing the efficiency of public services. In all cases, this process is based on the principle of subsidiarity. In Romania, along with political changes at the end of 1989, concrete actions have been taken to decentralize the public services. The process was difficult and long, considering the fact that during the communist period there was a hyper-centralized management of public services.

In the literature, there is a series of works that measure the impact of decentralization on the quality of health services offered to the population. Among the most recent studies we can mentioned in this respect the studies for Spain (Cantarero and Pascual, 2008, Cantarero, 2005) and Italy (Giannoni and Hitiris, 2002).

This paper will try to measure the effects of decentralization on the quality of medical services in Romania and compare results with those of the Spain, presented in (Cantarero and Pascual, 2008). The model presented here attempt to determine whether decentralization changed substantially in quality of life. The results should be viewed with reservation because the process of decentralization is still being implemented.

2. Characteristics of the public health system

In the following we present a number of features of public health system related to the evolution of the number of employees and the average wage. The indices that we've computed are aimed to analyze the evolution of the system in the last two election cycles, and a comparison of this system with other sectors. Table 1 presents some characteristics of the dynamics of health care

personnel and social welfare and other sectors. Tables 2 and 3 show the ratio of nominal wage in the health sector compared with other sectors.

Table 1. The changes in the number of personnel on electoral cycles

	Total change in absolute values (people)						
	Total	Agriculture	Industry	Construction	Commerce	Health	Public administration and defence
2000-2004	-154189	-40045	-131828	6385	29360	1164	6544
2004-2007	416482	-15267	-126308	83102	200937	37045	43492
	Average annual rate in each period (%)						
2000-2004	0.84	-7.68	-1.81	0.50	1.27	0.09	1.09
2004-2007	3.01	-5.03	-2.48	7.94	10.15	3.88	8.62

Data Source: own calculations based on data from INSSE, Bucharest, 2008

Table 2. Average nominal wages in the health system compared with other sectors of the economy

	2000	2001	2002	2003	2004	2005	2006	2007	2008
Total	0.83	0.87	0.84	0.85	0.87	0.91	0.95	0.91	0.95
Agriculture	1.99	1.95	1.87	2.02	1.90	2.37	2.66	2.79	2.32
Industry	0.79	0.84	0.83	0.85	0.87	0.92	1.00	0.97	0.99
Construction	0.95	1.00	0.98	0.97	0.99	1.08	1.16	1.08	1.12
Education	0.86	0.91	0.84	0.87	0.80	0.82	0.77	0.81	0.89
Public administration	0.58	0.63	0.62	0.60	0.62	0.58	0.52	0.47	0.60

Table 3. Average hourly earnings

	Total	Agriculture	Industry	Construction	Education	Public administration	Public health
Average hourly wage (lei/hour)	7.80	5.52	8.29	6.43	8.43	12.63	7.42
Ratio Health other sectors	1.05	0.74	1.12	0.87	1.14	1.70	1.00

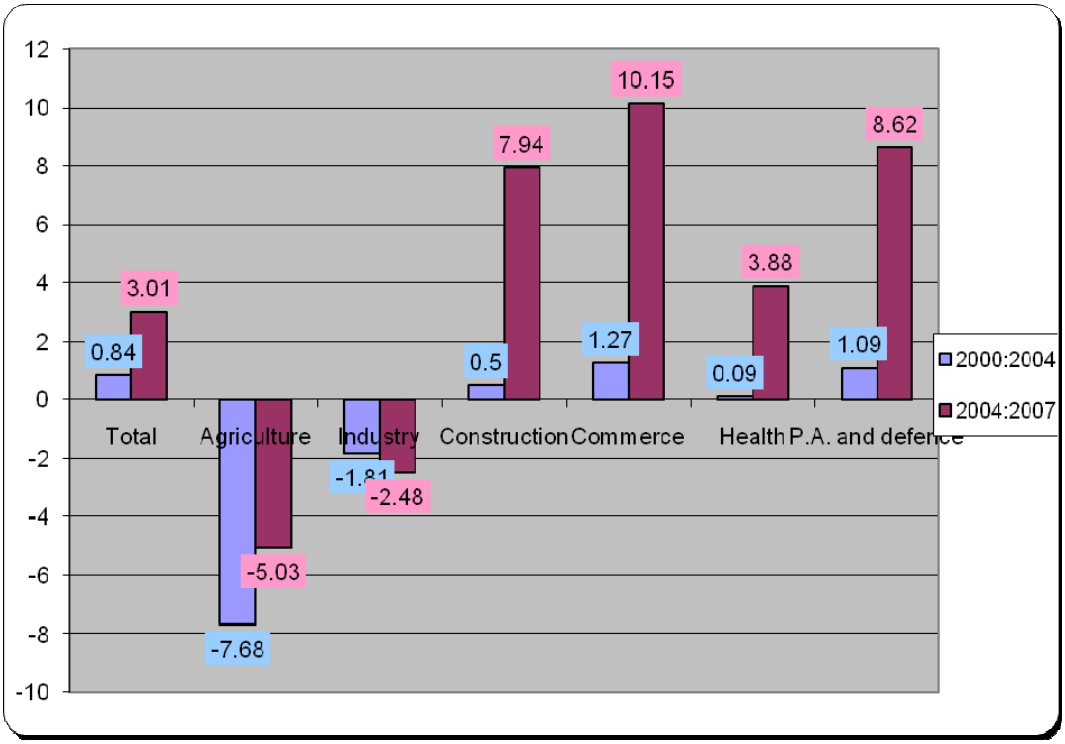

Figure 1. The annual average growth rhythms during the two election cycles

The above results show the following:

- The annual average growth in the health sector and social welfare in both periods was higher than the annual average growth in the economy.
- Personnel gains were significantly higher in public administration and defense in relation to that of health.
- Wages in this sector are below the national average salary and much lower than in administration and education. Thus, the average wage in this sector accounts for the year 2008 to only 60% of the average wage in the public administration.
- Average hourly earnings in the health system are at the level of the Average hourly earnings in the whole economy, but far below that of public administration and defense.
- The average real wages in the public health and social care system throughout the period 2000-2008 was lower than that of the public administration and defense (see Figure 2). The difference was reduced significantly in September 2008.

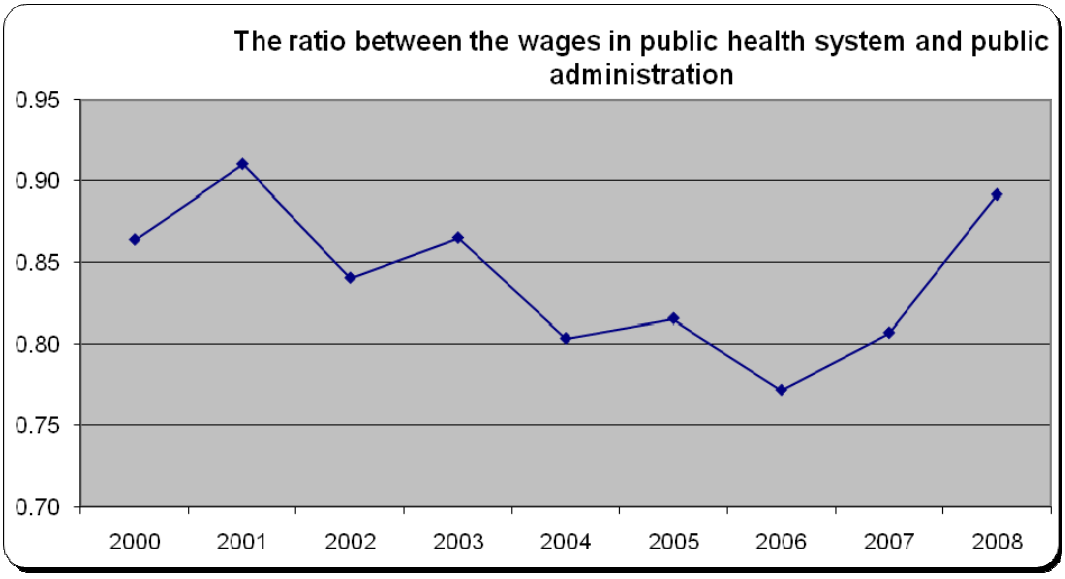

Figure 2. The evolution of ration between the real wages (1999 prices) in public health and social assistance and public administration in 2000-2004

3. Overview of the panel data models

Panel data are defined in relation to two dimensions. Thus, in this representation a variable is registered for each statistical unit in the population and for each time period from a given horizon. These types of data, take into account simultaneously both temporal dimension and the spatial dimension. There are a lot of examples of panel data that can be used in the analysis of economic and social regional level. In this paper we use panel data to highlight the effects of decentralization on some demographic characteristics that characterize the quality of life: average life expectancy and infant mortality.

We present a first example of using a panel data in economic analysis. In this paper we will estimate a model that will be used to analyze the impact of decentralization on public health system. We will use panel data.

This example is the assessment of investment issues in developing regions. In this approach, two aspects are important: defining the list of variables used in assessing the evolution of investment issues and their impact on regional economic and social development and defining the time horizon the series data are recorded. Thus, to highlight the factors that have allowed foreign investments in the developing regions in the last 20 years we mention the following categories of variables: the potential of the development area (number of enterprises with foreign capital participation per 100,000 inhabitants, the share of population employed in secondary sector, the share of population employed in agriculture, the share of population employed in services), foreign investment and fixed capital formation, labor market characteristics of the developing region (labor market pressures measured by each development region's unemployment rate, the efficient use of labor measured by the average labor productivity growth in the region, etc.) governmental decisions that are entered into the model by dummy variables which marks the emergence of a government act regulating the labor force (laws, retirement, layoff etc.), the demand at the development region level (the region's population share in total population, population density, etc.) living facilities in the developing region (the region's infrastructure, education system characteristics, the quality of the regional network of

hospitals, etc.) features of the privatization process in the region (the number of units privatized by region and by year and the number of privatizations with foreign capital, etc.).

For the variables used in the model there are data series with double dimension: regional and temporal. Data series are available at regional level in publications edited by the National Institute of Statistics.

Each series of panel data recorded at the regions level is defined by:

$$x_{it}, i = 1,...,8, t = 1,...,T$$

The data series used in the analysis are usually recorded in quarters or years. These are taken directly from official statistics and are obtained by performing statistical calculations.

If the variable Y is considered endogenous and exogenous variables are $X_1,...,X_p$, the panel data model is defined based on the relation below:

$$A_p(L)y_{it} = b_{0it} + C'_{it}X_{it} + \varepsilon_{it}, i = 1,...,R, t = 1,...,T \quad [1]$$

where $A_p(L) = 1 - a_{i1}L - ... - a_{ip}L^p$ is a polinomial of p degree, C_{it} is a column vector with a value equal to the number of exogenous variables, X_{it} is the vector of exogenous variables, and ε_{it} are the residual variables of the model that are realizations of white noises. In the above relationship R represents the number of statistical units and T the number of time units (years, quarters or months).

Relative to the introduction of the endogenous variables a panel data model can be:

1.static, in this case $A_p(L) = 1.$

2.dynamic, such as the model defined by relationship [1].

Usually, in the above introduced model it is considered that its parameters are constant over time. Under these conditions the static form of the model is defined via the linear relation:

$$y_{it} = b_{0i} + C'X_{it} + \varepsilon_{it}, i = 1,...,R, t = 1,...,T \quad [2]$$

To estimate the parameters we considered some particular cases of the above model. The data series used to estimate the parameters are of the form:

$$(y_{it}, x_{1it},..., x_{mit}, i = 1,..., R, t = 1,..., T).$$

4. The advantages of the panel data models

We present in the following several advantages of panel data models.

- **Panel data include a variety of information.**

Panel data series are composed of a large number of values. At the level of statistical regions there are recorded various statistical information. The main issues raised by the use of these data are related by the usage of the same methodology of calculation and elimination of slope or level breaks. For these reasons, for a great variation in the data series we encourage using only data from 1998. It should be noted that the series of data that will be used to estimate parameters of econometric models can be annual or quarterly.

- **Since panel data have a double index (individual and temporal), they allow to analyze the dynamics and homogeneity of the statistical units.**

At the same time we must take into account that the heterogeneity of the statistical units has two components: an observable one, which is evidenced in the regression model by C_{it} parameters corresponding to the explanatory variables in the model, and another unobservable one that is not controlled based on recorded factors.

For example, using panel data we can reveal the effects of decentralization of public health care system on the quality of life. In this analysis we must consider that the life level in a region is determined by two factors: observable factors through a series of data recorded in official statistics, and unobservable factors such as the cultural model of the population of each region, etc.

Depending on the assumptions made on unobservable heterogeneity we can define the following types of panel data models:

- The model with common constant which is defined on the basis of the following relationship:

$$y_{it} = a + c_1 x_{1it} + ... + c_m x_{mit} + \varepsilon_{it}, i = 1,..., R, t = 1,..., T \quad [3]$$

Basically this is a classic regression model estimated using data series defined without taking into account the sharing of statistical units into groups. In this case, each set of data includes a number of $R \cdot T$ values.

- Fixed effect model is defined via the linear application**:**

$$y_{it} = a + a_i + c_1 x_{1it} + ... + c_m x_{mit} + u_{it}, i = 1,..., R, t = 1,..., T \quad [4]$$

The term a_i is called the individual specific effect and highlights the endogenous characteristic value that is determined by those factors acting locally.

- The variable effect model is represented by linear application:

$$y_{it} = a + c_1 x_{1it} + ... + c_m x_{mit} + (v_i + u_{it}), i = 1,..., R, t = 1,..., T \quad [5]$$

where v_i is a random variable of zero mean and standard deviation σ_v.

• The form of the panel data allows the analysis of variance on three components: inter-individual factors, inter-temporal factors and intra-individual-temporal factors.

In the following table we consider the statistical data for a variable (e.g. the number of of employees in agriculture) in developing regions of Romania for the period 1998-2008.

Table 4. Panel data for variable *X*

	Region								Average on years
	1	2	3	4	5	6	7	8	
1998	x_{11}	x_{12}	x_{13}	x_{14}	x_{15}	x_{16}	x_{17}	x_{18}	$x_{1\bullet}$
	…	…	…	…	…	…	…	…	…
2008	x_{111}	x_{112}	x_{113}	x_{114}	x_{115}	x_{116}	x_{117}	x_{118}	$x_{11\bullet}$
Average on regions	$x_{\bullet 1}$	$x_{\bullet 2}$	$x_{\bullet 3}$	$x_{\bullet 4}$	$x_{\bullet 5}$	$x_{\bullet 6}$	$x_{\bullet 7}$	$x_{\bullet 8}$	$x_{\bullet\bullet}$

For data in the table above we calculated three types of average: in each region, on each year and at national level throughout the whole period. In these circumstances, the total dispersion of the data series is broken down into three components:

Total variance = inter-individual variance + variance inter-temporal + intra-individual-temporal variance

The variances occurring in the above relationship are calculated as follows:

- inter-individual variance is calculated on the basis of the averages at regional development level;

- inter-temporal variance is based on averages for each period of time;

- intra-individual-temporal variance is based on reporting each value in the series with respect to the the average level of the region, and annual average level of the average of all values (for all statistical units in the entire time horizon).

If the panel data are defined by $(x_{it}, i = 1,...,R, t = 1,...,T)$, then the variance decomposition is represented by the following relationship:

$$\sum_{i=1}^{R}\sum_{t=1}^{T}(x_{it} - \bar{x}_{\bullet\bullet})^2 = T\sum_{i=1}^{R}(\bar{x}_{i\bullet} - \bar{x}_{\bullet\bullet})^2 + R\sum_{t=1}^{T}(\bar{x}_{\bullet t} - \bar{x}_{\bullet\bullet})^2 + \sum_{i=1}^{R}\sum_{t=1}^{T}(x_{ij} - \bar{x}_{i\bullet} - \bar{x}_{\bullet t} + \bar{x}_{\bullet\bullet})^2 \quad [6]$$

- **In general, panel data consist of a large number of values.**

Under these conditions we witness a rise in the number of degrees of freedom and improved quality of tests used to estimate the parameters and to verify the statistical assumptions.

The main disadvantage of using panel data is related to the effects of the errors propagated by them. In this sense we must take into account Huber's comment which showed that 3% error in the panel data causes significant changes in the estimates. For this reason it must be have developed techniques to detect and eliminate possible aberrant values in the data series. In the event of a aberrant value in the data series, it is recommended either eliminating or correcting it by the interpolation operation.

Not a few times, from statistical data sources several statistical records are missing, but these can be approximated by applying the interpolation operator. In relation to lack of data from the panel data we can identify two categories of panel data: balanced data sets, if panel data are registered for all statistical units and for all time periods, and unbalanced data sets case in which on certain positions the appropriate values are not recorded.

5. Application

To estimate the impact of decentralization of public health, on some of the demographic indicators we used data sets recorded for the statistical indicators of the eight regions of economic development for the period 1998-2005.

To analyze the decentralization process in Romania, we define the following model:

$$\log(H_{it}) = a + b \cdot PIB\_R_{it} + c \cdot \log(M\_P_{it}) + d \cdot P\_P_{it} + \varepsilon_{it},\ i = \overline{1,8},\ t = \overline{1998,2005}$$

In this model we used the following variables: H_{it} a global indicator of performance used to characterize the public health system in a region, for a year. To assess this issue we appeal to the infant mortality rate, PIB_R per capita in the region, P_P the number of beds per 1,000 inhabitants and M_P the number of doctors per 1,000 inhabitants.

To estimate the parameters of the model we used statistics from the eight development regions of Romania. The data are annual and have been reported for the period 1998-2008.

Parameter estimation was done for the classical model, the fixed effect model and the variable effects model. For estimation we used the least squares method (OLS) and two stage least square method (Baltagi, 2008). The results are presented in Table 5.

For the model with fixed effects we test the null hypothesis according to which specific effects are negligible in the regions. In this case, we use a Fisher-type test. Statistical values calculated for the case in which the parameters are estimated by OLS and TSLS are higher than F values determined from the distribution table, which signals that the specific effects of the regions are significant. The results are obvious, if we consider that there are large disparities between the eight development regions in terms of economic and social development.

Table 5. Characteristics of the model with dependent variable $\log(RMI)$

	Clasic Model		Fixed effects		Random effects	
	LS	TSLS	LS	TSLS	LS	TSLS
C (coeficient) t-Statistic	0.7619 (1.84)	0.8310 (1.69)	1.7222 (3.46)	1.3773 (2.10)	1.0985 (2.61)	0.8768 (1.83)
Log(PIB_R) (coeficient) t-Statistic	-0.3424 (-5.47)	- 0.3314 (-4.34)	-0.3311 (-4.83)	- 0.3477 (-4.53)	-0.3118 (-4.98)	- 0.3554 (-4.80)
P_SSA (coeficient) t-Statistic	0.8620 (1.42)	0.5591 (0.86)	0.1015 (0.06)	2.6871 (0.78)	0.4989 (0.51)	- 0.0294 (-0.03)
log(M_P) (coeficient) t-Statistic	-0.1873 (-1.84)	- 0.2405 (-2,16)	-0.6558 (-4.06)	- 0.6895 (-3.85)	-0.2059 (-2.11)	- 0.1697 (-1.55)
P_P (coeficient) t-Statistic	-0.0050 (-0.31)	- 0.0054 (-0.30)	-0.0683 (-3.20)	- 0.0763 (-3.24)	-0.0169 (-1.11)	- 0.0184 (-1.16)
R-squared	0.8270	0.8248	0.9116	0.9070	0.6404	0.6357
F-statistic and Prob (F)	60.94 (0.0000)		41.24 (0.0000)		22.71 (0.0000)	
F-statistic (Clasic Model vs Fixed effects) and Prob (F)	6.56 (0.000)	6.06 (0.000)				
Hausman statistic and Prob (Hausman)			15.443 (0.000)	26.004 (0.000)		

The results presented in the above table shows that the infant mortality is negatively correlated with variables PIB_R, M_P and P_P and P_SSA variable has no significant influence on it. To test the orthogonality of random effect and explanatory variables we used a Hausman test (Baltaga, 2008). The values determined for both statistics, entitled to use fixed effects models to estimate the impact of decentralization on the quality of life in developing regions, to the detriment of the other two models.

6. Conclusions

The usage of the panel data has a number of advantages mainly related to the availability of data sets to estimate the parameters. But bear in mind that relatively small errors in the statistical data can determine significant errors in the estimated parameters.

The results from the above table show that the infant mortality rate is negatively correlated with the variable that characterizes the region's economic development, the number of beds and number of doctors per 1,000 inhabitants. Note that the regions specific factors have a significant influence on child mortality. The estimated model shows a lack of positive effects of decentralization on the outputs of public health.

The results should be viewed with reservation for the following reasons: to estimate parameters of data sets we used data series during 1998-2008 time period when the economy and the public health system had major changes from one period to another, the health reform is being implemented; in general the effects of decentralization process is difficult to see in a short period of time.

A more detailed analysis recommends consideration of other important statistical variables to characterize the public health system and the decentralization of public administration. It is recommended to introduce some variables in the model that takes into account the cultural and economic development in each region.

To define the analysis model one could use the life expectancy as a dependent variable (endogenous) instead of the child mortality. We believe that the chosen version in this paper is more appropriate because the infant mortality rate is a characteristic more sensitive to changes in public health care system in relation to average life expectancy.

CONCEPT OF SUSTAINABILITY – A LOGICAL APPROACH[1]

EMIL DINGA[*]
CORNEL IONESCU[**]
CAMELIA BĂLTĂREŢU[***]

Abstract
The paper aims to achieve a definition of the concept of sustainability and of sustainable system from a logical perspective. In this respect, it introduces and defines (through the sufficiency predicates) the concept of logically vivid system and, on this basis, are discussed a logical concept of sustainability, respectively of a sustainable system in general are discussed and built up. Sustainability is considered in light of identity preservation of the systems, as a static anchor, on one hand, and of the concept of automatic stabilizers as a dynamic anchor on the other side. Finally, the two sufficiency conditions for a logically vivid system be sustainable are identified: the presence of hyper-cycles, respectively the absence of positive feed-back.

Keywords*: sustainability, logically vivid system, automatic stabilizer, dissipativeness.*

JEL classification*: A10, O10*

Introduction

(1) What matter does the paper cover?

The paper aims at to treat the issue of system sustainability, from the point of view of logical features which could ensure on this sustainability. In this end, the paper re-visits the current definitions in the field, in order to get a more rigorous and consistent understanding of the main concept implied.

(2) Why is the studied matter important?

Generally, the current literature is working with the concept of system in a natural science view. The paper proposes a new and probable revolutionary concept, i.e. the logically vivid system. This concept is the only that can sustain in a theoretical way the crucial issue of the sustainability, because in a natural world we find not sustainability, but only durability. So, the importance of the study matter consists in a new conceptual foundation of the sustainability issue.

(3) How does the author intend to answer this matter?

The main method the authors intend to answer the matter of system sustainability is a logical one. This means identifying the sufficient and necessary predicates (attributes) that a system must verify so it be "declared" sustainable. This method is consolidated by an analysis concerning the three "C": completeness, consistency, and coherence.

(4) What is the relation between the paper and the already existent specialized literature?

Firstly, there are many misunderstandings concerning the concepts of logically vivid system, sustainability, evolution, etc.

Secondly, the concept of sustainability is defined in a "civil" way, that is un-appropriate for a scientific approach.

[1] The communication is an excerpt from the research project no. 821/2008 PNII - IDEI, „Mix of the adjustment policies in the light of the economic convergence of Romania with the European Union, financed by CNCSIS - UEFISCSU.

[***] Scientific researcher, Centre for Financial and Monetary Research „Victor Slăvescu", National Institute for Economic Research „Costin C. Kirițescu", Romanian Academy, (e-mail:cbaltaretu@yahoo.com).

Thirdly, the current literature treats the concept of sustainability in many particular cases, but very rare in an abstract consideration, so the mentioned concept cannot be used in general research.

Preliminaries

In order to discuss, in the most general manner, the problem of sustainability, we need to clarify first, which is the entity to which we refer when we are interested in sustainability. As it resulted from what we said before, sustainability is a definitory characteristic, but a characteristic of what? We will make some considerations in this matter:

a) reality presents itself, in the most general form, under the following „categories":

- numen: incognoscible essence, as the most appreciated philosophical system consider;
- phenomenon: form under which the numen appears to the knowing subject;
- process: manner of existence of the phenomenon (by process we understand, in the most common way, the variation of the phenomenon);
- system: manner of process systematization, at the level of the knowing subject.

Therefore, the knowing subject has access to its exterior reality (and interior, of course) through the system, because it must order, make intelligible what appears. It seems therefore that sustainability should be investigated in connection with the system. This is how we will proceed.

b) The system will be defined, in the most general way, as the logic sum of the following "ingredients":

- A multitude of elements, not necessarily homogenous, whose significance, for the knowing subject, doesn't require more analytical levels of examination;
- A multitude of relations, of any kind (substantial, energetic, informational, entropic) between the composing elements;
- A membrane, of whatever nature (physical, institutional, cognitive etc.) which separates the system from its environment;
- A multitude of relations between the composing elements and the exterior of the system (the accomplishment of these relations requires crossing the membrane).

Therefore, we can say that the sufficient predicates for the existence of a system are:

- A multitude[2] of *elements*[3] (discernible or not among them): $\mathbf{E}$;

- A *membrane* which includes the composing elements and which excludes everything else from the rest of the environment: $\mathbf{M}$

- A multitude of *connections between the composing elements*[4]: $\mathbf{C_I}$;

- A multitude of *connections between the system and the exterior environment*: $\mathbf{CO_O = X_S + Y_S}$, where X represents the connections which show inputs from the environment into the system, and Y represents the connections which show outputs from the system into the environment.

Therefore, the logic description of the actualization of a system is: $\mathbf{G_S = \{E, M, C_I, C_O\}}$. We consider that the sufficient predicates do not generate new necessary predicates; therefore, they coincide with the necessary predicates. Therefore, the logic description of a system is: $\mathbf{S \equiv G_S = \{E, M, C_I, C_C\}}$.

---

[2] In the meaning of the theory of multitudes.

[3] Logically, even just one element is enough to make this predicate exist. The predicate which refers to the connections between the elements of the system will be understood in this case as a multitude of auto-connections (it is not necessary to suppose that this element is, in turn, a system consisting of more than one element, because we would enter the trap of the argument with infinite regression).

[4] As said before, the multitude of connections also includes the-connections.

In order to get to the analysis of the artefacts, we want to bestow an additional qualification on the system, the qualification of logically vivid system. We consider that the following additional sufficient predicate may transform the system into a logically vivid system (SLV):

- *dissipativeness*: maintenance (or even decrease) of the entropy inside the membrane, at the cost of accelerating the entropy from the environment of the system[5]; we will note this sufficient predicate by **D**.

Therefore, the logic description of SLV actualization is: $G_{SLV} = \{S, D\}$.

The existence of a SLV generates, in our opinion, the following new necessary predicates:

- *auto-poietic capacity* (self-generating, self-organizing, self-reproducing); we note this new necessary predicate by **A**; the logic formula for the generation of this new necessary predicate is: $D \rightarrow A$;

- *non-linearity* (doesn't allow predictions[6], because predictions exclude novelty[7], rather only the decrease of the incertitude regarding the future[8]); we note this new necessary predicate by **N**; the logic formula for the generation of this new necessary predicate is: $D \rightarrow N$;

- *invariance of the total complexity*[9] (maintenance in a permanent invariant state,[10] of the logic sum between the inner complexity of the SLV and its external complexity – the external complexity is also called ecological complexity and it expresses the level of SLV metabolism with its environment); we note this new necessary predicate by **I**; the logic formula for the generation of this new necessary predicate is: $SLV \rightarrow I$.

Therefore, the logic description of a given SLV is: $SLV = \{G_{SLV}, A, N, I\}$.

Let us notice that the logic description of a SLV develops two particularly important characteristics:

• *Presence of the potential for identity preservation* (or for quality preservation). This means a specific capacity of the SLV to ensure the observer that it is the same SLV. Hence, some problems which require examination: 1) why doesn't this characteristic exist in the case of the systems too; 2) why isn't this characteristic implicit in the new necessary predicate named "invariance of the total

[5] Also see our study, *Dissipative systems and sustainability*, published in Theoretic and applied economy, no. 3/2008 (the ideas from the study have also been presented and debated within the Seminar of Methodology and Logics of the Economic Knowledge „Nicholas Georgescu-Roegen", in session no. 4/2007). The study also proposed a demonstration of Prigogine's principle of the minimum production of entropy, as well as a logic model of the entropic interaction.

[6] Predictions exclude novelty, being mere morphological combinations of the known elements.

[7] As we will subsequently see, novelty is associated to emergence, which is inconsistent with computability, with the deliberative planning.

[8] Although it is possible to argue against the independence of the three new necessary predicates (it seems that non-linearity might be regarded as a necessary consequence of the self-poietic capacity), we prefer to assume this possible logical non-rigorousness, with the purpose to highlight the crucial importance of the predicate of SLV non-linearity.

[9] Let us notice that the invariance of the total complexity is not a necessary predicate of a system in general. At the same time, there is no logic connection between the (relative) invariance of the set of identity parameters of a system and the invariance of the total complexity of that system.

[10] We cannot speak with full rightness about the character of continuity (therefore we will ignore this possible attribute of the invariance of the total complexity), as long as the hypothesis of the quantum nature of the macrocosmos is not accepted at the ontological level(although the quantum nature of the microcosmos is accepted at the ontological level and, furthermore, the principle of correspondence is introduced, which makes intelligible at the level of the macroscopic epistemic subject, the directly non-intelligible microscopic).

complexity" or in the new necessary predicate „auto-poietic capacity; 3) why isn't this characteristic just the fourth new necessary predicate.

(1) The sufficient predicates used to describe the actualization of a system don't allow any kind of conclusions regarding the evolution of the system. Therefore, no evaluations can be made whether the identity of the system is preserved or not. Hence, the conclusion that the problem of the identity can be raised only in connection with the logically vivid system, regarding the actualization of that logically vivid system (regarding only the predicates of sufficiency, not regarding the new necessary predicates). Indeed, the predicate of sufficiency named dissipativeness contains the suggestion of evolution, therefore it allows to discuss the matter of SLV identity;

(2) The new necessary predicate "invariance of the total complexity" only tells us that a relation of replaceability[11] exists between the variance of the inner complexity of a SLV and the variance of its external complexity. Therefore, if there are no limitations of this replaceability (the nature of these limitations is completely obscure for us, at this moment) we can say nothing, on the basis of this new necessary predicate, about the preservation or non-preservation of SLV identity. Therefore, we cannot accept the implicit character of this characteristic in the signification of the new necessary predicate "invariance of the total complexity". This characteristic is not implicit in the new necessary predicate "auto-poietic capacity" either, because the denotation of this predicate of self-generation or self-reparation doesn't ensure us on the perfect self-regeneration or self-reparation, also because of the new necessary predicate named "non-linearity". Therefore, we may witness the return of the SLV, through its auto-poietic capacity, to an initial or previous (generally speaking) capacity, but it is obvious that the failure of a perfect return, over a specific level, causes the loss of SLV identity;

(3) This is a more difficult question. Indeed, one might consider that we have a fourth new necessary predicate, "preservation of the identity", but in this case it would mean to stipulate that any SLV is invariant, that it can not evolve in any way (or, evolution, in the broadest meaning of the word, means alteration of identity). In order to avoid the absurd situation in which any SLV is, by definition (because the new necessary predicates enter, as sufficient predicates, in the logic definition of the concept) invariant, lacking evolution, static, we need to exclude this characteristic from the multitude of the new necessary predicates. Furthermore, such a new necessary predicate would be inconsistent with the new necessary predicate "invariance of the total complexity" which, as already shown, signifies SLV variance, on condition of the replaceability between the variance of the internal complexity and the variance of the external complexity.

It is necessary to develop further the concept of identity preservation because, on its basis, we will introduce the logical conditions of sustainability. As previously mentioned, we will discuss this concept exclusively in terms of quality, or logically; the aspects of quantification, observation/recoding or measurement are not of interest for us, for the time being.

The preservation of identity can be analysed from the perspective of the nature of this preservation. Thus, we may have the following types of identity preservation[12]:

---

[11] We draw attention on the following crucial aspect: the replaceability rate between the internal complexity and the external complexity is not necessarily 1 (it is obvious that it is negative), because of the new necessary predicate named "non-linearity". If this rate would be 1, it is furthermore possible to demonstrate that there is no global variation of entropy within the logic assembly "SLV-complementary environment", while we know from the second law of thermodynamics that, at the global level, there is a permanent increase of entropy. It would be interesting to study the existence of the continuous, or quantum (discrete) character of the replaceability rate between the two categories of complexity, because on the basis of these studies we might give a quantitative definition of SLV identity. For the time being, this research is beyond the scope of this study, hence we will make just some qualitative considerations.

[12] The first three classes of identity preservation originate in a genealogical perspective. Given the diversity of the classification criteria of the potential for identity preservation, the genealogical criterion seemed to be the most adequate, particularly since it is preferred in the field on nature science.

- *full identity preservation* (at individual level): it refers to the preservation of all necessary predicates of the SLV. This means that the necessary predicates $\mathbf{E}, \mathbf{M}, \mathbf{C_I}, \mathbf{C_O}$ are preserved[13];

✓ example: the system of banking saving, as individual of the system of saving

- *special identity preservation* (at species level): it refers to the preservation of the structural aspects of the analysed SLV. This means that the necessary predicates $\mathbf{E}, \mathbf{C_I}, \mathbf{C_O}$ are preserved;

✓ example: the system of banking saving, as individual of the system of using the available income;

- *general identity reservation* (at genus level): it refers to the preservation of SLV metabolism. This means that we have identity preservation in the necessary predicates $\mathbf{C_I}, \mathbf{C_O}$. The difference between the formal preservation of identity and the special preservation of identity is that the nature of SLV composing elements doesn't matter any more, rather the relations between them and between them and the environment;

✓ example: the system of using the available income as individual of the system of aggregate demand formation

- *formal identity preservation* (at the level of causality): it refers to the preservation of the generative mechanism of a SLV;

✓ example: preservation of the equation describing a specific process makes that process preserve its formal identity (that equation may represent the specific process, either graphically, or in other intelligible form which allow recognition).

• *Presence of the automatic stabilizers*. This characteristic is an immediate consequence of the auto-poietic capacity of the SLV (necessary predicate, as we have seen). The capacity of self-reparation, self-generation means the capacity to restore the initial conditions, after they have been possibly disturbed either by system functionality[14], or by its behaviour[15]. The restoration of the initial conditions signifies, theoretically, an action of negative feed-back. Therefore, this characteristic can very well be named "presence of negative feed-back". We prefer, nevertheless, to make reference to the automatic stabilizers because the negative feed-back has the connotation of purely natural process, while the automatic stabilizer al has the connotation of an artefact. In the case of the SLV which includes man/human society, almost all the mechanisms of negative feed-back are artefacts. It is obvious that similarly with the potential of identity preservation, this characteristic too, cannot be considered another necessary predicate. Indeed, if it would be a necessary predicate, it would be redundant with the necessary predicate of the auto-poietic capacity; therefore, the condition of independence of the multitude of necessary predicates would no longer be met.

1. Logic conditions of system sustainability

On the basis of what we have determined in the above paragraph, we propose to investigate the logic conditions of sustainability of a given system.

2.1 Logic concept of sustainability

From what we said so far, we obtained a definition of sustainability, at least for the economic systems. Nevertheless, we are interested in a more general definition, which to apply to any SLV, irrespective of its nature.

First, we will say that the distinction durability-sustainability has an "image" in the distinction „SLnV – SLV" (SLnV signifies logically non-vivid system). SLnV is a system in equilibrium or

[13] The attentive reader had already noticed that any sufficient predicate also is a necessary predicate, although not any necessary predicate is a sufficient predicate (for instance, the new necessary predicates are not sufficient predicates).

[14] According to the cybernetic theory, system functionality means the assembly of relations of any kind between the elements composing the system (within the membrane).

[15] According to the cybernetic theory, system behavior means the assembly of relations of any kind between the system and its environment (by crossing the membrane).

tends, irreversibly, towards a state of equilibrium[16]. The systems which are in equilibrium or which tend towards a state of equilibrium are characterised by durability. The durable systems are characterised exclusively by finality. On the other hand, SLV, the dissipative systems, are far from equilibrium or tend to go farther away from equilibrium[17]. They have a purpose. Figure 1 shows the fundamental distinctions between a SLV[18] and a SLnV:

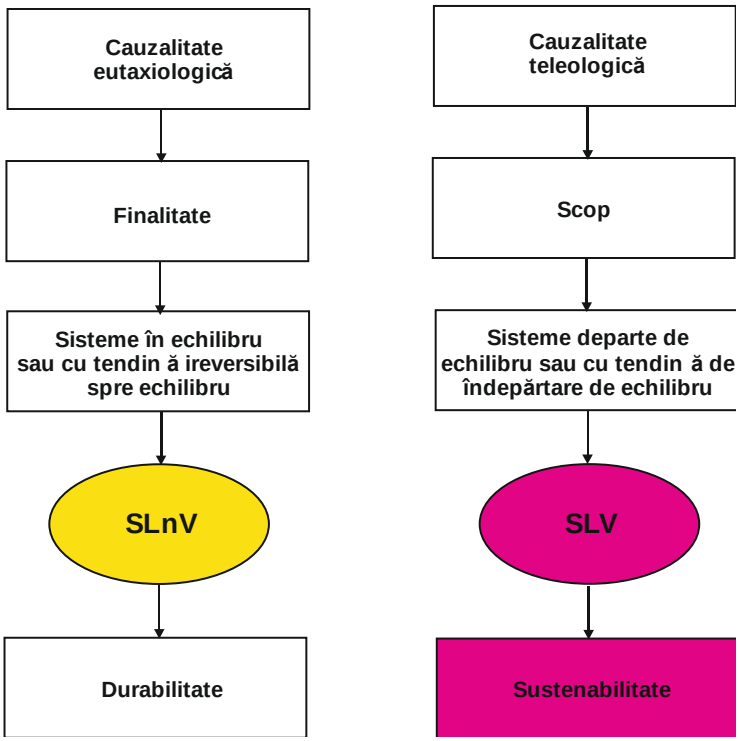

Figure 1: *Basic distinctions between SLnV and SLV. „Location" of sustainability*

Second, taking into account the necessary predicates of a SLV, it results that it has, at the same time, potential for identity preservation (by its auto-poietic capacity) and potential for identity differentiation (by non-linearity). Because of this reason, a SLV is not necessarily a sustainable system (SS). The necessary predicate of the invariance of the total complexity ensures only that the "losses" from a type of complexity are compensated by the "gains" from the other type of complexity, but it is obvious that a variation in excess of a specific level of the terms of the logic sum mentioned earlier, may result in the loss of identity preservation. The key concept here seems to be the *recognition* of the identity profile. By recognition of the identity profile of a SLV we understand the fact that the observing/recording subject notices a sufficient overlapping of the list of attributes specific to a particular SLV at the moment of reference t_r and at the moment of evaluation t_e. The significance of the syntagm "sufficient overlapping" is crucial for our discussion. Actually, we have

[16] Here, the concept of equilibrium must be taken in its most general meaning, that of entropic equilibrium.

[17] According to Prigogine's proposals (see, for instance, the *New Alliance – Metamorphosis of the science*, Political Press, Bucharest, 1984).

[18] A SLV van be both artefact and natural entity. For instance, the fiscal policy is and artefactual SLV, while an ecological pool is a natural SLV. A SLnV is always a natural entity.

here two correlated matters: the first one refers to the evaluation criterion – it is obvious that the observation/recording of the identity profile is always done from the perspective of a favouring criterion (for instance, the Turing test is done from the perspective of the criterion of rationality, more precisely, from the perspective of computability, not from a general perspective); the second refers to the threshold of observing the non-identity and it differs with the scientific background of=r general cultural background of the observing subject, with the technological possibilities to compare the two lists of SLV attributes. Once the evaluation criterion is accepted, and once the mentioned level can be detected, the operation of identity profile recognition is possible. If this identity profile is recognised, than the SLV is considered to be sustainable, otherwise it is considered to be unsustainable[19].

Therefore, on the basis of the above, we may try to give a logic definition of the concept of sustainability or, more precisely, of the concept of sustainable system. We will say the following:

A SLV is sustainable if, and only if its identity profile is preserved for an indefinite period of time (supposed to be infinite) within a tunnel[20] of recognition.

There is an extremely difficult problem that has to be discussed about this definition, problem which is not yet solved theoretically. This is about predictability within a SLV[21].

First, it seems somehow obvious that a sustainable SLV which, as the proposed definition says, has a trajectory which doesn't leave the identity profile of that system, should be a predictable system. Indeed, the recognition of the system by the observing/recording subject as the one that is already known about, should ensure on the fact that the margin of novelty[22] is so small (because the system doesn't leave a tunnel of predictability, which is a tunnel of necessary predictability, not of contingent predictability) that the future states of the system should be predictable[23]. However, things are not like that. As it is known, this predicate suspends the determinism in some points, named points of bifurcation (or fulgurant points), in which the choice of direction towards which the system will continue to evolve is the result of pure chance[24]. Therefore, due to the action of this necessary predicate, a sustainable system is not ipso facto a predictable system.

Second, a sustainable SLV is consistent with a poor predictability, so to say. We are referring exactly to the fact that, by definition, a sustainable system preserves its identity profile. This means that in the case in which the predictions limit to this preservation, they will be certainly verified. The poor predictability is what we understand by verisimilar scenarios, therefore they are not prognoses. As the scenarios are function of the model parameters, and as these parameters are the same with the parameters which control the preservation of the identity profile of the system, we draw the conclusion that, within the sustainable systems, it is possible to have poor predictability, in the form of the alternative scenarios.

[19] We are expecting subsequent research to propose a test of sustainability (of recognising the identity profile), to be used by the observing/recording subject (similar to the Turing test of computability).

[20] By definition, a tunnel is characterized by two limit thresholds (lower and upper) and by a direction of the travel given by the time arrow (therefore, ultimately, by the increase of the global entropy).

[21] The recent literature discusses the matter of the predictability, in general, for any system. An increasing number of researchers in this field reject the predictive capacity of a science as test of its scientificity.

[22] As it is known, novelty is unpredictable because it doesn't allow the mere morphological combination. Novelty implies emergence.

[23] Of course, we are speaking of predictability not in terms of probabilities (which only "increase" the microscopic indetermination for purposes of macroscopic knowledge), rather in terms of non-linearity.

[24] This time we are no longer confronted with a contingent (or, maybe, necessary) technological incapacity of the man to know the group of causal factors, incapacity which has been avoided by introducing the probabilities. We are confronted with a situation of indetermination generated by the so-called coupling of the phenomena which occurs in the dynamics of the system.

2.2 Logic conditions sufficient for a sustainable system

Identity profile recognition denotes that the examined SLV is sustainable between the two moments, t_r and t_s. But what makes us believe that sustainability preserves after the moment t_s? Actually, we have to determine just the logic conditions which, once verified, ensure us on system sustainability irrespective of the subsequent moments, $t_s^k > t_s$, where k is a time counter. There are two logic conditions for sustainability:

a) Presence of hyper-cycles, both in system functioning and in its behaviour (in the way that the two concepts, functionality and behaviour, have been defined previously);

b) Absence of the positive feedback.

(a) Presence of hyper-cycles[25]

A SLV actually is the "headquarters" of a process (or of several structurally and functionally coupled processes[26]). Consequently, it makes sense to speak about the time (irrespective whether we are speaking of an intrinsic time, proper time, or of clock time, mechanical time) of a repeatable sequence of that process (or of the envelope of several coupled processes). The period of time in which such repeatable sequence occurs (the suggestion of fractality is irresistible here) within a process will be called cycle of that process. In terms of the theory of the systems or of cybernetics, a cycle[27] can be measured by the interval of time in which an input of the system which "hosts" the process is repeated (Figure 2 gives a synoptic representation of this idea):

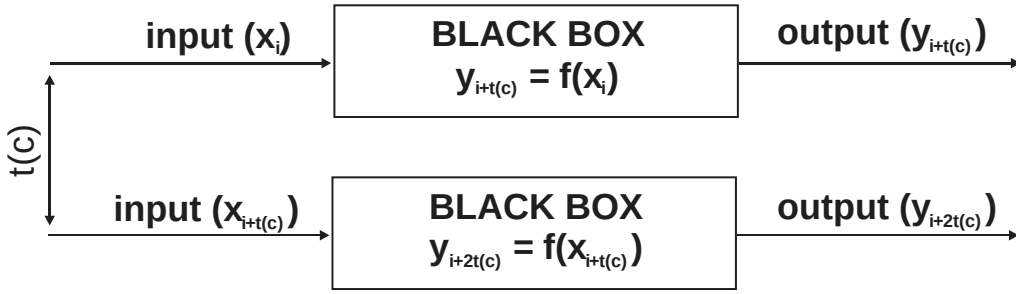

Figure 2: *Synoptic representation of the system cycle concept*

In most imaginable processes, the output can become, partially, input for the subsequent cycle of the same process or, most often, totally, or partially, input in the processes coupled to the original process. This idea which sets that an output of a process can become input in a coupled process[28] is the grounds for introducing the concept of hyper-cycle. Therefore, a hyper-cycle is a cluster, successive or concomitant, of cycles connected structurally or functionally, by which in several

[25] The concept of hyper-cycle has been inspired by the research in biochemistry of Manfred Eigen, regarding the self-organisation of the molecule (evoked in Friedrich Cramer, *Chaos and order. The complex structure of the living*, Bic All, Bucharest, 2001, p. 122).

[26] The expression „coupled" has a very precise signification here. It doesn't show a mere correlation; rather it refers to a reciprocal and permanent dependence between the coupled processes or phenomena (just about the way in which we speak, in the field of Econometry, of simultaneous equations), also from a causal perspective (although it is ironic to notice that the causal coupling is one of the phenomena or processes generating non-linearity, therefore, what we are mistakenly name non-causality or, at least, indeterminism).

[27] We consider that the duration of the cycle is constant throughout the "life" of the system. Otherwise, the acceptation of the hypothesis of a variable duration of the cycle doesn't change basically the reasoning or its conclusions.

[28] It is not necessary to add the syntagm „or within the same process", because a process is considered, by definition, to be coupled with itself.

coupled processes, the outputs from a process become partially[29] or totally, inputs for another process. This definition calls for comments:

1. The possibility of coupling the processes, as defined in this concept, implies adequacies or correlations of at least three categories:

- *Adequacy of nature*: the output of a process, which is to become input for another process, must be of the general nature of that input. The adequacy of nature occurs spontaneously within the SLV in which man is not present (it occurs, thus, by emergence), or deliberately in the SLV in which man is present (we are, of course, speaking of artefacts in this case;

- *Adequacy of cycle rate*: the rate of the process which generates the output must be equal with the rate of the process which uses this output as input, or it must by a submultiple of the latter (in this case, the first process will form stocks of output up to the coincidence between the rate of the process which uses the output as input and the corresponding number of cycles of the process which generates the output);

- *Adequacy of structure*: in the case in which the output of a process is not mono-qualitative, the coupling of the cycles of two processes involves the existence of an isomorphism between the structure of the output of a process and the structure of the process which uses the output as input. Of course, this condition is not rigid: it is possible that the input of a process consists of several outputs of several processes, so that their assembly verifies the necessary structure for that input. It all depends on the complexity of process coupling (of the cycles). Of course, the mirrored image is valid too: a poly-qualitative output may be distributed to several mono-qualitative inputs which are used as such by several processes, in agreement with the adequacy of nature that we mentioned previously. Figure 3 describes graphically these considerations inn the case of an open hyper-cycle (the input of the initial process(es) doesn't use the output of the last subsequent process(es), while Figure 4 describes graphically these considerations inn the case of a closed hyper-cycle[30] the input of the initial process(es) uses the output of the last subsequent process(es):

[29] The part from a random output of a process which doesn't form input for another process, must be consider as belonging to externalities. A externality is an output of a process whose finality is the increase of the global entropy through: decrease of the entropy in the system where this process develops in the case of the positive externalities, and increase of the entropy in the system where this process develops in the case of the negative externalities.

[30] Which, in other terms, referring exclusively to the economic systems, is expressed as active circular processes.

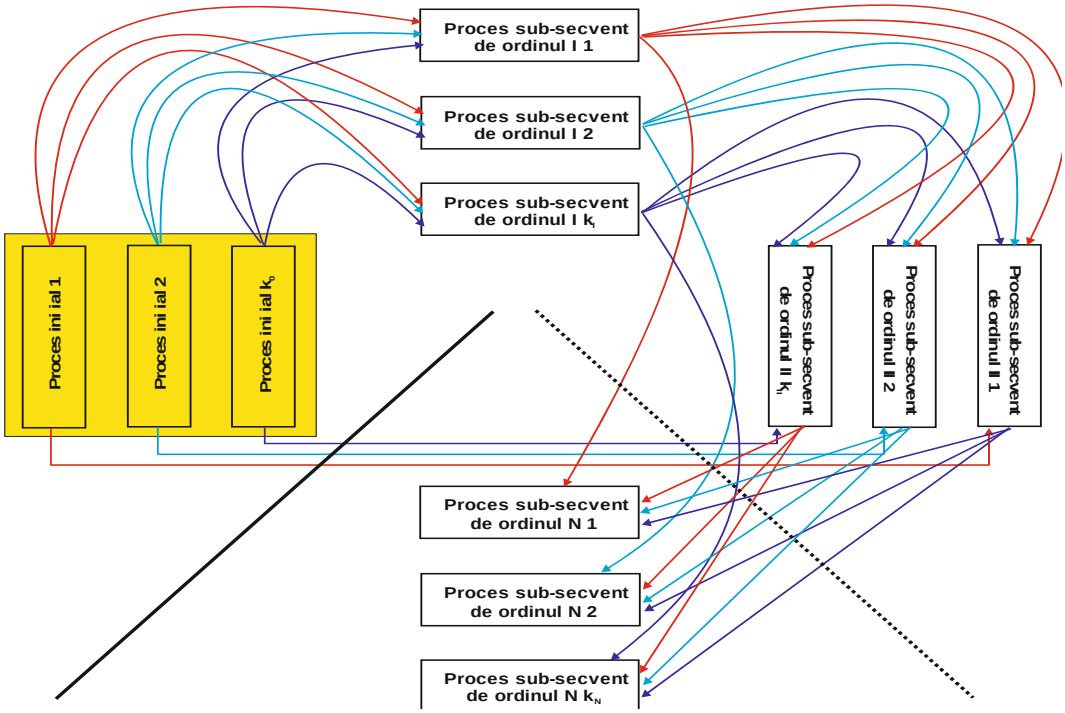

Figure 3: *Synoptic representation of an open hyper-cycle*

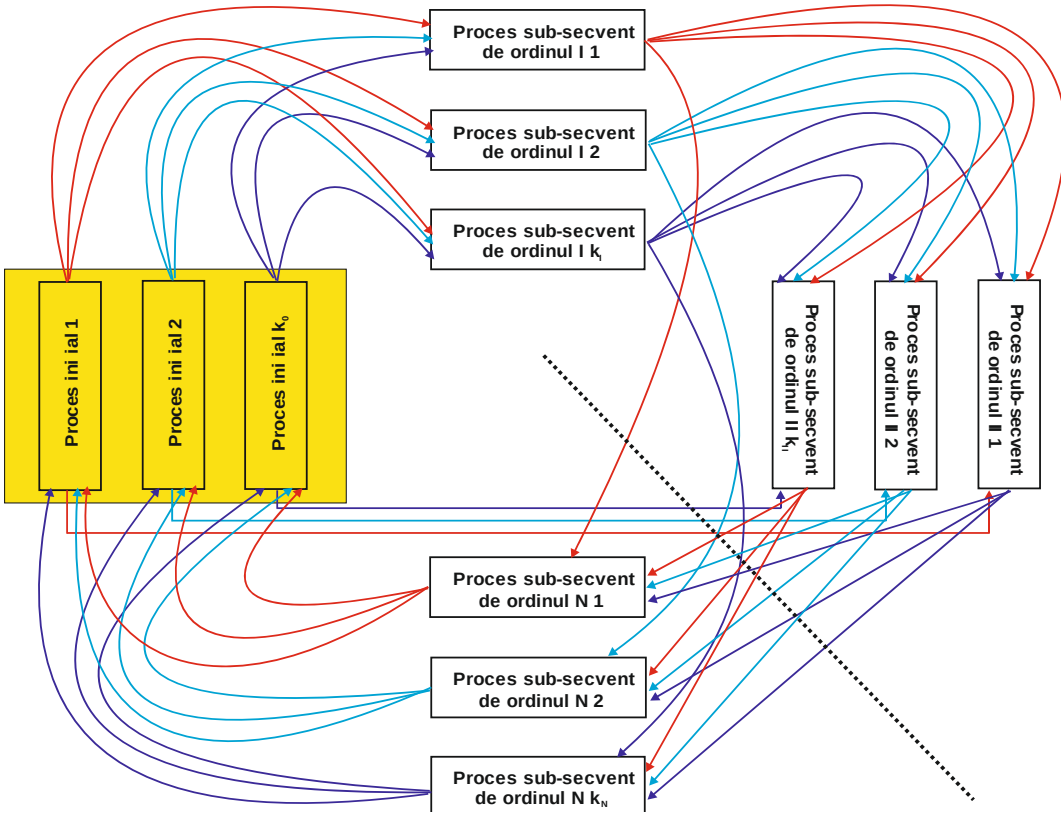

Figure 4: *Synoptic representation of a closed hyper-cycle*

3. The coupling of processes at the input – output level – refers both to the processes occurring within the membrane of the system, and between processes occurring within the membrane (from the system environment). As shown in our discussion about the necessary predicates of a SLV

4. As shown in the discussion about the necessary predicates of a SLV, the proportion of coupling between the processes within the membrane (coefficient of the internal couplings) increases in relation with the proportion of couplings between the processes within the membrane and the processes from the system environment (coefficient of external coupling) with the increase of the internal complexity in relation with the external complexity of the system (ecological complexity). Thus, the coefficient of internal couplings is much higher in man than in a river rock.

(b) Absence of the positive feed-back

The necessary predicate of the auto-poietic capacity implies automatic stabilizers, which means negative feed-back. This is obvious, because the sustainable SLV must preserve its identity profile by neutralizing or, ultimately, reversing the trend promoted by the non-linearity which necessarily appears within such systems. The presence of the automatic stabilizers doesn't ensure fully the absence of the positive feed-back. Positive feed-back often appears in the bifurcation points generated by quantitative accumulations, which cause disruptions in the process, unpredictability and emergence of novelties. The positive feed-back has the potential to take the system out of the tunnel of identity profile recognition. Consequently, we consider that the second logic condition for SLV sustainability is the absence of the positive fed-back in the processes which occur within the membrane, in the processes from the system's environment which are coupled with processes within

the system's membrane. We may have a question here: by putting this imperative condition, don't we cancel any possibility of evolution of the system, even within the limits of the tunnel of identity profile recognition? We think that the answer to this question is a negative one: the bifurcation points which produce novelty, therefore evolution within the system, are not banned by putting this condition. They are still allowed, only that their emergence on the path of the system doesn't produce dangerous escalations endangering the maintenance of the system within the limits of the tunnel of identity profile recognition. In other words, the emergence of the bifurcation points, thus of novelty, is accompanied by an immediate restabilization of the system, without giving it the opportunity[31] to develop principles of leaving the tunnel of identity profile recognition. Therefore, putting the logical condition of absence of the positive feed-back is necessary, but this is not inconsistent with the predictable evolution of the sustainable system; however, this is a weak predictability, as shown before, predictability which allows emergence, thus novelty, in the evolution of the system.

Conclusions

(1) The main outcomes of the paper

The paper delivers the following outcomes:

a) Logically rigorous definitions for system, logically vivid system, sustainability

b) Complete sets of sufficient and necessary predicates for the concepts introduced and used in the paper economy

c) The "locations" of the misunderstandings of the used concepts.

(2) The implications of the paper outcomes

(a) A new paradigm of modeling the systems by the concept of logically vivid system

(b) A new methodology to design the definitions of the concepts: the logical method (identifying of the sufficient and necessary predicates)

(c) A new methodology to ensure on the scientificity of the definitions: the three "C" analysis.

(3) Suggestions for future researches

(a) The causal relation between globalization process and sustainability feature

(b) A deeper research of the hyper-cycles associated with sustainable systems

(c) Reassessing of the automatic stabilizers as crucial predicate for the sustainable systems.

COMPARATIVE ANALYSIS OF VAT EVOLUTION IN THE EUROPEAN ECONOMIC SYSTEM

MIHAELA ANDREEA STROE*

Abstract
In this paper we study a comparative analysis of VAT in different states of the world. I made some observation on this theme because I believe that VAT is very important in carrying out transactions and the increase or decrease of this tax has a major impact upon national economies and also on the quality of life in developing countries. The papers has to pourpose to make a comparison between the American and European system of taxation with its advantages and disadvantages and, in the end to render an economic model and its statistics components. VAT is a value added tax which appeared about 50 years, initially with two purposes: one to replace certain indirect taxes, and another to reduce the budget deficit according to the faith of that time. The first country that has adopted this model was France, calling it today as value-added tax.

Keywords: *rate, tax, VAT, budget deficit*

Introduction

One of the important factors that led to this measure was established to avoid tax cascading phenomenon, namely the taxation of the same product. Today often easier and more correct, tax only the value-added product. This is why we consider taxes a necessary phenomenon . Along parallel between the U.S. and Europe which has been taken as reference models in order to discuss and debate their favorable and less favorable points, and most of them in my opinion is representative of the French model, implementation of the tax where it had a beneficial role in the economy. As an example, we use the European model which is used in the VAT and the American model. In the first chapter I talked about the effects of introducing VAT in the euro zone and pros to this measures. On the other hand we will use the U.S. model as an example for countries that have introduced this tax measure. It will be discussed the pros and cons of implementing these measures in both Europe and the USA and see why are the reasons for which VAT was implemented or not. In the next chapter I will analyze some concrete examples of Europe countries that have value added taxation system and will analyze the benefits that were subsequently introduced this measure in developing economies.

Today most European Union states have increased the rate of VAT and the effects of this measure for each economy participant will be a subject of debate. The largest VAT increase since 2010 had 5 percent, the case of Romania will be discussed and also the effects of this increase. This increase was primarily due to the population, and secondly due to the economy.

However, in addition to countries that have increased the VAT rate to reduce the budget deficit exists also the countries that have not implemented this measure, like France. Separately will discuss about tax reform and the reason which have not adopted the VAT increase in 2010 thus making a parallel with the current situation in Romania. I consider necessary the parallel between American and the taxation of European countries in order to see the effects on the population especially at the time when this method had been introduced but also to determine the need for that change in the economic environment. To see what effect had the change when decided to reduce its rate of VAT, and especially if it had the desired effect. Furthermore, I have chosen our country as a reference model to determine what effect had increased VAT revenues in 2010 and especially the

* Assistant, Economic Sciences Faculty, "Nicolae Titulescu" University, Bucharest (e-mail: stroeandreea@ univnt ro).

share of VAT and its direct relationship with revenue. In this model we determine whether the increase in VAT in our country had a negative effect of higher government spending and see what steps were taken to overcome the crisis in Romania and especially their effectiveness.

At the end of the work are presented conclusions and also some methods for improving the Romanian tax now, and we will see if Romania has achieved its purpose by increasing the VAT by 5 percent, especially if taken fiscal measures will be able to recover Romania.

COMPARISONS OF TAX POLICY IN THE EUROPEAN AND ECONOMIC SYSTEM

In this comparative approach of VAT in Europe versus the United States, we will determine why the U.S. did not want to adopt this tax, value added and the advantages and disadvantages of its implementation. In a paper drafted in 2001 and suggestively named "tax systems in the world," Lawrence W. Kenny American professor says: "There is surprisingly little empirical work to explain why the countries choose different tax policies." Although between tax systems currently existing in the world there are some similarities, however, we must observe that each country has its own individuality generated by specific elements (traditions, history, religion) and in finding a common ground should be determined on the basis of which can indicate similarities and differences between two or more countries. VAT is designed to charge efficient and comprehensive personal consumption in a economic reform .TVA site was most prevalent in the second half of the 20th century and into the 21st century, and proved to be a major source for government information .TVA's revenue is used both in developed and developing countries, both at local, national and supra-national level (European Union). It is effectively an indirect tax, originally adopted in France at the initiative of M. Laure in 1954.In the following years the value added tax was adopted on 1 January 1970 to all Common Market countries tax replacing the movement of goods cascade that leads to taxation.

VAT is in fact a tax on consumption in general, calculated and applied at every stage of goods and services flow from primary production to final consumption stage. Unlike European powers, the United States of America had many attempts to implement VAT in recent years but without success. This is due to the fact that VAT is regarded as having three weak points, namely: the first, is considered to be so-called "money machine" in the hands of government, secondly it is considered that the VAT is regressive, and at last it is believed that consumption taxes are used to broaden the State tax. In 2006, Keen and Lockwood points out the existence of two types of "money machine", a poor form and poor strong. This form is characterized by the assumption that countries with VAT budget revenues higher than those without VAT, or at least the same, which could lead to a better mobilization of savings inside a better financing of certain sectors. In strongest form it is suggested that an increase in budgetary revenues results in an increase in government spending is not beneficial within an economy. Such studies showed last year the opposite, namely the American belief that the VAT is not so-called "money machine" in the hands of pro government. An another argument for applying VAT in the U.S. is that it would reduce the deficit of the budget. This contradicted by Alverson (1986) showing that the average budget deficit is higher in countries that have adopted the VAT as a form of taxation and increased more rapidly with the implementation of VAT, except in countries that have adopted this method . Ali Agha and Jonathan Haughton (1996) stating that VAT is the perfect money making machine.Take, for example when Switzerland with the introduction of this tax, budget revenues have not increased, remained the same as in the period before the introduction of VAT, but in developing countries such as New Zealand budgetary revenues have increased substantially.

VAT proponents conclude that compared with other forms of taxation, VAT is not discouraging savings and create certain ways of fair competition in international trade. It is said that the burden of VAT may be in the worst case proportional and regressive if not the denominator for purposes of measuring the tax burden was a lifetime income rather than annual income as

contradicting American economists. [1]We notice that the socialist states tend to use more than other regimes, tax sources Corporation, sales and excise taxes, so that business can be more easily monitored.There is a strong ideological interest in taxing business and a necessity lower in individual taxation to achieve social goals. Making parallels between the fiscal pressure of the EU member countries and appreciation of the level of tax burden in the European Union in general is also facing many difficulties, due to the fact that tax levels are not the same from one country to another . Disagreement is due to a variety of general and specific factors for each country.

Most important are the following:

- differences in reference periods and methods;
- social security contributions, which are quite large in some countries (including Germany), tax levels are sometimes included, sometimes not, an example of this is given by employers' social security contributions for government employees;
- required government contributions are not included in fiscal reports;
- taxes on inheritance and gift taxes are sometimes considered, sometimes it is estimated that taxes should not be included in the category. For EU countries, VAT and customs duties sometimes appear as a net value sum. In the researched work, they also show that the level of taxation is determined and influenced by many factors, and that between taxation and its base and the level of GDP there is no strict correlation.

In a brief listing of factors influence the tax burden is represented by the volume of public expenditure, which depends on various economic, social and political,to reduce the effect of regressive some countries; especially in Eastern Europe, have provided substantial reduction of VAT on consumer goods and also primary health services, and this is underlined by Angelo Faria (2001). When the consumption tax rate increases on higher income levels it means that this rate is progressive, when this ratio is proportional when we deal with a proportional tax, we say that this rate decrease is a regressive tax

Unable to pay this fee are those who feel the tax burden harder. But this regressive is reduced by certain exemptions from VAT for commodities and population. The necessary medical services to France and New Zealand tried to reduce this effect by collecting the tax on social security and its spending for poor grades. Another pro argument is that VAT is not significantly different from other fees and does not encourage such an increase in taxation or to raise government spending.

On the other hand, opponents argue that a VAT increase in taxation will bring government spending, and this form of tax raises the overall tax burden too easy.

Another appeal of VAT is that it is vulnerable to fraud significant, this is to say that fraud losses in these countries was about 10% net income of such damage VAT collected. We can remember Germany (1.5% of revenues from VAT) and the UK (about 1.5 to 2.5% of revenues from VAT).

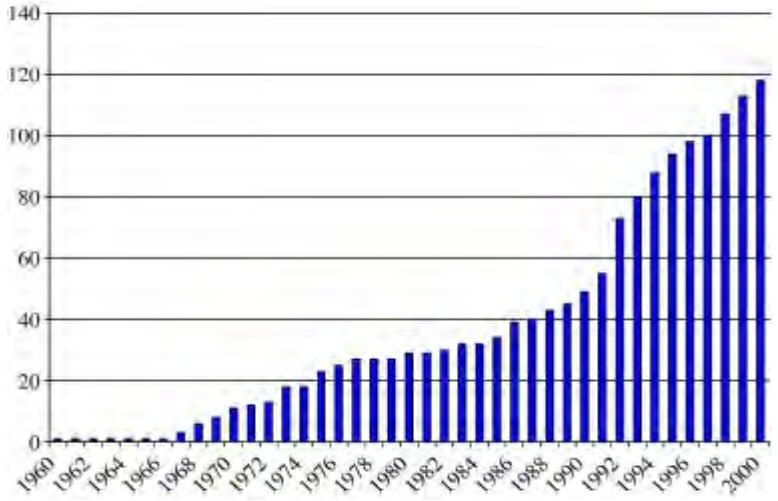
Cnossen says that tax is probably the best ever invented in terms of increasing budget revenues, but also in terms of fraud is much easier a tax fraud and RST (Retail Sales Tax) . But still, VAT fraud is significantly less than other types of consumption taxes, property taxes because it refers to different stages in production and not to the final property tax as it is used in the American system. (Retail Sales Tax)[2]. This form of taxation, perhaps better than the VAT it is much less expensive to implement because it represents just the final property tax and is much faster to implement in the tax system of a country, but has one big disadvantage: it is much easier to rig. This type of fraud is based on a fairly simple mechanism, at least in appearance: the country of origin trader VAT invoices (as performed an intra-Community, which fall into the category exempt operations with right of deduction), and the operator economic destination country applying the reverse charge for this operation (because making an intra-Community acquisition calculating and accounting for VAT on

[1] Angelo Faria (2001) - "Tax Policy IMF Fiscal Affaires Department Handbook" (P275).
[2] Bird, Richard M. & Cnossen, Sijbren. 1998 - "The Personal Income Tax: Phoenix from the ashes?".

intra-Community acquisitions, so that VAT is collected, as well as the tax deductible, but without actually pay it) .Piggot and Whalley (in 2001) illustrates that expanding the tax base of VAT in developing economies can reduce the population welfare sector informal. This deeper critique was developed by Joseph Stiglitz at the Congress IIPF 2003. Many countries in Eastern Europe have adopted lower VAT rates tax hoping to reduce the evasion that would be created with the adoption of a higher rate.

Many European countries have adopted this form of taxation as opposed to letting the United States as income levels increase further or being introduced as a substitute for existing taxes. Comparing the income tax used by countries that have adopted VAT in European countries we can say that income tax is more flexible as a tool to achieve a progressive tax.[3] However, unlike the European model, Americans have no VAT in the tray instead they have a similar sale of VAT ranging from 5% to 12% being imposed in many stages of production (RST-Retail Sales Tax). But still why VAT is better than a sales tax that excludes taxes like VAT cascade? In case of VAT, the taxation is taking place in various stages of production, so is much more difficult to nearly impossible to find certain Legal wickets.

Countries that have adopted VAT charge have chosen this path because this structure does not meet budgetary requirements. Also this method has raised a number of problems and over the years this have been intensely debated. Thus depending on the levers of government each country has its own system of taxation,so that in some states this form of consumption tax works, but in other countries like the U.S. is considered ineffective. Comparing tax rates in the world is difficult and somewhat subjective, tax laws are complex and in most countries the tax burden falling on different groups in each country. However, a strong point of this charge is that avoid cascading charge (charge applies several times on the same income) by taxing the value added at each stage of production. This practically be the main reason that most countries in Europe adopted VAT. In the chart below we see the number of countries that have implemented this form of taxation over the years:



Value Added Tax (flat tax collected divided as it is called) is calculated in Romania on increasing the value added by each undertaking participating in the cycle of making a product or performance of works that fall in the incidence of this tax circuit eliminating inequalities between

[3] John Piggott & John Whalley, 2001. - "VAT Base Broadening, Self Supply, and the Informal Sector".

phases economic products, applying the attributes on its share of all economic activities. Value added is the difference between the proceeds from the sale of goods or services and effectual payments for goods or services relating to the same stage of economic cycle. By setting the value added to avoid repeated entries external consumption (consumption from third parties) of productive enterprises. VAT tax is a single, neutral, and payment to be made in a single part. The character of this form of taxation wether you cycle through raw material to finished product realization (in this way can pass by two or more companies), is the same level as the rate of taxation, the tax is not dependent on the extent of the economic cycle, it is applyied at every stage of manufacturing value added. Operating system of value added is based on a fundamental principle that the fee charged for goods delivered and partner services rendered minus the fee for goods or services purchased or manufactured in their own units for the realization of taxable operations The object is the value of taxable goods, works and services at billing prices an also a taxable lump sum from the sale.

The mechanism by which one determine the VAT due to state budget continues to show it succinctly. The VAT account is recorded output VAT collected on sales or work product. The account is registered VAT paid input,VAT on buying by traders of material, to receive papers which were made or the payment of benefits. Reducing the output VAT results input VAT which the operator has to pay state tax (VAT to pay). If this difference is negative,output VAT is less than the input VAT, meaning that the trader has to recover this amount from the state. It is easily seen that the trader is not affected by VAT, and it pays only one who actually bear the ultimate consumer.

In fact, the producer who purchased raw materials, manufactures suppliers, although with the delivery of their share of VAT paid do not suffer a monetary loss because the asset sale will collect that amount, state and will return that value but the final consumer is not credited by the state, so that it will fully support the value added tax related. From product tax, value added is considered a consumption tax, borne by the final consumer and the state budget. Therefore an increase in the tax rate primarily affects the final consumer for the same commodity bought in a previous period will have to pay more in the current period.

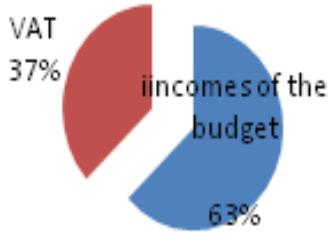
Regarding foreign trade, VAT is not paid for exports and imports. VAT levied on imports is to offset losses which occur due to taxes export. If goods were delivered to the internal state, revenues would increase.

Also, the VAT on imports representes an equalization of opportunities for companies, because if there is no VAT for importing foreign goods the competitiveness of prices would be more appyling that the national one

Countries where the product is consumed implemented VAT and not where it performs. Consequently, everything is exported, is completely absolved of paying this tax, but what is imported is taxed accordingly. VAT has a greater elasticity to economic processes in the sense that, if the business is developing , the VAT payment will be higher. If sales stagnate and VAT amount will be lower consequently in state revenues. The VAT as well as all indirect taxes "copy" the economy going. VAT is a tax, high tax efficiency, but that any indirect tax is unfair. This translates in that VAT is regressive in relation to revenue growth and do not lend themselves to a minimum non-taxable. The VAT affects more pronounced low-income people and those who affect a large proportion of their income for consumer spending. In our country the VAT was introduced for the following reasons: reasons of compatibility with the tax systems of European countries to increase resources for the state and the necessity of replacing the outdated formula has been taxed on the movement of goods. Our country's accession to EU economic structures imposed a series of changes in the national tax legislation to harmonize it with European regulations domain.In global crisis, the government of Romania was forced to increase the VAT rate from 19% to 24% to shrink the deficit this way budgetary. It is true that those who felt that this change was more low-income population small, the final consumer in the position are those that support this growth.Among European countries, Romania had the highest rate increase along with it and arousing discontent of the population who have experienced a rise in consumer prices. This increase had the intended effect,

registering a substantial increase from the state budget. With this increase in overall share of VAT revenues increased indicating an increase in revenues as the chart below illustrates:

The structure of VAT in the total incomes of the budget



Source of data: National Institute of Statistics, INS

To play multiple linear regression model we used data on the United Kingdom, between 1990 and 2007 about the total indirect taxes, excise duties, VAT and consumer price index, thus implementing the data extracted in Eviews. The base year chosen is 2000. Values are taken from the table below are expressed in millions of pounds.

Year	Total indirect taxes	Excise duties	VAT	Price index
1990	61.096	19.871	34.136	76.8
1991	66.466	21.660	37.523	82.6
1992	70.361	22.501	41.031	86.1
1993	72.591	24.267	41.762	88.3
1994	78.338	26.457	44.690	90
1995	85.507	28.167	47.539	92.4
1996	91.537	30.174	51.692	94.7
1997	96.637	31.866	54.475	96.4
1998	102.478	34.487	57.003	97.9
1999	109.161	36.471	61.415	99.2
2000	112.874	37.271	64.302	100
2001	115.007	36.597	67.051	101.2
2002	120.246	37.284	71.154	102.5
2003	127.731	38.081	77.308	103.9
2004	133.748,5	39.458,45	81.735,42	105.3
2005	135.366,6	39.289,65	83.537,46	107.5
2006	142.036,1	46.196,13	79.359,44	110
2007	155.309,3	50.612,33	87.678,99	112.5

Sursă: www.eurostat.com

The linear multiple model is:

$$\text{Im}\, p\_ind\_tot_t = \alpha + \beta_1 * accize_t + \beta_2 * TVA_t + \beta_3 * IPC_t + e_t; \qquad t=1,2,\ldots,T,$$

unde T=18.

In Eviews, the model is: Imp_Ind_Tot=C(1) + C(2)*Accize + C(3)*TVA + C(4)*IPC

Imp_Ind_Tot = 8528,4194 + 1.49457*Accize + 1.01587*TVA - 157.62403*IPC

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	8528.419	5692.535	1.498176	0.1563
ACCIZE	1.494572	0.087339	17.11226	0.0000
TVA	1.015874	0.037614	27.00770	0.0000
IPC	-157.6240	92.74270	-1.699584	0.1113
R-squared	0.999543	Mean dependent var		104249.5
Adjusted R-squared	0.999445	S.D. dependent var		28264.28
S.E. of regression	665.7775	Akaike info criterion		16.03292
Sum squared resid	6205635.	Schwarz criterion		16.23078
Log likelihood	-140.2963	F-statistic		10208.15
Durbin-Watson stat	1.623409	Prob(F-statistic)		0.000000

Tabel 1 The results for testing the parameters model in Eviews

For testing the parameters model,it is used the t test

Test student

The hypotheses are:

- The nule hypotheses, H_0 : $\alpha = 0$ or $\beta_t = 0$, t = 1,2,3
- The alternative hypotheses, H_1 : $\alpha \neq 0$ or $\beta_t \neq 0$, t = 1,2,3

Thus, the coefficient of excises is $\hat{\beta}_1$ = 1.4945, the stndard error $SE(\hat{\beta}_1)$ = 0.087339, and the statistics $\hat{t}_1$ = 17.11226, calculated thus: $\hat{t}_1 = \frac{\hat{\beta}_1}{SE(\hat{\beta})_1} = \frac{Coefficient}{Std.Error}$; the value p (*p value*) = 0.0000, which shows hat the volum of excises in the total indirect taxes is an important factor.

The VAT coefficient is $\hat{\beta}_2 = 1.015874$, the standard error $SE(\hat{\beta}) = 0.037614$, and statistics $\hat{t}_2$ = 27.0077. The value of this probability is 0.0000, so VAT is another significant component of total indirect taxes estimated regression model.

The coefficient of the price index is $\hat{\beta}_3 =$ -157.624, standard error $SE(\hat{\beta}_3) = 92.7427$, thus the statistics $\hat{t}_3 =$ -1.699584. But the probability for this indicator is 0.1113, which exceeds the threshold of 0.05. But student test (t test) has an associated p-value of 0.1113 that is close, so we can say, by assuming a 11.13% risk of error that we are doing by rejecting the null hypothesis is still small, so we can to reject, and thus influence the CPI's total indirect taxes.

The intercept is $\hat{\alpha}$ =8528.419, the standard error $SE(\hat{\alpha})$ =5692.535, the statistics $\hat{t}_\alpha$ = 1.498176, and the p value is 0.1563. Although he exceeds the probability of 0.05 applying the t test we can say that we take a risk that the value of 15.63% to be 0 and thus reject the null hypothesis, accepting the fact that free time is significant for multiple regression model chosen.

Report of determination (R^2) indicates what percentage is explained by the significant influence. It is calculated as: $R^2 = \frac{SPAR}{SPAT} = 1 - \frac{\sum e_t^2}{SPAT}$. It is used in assessing model quality. It can take only values falling in the interval [0,1]. The values are closer to 1, the model is better. The value that we take here is 0.999543, and thus we can say that the regression model is good. Approximately 99.95% of total indirect taxes are explained by multiple linear regression model chosen.

S.E. regression is the following indicator of our table, calculated as follows:

$SEof\ \text{Re}\ gression = \sqrt{\frac{\sum r_i^2}{n-4}}$, where r represents the errors; $\sum r_i^2$ = Sum Square Resid.

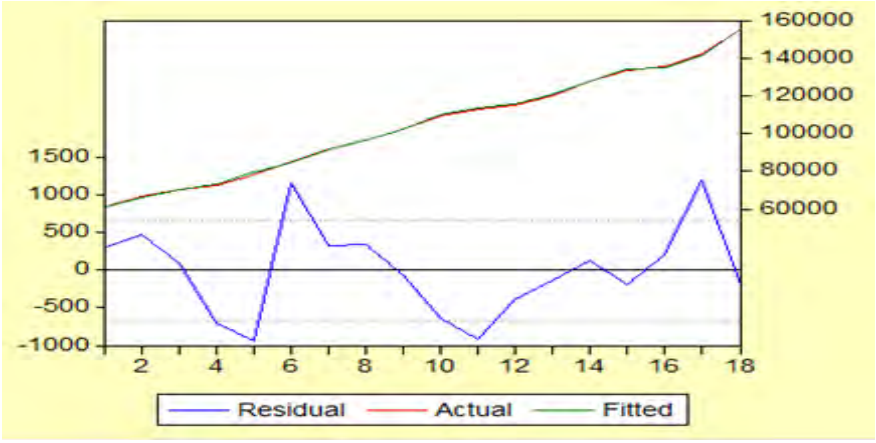
Then SE of Regression= $\sqrt{\frac{6205635}{14}} = 665.7774$.

$$\text{Im}\, p\_ind\_\hat{tot}_t = \hat{\alpha} + \hat{\beta}_1 * accize + \hat{\beta}_2 * TVA + \hat{\beta}_3 * IPC$$

$$\text{Im}\, p\_ind\_\hat{tot}_t = 8528.419 + 1.494572 * accize_t + 1.015874 * TVA_t - 157.624 * IPC_t.$$

The previous table contains the value of the residuals for each among from the 18 calculated:

$$r_t = \text{Im}\, p\_ind\_tot_t - \text{Im}\, p\_ind\_\hat{tot}_t$$



Tabel 3: The values for residuals, actual and fitted indirect taxes

Charts explaining residue values were also extracted from Eviews as follows: the below graph were residues is calculated as total indirect taxes chart taken from table in nominal source, represented by the red line (Actual) and total indirect taxes taken chart adjusted value, represented by the green line (Fitted). The blue line, is represented precisely by the difference of the residuals of the other two values above

Actual	Fitted	Residual	Residual Plot
61096.0	60799.4	296.586	
66466.0	65999.8	466.249	
70361.0	70268.7	92.3128

127731.	127601.	129.720	
133748.	133937.	-188.511	
135367.	135169.	198.039	
142036.	140852.	1183.66	
155309.	155510.	-201.003	

Tabel 4:The values for residuals, actual and fitted indirect taxes

It can be noted that the nominal values are almost equal, so the lines overlap almost second chart thus resulting in low values of their residues.

F test is used to test the validity of the model as a whole.

It is calculated as the ratio between the variation explained by regression and regression unexplained variation each of which is in turn divided by their degrees of freedom. The calculation formula looks like this:

$$F = \frac{\sum(\hat{y}_i - \bar{y})^2 / k}{\sum(y_i - \hat{y}_i)^2 / (T - k - 1)},$$ with k = number of variables for the model, here 3 and T = number of observations 18.

Analyzing the data in our model we see that F = 10208.15 and a probability of 0.00000. Therefore, we accept that overall multiple linear regression model is better studied.

The multicoliniarity test: The test of Klein

For the multiple linear model chosen:

$$\mathrm{Im}\, p\_ind\_tot_t = \alpha + \beta_1 * accize_t + \beta_2 * TVA_t + \beta_3 * IPC_t + e_t;$$

The hypotheses are:

$H_0 : \exists\ r^2_{x_i,x_j} > R^2$ is the multicoliniarity phenomenon;

$H_1 : r^2_{x_i,x_j} < R^2$ it is not the multicoliniarity phenomenon;

From EVIEWS the obtained results:

Correlation Matrix			
	TVA	**IPC**	**IMP_IND**
TVA	1.000000	0.967591	0.991579
IPC	0.967591	1.000000	0.980201
IMD IND	0.991579	0.980201	1.000000

Tabel 5: The correlation matrix

Value is 0.9995 and find that is greater than the pearson coefficients so multicoliniarity phenomenon is not present in the multiple regression model.

To check homoscedasticity

Homoscedasticity refers to the hypothesis that the regression model that states that errors must have the same variance model: for any t = 1,..., T. Homoscedasticity presence or not we can identify both graphically and by statistical tests. Graph residuals can not say for sure that neither the existence nor the homoscedasticity heteroskedasticity. The best known test is White's test to test the following hypotheses:

The nule hypothese $H_0 : \sigma_i^2 = \sigma^2$ for all i =1,...,T

The alternative hypothese $H_1 : \sigma_i^2 \neq \sigma^2$ for at least one i.

White Heteroskedasticity Test:

F-statistic	0.653726	Probability	0.730593
Obs*R-squared	7.628003	Probability	0.572025

Test Equation:
Dependent Variable: RESID^2
Method: Least Squares
Date: 01/23/10 Time: 12:25

ACCIZE*IPC	93.46943	86.50170	1.080550	0.3114
TVA	-1082.017	2819.240	-0.383798	0.7111
TVA^2	-0.003665	0.014057	-0.260728	0.8009
TVA*IPC	7.316386	40.42917	0.180968	0.8609
IPC	4585351.	5405744.	0.848237	0.4210
IPC^2	-41077.56	46417.93	-0.884950	0.4020

R-squared	0.423778	Mean dependent var	344757.5
Adjusted R-squared	-0.224472	S.D. dependent var	461276.3
S.E. of regression	510429.2	Akaike info criterion	29.42407
Sum squared resid	2.08E+12	Schwarz criterion	29.91872
Log likelihood	-254.8167	F-statistic	0.653726
Durbin-Watson stat	1.888994	Prob(F-statistic)	0.730593

Tabel 6: The White test applied for our model for test homoscedasticity

For the initial model has been build:

$$e_t^2 = \alpha_0 + \alpha_1 * accize + \alpha_2 * TVA + \alpha_3 * IPC + \alpha_4 * accize^2 + \alpha_5 * TVA^2 + \alpha_6 * IPC^2 + \alpha_7 * accize * TVA + \alpha_8 * accize * IPC + \alpha_9 * TVA * IPC + v_i$$

New errors v_i are normally distributed and the independent of e_i .

In these circumstances I have the null hypothesis: the alternative: not all α parameters are zero. If we accept the null hypothesis when the hypothesis homoscedasticity accept, and if there are different parameters of 0 accept heteroscedasticity. Output table for this new model obtained by regression apply t test of significance for each coefficient separately. The probability is 0.455 for the free time that exceeds the threshold of 0.05 and 0.8 is smaller than that are in the area of uncertainty. In this interval are coefficients of variables with two exceptions, the coefficient of VAT and the coefficient of CPI. For later, we can accept the null hypothesis. Also for F-test probability is quite high and again located in the area of uncertainty, p = 0.73059. Considering the value of p we could say that we reject the null hypothesis (presence of heteroskedasticity) with an error of 73%, therefore we can accept the null hypothesis (presence homoscedasticity) with an error of 27% (100% -73%).

The autocorrelation analysis of the first rank:

The Durbin – Watson test: $\text{cov}(e_t, e_{t-1}) = 0$

For the analysed equation:

$\text{Im}\, p\_ind\_tot_t = \alpha + \beta_1 * accize_t + \beta_2 * TVA_t + \beta_3 * IPC_t + e_t$;first-order autocorrelation of errors is expressed by the relation: $e_t = \rho e_{t-1} + v_t$, for t=2,...,T where v_t ~N(0, σ_t^2). DW statistical test used pair of hypotheses: H_0: ρ = 0 (the nule hypotheses); $H_1 : \rho \neq 0$ (the alternative hypotheses). DW statistics are tabulated, its values depend on the specified significance level, the number of observations in the sample and the number of variables influence the regression model. This, for a specified significance level, has two critical values is obtained from the DW tables.

Reject the null hypothesis regions are defined as:

If $DW \in (d_2, 4-d_2)$, it does not autocorrelation,if $DW \in (0, d_1)$ the positive autocorrelation of the residuals;if $DW \in (4-d_1, 4)$ the negative autocorrelation of the residuals;if the DW is between the two intervals (d_1, d_2) or $(4-d_2, 4-d_1)$ the test is not conclusive.In the model analyzed, DW statistics = 1.6234. For a significance level of 5%, a total of 18 observations and four variables influence the statistics are tabulated values: 0.93 and 1.69. The value obtained in the model belongs to the range so we can not rule on the autocorrelation of disturbances.

After analyzing the data entered in the multiple regression model, for best results on homoscedasticity, autocorrelation of errors, or model of normality may enter more observations to capture the relations between them

Conclusions

The model which explained the relationship between the indirect taxes, VAT, CPI and excises is a valid model and the majority of parameters are significant. The relationship is linear and strong between the four variables. It was studied the hypotheses for testing our model.

I think that it is a strong relationship between that four variables because the taxes represent an important factor for the quality of people's life. If people are pressured by the taxes, they cannot concentrate for increase their educational level and they are only oriented how to obtained money.

The model can be improved by analyzing a long series of data and can be extended for many countries and the obtained results can be compared and can be established which country has the better taxation system.

VAT is in fact a tax on consumption, calculated and applied at every stage of goods and services flow from primary production to final consumption stage.

Many European countries have adopted this form of taxation as opposed to United States as income levels increased further or were introduced as a substitute for existing taxes. Comparing the income tax used by countries that have adopted VAT in European countries it can be said that income tax is more flexible as a tool to achieve a progressive tax. Comparing tax rates in the world is difficult and somewhat subjective, tax laws are complex and in most countries the tax burden falling on different groups in each country.

Value Added Tax is calculated in Romania on increasing the value added by each undertaking participating in the cycle of making a product or performance of works that fall in the incidence of this tax circuit eliminating inequalities between phases economic products, applying the attributes on its share of all economic activities.

Fiscal pressure generated by the size of taxes paid by taxpayers is high in Romania and distribute.In Romania VAT became the target of argued opinions due to the tax burden on the population and especially small and medium businesses, besides direct taxes population supports a series of indirect taxes which currently holds the principal place within fiscal resources.

A high taxation, a „sick" economy can only have negative consequences because of the disrupt demand for goods and services and less likely investments. Among various tax savings in order to attract resources used by the State budget, those which are pressured are significant tax: personal income tax, consumption taxes and social contributions. I believe that indirect taxes are very burdensome for taxpayers and the dimensions of income and wages are lower compared to the fees and charges incurred by individuals.

For a more judicious distribution of income the tax system is necessary for policymakers to consider how it is constructed, the criteria underly the differentiation of taxes and how they participate in the formation of budgetary resources.

I appreciate that in the current period, the configuration of our country's tax revenue will over-tippe the balance in favor of indirect taxes along with the increase in VAT to 24%, resulting in increased tax burden on labor, with extremely negative effects on investment and savings.

GLOBALIZATION AND ECONOMICAL-SOCIAL INFLUENCES

LIVIU RADU [*]
CARMEN RADU [**]

Abstract
Globalization represents a myriad of processes of undeniable complexity and variable dynamics, which cover various society areas. It can depict various aspects of phenomenon, ideology, strategy, or all in one place. Globalization is with no doubt a complex concept that bears diverse significations which refer to many sides: the economical, the political, the cultural one etc. Most authors view as particularly important the economic side of globalization, while they seem to be looking over the political, social or cultural aspects of this phenomenon. Thus the optimists view contemporary globalization as a new phase in which all the world's states are subjected to sanctions from the global market, while skeptics argue that the globalization phenomenon determines chain reactions, incontrollable here and there, in conditions of a present crisis, precisely through the interdependency between states.

***Keywords**: Globalization, economic processes and phenomena, cross-border borders, network economy, deregulation, globalization-worldwide expansion, scale economies, creation of multinational companies.*

Introduction

In favor or against globalization? This is a question that will forever be a concern for the economical, social, financial or administrative world, until the worldwide crisis will inevitably appear. Although the globalization's fundamental tendencies assume: increasing the degree of economical liberalization, opening national economies, increasing the degree of interaction between such. These tendencies only take place in the contet of the progress recorded in international transports, of the unprecedented development of informatics technologies and telecommunications and of the economic increase in general. Therefore, globalization has been considered throughout time to be a final stage of space enlargement of the companies' economical activities, having as effect not only the multiplication of markets but especially the forming of a unique global market. But, as it is known, economical downturn and growth have a certain cycle, so by accepting the cycle process of the growth and recession periods we also automatically accept the occurence of world crises. However, in a globalization era in which the world's states are interconnected, the crisis started in the United States will have a domino effect on the collapse of other states' economies. The mortgage crisis from US affected Great Britain, Spain, Ireland, Germany and Italy, generally all the developed states strongly dependent on the Unites States' economy. Limiting loaning strongly affects small and middle enterprises, reduces the consumption and increases the will of people to save money.

Many developing countries will face competitiveness decline, due to decreasing exports, according to specialists[1], these countries being close to appealing for help from the International Monetary Fund.

Literature review

The study of the globalization phenomenon, of competitiveness and competitive advantage, also their modification under the conditions of economical crises as well as the role of foreign investments in diminishing economical crisis, are subjects of major impact on the research area. Over time specialized literature has benefited of studies made by many prestigious authors, among which John H. Dunning, William Northaus, Kirsty Hugues, Robert Solow, Gilbert Abraham – Frois, or Ngaire Woods. In Romanian economic literature the special contribution was made by the researchers Alexandra Horobet, Anda Mazilu, Costea Munteanu, Vasile Dan, Liviu Voinea etc.

Theoretical background

1. Conceptual Definition of the Globalization Process

Globalization continues to be depicted in different ways in the specialized literature. In the 2001[2] economy dictionary, globalization is regarded as a "*method or system of long-term reception and approach on the great contemporary problems, generated by the interaction of multiple economical, technical, political, social, cultural, ecological processes and phenomena, and the planning by the international community to settle them on a wide perspective"*. In some papers, signed by Paul Bairoch and Richard Kozul Wright (*Globalization Myths: Some Historical Reflections on Integration, Industrialization, and Growth in the World Economy – 1996)* and from 1997 by professors Michael Bordo and Kornelia Krajnyák (*Globalization in Historical Perspective, World Economic Outlook, Globalization Opportunities and Challenges*, May 1997, IMF, Washington), the process of globalization manifested in the second half of the XXth century is considered to resume some phenomena that took place one century ago in the global economy.

In the paper *Globalisierung der Unsicherheit – Arbeit im Schatten, schmutziges Geld und informelle Politik* (2002)[3], Elmar Altvater considers globalization to be the surmounting process of the borders appeared along history. Thus it becomes synonym to the erosion (but not disappearance) of the national states' sovereignty and is presented as the market economy's "detachment" from moral norms and from the connections that are institutionalized between societies …" For Anthony Giddens (2007)[4] the same phenomenon of globalization represents "…the intensification of social relations everywhere, through which places separated by a large distance are thus able to interconnect so that events taking place in an area are marked by processes taking place many kilometers away and vice versa…" Globalization represents a process or a set of processes that take the form of a transformation in the spatial organization of social relations and transactions – analyzed in terms of extensions, intensity, velocity and their impact – generating transcontinental or interregional fluxes and networks of activity, interaction and power enforcement[5].

A more pragmatic position is expressed by Professor Bruno Amoroso from Roskilde University in Denmark, who in the *"On globalization. Capitalism in the 21st Century"* paper[6], considers globalization as being a manifest of the transnational triadic capitalism with its basic institutions: transnational corporations, international organisms and lobby in the global market conditions.

The globalization process has generated the beginning and consolidation of multinational and transnational corporations which subsequently become the foundation for maintaining and amplifying the globalization process on a global scale.

Globalization has been scientifically analyzed and developed in the large American schools (Harvard, Columbia, Stanford), as well as in some English universities that promote the neo-liberal doctrine and sustain free trading between the world's states. The main institutional actors of globalization are: the state, multinational firms, nongovernmental organizations. The fundamental tendencies of globalization refer to: the increase of economical liberalization grade, opening of national economies, the increase of the interaction degree between them. Obviously these tendencies take place in the context of the revolution faced by international transports, of unprecedented development of the informatics technologies and telecommunications that projected on other coordinates the multinational firms' activity and the cross-borders movement of capitals.

Over time, globalization has been considered to be a last stage of space enlargement of the companies' economical activities, having as an effect not only the multiplication of markets but especially the forming of a unique global market. In other words, globalization represents the process through which geographical distance becomes a less important factor in establishing and developing economical, political, social-cultural cross-border relations. Globalization manifests in all life domains: political, economical, cultural, scientific, and has an impact on the human condition, being able to generate satisfactions for those who approach it to their advantage and unpleasantness for those who are marginalized.

The latest specialized literature draws attention on the fact that economical systems change from the theoretical model to *the network economy* (the term of global network was introduced by Prof. Richter Emanuel, PhD). The network is presented, from an economical point of view, as a resource allocation system in which problems of fluxes optimization are considered, as well as of finding scale economies, of deregulation or maintenance of the so-called natural monopolies. The network model is increasingly present in contemporary economy because it proclaims the superiority of administrating information fluxes by means of decentralized structures instead of those hierarchical and rigid.

To summarize the earlier mentioned tendencies in a unitary formula, we consider the definition formulated by John Dunning in his paper "The Advent of Alliance Capitalism"[7] to be the best that sustains the significance and directions of development of the globalization process:

The globalizing of economical life raises three large categories of problems for all states , which they cannot solve on national or on continental integration level:

1. problems of economical nature that can no longer be solved trough the industrialization model that has led to waste, pollution and unemployment, emphasizing the mimesis of the production structures that generate competition;

2. problems of social nature: unemployment, but also polarizing societies, trough extending poverty, demographical problems and the migration of economical workforce;

3. problems regarding the degradation of the natural environment, climate change and the dangers of irreversible perturbation of the planet's geo-biochemical equilibriums.

National identity in the contemporary globalization conditions "is determined by the particularities through which a human community reacts to stimulants provided by the modifications of the natural environment and social climate"[8].

Globalization of economical life, with its history and as a reality of our time, can be regarded as a phase of the evolution process of the capitalist economy the beginning of which was identified

by Fernand Braudel[9] from very ancient times. Over the last three millenniums, a single power centre has been exerting its domination at a time. Now, for the first time, we assist to the concomitant existence of more power centers. Some researchers mention the movement of the center from America to the Pacific (Japan, China, Indonesia, Singapore, Korea). Others sustain the existence of three centers: America, European Union and Japan with the South-East Asian region.

2. Globalization – Worldwide Expansion

In the UN and IMF documents and studies, in English language, the term "globalization" is used, while in French, as well as in the publications in this language, the term of "worldwide expansion" is used. Both linguistic expressions designate the same process.

Specialized Romanian literature uses more frequently the term of globalization although, sometimes, "worldwide expansion" is also used. However, the economic meaning attributed to the concept of globalization differs from one source to another.

The Economy Dictionary (Economic Publishing House, 1999) defines worldwide expansion as a process revealing the fact that the activities carried out by certain firms become the expression of some economical operations developed on a global scale, both in respect with production and trading. This worldwide expansion process is of objective nature, which occurred a long time ago, but has intensified over the last decades, being promoted by multinational and transnational companies. From an economic point of view, the worldwide expansion represents the method in which those certain firms capitalize the competitive advantages created on a global scale under the incidence of numerous existing differences between the countries and regions of the world. Multinational corporations thus exploit for their own purpose all economical advantages, and the production and trading acts become more profitable due to extending the rationality parameters from local, national or regional-international to global level.

The International Monetary Fund report from May 1997, entitled "World Economic Outlook. Globalization. Opportunities and challenges" says that the globalization phenomenon represents "the tight international growing integration of the goods and services markets as well as those of capital".

Also the International Labor Organization report entitled "L'emploi dans le monde 1996/1997. Les politiques nationals a'heure de la mondalisation" mentions that the term globalization is used, in a limited sense "to designate the global wave of liberalizing exchanges, investments and capital flows as well as the increasing importance of all these flows and international competition in global economy[10]. It can be noticed that this document, which originates from the UN institution handling labor problems, also considers that labor markets are not presently included in the globalization process.

Worldwide expansion expresses the development stage of non-boundaries states, where everything is almost accessible, being realized through communication, solidarity increase and interdependencies. Worldwide expansion represents the mankind's stage that began to take shape in the 1970's and, especially, after 1980 when the internationalization's result (which affect only certain countries and activities) was distinguished from globalization (which adds to the elimination of distances and obstacles related to space, the technologies and information related to time).

Worldwide expansion is remarkable due to the expansion of human activities throughout the globe, despite the unequal penetration. In economic life, worldwide expansion encountered the fewest obstacles, thus a spectacular modification took place in the nature of international trades from the second half of the 20th century. However, economy is not the only domain of the worldwide expansion – the political, habits and cultural ones are just a few of the sectors that are increasingly dependant on the global success. The actual conflicts, humanitarian dramas, poverty persistency, take a global aspect and the cultural and demographic particularity becomes conspicuous, while on all

[9] Braudel Fernand (1985) - *La dynamique du capitalisme*, Paris, Arthaud .
[10] Badrus Gheorghe, Rădăceanu Eduard (1999) - *Globalitate şi management*, Editura All Beck, Bucureşti, pg. 4.

meridians the same music is being played, the same information and images are being broadcast, often being dominated by an American influence.

In fact, the worldwide expansion is often identified with the generalization of market economy, doubled by the adhesion to plural democracy values and human rights. To this extent, the day of November 9th, 1989, on which the Berlin wall fell, symbolized the end of the world's division in two ideological units, also marking an important phase of the worldwide expansion process. For the first time in history the entire world gradually rediscovers itself around the same basic rules promoted by international organizations (UN, IMF, Global Market, etc.) that have truly become worldwide.

Worldwide expansion allows for the avoidance of high costs, the establishment of scale economies, diminishment of high costs, exploitation of different markets' imperfection and of the asymmetrical nature of information.

3. The Consequences of the Financial Economical Crisis in USA

The economical expansion during 2002 -2007 began with a problem – the shattered illusion of the American capital, in 2000-2001, that had a substantial effect, concerning wealth, on the American households. In order to reduce the duration and severity of the resulted downturn, the Federal Reserve aggressively tempered the monetary politics by reducing either the interest rate to federal funds, or the discount rate, 27 times between January 2001 and June 2003, producing the collapse of interest rate to federal funds from 6.5 percent to 1.0 percent in the mentioned period. This way, the aggravation determined by the downturn was prevented by the stimulation of an unprecedented development of the real estate market that afterwards rapidly became a real estate mirage. The financial capital accumulated in the real estate market compensated the loss recorded in the real estate market during 2000-2002. The increased prices in the real estate domain supplied a massive increase of expenditures and the continuous expansionist monetary politics of the Federal Reserve maintained the United States' economy flooded by excessive liquidity. Another fundamental ingredient at the base of the persistent low rates of the real American (or global) interest was directing developing countries into accumulating large amounts of American assets, motivated by the experiences accumulated by them during previous crises and this was possible due to their positive working capital. Because of this, the United States was able to finance their massive deficit on a long term without radically changing the real rates of interest or those of the real exchange rate. At the same time, Wall Street recorded profound financial innovations created by the attempt to obtain higher profit benefits in an environment with low interest rates. A large part of these innovations was made by the firms with unregulated activities and the new financial instruments used were too complicated to be regulated. If we organize a retrospective analysis we will notice the existence of reasons that determined the choice of these monetary politics. The Federal Reserve has never considered preventing the inflation of the assets' price to be part of its mandate. In addition, the increase of productivity and stagnation of the real average wages level in the USA during the expansion period were interpreted as signs of a surplus in the labor force market.

As a consequence, policies tended to support the liberalization of financial markets and were sometimes doubled by careless additional supervision. Other developed economies faced the same unfavorable impact because when the illusion of rapid circulation of capital flows was shattered, and other central banks also decreased their interest, indeed slower than the Federal Reserve, their economies recovered just as fast. In a few other developed economies the real estate mirage has grown and, in some cases, it was even larger than the American one. In this context, neither was our country differentiated in the international practice, using the easily given consumer loans and the expansion of the values circulated on the real estate market. If to all this we add the unusual desire for expenditure, we can have the complete precursory view for the global crisis' beginning.

4. The Consequences of the Financial – Economical Crisis in the World

Although this generalized crisis first occurred in the United States, said country was not the only one affected by the shocks and collapse of the consumer's trust. Many countries, both developed and emergent markets, have recently registered unrealistic increases on the financial assets market. The rapid growth of real estate prices was caused not only by the basic principles of the countries such as Ireland, United Kingdom and Australia, according to IMF (2008), while countries like China and Russia had faced before the crisis staggering levels on their assets markets, generated by the frenzy of speculations.

The phenomenon of worldwide expansion is represented by: financial integration and the constituency of cross-border holdings of mutual funds, speculative funds, branches of developed countries' banks and insurance companies that perpetuated perturbations and contributed to propagating the collapse of assets' prices in other countries as well. Many developed states in the European Union suffered from the capital market's internationalization.

The South Asian countries adopted a multi-billion dollars plan in order to sustain the banking system. USB, the largest bank in Switzerland, received from the government an infusion of capital of EUR 3.8 billion and, also, the central bank created a special fund where USB would be able to deposit "toxic assets" in a value of no more than USD 60 billion (EUR 44 billion). Another large Swiss bank, Credit Suisse Group, collected CHF 10 billion (EUR 6.5 billion) from private investors and announced loses for the third trimester. ECB supplied liquidities of EUR 5 billion for the Central Bank of Hungary that asked for and obtained support from IMF and the World Bank (the total value of contributions is of EUR 20 billion).

The portfolio investments will decrease because the larger fear of risks determines the capital maintenance in internal markets. Although, historically, the direct foreign investments have proven to have a higher flexibility to shocks, they are also expected to drop. In addition, the developing countries with a future access to capital will pay higher interest because of the exodus towards more secure markets and the higher aversion towards risks. The global deceleration will reduce the requirement of consumer goods and industrial products, thus decreasing the earnings from exports and as the labor force markets will decline, the workers from abroad will probably suffer over the disproportioned impacts on their incomes, which will reduce deliveries.

Approximately half of the developing countries started to face working capital deficits of over 5 percent from the GDP and, in some cases, the deficits are situated around the value of 10 percent. These economies are very vulnerable to the oscillations of these diverse sources of external financing. Due to the large investments inflow in the last years, an extremely large number of investment projects are already developing. As the investment's financings will decrease, two consequences will possibly appear, both of them of negative nature. In some cases the projects will not be finished and, as a consequence, will become unproductive and will burden the balance sheets of the banks with risky loans. In other cases, if the projects are ended, they will create a capacity of excessive production resulted from the global deceleration, thus increasing the risk of deflation.

These factors will have as consequence the decline of the increasing collective GDP of the developing countries down to less than 5 percent, as compared to the average 7 percent in 2004-2007. Moreover, the effects felt by the developing countries might not limit to the decrease of the revenues resulted from investments and exports and a deceleration of the increasing GDP. The danger also exists for all emerging markets to enter an individual crisis, as for instance if their own internal assets market starts collapsing (or even in the case in which the real market values will suffer a decline) and weaken their own banking systems. The drastic falls of stock markets in the developing countries already indicated the investors' worries regarding the future on a medium term, and the decline of the portfolio's values can also have significant effects of the wealth on consumption, emphasizing the effects of decreasing. The countries with deficits of the large payment and fiscal balances will be the most vulnerable. The aggravating factor of the developing economies' problems is the fact that these shocks will be simultaneous.

5. The Consequences of the Economical – Financial Crisis in Romania

In Romania the indirect effects of the crisis could be noticed. In the year 2008 we faced a limited impact of the financial crisis on the Romanian economy. The annual rate of inflation (6.3%) was on a descending trend but maintained itself on high levels over the variation interval, the economic growth rate being high in 2008 as well, the working capital deficit significantly increased (13.4% from GDP) and the budget deficit reached a record level of 5.4% of the GDP. Through prudential and administrative measures, NBR constantly acted to moderate the speed of the increasing loans granted to the private sector and for sustaining the loaning in national currency to the detriment of that in foreign currency.

The local banks no longer have a major role in loaning companies but remain the main vehicle in the case of population. Crediting has been aimed towards SME and strongly towards trading and services companies. SME are modestly financed by banks. Only 15% of the SME appeal to external sources of financing such as bank loans. The main sources of financing for the SME are their own shareholders and commercial credits. The internal bank loan represents approximately 12% of the liabilities, while in other European Union countries these are a lot higher (Germany 30%, Austria 16%, Italy and Spain 23%, Belgium 18%).

The population continues to have a high potential of crediting demand. The 11/2008 regulation regarding the population's crediting creates conditions for changing the search for quantity with searching quality. The new indebt levels are higher than the actual values implemented by banks in the case of clients of smaller risk. Some banks are more exigent than the NBR's recommendations. The cards are the product that keeps on developing. On a short term, EUR 5.4 billion external financial credits are due in the case of companies and EUR 3.6 billion as loans from the mother companies. Not renewing parts of these credits has caused the financing from local banks. Also, the indebted population's impossibility of paying their loans because of the collapse or restructuring of large companies, which had been previously profitable, generated the aggravation of the Romanian banks' financial situation. In this context, Romania called for support from the International Monetary Fund and in 2010 adopted measures of austerity which were genuinely severe but were aimed at re-launching the economy.

Conclusions

The advantages of worldwide expansion brought by the freedom of human actions without borders, the rapid and unhindered circulation of the production and especially of capitals, the unprecedented growth of technology, exchange of information and productivity, all of these can be rapidly affected by the beginning of an economical-financial crisis of epic proportions. The multinational corporations (MNC), the main actor and beneficiary of worldwide expansion, have actually known a different expansion, actually influencing all areas of economical-social life. It can be said that nowadays these have a great impact over: the technical progress and economical development of the origin as well as host states, of the increase of services sector's power, also referring to environmental issues, management and political and legal aspects. However, these multinational corporations are the ones to determine the externalization of the crisis, through the umbilical connections with the economy of other states.

Nevertheless, as we mentioned in the introduction, the economical crises of overproduction have a cyclic evolution demonstrated by many economists (Nikolai Kondratiev *The Major Economic Cycles* 1925). They come and go, but the amplitude of the fictive capital transfers causes powerful and more difficult to control trails in the financial banking system.

ECONOMICS OF HUMAN RESOURCES

IOANA - JULIETA JOSAN [*]

Abstract
The purpose of this paper is to analyze human resources in terms of quantitative and qualitative side with special focus on the human capital accumulation influence. The paper examines the human resources trough human capital accumulation in terms of modern theory of human resources, educational capital, health, unemployment and migration. The findings presented in this work are based on theoretical economy publications and data collected from research materials. Sources of information include: documents from organizations - the EUROSTAT, INSSE - studies from publications, books, periodicals, and the Internet. The paper describes and analyzes human resources characteristics, human resource capacities, social and economic benefits of human capital accumulation based on economy, and the government plans and policies on health, education and labor market.

Keywords: *human capital, education, work force, unemployment, investment*

Introduction

The study of the economics of human resources is characterized by complexity of the processes, but also by the factor of particular importance given to human resources in recent decades. Whether it's the Japanese model "Shushin Koyo", German method "working islands", American model based on ownership, human resources plays a crucial role and are rated as "one of the most important investments of the organization whose results become evident over time." (Manolescu, 2001). Given the importance of this factor, the paper examines the human capital accumulation trough Human Resources in terms of modern theory of Human Resources, educational equity, health, unemployment and migration. The desire to analyze human resources in terms of human capital accumulation is based on recent studies (in the last decades) of eminent authors, some of them Nobel laureates for their contribution to Human Capital Development Theory (e.g. Gary Becker). First, Human Capital Theory was focused on proving that by investing people will get a higher human capital which will be used to gain higher incomes accordingly to knowledge held. Secondly, specialists (Schultz, Becker, Mincer and others) analyzed its components in terms of human capital (educational capital and social - health capital), but also from the perspective of human capital - labor migration, human capital - unemployment, human capital - poverty. Thus, through this research, some experts were concerned with the problem that their economy now found an explanation through human capital theory, namely through the use and development of human resources.

Scientist G. Becker explains the extraordinary economic success of Japan and Taiwan and other Asian countries through massive investment in human capital. He claims that, having the lack of natural resources and facing discrimination imposed by the West, Asian countries have developed rapidly, building on a well-trained workforce, educated and hard working class.[1] Another item brought in for human resources development is the adaptation to new technologies required in the production process and in the economy overall. Therefore, education and training are helpful to keep pace with technological change and productivity in advanced manufacturing and services sectors. Recent studies show that industries which progresses more rapidly in particular attract better

[*] Assistant, Faculty of Business and Administration, Bucharest, University of Bucharest (e-mail: ioanajulieta@yahoo.com).

[1] Becker, 1997, p.26.

educated workers and offer tuition in the workplace.[2] A similar idea was also supported by another Nobel Laureate - Theodore Schultz - recognizing that "an integral part of the modernization of the economies of low-income countries is to decrease the economic importance of cultivated land and the increasing importance of human capital, skills materialized in knowledge"[3].

Therefore, the qualitative dimension of human resources has an important role in a country's economic growth. In addition to investments that are made at the microeconomic level, it is needed also for the state concerns for the development of appropriate policies adequate to increase the quality of the human factor in that certain state.

Thus, starting from major studies in the field to enhance the primary role of human resources, this paper will consider more qualitative dimension of human resources and will make references that are considered to be important for understanding the concept related to the quantitative dimension of human resources.

Paper content

In economic theory, human resources have been analyzed in numerous scientific treated. Depending on the period of time, on the economic currents, on the scientific nature of authors, employees, workers, human resources were presented in a multitude of facets. Use of terms has been closely linked to the role that it was assigned. Following the terminology used has been over time different, depending on the social order and according to historical period.

If in the past the task of the employees was work, mostly the rough work, the name used was "labor force" - because people were valued for their working force - or "manpower", referring to the description of the work, using mainly hands for process the work material. The concept of "manpower" used today, along with the new term "human resources", possessed all the physical and intellectual skills that people use in the process of obtaining goods and services and was used to describe or characterize the mass working and not the individual with distinct needs and personality. In the traditional theory of the enterprise employees were seen through the prism of how they are serving, in a discipline certain predetermined operations.

Labor force category was introduced in the means of production once with the transition from feudalism to capitalism; when the scope of the productive forces has broadened considerably. From that moment man began to be treated as "productive force" as well as other means of production. Socialist ordering brought a new perspective on the labor theory by introducing human-producer, owner, beneficiary, but that theory has not changed anything in the merchandise character of labor, but replaced the specific of the feudal relations with the relations characteristic for capitalism. This triple-stage status remained only the goal.

All these changes have led to changes in the contract of employment because it is no longer just work, but the human factor of production, namely the ability to work, all available skills, information skills qualifications, experience, etc.. Also in today's society, working and working ability of an individual is not becoming, through the act of selling, the whole property of the one who pays the work-product, as it provides a certain amount of labor, which is given by its own rules of ergonomics and those dictated by social security regulations. In modern market economy, the human factor has changed the nature and how it can make the growth performance of the organization.

It is interesting to note that changes in industry and general economic development have led to successive changes of the role of labor in those periods. Thus:

[2] Idem.
[3] Laureatii Premiului Nobel, vol 2, p. 202.

Feudal Ordering	**The rise of the Capitalism**	**Modern Period**
Raw labor exploited;	Changes imposed by industrialization and the industrial revolution;	Require increasingly more use of the individual's intellectual capacity;
This was done and purchased only for daily necessary goods living;	Use of cash payment for salary as an expression of the work provided;	Prized qualities are creativity, intelligence;
Relations between labor owners and its beneficiaries were the relations of domination and bondage.	Raw labor during this period still represents the majority;	They are increasingly better paid than raw labor;
	Relations between labor owners and its beneficiaries were poorly regulated and allowed the abuse of labor with a payment that was not reflecting the true value of the work	The individual has a double status - manufacturer and customer

Table 1. Characteristics of labor in specific periods

Thus, if at the beginning it was mainly used the term "manpower", industrialization and technical revolution imposed the introduction of additional terms to include and emphasize the complexity of today's working process, which, in addition to the raw work, requires the more and more use of the individual's intellectual capacity. In today's society, employment qualities such as creativity, intelligence and other intellectual abilities began to be valued and paid better than raw labor. As a result, in the new context of global economic development elements such as human capital, creative potential, etc. become particularly relevant. Some authors even emphasizes that it requires a reconsideration of the general acceptance linked to the concept of human resources-related since the work content has changed radically. In this sense, defining for human resources are: initiative, creativity and ability, learning capacity and use of information technologies and the neo-technology.

Economic theory indicates that the labor factor raises two issues related to *quantitative* and *qualitative* nature. Professor M. Roman[4] makes an important methodological distinction meant to discern a possible operating error in terms of work versus the concept of human resource. Thus, labor resources are economic in nature, linked to man's capacity to work, unlike human resources, which represents its dual nature - economic and social. Human resources represent the total population of a country, to affirm its economic dimension, through direct or indirect participation in the labor market, and its spiritual dimension (social), through the accumulation of knowledge.

Quantitative level is connected, first, to the existence of labor resources in the society and within the size of that segment actually performing work, and secondly, the working hours, i.e. the number of weekly working hours, according to regulations in existing in the society.

In terms of labor resources of a country, they are closely related to the population of that nation. Within this we include the following categories[5]:

- Adult population (with the legal age for employment) is determined by subtracting the total population of a country the young people and older people;

[4] Roman, p. 8, Accessed February 3, 2011. http://www.biblioteca-digitala.ase ro/biblioteca/carte2. asp?id=257&idb=.

[5] Cornescu and Platis, 2002, p. 40.

- Active population consists of what remains after subtracting from the adult population incapacitated adults;
- Active workforce available, all the working persons which remain after eliminating the housewives, students of legal age full-time employment;
- Employment that is determined by subtracting the number of available active population unemployed persons;
- The working population employed - resulting in employment by eliminating all those who work in their households and establishments.

Human resources of a country are made up of working age people and able to work. Working age limits are determined by the country through legislation. The size and dynamics of labor resources depend on a number of demographic and economic factors such as:

- Birth;
- Mortality;
- Life expectancy, living conditions, etc.

Also, work duration, in number of weekly working hours, is an important factor that can increase or decrease the work amount, therefore the volume of work available to a given country. This factor has, in turn, a series of economic, social, and political determinations.

Qualitative level of work is enhanced by training level, the amount of general knowledge, technical, scientific, etc. Quality of work is reflected, therefore in the training and qualification of carriers of this factor. Qualification is presented as a prerequisite and an essential condition of modern production, one of the major factors to increase efficiency.

Quality of work, seen through potentiating qualification, highlights the work capacity of human resources in society. In other words, this is the prerequisite for raising work efficiency. Therefore, the company is interested in increasing the quality of work, acting for it in the following areas[6]:

- Increase the general level of education and training of human resources;
- Ensuring a high level of health;
- Promote an effective system to motivate employees;
- Ensuring a high quality also for the other inputs.

Theodore Schultz[7] was referring to the quality of the population as a rare recourse, it has an economic value and its acquisition has a cost. In the analysis of human behavior that determine the quality and volume acquired during the time the key analysis is the relationship between benefit from an additional qualities and costs of acquiring them. When the benefit outweighs the cost, the quality stock of the population increases.

In time the increase of demand for quality determines the investments for children's instruction and improving the quality for a part of adults, reduce demand for quantity, quality and quantity are substitutes, and the decrease for the demand of quantity stimulates the option to have and raise a smaller number of children.

Also, Nobel laureate Theodore Schultz notes that Human Capital Theory considers the health of any person as a stock, of health capital respectively. Thus:

- A part of the initial stock is inherited, and part is acquired;
- Stock depreciates over time, and the depreciation rate is increasing rapidly towards the end of life.

Health investments have costs for the acquisition and maintenance costs. A longer life provides additional incentives:

- To acquire more education investment to future earnings;
- Parents invest more in their children;

[6] Cornescu and Platis, 2002, p. 41
[7] Laureații premiului Nobel în Economie, p. 209

- Training at the workplace becomes more attractive;
- Health capital and other forms of human capital tend to increase the productivity of workers;
- Better health leads to higher productivity per man-hour at work.

Economists Paul Samuelson and William Nordhaus[8] highlight the differences between the salaries of professional categories. Therefore, these differences are due to:

- The work seen as compensation differentiators. Labor is different in terms of its attractiveness, therefore it should be paid more to attract those people to work. Jobs requiring great physical effort, fatigue and low social prestige, with periods of inactivity, or seasonal work involving risks tend to be less attractive.
- Differences between people: quality of work. One of the main determinants of the salaries gap is between the qualitative differences between people, differences that can result from psychic or physical capacities, education acquired in the family and at school, training and experience.

The two authors mentioned above, explain the existence of higher salaries to graduates of higher education, bringing the example of doctors, lawyers, engineers, as they invest money in training and their professional development, and the money they receive as income should be considered as the return of investment made in the accumulation of human capital - education revenue is derived from making them a high-ranking workers. Categories with a high degree of training begin their careers with higher salaries; revenue is growing faster than the income of the categories with a lower degree of preparedness. But it should be noted that, in general, at the beginning of participation in the workforce the income is increasing with advancing age until they reach a common peak within 45-54 years and decline in the last age group. Since work occupation is amended along with age, most able to work down the hierarchy at a time. The earnings for different work occupations could indicate reaching a peak earlier for unskilled workers, mainly because unskilled older are less able than younger people. Higher education capital implies a higher value of the workforce due to increased productivity, implying a higher payment if it is sold (salary reflects, in general, the marginal productivity of labor, which increases with education level, as illustrated by the human capital). Human capital theory implies that salary differences reflect different productivity of employees. Experienced employees have higher productivity and receive a higher salary. The salary of a specialist includes a reward for hard work and reward for the work invested in education spending. For example, in Romania, according to National Institute of Statistics[9], in 2006 the highest average salary was in financial - banking field (2260 lei/month) where, as we know, trained is very important. Lower wages were situated in hotel and restaurant industry (534lei/month), agriculture and forestry (504lei/month). These two industries, usually operates with seasonal unskilled and poorly motivated workers.

Workers health care develops human capital by improving physical and mental capacities of the human and influences productivity by reducing time lost due to illness. As investment in workers' health are included expenses for labor protection, aimed to protect the life and health of working personnel, ensuring good working conditions, prevention of professional diseases and accidents, reducing physical and mental effort.

Another group of measures directed towards the development of human capital of the enterprise are measures related to workers' mobility: career development, coordination of qualitative and quantitative composition of employees. Occupational mobility of workers requires investment related to the period of vocational and psychological adjustment.

In early 2000, Professor Aurel Manolescu pointed out that "of all enterprise functions, personnel function which has probably the most spectacular and most constant development known

[8] Samuelson and Nordhaus, 2001, p. 280

[9] INSSE.Accessed,26,January2011. http://www.insse ro/cms/files/statistici/Statistica%20teritoriala%202008/rom/22 htm.

during the past ten years. This trend will continue also in the future, referring both to the content function and the profile of people who exercise it." Human resource management is a necessary for those organizations that tend to be performance leaders in their field of activity. The significance of human resources in achieving this goal is that they work through their complex action and ensure the enhancement of other resources. Human resources, depending on the qualities and skills embedded determine the effective use and exploitation of other existing and available resources at a time in the company. Unlike all other resources of the company, which are depreciating both physical and moral, human resources is the only resource that can be able to increase its value over time.

Another very important element that affects human resources is *migration* on the labor market. The portability of human capital explained by Becker[10], is a migratory behavior of those who feel threatened its own stock of human capital. Individuals, who make decisions to migrate, are generally richer in human capital, and their migratory movement is from the poorer to the developed areas. It directly affects human capital stocks at Community level which may induce marked discrepancies from one community to another within the same or between different societies. Such disparities have long term effects in terms of personal communities or societies in question and may lead to segregation. The decision to invest in human capital at macro level can be directed to discourage migration of individuals with above average education in poor areas in educational equity, while local investments in building human capital. The alternative may be to maintain this gap. Moreover, in some cases, migration of individuals, rich in human capital (both education and health) may be a solution in case of poor areas in resources and represented as lacking development opportunities, for reasons beyond human will. Massive departure of young people and educated individuals (with a superior work force) may lead to the dissolution of poor communities, while migrants can gain access to superior social and natural environmental conditions.

The phenomena of globalization and economic integration forward, now, new challenges for human capital theory. Therefore, the effects of human capital mobility between nations is generating debate on the relationship between distributive justice, global human capital and individual right to free movement and external opportunities, respectively the rights of nation states which made public investment in human capital of migrants. For example, according to Eurostat statistics[11], in 2009 across the European Union as a whole, Turkish citizens made up the biggest group of non-nationals (see Figure 1). This group comprised 2.4 million people in 2009, or 7.5 % of all non-nationals living in the EU. The second biggest group was Romanians living in another EU Member State (6.2 % of the non-national population), followed by Moroccans. The group of non-nationals with the most significant increase over the period 2001 to 2009 was Romanians, whose number living in other Member States increased more than six fold over the period considered (from 0.3 million in 2001 to 2.0 million people by 2009).

[11] Eurostat. Accessed January 26, 2011. http://epp.eurostat.ec.europa.eu/statistics_explained/index.php/Migration_and_migrant_population_statistics.

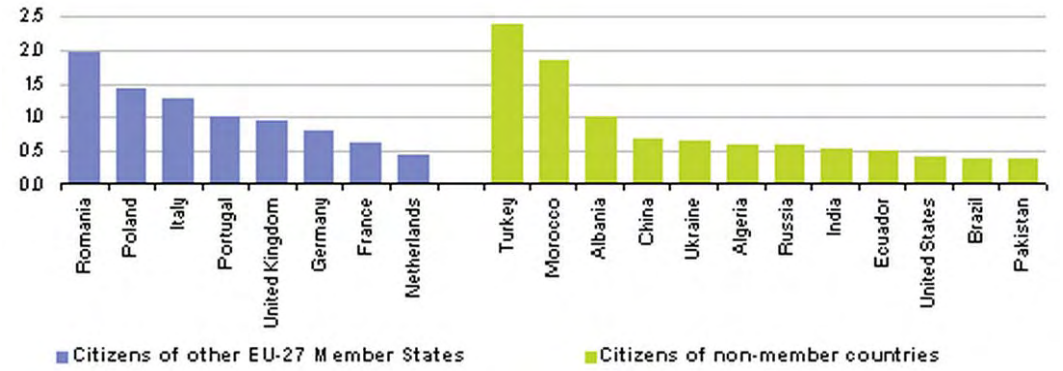

Figure 1. Migration population statistics

Worldwide and in this case in the European Union, the global redistribution processes occur because of past investment efforts of less developed countries, deficient human capital, are present benefit for the destination countries of migrants. A negative aspect of labor migration in Romania, in particular, is disqualifying employment. Typically, most people who migrate in search of a job, having a high enough training, is committed to work seasonal, unskilled. Many migrants are exposed to hazardous working conditions, living in shabby conditions, exploitation in employment and inadequate access to medical services.

This raises another problem about the relationship between *human capital and poverty*. Economist Theodore Schultz argued that the link between human capital and poverty goes to a macro level. For the individual, household, this link is exemplary illustrated in the collection of articles written by Theodore Schultz and published in 1993 under the name of The Economics of Being Poor. On the one hand, health is an essential resource for individual development, in particular for the production of income. Impairment of health stock of individual / households lead to reduce labor, which a social actor can use to meet its needs. On the other hand, higher education capital implies a higher amount of labor due to increased productivity, implying a higher payment if it is sold .In addition, a higher level of training requires greater flexibility in adapting to specific conditions of the labor market, helping to avoid the risk of unemployment. Secondly, poverty may cause degradation of the human capital stock, obstructing the maintenance and development costs of it (lack of economic resources is associated with the impossibility of purchasing health services and education). Thus, you can enter a vicious circle of poverty permanent generator. Thirdly, as James Hackman (1999)[12] noted, the gap between the wages of more educated employees and less educated employees is increasing, resulting in levels of increasingly higher inequality, with negative effects in terms of chronic poverty. Hackman sees as a need to improve skills of the less skilled workers and points the importance of capital development, of education development as a way to prevent impoverishment, by making their education systems effective, especially through investment in training of individuals. Similarly, Thomas Davenport[13] (1999) builds a model of the employee as an investor in human (education) capital. He notes that in recent years the number of highly specialized jobs increased at all levels of education at the expense of unskilled or low specialized work. Continuously investing in education is thus a priority for individuals and insurance for the low risks of unemployment and poverty. On the other hand, companies can achieve a higher return by investing in the education of their employees rather than to increase economic capital stock. Effects in terms of labor productivity

[12] In Voicu, Accessed January 27, 2011. http://www.iccv ro/oldiccv/romana/dictionar/bog/bog_capum htm.
[13] Idem.

can be seen immediately; employees become more creative and having a high decisional independence and can react more efficiently with the best solutions in new and unexpected situations.

According with Gary Becker[14] the duration of training at work varies from approximately one hour in some simple activities (such as washing dishes), up to several years, for complicated tasks. Becker quoted Jacob Mincer who suggests that total investment in training at work can be almost as big as the investment in education. Changing employment is more common among lower skilled workers than among skilled workers.

Acquiring knowledge and skills through *Training at Work*. Many workers increase their productivity, acquiring new skills and perfecting old ones at work. Future productivity can be improved only by fee because otherwise there would be an unlimited demand for training programs. The cost includes the value of time and effort consumed by people trained, the knowledge taught by others, as well as equipment and materials used.

Becker mentioned that are two different types of training professions:

- General education - increases the marginal productivity of those trained in exactly the same way for companies that provide these programs, as well as others. The knowledge gained can be used in other firms.

- Specific training - increasing productivity in the sector, but not elsewhere.

General education. To underline the importance of job training there are several elements that highlight the Training Overview:

- Is useful in many other companies besides those which providing this program;

- Most training programs enhance workplace, apparently, the future marginal productivity of workers in firms that offer these programs, but the general preparation determines the marginal increase in their production in many other companies;

- Wage rates will rise as much / with exactly the same amount as the marginal production and thus firms offering such training programs will not obtain any profit.

In this context, Becker raises the question bellow: "Is it then reasonable for firms to promote general education programs that do not derive any profit?" The answer is that companies will promote the general education programs only if they are not obliged to bear the costs. Persons eligible for these programs will be willing to pay the costs because without, their future wages will not increase. Those qualified will earn lower during training because in that period are paid and trained at the same time and will earn later in life because then the profit is collected.

Companies which do not pay salaries accordingly to qualification would have difficulty in meeting market demand for skilled labor and tend to be less profitable than other firms. Companies that pay the costs of preparation, but at the same time, provide below-market wages for skilled personnel will be in the most difficult situation because they will attract too many people willing to receive training and too few skilled workers. Gary Backer underlines that companies which can qualify workers must share with outside firms the costs because this firms can use these workers in future without incurring any cost.

Specific Training. It has a specific character, can be defined as a training program with no effect on productivity of workers participating in courses and who will work in other firms.

A better qualification allows a more efficient workload. Firms that have a very strong monopoly of the application could be isolated from other competing firms, and virtually all their investment in work force is specific. Companies located in labor markets extremely competitive would face a constant threat of attack from other companies and could have smaller amounts available for these specific investments. If a company has paid the costs of a specific training program for employees who leave to take another job, her main expense would be partially wasted because it will not be able to charge any profit thereafter. Also, a fired worker, which paid the costs for specific training program would be unable to collect any profit

[14] Becker, 1997, p. 31-60.

Fluctuation labor - becomes important when the costs are charged to the employee or company, and this is certainly the effect of specific training. A firm is affected by the departure of an employee because it cannot find qualified new worker as profitable as those who leave the firm. Similarly, an employee who bears the cost of specific training program would suffer a loss if it is fired because he could not find a job with same conditions elsewhere. Companies that bear the cost of specific training might consider the fluctuating labor to get a profit large enough from the personnel left to compensate the loss caused by those leaving the company. Companies could, however, perform better, recognizing that the probability of departure is not fixed but depends on salary. Thus, to reduce the probability of failure, companies can offer once with finalizing the training courses higher wages than those that might be received elsewhere. Some aspects of this problem would improve, but other could go worse because higher wages would lead to a bid for higher qualified personnel than demand which will require a rationalization.

Rational firms pay employees with the general training same salaries and for those with specific skills a higher salary than they could obtain elsewhere. Employees with specific skills are less willing to leave the workplace compared to the general skills workers, firms are less concerned to dismiss such employees - the unemployment rates are inversely correlated with the volume of specific training. Fluctuation would be minimal for highly specialized employees and the maximum for those who have received general training so that their productivity will be a smaller increase in companies that have provided training than elsewhere (for eg. School). Specialized Workers receive initially higher wages than they could obtain in other companies, and wage growth in the latter should be higher than the initial difference for these workers to consider leaving. Thus, the rate of leaving the job and a temporary layoff rate among those with a specific qualification should be relatively small and have minimal fluctuations over the business cycle.

Conclusions

This paper explored the most representative literature on human capital and its impact on the Human Resources in Modern Economy. The literature reviews show that the qualitative dimension of human resources has an important role in a country's economic growth. In addition to investments that are made at the microeconomic level, it is needed also for the state concerns for the development of appropriate policies adequate to increase the quality of the human factor in that certain state. As Theodore Schultz and others have demonstrated, the main source of improvements in productivity through time has been the substitution of ideas, skills and knowledge for physical resources and manual labor. But the acquisition of human capital requires resources that poor people everywhere have difficulties to acquire. Because there are limited resources for human capital formation, especially in poor countries, ways must be found to enable people to acquire these resources and to use them efficiently in the production of knowledge and skills. The choosing to continue studies creates prerequisites for higher future earnings. Gary Becker in his analyses showed that people with higher education will have higher earnings than those with education in secondary schools, and the latter mentioned will earn more than those who have not managed to finish high school. The choice to continue their studies is based on cost-benefit analysis. For people with low income, mostly, costs seem to be much larger than the immediate benefits. On the other hand, investment in human capital does not aim only individual level but also at organizational and state level (in policies). From an economic point of view, transaction-costs indicate that firm gains a competitive advantage when they own firm-specific resources that cannot be copied by rivals. Thus, as the uniqueness of human capital increases, firm have incentives to invest resources into its management and the aim to reduce risks and capitalize on productive potentials. In the same time, individuals need to enhance their competency skills in order to be competitive in their organizations. Studies also clearly substantiate the fact that financial performance is positively impacted through the consideration of human capitals. State intervention through policies not only helps increase human capital, but also the state

regulations can discourage migration of individuals with above average education in poor areas in educational equity, while local investments in building human capital.

This paper represents a starting point for future research in human resources regarding human capital investment, especially for a further investigation approaching the situation of human capital in Romania.

FOREIGN DIRECT INVESTEMENTS FLOWS IN BLACK SEA ECONOMIC COOPERATION

RADU-MARCEL JOIA*

Abstract

We live in a time when the world's economy is in a constantly change. Foreign direct investments flows are in actual economy one of the most dynamic and prospective part of the world's economy being in a continuous globalization. These international financial flows determine the traders who take part at the world's economy to know to adopt a specific management in the international affairs field. We are viewers of an unprecedented expansion of foreign direct investments.

The main objective of the paper is to analyze the foreign direct investments flows in Black Sea Economic Cooperation. This study is based on UNCTAD reports and on an econometrical model which gives us the possibility to create different analysis concerning FDI flow in this cooperation. So we defined a simple regression model, in which the dependent variable is represented by Nominal and real GDP, total and per capita, variable explicated by FDI flows, using as method the Least Squared, including 19 observations. Through this paper, we tried to illustrate the relation between the FDI flows and the economic growth rate in the past years in Romania, member of Black Sea Economic region.

In line with a general upward trend in FDI to Central and Eastern Europe, inward FDI to the Russian Federation held steady between 1998 and 2001, at an annual average of $2.8 billion. In Black Sea Economic region, Russian average is the biggest one, Russia being a leader country in warding FDI. The Russian Federation is by far the leading investor country in the region, accounting for more than 75% of its annual outflows. Inward and outward direct investments flows in Russia have reached in 2009 an amount of $38,722 billion. In Romania, following years of stagnation at very low levels, 1991 to 1997, FDI flows reached $1.1 billion in 2002. Inflows to Bulgaria peaked at $1 billion in 2000; the surge is largely due to flows from developed countries. Inward and outward direct investments flows in Romania has reached the highest level in 2008, when the total amount was $13,909 billion, in 2009, the world crisis, has influenced the trends in Romania, so the flows have reached only $6,329 billion.

So our analyze is based on seeing the evolution of the FDI flows in this economic region, specifically the case of Romania and based on the results of the Least Squared method we will extract some conclusions concerning the dependency that exists between FDI flows and GDP.

Keywords: *FDI flows, Black Sea Economic Cooperation, inward and outward of FDI, economical growth rate, Nominal and real GDP, total and per capita.*

1. Introduction

Investments are a part of GDP, is one element that determines a country's economic growth. As we know, from a macro perspective, there are two types of economic disparities, the expansionary gap respectively a recession one. When we have an expansionary gap, it is characterized by heating of the economy, all the components of GDP is rising. Over time, Romania has gone through the gaps so expansionary, but also gap characterized by recession. The period 2004-2008 was an expansionary economic cycle, and this is illustrated by the size of FDI flows in our country.

In 1992, Romania together with 11 other BSEC countries formed an organization in Eastern Europe, which wants to bring harmony from demographic and economic point of view, especially in this region with great growth potential. Becoming chairman of the BSEC, Romania wants to promote and to develop the region, respecting economic and social principles. The FDI flows analysis is based on the statistical databases extracted from the UNCTAD website, actual data that demonstrate that

* Ph. Candidate, Assistant, Nicolae Titulescu University, Bucharest, (e-mail: radu.joia@univnt ro).

this organization, representative for Black Sea region is one with a huge economic potential, FDI flows reaching impressive values. We chose as an example of our detailed analysis, Romania, a representative country for this organization, along with Russia, motivated also by the fact that at present it holds the presidency of this global organization.

Principles and areas of cooperation in the Black Sea Economic Cooperation

The 25th June 1992 was the date when the Heads of State and Government of eleven countries: Albania, Armenia, Azerbaijan, Bulgaria, Georgia, Greece, Moldova, Romania, the Russian Federation, Turkey and Ukraine signed in Istanbul the Summit Declaration and the Bosphorus Statement giving birth to the Black Sea Economic Cooperation (BSEC).

It came into existence as a unique and promising model of multilateral political and economic initiative aimed at fostering interaction and harmony among the Member States, as well as to ensure peace, stability and prosperity encouraging friendly and good-neighbourly relations in the Black Sea region.

The BSEC Headquarters - the Permanent International Secretariat of the Organization of the Black Sea Economic Cooperation (BSEC PERMIS) - was established in March 1994 in Istanbul. With the entry into force of its Charter on 1 May 1999, BSEC acquired international legal identity and was transformed into a full-fledged regional economic organization: **ORGANIZATION OF THE BLACK SEA ECONOMIC COOPERATION.** With the accession of Serbia and Montenegro in April 2004, the Organization's Member States increased to twelve member state.

Through this declaration the Founding members determined to promote a lasting and closer cooperation among the states of BSEC Region, conscious of the growing role importance of regional initiatives in promoting progress and shaping contemporary international life. This cooperation is first of all an economical one, aware of the potential of the Founding Members and the opportunities for enhancing the mutually advantageous economic cooperation.

This cooperation share the common vision of the Founding Members of their regional cooperation as a part of the integration process in Europe, based on human rights and fundamental freedoms, prosperity through economic liberty, social justice, and equal security and stability which is open for interaction with other countries, regional initiatives and international organizations and financial institutions.

This organization is determined to resolve economic cooperation as a contribution to the achievement of a higher degree of integration of the Founding Members into the world economy, expressing the desire of their countries and people for constructive and fruitful collaboration in wide ranging fields of economic activity with the aim of turning the BSEC Region into one of peace, stability and prosperity.

Which are the principles and the objectives of this organization? The following principles and objectives shall be promoted through the BSEC activities at various levels:

- to act in a spirit of friendship and good neighborliness and enhance mutual respect and confidence, dialogue and cooperation among the Member States;
- to further develop and diversify bilateral and multilateral cooperation on the basis of the principles and rules of international law;
- to act for improving the business environment and promoting individual and collective initiative of the enterprises and companies directly involved in the process of economic cooperation;
- to develop economic collaboration in a manner not contravening the inter-national obligations of the Member States including those deriving from their membership to international organizations or institutions of an integrative or other nature and not preventing the promotion of their relations with third parties;
- to take into account the specific economic conditions and interests of the Member States involved;

• to further encourage the participation in the BSEC process of economic cooperation of other interested states, international economic and financial institutions as well as enterprises and companies[1].

In accordance with the agreed principles and with the aim of utilizing more effectively their human, natural and other resources for attaining a sustained growth of their national economies and the social well-being of their peoples, the Member States shall cooperate in the following areas: *trade and economic development*, banking and finance, communications, energy, transport, agriculture and agro-industry, health care and pharmaceutics, environmental protection, tourism, science and technology, exchange of statistical data and economic information, collaboration between customs and other border authorities, human contacts, combating organized crime, illicit trafficking of drugs, weapons and radioactive materials, all acts of terrorism and illegal migration, or in any other related area, following a decision of the Council.

Romanian chairmanship of the organization of the black sea economic cooperation

BSEC is a regional organization whose principles and objectives aimed at developing and diversifying the bilateral and multilateral economic cooperation based on principles and norms of international law. In order to accomplish these objectives, the BSEC is working to improve the business environment and promoting individual and collective initiatives of companies involved in economic cooperation.

Romania considers that the political valences of the intrinsic organization and a solid economic cooperation and dialogue, including at political level, creates a solid basis for cooperation of the BSEC Member States and the region. Thus, good neighborly relations, mutual trust, dialogue and cooperation between Member States, are characteristics for BSEC.

Wider Black Sea Region has a considerable human and economic potential, whose effective use may also help to overcome the negative effects of international economic context. The strategic position of the BSEC Member States defines the Black Sea area as a hub of transport corridors and trade routes. However, the region has substantial natural resources, including energy. These arguments explain the growing international interest to the region.

BSEC was among the first initiatives launched in the Black Sea on 25 June 1992, when Heads of State or Government of eleven countries - Albania, Armenia, Azerbaijan, Bulgaria, Georgia, Greece, Moldova, Romania, Russian Federation, Turkey and Ukraine signed the "Istanbul Declaration". With the entry into force of its Charter on 1 May 1999, BSEC acquired international organization status, becoming an economical cooperation organization the most representative and well developed from an institutional perspective, for a geographical area of 20 million square kilometers (Black Sea littoral states, the Balkans and the Caucasus).

Along with its economic mission defined by the statutory documents, the BSEC is a useful platform for meetings and consultations at various levels, bringing a distinct contribution, implicit in the BSEC regional confidence building. As EU member states from the Black Sea region (along with Bulgaria and Greece) and the BSEC founding state, the fundamental premise of **chairmanship of the organization of the black sea economic cooperation** from Romania, based on the organization's governing documents, is to **increase cooperation and dialogue with BSEC**, both to strengthen and increase economic cooperation and to achieve a positive impact on relations between all Member States.

Prior to the current mandate of **chairmanship of the organization of the black sea economic cooperation** which will be exercised during the period January to June 2011, Romania has also held similar qualities in 1996, 2000, 2006.

[1] Charter of the Organization of the Black Sea Economic Cooperation, The Charter entered into force on 1 May 1999.

The dominant actions of Romania in BSEC has been and will continue to be full participation in economic projects whose effects are multiplied and added value certain activities on all sizes and all BSEC members.

Thus, Romania's actions as **chairman** of BSEC will pursue revitalization of economic cooperation, and emphasizing practical results-oriented nature of the organization's projects.

2. FDI flows in Black Sea Economic Cooperation

BSEC is one of the most important organizations in Eastern Europe, and it is included in UNCTAD statistics concerning economical growth. We tried to analyze the FDI flows in this region. So as we can see, in Table 1 we have all the data concerning FDI flows for the 12 countries which are members of Black Sea Economic Cooperation. The source of the data is UNCTAD statistics and reports; the data is presented from 1990 to 2009. So we presented 19 observations, for each year and for each country the FDI flows.

After making a brief analyze on Table 1 we can observe that from 1990 to 2009, only Greece and Turkey have had constantly inward and outward foreign direct investments and the biggest flows as we can see are in Russia. So in BSEC, Russian Federation has a very big influence concerning the FDI flows and the economical situation. If we compare each year starting with 2000 we can see that Russia has a leadership position in inward and outward investments.

Table 1 – FDI flows in Black Sea Economic Cooperation 1980-2009

Year/ Economy	Albania	Armenia	Azerbaijan	Bulgaria	Georgia	Greece	Moldova	Romania	Russia	Serbia	Turkey	Ukraine
1990	0	0	0	4	0	1.005	0	**0**	**0**	0	684	0

Source: Data extracted from UNCTAD statistics (http://unctadstat.unctad.org/TableViewer/tableView.aspx)

"2006 was a year when FDI flows have raised significantly compared to previous years, which makes it a reference year. During this period, inflows into developed countries increased by 47%, reaching a turnover of $ 857 billion, those to developing countries increased by 21% and in the process of transition towards a market economy increased by 68%, record growth rates for this category of countries..... And with regard to Eastern Europe, Russian Federation is the most significant host country of these investment flows."[2]

In Figure 1, we selected from the Table 1 the countries more significant, Greece and Turkey, because this two countries have had constantly FDI flows during 29 years, from 1980 to 2009, and Romania and Russian Federation, because both having direct contact with Black Sea had the opportunity to attract more FDI. We selected Russia because it is the leader of FDI flows in this economical region.

"2007 was a year of steady growth of FDI, even though in its second half the financial crisis began. As a result we can say that globally FDI flows rose by 30% to a rate of $ 2.063 billion. In addition, reinvested profits accounted for 30% of total FDI."[3] As the authors of this article said, 2007 was an year of expansion of FDI; as we can see in Figure 1, starting with 2006 and 2007, FDI flows in this region have growned, the most significant growth being in Russia in 2008, followed by Turkey and Romania in the same year. Globally "2008 marks the end of a cycle of expansion of foreign direct investment, cycle that began in 2004"[4]. As we can see from Table 1 in 2009 all the FDI flows are affected comparing with the expansion from 2004 to 2008.

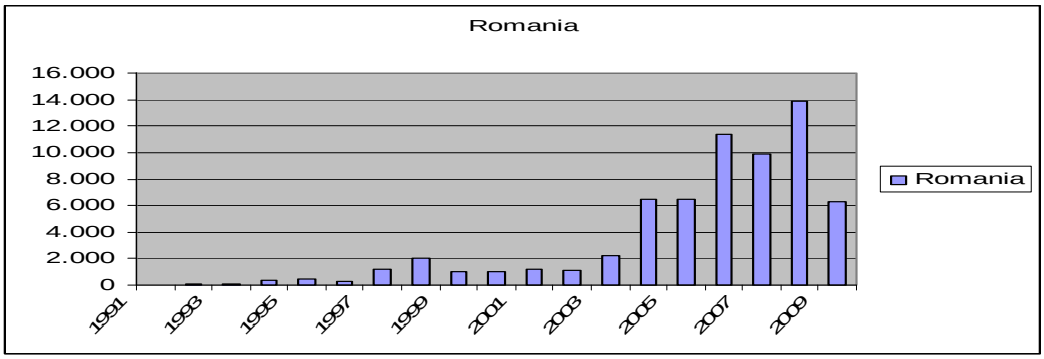
[4] Idem.

2009 was a year of considerable reduction in the FDI flows area, continuing their trend to be like in 2008, according to UNCTAD, World Investment Prospects Survey 2009-2011, June 2009. In 2009, FDI flows fell by 46% over the same period of 2008 in emerging countries. The 4 analyzed countries are in this category, developing ones. The results of 2009 show negative effects of FDI flows, their reduction being a drastic one, as we can see from Table 1.

Now we will make an analysis on Romania, to see the evolution of FDI flows, as one of the most important members of BSEC.

Figure 2 – FDI flows 1991-2009



In terms of our country, we can expect the upward trend of FDI from 2004 to 2008 is preserved, so this can be seen in Figure 2 and in Table 1. Year 2004 brings a great increase in foreign investment flows in our country, their value tripling over the previous year. This cycle of four years of expansion of FDI has led to considerable economic growth seen in the value of the gross domestic product, the main indicator of economical growth. This time, a period of economic expansion, by a macroeconomic point of view, an expansionary gap, a heating of the economy, which has been determined also by the growth of FDI flows.

Peak reached in terms of attraction, namely the direct foreign investment, was the 2006 and 2008, when the flows have reached impressive values, if we compare our values with other's BSEC countries. Romania is part of the leading countries in terms of expansion of FDI flows, together with Russia, the leader, and Turkey (see in Table 1). But the global economic crisis in this region makes its appearance later, and in 2009, full year of recession, its impact is felt. In Romania, FDI flows, reached half of the value from the previous year, effectively halving the share of the value recorded in the previous period, the growth indicator has recorded a disappointing value compared with previous years, years of heating of the economy.

Based on data presented in Table 2, data extracted from UNCTAD.org, we made a small econometric analysis on the dependency that exists between FDI flows and Nominal and real GDP, total and per capita. We created a simple regression model, where the dependent variable is Nominal and real GDP, total and per capita, and the independent or explanatory variable is represented by the value of FDI flows. In this model we wanted to analyze whether a positive or negative change in flows determines in what proportion the GDP.

Table 2 – Real GDP vs. FDI flows

Year	Nominal and real GDP, total and per capita (US Dollars at current prices and current exchange rates in millions)	FDI flows (US Dollars at current prices and current exchange rates in millions)
1991	29.054,33	40
1992	19.715,60	77
1993	26.546,04	94
1994	30.283,94	341
1995	35.726,50	419
1996	35.563,02	263
1997	35.533,25	1.215

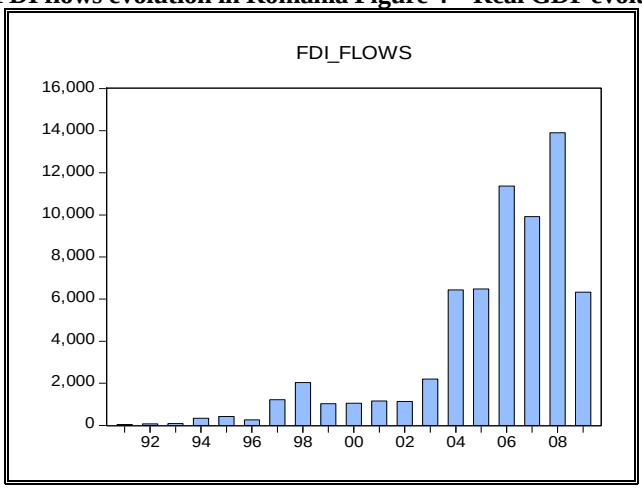
Source: Data extracted from UNCTAD statistics (http://unctadstat.unctad.org/TableViewer/tableView.aspx

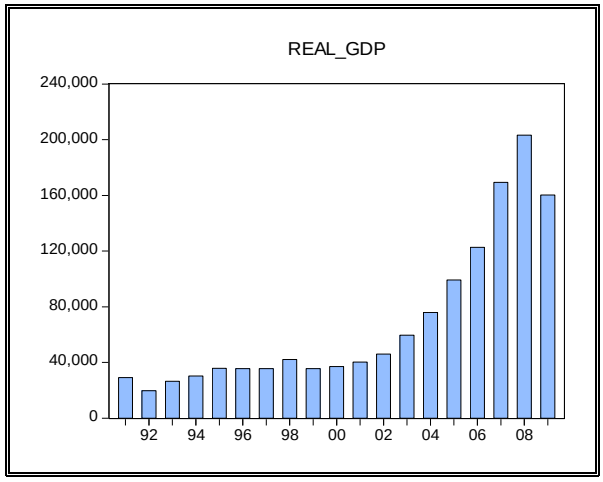
We analyzed the economic period since 1991, because until 1990, Romania hasn't been an open economy, because of the political system. Beginning with 1990, Romania started to attract investment flows. If performing a brief analysis of the data presented in Table 2 we can see that starting from 1991 to 1998 there is an upward trend of FDI flows. 1999 represents a break, halving the amount of FDI flows since 1998 and remain stable for a certain period of time. Of course this can be explained by political factors that influenced in a greater measure the FDI flows.

Phenomena that have occurred internationally with FDI flows, namely, their growth in the business cycle 2004 - 2008 are held in Romania too (see in Figure 3). According to statistics provided by UNCTAD, we can observe that 2004 is a year in which the FDI flows have tripled the amount recorded in 2003, following an upward trend and in 2006 they reached an impressive value, same in 2008. So our strong FDI's glory years are 2006 and 2008. Unfortunately, the economic crisis hasn't prevented our country and 2009 is a year in which its effects are felt, FDI is affected.

Looking at Figures 3 and 4, we can see that every change in FDI flows will lead to a modification of the GDP, which we underline a significant dependence between the two variables.

Figure 3 – FDI flows evolution in Romania Figure 4 – Real GDP evolution in Romania





Simple regression model is widely used in applications of economic theory, but we chose the model application to the existence of a linear relationship between real GDP and FDI Flows. As mentioned above, real GDP is explained variable and FDI Flows is an explanatory variable or independent. The model has been defined by the following equation:

REAL_GDP i = bi + a FDI_FLOWS i + ε i, where:

- ✓ **REAL_GDP** - Nominal and real GDP, total and per capita – dependent variable;
- ✓ **REAL_GDP i** - Nominal and real GDP, total and per capita share;
- ✓ **FDI_FLOWS** – FDI flows – independent or explanatory variable;
- ✓ **FDI_FLOWS i** – FDI flows share;
- ✓ a, b – model parametres;
- ✓ ε = residual variable;
- ✓ i = 1.....19

This model is analyzed by the simple regression method in conditions which do not specify the existence of other exogenous variables that depend on real GDP. In the conduct of research we needed more data series, so by default and data sources. Thus, we sought statistical database on the UNCTAD website.

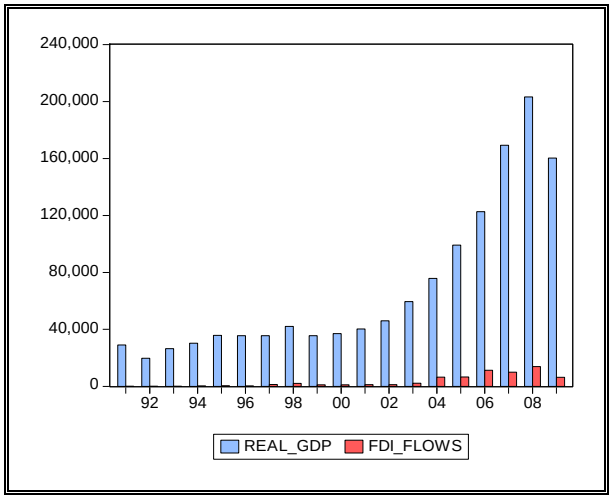
To determine the previous econometric model, by estimating two parameters, bi, a, are needed real databases for the two variables REAL_GDPi and FDI_FLOWSi. The data series used are those corresponding to Table 2. Data series are designed for a total of 19 years, from 1991 to 2009, so there are 19 observations, i = 1 ....19.

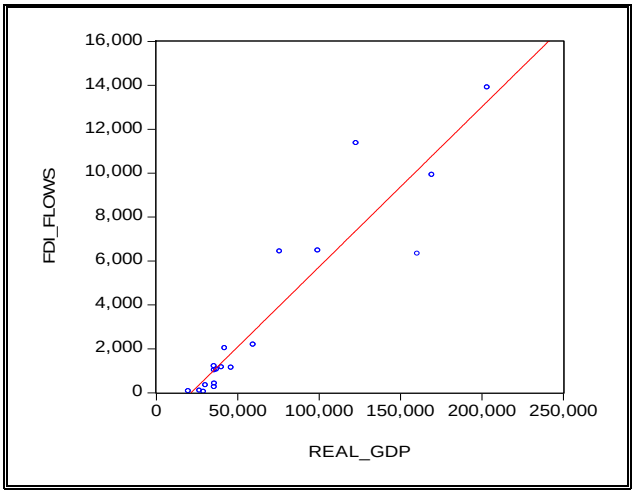
Data on real GDP and FDI flows have annual frequency refers to Romania during 1991-2009, and did not need any transformation. Units of measurement for both variables are U.S. Dollars at current prices and current exchange rates in millions. The two data sets are used to calculate descriptive indicators, development of graphics and statistical estimation. To obtain the required characteristics of the original series regression model requires no additional processing in this case.

Based on the data series can make graphics, data interpretation (see in Figure 3 and 4). Depending on the measurement scale that is each feature, we can calculate a number of descriptive indicators, alternative indicators to describe and characterize the shape distribution. These indicators can be calculated separately for each variable or several variables simultaneously. Equally, we can develop a histogram.

For a better illustration of the evolution of both explained and explanatory variables we created different graphs, illustrated in Figure 5 and 6.

Figure 5 – Real GDP vs. FDI flows Figure 6 – Scatter with Regression





Thus, in Figure 6 we can observe the linear dependence that exists between real GDP and FDI flows. Such an explanatory variable affects real GDP in a proportion of 87.80%, according to calculations made through **Least Squares Method,** calculations illustrated in Table 3.

Table 3 - Least Squares Method

Dependent Variable: REAL GDP				
Method: Least Squares				
Sample: 1991 2009				
Included observations: 19				
	Coefficient	Std. Error	t-Statistic	Prob.
FDI FLOWS	12.04560	1.088876	**11.06242**	0.0000
C	27071.14	5912.561	4.578581	0.0003
R-squared	**0.878029**	Mean dependent var		68598.74
Adjusted R-squared	**0.870854**	S.D. dependent var		55406.32
S.E. of regression	19911.32	Akaike info criterion		22.73526
Sum squared resid	6.74E+09	Schwarz criterion		22.83468
Log likelihood	-213.9850	Hannan-Quinn criter.		22.75209
F-statistic	**122.3770**	Durbin-Watson stat		1.480325
Prob(F-statistic)	0.000000			

Following the interpretation of these results, the GDP variation depends on a ratio of 87.80% by the FDI flows. Real GDP is equal to 12.04560 x FDI_FLOWS + 27071.14.

We can see that the parameters are significantly different from zero, so that when p = 0, F is 122.3770, so the model is valid. After the calculations are done we can observe:

- regression slope value is 12.04560, statistically higher than 1, which does not show a marginal propensity to make investments; if the slope was less than 1, had a marginal propensity to investment, the slope is positive, so the parameters are significant and is a significant dependence between variables, it showed also by the value of R-squared, which is 0.878029, an addiction of 87.80% between the two variables analyzed;
- FDI_FLOWS coefficient and C coefficient are different from zero, rejecting the null hypothesis, t-statistic evaluation (high in both cases) and P-value equal to 0;
- Between the value of F statistics and t, which corresponds to the regression slope, check that relationship, t2 = F (11.06242 squared = 122.3770).
- From small values of the calculated probabilities and from those of t student statistics we reject the null hypothesis and conclude that the parameters are significant.
- The value of Adjusted R-squared shows that the dependent variable variation is explained 87.08% by the model.
- F test or Fisher Test has more meanings: F-statistic has a high value, of 122.3770, and the probability calculated for F-statistic is 0, so our regression model is correct, confirmed by the R-squared and Adjusted R-squared, which have values close to 1.
- R squared/Adjusted R shows the dependent variable variation R squared = **0.878029,** which means that FDI_FLOWS explain 87.80% of REAL_GDP variation.
- Durbin Watson test - we can verify the hypothesis of autocorrelation. It is better if this value is close to "2", because the relationship with first order autocorrelation coefficient r or ρ = DW = 2 (1-r). The coefficient measures the connection / correlation / dependency between two variables. The value of Durbin Watson statistic is 1.480325, close to 2, which indicates that errors are independent and leads to the conclusion that the dependency equation is correctly specified.

As a conclusion to our analyze we can say that following years of stagnation at very low levels, FDI flows to Romania suddenly jumped to more than US$ 1 billion in 1997 and remained around that level through 2001 (see table 2). Accordingly, the country's FDI stock rose eight-fold during the second half of the 1990s to reach about US$ 7 billion in 2000 (see table 4), the fifth largest in size in Central and Eastern Europe. As we can see, 9 years later, Romania achieved a stock of FDI of US$ 73.983 billion in 2009, Russia being the Leader with US$ 252.456 billion.

Table 4 – FDI stock in BSEC

Source: Data extracted from UNCTAD statistics (http://unctadstat.unctad.org/TableViewer/tableView.aspx

As we could see in the econometrical model, there is a significant dependence between the GDP and the FDI flows. Our model is based on real database and we could see that in proportion of 87.80%, the GDP is explained by the FDI flows. That means that the FDI flows not only has an influence on GDP value, but also their proportion during the time has gowned. In a next paper we will analyze the relation between FDI stock and GDP, to see if there is any difference.

3. Conclusions

Black Sea Economic Cooperation is a regional organization whose principles and objectives are developing and diversifying the geographical region, with such an amazing economical potential. First of all this organization has an economical purpose, more that social and demographical.

Romania considers that good neighborly relations, mutual trust, dialogue and cooperation between Member States, are characteristics for BSEC. Black Sea Region has a considerable human and economic potential, whose effective use may also help to overcome the negative effects of international economic context. The strategic position of the BSEC Member States defines the Black Sea area as a hub of transport corridors and trade routes. However, the region has substantial natural resources, including energy. These arguments explain the growing international interest to the region.

In terms of our country, Romania, the FDI flows from 2004 to 2008 increased. This cycle of four years of expansion of FDI has led to considerable economic growth seen in the value of the gross domestic product, the main indicator of economical growth. This time, a period of economic expansion, by a macroeconomic point of view, an expansionary gap, a heating of the economy, which has been determined also by the growth of FDI flows.

Peak reached in terms of attraction, namely the direct foreign investment, was the 2006 and 2008, when the flows have reached impressive values, if we compare our values with other's BSEC countries. Romania is part of the leading countries in terms of expansion of FDI flows, together with Russia, the leader, and Turkey. 2009 was a year of considerable reduction in the FDI flows area. In 2009, FDI flows fell by 46% over the same period of 2008 in emerging countries.

We made a small econometric analysis on the dependency that exists between FDI flows and Nominal and real GDP, total and per capita. We could see in the econometrical model, there is a significant dependence between the GDP and the FDI flows. Our model is based on real database and we could see that in proportion of 87.80%, the GDP is explained by the FDI flows. That means that the FDI flows not only has an influence on GDP value, but also their proportion during the time has gowned. In a next paper we will analyze the relation between FDI stock and GDP, to see if there is any difference.

THE IMPORTANCE OF GOODS PRODUCTION AND INTERMEDIATE CONSUMPTION FOR AN INCREASED GDP

RADU-MARCEL JOIA*

Abstract
Human existence is conditioned, of course, by the consumption of goods to meet the needs. Using the property to obtain other goods in this way is not consumption, but production. Goods that are the object of consumption can be natural or economic (created or produced by man). The natural goods that we can find in the human consumption, even if there are extremely important, there are not the subject of our attention because they are a gift of nature. In economics, the effect that a good is predicted to have during or after it is consumed is designated by the term of utility. In the context of a severe economic crisis, which determines a real sacrifice of consumer's wishes, under the impact of budgetary constraint, the utility and the consumer optimum suffer various modifications.
Increasingly limited resources and low incomes lead to more people sacrifices concerning the goods that they will consume, respectively purchase. So we consume less, we produce less, causing a reduction in GDP. The economical crisis, through its effects has changed the people consumption habitudes by editing it according to the available resources. Manufacturers, in the absence of profits will be forced to find new solutions to attract consumers.
The main objective of this paper is to highlight the relationship that exists between the consumption, goods and services production and GDP. In terms of economics, the goods and services production and intermediate consumption directly influence GDP, as two independent variables and dependent GDP. We performed a simple regression model based on a series of data in Romania, during 1995-2009, to evidence the importance of the two independent variables in obtaining an increased GDP.

Keywords: goods and services production, intermediate consumption, increased GDP, budgetary constraint, economical crisis.

1. Introduction

Man and society, to exist, are forced to satisfy the needs and because nature provides ready-made only a little of the necessary, they must ensure all the others. The activities of all kinds through which people achieve the necessary form economic activity or economics. In essence, these are acts or transactions that are exercised by the people and nature together forming together the economy (of one area, one country, one region etc..). What causes people to act economically are: insufficient resources that nature provides ready-made, the needs while in time are growing and diversifying.

Needs are demands determined by the nature or by the social life. They represent the aspirations, expectations or human's unfulfilled desires. The needs nature and intensity are different in time and space. There are individual, collective and social needs; they are felt by each person in every way and in different intensities; the needs are different both in terms of how we perceive them and how to meet them. In comparison with the limited means the people have to meet their needs, they are much bigger and different and tend to grow and diversify quickest than the means of satisfying them. Resource limits are permanent but fluctuating in time.

Resources are the means of any kind which serve to satisfy needs or, depending on the progress of science, art and technology, are likely to serve this purpose. They are designed as both consumption and production (economic activities). In essence, resources are assets. Some resources are used directly in individual consumption, others are used in economic activities and there is another category used to make resources reserves.

2. The dependence between GDP and goods production and intermediate consumption

Simple regression model is concerned with describing and evaluating the relationship between a dependent variable and one or more independent variables. Analyzed using regression functions, called regression functions, how the variable outcome (dependent) evolves in relation to changing one or more known variables (independent). The general form of the simple regression model: $f(x) = \alpha + \beta x$, where α, β are the parameters of linear regression function. If addiction is a stochastic, then: $y = f(x) + \varepsilon$, where ε is called error of significance and has a known probability distribution - is a random variable.

We created a simple regression model through which we tried to explore one of the most important economic aggregates, namely GDP. For this application we chose the GDP calculated by the method of production. In the application GDP calculated by the method of production is denoted by PIB_PR, representing the dependent variable. Through this application we tried to analyze the influence the production of goods and services (PBS) has on GDP calculated by the method of production. So in other words independent variable, the dependent variable is influencing the production of goods and services, denoted by PBS.

We defined a simple regression model, in which the estimated variable is represented by PIB_PR and explanatory variable is PBS. Of course GDP calculated by the method of production is also affected by other variables such as intermediate consumption, for example, the variable will be analyzed in another application, also through a simple regression model. We could estimate the dependence using a multiple regression model, but we want to show each independent variable influence on GDP, separately.

The decision to analyze the relationship between GDP by production method and the actual production of goods and services was taken from the study of two macroeconomic reference books. Depending on the method that underlies its determination, the GDP can be defined in three ways: GDP by production approach, GDP by expenditure approach and the income approach GDP. GDP represents the value calculated by the method of production of goods and services for final consumption, intermediate consumption being excluded, within a country, is a flow variable representing the sum of gross value added (GVA) carried out within the national economy, the rule of GDP site calculated at market prices, which include indirect taxes and excise taxes. In other words, we can observe other variables that influence the dependent variable in our model.

Simple regression model is widely used in applications of economic theory, but we chose the model application to the existence of a linear relationship between PIB_PR and PBS. As mentioned above, is PIB_PR represents GDP calculated by the method of production, explained variable, and PBS is the production of goods and services, representing the explanatory or independent variable. The model has been defined by the following equation:

$$\mathbf{PIB\_PR\ i = bi + a\ PBS + \varepsilon\ i,}$$

- ✓ PIB_PR – GDP calculated by the method of production - the dependent variable;
- ✓ PIB_PRi – GDP share calculated by the method of production;
- ✓ PBS – production of goods and services - independent variable;
- ✓ PBSi – production of goods and services share;
- ✓ a, b – model parameters;
- ✓ ε = residual variable;
- ✓ i = 1.....15

This model is analyzed by simple regression model in conditions which we do not specify the existence of other exogenous variables on which the GDP by production method depends. In the conduct of the research, I needed more data series. Thus, we sought statistical databases on various specialized websites, especially the annual statistical yearbooks.

To determine the previous econometric model, by estimating two parameters, bi and a, there are needed real data sets for the two variable PIB_PRi and PBSi. The data series used are those for GDP and production of goods and services, imported after processing in Excel and displayed in the table. 1. Data series are designed for a total of 15 years, from 1995 until 2009, so there are 15 observations, i = 1.... 15.

Table 1 – GDP by production method and production of goods and services evolution from 1995 until 2009, in Romania

AN	PIB_PR	PBS
1995	**7648,9**	**16004**
1996	**11384,2**	**25354,4**
1997	**25529,8**	**54366,2**
1998	**37055,1**	**71346,2**

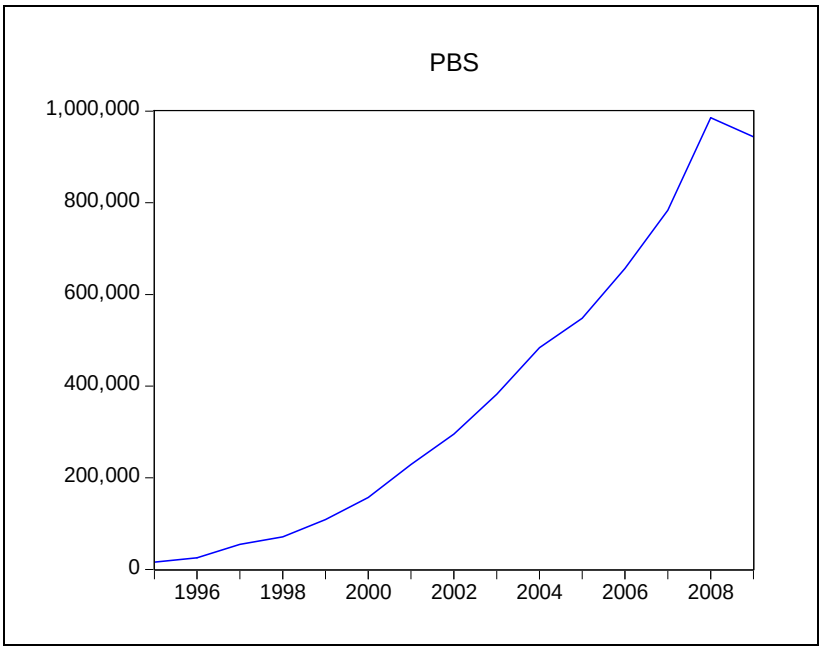
2009	**491273,7**	**943867,3**

Source: National Statistic Institution, www.insse ro

Data on GDP and the production of goods and services have annual frequency refers to Romania during 1995-2009, and did not need any transformation. Units of measurement for both variables are million. The two data sets are used to calculate descriptive indicators, development of graphics and statistical estimation. To obtain the required characteristics of the original series regression model requires no additional processing in this case.

Based on the data series can make graphics for data interpretation. Depending on the measurement scale that is each feature, we can calculate a number of descriptive indicators, such as average, minimum and maximum outliers, alternative indicators to describe and characterize the shape distribution. These indicators can be calculated separately for each variable or several variables simultaneously. Equally, we can develop and histogram.



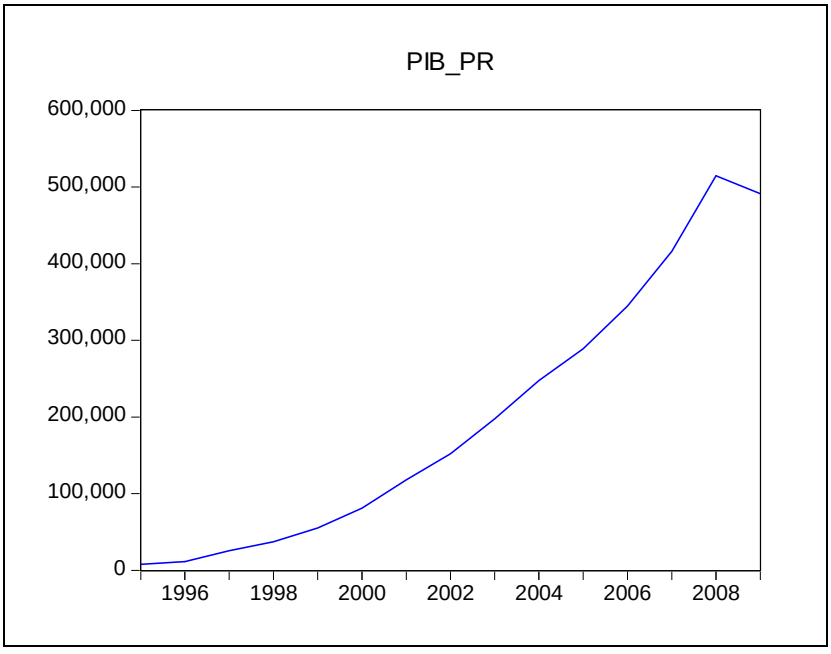


Figure 1: PBS evolution from 1995 until 2009 Figure 2: PIB_PR evolution from 1995 until 2009

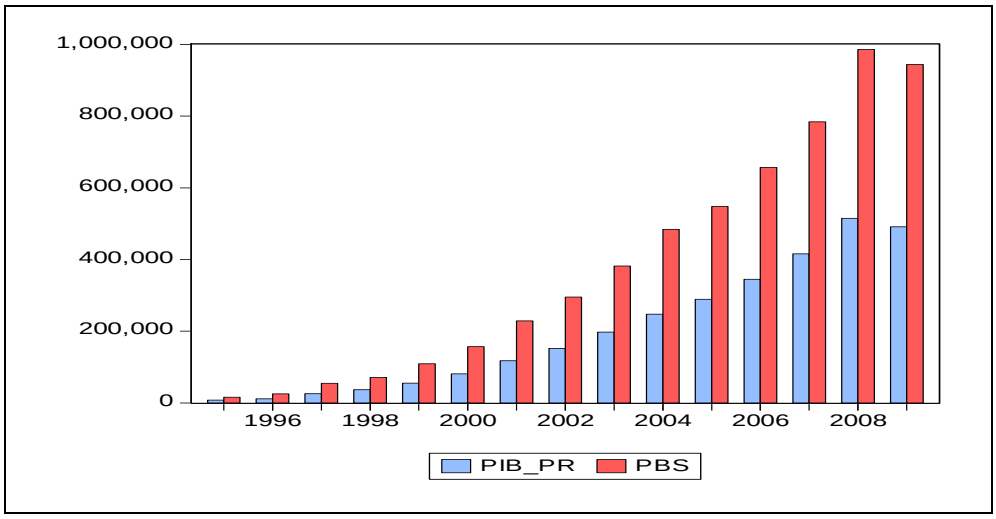
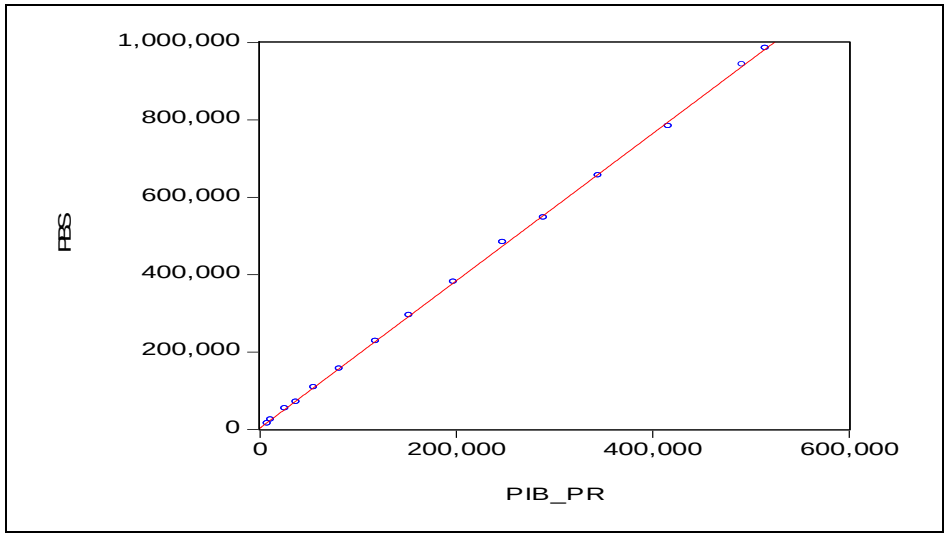
For a better illustration of the evolution of both explained and explanatory variables we created the following graph:

Figure 3: PIB_PR and PBS evolution from 1995 until 2009



After elaborating the histogram we can say that the two variables are highly dependent on one another, PBS greatly influencing PIB_PR, demonstrated by Adjusted R-squared that shows that the variation of the dependent variable is explained by the model rate of 99.97%. This shows the dependence between two variables.

Figure 4: PIB_PR vs. PBS



Following the interpretation of these results, the variation of GDP calculated by the method depends on the production rate of 99.97% in the production of goods and services. GDP by production approach is equal to 0.525499 x PBS - 1917.091. This equation reveals that between 1995 - 2009 minimum production of goods and services was 1917.091 million annually.

We can see that the parameters are significantly different from zero, so that when p = 0, F is 62809.83, so the model is valid. So we can say that the production of goods and services determine a rate of 99.97% variation PIB_PR.

Since the dependence between the independent and dependent variable in the model analysis, we conducted other tests on the explanatory variable. So we conducted an analysis to see if PBS is normally distributed.

Table 2 - Empirical Distribution Test for PBS

Empirical Distribution Test for PBS				
Sample: 1995 2009				
Included observations: 15				
Method	**Value**	**Adj. Value**	**Probability**	
Lilliefors (D)	0.149528	NA	> 0.1	
Cramer-von Mises (W2)	0.077164	0.079736	0.2089	
Watson (U2)	0.071135	0.073507	0.2186

SIGMA	335535.0	63410.16	5.291503	0.0000
Log likelihood	-211.6363	Mean dependent var.		382734.2
No. of Coefficients	2	S.D. dependent var.		335535.0

We used the method of least squares for **PIB_PR i = bi + a PBS + ε i** and got:

Table 3 - Method: Least Squares

Dependent Variable: PIB_PR				
Method: Least Squares				
Sample: 1995 2009				
Included observations: 15				
	Coefficient	**Std. Error**	**t-Statistic**	**Prob.**
PBS	**0.525499**	0.002097	**250.6189**	0.0000
C	-1917.091	1051.675	-1.822892	0.0914
R-squared	**0.999793**	Mean dependent var		199209.2
Adjusted R-squared	**0.999777**	S.D. dependent var		176341.4
S.E. of regression	2632.447	Akaike info criterion		18.71278

Sum squared resid	90087116	Schwarz criterion	18.80719
Log likelihood	-138.3459	Hannan-Quinn criter.	18.71178
F-statistic	**62809.83**	Durbin-Watson stat	1.854276
Prob(F-statistic)	0.000000		

After the calculations are done we can observe:

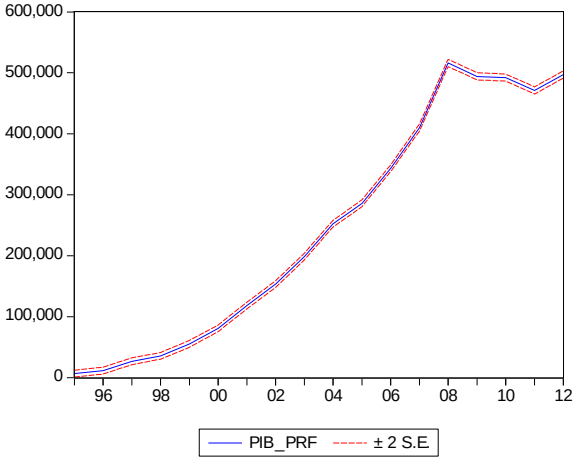
- regression slope value is 0.525499, statistically lower than 1, which show a marginal propensity to product; if the slope is less than 1, it has a marginal propensity to production, the slope is positive, so the parameters are significant and is a significant dependence between variables, it showed also by the value of R-squared, which is 0.999793, an addiction of 99.97% between the two variables analyzed;
- PBS coefficient and C coefficient is different from zero, rejecting the null hypothesis, t-statistic evaluation (high in both cases) and P-value equal to 0;
- Between the value of F statistics and t, which corresponds to the regression slope, check that relationship, t2 = F (250.6189 squared = 62809.83).
- From small values of the calculated probabilities and from those of t student statistics we reject the null hypothesis and conclude that the parameters are significant.
- The value of Adjusted R-squared shows that the dependent variable variation is explained 99.97% by the model.
- F test or Fisher Test has more meanings: F-statistic has a high value, of 62809.83, and the probability calculated for F-statistic is 0, so our regression model is correct, confirmed by the R-squared and Adjusted R-squared, which have values close to 1.
- R squared/Adjusted R shows the dependent variable variation R squared = **0.999793,** which means that PBS explain 99.97% of PIB_PR variation;
- Durbin Watson test - we can verify the hypothesis of autocorrelation. It is better if this value is close to "2", because the relationship with first order autocorrelation coefficient r or ρ = DW = 2 (1-r). The coefficient measures the connection / correlation / dependency between two variables. The value of Durbin Watson statistic is 1.854276, close to 2, which indicates that errors are independent and leads to the conclusion that the dependency equation is correctly specified.

Predicted values of GDP if the production will be 940,000.0, 900,000.0, and 950,000.0 in the next three years are presented in Figure 5. To this end we have covered these steps:

- We resized the data series by introducing three values for the following 3 years, range from 15 to baseline values will be 18 by the command: proc / structure / resize, we introduced the three prospective data;

- We expected the three values of GDP, depending on the values set for the production forecast command. In our case we obtain the following chart:

Figure 5 – Forecast GDP 2012



Forecast: PIB_PRF
Actual: PIB_PR
Forecast sample: 1995 2012
Included observations: 15

Root Mean Squared Error	2450.675
Mean Absolute Error	1804.273
Mean Abs. Percent Error	2.140805
Theil Inequality Coefficient	0.004675
Bias Proportion	0.000000
Variance Proportion	0.000052
Covariance Proportion	0.999948

Upon implementation of this process, we can see that the dependency relationship between two variables is very close. On a fall PBS, GDP will register a decrease and an increase in the explanatory variable, will be its growth. In other words we can conclude that the two variables are directly proportional, increasing and decreasing in the same way.

Our model was made also for the intermediate consumption. We created the same model, where the only difference was the explanatory variable, which was the intermediate consumption. We used the data from the National Statistic Institute for the same period and we got the following results. We started our analysis based on the following equation:

PIB_PR i = bi + a CI + ε i,

- ✓ PIB_PR – GDP calculated by the method of production - the dependent variable;
- ✓ PIB_PRi – GDP share calculated by the method of production;
- ✓ CI – intermediate consumption - independent variable;
- ✓ CIi – intermediate consumption share;
- ✓ a, b – model parameters;
- ✓ ε = residual variable;
- ✓ i = 1.....15

The results are presented in Table 4.

Table 4 - Method: Least Squares

Dependent Variable: PIB_PR				
Method: Least Squares				
Sample: 1995 2009				
Included observations: 15				
	Coefficient	Std. Error	t-Statistic	Prob.

CI	0.987052	0.005935	**166.3173**	0.0000
C	-3225.837	1590.667	-2.027978	0.0636
R-squared	**0.999530**	Mean dependent var		199209.2
Adjusted R-squared	0.999494	S.D. dependent var		176341.4
S.E. of regression	3966.241	Akaike info criterion		19.53259
Sum squared resid	2.05E+08	Schwarz criterion		19.62700
Log likelihood	-144.4944	Hannan-Quinn criter.		19.53159
F-statistic	**27661.43**	Durbin-Watson stat		**2.189366**
Prob(F-statistic)	0.000000			

After the calculations are done we can observe:

- regression slope value is 0.987052, statistically lower than 1, which show a marginal propensity to consumption; if the slope is less than 1, it has a marginal propensity to consumption, the slope is positive, so the parameters are significant and is a significant dependence between variables, it showed also by the value of R-squared, which is 0.999530, an addiction of 99.95% between the two variables analyzed;
- CI coefficient and C coefficient is different from zero, rejecting the null hypothesis, t-statistic evaluation (high in both cases) and P-value equal to 0;
- Between the value of F statistics and t, which corresponds to the regression slope, check that relationship, t2 = F (166.3173 squared = 27661.43).
- From small values of the calculated probabilities and from those of t student statistics we reject the null hypothesis and conclude that the parameters are significant.
- The value of Adjusted R-squared shows that the dependent variable variation is explained 99.95% by the model.
- F test or Fisher Test has more meanings: F-statistic has a high value, of 27661.43, and the probability calculated for F-statistic is 0, so our regression model is correct, confirmed by the R-squared and Adjusted R-squared, which have values close to 1.
- R squared/Adjusted R shows the dependent variable variation R squared = **0.999530,** which means that CI explain 99.95% of PIB_PR variation;
- Durbin Watson test - we can verify the hypothesis of autocorrelation. It is better if this value is close to "2", because the relationship with first order autocorrelation coefficient r or ρ = DW = 2 (1-r). The coefficient measures the connection / correlation / dependency between two variables. The value of Durbin Watson statistic is **2.189366**, more than 2, which indicates that errors are independent and leads to the conclusion that the dependency equation is correctly specified.

3. Conclusions

Production method - determine GDP as the sum of gross value added (GVA) of final goods (whose production was completed) completed a given period, usually one year. Capital consumption for the production of new goods of any kind is not included in GDP and is called Intermediate consumption.

Economic growth is the process by which economic activities taken in their assembly in a country produce more goods. It is apparent from the upturn in macroeconomic variables or aggregates and especially of the GDP, GNP and VN - both at country level and per capita. In reality there may be an increase in GDP in the country but a decrease in GDP per capita for the population

grew faster than production. When the results of economic activity (GDP) and population increase at the same rate so that the results of per capita (GDP / capita) remains constant we deal with zero growth. This latter type of growth is the expression of the inability of existing resources in terms of economic policy and population growth to meet needs. As we can see, GDP represents the most important aggregate for an economical growth.

We tried to explain the dependency between GDP and production, and GDP ad Intermediate consumption. As we can see in this analyze, if we want an economical growth we have to stimulate the production and the intermediate consumption. Stimulating these two variables, we will stimulate the growth of GDP. This relative, of course, because here we talk about the GDP calculated through production method.

The logic of the capitalist economy (market) growth is, first, aggregate supply source but by its very nature induces the formation of a very large part of aggregate demand as it needs inputs (machinery, equipment, raw materials, materials, etc..) and labor. Therefore, achieving economic growth has become a central goal of any economic policy. Obviously, economic policy starts from the premise of achieving economic growth based on economic potential, the exploitation of its opportunities at the highest level. In this respect, the starting point is therefore growth potential and the goal is potential GDP - the highest level of production that can be achieved over a relatively long or longer and not as an exception, in terms of stability prices and natural unemployment.

In reality the economies are often affected by economic fluctuations or increases in prices and worrying levels of unemployment which makes it impossible to use the full potential they have. Therefore policies should remember that real growth objective embodied in a certain level of real GDP that is not possible under existing concrete. The difference between potential and actual GDP is the potential production that can not be achieved due to which, through appropriate measures, could provide greater economic growth. Indicators of economic growth (GDP, GNP, VN) are quantities that are expressed in nominal and real value. In nominal terms, their values are calculated as current prices charged in the period, while in real terms are established by making use of constant prices or that is comparable to prices in an earlier period taken as a reference to remove influence of price increases during the calculation. Calculated in real terms remove the influence of price changes (increase or decrease them).

So as we can see, the analysi done in this paper shows the importance of knowing each variable and the proportion of influence, because then we can take the best policies of economical growth.

USING SIMULTANEOUS EQUATIONS MODELS TO ANALYZE THE CAUSES OF CORRUPTION AND ITS IMPLICATIONS

TUDOREL ANDREI[*]
BOGDAN OANCEA[**]

Abstract
For a country that is in the process of integration into EU structures, reducing the corruption is a good sign for attracting foreign investment and developing the economic environment. The paper estimates the parameters of a simultaneous equation model based on data sets obtained at a sample of employees in public administration. Statistical sample consist in 407 people and the maximum allowable error was estimated at ± 2.5%. For the effective development of the statistical questionnaire we identified major themes of public administration that are directly related to the problem of corruption: managing the institution, the civil service, transparency in the system, the decentralization process, causes and effects of corruption and the quality of the reform in the public administration. Based on the questionnaire we defined primary and secondary variables that have been used to define the model with simultaneous equations. For the variables in the model they have been divided into endogenous and exogenous.

Keywords*: simultaneous equations model, two stages least square method, corruption, public health system, Hausman statistics*

1. Introduction

During the transition, the level of corruption in Romania stood at the highest values among the countries of Eastern Europe. The reasons for this are various. The high level of corruption has led to significant social and economic losses: the reduction of foreign investment, reduction of production capacities in industry, construction, agriculture etc. through fraudulent privatization and liquidation of them, inefficient use of funds from the state and local communities.

There are a number of applications of simultaneous equations models for the analysis of social phenomena in the literature, while the parameters are estimated using data series that are obtained through the application of statistical surveys.

The major problems that arise in the definition and use of simultaneous equations models that uses the data sets obtained from a sample are related to two aspects: the definition of endogenous variables list, and the definition instrumental variables list that are used in parameter estimation by the two stages least squares method. Each of the two issues has an important role in obtaining conclusive results.

2. The simultaneous equations model for corruption analysis

To define the simultaneous equations model we considered two categories of variables: the endogenous variables that are specified in the model by the vectorial variable $\mathbf{y_i}$ and the exogenous variables included in the model by the variable $\mathbf{x_i}$. Under these conditions the simultaneous equations model is defined in the structural form as:

$$\mathbf{B}\mathbf{y}_i + \mathbf{C}\mathbf{x}_i = \boldsymbol{\varepsilon}_i \quad [1]$$

[**]Professor, "Nicolae Titluescu" University, Bucharest, (e-mail: oanceab@ie.ase ro).

where the residuum vector follows a normal distribution $\boldsymbol{\varepsilon}_i \to N(\mathbf{0},\boldsymbol{\Omega}), i = 1,...,G,$ and the matrix $\Omega = (\sigma_{ij})_{i,j=1,\ ,G}$.

To define this model, first, the following problem should be solved: the separation of the variables in the model in endogenous and exogenous. Moreover, among these variables can be identified causal relationships.

For a correct division of the variables in endogenous and exogenous variables, we will consider the analysis of the causal relationship that exists between different variables. In applying statistical tests to be taken into account that data series are recorded at the level of a statistical sample and are not recorded values for a variable for a certain period of time.

Solving the second problem is important for correct estimation of the parameters. This decision must be taken when the parameters of the model with simultaneous equations is estimated by the method of two-stage least squares (TSLS). Please note that in literature there is no uniform approach in choosing the list of instrumental variables in simultaneous equations models used to analyze issues related to corruption (Bai and Wei, 2000) (Kaufmann et al., 1999).

3. Aplication

In the following we present the application of the model with simultaneous equations for the analysis of some important issues in the public health system. The model thus defined can be used to analyze particular aspects of the system such as the quality of the reform of the system, the size of non-academic behavior in the public health system, government policy on health characteristics, education level of population for preventing or agravation of a disease, etc.

To estimate the parameters we used data sets obtained from a representative sample from Bucharest. The volume of the sample was 407 people, and the survey results are guaranteed with a probability of 95%, given that there was a representation error of ± 2.5%. For the data collection process we used a two-stage sampling plan. The first step was the health units in Bucharest (hospitals, health centers, clinics) that have been treated as primary sampling units. The second step was the doctors in each primary sampling units.

To define the endogenous and exogenous variables and the equations of the model we considered the following hypotheses:

- To define the variable that quantify the quality of the public health system reform it must be considered that the medical personnel opinion on this issue is in relation to quality of the public health system financing, the reform measures taken at the medical institutions, the quality of decentralization in the health system, drug procurement system characteristics and quality of employment and promotion system for staff in public health system;
- The effects of the reform process in this system are observable in the first period by increasing public health expenditure, the improvement of the quality of the national health care programs undertaken by the ministry, the ministry's decision to increase transparency at the medical units level, etc.
- The reform process must support measures to improve the health education of the population;
- The results of the reform process are perceived at the population level by reducing the corruption in the public health system, improving the medical care, etc.

The model is defined by the following equations:

$$RSS = f_1(CF, CSE, TMS, PDS, ESP, \mathbf{VP}) + \varepsilon_1$$

$$TMS = f_2(PDS, RSS, COR, \mathbf{VP}) + \varepsilon_2$$

$$ESP = f_3(PCS, PAC, ACS, DPE, UDP) + \varepsilon_3$$

$$COR = f_4(RSS, CSE, TMS, SCP, GSM, \mathbf{VP}) + \varepsilon_4$$

Within these linear models we used the following variables: the quality of the public health system reform (RSS), the quality of the factors influencing the achievement of a qualitative medical act (CF) and rating system of the institution and employees (CSE); the transparency of the ministry in making decisions about the ongoing reform (TMS); the ministry's policy in the area (PDS); the health education of the population (ESP), the interviewed person characteristics, including gender of the person, age and category of staff defined in the model on the basis of the vector variable VP; transparency of decisions from the public health system (TMS), the corruption at the national level (COR), the health education of the population (ESP), the frequency of application, at the end of a treatment period for a new medical examination (PCS), the extent to which people give enough importance to their health (PAC), factors related to the accessibility of citizens to primary, secondary and tertiary health care (ACS), the usefulness of developing health education and prevention programs for the population (UDP), the evaluation system of the quality of the medical services (CSE), changing the executives based on the political criteria (SCP) and medical staff satisfaction (GSM).

The simultaneous equations model variables are divided into endogenous and exogenous, as follows:

- Endogenous variables: RSS, TMS, ESP and COR;
- Exogenous variables: CF, CSE, PDS, GEN, ANI, PER, PCS, PAC, ACS, DPE, UDP, SCP, GSM and CSE.

In the following parameters for the four equations are estimated by two methods: the method of least squares (OLS) and two stages least square method (TSLS). The results are presented in Tables 1 and 2.

In the following we present the most important variables used in the model:

- RSS is a variable defined to measure the opinion on the quality of health care reform process in the public health system. To define we envisaged six components: the financing of the system, the procurement of the drugs, the decentralization process in the health system, the employment and promotion system of the medical personnel with secondary and higher education and the reform measures implemented in the medical units. For measuring the opinion of physicians on each of the six questions we used a scale with five values: 1 - very poor, 2, 3, 4, 5-very good. This variable is an aggregate variable that is defined on the basis of the six primary variables;
- CF is an aggregate variable used to measure the quality of the factors that contribute to a qualitative medical act in the public health units. To measure the values of these characteristics we used a scale with five values that are defined as: 1-very poor, 2, 3, 4, 5 - very good. The aggregate variable is calculated as the arithmetic mean of five primary variables defined directly on the basis of the questionnaire;
- CSE is an aggregate variable that is calculated as the average of three primary variables. It is used to estimate the quality of the assessment system of health services rendered to beneficiaries. To define the primary variables we used a scale with four values: 1 - unsatisfactory, 2, 3, 4 - very good.
- TMS is an aggregate variable used to assess transparency in ministry decision-making about the reform process. It is calculated as the arithmetic average of the two primary variables defined on the questionnaire. The measurement scale used has four values: 1 - unsatisfactory, 2, 3, 4 - very good;
- PDS is an aggregate variable used to assess the quality of government health policy in terms of volume of public health expenditure, the quality of national health programs run by the ministry and the transparent use of funds for compensated and free drugs in the primary care. The range is 1 - unsatisfactory, 2, 3, 4 - very good. This is calculated as an arithmetic average of the three primary variables;

- ESP is a variable used to measure the aggregate level of population health education and disease prevention or progression. The range is 1 - most people do not give importance to prevent the emergence or worsening of a disease, 2, 3, 4, 5 - most people consider this issue very important. It is calculated as the arithmetic average of the two primary variables;
- COR is an aggregate variable used to measure the corruption at the national level according to the medical staff with higher education. The range is 1 - there is no corruption, 2, 3, 4, 5 - there is a widespread corruption. It is calculated as the arithmetic average of the five variables defined directly from the questionnaire.
- PCS quantifies the extent to which patients that received a medical treatment calls for a new specialist advice. The range is 1 a small part of them, 2, 3, 4, 5 - with few exceptions, all patients.
- PAC is a variable used for an overall assessment of the extent to which people give enough importance to their health. The range is 1 - do not give enough importance to their health, 2, 3, 4, 5 – gives a great importance to health. It is determined based on the arithmetic average of two primary variables;
- ACS is a variable that measures the degree of accessibility of citizens to the primary, secondary and tertiary health care system. The range is 1 - poor accessibility, 2, 3, 4, 5 - highest availability to the medical act. It is calculated by means of three primary variables;
- DPE is an aggregate variable used to assess the overall contribution of public institutions to develop health education programs and prevention of disease among the population. The range is 1 - unsatisfactory, 2, 3, 4 - very good. The aggregate variable is calculated as an average of four primary variables;
- UDP is a primary variable used to assess the usefulness of health education programs and prevention among the population. The range is 1 - not useful, 2, 3, 4, 5 - totally useful;
- SCP is a primary variable used to assess to what extent the political level influences the changing of the management personnel based on political criteria. The range is 1 – there are no changes in the leadership based on political criteria, 2, 3, 4 – changing the personnel based on political criteria is a current practice;
- GSM is an aggregate variable defined to evaluate medical staff satisfaction. The range is 1 - not satisfied at all, 2, 3, 4, 5 - completely satisfied. It is calculated as the average of five primary variables that are defined directly on the questionnaire.

For each variable defined above we can computed a number of indicators to characterize the central tendency, dispersion and the asymmetry of the distribution. In this case, we used questionnaires with valid responses to questions used to define the underlying primary variables that define the aggregate variable.

To estimate the parameters of the four regression models we used only statistical questionnaires that have valid answers to all questions underlying the definition of the aggregate variables in the regression equation.

For a successful application of the method of two stages least squares in (TSLS) in the application it must be defined a list of instrumental variables. They must meet a number of conditions (Andrew and Bourbonnais 2008) to obtain suitable results.

For the second stage an important role is played by the definition of the list of instrumental variables. In this context the exogeneity of the variables of the model is analyzed. An important tool in this approach is the Hausman test (Hausman, 1978). It seeks to check the effectiveness and consistency of estimators. In this regard the following two hypotheses are defined.

The first is the case when the list of instrumental variables is correctly specified. The estimator of the parameter $\boldsymbol{\beta}$ obtained by the OLS, denoted by $\hat{\boldsymbol{\beta}}_0$, is effectively and consistent. In

this case the explanatory variables of regression model $\mathbf{y} = \mathbf{X\beta} + \mathbf{u}$ are not correlated with residual variables, so $H_0 : \text{cov}(\mathbf{u}, \mathbf{X}) = \mathbf{0}$.

In the second case, the list of instrumental variables is not correctly specified. The estimator for the parameter $\boldsymbol{\beta}$ obtained by the OLS, denoted by $\hat{\boldsymbol{\beta}}_1$, is effective and inconsistent. Residual variables are correlated with one or more explanatory variables, so $H_1 : \text{cov}(\mathbf{u}, \mathbf{X}) \neq \mathbf{0}$.

The difference between the two estimators is $\hat{\mathbf{d}} = \hat{\boldsymbol{\beta}}_1 - \hat{\boldsymbol{\beta}}_0$, and the Hausman test statistics is:

$$H = \hat{\mathbf{d}}'(\text{var}(\hat{\boldsymbol{\beta}}_1) - \text{var}(\hat{\boldsymbol{\beta}}_0))^{-1}\hat{\mathbf{d}} \rightarrow \chi^2(r)$$

where r is the number of endogenous varibles from the list of explicative varibles, so of the variables $X_i, i = 1,...,r$ that verify the following $\text{cov}(u, X_i) \neq 0$.

If the statistics value is greater than the tabulated value, then we reject the null hypothesis, considering in this case that the second estimator gives more appropriate results.

4. Conclusions

To increase the efficiency of the public health services is necessary to implement measures that will lead to major changes in the public health system. The new philosophy of operation of the health system will cause a reduction in corruption in the system and increase the quality of medical care.

To identify important aspects of health system operation an important tool is the statistical questionnaire. Its application to medical personnel will identify positive and negative aspects of the system.

The simultaneous equations model is used to analyze some aspects of functioning of the public health system. To define the model we used four endogenous variables and thirteen exogenous variables. The variables used in the model are mostly aggregated variables that are calculated as the average primary variables. They are defined based on statistical questions in the questionnaire taking into account the measurement scales used for each question in the questionnaire. For writing the four equations we start from a set of assumptions. The four equations are used for the assertion of some observations regarding the quality of the system reform and its implications for the quality of the medical services provided to citizens, identifying the characteristics of government health policy, evaluating the effect of public health education in preventing and worsening of a disease, assessing the extent of non-academic behavior in the public health system and its implications for the reform process and the quality of medical services provided to citizens.

For the identification of the four equations we used variables regarding the system behavior, the degree of satisfaction of physicians and physicians' personal characteristics. The results highlight the different opinions of doctors in relation to personal characteristics considered. In three of the four models the parameters that correspond to these variables are different from zero. To analyze the variable used to measure the levels of the health education we used a regression model with a series of explanatory variables related to the attention that people give to health (PAC), the practice of patients seeking care and new investigations at the end treatment period (PCS), the extent to which institutions or organizations are involved in developing health education programs in the population (DPE), population accessibility to health services (ACS) and the usefulness of these types of programs (UDP). To define the equation that describes the influence of corruption and non-academic conduct we considered the results of descriptive analysis of data series on corruption levels and intensity of factors acting to reduce it.

RESEARCH AND INNOVATION – THE CHANCE OF ROMANIA'S ECONOMIC AND FINANCIAL PROGRESS

ELENA CIUCUR [*]
DUMITRU CIUCUR [**]

Abstract
This paper aims at highlighting the importance of scientific research and economic innovation for economic and financial progress of Romania in the long term. Stem analysis is the gradual accumulation of organic connection between science and how it is used, in a productive vision deeply understood both in the public and private spaces. Financial and economic progress involves scientific research and innovation as the ideal long-term and daily movement of the economy in the short term. So we should keep in mind that not everything is equally urgent and important, in a correct view of the labor and force of the economic and financial effort.

Keywords: *economic and financial progress, research, innovation, development*

1. Human economy and the osmosis of research and innovation

Human economy relies on great scientific and technical discoveries, on extensive environmental improvements, demo-economic and on behavioral changes beneficial to the entire population. The new economy involves multiple and profound reforms, of a structural effectiveness, considering that scientific research contributes to the expansion of both wealth and poverty. It also contributes to the substitution of raw labor with information or knowledge and to the rational use of sophisticated economic, financial and management mechanisms on national and global levels.

The emergence of new systems of economic activity undermines the pillars of the old economic system, transforming all – individual life, business, politics, morality, nation-state – and placing the economy on the verge of the deepest switch, according to the trend of a lasting, sustainable economy, global and eventually cosmic. Such issues are directly related to the very essence of economy because **the economy is a consistent mix of relational activities, in which one selects *what, how* and *how much* to produce in order to achieve his goals of development and personality manifestation within the community, being himself the product of nature and society.**

The content and the continuous transformation of economy reflects the manner in which **individuals manage to correlate their unlimited needs, constantly diversifying, with scarce resources that have alternative uses.** The tension between needs and resources is permanent and is reflected by human satisfaction or dissatisfaction on the individual and society level, by inequities, gaps or relative stability. "Without such a system which is able to produce food, to process it, to wrap and distribute it, which is able to produce fabric, to provide medical and educational services, to regulate and maintain order, to make itself ready to defend the community, life would be very hard."[1] During this complex process, each individual finds himself in transition through life, permanently recording joy or bitterness. Thus, **economy is the real form of human social action, it itself is in continuous transition**. Economical life is man's unceasing struggle with the principles of rarity, impossible and unknown, with the limits of freedom in order to transform them in certain, possible

[*]Professor Ph.D., Faculty of Economic Sciences, "Nicolae Titulescu" University, Bucharest (e-mail: ciucurelena@univnt ro)

[1] J. K. Galbraith, *Economic Science and Public Interest*, Politica Publishing House, Bucharest, 1983, p. 11.

and known elements of everyday life. "The true problem is that in real life, normally, we do not have the possibility of choosing between risky and certain situations, but only between degrees of risk and different possible results".[2]

Within this struggle with the limits of our existence, man and human community are in permanent transition to adjust to the natural environment, simultaneously constituting a **specific living environment**. Human economy cannot stop its movement, transformation or transition. **Any simplistic, insufficiently precise understanding about finalizing the transition in economy is counterproductive**. The transition proves itself the permanent form of human evolution with the help of science, research and innovation, and the costs of the transition through life interest each individual and the social community as a whole.

The chance of economic and financial progress is **the osmosis of human economy with research and innovation**, which ensures an effective, high-performance human action.

Our demarche pursues two concepts: the filiation of ideas and classical situation. **The filiation of ideas** reveals the efforts for understanding economic phenomena, for creating, perfecting and reconsideration of economical theory, in an endless process. **The classical situation** means consolidating, correlating and synthesizing scientific acquisitions to the certain moment, including appreciating present status in the direction of future development in economic science.

In every era, people were preoccupied to understand internal relations of their action for material existence, starting from observing the limitation and rarity of economic resources. The totality of reflections which refer to economic activities in society (ideas, theories, doctrines, ideologies) forms an **economic thinking**, which has an emphasized historical feature.

Economic reflections can be common and specialized. **Common economic knowledge** stand in reflections which are possible to be made by all people, as participants to ordinary life, without them handling knowledge and necessary instruments to thoroughly understand economic reality. **Specialized economic knowledge** is the scientific knowledge, consisting of people's reflections who participate to economic life on the grounds of prior professional training, specialized and having corresponding research instruments for economic problems and showing results of their research and discoveries. Thus, scientific knowledge exists since a long time, since, in economy, the passage has been made from manufacturing to industrial capitalism. Therefore, we do not consider entirely justified the expression according to which, nowadays, economic life passes to scientific knowledge. Though, it actually means the passage to a new stage of **scientific knowledge, that of elevated, wise scientific knowledge**, which is to contribute to solving the above shown tension.

In such circumstances we emphasize the importance that scientific research and innovation form an organic logical and historical unity. **The second dimension** considers that economic phenomena are, in their essence, social phenomena conceived and established always with a precise human finality. **The third dimension** is in the tension between unlimited human needs, permanent, and limited economic resources, rare, expensive and more difficult to obtain. Thus, the access to natural and economic-financial resources, national and global, is ensured by the context of long term tendency of consolidating the dependency on foreign resources. **The fourth dimension** considers demand of growth and diversification of scientific-innovation exchange of Romania with all countries in the communitarian European area and in extra-communitarian.

Economic scientific research means the action of examining thoroughly, of studying, of analyzing rationally, at system level, phenomena and economic processes, this to obtain new elements materialized in novel variants of understanding their essence, of their internal causality and new possibilities of improvement.

Economic innovation represents the action of change, of introducing in a process or a system, an already known novelty which is supposed to solve the economic problem, to ensure dynamic optimization of rare and limited resources use.

[2] Orio Giarini and Walter Stahel, *The Limits of Certainty*, Camro Publishing House, Bucharest, 1996, p. 256.

Understood as such, research and innovation are harmonized in an objective manner, are mutually conditioned, determining the growth of productivity, of systemic economic efficiency. As a consequence, these two concepts exist and function in their unity, ensuring obtaining from a unity of resources spent an economic effect more socially useful.

The distinction between these two notions is realized, especially, by the social need of boosting relational dynamics between research and innovation. Such a dynamics must lead to a new specific human behavior, of researching by innovation and innovating by research, especially in the conditions of economic-financial resources are rarer, more expensive and more difficult to obtain.

As a consequence, economic scientific research and innovation prove to be an **authentic axis of economic development**, an anatomic and functional ensemble, which maintains the elements of economic system, defined by own content and permanent dialectic movement. In the presentation of our paper we use with priority the expression of scientific research, understanding, though, its intimate unity with innovation.

Scientific research is materialized nowadays in the tensions of change, being an expression of rational perceptibility of economic evolution by those who have a creative gift, of inventing and innovating and, also, have the motivation of being involved in such matters. Research and innovation actors think according to their interest, correlated with public agenda inherited from a revolution which, like all the others in history, imply an ensemble of quality transformation from an entire system or from its components, lasting an instant and leaving behind a whole century.

Scientific economic research implies essential change in the behavior, in science and technology, in education or in family, in religion and so on. All these hold in an essential proportion of economic creativity. **Creativity** means, above all, creation of New, then its reception and consumption. In the conditions of very fast technical-scientific progress, with low creativity degree, in economy the complex problems of present development could not be solved efficiently. As a perspective, heroes of a country will be the authors of most daring and important accomplishments in science, technology, economy and culture, moving the competition between countries from military environment to great values of human creativity environment. New and original ideas will become decisive, though not by them. It must be known that in their way multiple blockings appear, determined especially by the system of training and education, as well as the psycho-social climate. Any participant in economic life can be creative, though for this reason multiple conditions are imposed, which are related to the specific person, to creativity levels, to individual structures and creativity group, to identification instruments, to creativity evaluation and so on.

Creativity contents are in its **novelty and originality**, thus an economic good, as impossible to imitate and with further effects, as harshly judged by contemporaries, being appreciated as fantasy, useless. Though, such a situation does not discourage geniuses to exist and manifest, opening new tracks to technical-economical efficiency.

Specialists consider that creative minds always imply: imagination (capacity of accomplishing infinity of new associations, by composition and decomposition of ideas), judgement (combining imagined ideas, reuniting in the same class of those homogenous and rejecting the inappropriate), taste (the internal sense of delimitating aesthetic by unaesthetic, decent by insignificant).

Creativity as a composite element of scientific research, as a psychological formation of great complexity is materialized in many and diverse effects such as: productivity, value, quality, utility and so on. These are not limitative, though they must be connected with many others such as: ingenuity, novelty, originality, dare and so on.

Creativity is, as a matter of fact, a **social need**, which must ensure economy development, though its accomplishment depends on removing inappropriate mentalities. We point out, for this matter, that presently in Romania, but also in other more developed countries, some negative cultural-educational phenomena manifest, such as: preference for a more complete education than stimulating the development of an original and creative thinking (conformist specialists, with diverse stereotypes); passive character, non-creative of some actions which develop during free time; more

appreciation for scholars than for those with original ideas, who are somehow tolerated; many people's frustration because of the lack of creative effectiveness; tendency towards multiplication of same modalities of superficial, inefficient behavior in personal life, and so on.

Profound understanding of the essence and functions of scientific research and economic innovation presumes also capturing the main tendencies of economic science, as organic part of science in its totality and coherence, which influences quality development of economy on grounds of an adequate scientific research.

In the frame of science system, economic science develops permanently related to other sciences and, especially, with sciences of nature. Revolution in natural sciences, starting with physics, brings back to exegetes' attention the concept of **perfect prediction**, as an object of economic science. For this matter, an elitist trend of economic thinking accepts the **transformation of economic science into an exact science**, as any natural science. Therefore, notions, theories and economic science methodology should be profoundly restructured. For example, the theory of economic equilibrium, having as a genesis the progress of mechanical physics of Newton, is about to give way nowadays, on grounds of modern physics revolution, to disequilibrium, to chaos.

Another tendency of economic science is represented by the **movement towards interdisciplinarity and multidisciplinarity.** Causes are found in the complexity of analyzed object; science penetration in every section of economic life; technology input and use of instrumental methods in order to achieve scientific knowledge; creation of a tighter link between raw science and applied science, between fundamental theoretical disciplines and those experimentally-applied; emphasizing the historical dimension of science; transition to theories with a high degree of structural organization, open to both natural and human created environment, and so on.

In such frame, emphasizing the importance of **social significance that economic phenomenon (social by its essence) holds, is imposed.** Therefore, when making decisions of economic politics, one must consider the dimension and social impact that they bear; otherwise heavy costs, economic, social and ecologic imbalance, would be generated, and it would be hard or impossible to manage them. Economic science holds, before all, a **powerful social determination**. As a consequence, facts and acts of economy can satisfy every man's needs, giving him the dignity and allowing him to fully take advantage of human essence's own rights and liberties.

2. Directions of reasoning in research and innovation for economic and financial progress

The first direction of this reasoning results from the fact that along with some elements of "civil global society" **comes again the social problem**, as opposed to forces behind the globalization process.

In such circumstances, economic science enters more in direct contact with natural sciences, with juridical sciences, with technical sciences and so on. It must approach the more complex individual, that is as a consumer, a labor resource, as governor, which opens new tracks of investigation and offers more refined instruments for measurement, perfecting and capitalization of economic analysis in itself. Experience of totalitarian systems in the past century shows us that only in democracy it is possible to have economic development and plenary affirmation of human aspiration, regarding the rights and fundamental liberties of the human being. For such reason, to reduce the citizen only to his consumer dimension generates premises of a new type of totalitarianism, overly dangerous.

Thus, economic science includes in the research field also **the present role of the state**. Though, it concerns the state as organizer of social cohesion, the regulating state, the judge state and not ultimately state as economic actor. Such vision about state in actuality rehabilitates the public service and its social utility, meaning that population demands broad and quality public services to

international standards and performances, of health, education, social protection. Health, culture, personal safety cannot and must not be transformed into goods only for market's sake.

Another direction of reasoning in economic science, implicitly in economical research, represents **the growth of mathematics application in researching economic phenomena and processes**. Mathematics proves to be an essential and indispensable instrument for elaborating models, for analyzing and explaining of profound sides of economic processes and phenomena, for their prediction, for discovering elements of relative truth in economy.

Using mathematics in growing proportions in economic research derives from the thoughts of Alexander Rosenburg, well-known specialist, who states that "economic science is not a discipline, but a particular theory, of extreme character and, thus, by its nature, mathematical"[3]. Still, economy is not the field of absolute supremacy of the mathematic instrument. For this reason Anghel Rugina underlined that "in reality, roots of nowadays problems could be expressed only in quantity"[4]. By extension, the relationship between economic science and mathematics must be understood and applied correctly, as the relationship between any science branches, ensuring their unity, implicitly necessary, through the compatibility of rational systems.

An obvious reasoning direction of economic scientific research and innovation regards the **integrative approach of economic phenomena**. This means the transition from the classical, analytical model, to the synthetic-integrative model of economic thinking. Thus, integrative disciplines are constituted, such as: cybernetics, communication theory, systems theory, semiotics and others, that favor the transfer of methods, principles and concepts between science branches.

This way, a movement of science and economic research is established, towards **logics competence field**, blending common, empirical knowledge with the scientific, systematized one. Different logical models are built with the help of generalizations of essential aspects, common to a mass of homogenous phenomena. Thus, economic science fulfils more systemic functions such as: **methodological function** by which critical analysis and methodical evaluations of real facts are accomplished, passing beyond their immediate appearance and reaching their essence, which favors the putting in order and systematization of empirical material; **heuristic function**, meaning the discovery of new facts and laws; **explicative** function, that is understanding of known facts; **prospective or predictive function**, which allows anticipating the relations between facts, establishing new predictions concerning the way economic reality will look like in the future.

We reveal, as well, the fact that ideas of causality, of probability and so on, gain more and more space in the economic science and research, using also, insistently, logical methods such as formalization or model building.

From the epistemological standpoint, the most difficult problem that economic scientific research faces is the **testability or verification of results**. Unlike natural and technical sciences, where there are relatively wide testing possibilities, in economic science these are more limited because of the specificity of the economic phenomenon, which directly implies the human being, with its own system of needs and interests, as well as due to high social cost of experiments. Practically, economists exclude the possibility of laboratory experiment, on people and groups of people.

We underline that other forms of experiment, such as econometric testing, inquiries and surveys, simulation, scenarios play and important part in investigation and evaluation of the economic phenomenon. Therefore, experiment, despite its critiques, is the main procedure of verifying assumptions and building scientific conclusions.

Conclusions

We must emphasize one more time that the chance of Romania's economic and financial progress is the osmosis of human action with scientific research and innovation within the Romanian economic space as a whole and in all periods of evolution, including conditions of crisis. The major internal and external imbalances, of financial-economic and also social nature that we perceive are, for scientific research and innovation, an unprecedented challenge, a duty to attend irreproachable standards as concerns the behavior in economy, moral issues and fairness. This duty must be directly coupled with proactive management involving high professional competence and performance on the micro, meso and macro- levels, on the complex path of real convergence with the economy of the developed world.

A SIMPLE ASSESSMENT OF FISCAL SUSTAINABILITY FOR THE ROMANIAN ECONOMY

ALEXANDRU LEONTE[*]

Abstract
The financial crisis has seriously impacted the economies around the world, emerging and developed alike. With interest rates at historical low levels, constrained in many cases by the zero lower bound, the emphasis is put on fiscal policy to restore the economies on the path of sustainable growth. This paper attempts to shed light on the issue of fiscal sustainability of the Romanian economy, by checking if the intertemporal fiscal constraint of the government is respected. According to the constraint, the current value of debt equals the sum of the discounted values of future government surpluses, which means that the government is not financing itself through a Ponzi scheme. I build on the econometric approach used in papers such as Hamilton and Flavin (1986), Hakkio and Rush (1991), Quintos (1995), Santos Bravo and Silvestre (2002), Bohn (2007). More specifically, I focus on the time series properties of government debt, revenue and expenditure, determining: i) the order of integration for the government debt series; ii) whether or not government revenue and expenditure are cointegrated. Thus I am able to evaluate the strength of the fiscal position of the Romanian economy and to see the impact of the financial crisis on this position.

***Keywords**: fiscal policy, intertemporal budget constraint, cointegration*

Introduction

The financial crisis has seriously impacted the economies around the world, emerging and developed alike. One of the most important consequences is the current sovereign debt crisis, affecting a number of countries including members of the European Union (EU) and the euro area. Economies which promoted an unsustainable growth, with unconsolidated budgets and a large volume of debt, currently encounter difficulties financing that debt.

Against this background, this paper studies the fiscal sustainability of the Romanian economy, by checking if the intertemporal fiscal constraint (henceforth IFC) of the government is respected. According to the constraint, the current value of debt equals the sum of the discounted values of future government surpluses, which means that the government is not financing itself through a Ponzi scheme. More details are given in the following section which contains a theoretical presentation of the problem and an empirical application.

Previous papers study and derive necessary and sufficient conditions for the IFC to hold. For example, Hamilton and Flavin (1986) notice that the government can have a permanent deficit including interest payments on debt, and still the constraint would be respected, however, not in the case of a permanent deficit excluding interest payments on debt. Trehan and Walsh (1991) consider in their analysis two cases: constant and variable interest rate. They show that if interest rate is a positive stochastic process, a sufficient condition for the IFC is that the first difference of the debt series is stationary (and the debt series is integrated of order 1 – I(1)). Focusing on government revenue and expenditures, Hakkio and Rush (1991) show that if the two variables are cointegrated, the IFC holds, even though expenses rise faster than revenue. Still, they argue that in this case, government credibility is affected which makes financing deficits more difficult. Quintos (1995) distinguishes between a strong and a weak condition for fiscal sustainability: she shows that revenue and expenditure cointegration is a sufficient but not necessary condition for the bubble term in the fiscal constraint to converge to 0, still a faster convergence is achieved when the debt process is

[*] Assistant, ASE Bucureşti, (e-mail: alexandruleonte@yahoo.com).

stationary or I(1) (this corresponds to the strong condition). Empirical testing of the IFC relies on econometric tests to see if these conditions (stationarity of the debt process, cointegration between expenditures and revenues, etc.) hold. The studies mentioned above focus on the U.S. economy, and similar approaches have been put forward in papers that focus on other economies (see Afonso (2004) for a review). Recent papers in this strand of literature study the IFC for groups of countries using panel data (see for example Prohl and Schneider (2006), Afonso and Rault (2007)), which allows them to capture fiscal spillover effects. Bohn (2007) adopts a critical point of view with regard to the unit root and cointegration tests used in the literature. He proves that the IFC is satisfied if public debt follows an integrated process of any finite order (this is also shown in Bergman (2001)) and argues that the strict econometric approach delivers weak conditions, in a sense that one can show that the IBC is satisfied, and still that economy could default.

This paper studies the sustainability of the fiscal position of the Romanian economy, by determining: i) the order of integration of the government debt series; ii) whether or not government revenue and expenditure are cointegrated. This study has two main motivations. First of all, it is instructive to analyze the fiscal position of a country, to better understand the risks the country is facing, especially in the current economic context. Even though the level of government debt is relatively low compared with the other countries of the EU, according to Reinhart and Rogoff (2009), as debt levels rise to historical limits (as is the case for the Romanian economy), risk premia begin to rise sharply, and so the economic situation will deteriorate. The second reason concerns the impact of fiscal policy on economic growth. A fiscally sound country is able to provide public investments and at the same time its credibility attracts foreign investors.

Paper content

In this section I briefly present the theoretical background of the paper, following Bohn (2007). Then I review the results of my case study of the Romanian economy.

Theoretical background

In every period, the government's budget constraint is:

$$B_t = G_t^0 - T_t + (1 + r_t) \cdot B_{t-1} \quad (1).$$

The government uses currently issued debt (B_t) to cover its deficit (G_t^0 represents public spending excluding debt payments and T_t represents public revenue) and the payments on the previous period's debt. The following notations are often used:

$$\Delta B_t = B_t - B_{t-1} = G_t^0 + r_t \cdot B_{t-1} - T_t \quad (2)$$

ΔB_t is the first difference of government debt and the period's *with interest deficit*. Excluding the interest payment from (2), we get the period's primary or no interest deficit:

$$DEF_t = G_t^0 - T_t \quad (3)$$

In order to obtain the IPC for each period's budget constraint, assumptions are made regarding the interest rate process. The most common are:

- ✓ The interest rate is positive and constant: $r_t = r > 0$
- ✓ The interest rate is uncorrelated over time with a positive constant conditional expectation: $E_t r_{t+1} = r > 0$
- ✓ The interest rate is a stationary process with mean $r > 0$.

For the last assumption, additional restrictions may be imposed to assure that the process G_t has similar properties to G_t^0, where:

$$G_t = G_t^0 + (r_t - r) \cdot B_t \quad (4)$$

is government adjusted spending.

For either assumption, writing (1) for period *t+1*, with information from the current period *t*, and defining $G_t = G_t^0$ in the first two cases, we get:

$$B_t = \frac{1}{1+r} E_t (T_{t+1} - G_{t+1} + B_{t+1}) \quad (5)$$

Iterating forward, we obtain:

$$B_t = \left(\frac{1}{1+r}\right)^N \cdot E_t B_{t+N} + \sum_{i=i}^{N} \left(\frac{1}{1+r}\right)^i \cdot (T_{t+i} - G_{t+i}) \quad (6)$$

Taking $N \to +\infty$ in (6), the result is:

$$B_t = \lim_{N \to +\infty} \left(\frac{1}{1+r}\right)^N \cdot E_t B_{t+N} + \sum_{i=i}^{+\infty} \left(\frac{1}{1+r}\right)^i \cdot (T_{t+i} - G_{t+i}) \quad (7)$$

The IPC is respected if and only if the first term of the right-hand side of (7) is 0, that is:

$$\lim_{N \to +\infty} \left(\frac{1}{1+r}\right)^N \cdot E_t B_{t+N} = 0 \quad (8).$$

This corresponds to the government not financing its activity through a Ponzi scheme, so that the current value of debt equals the discounted value of future government surpluses.

Bohn (2007) shows that any stochastic process that is integrated of a finite order (and even a mildly explosive process) satisfies (8) and thus the IPC, but follows Quintos (1995) and argues for a qualitative evaluation, the general idea being that the larger the order of integration for the debt series, the *weaker* the sustainability of government finances (even though strictly speaking the IPC continues to hold and (8) is respected, the convergence is much slower the higher the integration order of debt).

With regard to the relation between government revenue and expenditure, first one can define the government spending including interest payments on debt as:

$$G_t^r = G_t^0 + r_t \cdot B_{t-1} \quad (9)$$

With this notation, from (2) we obtain:

$$\Delta B_t = G_t^r - T_t \quad (10)$$

Bohn (2007) shows that G_t^r is $I(m_G)$ and T_t is $I(m_T)$, than the IPC holds if B_t is $I(m)$ and $m \le \max(m_G, m_T)+1$. However, if both G_t^r and T_t are $I(1)$ and cointegrated such that:

$$T_t = \mu + b \cdot G_t^r + \varepsilon_t \quad (11)$$

with ε_t stationary, from (10) we get that:

$$\Delta B_t = -\mu + (1-b) \cdot G_t^r - \varepsilon_t \quad (12)$$

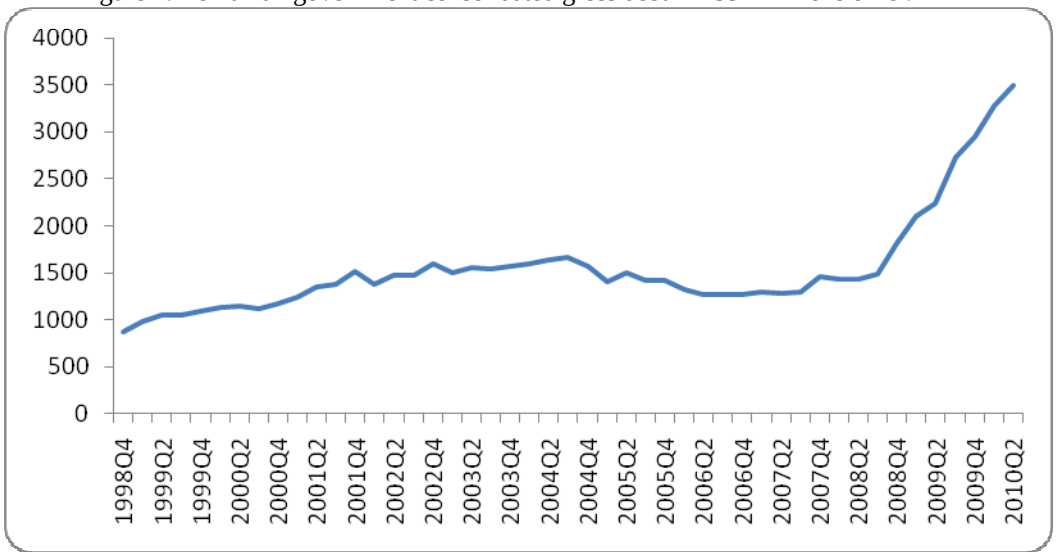
which means that ΔB_t is either stationary or $I(1)$, so B_t is either $I(1)$ or $I(2)$. In this case, convergence in (8) is much faster.

Empirical results

I test the IPC for the Romanian economy by determining: i) the order of integration for the government debt series; ii) whether or not government revenue and expenditure is cointegrated. The sample consists of quarterly data covering the period 1998Q4 – 2010Q2 for the government debt series and 1995Q1 – 2010Q2 for government revenue and expenditure. The variables are expressed in real terms, more precisely, they are expressed in 1994 lei, the series in nominal terms is deflated using the Consumer Price Index. Other possibilities are to work with per – capital values or with percentages of GDP. The data source is the Eurostat.

Figure 1 shows government consolidated gross debt for the analyzed period.

Figure 1: Romanian government consolidated gross debt in 1994 millions of lei.



Source: Eurostat

A visual inspection reveals that the series is stationary up to the year 2008, when it registers a significant increase. Keeping in mind that the fiscal situation of an economy is more sustainable if the convergence in (8) is faster, an increase in the order of integration of the series in 2008 would signify a deterioration of the fiscal position. I formally test this using the *Augumented Dickey – Fuller* and the *Kwiatkowski – Philips – Schmidt – Shin* tests. The results of the tests are highlighted in Table 1. The tests are applied to the natural logarithm of the raw series, as there is no visible pattern of seasonality.

Table 1: Stationarity tests for ln (gov debt)

Test	**Sample**	**Test statistic**	**Theoretical statistic**
ADF	1998Q4 – 2010Q2	3,84	-2,60 (10%)
KPSS	1998Q4 – 2010Q2	0,51	0,46 (5%)
ADF	1998Q4 – 2008Q3	-2,58	-2,61 (10%)
KPSS	1998Q4 – 2008Q3	0,34	0,35 (10%)
ADF	2008Q4 – 2010Q2	0,37	-2,80(10%)
KPSS	2008Q4 – 2010Q2	0,40	0,35 (10%)

Source: my own calculations in Eviews 5

Both tests reveal that the whole sample is non-stationary. The ADF cannot reject the null hypothesis that the series has a unit root, and the KPSS rejects the null that the series is stationary at the 95% level. Running the tests on two subsamples (one runs from the start of the available data to the third quarter of 2008 and would correspond to "normal times" in the economy, while the other would correspond to "crisis times") reveals that the first period is characterized by "more stationarity" than the second. The ADF rejects the null at a 89% level of confidence (the p-value is 0,1042), still the KPSS also comes very close to rejecting the null at the 90% level. Because of the contradictory results, one cannot say based on only the two tests whether the series is stationary or not. It is possible to gain more insight using appropriate fractional integration tests. Testing stationarity on the second sample should be taken with a grain of salt, because of the small number of

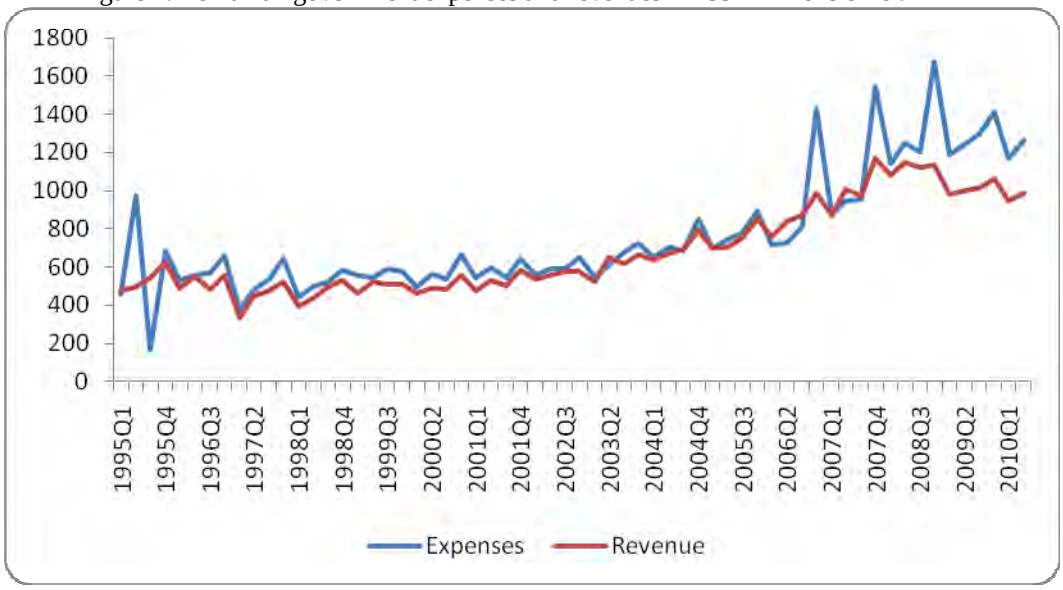
observations. However, both tests indicate the same result of non-stationarity (ADF cannot reject the null and KPSS rejects the null at the 90% level of confidence).

With respect to the order of integration of the debt series, the ADF reveals that for the whole sample, the series is *I(2)*. For the first period, we can almost reject the null of a unit root with 90% confidence, so in the first period, debt is *I(0)*. For the second sub-sample, debt is *I(1)*, we can reject the null for the first difference series with 99% confidence.

These results indicate that that the fiscal position has deteriorated in the second period. The government contracted loans to finance its expenses, at the same time pursuing a fiscal consolidation agenda which implied a decrease in the level of the budget deficit, while public revenues were dropping as a result of the crisis. Even though strictly speaking, the IPC is respected, maintaining credibility is crucial in order for the government to finance itself.

The second empirical test refers to revenue and expenses cointegration. If two series are not stationary, and are integrated of the same order (we shall see that this is the case in this study), most of their linear combinations are also integrated of the same order. However, if there is a linear combination that is stationary, the two initial time series are cointegrated. Intuitively, cointegration can be interpreted as the two series which have nonstationary trajectories never drifting off too far away from each other. Referring to government finances, one can say that they are sustainable even if expenses are on a path of growth, if revenues move "together" with expenses. Figure 2 shows the two time series for the period 1995Q1 – 2010Q2.

Figure 2: Romanian government expenses and revenues in 1994 millions of lei.



Source: Eurostat.

Both series but especially government expenses display seasonal patterns, so I shall perform a seasonal adjustment for both series using the Census X12 method implemented in Eviews.

In order to test for cointegration two methodologies are employed, Engle – Granger test and Johansen. Both of them require that the order of integration of the initial series be determined, which is done using the ADF and KPSS tests. They reveal that the series are *I(1)*. The results are displayed in table 2.

Both tests indicate the series are *I(1)*.

Table 2: Order of integration for government income and expenditure

Test	**Series**	**Test statistic**	**Theoretical statistic**	**Conclusion**
ADF	Exp: level	3,53	-2,59 (10%)	unit root
ADF	Exp: 1 diff	-15,28	-3,56(1%)	no unit root
KPSS	Exp: level	0,79	0,73 (1%)	not stationary
KPSS	Exp: 1 diff	0,34	0,35 (10%)	stationary
ADF	Rev: level	0,43	-2,59 (10%)	unit root
ADF	Rev: 1 diff	-9,24	-3,56(1%)	no unit root
KPSS	Rev: level	0,75	0,73 (1%)	not stationary
KPSS	Rev: 1 diff	0,34	0,35 (10%)	stationary

Source: my own calculations in Eviews 5

The Engle-Granger methodology consists of regressing the two series and verifying to see if the residuals are stationary. I estimate regression (11) and use the ADF to see if the series $\hat{\varepsilon}_t$ is stationary. I do this for the whole sample and the two sub-samples. The results are displayed in table 3.

For the whole sample, the test indicates the existence of cointegration between government expenditures and income. However, sub-sample testing reveals that the cointegration relation is not consistent with the second part of the studied period. This points to a negative impact of the economic crisis on the sustainability of public finances in Romania, though the second sample is of a very short length, and the results should be interpreted with caution for the second sub-sample.

Table 3: Engle-Granger test for government revenue and expenses

Sample	$\hat{b}$	$R^2 - adj.$	**ADF stat.**	**Conclusion**
1995Q1 – 2010Q2	0,69***	85,11%	-1,78*	cointegrated
1995Q1 – 2008Q3	0,77***	81,92%	-7,79***	cointegrated
2008Q4 – 2010Q2	0,1	-2,29%	-1,08	not cointegrated

Source: my own calculations in Eviews 5

Note: * corresponds to a 90% level of confidence, *** corresponds to a 99% level of confidence.

The second methodology I apply is the Johansen test. As noticed in (Enders, 2004), this is nothing more than a generalization (basically, an extension to a multivariate case) of the Dickey – Fuller procedure. It involves building the following model:

$$\Delta x_t = \pi \cdot x_{t-1} + \sum_{i=1}^{p-1} \pi_i \cdot \Delta x_{t-i} + \varepsilon_t \quad (13)$$

The residuals in (13) are stationary. *x* is a vector that contains the variables for which cointegration is being tested, in our case, $x_t = \left(G_t^r \quad T_t\right)^{trans}$. The rank of the matrix π equals the number of cointegration relations between the variables in *x*. Since the latter is a (2,1) vector, this means that π is a (2,2) matrix, and its rank can either be 0, 1 or 2. If the rank is 0, this means that $\pi = 0_2$ and both series are unit root processes with no linear combination of them being stationary. If π is full-rank, both series are stationary. If the rank is 1, the variables are cointegrated. Determining the rank of π is done using the maximum eigenvalue and the trace statistics. More details are available in (Enders, 2004).

I use the Johansen procedure for the entire sample and the firs sub-sample. The small number of observations in the second sample makes it difficult to draw meaningful conclusions. I use two specifications of the model depicted by (13), one that includes an intercept in the cointegrating equation and the VAR (I shall call it specification A) and another that includes an intercept and a trend in the cointegrating equation and an intercept in the VAR (specification B). I include a maximum of 4 lags in the VAR. The Johansen test results are displayed in table 4.

Based on the results in table 4, it can be concluded that there is a cointegration relation between government revenues and expenditures for the first sub-sample and the whole sample. It would seem that government finances are in a sustainable position, however due to the small number of observations in the second sub-sample, the impact of the economic crisis is rather unclear.

Table 4: Johansen test results

Sample	Specification	Lag(s)	Trace stat.	Max. eigenval. stat.	Conclusion
full	A	1	34,61***	34,38***	cointegrated
full	A	2	16,07**	15,04**	cointegrated
full	A	3	15,95**	15,13**	cointegrated
full	A	4	15,07*	12,55*	cointegrated
full	B	1	40,58***	37,69***	cointegrated
full	B	2	25,79*	15,37	mixed
full	B	3	26,76**	15,14	mixed
full	B	4	29,38**	17,28*	cointegrated
1st subs.	A	1	52,33***	47,13***	cointegrated
1st subs.	A	2	19,44**	15,42**	cointegrated

1st subs.	B	4	29,34**	21,16**	Cointegrated

Source: my own calculations in Eviews 5

Conclusions

In this paper I used an econometric approach consisting of unit root and cointegration tests to see if the debt issuing process of the Romanian government is sustainable or is in fact a Ponzi – scheme. In the current context, this issue is very important as more and more countries experience a decrease in public revenues and rely on public debt to finance their expenses.

Unit root testing has revealed that public debt has been stationary until the beginning of the crisis, while in the second sub-sample, it is a *I(1)* process. Cointegration tests between government revenues and expenditures have shown that between 1995 and the second half of 2008, they are cointegrated. For the second sub-sample, the Engle – Granger methodology indicates lack of cointegration. Overall results point to a generally sound fiscal position of the Romanian government, however, the economic crisis had a consistent negative impact.

An interesting avenue to continue this research would be to study the relationship between government deficit and debt, by estimating a fiscal reaction function.

ECONOMIC ASPECTS OF MASS-MEDIA AND THE CHANGES GENERATED BY THE ECONOMIC CRISIS

TRAIAN ALEXANDRU NĂSTASE*

Abstract
In this paper we intend to describe the economic implications of mass-media in correlation with the recent socio-economic changes generated by the economic crisis. We take into consideration the dual market on which mass-media evolves: the mass-media products market, and the advertising market, keeping in mind that the behavior of a mass-media institution on one market, can have direct implication on the other market. We analyze the relation between mass-media and the public (audience), the cost for creating mass-media products, the ways in which mass-media reduces costs and the ways of increasing their profits. As mass-media must always adapt to the social changes and to the public, we take our analysis further and we describe how the recent economic changes influenced the mass-media consumption trends and mass-media profits on all the main communication channels: TV, radio, outdoor, internet, newspapers/magazines. This analysis is performed at both a global and a local level, for Romania. In the end we predict how other key changes may affect the economic model approach of the mass-media institutions on short and middle terms.

Keywords: *mass-media, economic crisis, costs, profits, predictions*

Introduction

Our purpose in this theoretic paper is to present the complex economic mechanisms of mass media.

We consider important in this paper the fact that we also take into consideration the complex economic situation generated by the economic crisis and we analyze the evolution of mass-media in correspondence with the complex socio-economic modifications.

We rely our study on classic literature regarding mass-media but also on recent economic figures provided by research reports.

Media market is very diverse and complex, with some specific notes from other markets. With the industrialization of the nineteenth century, the press has passed from one entity that referred particularly to intellectuals, to an industrialized one, which creates products for mass consumption.

Media products are usually perishable goods. The news today does not become obsolete the day after, the programs or movies that are now enjoying success, tomorrow may be outdated, the football game has an impact when it is broadcast live and loses its importance when it is reran. Perishable product compels the media to continually create new content and not allow gaps in the provision of certain products. Providing the product is affordable for people and through an extensive distribution channel in order to reach a large audience in a short time.

Media market is closely related to public needs and preferences. Therefore, these needs and tastes are unpredictable and change very quickly. As a result, media institutions can not establish long-term production policy.

This makes prediction impossible for media institutions to be more vulnerable. Therefore, "media industry is more concerned than other industries, to limit production costs or find alternative financing on the one hand and constantly expand their distribution area on the other side" (Mihai Coman 2007, p. 46).

* Ph.D. candidate, Faculty of Sociology and Social Services, Bucharest University; Online Project Manager, GFK Romania (e-mail: traian nastase@gmail.com).

Most of the times, the amounts invested to produce a media product, can not be recovered, if it is unsuccessful. Therefore, many institutions test their various shows, programs or products before they are broadcast, with the help of the marketing research. Also, often, a TV series is released after several pilot episodes, to test the public reaction to it and it continues if the reaction is positive. Many programs are stopped after a few appearances for the simple reason that it failed to attract sufficient audiences and production costs per program are greater than the resulted profit.

Costs

To attain a product, media bears multiple costs. Broadly, we can classify these costs as production costs and distribution costs.

Production costs include: raw materials (paper, ink, tapes, etc.), energy, equipment, work force, information costs and cultural goods purchased, from specialized suppliers.

Through media development, the majority of costs have increased. For example, the price of paper has increased because it has been reduced the cutting of trees and the availability of raw materials declined, but the demand of the many publishers has increased. The technological evolution facilitated the appearance of the increasingly more efficient equipment and institutions, out of the desire to produce quality goods as valuable are increasingly turning to new technologies. Obsolescence requires a more rapid replacement of equipment and a range of investment and the next one came to be often less than the time needed to recoup the investment (estimates made for the press in Western Europe have shown that the investment required to launch a publication pays off in 3-4 years, and to launch a television channel in 8-10 years).

Human resources in the media industry are a highly qualified workforce and journalists have often enjoyed higher incomes than other professionals. This greater investment in staff is explained by its indispensability. In the history of the press there are few strikes, and employers know that any work interruption results in the loss of income- generating audience. Even if the media industry staff is more expensive for the institution, the costs are not very high. It represents 10% in the USA and 15% in France of the publication's budget.

Costs for information and cultural goods have also known a dramatic increase, due to the increase in production prices and prices related to copyright. Increased costs associated to information and cultural goods have led many media institutions to stop the production of these goods and to focus more on the distribution of goods that are produced outside their institutions. Information is often purchased by subscription or per production from multiple vendors. Statistics show that in the U.S., games or talk-shows cost about 120,000 $ an episode of TV series with one-hour costs between 0.8 and 1.4 million $. These figures vary depending on the success of those products an episode from a successful movie can reach or exceed $ 2 million.

In the distribution of goods, costs vary depending on the type of media. The print media costs include: mailing, transportation, fees for news agents (kiosks or mail), market prospection, managing subscriptions, promotion, costs related to returns (materials not sold and sent back by the publisher). "For print media, distribution costs can go up to 50% of the total costs of the institution" (Toussaint - Desmoulins, 1992, p. 46), Netherlands 17%, 40-45% in Switzerland, France 36-40 %, 20-25% in Spain, Italy 20-23%, Germany 19% (J. Gabszewicz, N. Sonnac, 2006, p. 22).

For the audiovisual, distribution costs are those amounts of money paid to the operators to facilitate the broadcast of programs by radio, cable or satellite. If their distribution costs are much lower than production costs, the purchase rights to broadcast certain products or acquire the right to broadcast some events.

Ways to reduce production costs and obtain profit

To reduce costs associated with the media process and for profit media institutions resort to different resources. Among these are: the association of producers in networks, trusts, retail sales,

sale / lease access rights, the sale of advertising space, alternative funding through grants, sponsorships, fee reductions.

The television network is an organization developed in parallel with the trusts. A network consists of several stations, which emit the same program simultaneously. Often, they are affiliated to a central station, which is responsible for the broadcasting. Among the advantages of networks are: sharing the costs of production between the different members of networks, increased revenue from advertising (each station provides its own audience, the audience is larger and the price negotiated for the advertising space is more profitable).

News media trusts represent the integration of the media institutions in a complex conglomerate. They are generated by the absorption of other institutions or voluntary association. Since the inception of the written press, there were organizations that by which institutions were putting together their information, materials and distribution networks.

The press group can absorb institutions tangent with their activity. The assimilation can be horizontal when they attract organizations that produce goods of the same kind (mass communication products - media print, radio, television, film, etc.) or vertically, by assimilating organizations that provide support to the main activity by auxiliary activities (production, raw materials, distribution, etc.).

Among the benefits of trusts are: reducing costs, the power to spread information on multiple channels simultaneously, optimizing management and administration by handling it in trust for all organizations and handling the tasks of a small number of employees, providing the best framework for professional training in the field through the audience than they have, a great advertising potential for customers advertising.

Among the largest media groups are: International News Corporation, Time-Warner, Disney-ABC CapCities, Hearst, Gannett (USA), Matra-Hachette-Filipachi, Hers, Maxwell (England), Bertelsmann. In Romania, the most important media groups are: Media Pro Group, Group Ringier, Intact Group, Reality-Academy group Catavencu, ARBO Media, RPG, Sanoma-Hearst, WAZ, Truth.

With the joint trusts a number of risks occur. Among these, the most important is related to the monopole of a few groups. For example, in 1990 the media was controlled by 23 groups. In 1997, their number was 10 (J. Dominik, 1983, p. 196, BH Bagdikian, 1997, p. 13). These giant groups, thus becomes a great power of coverage and extensively directing the public's opinion. "Critics regard these trusts as structural enemies of democracy and accuse the employer's groups that they have hidden political interests (related to the promotion of economic interests); they consider that the pressure exerted by employers on the editorial board is the source of unilateral presentation of issues of general interest, the blocking of some aspects of reality, privileging some voices favorable to group interests and eliminate the opposite voices from the public sphere "(M. Coman, 2007, p. 56).

Another risk is the prospect for viability of the trusts, their desire to maximize profits. With mergers or acquisitions of new institutions, they are looking for new ways to reduce costs and often taking place the layoffs of journalists. The products of these trusts are suffering too and they change as they need to address and capture a wide audience. Therefore, they are simple products that can be easily understood by many people, that address to an average audience but large and/ or products that look for spectacular to interest and capture attention. At the same time the rush for audience neglects the function of education and culture of the media and gives a greater importance to the function of entertainment.

As a way of obtaining profit, retail sales are prominent in print media. Selling or leasing the access rights requires user's subscription to public radio and television programs, cable TV fee, pay-per-view fee paid for certain programs or special programs.

As advertising is concerned, for most press institutions it is the most important source of income. Advertising is a form of "ad aired by a commercial company or institution, public and private, in connection with a business transaction, a business, a job or profession, to promote the

input for a fee, goods or services'' (http://www.activision-advertising ro/articole/5-publicitate---definitie). To achieve this goal, the organizations listed are buying space from media institutions, which they use in their own interest.

Press institutions may appeal mostly to one of these mean or may use several simultaneously. For example, newspapers profit by retail selling, but also by selling ad space. Television benefits from broadcasting and the sale of advertising space. To reduce other assimilated costs, an institution may or may not, as I said, to be included in a trust.

To summarize, we see that the media operates on two markets: media's own market (news, programs, entertainment, movies, etc.) and the advertising market. R. Picard (1997, p. 17) believes that due to this phenomenon, the media product „participates in two separate markets and the market's behavior affects the behavior on the other market''. The media institutions get their income from the sale of their own products (price embedded in the retail sale, in the case of newspapers, access fees for cable television services, etc.) and by selling advertising space.

The convergence point of these two markets is the audience. Advertisers, business men and politicians appeal to media to transmit their messages, the reason being that through it, it reaches a large audience, and costs per unit are low. In the case of advertising, media institutions are actually selling their audience and as a show has more viewers, the advertiser paid price is higher.

In Romania, the total amount invested in advertising in 2008, according to the media agents estimates amounted to a value between 530 and 607 million euro. According to Alfa Cont Media Watch data who are considering investments in ratecard, the first three companies among from 2007 are found on the same positions in 2008, that is Procter & Gamble at No. 1 with 335 million euro invested in 2008, Unilever with 187 million euro and L 'Oreal with 176 million euro on the following positions. The media institutions obtain funding from other sources such as state companies, firms, foundations, individuals.

The state intervenes both directly and indirectly in financing. State contribution into the realm of public interest, thus understanding, to ensure equal and generalized to a public good (information or cultural values), regardless of the core where those values are concentrated or the financial capacity of each. The direct contribution of the state implies the endorsement of the state of the media institutions, by legal regulations and financial resources. The state can intervene to reduce costs (distribution and production). For these types of interventions the state uses resources from specific taxes (radio and television fees) or the global budget. The state participation in the public services budget is distributed uneven in different countries. The state direct intervention does not confine only to public television or radio. He can finance newspapers, magazines, books, movies, specialized institutions, provided that they address the public interest. In France, in 2004, the state supported the press by 1.3 billion euro (approx. 12% of the turnover of the press).

A media market analysis during the economic crisis

The media market is evolving in direct connection with society. Any social, economic, political disruption influences directly the media industry.

The period of economic crisis, which began in 2008 and still to continue in 2010 and in some countries in 2011, represents a good opportunity to do analysis to reveal precisely the relationship between the economic development of a society and economic transformation of media. .

U.S. market, where economic crisis began, decreased by 12.3% in 2009 to 125.3 billion euro, compared with the previous year, according to data provided by research firm Media Kantar.

The data provided by the same research company shows that in the last quarter of 2009, advertising expenses fell by six percent compared with the same period of the last year, this low decrease indicating a possible rebound.

The economic recovery is confirmed by the fact that the U.S the recession in advertising began to diminish in the last two months of 2009 and early 2010 (according to preliminary figures from the first quarter of 2010).

Looking to the average expenses recorded depending on the media, Internet display advertising expenditures rose by 7.3% in 2009, helped by investments in the telecom area auto and travel area. Television in the U.S. continued to lead the competition with other media and cable television declined by 1.4 percent in 2009. Print media has suffered a lot due to the withdrawal of advertising in publications, registering a decrease of 19.7% over 2009.

According to advertisers, in 2009, the top 10 advertisers spent cumulated 16,556.1 millions of dollars in measurable media, representing a decrease of only 0.9% compared to 2008. Procter & Gamble is again leading the way, spending 2714.3 millions, 15.6 percent less than the previous year. Verizon Communications has maintained the second position, a drop of just 6.9%. Despite a 30% drop in the sale of cars sold, General Motors, spent 1.3% more on advertising and managed to be the only car company in the top 10. Three of the advertisers have spent more in 2009: Wal-Mart has increased the budget by 35.4 percent, 32.7%, and Sprint Nextel rose 29.9%.

The investments of the top 10 categories in which advertising has been made decreased by 10.7% in 2009 and have made a total of 70,739.4 millions of dollars. The top rankings are Automotive, which has registered investment of 10,977.6 millions, 23.4% less than the previous year. Telecom is the category ranked second with an amount of 8606.8 millions registering a growth of 1.6%. Another two other categories that had increases were Food & Candy, which increased by 3.5% ($ 6.261 millions) and Pharma by 3.9 percent ($ 4751.8 millions).

Globally, however, is noticed an optimism regarding the rebound of the global economy, which is also reflected in the advertising industry, increasing budgets in the first quarter of 2010 for the first time in over two and half years (according to the report IPA / BDO Bellwether, cited by Brandrepublic.com).

According to the study, involving 300 companies, the marketing budgets for 21% of the respondents were raised in the first quarter of 2010.

In addition, marketers have shown optimistic about the economic development in 2010 and said that they would continue to increase the advertising budget.

Approximately 42% of executives said they were confident in the financial evolution of the companies that they control, while 31% affirmed their optimism on positive developments in their industry.

It should be noted that online advertising budgets have been increased for the third consecutive quarter, online medium with the highest growth rate.

Romanian advertising market

Media market in Romania started to decline in October 2008, experiencing the financial crisis. Basically, decreases were recorded in all types of mediums (TV, radio, print, Internet, cinema, outdoor).

In 2009, media market fell by 37% to a level even lower than it was in 2006. The most affected medium was the printing (decrease of 55%), followed by the street advertising (down 40%), TV (34%), radio (28%), cinema and Internet (19%).

Television took from the share of the other mediums 3%, due to falling prices for television advertising, and because of various programs and stations and the tendency of people to spend more time watching TV during the economic crisis. The print market has declined in the audience, most shops and newspapers and declining circulation. Some titles have begun to focus on the online version, others were closed. The radio market had similar problems with the print media. Many local stations have closed and others have become more active on the Internet. Street advertising has been severely hit by the crisis, especially because there is no possibility of measurement of the audience and increased cost for larger sizes formats and specific locations. Street advertising operators have not increased the number of billboards displayed, their number remaining similar to 2008. The Internet has increased the rate compared to other communication mediums, with the smallest

decrease. This was due to the increasing number of users, the possibilities for existing customization and targeting and enjoyed greater confidence compared with the television and print.

The Initiative Media estimates show that the advertising market will continue to decline by 9% in 2010 compared to 2009. Despite lower investment in advertising, television and online site is expected to take the share of the other mediums. Print and street advertising will still be the most affected mediums (minus 27% and minus 17%) while the radio will drop less (minus 10%). TV will fall by 6% and the Internet is expected to grow by 12%. It is estimated that the print will lose share in favor of online and radio.

According to the ROADS study ("Online Advertising Romanian Study") conducted by the IAB and PricewaterhouseCoopers Romania Romania, Romania online advertising market in 2009 amounted to approximately 65.2 million lei (15.5 million), down 10 % compared to 2008. The market has been, however, an increase of 3% (first half of 2009 compared to second half of 2008). Despite a decline of 10% the online advertising market was in 2009 with 53% higher than in 2007.

Ruxandra Bandilă (Marketing, Communications and Business Development Director of PricewaterhouseCoopers Romania) believes that "The latest edition of the Roads study shows that online advertising market has exceeded the critical moment of the crisis and had a slightly upward trend in the second half of 2010, which is remarkable taking into account the general economic development."

However, if on foreign markets economic growth is real, instability in Romania will make tough the assessment of the economical growth and the media growth, any scenario is possible.

Predictions regarding the media markets trend

According to the latest report of the specialized group in technology, media and telecommunications (TMT) of Deloitte, the global recession and digitization are the main challenges facing media companies, new trends and anticipated events will change the balance of forces industry and even the prospects of other sectors. Deloitte's report is based on the opinions of companies and experts, the contributions of 7,000 partners and senior specialists of the member firms of Deloitte Touche Tohmatsu, and discussions with financial analysts, specialized analysts and various organizations specializing in the field.

Regarding the evolutive trends, it is considered that the use of television and radio will maintain its supremacy. In 2010-2011, most video and audio content will be consumed in the programs established by the media profile. Over 90% of the television and over 80% of the audio will be accessible through traditional channels. Furthermore, because of the acquisition of new TV equipment or launching new services (high definition HD or 3D, special movie channels), such consumption type might even increase. Statistical figures show that the sales of televisions have remained relatively high in developing countries, where the progress of television is evident, amid a significant increase in ad revenue. In many countries, the penetration rate of the HD systems steadily increases.

Electronic Books and reading newspapers electronically begin to enjoy an increasingly high success. The success of books in electronic format is a challenge for writers and for publishing houses. While they are easy to purchase, the low price for such a book indicates a change of economic model. Low prices are no novelty for the publishing houses, but such practices have now been reserved for a small number of books, not for hundreds of thousands of titles. Perhaps the book industry will need a new model of income distribution. Also, a number of new technologies facilitates the sales increase of electronic books (eBook readers, personal computers, smart phones, etc.).

The Internet brings new features in terms of access to information. There are many discussions whether the access to online content of the newspapers and magazines to have a fee, but the chances for these discussions to be translated into real actions and outcomes are low. Deloitte specialists believes that only a small proportion of the world publications could implement such

models and much less could profit in this way. Even if there is a possibility that some online initiatives to apprehend a fee to obtain an important success, these will be few and the revenue for the online business will still come from advertising.

It is noted that the practice of putting the entire publication available online and free of charge appears to accelerate the decline in the number of subscribers to the printed version of the publications. In the future it is expected for the industry to intend to alleviate this continued migration of the existing subscribers of the printed version online.

It is expected that the largest media distribution platforms - Internet and television - will be filled increasingly more in the future. Advertising will be one of the largest recipients of simultaneous use of the Internet and television.

The value of the advertising market broadcasted on the TV is estimated at 180 billion dollars globally in 2010, while online advertising could reach 63 billion dollars.

Studies have shown that the combined use of online channels and TV channels can generate a 47% more interest in a brand than if the two channels are used separately. Advertisements on TV can immediately redirect users to related sites; this way, a product viewed in an advertising break can be purchased even before the program is resumed.

The success of last year's 3D film generated high expectations for a similar leap in television. In 2010 it witnessed a significant launch of 3D TV, including the launch of first 3D television channels in Europe and North America, the first3D TVs and cameras. Even so, the debut will be hampered by significant challenges.

3D technology has a significant potential increase in television revenue, but the number of subscribers, revenues from subscriptions or sales of equipment as well as the available content could be neglected for another 1-2 years. A large share of the initial challenges will be due to consumer confusion, the main obstacle being the lack of a 3D unique standard TV. Thus, one of the immediate key objectives would be to establish and promote a single definition of the 3D television.

Predictions regarding online advertising

Online advertising budgets are expected to increase in value and at a pace much faster than the rest of the advertising market. Even if the recession has affected this segment too, the decline is much smaller than that registered by any other advertising category. In other words, even if the online medium had a negative growth, the market share continues to grow. It is estimated that online advertising will increase its share of the industry from around 10% in 2009 to 15% at the end of 2011.

The performance in the first half of the last year shows that traditional media markets most vulnerable to online sites are magazines and newspapers, followed by radio and outdoor advertising segment. Television seems to resist best in the face of this trend.

The risk is that the online offensive to affect the traditional advertising manner, which can result in an abrupt and permanent reduction in revenues and margins. In this case, the entire advertising and promotion ecosystem must be strengthened to control costs in a more aggressive and to identify new business models.

In Romania, taking into account the considerable difference between spending for online advertising in Romania and those recorded in other European Union countries, we believe that online advertising has a good growth potential. In fact, the current economic crisis could prove beneficial to bring about changes for the online advertising more and more advertisers are allocating a substantial budget for this. We must not forget that digital mediums offers increased efficiency with regard to a specific audience and allow more precise measurement of the impact of certain advertisements.

Conclusions

We have shown that mass-media market is very complex and very vurnerable to any socio-economic changes. In order to survive, a mass-media institution doesn’t need only to reduce costs,

but also to keep an eye on new opportunities and market niches that may be explored. Further studies may approach the alternative income sources for mass-media and posible marketing niches, as well as the best strategies for dealing with them.

COORDINATES OF ROMANIAN SUSTAINABLE DEVELOPMENT

VIOREL CORNESCU[*]
VLADIMIR – CODRIN IONESCU[**]

Abstract
Strategic objective of macroeconomic management, sustainable development implies the identification of an interaction space between economic, social, environmental and technological systems, in a dynamic and flexible process of functioning. Starting from fundamental macroeconomic principles, the paper synthesizes relevant aspects concerning planning, as main instrument of macroeconomic management and macroeconomic modelling, as a basis of substantiating development strategies. Likewise, the paper presents a mix of politics which operationalization could register Romania on sustainable development coordinates.

Keywords: *sustainable development, macroeconomic management, planning, macroeconomic modelling, strategic objectives, development politics.*

1. Introduction

Romania has come, over the passed few years, an ample and complex process of systemic transformation, of legal, institutional and organizational frame readjustment, having strategic objectives in settling a democratic system and building a functional, modern and competitive economy. Economy reforming took place by a compacting process of structures, of resources control, privatization and economic sectors restructuration, of ensuring a balanced and predictable business environment.

In implementation of structural reformation, Romania permanently benefits of support and consultancy from European Union and international financial institution (World Bank, International Monetary Fund, European Bank for Reconstruction and Development and so on), by multiannual reforming programmes of public administration, law and budgetary systems, of privatization support, bank and state enterprises restructuring, improvement of business environment, assistance in preparation for integrating in economic and institutional structures of European Union.[1]

The National Strategic Reference Framework 2007/2013 (CSNR), approved by European Committee in 2007, establishes intervention priorities of Structural Instruments of European Union[1]. Likewise, CSNR connects between priorities of National Development Plan 2007 – 2013 and those of European Union, established by Community Strategic Orientation concerning Cohesion and by revised Lisbon Strategy[7].

European Commission has allocated Romania, for 2007-2013, a total amount of approximately 19,67 billion euro, from which 19, 21 billion for Convergence objective and 0, 46 billion for European Territorial Cooperation objective. Reforming and Convergence programme answer the accomplishment efforts of convergence targets by defining direction of action at national level for subscribing to politics objectives and European strategies.

In 2010, European Commission launched "Europe of 2020" Strategy, for a smart economic growth, ecologic and in favour of inclusion. Romanian, as a state member of European Union, assumed general targets of "Europe of 2020" Strategy, as well as national development targets subsumed to European document [2].

[**] Associate Professor Ph.D., University of Bucharest, Faculty of Business and Administration, Romania, (e-mail: vladimir-codrin.ionescu@drept.unibuc ro).

[1] European Fund of Regional Development, Social European Fun and Cohesion Fund.

It is necessary to promote an integrated system of planning to reunite national politics with European politics in terms of a wholesome coordination. Also, "Europe of 2020" Strategy, as a central document of planning of public politics, will be filled with precise objective in priority domains form national perspective.

2. Macroeconomic principles

From conceptual point of view, macroeconomic could be defined as the ensemble of economic activities seen in their unit and interdependency, which takes place in a political-cultural frame and constituted in a historical ethics, within state borders.[12] Mezoeconomics reunites economics activities in frames, subframes and regions, while microeconomics describes the total of economic process in economic unities, approached through existent interaction between these.

In time, macroeconomics has been the subject of many controversies. Research in this area had as a result the elaboration of five principles which compose the so-called "macroeconomics core"[4] nowadays, these principles are accepted by the majority of macroeconomics specialists. The macroeconomics core presents a double dimension: theoretical and applicative. The theoretical dimension comes from the scientific substantiation of principles, which develops a methodological support of macroeconomics, while the practical dimension is derivate from the significant impact of such nucleus on options of macroeconomic politics.

According to first principle, in national economy quasitotality, the real gross domestic product is fluctuant around a climbing trend.[13] This trend is determined by the offer manifested on economy ensemble, while the fluctuation of real gross domestic product is a consequence of registered modification within the sphere of demand. The second principle states there is no compromise on long term between inflation and unemployment [14]. The essence of such principle resides in the fact that monetary expansion acceleration is reflected on long term in inflation rate growth, without having an impact on unemployment decrease.

Accepting compromise on short term between inflation and unemployment develops the content of a third principle of macroeconomics core. There are different opinions on what concerns the efficiency of monetary politics reported to the fiscal one, though, unanimously recognized the fact that macroeconomic politics have the role of fading gross domestic product fluctuation by balancing aggregate nominal demand.

The fourth principle underlines that anticipation is a factor which influences macroeconomic politics' effect. The principle emphasizes a connection between the level of credibility of macroeconomic politics and the short term cost of disinflation. Nevertheless, last principle recommends fitting macroeconomic politics, which in uncertain terms, are landmarks of macroeconomic politics. This core represents the theoretical-methodological fundament of macroeconomic management.

3. Planning and macroeconomic management

Constructing a modern and competitive economy needs an efficient management at macroeconomic level, which main instrument is planning. Macroeconomic planning was institutionalized in developed countries right after World War II. In these states were established national plans or economical – social development projects. In the second half of '70's and the beginning of '80's was registered a reduction of manifested interest for planning. Presently, the problem of planning and its importance in a modern economy represents a controversy in the world of economists. In our opinion, macroeconomic planning is absolutely necessary in contemporary economic context, marked by profound evolution, complex and unpredictable. It is important to mention the fact that planning presents a pronounced international dimension, becoming a global phenomenon. Some authors appreciate that planning is present also in interstate and superstate economic structures, which give content to international economic integration, including economical-social life globalization process[11]. Use of macroeconomic planning is determined by a series of

objective factors, between which we remind: insufficiency of information offered by market; its incapacity of adequately allocating resources; modifying economic agents' behaviour, by transition from organizing production with the purpose of immediate profit, to organizing on long term; the impure and imperfect nature of existent competiveness in present economies.

Macroeconomic planning includes two stages, such as: diagnosis-analysis of national economic system and projecting national strategy of economic development. The diagnosis – analysis of national economy aims to an evaluation of internal economic potential, as well as identifying progressive landmarks in international economic environment. The national strategy of development is planned on the basis of diagnosis-analysis of economy. As a fact, the strategy constitutes the result of macroeconomic planning activity, the "national product" with which a state enters the existent competition on grounds of elaborating partial – sector strategies, of branch, of sub-branch and regional. Strategy constitutes an essential premise of economic progress, creating, by means of present times, a bridge to connect past and future. Strategy defines first exterior concretization of paradigm "start thinking to finish". Such paradigm is based on the principle "All things are created twice", meaning there is an initial creation, of mental order and a second physical creation.[3]

Projecting strategies of development represents a complex step with the help of macroeconomic modelling activity. In the second half of XX century we witnessed an accelerated development of macroeconomic modelling, as a consequence of progress registered in areas such as macroeconomic, national accounting, econometrics and calculus techniques. Thus, in states with advanced economy, were created informational banks and macro-models, one of the most important being the Institute of Statistics and Quantity Economics in Hamburg.

The macroeconomic model is a mathematic construction made by variables which condition one another and have a significant impact on functioning mechanism of a national economy. Academician Emilian Dobrescu appreciates that a macroeconomic model could be expressed by a function such as[5]:

$$ST_T = \phi\ [ST_t, EX_\tau, AP_T, OP_T, R]$$

where:

ST_T = vector of indicators which mark economic system status in T time;

STt = historical information, consisting in data referring to economic system status in previous time;

EX_τ = variables expected or planned, representing anticipated evaluation of indicators which significantly influence the decisions of economic operators ($\tau \geq T$);

AP_T = values determined by algorithms of calculus outside the specific model;

OPT = optional or control parameters which mark politics with great impact on business environment (public expenses, international position of economy, monetary politics, operating mode of markets);

R = set of relations through which values of models are connected (balance relations, behavioural equations, objective functions).

Nowadays, we find a great number of macroeconomic models worldwide, fact which indicates a significant importance given to modelling by states with advanced economy, as a support to project activity of development strategies. Necessity of macroeconomic planning is confirmed, therefore, also by recent activity registered internationally.

4. Romanian politics of sustainable development

The fundamental objective of sustainable development is identifying a space of interaction between economic, social, environmental and technological systems, in a dynamic process and flexible of functioning[9].

Sustainable development is defined, in essence, by the following coordinates[12]: permanent compatibility of man created environment with natural environment; equality of chances of generations who coexist succeeding each other in time and space; interpretation of present by future, under introducing as a purpose lasting development of ecologic security, instead of maximizing profit; moving the gravity centre in ensuring general welfare from quantity and intensity of economic growth to its quality; organic integration of ecologic assets with human assets.

For subscribing to sustainability trajectory, Romania must fulfil the following strategic objectives on short, medium and long term[7]:

- 2013 horizon – organic embodying of principles and lasting development practice in the sum of programmes and public politics of Romania, as a member state of European Union;
- 2020 horizon – reaching present medium level of community countries to main indicators of sustainable development;
- Romania's significant approximation to the medium level of the year of European Union member states from the point of view of sustainable development indicators.

Sustainable development of Romanian economy implies the operationalization of a mix of economic politics structured by the following main axes[7,8]:

- Economic competitiveness increase and economic development based on knowledge;
- Development and modernization of transportation infrastructure;
- Protection and improvement of environmental quality;
- Developing human resources, promoting occupancy and social inclusion, as well as reinforcement of administrative capacity;
- Developing rural economy and productivity growth in agriculture;
- Decrease of development disparities countrywide;

First priority axis of development has three major directions:

- Improvement of market access for enterprises, especially small and medium ones, by sustain of productive investment, by certifying enterprises and products, by creating an environment favourable to business financing, by developing business infrastructure (incubators, business centres, emerging clusters), as well as by promoting the Romanian touristic potential;
- Developing economy based on knowledge by promoting research and innovation as well as by efficiency of modern electronic public services (e-Governance, e-Education and e-Health);
- Energy efficiency improvement and value renewable resources of energy.

The transportation strategy targets an infrastructure modernisation in trans-European transportation and connectivity networks, developing transportation infrastructure of national interest, improving afferent services and sustainable development in transportation sector, by promoting intermodality, by traffic security enhancement on all transportation modes, as well as by decreasing the impact of transportation work and activities on the environment.

Environmental policy has as main targets to provide public utilities services at highest standards of quality and necessary quantity, development of integrated systems of waste management, improvement of sector systems of environmental management, developing systems of natural resources management (preservation of biologic diversity, ecologic reconstruction of deteriorated systems, prevention and intervention in case of natural hazards and so on), as well as infrastructure modernisation of air protection.

The fourth axis of development implies to fundament and to adopt measures of structuring on the following directions:

- Developing human assets, by investment which target initial educational system, disseminators of learning (human resources from education), content of learning (diversification and providing quality to educational offers) and professional formation system continues;
- Promoting fully occupying (are taken into concern the growth of adaptability of work labour and enterprises; development of initiative for social partners; improving transition from school

to work places, promoting entrepreneurial culture in education and formation, identifying and capitalizing all opportunities of labour market integration and so on);

- Promoting social inclusion (main domains of intervention are integration on labour market and fighting discrimination, improving access and participation to initial education and continues to vulnerable groups, developing an efficient system of social services destined to marginalization risk reduction and social exclusion);
- Developing administrative capacity and good governing, by creating a public administration – central and local – which to become an important factor of competitiveness, of development, progress and cohesion.

Rural economy development and raise of productivity in agriculture have as strategic objective building a competitive agriculture based on knowledge and private initiative, along with protection of natural, cultural and historical patrimony in rural areas of Romania. Thus there will be taken actions in directions such as increase competitiveness in agrifood and forest economy, raising standard of life in rural areas, sustainable economic development of farms and forest exploit, as well as promoting "LEADER" initiatives, by which it is expected to increase rural community capacity to develop business initiatives based on partnerships.

Diminishing disparities of development between country regions implies, mainly, improving transportation infrastructure, health, social and education services, developing business infrastructure and supporting local business activities with innovation character, increase the degree of touristic attraction of certain regions by creating an adequate infrastructure and improving specific services, developing alternative ways of tourism, protecting and promoting natural and cultural patrimony locally and regionally, renewing urban areas affected by industrial restructuration or which handle serious social-economic problems, such as European territorial cooperation at crossborder level, transnational and interregional.

Reaching strategic objective within the six national priorities of development represents support for a sustainable economic development. Increase long term competiveness in Romanian economy, developing basic infrastructure in conformity with European standards and continuous improvement of local human asset are the fundamental premises of Romanian integration in economic, institutional and social architecture of European Union.

5. Conclusions

In structural reform implementation, Romania beneficiated of support and consultancy from European Union and international financial institutions by multiannual programmes of reform in public administration, law and budgetary system, support of privatization and bank restructuration, as well as state enterprises, improvement of business environment, as well as assistance in preparation to integrate in economic and community institutional structures.

European committee allocated Romania, for 2007 – 2013, the total amount of 19, 67 billion Euros, from which 19, 21 billion for Convergence objective and 0, 46 for European Territorial Cooperation programme. Convergence Reform and Programme answer the efforts to accomplish convergence targets by defining directions of actions at national level for framing politics objectives and European strategies. Romania assumed general targets of "Europe of 2020" Strategy, launched in European Committee in 2010, as well as national objective in development subsumed to European document.

After accomplished research in macroeconomics the so-called "macroeconomics nucleus" appeared, which presents a theoretical-methodological dimension as well as a practical-applicative dimension. First dimension derives from scientific substantiation of principles, which is a methodological support of macroeconomics, while the second has in sight the significant impact of this nucleus on macroeconomic politics options.

Creating and consolidating a functional economic system, modern and competitive, needs a performing management a macroeconomic level. Main instrument of macroeconomic management, macroeconomic planning needs a diagnosis-analysis of national economic system, followed by projection of national strategy of economic development. Diagnosis-analysis of national economy has as main objectives evaluation of internal economic potential, also indentifying landmarks of evolution in international economic environment. Based on diagnosis-analysis the national strategy of economic development is projected. Actually, the strategy is the result of activity in macroeconomic planning, "national product" with which a state enters international competition.

For subscribing the sustainable development trajectory, Romania must operationalize a mix of economic politics structured on the following main axes: increase of economic competiveness and economic development based on knowledge; development and modernization of transportation infrastructure; protecting and improving environmental quality; developing human resources, promoting social occupancy and inclusion, as well as enhancement of administrative capacity; developing rural economy and increase agriculture productivity; diminishing disparities of development countrywide.

ROMANIA'S MACROECONOMIC ACHIEVEMENTSFOR JOINING THE UNIQUE EUROPEAN CURENCY

SILVIA POPESCU[*]

Abstract

The Romanian government has announced plans to join the eurozone by 2015. Currently, the leu is not yet part of ERM II but plans to join in 2010-2012. The economic advantages of the monetary union grow with expansion of the Euro zone. There is also a high level of skepticism; the main fear about the Euro is the inflation –that is considerable promoted by the Euro currency's exchange rate in comparison with 2002; another restraint is due to member states inability to establish their own interest rates. The IMF arose the option of joining the Euro zone criteria relaxing. A one-sided Euro's joining was suggested by International Monetary Fund on March-April 2009, in a confidential report mentioned by The Financial Times as the emergent states in Central and Eastern Europe to be able to pass to the unique currency, but not being represented in the Central European Bank Board. By its side, CEB considers that emergent states of the European Union must not pass to the unique currency unilaterally, because such a fact could under-mine the trust in Euro currency worldwide. This option would hardly deepen the macroeconomic controversies inside the Euro zone and would contradict the previous conditions already imposed. An acceptable solution could be the fastening of emergent countries joining the Exchange Rate Mechanism 2, after they are aware of risks arisen by such a step. The European Commission endorses in the Convergence Report on 2010 that Romania doesn't meet any criteria needed by passing to the unique European currency, respectively: prices stability; budget position of the government; stability of exchange rate; interest convergence on long run and there are also law impediments. Our paper discusses arguments for a faster passing to the Euro currency versus arguments for a late joining the Euro currency in Romania.

***Keywords**: Euro currency, the economic depression, stability of exchange rate, monetary policy, the financial depression.*

Introduction

Theoretical foundation of optimum currency area (OCA) was pioneered by Mundell (1961) and further developed by McKinnon (1963), Kenen (1969), Tavlas (1993), Bayoumi and Eichengreen (1996) and others. Frankel and Rose (1996), found a strong positive relationship between business cycles correlation and trade integration as the participation to a currency union increases the integration of collateral trade which lead to greater business cycles synchronization; Beside the nominal convergence criteria, the states who want to join a monetary union have to take into consideration also the real convergence criteria: business cycle synchronization, demand and supply shocks correlation, market flexibility, etc; Among OCA's properties business cycle synchronization features prominently; Synchronization of Business Cycles: Artis and Zhang (1997,1999), Artis (2003), Darvas and Szapary (2004),Massmann and Mitchell (2003), Fidrmuc and Korhonen (2006);Demand and supply shocks correlation: Blanchard and Quah (1989) and further Bayoumi and Eichengreen (1992), Frenkel and Nickel (2002), etc; The theory of optimum currency areas tries to identify more exactly thereport between the benefits and costs and the opportune moment of entrance in a monetary union. The pioneer of this theory is Robert Mundell (1961):"The Theory of Optimum Currency Areas", American Economic Review 51 (September 1961), pp. 717 – 725, a classic paper. What seemed to be a utopia in 1961 became a reality in 1999. „The European states may agree on a simple act […], they may establish a currency authority or a central bank. This

[*] Associated Professor, Ph.D., Economics Faculty, „Titu Maiorescu" University, Bucharest (e-mail: silvipopescu@gmail.com).

is a possible solution, and may be even the ideal solution. From a political point of view, it is very complicated, almost utopian." R. Mundell (1973).The optimality of a currency area is defined within the terms of certain properties (criteria), among which the economic integration of the member states, the mobility of the factors of production, the similarity of the production structure. According to a definition, it is optimum for a country to adopt the currency of the monetary union if the benefits associated to this decision exceed the costs. There is an extremely wide literature with respect to the optimum currency areas, but all articles and books in the field are focused on the manner in which a country may assure the internal stability with the policies remained available after the loss of the monetary autonomy and the rate of exchange policy. This literature refers to the possibilities of insuring a macroeconomic balance (internal and external balance) after an asymmetric shock, namely a shock which affects a country of the union, but not the others. The internal balance refers to bringing the unemployment rate to the level of the natural rate and to the insurance of economic increase. The external balance refers to assuring the balance of payments, seen as balance equilibrium This paper has the merit of elaborating a synthesis of the evolution of the concept of unique currency, as well as the assessment of the performances of the countries which adhered to the Economic and Monetary Union from the point of view of the mechanisms of operation of their economies. It also deals with the steps necessary for a careful preparation of adopting the unique currency by Romania, the efforts and the progresses made by our country in the process of macro stabilization, the main directory lines of the monetary policy in the last years and last but not least a careful assessment of the impact and implications of adopting Euro in Romania

Paper content

1.Economic advantajes of the euro zone 's extension

The Euro currency is public assets, bringing many advantages to envolved countries. This removes the exchange rate risk for the member countries, by diminishing the interest rate, and allows to those countries to benefit by the advantage of prices stability, the basic purpose of ECB. Also, it creates the conditions for an integrated market, a liquid and compact one, among the participating countries. Once the expansion of Euro zone is done, more EU member states will enjoy these advantages. Much more, some of the advantages of the monetary union, as removing the incertainity of exchange rate, are higher. A currency exchange will not be needed, nor the payment of added taxes for that transactions in the countries inside the Euro zone. Although, to achieve the maximum potential of these advantages, a country must be prepared for passing to Euro currency. The stage will be evaluated on the Maastricht convergence criteria basis.Member States of Euro currency zone gain from being parts of a wider currency block. It is more difficult, for example, for those that speculate to make a quick profit from currency exchange and by this way to remove a great part of pressure affecting the value. A trip in Euro currency zone countries is easier for the EU citizens, with no currency exchange expenses. Also, it's an easier task to compare the prices of goods and services, contributing to a better home market work and suporting a healthy competition, with benefits for consumers.The economic and prices stability as a whole brought by Euro currency is benefic for entire economic environment, from individuals to large companies.

2.The skepticism about the euro currency zone

The main fear about the Euro is the prices inflation –that is considerable promoted by the Euro currency's exchange rate in comparison with 2002. An average citizen could be able to face the conversion from previous currency into Euro. But only those that are systematically registering the prices have a clare vision upon changes of prices for a large quantity of goods. In this context there is another phenomenon: as the use of previous currency was longer, as the sensation that prices grew is stronger. The reason is that the actual prices in Euro are compared with former prices. Often it is neglected the fact that the previous currency would generate higher prices because of inflation. The most frequent restraint is due to member states inability to establish their own interest rates. The

member states incapacity to modify interest rates means that they can't decrease the interest rates unilaterally to encourage the investments or to grow them to stimulate savings. A unique European currency means a European unique monetary policy and that needs answers to several questions.

3.Opinions concerning a faster pass to euro currency in the context of economic depression

3. 1. One-sided pass to Euro currency

A one-sided Euro's joining was suggested by International Monetary Fund on March-April 2009, in a confidential report mentioned by The Financial Times as the emergent states in Central and Eastern Europe to be able to pass to the unique currency, but not being represented in the Central European Bank Board. According to the report, such a fact would solve the problems of off-shore debts of those countries and would take-off the incertitude on markets in the region. The European Commission rejected the information suggesting that the report is overfulfilled and said that European Union took several decisions to help the Eastern Europe countries to pass the financial depression. The Central European Bank considers that emergent states of the European Union must not pass to the unique currency unilaterally, because such a fact could under-mine the trust in Euro currency worldwide. This option would hardly deepen the macroeconomic controversies inside the Euro zone and would contradict the previous conditions already imposed. An acceptable solution could be the fastening of emergent countries joining the ERM 2, after they are aware of risks arisen by such a step. Entering in ERM 2 means to take the responsibility to keep a stabile exchanging course for a determined period, but this implies risks. For the countries that are targeting the exchange rate (the Baltic states and Bulgaria) the perfect solution is to pass to the Euro zone as soon as possible, but they don't fulfil the conditions for that. For those four countries at least, a one-sided pass to Euro currency could be a solution. Those countries would not be accepted as full-members of the Euro zone, would not take part to political decisions of the Euro zone, could not rise funds from Central European Bank and would not affect the statistics of the Euro zone, but they would remove the exchange rate risk and would be members of a liquid Euro market. Their main next purpose would become to be promoted from the position of semi-member to that of full-member inside the Euro zone. In a way, a one-sided pass to Euro currency could discredit the joining rules; in the end, these countries will pass to Euro currency taking upon themselves all the risks and pay for them from their own reserves. Some analysts consider that by this way the costs would fall for all the European Union countries. The other four applicant countries for the Euro zone (Czech Republic, Poland, Romania, Hungary) are the greatest economies in the region, and their size makes the sudden change of national currency a more risky, more complex and less realistic process. Their floating exchange rate regim makes the change vulnerable to speculations. Although some advantages would be for Romania (removal of exchange rate risk), as long as there are not fulfilled all the criteria for convergence, more riks appear, generated by the inadecvate macroeconomic statement for this approach.

3.2 Change of criteria for passing to the Euro zone

On the background of the new economic depression it was arisen the problem of *relaxing criteria* for passing to the Euro currency. Western countries' leaders gave different answers during discussions refering to this subject. Although leaders as Angela Merkel (Germany's Cancelor, a country considered the most uncompromising about respecting the passing rules to the Euro currency) considered that the decision concerning *pre-joining period* could be re-examined, the criteria of passing to the Euro zone were not modified. Most leaders reject the idea of more flexible criteria that are limiting the level of budget deficit, public debt and inflation. Behalf of the Czech Presidency of the European Union, MirekTopolanek declared that there is a wide consensus among the 27 members of the Union upon the fact that would be an "error the play rules to be changed at this moment". Several leaders of the EU countries said they agree an acceleration of passing for the East European countries, but they don't discuss about relaxing criteria, nor exceptions to the rules.

Fulfiling criteria also means to ensure the sustenability of nominal convergence indices. Lithuania had been refused to join the Euro zone on 1st January 2007, because it didn't fulfiled the criterium about prices stability in the referred year and the inflation rate surpassed the accepted level. Although the inflation rate is a moving target, known *post factum*, it was considered that a sustenable inflation low rate is not enough, implying many risks.

4.Eu member states and passing to euro

The less member states non-members of the Euro zone can join the Euro zone faster than greater countries. Estonia, Lithuania and Slovenia joined to ERM 2 on June 2004 (less than two month since the moment of their adjoining to EU), and in May 2005, Cyprus, Malta and Latvia made the same thing. The Baltic states are preparing to pass to the Euro zone as soon as the economic conditions will permit them to. At the begining these countries planed to be ready for passing to Euro in 2007-2008. All of them are fighting to fulfil the inflation criteria seriously and also the need of re-considering the national targets being realistic. The non- EU micro-states as Vatican, San Marino and Monaco, passed to Euro as a part of the union with states they are involved to, EU members. Andorra, Montenegro and Kosovo passed to Euro zone one-sidedly. On contrary, although Slovakia entered the ERM 2 in 2005, it seems to be accepted not very soon, while bigger states as Bulgaria, Czech Republic, Hungary, Poland and Romania still didn't that. Czech Republic and Hungary planed to pass to the Euro zone in 2010, and both of them have now a delay and didn't proposed a new date. Poland has no official date-target yet for passing to Euro currency. Bulgaria proposed its dead-line for 2010 but certainly will be a longer time to wait, as long as Romania seems to pass to the Euro zone about 2014.The public opinion of some new entered countries into the EU is changing. Many citizens feel that the benefits of a member statement could be seen very few. They are very suspicious about finding themselves into a way to get a stable position about the limiting economic policy that seem be represented by the Economic Monetary Union. They can see the most of economies inside the Euro zone fighting for economic growth, as long as their own economies had been growing faster some years ago. If the main performance for the new accepted states is to reach the same economic performances as older states into the Union, as fast as this is possible; so it arises the question: why such a rush to impose more difficult economic policies, that make these tasks more and more difficult. The new member states could see that the older ones dislike to suport them to develop, being afraid of their potential competition in the future. Much more, some new member states feel that economic criteria required are more strictly imposed than the already adopted Economic Stability and Growth Reformed Pact that is working now.

5. Romania' way towards the euro zone

5.1.Analyse belonging the Convergence Report – May 2010

Romania doesn't fulfil any criteria for passing to unique European currency, it is said by the European Commission in its Convergence Report on 2010, respectively: prices stability; budget position of the Government; stability of exchange rate.Convergence of interest on long run, but also faces law obstacles. Behind the *economic problems*, as a too high inflation or rather high variations of national currency during the last two years, due to the economic global depression, *Romania also has legislative problems.*The Commission considers that the law referring to the statement of National Bank of Romania is not aligned to European standards yet, neither concerning the independence of institution, nor about the interdiction to grant loans to financial institutions, excepting "the rescue aid". Strictly referring to economic criteria, the Commission emphasizes that Romania had a too high rate of inflation since 2007, the year of joining EU, to present day, for passing to the Euro zone. Actually the procedure for excessive deficit is started by the Commission against Romania, the dead-line for reducing the deficit below 3% of GDP being 2012. The deficit was 5.4% for 2008 and rose to 8.3% for 2009. For this year the deficit is estimated to 8% of GDP. Another problem is the public debt that will rise from 30.5% this year to 35.8% of GDP for the next

year. Although the Joining Treatise stipulates that the maximum level of the public debt could be 60% of GDP, the economists consider that Romania can't afford such a big debt, its economy being rather weak. Romania doesn't seem for a moment being interested in joining the Euroland in 2015 as it was predicted, a more reasonable horizon being 2018. Actually it is not known if the costs of passing to the unique currency could be higher than the future benefits. We need an anchor like passing to Euro currency, but it is better to look realistically. For an economy with such sized GDP, the Euro currency "umbrella" could offer protection.

Table nr.1
Arguments for a fast passing vs. Arguments for a late passing to Euro currency in Romania

Arguments for a fast passing to Euro currency	*Arguments for a late passing to Euro currency*
Faster benefits due the exchange rate disappearance, implying a sustenable economic growth stimulation.	Delaying in structural reforms implementation would have negative effects on long run if the passing to Euro currency is made too soon.
Actually we have a high exchange rate risk due to the high level of indebting in foreign currency (the exchange rate could be sooner a propagator of shocks than an instrument for adjustment).	High inflation pressures – low potential for prices convergence.
The delay could lower the motivation for making structural reforms.	A low correlation of Romanian economic cycle with that of the Euro zone; the synchronization of the business cycle is a pre-condition to diminish the asymetric shocks risks.
The actual essemby of policies would continue to be stimulated.	The low sustenability of the public finance – a high pressure on expenses and a very low level of budget rises.
The trade affairs with the Euro zone would make possible a faster passing technically.	A different structure of economy.
	The low level of the real convergence (GDP per capita).
	Difficulties on the labour market.
	A longer independence for monetary policy and exchange rate.
	It would facilitate the progress of real and nominal convergence.

5.2.Possiblescren-plays for Romania's passing to Euro currency
5.2.1.A delay on long run for passing to Euro currency
(1) Advantages
A longer period to fulfil the structural adjustments still not made
A better progress of real and nominal convergence

The synchronization of the business cycle in Romania with that in the Euro zone countries (pre-condition to diminish the asymetric shocks risks).

A longer independence for monetary policy and exchange rate

(2) Disadvantages

Higher transacting costs together exchange rate risks, that could inhibit investments and economic growth

The possibility to delay some structural reforms and to relax the macroeconomic policies (mainly in fiscal and salary fields) if a long run is decided for passing to the Euro currency

The unclear message given to international capital markets, the delaying could be atributed to some structural or economic policy weakness, hard to be seen by investors

5.2.2..An accelerated passing to Euro currency on a short run

(1) Advantages

Faster benefits due the exchange rate disappearance, implying a sustenable economic growth stimulation

Lowering motivations for relaxing the rhytm of structural reforms

Stimulating the consistency of macroeconomic policies assambly

(2) Disadvantages

The loss of monetary and exchange rate independence would move the pressure of structural adjustments to the economic activity and labour market, in the actual condition of a limited flexibility of Romanian economy

The lack of synchronization between Romanian business cycle and the Euro zone countries would increase the risk of asymetric shocks, very difficult to be controlled without independent monetary and exchange rate policy

The difficulty to find a representative central parity for a stable exchange rate Leu/Euro, that could delay on long run the belonging to ERM2

A higher probability to act the Balassa-Samuelson effect in the first part of the economic adjustment process after the moment of joining EU, it having cosequences upon targeting inflation and/or the national currency growing up

A limited period to finish the target inflation effectiveness as a monetary policy

A passing to Euro currency would remove the exchange rate risk, and lower the costs for firms in commercial activities, that meaning a higher stability for Romanian economy. But the exchange rate decided at the moment of passing is very important; a low rate for Leu means an increasing in prices. On the other hand, the salaries couldn't grow easily, and the National Bank of Romania couldn't decide the interest rates and the inflation would be hardly controlled. But, the purpose of passing to Euro currency remains an available improvement for the future coherent policies.

Conclusions

The papers offers a short in time to the idea of monetary unionwhich allows us a more objective appreciation of the political dimensions of themonetary unions, approaching with accuracy the history and the bases ofcreation of the European Monetary System (SME) and especially the political andeconomic context of the time. There are presented the basic elements of SME, the stages and effects of UEM incorporation.Thepaper presents the European integration regarded synthetically, which is reduced to the incorporation and use by the members of the monetaryunion of the unique currency, which replaces the national currencies. "The currency is a macroeconomic phenomenon, and by this a political phenomenon", the monetary integration is therefore, in its essence, an integration from thepolitical perspective. The currency, regarded as institution, has a social-politicalnature and relies on the "trust of the agents in the system which proposed and warrants it". From a functional perspective, the currency fulfils the role of unique tool of transactions, of reserve,

of valueand cash or of value standard. The institution of unique currency – EURO – is a synthetic expression of European monetary integration and the visible sign of the European Monetary Union. EURO imposes the formation of the consciousness that all members of this union belong to a sole monetary space and compels the citizens of the member states of the Union to acknowledge it as material form of the right of obtaining by it a part of the goods and services offered for sale on the territory of the Union. Robert Muldell, the author of the theory of „optimum currency areas", stated that Euro would be a factor of understanding, prosperity and peace. Is presented the evolution and the impact of adopting Euro. The creation and acceptance of the unique currency, was without any doubt an act of trust in Europe, and at the same time a challenge in the context of global economy. All changes generated by the passing to unique currency wereincurred for the increase of the capacity of competing in a globalization economy, the passing to Euro being favoured by the economic stability whichallowed the subsequent development of he member states, without the risk of inflation.is presented the impact of creating the unique currency Euro TheEuro currency was a protection wall before the financial crisis, registering an increased interest of the countries of the European Union (UE) which were not convinced of the importance of a unique method, as Denmark and Sweden, as well as of Iceland, which is not even a part of the communitarian block. "During this period of crisis, Euro protects the companies in front of volatilisation of the

rate of exchange, which affected them strongly during the previous periods of recession", stated the president of the European Committee, Jose Manuel Barroso But Euro has other advantages as well. Being the second global currency, after dollar, the European unique currency - in which are denominated 27% of the global currency reserves – is considered as important as the dollar and yen on global plan and allows the avoidance of some monetary crises. However, the Euro area shall be affected by the adverse representation oninternational plan, not having individual representatives within the internationalorganisations, such as the International Monetary Fund or the Group of Seven (G7). A special attention is paid to the manner in which Romania was situated in the process of preparation of adhering to the European Union, by stating the advantages and costs of this demarche. The quality of EU member has a major impact on our country with respect to the economic, political and social dimensions. The economic implications shall be preponderant, but radical mutations shall also be registered in the political, security, social and cultural fields. From the political perspective, the mechanisms of taking decisions shall have to be reconfigured, in the sense of a transfer of competences to the communitarian institutions. At the same time, Romania shall benefit of the possibility of participating, within the Union, to the collective complex decisional processes, having thus the possibility to promote and protect, better, its own interests. The development of the economy shall not be performed homogenously between the economic sectors, since there shall always be

relative losers and winners. The introduction of unique currency raises problems of strategy and tactic for the economy of Romania. It is accepted the idea that Romania is interested and preoccupied of the future of Euro in the international system of payments and, as a reserve currency, of the evolution of Euro- American dollar rate of exchange, of the connections which may be established between leu and Euro. Euro involves a series of modifications both in the global economy and in the Romanian economy. "All the people agrees that the occurrence of the sole currency shall involve transformations of historical importance, but also that our possibilities of anticipating the nature of these transformations are extremely limited".(Romano Prodi, "A vision on Europe", 2001). The paper confirms some previous results in the literature, concerning the quantitative and qualitative properties of the business cycles which vary across detrending techniques by extracting different types of information from the initial data (Canova, 1998). Most of the CEECs showed a certain tendency to move toward higher synchronization level, especially during 2004-2008, however Romania, Hungary and Bulgaria still register the most reduced business cycle correlations among CEECs. This study support strong correlations between the GDP cyclical component of the Baltic States and Euro zone after 2004, explained by the collapse of trade with Russia and reorientation toward Western countries. The study support also the endogeneity

hypothesis of the optimum currency area criteria which tells that a common market intensifies the bilateral trade with impact on higher business cycle synchronization degree. However, we observe the clear impact of the financial crisis on the last analyzed subperiod, where all the correlation coefficients increased significantly as most of the countries faced strong GDP contractions. Demand shocks for most of the countries included in the study, are negatively correlated with few exceptions (France and Poland), while supply shocks are positive and strong for France and Poland, while for Germany and Italy is negative and seems relatively week. In Romania's case, demand disturbances are negatively correlated with the Euro zone and are quite significant for the analyzed period; supply disturbances are important and positive due to the different policies and exchange rate regimes in time. The major result of our paper is that, Romania as well as others CEECs countries still need time to progress and to real converge toward Euro zone, in order to reduce the costs of loosing the monetary and the exchange rate policy independence.

THE CONNECTIONS OF MONETARY POLICIES WITH THE EVOLUTION OF INTEGRATION AND GLOBALIZATION

MĂDĂLINA ANTOANETA RĂDOI*

Abstract
The last decades have marked a tumultuous acceleration of historical and political processes and this produced significant changes in the geopolitical sphere, which continues to influence the economy, the financial markets and international relations, with effects on the construction of a new global balance.
The unprecedented development of financial relations and monetary policies has contributed to their internationalization, to the homogenization of the financial markets and of some regulations regarding their efficiency.

***Keywords**: Bilateralism, regionalism, globalization, financial and monetary volatilization, general and financial-monetary integration, efficiency of monetary policies, etc.*

Introduction

The economic and financial-monetary relations have long preceded the appearance of the first states. Especially commercial links are very old and at first they were completely independent of state social formations. Therefore, bilateralism as a relation between two economic operators is the concept with the longest history, daily needs requiring the exchange of products.

Despite these trends, autarchy dominated economic life from its beginnings to the great geographical discoveries and the Industrial Revolution.

Economic "coagulation" continued and widened gradually until today, reaching various forms, interconnected levels that were unbelievable some time ago, representing a balancing factor at regional and international level. Current developments confirm the old forecasts referring to the indissoluble relationship between the economic and financial-monetary factor and international stability.

Literature review

1. Integration, globalization

One of the problems developed by economists and monetarists in the last decades is that of economic and financial-monetary integration involving the interests of states, classes, nations.

Etymologically “to integrate” means to include, to incorporate into a whole. The French economist Jean Weiller tries to broaden the definition of integration. For him, "integration is not simply an addition, but in a given space, it means increasing the possibilities for coordination of plans of decision centers, in order to form a single economic system. To study integration means to rise above the market and to focus the attention on decisions, expectations and intentions". This definition takes into account the West-European integration and the “centers of decision "are the authorities and the bodies of different national states.

For economists like Viner, Seitovschi, Haberler, integration would be simply the bringing

* Lecturer, Economic Sciences Faculty, “Nicolae Titulescu” University, Bucharest, (e-mail: radoimadalina@ univnt ro).

into contact of the economies by removing all barriers that stand in the way of their exchanges. This integration would be nothing else but the creation of a vast free market, formed as a result of the unification of two or more economies. In this case, as André Marshall considers, we can not talk about integration, but about a juxtaposition of economies which keep their own character and become more or less independent, each of them undergoing consequences that appear in their neighbors' countries. The real integration, as André Marshall says, is the one designed in the structural and voluntarist meaning of the word. "It combines various elements of an economic assembly so that it looks like a space of solidarity."

François Perroux defines the concept of integration based on the Western European integration. "The integration act unites the elements to form a whole or enhances the cohesion of an existing whole. To integrate Europe will be, supposing that the elements of Europe are the nations, to gather them in a whole entity, that deserves by means of its cohesion, to be called European, or to increase the cohesion of an existing whole, that will be legitimate to be called Europe".

In the economic field, Perroux considers that integration aims to replace the national balances established in each European nation, between each European nation and other nations in Europe and beyond, with a new balance of an assembly formed by the European nations, which is considered more favorable and stable for its own benefit. André Marchall, starting from the definition of Western European integration based on solidarity, considers this could be of four kinds, namely:

a) Economic, which, except from the coordination of national policies or the application of a common policy, can be the result of the many and complex economic ties woven over the borders between member nations producers: industrialists, bankers, merchants.

b) Social, i.e. it appears what Myrdal called "equal opportunity" that involves, contrary to economic integration, the intervention of national and European public powers. If economic integration can be private in nature, social integration cannot be conceived otherwise than institutional.

c) Political, when in Western Europe the management unity is achieved and the conditions for creation and operation of a supranational authority are met, the integrated whole will be structured as each nation is structured.

d) Territorial, this is real integration because it is economic, monetary, social and political, all at the same time.

Unfortunately, we find that André Marchall, as other economists also do, omits one of the fundamental integrations which determines the four types, the **financial-monetary one**.

In this way, we consider that Perroux's considerations, namely that there are three forms of integration, are more comprehensive:

a) market integration

b) integration through investments

c) integration by means of institutions

These forms are, ultimately, different steps in the integration process.

Market integration is the simplest form of integration, which aims to create a common market - economic and financial-monetary - by removing the Customs barriers and ensuring the free movement of goods and money in the area. The financial and monetary integration has an important role in forming the common market, and its element of crucial importance is the free convertibility and movement of national currencies.

The unification of Western Europe, from an economic point of view, resulted in a vast market, which allows the existence of an economy on a higher level, similar to the American or Asian ones.

However, under the shelter of a formula like "the vast territorial unity", "the optimal size", they motivate and protect the greedy expansionist policy of large capitalist countries and imperialist monopolies against small countries, which, under the disguise of integration, seek to plunder the latter's natural wealth and subdue them economically and politically.

Another argument frequently invoked by economists to justify European integration is the development of productive forces, the very rapid contemporary technical progress.

Andre Marchal argues that in its structural sense, integration is impossible to occur unless the following conditions are met:

1. Geographic proximity - Statistics show that neighboring countries have a greater commercial exchange and that despite the progress of the means of transport, distance is an obstacle. He said that "here there is one of the irrefutable superiority of EMU on free trade area which groups seven countries geographically spread: Austria, Denmark, Norway, Portugal, United Kingdom, Sweden, Switzerland."

2. Similar development levels and the homogeneity of the structures."This means, Andre Marchal says, that territorial integrity must unite not complementary economies, but similar economies, with a view to restructure them in a broader framework - which undoubtedly arises numerous problems and obstacles, but which proves to be advantageous. While, on the other way round, the union of complementary economies, which do not arise any problem, seems to be of no utility, because it simply embodies the status quo. "

3. Psychological conditions: the will to become united in order to form a balanced economic complex.

Listing these conditions that would make the economic integration sound and politically acceptable, Andre Marchal shows that it can not be extended to too many countries. That is why no one can speak of global integration, but only of a regional one.

An extremely important observation and at the same time a correct one is made by Myrdal in connection with the worsening regional disparities in terms of integration, because of the mechanism of "circular and cumulative causation". The complete liberalization of trade following the completion of customs unity, labor force, capital, generates a double cumulative process of enrichment of the rich areas and impoverishment the poor regions.

We must understand that European integration does not take place in an international "vacuum". European Union countries are open economies with close links with the world. Therefore, the development of the European Union will be seriously affected also by economic, monetary and political events outside the Community.

On the other hand, the EU is a major player on the world stage, an actor whose actions have a significant impact on the global economic system. All these challenges and evolutions are ultimately the key to progress and to the perpetuation of competition.

2. The impact of the Monetary Union (MU) on the globalization of capital markets

The Capital Liberalization Directive adopted in June 1988 is the document that governs the European Economic Community's full liberalization of capital movements.

EU Treaty agreed between Member States shall prohibit any restriction on capital movements and payments between Member States and shall, in principle, ensure the strength of the European integration, without which the single market cannot be fully supported and carried out.

The full harmonization of the capital market is also hampered by the national characteristics of money markets, resulting mainly from the level of inflation.

The expansion of world trade, seconded by the capital flows, the unprecedented progress of science and technology, the transition of the communist economic system to a market economy have generated the acceleration of the regional and global integration process, which basically represents increased business opportunities for the banks, financial institutions, firms and financial investors.

A brief overview of these events relate to the expansion of the eurocurrency market, the birth and strengthening of the European Union, the growing importance of multinational companies, plus

the financial crises, the oil shocks, the debt crisis, the collapse of communism in Russia and in Eastern Europe.

At the beginning of the third millennium, globalization has become a fact. In these circumstances governments, international financial institutions, businessmen/businesswomen will have to face challenges, the so called "new rules of the game."

Globalization involves both a series of positive, innovative and dynamic aspects, but also many negative, disturbing and marginalized aspects. In terms of the positive effects, the relations between states and individuals are deeper than ever. World exports in the year 2009 are over 22% of GDP, compared to 17% in 1970.

Direct investments abroad in 2009 were over 11 times higher than the level of the 70s. This process of global integration is the result of **changes in the political view,** namely: to promote economic efficiency by:

1.the liberalization of domestic capital markets, financial services and the three factors of production;

2. State disengagement regarding many economic activities although at the origin of the process there are recent innovations in communications technology, integration is still partial: *borders remain a closed path, especially for low-skilled labor force.*

However, these trends mask some differences: **big progress, but also huge drawbacks, shortcomings and inequalities between countries and regions, poverty is everywhere today**. In industrialized countries, poverty is still obscured by statistics and one in eight is affected either by long-term unemployment or a life expectancy below 60 years, or an income below the national poverty line and a brief training level without the possibility of overcoming the situation.

In some countries, human poverty indicator shows large disparities by regions, for example, in the case of India where the poverty level is twice higher in Bihar state, in comparison to Kerala region. At the same time, the inequalities between men and women are still striking. In many developed countries, women are almost totally excluded from political life. Women occupy more than 30% of parliamentary seats in only five countries in the world and in other 31 countries, their presence in the Parliament is below 3%.

If financial markets or the markets of crime collapse, in the case of AIDS transmission and of the greenhouse effect, the risk of propagation of disturbances is huge. Planetary hazards, such as the global financial crisis started in 2007, are growing beyond the national and international capacity of intervention or response.

The main feature of the economic and financial environment is **the alternation of the phases of expansion with those of recession and the financial and monetary volatility**.

The financial crisis in America, Europe and Asia has destabilized the lives of millions of people, reduced the prospects of economic growth in the world. The analysis of the crisis allows the release of some important conclusions as regards the financial market:

a) **First of all, the instability is the characteristic of globalized financial markets**. A key element in triggering the Asian crisis, for example, was the instant and massive injection of capital for a short term, followed by an equally abrupt withdrawal.

b) **The second important conclusion** that is released from the crisis is **the increased caution with which the governments should open access to capital for the short term**, highly speculative, especially when the regulatory institutions of the financial market are infantile.

How are we going to live with this node of divergence? Will globalization defeat with her good intentions of equilibrium in a kingdom dominated by the Faustian spirit and intelligence or terrorism? It remains to be noticed what will be the answer to these questions.

Who will benefit most from the change? This is not the case of European exchange offices. The sector of IT and business consulting companies will take full advantage of the integration and stability of the currency, as a consequence of a strong demand for the adaptation of

information systems. Finally, the whole economy will benefit as a result of integration and currency stability, which is the fundamental goal of the project.

Capital markets have prepared themselves. The state bonds issued after 1999 have been issued in Euro and those in circulation have been converted. As regards the future of the financial centers, the opinions are divided and we cannot make reliable estimates yet. **If Britain will enter the monetary union, London would be able to dominate the capital market.** Smaller financial centers, for example, Brussels and Milan will restrict its activities. **Otherwise there is a risk that the offshore market in the UK to divert a portion of its profits volume of financial activities generated by the euro area**. Competition among financial centers and institutions will increase, and the result will be the production of alliances on continental markets.

London has an advantage over the competition in terms of financial liberalization, and this allows it to exploit the natural tendency of concentration which is found in the finance industry.

Making use of the "opting out" clause, the UK yet avoids the rigorous monetary policy and the discipline imposed by the ECB, London still retaining its status of offshore center. At the same time, London's advantage is reduced, increasingly, in favor of Paris that offers superior security guarantees for financial transactions.

In terms of derived products from the capital market, the Single currency triggers a uniformity of the futures contracts. At the same time, the listing of securities in euro allows a better comparison and creates new opportunities for arbitrage.

Potential efficiency and success in the financial sector depend, ultimately, on the ability of MU to achieve full financial integration of member countries, to create a more uniform system of practices on financial markets and achieve the fullest possible transparency in the system of quotation and evaluation.

The efficiency and the scope for monetary policy and the statute of the central bank are inseparable.

The impact of external constraints should not be generalized: no country can completely abandon the wave of adjustments, operating continuously. It follows therefore that **a certain degree of independence** must be considered and maintained at all times, **which does not mean isolation** from the process of internationalization. Economic independence is now discretion and security, allowing us to retreat from the game when "cards are bad" and it also means maintaining the autonomy of decision. Independence is connected to the national interest and to the quality of the most precious capital, the human capital. A country that does not make any efforts in this direction, in terms of **nutrition, health, education, comfort and civilization** in general, everything that is related to the **quality of life** today, is likely to disappear sooner or later, from the geopolitical landscape. Today, when we know too well how many forces are raging, many inequalities overwhelm us, and it is clear that this goal is not simple at all.

Two foreign policies are essentially required today:

- **the competition policy;**
- **the cooperation policy.**

The Competition policy is the cornerstone of the margin of maneuver. If we fail to provide a satisfactory level of competitiveness, we expect a dependent position, of a colony or satellite.

Although it was said from the beginning that once the currency are allowed to float freely, they will solve all the problems and the adjustments will be made by themselves, they arrived shortly afterwards to the flotation controlled by central banks, but still this was not effective. Then the coordination of monetary policies appeared, and at present we can also talk about the coordination of economic policies, within the EU and G7.

3. The debut of EURO – in between success and skepticism

"**E Day**", i.e. the euro day, on 1 January 2002, when over 300 million people in Europe began to have one thing in common: the same currency.
