A series of regulations to reduce corruption are contained in the Law on local government which sets out the principles of local autonomy and decentralization of public services, prohibitions and incompatibilities to avoid conflicts of interest, elements of transparency and public participation to drafting judgments and decisions, control and responsibilities for local government, including the legality of control exercised by the prefect, the terms and obligations in the administration of the patrimonial administrative unit - territorial, concessions and public procurement regime.

A highlight of actions to combat corruption in Romania is the decision to align to European requirements and the implementation of experience of other countries with experience in fraud detection and investigation, National Anticorruption Prosecution (N.A.P.) being etablished by the Government Emergency Ordinance no.43/2002 as independent structure, specialized in combating corruption crimes.

In the period 2002-2004, trying to answer alarming dimensions of the phenomenon of corruption in Romania, there have been numerous legislative measures which were referred to the activities of this institution. Also, international and European authorities, in particular the European Union, but also similar specialized structures in the Member States of the European Union, have offered N.A.P. professional and financial assistance in order to make it more effective. At the same time, he was constantly criticized the lack of activity of N.A.P. in serious corruption[15].

National Anti-Corruption Department was established by the Emergency Ordinance 134 / 29 September 2005, following the reorganization of N.A.P. Emergency Ordinance nr.235/2005 respond to Constitutional Court and the decision meant regaining power and anti-corruption prosecutors to investigate crimes of corruption committed by Members of the Parliament.

Corruption in international law

There are numerous international initiatives to fight corruption belonging to international authorities such as the United Nations, the Organization for Economic Cooperation and Development (O.E.C.D.), World Customs Organization, the Council of Europe, the Commonwealth, the Group of Eight, etc.

These initiatives may include exchanging information, promoting best practices, developing international recommendations and development of international law in order to encourage national programs to combat corruption and foster international cooperation and technical cooperation in this field.

The most important international legal instruments that enable collaboration in combating corruption states are:

• O.E.C.D. Convention on combating corruption of foreign public officials in international business transactions;

The scope of the O.E.C.D. Convention is relatively close and specific. His only objective is to use national law to criminalize acts of corruption committed by foreign public officials. The Convention deal in particular with active corruption, such as the offense committed by the person

[13] O.U.G. No.5 of 2002 on the establishment of elected local ban was published in the Official Gazette Nr.90/02.02.2002.

[14] See art.l of O.U.G. nr.5/2002.

[15] See European Commission country report in October 2004.

who promises or offers a bribe, as opposed to passive corruption, that the offense committed by the public official receiving the bribe.

• Revised OECD Recommendation on combating corruption in international business transactions;

It covers several areas such as taxation, accounting rules and operations of the institutions, regulations and procedures relating to the control, banking and financial provisions, public funds, public authorizations, etc.

• Inter-American Convention against Corruption;

It is the first international document against corruption that has ever been adopted (March 6, 1997). It has been ratified by 29 countries, and its scope is broader than the O.E.C.D. Provisions of the Convention can be classified into three main groups: preventive measures, criminal offenses and mutual judicial cooperation. European Union Convention on combating corruption involving European Community officials or officials of Member States.

• Council of Europe Criminal Law Convention on Corruption;

This agreement is drafted as a legal instrument of coercion and applies to a wide range of activities and circumstances. It contains specific provisions that criminalize various forms of corruption, cover active and passive corruption, private and public sector.

• Council of Europe Civil Law Convention on Corruption;

This is the first attempt to define common international rules in civil actions in cases of corruption. While the Criminal Law Convention seeks to control corruption by ensuring that crimes and penalties are clearly established, the Civil Law Convention requires Member States to proceed so that those who were affected by corruption can bring a civil action when they are identified offenders of corruption, which, in practice, victims of corruption in integrating anti-corruption strategy.

• United Nations Convention against Corruption.

In the period 1999-2001 were conducted negotiations which was developed this international legal instrument of coercion, applicable worldwide. Negotiations have been used not only for specific development tool, these are also a forum in which all United Nations member states can come together to evoke the problems of corruption, to apply effective measures to combat corruption and to reach an international consensus in favor of these measures.

The Convention was signed by more than 90 countries, entered into force on 14 December 2005 and provides for joint action by governments and specific measures, such as:

• public policy control of assets for public officials, senior civil servants, magistrates and others;
• implementing the law on protection of whistleblowers;
• international mechanisms for the repatriation of assets acquired through corruption;
• strengthening institutions for prevention of conflicts of interest and incompatibilities;
• prevention of corruption in business[16].

Conclusions

Corruption has become a structural and professional phenomenon, who, through informal networks of organizations and individuals, can influence decision makers in the sphere of political, legislative, judicial or administration and thus national security, so the measures and targets that must take into account immediate and future dynamics of the Romanian reality, to eliminate causes of corruption, in areas where the coefficient of vulnerability is high.

"Corruption" is both an expression of the proliferation of negative phenomena which are amplified in the context of globalization, as well as a direct consequence of inefficient management

[16] www.onuinfo ro/biblioteca/sistemul_de_documente.

of political exchanges, economic and social depth that occurred in Central and Eastern Europe in the disappearance of the communist regimes.

From 1989 until now, Romania has made significant changes, but nothing comparable to the capitalist society, explicitly embracing the idea of modernization and transition, as such, the European model.

Transitions are efforts to change the societies by groups of politicians with initiative who are proposing to modernize the company they run. Romania has seen many transitions and so far none of them fully succeed. Therefore, Romania is currently in a position underdeveloped society, and the distance from the developed world tends to increase. Romania currently has, however, by joining the European Union, a very special opportunity to modernize.

Unanimous opinion of theorists, lawyers and experts in economics is that, today, corruption has reached a significant size and the underground economy and organized crime increases by a huge amount that these forms convey them to criminal and protection.

Corruption is perceived more as a serious and dangerous phenomenon that undermines the power and authority structures, deceiving peoples expectations about maintaining a climate of social justice to ensure equal opportunities for everyone, but encouraging the rise of groups and individuals.

FEMINISM AND COSMOPOLITANISM: SOME INEVITABLE CONNECTIONS

DIANA ELENA NEAGA*

Abstract
In this paper I will approach the issue of feminism and cosmopolitanism in order to give arguments in sustaining the fact that, today, feminism and cosmopolitanism are inevitable connected. In constructing my discourse I will begin by laying out the main ideas of cosmopolitanism, followed by a presentation of the construction of the feminist movement over time, inter-relating these two discourses at the end of the analysis.
Connected with political ethics, political theory and political philosophy, the theoretical framework selected for this paper is based on the cosmopolitan theory developed by scholars like Martha Nussbaum, Fiona Robinson and Kwame Anthony Appaih who, underlining universality, define cosmopolitism as a universal concern with every human life and its well-being, but who are also giving value to the differences (seen as cultural or/ and of identity) insofar as they are not harmful to people.

Keywords: *Feminism, cosmopolitanism, differences, identity, ethics.*

Introduction

What are the connections, if they are, between feminism and cosmopolitanism – this is the main questions at which I try to give an answer in this paper. In order to achive my goal I divided the paper in three parts. In the first one I present the way cosmopolitan discourse developed over time, but in the same time I try to give some practical answers to some critics that put the cosmopolite theory in difficulty, critics related to the problem of identity and diversity. The main scholar the are guiding my arguments in this part are Martha Nussbaum, Fiona Robinson and Anthony Appiah. In the second part of the paper will be focused on the presentation of the successive stages that feminism went through in order to become the present movement, stressing along this presentation, the common elements between the feminist and the cosmopolitan construction. At the end of this paper I will underline how the *cosmopolitan discourse* which revolves around a few principles regarded as being fundamental is highly convergent with that promoted by the feminist movements. In order to do so I will answer to the questions: *How did the feminist movement evlove in time? What were the central and defining concepts of the three waves?* by using the main core of cosmopolitan principles - humanity, universality of the human rights, acknowledging, understanding and valorizing differences – and the metaphor of concentric ciercles developed by Martha Nussbaum.

The discourse of cosmopolitanism is revolves around some basic principles, among which: *humanity* which is a distinctive feature to all humans, the *universality of human rights* resulting from their very belonging to humanity, the awareness and understanding of the *differences*, principles by the means of which it aims at designing a truly inclusive and universal „human community", namely encompassing all human individuals.

The philosophical origins of cosmopolitism reside with the stoics, who claimed that the moral foundation of the human being consists in its very quality as member of the humanity, perceived as

* PhD Candidate, National School of Political Studies and Public Administration (NSPSPA) University, Bucharest, beneficiary of the project "Doctoral scholarships supporting research: Competitiveness, quality, and cooperation in the European Higher Education Area", co-funded by the European Union through the European Social Fund, Sectorial Operational Programme Human Resources Development 2007-2013; (e-mail: diana_elena_neaga@yahoo.com).

being essentially rational[1]. Diogenes the Cynic was the first one to refuse his membership with the local community by defining himself as a „citizen of the world". Besides the stoics, another important contribution to the development of the cosmopolitist moral was Descartes', who assumed the task of reconstructing the entire philosophy on the basis of a mathematical model, applicable with the entire science, model that could mediate the transition from doubt to certainty. Therefore, by means of the „doubt method" he attempted to systematically deconstruct the contemporary accepted beliefs in order to gain access to the *essence*, namely to that which can no longer be subject to deconstruction, i.e. reason – „I think therefore I am". Strongly influenced by the Cartesian philosophy, by the logic that there had to be a certain *a priori*, an undoubtable essence, the philosophy of Immanuel Kant is one of the sources on the grounds of which a model of universal ethic was later on developed, claiming as fundament the aforementioned "essence", namely the very quality as a human being, especially by postulating the categorical imperative – "act only according to that maxim whereby you can, at the same time, will that it should become a universal law", respectively „act in such a way that you treat humanity, whether in your own person or in the person of any other, always at the same time as an end and never merely as a means to an end."[2] This universal ethic is guided by a fundamental principle claiming that any human being must be humanly treated, that is in keeping with an undeniable dignity hypostasized in a global attachment to a culture of non-violence and respect for life, to a just economical order, to tolerance, to a life led by truth and, last but not least, to the principle of equal rights[3].

Alejandro Colas defines cosmopolitanism through the following three principles:

1. all individuals are members of a single moral community by virtue of their humanity;
2. therefore, they have reciprocal moral obligations that transcend the particular boundaries of ethnicity, nationality or of any other particular definition of identity;
3. these obligations require political involvement with respect to their enforcement[4].

Easily discernible is the fact that the first two principles refer to the moral dimension of cosmopolitanism, while the third to its political one. These dimensions aroused strong debate with respect to the validity of this concept, more specifically to the possibility of transforming a moral vision into a political one. One of these critiques claim that a universalistic moral vision, once it has been transformed into a political vision, involves the great risk of imperialism and ethnocentrism, namely that of claiming that all, or at least part of "our" values are or should be shared by the "others", the problem getting even more complicated once we try to find out what these values are.

These disputes bring to the forefront the problem of respecting diversity, looked upon as a solution both to these objections, as to the issue of the importance of the moral dimension promoted by cosmopolitanism with respect to identity construction. Therefore, as a way of avoiding the imperialistic or ethnocentric traps, the core of cosmopolitanism is fundamentally embedded with the *principle of respecting diversity*, concept which, I find, requires a few observations. The concept of diversity which I find to be related to cosmopolitanism implies the type of diversity that assumes not so much intrinsic valorization –diversity as a value in itself- as extrinsic valorization – that is valorization as a means of generating the kind of social emulation by the means of which

the citizens of the world can gain access to diversity as being empowering and not constraining[5]. At the same time, when I refer to diversity as a value in itself and to the instrumentality of diversity within a cosmopolitan construction, I do not necessarily mean to imply that lack of diversity would be negatively valued, but rather I attempt to avoid the use of diversity as a generative

[5] Diversity is valuable in the sense of becoming instrumental to the attainment of certain legitimate purposes within a cosmopolitan construction.

doctrine for certain forms of hierarchization unavoidably leading to various forms of moral exclusion, fact that would necessarily impinge on the cosmopolitan essence by the hierarchical categorization of the human beings. The same argument is also supported by the Frankfurt School, by the Habermasian tradition in particular, according to which universal inclusion presupposes a continuous dialogue between all the parties affected by a decision, dialogue which is grounded on the moral acknowledgement of the subjects resulting in their right to participate in the decision making[6].

Differences and their acknowledgement are essential aspects of the discussion on constructing human identity. Although the cornerstone of cosmopolitanism is represented by the membership with the humanity, our quality as human beings remains only part of the complex identitary puzzle, the mere *yarn of the fabric*. At the same time, identities can be not only dynamical, but also multiple depending on the contexts to which the individuals adhere, but these identities do not impinge on the cosmopolitan one, quite the opposite, they complete it without diluting it. Martha Nussbaum, one of the modern theorists of cosmopolitanism, stresses the fact that there is no conflict among the multiple identities, that is between the national, the ethnic, the religious and the cosmopolitan one, turning to the metaphor of the concentric circles in order to illustrate this idea of identity, in which context, the bigger circle obviously represents the membership with the universal human community[7]. This metaphor of the concentric circles is also assumed by Kwame Anthony Appaih when discussing cosmopolitan patriotism, presenting communities as small spheres within which individuals can perceive and at the same time bring into force their moral duties[8].

These individuals become cosmopolitan by acknowledging, understanding, respecting and mediating the identity spheres of their interacting parties, thereby becoming "rooted cosmopolitans"[9]. "When identities are manifold, passions are divided and leave open the possibility of having particular loyalties and a universal moral concern at the same time"[10].

As such, setting about with the acknowledgement of diversity we are, more or less unavoidably led to another essential concept for the cosmopolitan construction, namely that of identity, amply discussed by philosophers such as Nussbaum or O'Neill[11] who claim that precisely the kinds of identity, which are shaped within diversity, generate a complex set of interactions which sometimes can be conflictual in nature, but which are especially useful for creating a cosmopolitan perspective. There might be added the cosmopolitan interpretation of the well known Hegelian dialectic, in the sense that conflictual interactions among nations, ethnic groups, religions etc. are conducive to that type of *conflict* which could reveal in the end that something that unites us all, namely our capacity as human beings. This struggle for acknowledgement can therefore generate mutual understanding and respect by getting to know *the other*[12]. A notable aspect is the fact that the shaping of the cosmopolitan citizen cannot be realized by the elimination of the process of knowing/understanding the other, therefore, dialectically speaking the synthesis necessarily presupposes both thesis and antithesis.

[12] F. Dallmayr, Cosmopolitanism. Moral and Political, *Sage Publication, Political Theory* 2003, 2;

If someone wanted to sketch the generic portrait of a cosmopolitan citizen, the following features should be account for:

- continuous swinging between the local and the global spheres, with a definitive influence on the shaping of the global citizenship;
- respect for and acknowledgement of cultural diversity whenever possible, therefore the enactment of an interested dilletantism;
- general intent and opening to cultural diversity, leaving open the possibility of rejecting certain principles this diversity implies;
- high mobility rate, as empowering factor ;
- perceiving the notion of "home" in an extremely diverse manner;
- critical attitude with respect to fixed boundaries.[13]

In short, cosmopolitanism requires a continuous swinging of the individuals along a central axis determined by their membership to humanity, by their capacity as human beings. Therefore, on one end of the axis there is humanity, the citizens of the world, *sifted* through many diversity and contextual filters, thereby generating, first groups of individuals[14] (nations, ethnic and religious groups), then communities and, on the other end, the individual, whose identity is defined, according to Martha Nussbaum, by the small circle, namely that of the family. The essential link between the latter aspect and the cosmopolitan citizen is the humanity membership, but the individual, along its identity construction process, can just as well get to the other end of the axis, as he can stop along the way, at any intermediary point.

II

After this presentation of cosmopolitanism, I want to return to the main subject of this paper, namely cosmopolitan feminism. In what follows I aim at showing why today, as I was claiming in the beginning, feminism can only be seen as a cosmopolitan movement. In constructing the argument I will appeal to the *conceptual mechanism* involved with the construction of the cosmopolitan citizen which I have previously described.

I set about my argument, with a nutshell definition of feminism, followed by a presentation of the successive stages that feminism went through in order to become the present movement, stressing along this presentation, the common elements between the feminist and the cosmopolitan construction. As such, in short, feminism represents the movement for the women's rights. As such, the substance of the feminist movements and theories can be traced back to the following minimal assumptions: a) women are the subjects of systematical oppression; b) gender relationship are neither natural nor immutable; c) they are unjust with respect to women and therefore political action is called upon for their amendment.[15] Feminism is also defined as the belief that men and women are the equal heirs of the world and while most societies favor men as a group, the emergence of social movements promoting the idea of equality among men and women becomes unavoidable and legitimate[16]. However it would be false to assume that these are the definitions by which the first feminists operated, as would be equally false to imagine that these definitions, just as any others in fact, would have the capacity to convey the fierce unrests which generated them, or to exhaustively cover the concepts employed by feminism. These definitions are intended to raise interest for the realities behind the defined concept through a, so called, minimal effort shortcut.

---

[13] K. Gunesch, Education for cosmopolitanism? Cosmopolitanism as a personal cultural identity model for and within international education, *Journal of Research in International Education* 2004; 3; 251, 16;

[14] Individuals who are aware of the common interests.

[15] M. Miroiu, O. Dragomir, *Lexicon feminist*, (Iasi: Polirom 2002), 121;

[16] B. Winslow, Feminist Movements: Gender and Sexual Equality, in T. A. Meade, M. E. Wiesner-Hanks (ed), *A Companion to Gender History*, (London: Blackwell Publishing Ltd, 2004), 186;

Therefore, what lies behind the concept of feminism? Most authors, in explaining the emergence of feminism, take as landmark the Enlightenment discourse, the concept outspreading in Europe during the second half of the 19th century. The feminist movement initially manifested through the publication of a few isolated works[17] in which the opinion according to which women are an inferior social category, a "minority", was objected. But these works were the product of thousands of years of male dominance, during which women were denied the *privilege* of humanity[18] and treated accordingly. Toma d'Aquino, one of the most important Christian philosophers, claimed that women are "defective men", the source for this interpretation being The Old Testament, more specifically women's birth out of Adam's rib[19]. Several other sources of oppression are to be found in other religions as well. For example, the sacred Hindu text, The Law of Manu, classifies the Indian society according to castes and gender ("the woman is guarded by her father during childhood, by her man during her youth, she must never be allowed to act according to her will"[20]), while Imam Nawawi claimed that the seduction of men is in the nature of women and that is why the prophet did not appreciate their company[21].

The degree of oppression varies across societies[22], but generally speaking, women were disadvantaged for being borne as such, disadvantages that generated, along millennia, various reactions. Initially those were isolated reactions, most of the times consisting in religious revolts. For example, Mohammed's third wife, A'ishah created her own religious norms; in India, a group of women supported the *bhakti* movement objecting to one of the forms of the Hindu religion, demanding spiritual equality with men; in Europe, at the end of the 13th century, Guillemine of Bohemia created a women's church by which means she contested the catholic norms[23]. However, the origins of modern feminism can be traced back to the Renaissance and the Enlightenment, Marry Wollstonecraft's *A Vindication of the Rights of Woman* being one of the grounding works of feminism[24]. In the same period, the feminist movement in the USA was grounded, event marked by the Seneca Falls Convention in 1848, the main demand of which involved the complete abolition of all gender based discrimination forms.

Generally speaking, most of the initial feminist demands revolved around what we call today First-wave feminism – that of *equality*. As previously mentioned, the First-wave feminism started with the identification and deprecation by a group of women of the injustices they were subject to. The debate originated with a certain type of society, the Western one – Great Britain and USA, with a certain intellectual context – the Enlightenment – sticking to this circumstance for a significant period of time. At the same time, the demands strictly involved equal rights[25] and their attainment is

[17] Just as isolated was Diogene's position when claiming he was rather a citizen of the world than of the local community;

[18] They were denied membership to humanity;

[19] Another source for women's oppression also to be found with The Old Testament is the doctrine of the original sin, but I will not follow this path, as it doesn't strictly concern the subject of this paper.

[20] I. Mihălcescu (trad.), *Lega lui Manu*, (Craiova: Chrater B.), 229;

[21] B. Winslow, Feminist Movements: Gender and Sexual Equality, in T. A. Meade, M. E. Wiesner-Hanks (ed), *A Companion to Gender History*, (London: Blackwell Publishing Ltd, 2004), 188;

[22] For example, in societies that venerated goddesses such as Astarte, the Summerian goddess Innana, the Greek Gaia; in Egypt, during the Old Kingdom, women were allowed to manifest within the public sphere, girls had equal inheritance rights with those of boys; in the Aztec civilization women had parallel but equivalent parental rights with those of men etc..

[23] B. Winslow, Feminist Movements: Gender and Sexual Equality, in T. A. Meade, M. E. Wiesner-Hanks (ed), *A Companion to Gender History*, (London: Blackwell Publishing Ltd, 2004) 192;

[24] Among those who gave political coherence to the first wave feminist demands were John Stuart Mill, with his work *Subjection of Women (1869)* and his wife Harriett Taylor with her *Enfranchisement of women (* anonymously published*)*.

[25] Women's access to higher education, the secondary and high school education reform, the access of women to some professions from which they had been previously excluded (especially those related to medicine and law), the

still regarded by some theorists as sufficient correction of the injustices. At the same time, the First-wave feminism predilectly answered the needs of certain categories of women: *white, European, middle class*. The main point of this stage in the evolution of feminism was the attainment of rights for a specific category of women and was less responsive to issues concerning race, worker women and peasant women matters. Notwithstanding the fact that some of the voting right militants were also abolitionists, among which Elizabeth Candy Stanton, the former movement had a separate agenda from the latter[26]. The women's rights movements in Asia and Middle East have assumed some of the Western principles, while at the same time opposing imperialism and strongly supporting nationalist, socialist and anti-colonialist movements.

Therefore, if we were to make an analysis of the origins of the feminist movement according to Martha Nussbaum's cosmopolitan model, we should place it somewhere close to the middle of the representation, where it is preponderantly characterized by a strong loyalty to a certain group of women belonging to a certain geographical region, ethnic group, social class or even religion.

Even if after a long period of feminist militantism, the demands of the First Wave became a reality for most women, its results were not quite those envisioned, in the sense that equal rights proved to be a necessary but not sufficient aspect of the elimination of gender inequalities, part because it became a rather formal equality and part because the application of such rights, that were originally conceived for a masculine model, on other groups (consisting of both men and women), characterized by very different needs could not have led to the desired results. Therefore the feminist discourse started to include a completely different concept as to the difference and diversity issue, concepts which were related to certain needs to which the new theoretical constructions should provide an answer, thereby widening the militants' view of the nature of rights and women's emancipation.

The starting point of the Second-Wave Feminism – that of difference and liberation – was marked by Simon de Beauvoir's *The Second Sex* (1949), in which the author attempts to find an explanation for the inefficiency of equal rights with respect to women's emancipation and reaching the conclusion that in order to benefit from such rights, women must become men. Simone de Beauvoir paves the way for the new manners of approaching the issue of women on the grounds of the concept of difference. In 1963 another capital work for the Second-Wave Feminism is published, i.e. Betty Friedan's *The Feminine Mystique*, stressing the aspect of women's identitary construction, that up to that point had allways been considered as being closely and naturally linked to the private sphere and to family life. She objects to the mainstream thought of that time, in the view of which women can only perfect themselves by raising and caring for their children and, generaly speaking, through activities strictly belonging to the private sphere. Thereby, the problem of equality through and in diversity, problem that includes, alongside equal rights issues, that of the gender speciffic differences, leading to the acknowledgement of the common interests based on common experiences.

During the same period and following the acknowledgement of the common interests, the concept of trans-racial women's solidarity gains strong support[27]. As such, while, for example, the original feminist movement was ignorant as to the problems faced by coloured women, under the assumption of the preeminence of the racial criterium and, therefore, that coloured women would become fierce critics of white women and, followingly, reject feminism, dialectically Afro-american women contributed to the revival of the feminist movement during the 60's and the 70's, movements such as Black Woman's Liberation Commitee of Student Non Violent Coordinating Commitee, The Third World Women's Alliance, The Harlem-bases Black Women Enraged and The Oakland Black Women Organizig for Action belonging to this period. Moreover, during this period the radical

acknowledgement of the property right for married women, legislation improvement with respect to divorce and child custody, as well as, the gradual extension of the right to vote (M. Miroiu, 2004, 22);

[26] M. Miroiu, *Drumul către autonomie*, (Iasi: Polirom, 2004), 21;

[27] M. Miroiu, *Drumul către autonomie*, (Iasi: Polirom, 2004), 24;

movement promoting an internationalist view and supporting the anti-colonialist and liberation movements from South Africa, Palestine, Mexico and Cuba emerged. The radical feminism in that period demanded a deconstruction of the gender based order, which was considered to be male-centered and a reconstruction convergent with the particular experiences of women, thereby militating for the construction of a distinct feminine culture.

Obviously, the Second Wave feminism is a feminism of contrasts, of swinging between the local and the global dimensions, between women and women groups, between race and gender, between national and international, between androcentric and ginocentric. By the same dialectical logic, just as with cosmopolitanism, we can notice how the struggle for the acknowledgement of women's rights (First Wave) led, first, to a better understanding of the interests of women, second to a better understanding of women's and men's interests (Second Wave). This knowledge and understanding led to the possibility of the internationalization of the women's movement by organizing conferences (World Conference on Women, Mexico City 1975), by the signing of the International Convention on the Elimination of All Forms of Discrimination against women etc..

The internationalization of the movement coincided, not at all by accident, with the starting point of the Third-wave Feminism – that of *autonomy*, beginning in the 80's, that lays special emphasis on contextualization. This wave is generically characterized by the refusal of universalistic thought, accused of imperialism and ethnocentrism, and by the stressing of the importance of the plurality of women's experiences. The agenda of the Third Wave includes the acknowledgement of "pluralism, of the hybrid orientations, of the fact that opinions differ with context. […] Feminism is an argument, an action dirrected to women that have to preponderently dirrect themselves towards capacitation […] a new political generation is born, in the context of which neither age, nor the old statal frameworks matter, but rather the relevance of the similar experiences[…]"[28]. Therefore, pluralism and diversity are the values that oppose the imperialistic universalism, that could facilitate the empowerment of the individuals, of women, in this case. Boundaries become flexible and criticizable, a permanent interaction between the local and the global spheres takes place, interaction leading to the understanding of diversity as an empowerment generating mechanism. The change in the problems' approach strategy is very important, this consisting in the formulation of punctual solutions, coherent with a maximum degree of autonomy, the general purpose remaining however the same: the elimination of the oppression of women[29].

In short, thereof we speak of the First Wave as the struggle for the acknowledgement of women as persons, as moral subjects, realized through ensuring equal rights for men and women; the Second Wave mainly reffers to the struggle against the imposition of the male model as rights landmark, to the discovery and valorization of the differences between men and women, to the internationalization of the movement, grounded on the acknowledgement of the common interests; the third wave, bringing forth a much more nuanced concept of difference, stressing the differences among women and the necessity of knowing, acknowledging and understanding womens' multiple identities.

Conclusions

At the beginning of this paper we were speaking of the fact that the *cosmopolitan discourse* revolves around a few principles which it regards as being fundamental and that, as I will hereafter attempt to prove, are highly convergent with those promoted by the feminist movements: *humanity, universality of the human rights, acknowledging, understanding and valorizing differences.*

[28] M. Miroiu, O. Dragomir, *Lexicon feminist*, (Iasi: Polirom, 2002), 143;

[29] Notwithstanding our acceptance or denial of the theory by which women have common interests resulting from their specific experiences – womanly and feminine- the feminist movement still revolves around the idea of oppression even if its deployment mechanisms became ever more subtle.

How did the feminist movement evlove in time? What were the central and defining concepts of the three waves? First, the First Wave stressed the importance of **acknowledging women as persons, as moral and as legal subjects**, militating, first and foremost, for the acknowledgement of their humanity and, on these grounds, for the universalization of the human rights. The universality of the human rights which resulted from the membership to the human community, brought forth **women's rights as human rights**, while at the same time underlining an aspect that had been previously neglected, namely the issue of the differences. This issue, that proved to be central with the Second-wave Feminism, determined and stimulated the theoretical constructions regarding the acknowledgement and understanding of the differences **– both between men and women, as among women.** Further on, the acknowledgement, understanding and valorization of the differences, involves a specific sensibility as to the **identitary constructions** and to the **autonomy support**. As such, the Third Wave emerges, promoting principles by the means of which it seeks to shape a community which is truly inclusive, **as to both men and women**. – by taking into account, this time, the multiple differences among the individuals and **their valorization**.

As it can be seen, this entire edification of the feminist movement took place on two interconnected levels:

1.*the actual, pragmatic level*, related to the actual emmancipation of women;

2.*the theoretical construction level* involving the consolidation of the feminist theory;

The two levels evloved in a permanent interconnection, their ultimate goal remaining that of promoting, as efficiently as possible, the rights of women and creating a just society. As such, the theoretical constructions have allways had the same purpose, namely that of integrating women *as women* in a construction in which hyerarchies are not determined by gender and in which humanity, involving equal respect for the dignity of women as human beings, is the foundament of any judgement of value. Therefore, we speak of ineluctable connections between the theoretical and the practical evolution of the feminist and cosmopolitan movements and perspectives. These connections consist, on the one side, in the stagial and, at the same time, non-exclusive[30] construction of both theories, on the other, in the assumption and promotion of the previously mentioned valorical core.

DO WE STILL WANT AN AMERICAN HEGEMONY?

MARIUS DINCĂ*

Abstract
We are not just in an economic crisis. We are witnessing a global identity crisis that challenges the very nature of the international system. And the current system seems to be made after the image and likeness of the United States of America: The Global Hegemony.
This paper aims to analyze the current international system in terms of challenging the U.S. hegemony; the conclusion being favorable to the status-quo.
In the first part of this paper, I will make an analysis of the last 20 years of American hegemony. My investigation is based on the concepts of the realistic and liberal theories. Then, based on the imperial overexpansion theory and on the critical theory, I will review the key moments of the American hegemony challenge. The analysis will emphasize the military conflicts in which U.S. were involved since the end of the Cold War and their un-civilizing influence on the international relations.
In the last part I will try to evoke the risks of overturning the existing world order, making a parallel with the period before the Second World War. Thus, because of the weakening of the U.S. and the challenges they face, the present economic crisis could find justification for the totalitarian regimes and for the nationalist effervescence which marked the period of the Great Depression of 1932 and the Second World War.
In conclusion, I will try to argue a favorable response for the title of this paper.

Introduction

The first evidence that the U.S. has become a regional hegemony was winning the Spanish – American War in 1898, gaining control over Cuba, the Philippines, Puerto Rico Islands and Guam. The U.S. already had the strongest economy in the world and obtained clear hegemony in the Western Hemisphere. Since the nineteenth century, the U.S. has had the belief that it has a divine destiny to bring moral dignity, equality and freedom to the world. After the Second World War, with victory against Germany and Japan, and amid the breakdown of Great Britain and Russia, the U.S. is in the position for claiming global hegemony. In the past 100 years the U.S. has consistently had the highest GDP and is undoubtedly the greatest military power on land, sea and air. It also became a cultural and technological leader. It concluded the most bilateral and international treaties and is the main initiator of political and economic international organization – with the greatest financial contribution. It is a proponent of democracy, political freedom and constitutional rights guaranteed.

End of the Cold War

After 1990, people lived a moment of definit American hegemony. So definite, that some voices were quick to announce the „end of history" (Fukuyama, 1992). Liberalism rant by Fukuyama's voice the triumph of „ideal state". The collapse of the Soviet Union has shown that liberal democracy, whose flag is USA, has no serious ideological competitor (Scott Burchill, 2008, page 72). And above all, this was a peaceful transition, as liberal doctrines have always preached that it should be. And victory was not one that can be demonstrated in realist terms of power. The military forces of the two superpowers, did not come to confrontation.

It thus fulfilling the wishes of interwar idealists, who have put their peace hopes in the League of Nations. And which after the painful experience of the First World War, with the help of U.S. President Woodrow Wilson, founded the first formal structure of a community of nations. An

* M.A. Student, European Politics and Economy Faculty, National School of Political Studies and Public Administration", Bucharest (e-mail: dincamr@gmail.com)

organization to manage relations between states and respond to the need for harmonization of the interests, like the world seen by the liberal internationalists.

Unlike that time, when the U.S. senate had chosen not to ratify the League of Nations Convention, the end of the Cold War is a peak moment of U.S. liberal foreign policy. The vast majority of political and economic global organization operated under American protection. The headquarters of the United Nations is in New York and the main contributor to the organization's budget is US. At U.S. intiative was elaborated in the Geneva Conference in October 1949, attended by 23 countries, a multilateral trade agreement known as GATT (General Agreement of Tariffs and Trade), which in 1995 became the WTO (World Trade Organization). Because of the GATT negotiations, tariffs and other trade barriers where reduced, which contributed to acceleration of international trade and the adoption for the first time, of the government's economic growth strategy under an open market.

U.S. victory in the Cold War, is a liberal victory, in which the free trade economy has proven it promotes best „welfare for all through a more efficient allocation of scarce resources in society" (Scott Burchill, 2008, pag71). Soviet Union has failed to resist the liberal internationalist pressure and accepted democracy in its country and sphere of influence.

But here comes Josh Mearsheimer, who tell us that the end of the Cold War is the best proof of permanent uncertainty that surrounds U.S. and the extra need for security to ensure survival. It confirms the anarchy of the international environment in which all states rationally pursue their own interests. And the U.S. has followed the percepts of offensive realism. You never know how much power is needed, so the best way to ensure your survival is to try to achieve hegemony, what the U.S. did, and eliminate any possibility of another power to challenge you, which happened again at the end of the Cold War by unraveling USSR.

Iraq War 1990-1991

And the right time to confirm hegemony had come for US, also military. Iraq invaded Kuwait in 1990. John Mearsheimer had published in New York Times a controversial article that claims a broad and rapid response of the U.S. military, leading to a decisive victory and all this with no more than 1.000 casualties among U.S. soldiers. Those predictions were contradicted by the vast majority of analysts which forecast a minimum four months war, with thousands of victims.

Mearsheimer's arguments were all rational, bound to the reality on the ground. Iraqi Army was poorly trained and equipped, unprepared to face U.S. military, both tactical and technological. And all predictions have been confirmed during the war.

And U.S. prove that it would not tolerate open defiance of its demands, threats to its interests in political stability and the continuous delivery of oil from the Gulf, or broader attempts to overturn the 'international order.' As the dominant power in the international system, the U.S. would act to protect the stability of the system, and also to ensure perpetuation of its own pre-eminence. The Gulf War prove both America's dominance of the international system and its resulting relative freedom in enforcing its interests, consistent with the tenets of Realist IR theory.

Neither have the liberals hesitated to belive the war in Iraq was the first military intervention in history in accordance with liberal theories and a demonstration of their validity. The invasion of Kuwait was immediately followed by a rapid UN reaction, which tried through diplomatic means to push for restoring the rule of international law. United States had not acted unilaterally, when it was clear that an intervention would be based on American forces and technology. U.S. managed to create a coalition of states that have acted after eliminating all other possibilities under a clear UN mandate, while respecting international law in the field and exceeding the Kuwait boundaries, after Iraqi troups defeat. 28 states, including powerfull muslim countries like Saudi Arabia, joined in a coalition with a legal mandate for intervention, was the U.S. argument that they were a liberal hegemon which takes into account the importance of multilateralism and international institutions.

US President, George H.W. Bush, on January 16, 1991, two hours after the rescue of Kuwait, speaking in the language of liberalism and emphasizing a new world characterized by the principles of international law, the UN, and peacekeeping: "This is an historic moment… We have before U.S. the opportunity to forge for ourselves and for future generations a new world order, a world where the rule of law, not the law of the jungle, governs the conduct of nations".

Although realists claim that military force is the ultimate form of power, liberals find this claim problematic. They argue instead that, the use of force is always influenced by other political factors, and moreover, must always be employed in tandem with other forms such as diplomacy, economic influence, and media influence. For liberals, pure force is a less efficient means of achieving one's will than persuasion and politics.

Prior to, during, and since the 1990-91 Gulf War, the Kurds and Shiites of Iraq have suffered huge repression from the Iraqi regime. Immediately after Operation Desert Storm, UN Resolution 688 established "no fly zones" for Iraqi forces along with "safe havens" to protect the Kurds. Viewed through a liberal way, the establishment of these safe havens may constitute a case of humanitarian intervention.

NATO

North Atlantic Treaty Organization as a political-military alliance was created by the U.S. with a clear intention to counterbalance Soviet power on the European continent. After the collapse of the Soviet Union there voices that questioned the need to maintain this military alliance.

But the end of the Cold War gave new opportunities to both NATO and the European Union to spread East, and bring the economic, political and security advantage to a wider area. NATO took in Poland, Hungary and the Czech Republic in 1999, and another 7 new members in 2004. This is a great step forward for peace and security in liberal terms.

But both Kenneth Waltz and also John Mearsheimer, have not shared the libera post-Cold War optimism, arguing that the collapse of bipolarity in the early 1990s was a cause for real concern. Both deplore the equilibrum of nuclear forces which maintained the balance of power in the world for more than four decades, considering unipolarity unstable and prone to lead to a major war. This is because even the U.S. does not have enough power to truly be a hegemon, not have sufficient resources to impose worlwide, as to enjoy, security. Furthermore Stopping Power Of Watter (SPOW), will prevent any power to become a truly global hegemon.

This explains the attitude of maintaining and increasing U.S. military and financial support of NATO, and even its extension to the Soviet bloc countries. On the long-term, maintaining the alliance had the desired effect in terms of American security and its ability to defend and enforce the offensive policy. The alliance played a key role in controlling the conflicts in the Balkans. Because Europe has shown that it dosen't have the needed cohesion to act decisively.

And the Balkan Wars prove that realists are right again. The war in Bosnia and Hertegovina was unable to be stopped, despite intervention of UN peacekeeping forces UNPROFOR and Rusian mediation attempts. Only decisive U.S. intervention forced the warring parties to sit at the negotiating table and sign the Dayton Peace Agreement in November 1995. U.S. ultimatum and NATO presence in the area were apparently stronger than Security Council indecision and powerless peacekeeping forces deployed by the UN.

Also, by maintaining NATO, the U.S. could invoke, for the first time in the alliances history, the article which requires that any attack on one member state to be considered as an attack against the entire alliance. And that happened in September 13, 2001, two days after the terrorist attacks.

Realistic conclusion of this post-Cold War era, would be that balance is maintained not by the signed treaties, but by threat of a hegemon, in a unipolar system in which power belong to the United States of America.

Challenging U.S. hegemony

All accusations against the United States, are reduced to one, they were wrapped in liberal doctrine while they have always had a realistic attitude. And this, can be best observed by looking at modern forms of humanitarian intervention. The United Nations recognizes the sovereign right of all independent states, but also intervention right in certain cases when there is an acute humanitarian crisis. It is particularly difficult to reconcile both international standards.

War in Kosovo

In 1999 we have the first seriously challenged humanitarian intervention in the world, a key moment of the charges of U.S. aggression and imperialism. Charges were aroused precisely by the humanitarian justification of the NATO bombing campaign. Which has never been agreed by the UN Security Council. Because the permanent members who had relations with Yugoslavia, especially China and Russia, opposed any resolution authorizing the military intervention. And it could not be argued as intervention coming from a liberal hegemon.

NATO claim security interests of alliance members to justify the intervention, and crossed over the Security Council, citing an international humanitarian emergency, but the realistic American attitude was visible. Thus wrote the history of the first military NATO intervention. The War in Kosovo, was a campaign of 11 weeks, longer than hoped and with significant casualties and material costs. It was the milestone of challenging American interventionism in the modern era, and the first sign that the U.S. will fall into the sin of all great powers, imperialistic over extension.

War against terrorism

The liberals were wrong once again proclaiming that political and economic development ends with liberal democracy and its victory is complete with the end of the Cold War. The challenges come not only from communism. Fukuyama did not take into account national and cultural differences. How, otherwise, could the realists, who saw states with „religions, ideologies and different economic systems; as similar in their actions relating to national power", not have been taken into account either (Morgenthau H.J. 2007, p46). They reduced everything to the interests of actors and to objective rules of the international anarchical system.

Because of September 11 and the War Agains Terrorism, a recent wave of anti-western islamic terrorism emerged as a significant obstacle on the path of globalization, which put the U.S. in a series of intellectual and political dilemas for which they were not prepared.

The Bush Doctrine has changed American foreign policy from containment of the Soviet Union during 1947-1990 to the preemption policy (Iraq War), and the prevention policy (Afganistan War): „promise of massive retaliation against nations means nothing for terrorist networks ... containment is not possible when crazy dictators, possess weapon of mass destruction ... we can not trust the word of tyrants who solemnly sign nonproliferation treaties and then systematically violate them" (Bush G.W., 2002)

But the Bush doctrine has led to a more subtle and dangerous anti-Americanism. The view that the U.S. is an aggressive power which mix in the affairs of other states, has been promoted. „Targeting terror cells proved to be more difficult than traditional containment and deterrence of the states. " (Joshua S. Goldstein,2009, p.144).

Offensive realists urge was: reorientation to the old politics of power which still operates in this world. „Power is the international system currency, and the United States should use it as it believes" (Mearsheimer J, The New York Times , 2002). And this advice was followed in the first term of U.S. President George Bush.

Liberal advice, aimed at reorientation of policy towards international cooperation. It acknowledges the superior power of America but it showed the risk of turning the U.S. into an unpopular and alone power. And in the second term in the White House, Bush nuanced U.S. position in this direction, as a tacit acknowledgment of failure.

For adherents of critical theory, the events that followed the terrorist attack on September 11, 2001, including this „unfinished war", were liable to bring this concept to the attention of those concerned to understand the central features of contemporary society. Critical theorists have sustained the idea that action taken by Washington and London against terrorism will induce rather "de-civilizing forces in international relations" (Richard Devetak,2008, p.155). And this because the most important aspect was overlooked: analysis of fundamental social structures which result in such abuses. Knowledge is always conditioned by material and historical context. Critical theorists recognize the political nature of the claims about knowledge, and more, states that any theory always serves someone and a specific purpose (Richard Devetak,2008, p.159). Thus classical theories of international relations are not just about politics, but they themselves have a political character.

Perhaps the best description of this reality is made by Peter Mansoor, U.S. Army colonel and brigade commander in the Iraqi War. „When U.S. forces invaded Iraq in 2003, soldiers were not interested in the cultural impact operations. American leaders believed that an assault would be followed quikly by a stabilization only slightly more difficult than in Kosovo. I quickly discovered not only that this assumption was incorrect but also that sectarian and ethnic identities, the role of tribes in Iraqi society, and the U.S. Army's own internal culture would weigh heavily on the course of the conflict, influence our approach to waging the war, and impact our interactions with our coalition allies" (Foreign Affairs – January 2011). And all this are not the words of a critical theorist but from a U.S. Military employee. We can see in a few phrases, a shift of thinking from a realism to critical, in terms of concepts of international relations theories.

Looking back on a decade of war between America and Al Qaeda, literally the longest U.S. war in history (Daniel Byman,2011), conducted in recent years in the context of a major economic crisis, we can not avoid thinking of what the historian Paul Kennedy has said since the 80s. Imperial over expansion is the main cause of all empires decline, which sooner or later will also hit America.

Iraq not only means that the U.S. will need at least a generation to recover from this war, but first of all, that the U.S. does not have enough military and political means to continue this adventure; Afghanistan also. Even if by such action of force, the U.S. is trying to preserve its hegemony, the decline is visible in the growth of reserved or even hostile attitude towards the U.S. and in record budget deficits. Amid risky monetary and fiscal policies and a high government spending, U.S. starts the global economic crisis, stressing hegemonic decline. The latter have benefited countries such as China, which is the best example of a state taking advantage of U.S. decline, in a zero sum game.

The risks of overthrowing the current world order

The current world order means U.S. hegemony. And this translates in to the present also by a set of standardized and subtle practices identified with a particular state. U.S. hegemony means projection and movement of an exemplary pattern, which works as an ideal regulator (Richard Devetak, 2008, p.197). But now a growing number of conservative political leaders from Asia, have argued that there is an "Asian model of political organization and social education, which includes the principles of harmony, hierarchy and consensus (Scott Burchill, 2008, p.85). But all these regimes do not enjoy democratic legitimacy.

Islamic terrorism is not just a concern for internal security of the U.S. Ie looks back upon an ideology and an islamic culture that makes states immune to ideas of liberal democracy. However incoherent in terms of politics, islamic terrorism is deeply anti-secular and a critic of liberal doctrine.

Amid increasing islamic terrorism, even the strongest democrats allowed the state to accumulate more power. State sovereignty, which the liberals have thought was eroded by globalization, has returned to the foreground with the revival of national security. This has taken various forms, ranging from restrictions of civil liberties, to increase in the power of intelligence services and surveillance of the population. Realistic rational precepts have prevailed over liberal partisans.

Wikileaks disclosures gave a blow to U.S. diplomacy and American prestige. They also revealed corruption and organized crime in Tunisia, where this information has led to outbreak of the rebellion, which increased appreciably global threats. As if it is not enough, like the revolutions that broke out in parallel in the former communist countries in the 90s, Egypt was seized by revolutionary fever. Egypt was an authoritarian state, ruled for nearly 30 years by Hosni Moubarak, a recognized protege of the U.S. Yemen is also preparing to street moves and no one can give a prognosis on the evolution of the Middle East. There is no certainty that the current uprising against authoritarian and corrupt regimes will not lead to even more dangerous dictatorship, at islamic fundamentalism and complet removal from liberal democratic values. Or even worse, given the existing tensions related to Iran and North Korea, will not degenerate into an international conflict.

1918-1939 vs. 1991-Today

By its consequences, the First World War, profoundly affected political, social and cultural life of the globe. The Ottoman Empire collapsed completely and was divided between the victorious powers of the Allies, after signing the Treaty of Sevres on August, 1920. Collapse lead to the modern Middle East. New states have emerged on the political map of the world, old ones have disappeared or have changed the boundaries. International organization were established, new political and economic ideas have earned a place in the world. Liberalism has proclaimed a new era of cooperation under the banner of the League of Nations, which will bring world peace after a devastating First World War.

Here is that even after the Cold War, liberals have proclaimed the decisive victory of peace and completeness of the "final form of human government" (Fukuyama, 1992). New states claimed independence, those detached from the former USSR and those formed by dividing the countries in the sphere of the red influence. International organization has soared, with the newly proclaimed European Union in front – the Maastricht Treaty in 1991.

Realists, however, demonstrated after the Second World War, that utopian interwar idealism was wrong, and this huge mistake has cost humanity tremendously. Today realists, are also afraid of a tough transition and a violent rearrangement of the geopolitical world map.

Upon hearing the provisions of the Treaty of Versailles, which left Germany intact after the WWI, there were voices that warn: "this is not peace, it's an armistice for 20 years" (Field Marchal Ferdinand Foch). Also the collapse of the communist USSR, has not lead to a Russian democracy like the western countries hoped. It has not lead to a calming of latent conflict. Furthermore, with the advent to power of Vladimir Putin and outbreak of the Georgian War, we have even more reasons for threats in this area.

The beginning of the Great Depresion is usually associated with the collapse of the stock market on the so-called Black Tuesday October 29, 1929. The current global economic crisis took as a starting point the New York stock market crash in October 2008. Both were preceded by years of prosperity for Americans. If after the First World War, the U.S. chose isolationism, the end of the Cold War marked the official start of globalization and even Americanization. Both, however, have concluded in a major economic crisis that has spread progressively through the world. World trade levels fell rapidly, just as personal income, business revenue and profit decreased. Unemployment and inflation on the other hand will increase dramatically. Hundreds of banks will declare bankruptcy and will be needed a strong state intervention.

U.S. was the promoter of the "open doors" policy, which changed the whole world trade. But it also made countries more interdependent and vulnerable to crisis. Even these days, The World Economic Forum in Davos is more often dominated by questions, rather then answers. It is recognized that the current model of capital market was the source of excess. All for shareholders welfare, and this principle can not dominate the 21 century. Countries are no longer happy with the american financial system and stock market rules.

The Great Depression ended at different times in world countries. In most countries have been designed rehabilitation programs and most have gone through various political transformations that have pushed to the left or right political extreme. Liberal democracy-based societies have come weakly from the crisis, and the dictators like Adolf Hitler and Benito Mussolini came to lead some of the most powerful states and will prepare the conditions for initiation in 1939 of the Second World War. Even now, economic crisis brought to power more authoritarian governments. If on the background of the Great Depression, nationalism led to the installation of communist and fascist, totalitarian regimes, current threats came especially from islamic countries and China, countries who can not justify in democratic terms their place in the domestic political scene. Alike, Europe now admits that it has failed in its multicultural attempt. The German and British Prime Ministers, as well as the President of France, was surprised the public opinion at the beginning of 2011, with statements that require the introduction of a "muscular liberalism". Which should have as priority the integration, equality and rule of law. David Cameron said "We encouraged the cultures to live separate lives, away from each other and the rest of society". And thus explain the terrorist attacks, who have generally been done by its own citizens, but with islamic religion and ethnicity.

This crisis proved to be a system of power redistribution. Amid economic crisis, China has managed to reach the second world economy, displacing Japan. More, keeping this cadence of growth will threaten the U.S. itself. All this power is already beginning to be felt in the international relations. China has in recent years, consistently had the largest delegation participating in any global event: World Economic Forum in Davos, International Climate Conference in Cancun, etc. China helps countries with authoritarian regimes such as Venezuela and Cuba, engages in the exploitation of African resources and buy bonds issued by the European countries which are still in economic crisis. Despite reassuring statements of Chinese leaders, that it's just a peaceful developing country, its actions often lead us to think to a dangerous predator. China has managed to get into the spotlight because of authoritarian domestic policies combined with the unprecedented long term economic growth. In recent years, China has also tried to become a major military power. It is the only country outside the U.S., who owns an "invisible" plane, and is the country with the second largest military budget (87 billion USD in 2010), tailing the U.S.

On the other hand, Russia claim its place on the international stage, place lost in 1990, under a power that it's not afraid to show in the most realistic way: the war in Georgia, maintaining armed forces in Transnistria, blackmail gas supplies, missile installation threats in the islands under dispute with Japan etc.

League of Nations – the organization designed to introduce the principle of collective security after the First World War, had to face very similar crisis to those of today's U.N. The League was undermined by the bellicosity of Nazi Germany, Imperial Japan, and Mussolini's Italy. A series of international crises strained the League to its limits, the earliest being the invasion of Manchuria by Japan and the Abyssinian crisis of 1935-36 in which Italy invaded Abyssinia, one of the only free African nations at that time. The Abyssinian war showed Hitler how weak the League was and encouraged his participation in the Spanish Civil War. He also remilitarized the Rhineland in flagrant disregard of the Treaty of Versailles. This was the first in a series of provocative acts culminating in the invasion of Poland in September 1939 and the beginning of the Second World War.

In 2003, the war against Iraq has divided the world into two camps, and above all it was a time when U.S. decided to go to war without the approval of the Security Council. Dramatically weakening U.N. authority and coherence of the European Union. Russia attacked Georgia in 2008, and international organization proves to be powerless despite global protests.

Nevertheless, the League did witness one effort to go beyond mere cooperation between governments. This was the proposal for European unity, made by the French statesman Aristide Briand. In 1925 he had declared his ambition to establish "a United States of Europe," and on Sept.

9, 1929, he made a speech to the then 27 European members of the League in which he proposed a federal union. The general response was at best skeptical and at worst politely hostile.

In 2005, the European Union failed to adopt a draft constitution that would have been a unique occasion to reach the european politic purpose. Even after the adoption of the Lisbon Treaty in 2009, european states are reluctant. Defence and also foreign policy are still prerogative of national governments. Even newly created External Action Service lead by the High Representative Catherine Ashton, who really wanted to be a European Foreign Minister, a unique voice for Europe, proves to be a failure in these days.

If we draw a parallel between the interwar period and today, we discover those similarities that should give us a pause for thought in view of avoiding a global confrontation.

Conclusions

We are not just in an economic crisis. We are witnessing a global identity crisis that challenges the very nature of the international system. And the current system seems to be made after the image and likeness of the United States of America, the Global Hegemon. Throughout history no passing power from one cycle to another was easy nor peaceful. Now more than ever, risks are measured in terms of technological progress. The dangers are not the same, because the destructive forces of modern weapons are at a lethal level, hard to imagine.

Given the real power: economic, technological, military and ideological; the U.S. hegemony was rather peaceful and providing hope for human evolution. Despite the political mistake that have eroded confidence in the American Dream, U.S. hegemony is desirable if we consider the alternative.

Through the followed policy as a global power, the U.S. is responsible for peace, stability and prosperity of humanity after the Second World War, especially for countries who have embraced democracy and the American way.

In these days we are witnessing a crucial moment in rewriting the world order agenda: The visit of Chinese President Hu Jintao in America. The discourse is one that gives hope for the prospects of global stability. Beyond liberal message, this speech is a symbol of possible reconciliation U.S. – China, and entry into a new phase of international cooperation. Notify the major powers were seated at the negotiating table, a new club of power which would ensure global stability and the transition to a postindustrial civilization.

EUROPEAN UNION AND ROMANIAN POLICIES ON WOMEN'S SOCIAL EXCLUSION AFTER THE LISBON TREATY

ALICE IANCU[*]

Abstract
The Lisbon Treaty marked many important changes in European Union's institutional make-up and policy-making. One particularly important field of inquiry, especially in light of the current financial crisis, is European policy-making regarding social exclusion in general and women's social exclusion in particular.
First, through my paper I aim to answer three interconnected questions: 1) Has the Lisbon Treaty influenced policy-making regarding social exclusion, in the context of the current financial crisis? 2) What were the specific changes ensued? 3) IF/How is the European trend translated in Romanian national policies concerning women's social exclusion? Second I aim to sketch several recommendations for addressing women's social exclusion in light of the Lisbon Treaty.
Since social exclusion is a vast domain I will limit myself in discussing primarily issues connected to women's participation in the labour market, as well as participation in decision-making. In this sense I will use policy documents, available data and academic papers concerning the changes bought on by the Lisbon treaty, the main theoretical contributions in the field of women's social exclusion and recent data obtained through a series of conferences on the Lisbon Treaty and Romania's Role in the Process of Deepening European Integration 2010. The conferences, where I was a key speaker for one of the panels, were developed by the Romanian Government- the Department for European Affairs, The National School of Political and Administative Studies and the Academic Club of European Studies and provided an opportunity for conducting a small pilot-research providing data on the response of various social groups to the changes brought on by the Lisbon Treaty.
Both the theme and the analysis of the paper are relevant and current, focusing on the interplay between the EU and Romanian policies after the Lisbon Treaty in the context of the present financial crisis.

Keywords: *Lisbon Treaty; women's social exclusion; participation; financial crisis*

Introduction

The Lisbon Treaty marked many important changes in the European Union's institutional make-up and policy-making. One particularly important field of inquiry, especially in light of the current financial crisis, is European policy-making regarding social exclusion in general and women's social exclusion in particular.

First, I aim to answer three interconnected questions: 1) Has the Lisbon Treaty influenced policy-making regarding social exclusion, in the context of the current financial crisis in Romania? 2) What were the specific changes ensued ? 3) IF/How is the European trend translated in Romanian national policies concerning women's social exclusion? Second, I aim to sketch several recommendations for addressing social exclusion, particularly women's social exclusion in light of the Lisbon Treaty.

Since social exclusion is a vast domain I will limit myself in discussing primarily issues connected to women's participation in the labour market and income, as well as participation in decision-making. My approach focuses on two main aspects of social exclusion. Jane Millar proposed that a distinction needs to be made between two avenues of research: one focusing on *becoming socially excluded* and one on *being socially excluded.* The first approach underscores the processes of social exclusion, the way people, social networks and institutions respond to social exclusion. The second approach is focused on identifying specific indicators and dimensions of

[*] PhD, Lecturer, "Hyperion" University, Bucharest. (e-mail: alice_iancu@yahoo.com)

social exclusion[1]. While limited to only two dimensions, my accounts seeks to identify and discuss both the specific dimensions with their correlating indicators, as well highlight the processes of exclusion, particularly in a Romanian context. While numbers and indicators are useful in determining women's particular reality of social exclusion, Romanian institutions' response to this reality, in the context of changes within the European Union emerging after the Lisbon Treaty is just as relevant.

1. At a glance: Social Exclusion and the Lisbon Treaty

1.1. A Brief History of a Complicated Journey: the emergence of Social Exclusion on the EU policy stage and its General Meaning

Social policy started to become a part of the EU's working agenda with the introduction of the principle of equal treatment for men and women in social security and in labor law and with start of the European Communities anti-poverty programs (1975-1980, 1986-1989 and 1990-1994). By the beginning of the third one, a multidimensional approach to poverty was adopted and social exclusion became the key policy term. The Community Charter of the Fundamental Social Rights of Workers used the term social exclusion in 1989 and the European Observatory for Combating Social Exclusion was set up[2].

The significant shift was made from a social policy oriented towards the poor to a policy oriented towards the excluded, and this entailed "a change in perspective: from a static to a dynamic approach, from a one-dimensional to a multidimensional perspective, and also from a distributional to a relational focus"[3]

Social exclusion's recent emergence on the EU public policy scene has roots in different national contexts and debates[4]. The French context[5] proved particularly relevant, since the term's "social exclusion" initial appearance on the policy and political theory stage is usually traced to *Les exclus: Un francais sur dix*, written by Rene Lenoir, then the Secretary of State for Social Action in the Chirac government, in 1974. According to the author the excluded were not only the "traditional" poor, but also people from a wide range of groups[6].

[4] This is only meant as a brief introduction to the subject matter. The current presentation is based on a more detailed account and interpretation of the history and understanding of social exclusion within the European Union : see. Alice Iancu *A Conceptual Approach to Social Exclusion,* PhD. Thesis, Bucharest, National School of Political and Administrative Studies, 2010 (unpublished)

[5] Social exclusion did not reach the mainstream of European and Anglo-Saxon Political public discourse until the late 90's and was fully established within the European Union's policies after 2000. See 2. Haan, Arjan de. 1999: Social Exclusion: Towards a Holistic Understanding of Deprivation, http://webarchive nationalarchives.gov.uk/ +/http://www.dfid.gov.uk/Documents/publications/sdd9socex.pdf., 55-56

[6] The concept of social exclusion encompassed " the mentally and physically handicapped, suicidal people, aged invalids, abused children, drug addicts, delinquents, single parents, multi-problem households, marginal, asocial persons and other "social misfits" that Lenoir estimated made for a tenth of the French population at the time. During the 1970's the term seemed to depart from (explicit) political discourse as it divided into objective and subjective exclusion. Subjective exclusion "referred to alienation and the loss of personal autonomy under advanced capitalism".

Social exclusion was not a term widely used in France until when it became apparent, during the late 1970's, that some were not benefiting from the economic growth. France was confronted with a series of social and economic crisis the 1980's. The Socialist Government in the mid-80's, as response to criticism, adopted the language of solidarity and inclusion. By this time we can begin to attribute to the concept of social exclusion a multi-dimensional character. New dimensions were addressed and "There were not only material, but also spiritual and symbolic aspects to this phenomenon"[7]. New groups of individuals were enlisted as vulnerable. Political discourse centered on the need to include or insert these groups into society. By the late 1980's the inclusion discourse had made its way on the political agenda of both the French Left and Right and by this route entered European Union's policy discourse[8].

At the European Union Level social exclusion was related initially to social groups being outside the social protection system and exposed to different types of risks. In time some groups remained within the social exclusion discourse while others became the target of specific policies- such as abused children- and others were added- such as young people and the long-term unemployed[9]. At the present, there still is a strong connection between social inclusion and social protection, and the two domains are reported on through annual Joint Reports on Social Inclusion and Social Protection[10].

The European Union published within its 2004 Joint report the following definition of social exclusion: "Social exclusion is a process whereby certain individuals are pushed to the edge of society and prevented from participating fully by virtue of their poverty, or lack of basic competencies and lifelong learning opportunities, or as a result of discrimination. *This distances them from job, income*[11] and education opportunities, as well as social and community networks and activities. *They have little access to power and decision-making bodies*[12] and thus often feeling powerless and unable to take control over the decisions that affect their day today lives." [13]

Social inclusion policies show an overarching approach, comprising of three interconnected strands: social inclusion, pensions and health care.[14] The European Union established a set of overarching objectives and a list of objectives for each strand: In 2008 the overarching objectives set in 2006 were re-stated: (a) social cohesion, *equality between men and women and equal opportunities for all*[15] through adequate, accessible, financially sustainable, adaptable and efficient social protection systems and social inclusion policies; (b) effective and mutual interaction between the Lisbon objectives of greater economic growth, *more and better jobs*[16] and greater social

[16] My emphasis

cohesion, and with the EU's Sustainable Development Strategy; (c) good governance, transparency and *the involvement of stakeholders in the design, implementation and monitoring of policy*[17]."[18]

Under these overarching objectives each strand: social exclusion, pensions and healthcare, have three specific objectives. There are three objectives and indicators stated under the eradicating poverty and social exclusion strand "(d) access for all to the resources, rights[19] and services needed for participation in society, preventing and addressing exclusion, and fighting all forms of discrimination leading to exclusion; (e) the active social inclusion of all, both by promoting participation in the labour market and by fighting poverty and exclusion; (f) that social inclusion policies are well-coordinated and involve all levels of government and relevant actors, including people experiencing poverty."[20] In the same time it is clear that, both at the level of objectives concerning pensions and those concerning healthcare there is an inclusion/exclusion axis to be considered. The objectives set for the pensions strand clearly state the necessity to assure that retirement be accessible to all (both through public or private pension schemes), that it provides a decent life standard and that it is transparent and available[21]. The first objective of the health strand is addressing "accessibility and health inequalities"[22], along with issues related to the quality and sustainability of healthcare systems. Thus the three strands are to be taken into account as interconnected.

In terms of methodology and measurement, social inclusion was a policy area subject to specific methods and indicators. The member states all were encouraged to work together in combating social exclusion through the Open Method of Coordination, which entailed agreeing to common objectives, a set of common indicators, preparing national strategic reports and evaluating these strategies jointly with the European Commission and the Member States[23]

The social indicators were initially agreed on at the Laeken Council in 2001 and they have been considerably updated since then. Three levels of indicators have been established: primary indicators, secondary indicators and third-level indicators. The primary and secondary indicators were commonly agreed on and thus allow for a European-wide analysis, while the third-level indicators are to be established by each member state, to better reveal its own national context[24].

The evolution in the understanding of the complexity of social exclusion indicators is reflected through the differences between the 2001 report, the 2006 one and the 2008 update[25]. The 2001 report on indicators in the field of poverty and social exclusion reflects the beginning of an attempt to keep up with the requirements of the Lisbon Agenda, measuring the only dimension of

social exclusion, at that time: access to labor market. And while in 2002 the indicators were addressed in terms of financial poverty seen as multidimensional and cumulating deprivation, financial or otherwise by 2004 the concept used was social inclusion[26]. The 2006 report on indicators covers three dimensions of social exclusion, therefore it has three portfolios: on social inclusion, on pensions and on health. Thus social exclusion is a relative flexible field in European policy-making, having been modified many times over the years, sometimes substantively. The Lisbon Treaty is another new context with great potential for impacting the domain of social inclusion.

1.2. The Lisbon Treaty: a Brief History of Revisioned Objectives

The Lisbon Treaty was seen by many as a sign of surprising recovery for the European Union. After the failure of the attempt for a European Constitution it proved hard for many to imagine that a new treaty, and one so similar to that Constitution, would be in place only a few years later:" The negative outcome of the referendums in France and the Netherlands in May–June 2005 was expected to precipitate the European Union into one of the most serious crises of its 50- year history. Its predicted lethal effects, however, failed to materialize"[27]. The new treaty, called the Lisbon Treaty, maintained most of the provisions of the old rejected one and side-by-side comparisons reveal how the bulk of the articles have endured, albeit modified to less or greater extent.

What was lost were the "constitutional and statist references"[28], what was left provided the European Union with a framework for many substantial changes. The separation between what was lost and what was to be retained became an important issue fairly quickly after the rejection crisis: "In terms of the search for a solution to the 'constitutional crisis' in Europe during this period, what soon emerged was a perceived need to separate the symbolic (and therefore constitutional) elements of the Constitutional Treaty from the substantive reforms to the institutional structure and decision-making processes"[29]

The Lisbon Treaty or "Reform treaty" subsequently shifted the focus on three documents: the *Treaty on European Union*, the *Treaty on the Functioning of the European Union* and *The Charter of Fundamental Rights of the European Union.* One could argue that one of the most potentially momentous changes was the positioning of the Charter as a central EU document: "The protection of citizens' rights is being expanded, with the Charter of Fundamental Rights, adopted at the Nice European Council in 2000 merely as a 'solemn proclamation', becoming *legally binding*[30] with the Lisbon Treaty"[31]

Of the many modifications the treaty entails for the EU status quo, mostly issues pertaining to participation and democratization became some of the most discussed, especially in light of the "democratic deficit" attributed to the European Union[32]. A brief presentation[33] of these issues will be

[26] Atkinson, Tony; Cantillon, Bea; Marlier, Eric; Nolan, Brian "Social Indicators. The EU and Social Inclusion" (Oxford: Oxford University Press, 2002), p. 79

[27] Carbone, Maurizio "Introduction: understanding the domestic politics of treaty reform" in *National Politics and European Integration From the Constitution to the Lisbon Treaty,* edited by Maurizio Carbone (Cheltenham: Edward Elgar Publishing Limited, 2010), 1

[30] My Emphasis

[31] Cristiansen, Thomas "The EU reform process: from the European Constitution to the Lisbon Treaty" in *National Politics and European Integration From the Constitution to the Lisbon Treaty,* edited by Maurizio Carbone (Cheltenham: Edward Elgar Publishing Limited, 2010), 27

[32] Some researchers stress the many ways in which the democratic deficit works on several different levels and is not to be understood as a general overall distancing of the EU vis a vis its citizens: "the democratic deficit of the EU

useful for understanding the overall purpose of the Lisbon Treaty. The Treaty clearly states in a most inclusive article "Every national of a Member State shall be a citizen of the Union" (Lisbon, art. 8, TFUE, art. 20). In terms of democracy Article 8 of the treaty established three important principles ensuring "democratic equality, representative democracy and participatory democracy"[34]

One way of insuring the inclusion to decision-making of all citizens was by increasing the role of their representative institutions. Thus both the European Parliament and national Parliaments saw their powers increased (through the extension of the co-decision method) and overall a greater status was attributed to national representative bodies (such as the European Council).

The EU-citizens dyad should not be however read in terms of it being a one way street. What was sought ever since 2006 was the practice of an active citizenship, through a visible "citizens' agenda" that could gain new visibility and importance[35]. The Treaty insures through its provisions that European Citizens can actively participate in policy-making. The widest discussed and perhaps controversial provision regards the "Citizens' initiative" though which a million citizens from several European states could in fact propose issues for the Commission to Consider (Lisbon, art. 8B.4; TEU 11.4). Any citizen, NGO or other forms of association pertain the right to petition the European Parliament, to access the documents of EU institutions or to question European institutions regarding a particular issue (Charter, art. 42, art.43, art. 44).

In terms of social inclusion and four main issues are central to the Lisbon Treaty: acknowledging the Charter rights (Lisbon art. 6.1; TEU, art. 6), stating the equality of all citizens (TEU, art. 9), setting the EU to function as a truly representative democracy (TEU, art. 10) and ensuring the interactions between the EU and its citizens (TEU, art. 11). All these under the principles established in Art. 8 mentioned previously[36].

However, while democratization is linked to social inclusion in terms of access to decision making by citizens, social inclusion remains a distinct domain and it connected rather to issues such as access to the labour market, social protection, healthcare and the pensions system. Before moving to a more detailed analysis of how the social dimension is addressed in the Lisbon Treaty, one should note, as part of a general presentation, that among the goals of the Treaty a wide encompassing social

---

can be summarized in four aspects: The constitutional architecture of the EU, which has evolved from a series of Treaties agreed by the Member States and contitutionalised by the European Court of Justice (ECJ), points out a system lacking constitutional clarity, since the consent of citizens at national level has not been taken at national level. In the institutional design of the EU, which is based on a set of common institutions at EU level, the decisions evolve from intense bargaining within and across the policy-making institutions, operating within a delicate institutional balance. In this institutional design, there is no doubt that Europe's citizens have difficulty in identifying "who governs" in the Union and cannot exercise their own perogative to dismiss them at elections." See Nevra Esentürk "Democracy in the European Union and the Treaty of Lisbon" in Alternatives: Turkish Journal of International Relations, Vol. 8, No. 4,)Winter 2009), 4.

[33] For a more extended presentation see *Strategy and Policy Study: Adapting the legislation, institutions and policies to the functioning of the European Union, after the entry into force of the Treaty of Lisbon* (coauthors: Iordan Gheorghe Băbulescu, Alice Iancu, Oana-Andreea Ion and Nicolae Toderaş). IER – The European Institute of Romania.

[34] Nevra Esentürk "Democracy in the European Union and the Treaty of Lisbon" in Alternatives: Turkish Journal of International Relations, Vol. 8, No. 4, (Winter 2009), 4.

[35] European Commission "Delivering Results for Europe: Commission calls for a Citizen's agenda", http://europa.eu/rapid/pressReleasesAction.do?reference=IP/06/595&format=HTML&aged=0&language=EN&guiLanguage=en

[36] I aim to offer only a brief presentation of the democratization issue. The implications of the Treaty for democratization of the EU are many and some researchers review the ensuing changes as positive: "In the first place, the Treaty of Lisbon has strengthened the role of the EP as a co-legislator through extension of the coverage of co-decision procedure discussed above and the national parliaments are more involved in the decision-making process. Secondly, the lack of the Council's control by the national governments due to secret deliberation and voting in this institution, is partly removed by the Treaty of Lisbon and the vacuum of the control of European government is filled with the European citizens' initiative, which is an important development in line with Preface of the Treaty, stating to make the Union closer to its citizens." (Esenturk, 2009, p. 16)

objective is present: the "well-being of all its people" (Art 3.1 TEU). This well-being is explicitly linked to social inclusion and related issues: "It shall combat social exclusion and discrimination, and shall promote social justice and protection, equality between women and men, solidarity between generations and protection of the rights of the child. It shall promote economic, social and territorial cohesion, and solidarity among Member States." (Art.3.3 TEU). This approach, as researchers have noted, is a premiere for EU treaties.[37]

2. Social Inclusion European Policies in the Lisbon Treaty Aftermath: Preliminary intersections

While much attention has been given to the democratization aspect of the Lisbon Treaty, social inclusion and Social Europe in general have been secondary. However new momentum is gained in questioning the impact of the Lisbon Treaty for social policies. One provision with great potential impact ensures a mainstreaming of social policy "In defining and implementing its policies and activities, the Union shall take into account requirements linked to the promotion of a high level of employment, the guarantee of adequate social protection, the fight against social exclusion, and a high level of education, training and protection of human health". (TFEU Article 9). This provision became known as the horizontal "the social clause"[38].

One key aspect to be mentioned is that in terms of actual EU competences in the field, they remain secondary to those of the national member states[39]. The enrichment of objectives, the clarification of competencies and instruments (OMC) are clear positive signs of an enrichment of social policies after the Lisbon Treaty. However, the limitations on the EU competencies and the maintaining of the member states as key actors for such policies allowed for some researchers to conclude "From a social policy perspective, the assessment of the Lisbon Treaty is rather ambivalent"[40]. However, in light of the horizontal social clause and of the clarification of the role of social dialogue, a new dynamic of social policy could ensue. Thus sub-national actors and supra-national actors might prove to become important actors in social policy and their role could prove fundamental-with trade unions and employer associations as the most prominent[41].

Other specific provisions give a fuller picture of the Treaty's social aspects: It specifically mentions social partners as key to social policies[42] and it re-affirms the place of social dialogue[43],

which could potentially have great impact in the future. The Tripartite Social Summit for Growth and Employment and its role are benefited from their mention to the treaty.[44]

At a general level, apart from taking the well-being of all as an overall objective and setting a horizontal social clause, the Lisbon Treaty contains many premiere provisions in terms of social policies and consolidates other previous trends. The validation of *The Charter of Fundamental Rights of the European Union*, containing many social rights, remains "widely interpreted" and explicitly avoided in some cases[45]. Some researchers believe that the European Court of Justice could become a pivotal actor for social policies: "In two cases decided by the European Court of Justice at the end of 2007: the Viking case, referred by the English Court of Appeal and the Laval case, referred by the Swedish Labour Court, the issue raised was whether EU law includes a fundamental right to take collective action, including strike action, as declared in Article 28 of the EU Charter of Fundamental Rights. The decision of the Court as to the fundamental right of workers and trade unions to take transnational collective action may have a catalytic effect on the future of Social Europe"[46]. However, since through the Lisbon Treaty the Charter is given the same weight as the treaties (implying it is not to be extended) and since it lacks reference to fundamental rights (as the Constitutional Treaty maintained), the effects might, from a European Court of Justice perspective, prove to be actually damaging[47].

3. Methodological considerations A modest feminist proposal

Gender equality is present at the level of overarching objectives in the field of social exclusion, and this should be put in the larger context of the European Union's commitment to equal opportunities between men and women. The instrument for achieving this is gender mainstreaming, meaning "the integration of the gender perspective into every stage of the policy process – design, implementation, monitoring and evaluation – with a view to promoting equality between women and men. Gender mainstreaming is **not** a goal is itself but a means to achieving equality."[48] As an example the social indicators that have an explicit gender dimension are the result of gender mainstreaming at the level of measuring social exclusion.

The Lisbon Treaty clearly affirms as its core values non-discrimination and equality between women and men (Art 1.a TEU), also understood as key instruments in combating social exclusion (Art.2 TEU). While at a principle level the gender dimension is vindicated, some researchers have noted that the actual instruments provided by the Treaty (Including the strenghthening of the Charter's position) are rather weak " in fact, the right to a decent employment does not exist, and some rights referring especially to women, such as the right to contraception and or legal abortion, are not mentioned at all"[49]. Also the vagueness of the provisions regarding decent employment affect primarily groups vulnerable to exclusion and discrimination in the market[50].

As mentioned earlier, my approach focuses on *becoming socially excluded* and on *being socially excluded.* Estivill offers one definition of social exclusion as a process that is representative of this specific approach: "Social exclusion may therefore be understood as an accumulation of confluent processes with successive ruptures arising from the heart of the economy, politics and society, which gradually distances and places persons, groups, communities and territories in a position of inferiority in relation to centres of power, resources and prevailing values"[51]. Focusing on social exclusion as a process puts agency at the center of the analysis. Agency is correlated with both spectrums of social exclusion: the excluded and those doing the excluding. At one end, the focus is on how people respond to social exclusion and the resources they have at their disposal in reacting to it. At the other end the analysis addresses the ways in which individuals, communities or states act to exclude certain groups or individuals[52]. While limited to only two dimensions, my accounts seeks to identify and discuss both the specific dimensions with their correlating indicators, as well highlight the processes of exclusion, particularly in a Romanian context. While numbers and indicators are useful to determining women's particular reality of social exclusion, Romanian institutions' response to this reality, in the context of changes within the European Union emerging after the Lisbon treaty is just as important. In this sense "being socially excluded" is treated here as the basis for addressing questions about "becoming socially excluded" as a woman in present day Romania.

If one were to categorize feminist research on social exclusion by its scope two categories would unravel. The first category is one that adds gender to the analysis working within present dimensions. The second category addresses the need for new dimensions of social exclusion for a more adequate account of social exclusion to be reached. The first one is a minimalist approach, while the second seeks to maximize feminist theoretical insights.

Minimalist approaches focus particularly on measuring and operationalizing of women's life experiences and specific forms of exclusion. Such studies focus on the exclusion of women from a variety of rights and services: social protection schemes, political participation, the labour market and social networks[53]. While such analysis is valuable, it remains limited in terms of impact of the overall theoretical frame of one domain[54].

Maximalist approaches focus not only on indicators or measurement, but also on how a concept itself and our theoretical understanding of it is gendered. In the case of social exclusion what such approaches would provide are in fact new dimensions to be added to the analysis. For example, they focus not (only) on how women fare in the labour market, but also on related dimensions highly relevant from a gendered perspective, such as care or reconciliation between work, career and private life. The resulting gendered account of social exclusion has thus, at least from a feminist theoretical standpoint, one additional dimension and it is one dimension I will address here. My approach could in this sense be considered maximalist ,in that it introduces new variables into the analysis. However, while care work has significant impact on a variety of women's experiences in Romania relating to social exclusion and social protection (such as healthcare or pensions), I will focus here only on how it impacts employment. Also, while taking care into account entails analysis of a variety of factors (the valorization of care though an ethics of care, the cultural factors favoring women's unpaid care work, the conception of the welfare state encompassing or not care) I will not go into such details

[53] An example of such an analysis is Houston, Diane "Women's Social Exclusion", in Multidisciplinary Handbook of Social Exclusion Research , edited by Dominic Abrams, Julie Christian and David Gordon, (West Sussex: John Wiley&Sons, 2007), 17-28

[54] For a minimalist approach to women's social exclusion in Romania see Iancu, Alice 2007: "The Gender Dimension of Social Exclusion" (Dimensiunea de gen a excluziunii sociale) in *Equal Partners, Equal Competitors (Parteneri egali, Competitori egali),* coordinated by Băluță, Oana, Maiko Publishing, Bucharest, 2007

here[55]. In this sense, my analysis is modest in scope: my purpose is not an analysis of the entirety of dimensions of social exclusion.

Finally, a note on the two selected main variables: the labour market and decision-making. Choosing to focus on the labour market is in sync with current European and Romanian policy priorities in the field of social inclusion. In 2006 the concept of active inclusion was introduced and it stressed the importance of participation to the market and the importance of assuring both a sufficient income and of improved services needed for a better participation in society (in the market). The concept " is based on three main pillars, namely: (i) a link to the labour market through job opportunities or vocational training; (ii) income support at a level that is sufficient for people to have a dignified life; and (iii) better access to services that may help some individuals and their families in entering mainstream society, supporting their re-insertion into employment"[56]. Even if during the public consultation it became apparent that the focus on the labour market as means of inclusion raises several objections, this remains *the* priority area within the EU [57]. Also, as I will show in the next section, it remains the central focus within Romanian policy-making concerning social exclusion.

As far as decision-making is concerned, while the official European definition of the socially excluded does mention that "*They have little access to power and decision-making bodies*[58] and thus often feeling powerless and unable to take control over the decisions that affect their day today lives."[59], there has been little focus on this particular dimension in European social policy, explicitly connecting it to social exclusion. In the aftermath of the Lisbon Treaty, since much attention was given to its democratization provisions, such a link appears fitting. Thus the next section will address how relevant actors (Romanian state institutions and policy-makers) and women themselves act and think in relation to those two dimensions.

4. Romanian policies on women's social exclusion after the Lisbon treaty

The Romanian context is one particularly favorable to assessing the Lisbon treaty's impact on social policy, especially when one considers the overall public opinion regarding the EU. The latest Eurobarometer on public opinion indicates a positive attitude of Romanians regarding the EU: "Six months into a year officially declared as one of global economic crisis, Romanians have kept their optimism and traditionally positive image of the EU. Around two thirds of the population aged 15 years and over has a positive image about the EU (62%), expresses its optimism about the Union's future (67%), believes that Romania's membership is a good thing (66%) and that Romania benefits from being an EU Member State (63%)."[60] Women are more skeptical than men in their view of the EU, as well as older people and people with a lower level of education. However, this optimism needs to be treated with caution, as it is often accompanied by a low level of knowledge on the actual

[55] For my own detailed account of feminist theories regarding care in relation to the Romanian context see Alice Iancu *The Politics of Care in a State of Crisis: the Romanian case*, LESIJ NO. XVII, VOL. 2/2010, 224-241.

[56] It was highlighted that focusing on the labour market neglects other types of exclusion, some social categories might never be integrated in the market and thus would remain excluded should the definition of social exclusion (and the policies it entails) become equated with exclusion from the labor market. See *Public consultation on active inclusion. Synthesis report by the Commission Services,* p.1

functioning of the EU[61]. This overall positive attitude was also reflected in how Romania related to the Lisbon Treaty. It is important to note that "Romania has been one of the first member states to ratify the reform document in parliament, on the 4th of February 2008, with a striking majority, where only one vote stood against the treaty. In fact, there have been no significant voices advocating a rejection of the legislative act in public debates[62]."

In 2010 a series of conferences was conducted named *Lisbon Treaty and Romania's Role in the Deepening of European Integration.* The Conferences were organized by the Romanian Government's Departement for European Affairs, The National School of Political and Administrative Studies, the Comission for European Affairs of the Romanian Parliament, with the support of the Academic Club of European Studies. With this occasion a small pilot-research was conducted among the participants[63] entitled *The Lisbon Treaty and its Implications for Romania.* This research showed that 60% of respondents believed the Lisbon Treaty would help diminish the distance between the EU and its citizens. Based on all these numbers one could presume an overall positive atitude among the policy-makers and among the Romanian population. However our pilot-research indicated that respondents did not feel confident in significant poverty reduction by 2020. They also believed that the portion of the European budget for social cohesion is too small and that European funding has done little to address this problem. What remains to be seen is how exactly and if the Lisbon Treaty has actually had an impact on Romanian policies regarding social exclusion.

Romanian policies regarding women's social exclusion: Has anything changed?

This section of the paper will address the Romanian context of women's social exclusion by following three distinct coordinates: 1. the actual reality on the ground regarding women's access to the labour market and decision-making 2. the official social inclusion reports and their analysis in relation to the Lisbon Treaty, as well as 3. relevant policies adopted by the Romanian Government.

At a general level, even if the Lisbon Treaty acknowledges gender equality as one of the EU core values, news of this has apparently not reached Bucharest policy makers. In terms of overall policy approach to gender equality the Romanian Government *disbanded* in 2010 both the National Agency for Equal Opportunities for Women and Men (responsible for the promotion and implementation of equal opportunities policies) and the National Agency for Family Protection (responsible, among others, with gathering data and managing domestic violence).

4.1. Women, Poverty and the Romanian Labour Market

Romania, like all European states, has been affected by the financial crisis. In 2009 there was great trust among Romanians in their government and the EU in terms of leadership for combating the current financial crisis[64]. In 2010 however data provided by the The Research Institute for Quality of Life showed that 74% of Romanians believed their quality of life and overall living conditions has worsened in the past year. Even more, the researchers asserted that " In many aspects of material

living conditions in 2010 we had a return of conditions from 1999, another moment of socio-economical crisis"[65]

The Romanian social exclusion policies focus on the labor market. The institution with most attributions in the area of social inclusion is the Ministry of Labor. In terms of priorities, the first priority for increasing social inclusion is "general improvement of the population's standard of living and stimulation of income gained from work by means of ensuring employment and promoting inclusive policies."[66]

The Romania Joint Inclusion Report 2010 named as some the poorest social groups elderly women, single parent families and young people. The 2010 Report only explicitly names women when referring to the elderly. However single-parent families are overwhelmingly run by women. Young women also have higher poverty rates their male counterparts, something acknowledged within the National Strategic Report on social Protection and Social Inclusion 2008-2010 [67]. Aproximately 30% of women within these three categories fall beneath the poverty threshold, in a country where overall women are poorer than men[68] and the overall population has *the lowest incomes* in the European Union[69]. In this sense one could argue that one in three women of these categories are the poorest of the poor in the European Union.

Income is directly connected to both access in the labour market and women's position within it. In terms of employment the overall numbers show a decrease in employment, with women less present on the labour market than men (52%)[70]. The Romanian market place is affected by both horizontal and vertical segregation, with negative consequences for women's income. This mirrors the overall situation at the European level, since "the gender pay gap, labour market segregation, work–life balance and the unfair distribution of reproductive and care work are still major challenges"[71]. In Romania nothing has been done in the last year to address such issues and the only state Agency who actually had a National Strategy for addressing such issues, the National Agency for Equal Opportunities for Women and Men, was disbanded.

Research also highlights the connection between care and employment or income, where dependents in the household are, lacking necessary politics, one of the obstacles faced by women in accessing the labour market[72]. This is also supported by European Union official documents[73].

In Romania the numbers are significant: 61% of women living in household with dependants declared that they do not have their own income; in households with no dependents only 38% of

women declared the same thing[74]. From 1991 to 2006 the number of state-funded kinder gardens reduced dramatically[75]. In 2008 National Strategic Report on social Protection and Social Inclusion named as its second priority the insurance of access to rights and services, including those related to child-care. The report stated that "measures shall be taken with regard to the consolidation of equal opportunities on the labour market between men and women and to enabling the harmonization of the professional life and the family life."[76] . The same document clearly showed both the acknowledgement of a link between the labor market and care and expressed commitments to address it "During 2008 – 2010, the development of family policies shall focus on promoting measures to encourage women's participation on the labour market by developing child care facilities and developing day-care centers to ensure the return of mothers to their jobs"[77]. In a Romanian setting however it is necessary that other categories of dependents be included in reconciliation policies: most people with disabilities in Romania are taken care of within the family (read: by women within the family), for example. This is addressed in 2009 in terms of access to proper care for people with disabilities, but the gender dimension of their care-takers escapes unnoticed by policy-makers[78].

This brief presentation of Romanian key policy-papers indicates a rather gender-blind understanding of social inclusion. *Some policy documents on social inclusion fail to even mention women at least once*[79]. Some of the policies undertaken by the Government in 2010 showed the true extent of this gender blindness.

Policies for child-care facilities were never put into place, however the Government tampered with child- care leave period and benefits as it saw fit, invoking that such measures had been requested by the International Monetary Fund[80]. Child support policies were changed throughout the year. Child support was slashed in June 2010 and the Government announced its intention to reduce child-care leave to one year. In December the Government finally came up with a new law regulating child leave. The new law Emergency Ordonance 111/2010 gives women the option of choosing for a one-year or two-year leaves, with different monetary benefits (the maximum threshold is higher for a one-year child-care leave option). What was apparent throughout the year was that the overall Romanian political debate simply ignored the lack of child care facilities. A one-year mandatory leave would have put women in very difficult situations, since losing child-support in a country with so few care facilities would have impacted greatly on their unemployment and poverty risks. It is still difficult to ascertain the future impact of the present policy, however the year 2010 clearly indicated how gender-(in)sensitive Romanian policy makers are.

Social policy is not something Romanians automatically link to the EU. As far as the Eurobarometer indicated, most respondents' own representation of the European Union, in terms of

values indicates that a direct connection to social protection decreased from 23% to 17%[81]. However Romanian state institutions have an obligation to take EU social policies into account, including the social clause of the Lisbon Treaty. Budget cuts undertaken by the Government in 2010 show that such a clause was not taken into consideration. In 2010 salaries in public sectors were cut by 25%, affecting mostly public workers, those working in healthcare and those working within the public education system. *Something that was never addressed in Romanian public and political discourse was that the vast majority of the workers in these sectors are women*.

In short, 2010 proved to be a year when policy-makers, far from taking into account women as a vulnerable group to poverty and social exclusion, actually worsened their situation. The main budget cuts aimed at feminized sectors. Any policies or measures to combat non-discrimination in the labour market and to promote equal opportunities were disturbed by the disappearance of the National Agency for Equal Opportunities for Women and Men. Also, Romanian mothers faced a deeply insecure year and were vulnerable to changes in child support and child-care leave.

Women in decision-making

The sense of insecurity and anger felt by Romanian mothers in 2010 lead to a premiere event in Romanian post-communist transition: Romanian mothers organized public protests against the Government's policies. Two separate protests were held in Bucharest, one in front of the Ministry of Labour, Family and Social Protection and one in front of the Government building and similar protests were organized in other cities. While these were not big protests, they were a first in Romanian politics. More remarkably, they were organized at a grassroots level, by mothers, through the internet. These protests were supported publicly and at the protest (through actual participation) by one NGO and a handful of women politicians[82].

This rare instance of Romanian women public protests serves to underline their absence in decision-making bodies. Women hold 5.3% of the seats in the Senate and 11,3% of the seats in the Chamber of Deputies. In county councils women make up 12,6% of the total seats, in local councils 10,8%, 3,4% as mayors and 4,7%as prefects[83]. Only two women are ministers in the Romanian Government. These numbers are exceptionally low. When Romanian mothers protested they found that they had few other women in decision-making positions to count on. This was partly due to politicians' own positions, but also had a great deal to do with the fact that there are scarcely any women in Romanian decision-making representative bodies. The only state Agency that would have at least had a public position on the matter, the National Agency for Equal Opportunities for Women and Men, was already functioning with great difficulty and practically disappeared by the end of the year.

In terms of social partners, women's presence in decision-making bodies is not better. While the Lisbon Treaty does explicitly support Social Dialogue this is primarily concerned with tripartite dialogue between political representatives, employers' associations and unions. Romania has steadily sought to increase social dialogue in recent years and several institutions and mechanisms were put in

place in the field before Romania's ascension to the EU[84]. The Economic and Social Council of Romania (CES) is the organization that should be central to social dialogue. Within our research *The Lisbon Treaty and its Implications for Romania*, 61% of respondeds believed its policy assessments should be mandatorily taken into consideration, while 53% believed it should have legislative initiatives. Applying a gender lens in looking at social partners in Romania the absence of women becomes apparent. Of the 45 members of the Economic and Social Council of Romania (CES) only four are women in 2011[85] (one being vice-president). No available data exists on the numbers of women present at the level of unions or employers' associations, although some unions have their own women's organizations. Several active womens' NGO's do exist in Romania, however NGO's are not usually a part of sustained social dialogue. As far as individual women's participation to NGO and association life in Romania, I could find no recent data. In this particular instance analysis of the consequences of the Lisbon Treaty, for example to what extent the "citizens initiative" would be used by women in Romania, would be highly speculative.

In one particular area the Lisbon Treaty could in fact have a mixed effect on women's representation. First, the increase of the role of the European Parliament is positive, since more women are elected to the European Parliament than to national parliaments (for Romania 36.36% of MEP's were women, with only 11, 38 % representation in the national parliament[86]). However the increase of the role of national representative bodies is ambivalent. Theoretically the Treaty's provisions would lead to better representation of national interests, in practice in Romania there is no significant representation for women's interests and needs. Gender-wise the increased role of national parliaments could in fact prove detrimental.

Conclusion and recommendations

As a social group women in Romania are vulnerable to social exclusion and lack adequate representation in decision-making bodies. In 2010 women's risks of social exclusion and poverty were only deepened by state policies. They had few voices or avenues to contest or even address the gender dimension of such policies at the decision-making level.

In keeping with The Lisbon Treaty's affirmation of the values of non-discrimination and equality between women and men (Art 1.a TEU), Romanian state policies should reflect a similar commitment. The National Agency for Equal Opportunities for Women and Men, with an adequate budgeting and clear strategies, needs to be reinstated.

Gender needs to be truly mainstreamed in Romania's Reports on Social Exclusion. This means that gender has to be taken into account in relation to a multitude of variables and consistently included into the analysis. The recommendations of the National Strategic Report on social Protection and Social Inclusion 2008-2010 regarding child-care facilities, social benefits and family support needs to be put into action. The foreseeable financial and social consequences of the current policies on women's income and access to the labour market are yet to be measured. All signs however point to a deepening of women's socio-economical vulnerabilities.

In terms of the presence of women in decision-making bodies several measures need to be undertaken. First national databases should be compiled detailing the presence of women at the social partners' level. Second, women's presence in political representative bodies should be encouraged by

enforcing quotas on party lists of candidates. The under-representation of women in Romanian politics is a long-standing continuous reality. In 2010 this lack of representation emerged clearly, with state policies hitting women hard and with gender not even being taken into account at a legislative or Government level. In this sense the effects of the Lisbon Treaty should be subject to further gendered analysis.

My account unveils a (still incomplete) image of a social group of women, the women of Romania, vulnerable to poverty and social exclusion, vulnerable to state policies and without having a significant voice in the decision-making process affecting them. In short, the brief presentation in this article and the data and indicators available at this time point to the social exclusion of a significant part of the Romanian population, on account of gender.

IDENTITY AND INTERESTS IN EUROPEAN INTEGRATION THEORY: THE INSTITUTIONALIZATION OF THE CFSP

HORIA BĂRBULESCU[*]

Abstract
The paper aims to analyze the evolution of the Common Foreign and Security Policy from the stand point of two competing approaches: the intergovernmentalist theory, based on rational institutionalism, and the constructivist theories in integration studies. I also attempt an evaluation of their analytical importance inside the theoretical research concerning CFSP. The contribution of this paper lies in emphasizing that even if interests, material and negotiation power and asymmetrical interdependence are useful starting points in analyzing the potential influence of states on early institutional evolution, power alone does not explain the final outcomes of this evolution or of the policies pursued inside the CFSP.

Keywords: *rational institutionalism, constructivism, interests, identities, logic of consequentiality, logic of appropriateness.*

Introduction

The paper aims to analyze the evolution of the Common Foreign and Security Policy from the stand point of two competing approaches: the intergovernmentalist theory, based on rational institutionalism, and the constructivist theories in integration studies. I also attempt an evaluation of their analytical importance inside the theoretical research concerning CFSP.

In the first part of the paper I discuss the main theoretical assumptions associated with intergovernmentalism with an emphasis on liberal intergovernmentalism. In this section I will also underline the methodological roots that the liberal intergovernmentalism borrowed from rational institutionalism. In the second section, I seek to outline the constructivist approaches in integration studies, with their emphasis on the importance of identity for the evolution and the implementation of CFSP. In the third section and fourth sections, I briefly consider the evolution of the CFSP institutionalization and I will present some empirical cases that can be successfully explained using identity as an independent variable. I conclude with an evaluation on the dynamics and interactions between interests and identity and I seek to asses the advantages and disadvantages that rest with each theory taken into consideration.

The contribution of this paper lies in emphasizing that even if interests, material and negotiation power and asymmetrical interdependence are useful starting points in analyzing the potential influence of states on early institutional evolution, power alone does not explain the final outcomes of this evolution or of the policies pursued inside the CFSP.

The intergovernmentalist approaches and rational institutionalism in theorizing the CFSP

In the following section I will present the intergovernmentalist (IG) approaches in theorizing the CFSP. The first part of the section contains an overview of the different types of IG and their place inside the larger field of integration studies. In the last part of the section, I will present the hypotheses formulated by these theories regarding the field of CFSP.

[*] PhD Candidate with the National School of Political Studies and Public Administration (NSPSPA), beneficiary of the project "Doctoral scholarships supporting research: Competitiveness, quality, and cooperation in the European Higher Education Area", co-funded by the European Union through the European Social Fund, Sectorial Operational Programme Human Resources Development 2007-2013 (e-mail: horia.barbulescu@gmail.com).

Before embarking on the presentation of the theories brought into discussion, I want to stress their intellectual roots in the field of international relations[1], a point to which I will return to during the following presentation. As for IG approaches, although they might appear to favor realist assumptions in their explanations, they are not realist per se. As Rosamond points out, "intergovernmentalists of various persuasions are distinguished from realists because they are attentive to the fact that the (international) politics of European integration takes place within a very specific institutional environment"[2]. The IG approaches are rather liberal institutionalist in their origins because they treat the EU as an international regime where national security is not the dominant motivation, states power is not based on coercive capabilities, state preferences and identities are not uniform, and interstate institutions are not insignificant[3]. This association is justified in the light of the fact that these theories emphasize the influence of institutionalization on state behavior.

IG emerged in the context of the lack of progress in European integration in the late 1960' and of the apparent failure of neofunctionalism in explaining these phenomena. One of the first proponents of the IG approach was Stanley Hoffmann, the most famous supporter of traditional or classical IG. His main theoretical concern was to emphasize "the importance of national interests in the international politics of post-war Europe"[4]. He explained the tension between integration and diversity in Western Europe after the Empty Chair Crisis through the incursions of supranational principles and institutions in the sensitive areas related to national sovereignty. In order to ground his explanatory approach, Hoffman[5] resorts to the distinction between high politics (the politics of "vital national interests" and military security) and low politics (dominated especially by economic matters). In Rosamond's formulation, Hoffmann's basic assumptions about the integration at that moment was that high politics is an autonomous domain, "virtually immune from the penetration of integrative impulses"[6], even if the governments were cooperating in the field of low politics in order to maintain control over the areas where intersocietal transactions became pervasive. In other words, his theory didn't give much chances of success to integration in domains like foreign policy and national security.

In the same IG tradition, economic historian Alan Milward tries to argue that, rather than undermining the nation-state, the integration process and the EU saved it. He points out that after the Second World War, European governments were confronted with two dilemmas: rising interdependence and societal discontent. They opted for integration as a solution to the need to provide public policies for their domestic constituencies and to mitigate the negative effects of interdependence.[7]

The preoccupation for the domestic context of the state is also illustrated by liberal IG, one of the most developed theoretical strands of IG. Andrew Moravcsik is the main exponent of this theory which some main characteristics: it is an application of rational institutionalism used to explain interstate cooperation; it is a "«grand» theory that seeks to explain the broad evolution of regional

integration"[8] and it is a parsimonious theory that uses a limited number of parameters (among which the decisive one is the domestic issue-specific preference structure of a few major states)[9].

Regarding the first characteristic mentioned above, the theories in the fields of international relations or European integration studies that build on rational institutionalism share some basic assumptions: individualism, state-centrism, materialism, egoism and instrumentalism[10]. Individualism refers to the fact that the agent (and not the structure) with given and relatively stable identity and interests is the primary generator of social practices. In the rational institutionalist approaches in international relations and European integration studies, the agent is not the individual, but a collective actor: the state, whose unitary character is assumed. Materialism refers to the fact that the distribution of power and wealth are the main variables that explain the processes and variations in international politics. This doesn't mean that institutions are not important but that they are generated by the materials interests of agents and do not modify their identities or interests, only cost-benefit calculations. The institutions are intervening variables between the actors and the environment and between individual and collective action. The good functioning of institutions depends on their utility to the actors. They act on the basis of concern for their benefits and not for the others benefits (they are egoistic). The last characteristic of rational institutionalism, instrumentalism, refers to the fact that actors act according to rational instrumentalism: they try to maximize their own utility. But generally, this assumption is relaxed through "bounded rationality" which assumes that actors don't have to be strict utility maximizers, to posses all the information about the consequences of their actions or to have the capacity to process this information[11]. Building on these characteristics it can be argued, like Schimmelfennig, that "the assumption of rational states acting in a materially structured system and the rationalist indifference to actor-specific cognitions and individual as well as social meanings suggest an *objectivist* analysis"[12]. Moreover, theories that are rooted in rational institutionalism emphasize that agents operate according to the logic of consequentiality, not according to the logic of appropriateness. "In a logic of consequentiality, behaviors are driven by preferences and expectations about consequences."[13] and this logic is associated with anticipatory choice. On the other hand, the logic of appropriateness is associated with obligatory action[14] and it involves fulfilling the obligations of a role in a situation[15] and actions are chosen by recognizing a situation as being familiar, typical.

Returning to the other characteristics of liberal IG, it is worth mentioning that the latter is using three theoretical subcomponents: a liberal or societal theory of national preference formation; a theory of international negotiations and a functional theory of institutional choice[16]. The main assumption of liberal IG is that rational and unitary states are the most important actors in the international anarchical context and international institutions such as the EU are the result of negotiations between states that "continue to enjoy pre-eminent decision-making power and political legitimacy"[17]. The "unitary actor" character of the state is given by the fact that domestic political

negotiations, representation and diplomacy generate a consistent preference function[18]. However, this does not mean that domestic actors don't play an independent and significant role in the negotiations beyond the state because "multiple representation can be consistent with the rational actor model - as long as it is consistent with a preference ordering."[19] Thus, the liberal character of IG comes from the fact that it offers an interpretation of national preference formation which tries to take full account of the diversity of commercial, industrial, monetary and social interests in a state and "the readiness of the nation-state to negotiate agreements if the complex balance of different domestic interests requires it"[20]. As one of the analysts and admirers of Moravcsik's theory, Roger Morgan, observes, although the theoretician of liberal IG accepts that the idea of Europe –the vision of a European federation- has played some role in the integration process, Moravcsik insists that "the EC has been, for the most part, the deliberate creation of statesmen and citizens seeking to realize economic interest through traditional diplomatic means". The paradox is that these traditional means lead to a result which is very non-traditional indeed: the persistent widening and deepening of the EC/EU by "repeated transfers of sovereign prerogatives" [21].

From a liberal IG perspective, international cooperation can be explained by three processes: states define their preferences, then they negotiate agreements and they create or adjust institutions in order to secure certain outcomes[22]. Thus, Moravcsik considers that "EU integration can be best understood as a series of rational choices made by national leaders. These choices responded to constraints and opportunities stemming from the economic interests of powerful domestic constituents, the relative power of states stemming from asymmetrical interdependence, and the role of institutions in bolstering the credibility of interstate commitments"[23]. His perspective was sometimes criticized because it favours economic interests and explanations dominated by producers' interests. This critique seems legitimate taking into consideration that the supporters of liberal IG acknowledge that its ideal application on a concrete case is the Common Agricultural Policy (CAP)[24]. CAP is a policy which has a prevailing economic side dominated by the interests of the producers. Moreover, Moravcsik considers that state preferences regarding European integration have reflected mainly concrete economic interests rather than other general concerns like security or European ideals. However, Moravcsik and Schimmelfennig acknowledge that in non-economic domains, like foreign policy, the economic factor can be less important in calculations regarding a specific policy. Also, the authors admit that geopolitical interests had a role, albeit a secondary one, in European integration[25].

Concerning the relative bargaining power –considered by liberal intergovernmentalists a crucial factor in determining the outcomes of an international negotiation, they argue that it is determined by asymmetrical interdependence: the uneven distribution of the benefits of an agreement, and by the information about preferences and agreements[26].

The institutional framework is considered by liberal IG as an important element in facilitating positive sum negotiations[27]. Institutions help states to collectively arrive at a superior

[18] Moravcsik's theory of state preference formation resembles the logic of two-level games theory in foreign policy analysis. The seminal article for this theory is Robert D. Putnam, "Diplomacy and Domestic Politics: The Logic of Two-Level Games", *International Organization* 42, 3 (1988): 427-460.

outcome by reducing transaction costs and providing the necessary information in order to reduce state's uncertainty about each other's behavior and future preferences. Also, liberal intergovernmentalists claim to accept some of the assumptions traditionally attributed to neofunctionalism and historical institutionalism such as the fact that institutions can have unintended and unwanted consequences but also argue that the later theories overinterpret their consequences[28]. Moreover, Moravcsik and Schimmelfennig accept two limitations of liberal IG[29]. The first is related to the fact their theory explains best policy-making in areas where social preferences are relatively well defined. Thus, "the weaker and more diffuse the domestic constituency behind a policy and the more modest or uncertain are "the substantial implications of a choice, the less predictable are national preferences and the more likely ideological preferences and beliefs" may be influential. The second limitation acknowledged by the authors refers to the fact that in the case of both high transaction costs and asymmetrical information, supranational institutions will have greater influence.

As I have mentioned above, traditional IG were sceptical regarding advanced political integration, especially in the fields of foreign policy and security. These domains were considered as highly connected with the survival of the state and belonged to the deepest layers of state sovereignty. Thus, IG insisted that the analysis of these areas can be approached appropriately only through interpretation of intergovernmental negotiations by the schools of thought tributary to rational institutionalism.

In his analysis regarding CFSP, Koenig-Archibugi[30] argues that the integration, generally and specifically in the field of CFSP is decided in Intergovernmental Conferences, that lead to "grand" bargains, whose terms are written in the basic treaties of the EU. Regarding integration in the CFSP area, the European governments had different positions that influenced the duration of the negotiations. The author mentions the situation that occurred during the 1996-1997 IGC which lead to the signing of the Amsterdam Treaty, when EU foreign ministers or their representatives met more than twenty times to discuss the possible revisions of the provisions regarding CFSP in the Maastricht Treaty. Generally, the option for deeper integration in the case of the CFSP is related to pooling sovereignty (when states accept to take decisions that apply to all without the possibility of national veto) or to delegating sovereignty (the process through which states transfer their decisional power regarding an issue or a field to supranational institutions in the EU). Concretely, the pooling of sovereignty refers to accepting the qualified majority voting system in the Council of Ministers for the decisions in the CFSP field (or at least decisions regarding implementation) and delegating sovereignty means increasing the powers of the Commission and the European Parliament in CFSP, mitigating the intergovernmental character of the CFSP through the fusion of the three pillars and financing CFSP operations from the community budget instead of ad-hoc contributions from the states.[31]

Approaching the issues of state preferences, Koenig-Archibugi makes the observation that although, in the 1990', most states that wanted a supranational CFSP also wanted including defence in the EU's competences, this coincidence was not general: some states supporting the deepening of the integration didn't want to extend it to issues of defence and security and viceversa. This observation is confirmed in the case of France, that encouraged the creation of a European defence identity but opposed taking decisions on a supranational level in CFSP or in defence and security matters. The position of the UK, until 1998, was to oppose both undertakings. From 1998, the attitude of the British government approximated the French government's position: they did not oppose a role in defence for EU, but kept its reticence towards supranational procedures, favouring

[28] Moravcsik and Schimmelfennig, "Liberal Intergovermentalism", 75.

[31] Koenig-Archibugi, "Explaining Government Preferences…", 140-141.

intergovernmental procedures. Koenig-Archibugi attributes the progress of CFSP to the convergence of French and British positions. By contrast, the Netherlands, during the 1990-1991 IGC, supported a supranational foreign policy but opposed the development of a European defence[32].

As I have mentioned earlier, the standpoint of rationalist institutionalism assumes that the agents act according to instrumental rationality and that the pre-eminent explanation is based on material factors. From here it can be deduced that governments would prefer different institutional arrangements because they have different interests and different resources. In the first interpretation, focusing on interests, governments support or oppose the creation of institutions or decision-making procedures if they believe or not that these will determine results that correspond to their exogenously determined interests[33]. Thus, in the context of the CFSP, states' opposition to supranational institutions is related to the concern that once introduced, the EU would take decisions that would be contrary to state preferences. Regarding the pooling of sovereignty, states might fear that the supranational institutions might have the tendency to privilege the preferences of a majority of member states, especially where the preferences of some states do not correspond with those of the majority.

The second interpretation, that stresses the distribution of resources (power) as an explaining factor of the variations in the interests of each state is usually associated with realist theories in international relations. From this perspective, the states whose power allows them to pursue an independent and effective foreign policy do not manifest the tendency to give up their autonomy in favour of supranational institutions. On the other hand, less powerful states are more interested in developing a more integrated foreign and security policy because of two reasons: 1. in the hope that their influence in global issues will rise when the EU will act as a global actor; 2. because a more robust institutional framework might constrain the more powerful states, whose foreign policy might become threatening, not to become a danger in the future.[34]

1. The constructivist approach, integration studies and the theorizing on CFSP

In this section of the paper I will emphasize the explanations provided by the constructivist approaches[35] regarding European integration in the field of foreign and security policy. In the first part of the section I describe the general characteristics and assumptions of the constructivist approaches in international relations and their most important versions. I will then try to present their relevance for integration theories and their explanatory value in the context of the evolution of integration.

Although they differ in some of their assumptions, the constructivist approaches exhibit some common characteristics. First of all, they question the claim of rationalist approaches to explain the socially constructed world solely through conventional procedures of rationalist research[36]. Another characteristic of the approaches discussed here is their scepticism towards "grand theories" that try to explain all social practices regardless of space and time[37]. Constructivism tends towards a rather contextualized theorization that does not claim to be a general theory of social sciences and most constructivists even refuse to call their explanatory model a "theory", preferring to consider it an analytical framework[38].

[33] Koenig-Archibugi, "Explaining Government Preferences…", 143.

[34] Koenig-Archibugi, "Explaining Government Preferences…", 144.

[35] These approaches are often called "sociological institutionalism", defined as "a version of institutional research inspired by constructivism" (Risse 2009: 158). However, the approaches discussed here include a broader range of approaches that stress other factors besides institutions, such as Self/Other interactions – which may be included in the strand of poststructuralism/critical constructivism.

The first assumption of constructivist approaches that I will present[39] refers to the importance that they assign to ideal or normative factors. Thus, "to the extent that structures can be said to shape the behaviour of social and political actors […] constructivists hold that normative or ideational structures are just as important as material structures"[40]. As Wendt argues: "this does not mean that material power and interests are unimportant, but rather that their meaning and effects depend on the social structure of the system"[41] to which they belong. Moreover, the normative or ideational structure in which the agent acts constitutes his social identity. This assumption is related to the fact that the sociological institutionalism approaches emphasize what I previously defined as the "logic of appropriateness". Unlike instrumental behaviour, the one guided by rules and norms differs through the fact that actors try to do the "appropriate thing", to determine the adequate rule for a given social situation. Concerning the analytical importance given to the non-material structure it can be argued that the constructivist approaches are often regarded as privileging structural rather than agent-based explanations. But this observation is only valid for some of the versions of constructivism, as we shall see below.

Another assumption of constructivist approaches is that identities structure interests which in turn influence behaviour. Unlike the approaches in rational institutionalism, the constructivists emphasize the fact that the interests and preferences of the actors are endogenous to processes of institutional interactions, emanating from them. Moreover, the constructivist author Bill McSweeney raises the argument that identity and interests are mutually constituted[42].

A third major assumption of constructivism is that agents and structures are mutually constituted – although an author such as Wendt is considered to privilege the structure. Thus, the majority of constructivists claim to share the structurationist perspective which emphasizes both the impact of non-material structures on identities and interests and the role of actors' practices in maintaining and transforming these structures[43].

The assumptions shared by the constructivist schools in international relations can be correlated with the ones in integration studies. The first observation I need to make in order to determine the assumptions of constructivism in integration studies is that even though it can be used to generate theoretical propositions and hypotheses that can be tested or supplemented with rationalist explanations of institutional effects, authors like Risse consider that constructivism does not present itself as a concrete integration theory, but rather as an ontological or meta-theoretical perspective[44]. The same author considers that the emphasis on the ideational, cultural and discursive origins of national preferences is complementary, rather than substitutable to agent-based rationalist approaches[45]. However, the extended use of constructivism in integration studies, if not as a theory but as an analytical framework, and the interest shown in integrating its assumptions by the representatives of other integration theories (Frank Schimmelfennig[46], Ulrich Sedelmeier[47]) can be interpreted as a confirmation of the theoretical and analytical value provided by this approach.

[47] Ulrich Sedelmeier, „Collective Identity", in *Contemporary European Foreign Policy*, ed. Walter Carlsnaes *et al.* (London: Sage, 2004).

In the field of European integration theories, constructivist approaches must be based on three foundations: to view the units on every level as social constructs, to asses the political significance of these units in the nature of the processes for which they provide containers and not to assume the primacy of any level[48]. As we will see in the next part of this section, these epistemological directions were more or less pursued in constructivist research regarding the EU. However, regardless of the privileged level of analysis (system, unit, or both), constructivist approaches take into consideration the fact that states' identities influence their interests and policies, even in the field of security, considered to be a part of high politics. In addition, changes in the collective identity of actors inside states can modify their interests in the international environment[49]. Thus, in the case of the EU, collective identities may affect the attitude of governments towards European treaty reform in two ways which are often complementary: governmental elites make choices on European integration on the basis of their identities and/or the public develops preferences to which the elites conform in order to gain votes. This last relation includes influences from both directions: even though elites are constrained by public opinion, the latter can be influenced by the discourses of the elites[50].

Koenig-Archibugi also considers that a supplementary explanatory factor (in addition to the identity of governmental elites and of the public), important for the perceptions on supranational integration in CFSP, is the constitutional culture of a state. The latter is defined as the image that a state has regarding its sovereignty and the legitimacy and practice of multi-level governance inside its territory. The author identifies two such cultures: one that conceives of sovereignty as unitary and indivisible and whose prerogatives are mostly centralized (France, UK), the other in which the prerogatives of sovereignty can and ought to be distributed between multiple territorial levels, according to the principles of subsidiarity or of comparative efficiency. The article of Koenig-Archibugi concludes that keeping the prerogatives of sovereignty at the level of the state is not a purpose shared equally by all states, because some of them have shown a willingness to promote strong forms of political integration in Europe[51].

Another direction of research in constructivist integration studies emphasizes the treaty reform process, a research subject traditionally dominated by liberal intergovermentalists. However, in the constructivist approach, the focus is rather on the structurationist perspective -as opposed to a liberal IG focus on actors with exogenously determined interests, and on accepting a larger category of actors exerting influence on the treaty reform process. The influence of structure refers to the established formalities and routine practices of intergovernmental conferences and to the path-dependent institutional developments but also to the discourses that constrain and define the preferences of the actors involved[52].

A different direction of research, sharing the same analytical framework, seeks to explain and interpret the enlargement of the EU in the context of the substantial financial cost involved by this process, especially in the last wave. This approach stresses that the enlargement to the countries of Central and Eastern Europe can be explained only by taking into consideration the acceptance of norms and of shared standards of legitimacy according to which the EU cannot reject the requests of membership from countries that invoke values like democracy and the free market. Such an approach that appeals to the explanatory power of ideational and normative factors is characteristic to Frank

Schimmelfennig[53]. Although he is rather a liberal IG his analyses try to find a "third way" between rationalist and constructivist research programmes. However, for Schimmelfennig the norms of democracy and free market do not constitute the identity of member governments of the EU, but are rather external constrains for governments that are preoccupied by their reputation on the international stage.

Another constructivist way to approach issues concerning the CFSP and enlargement is through reference to the construction of EU's identity in relation to a significant "Other". For example, the discourse about the EU as a normative or civilian power constructs the USA as its "Other"[54]. In a different line of thought, the EU's "Other" is not a spatial one, but a temporal "Other". As Ole Waever argues, it is "Europe's own past that should not be allowed to become its future"[55]. In this interpretation, the European past, characterized by militarism, nationalism and the balance of power as a norm of behaviour in international relations is the major securitization that the EU states operate. Scholars such as Rumelili reject this view arguing that internally located difference does not exclude difference located externally and that the latter can be a source of tension in the Self/Other interactions between the EU and its neighbours and prospective members[56].

A closely related research strand analyzes two opposite trends in the construction of the European polity. The first emphasizes the idea of "United in Diversity" and values like democracy, human rights, the rule of law, and social market economy. From this perspective, the European institutions seek to construct a European post-national civic identity whose values are sought and embraced by the ones who aspire to become members. Such a conceptualization of identity is inclusive to those perceived as being the "Other". A second construction of European identity is the more exclusive one that emphasizes the idea of "fortress Europe", with a common history and cultural heritage based on Judeo-Christian values. This last vision of Europe was brought forward by Euro-sceptics and right-wing politicians and became salient in the debates concerning immigration from outside the EU and Turkey's prospective membership in the EU[57].

The methods of research used by the above mentioned constructivist approaches include the analysis of the dominant discourses and practices adopted in the performance of identity and the analysis of the processes of socialization. From the perspective of these approaches, discourses can be seen as guiding political action towards appropriate behaviour in the context of an agreed environment[58].

In conclusion, the added value of constructivist approaches to European integration is threefold[59]. First of all, by accepting the mutual constitution of agent and structure, it can help us understand better the impact of Europeanization on the state. The fact that constructivism emphasizes the constitutive effects of laws, rules and policies, allows us to study how are actors' identities and interests shaped. Membership in the EU influences the way in which actors perceive themselves and are perceived by the others and involves the voluntary acceptance of a specific political order as legitimate[60]. Moreover, analyses from a structurationist perspective focus both on the way in which the global structural environment contributes to the emergence of an identity for the EU and on the

way that actors inside de EU define the global environment in order to give a reason for a cohesive identity of the EU[61]. Second of all, using constructivism we can investigate the degree to which the cohesion of the EU in international relations influences the perceptions of other actors about EU's actorness[62]. The third way in which constructivism can help us study European integration is through the discursive approaches that allow us to examine how the EU and Europe are constructed, how other actors relate to this structure and how a European public sphere is developed.

The dynamics of identities and interests inside the CFSP

In the next section I will make a short presentation of the evolution of the CFSP without going into details. Then, I will approach the analysis of the CFSP from the perspective of the assumptions presented in the previous sections and I will include relevant examples in the course of the evolution of CFSP.

The origins of the CFSP can be detected in the European Political Cooperation (EPC) which was started in 1970. Before this moment only cooperation inside international trade negotiations existed. The necessity of creating an instrument which would be more efficient than the EPC, for managing foreign policy and security, was illustrated by events such as the Gulf War, the wars in Yugoslavia and other external factors associated most often with the end of the Cold War. The essential characteristic of the EPC was its strictly intergovernmental structure and its weak institutionalization.

The entry into force of the Maastricht Treaty also meant the creation of CFSP. The latter was to be a part of the so-called pillar structure together with the European Communities -the first pillar- and Justice and Home Affairs (JHA)-the third pillar. Despite the criticism from the partisans of a more profound "communitarisation" of the CFSP, the Maastricht Treaty represented the moment when the CFSP was institutionalized as a sector of European policy. The importance of the TEU for the institutionalization and governance of the CFSP is illustrated by four effects that it had: it involved a greater coherence and rationalization of policy-making in this field; it made CFSP legally binding for the member states, including compliance mechanisms; it introduced several authoritative decision-making rules, such as qualified majority voting (QMV) –even if for a small number of issues- and allowed for a greater degree of autonomy for the organizational actors in the European foreign policy[63]. What is significant for the TEU is the explicit mention, in the Preamble, article B and article J.4.1 the necessity for the EU to assert its identity on the international scene that could manifest itself thorough a common defence policy, "which might in time lead to a common defence"[64].

The next treaty taken into discussion, the Amsterdam Treaty, included, besides the provisions related to the coherence of the CFSP and common interests, reforms in three other areas of CFSP: decision making, implementation and financing[65]. Regarding the first area, it was agreed upon codifying the doctrine of "flexibility" which permitted a state to abstain from any action inside the CFSP even if he was required to accept the EU decision and abstain from actions that might endanger it. Although this provision was an important exception from the rule of consensus, it didn't apply to decisions in the field of defense and didn't exclude the right to opposition from a member state that could thus block an action. Regarding implementation and representation, the Treaty of Amsterdam introduced the position of High Representative for the CFSP, which also held the position of secretary general of the Council of Ministers, but was subordinated to the EU Presidency.

[65] Smith, *Europe's Foreign and Security Policy…*, 227-231;

Regarding financing, the treaty provided for the first time that the EC budget will be the main source of finance for the CFSP, although the Council could unanimously decide otherwise.

After Amsterdam, the next significant treaty was Nice which entered into force on the 1st of February 2003. Even if the European Security and Defense Policy was a key subject in the discussions from Nice, and "although until that time the Western European Union was effectively merged with the EU, specific treaty provisions in this domain actually were quite few"[66]. A notable exception through which the ESDP was mentioned in Nice was the renaming of the "Political Committee" in the "Political and Security Committee" and charging it with exercising political control (under the responsibility of the Council) and strategic direction of crisis management operations. Another significant evolution in the Nice Treaty (determined by the controversy generated by the composition of the Austrian government in 2000) was allowing for a majority of four fifths of the member states in order to suspend certain rights for a member that violated EU's fundamental principles. Regarding the decision-making process for CFSP, Nice brought the evolution of the principle of "flexibility" into "enhanced cooperation" by basing it on provisions applied to JHA in Amsterdam. "Enhanced cooperation" was meant to safeguard the values and serve the interests of the EU whenever it manifested its identity as a coherent force on the international scene. However, using consolidate cooperation was limited because of the lengthy process of approving an action through this method and the fact that it did not apply to matters that might have military of defence implications[67].

The next important treaty for the European integration in all areas, not only CFSP, was the Lisbon Treaty. So let us note what were the most significant changes brought about by this treaty. First of all, it eliminated the pillar structure of the EU. However, if we take into consideration the fact that this structure referred to different sets of rules for decision-making, the second pillar is still in place. This is because although Lisbon extended the "community method" of decision-making to all domains of EU action, CFSP remained outside its area of application[68]. The Lisbon Treaty transformed the High Representative for CFSP, which only had the attribution to assist the Presidency, in High Representative of the EU for Foreign Affairs and Security Policy. He/She is charged with ensuring the coherence of external action and is supported in fulfilling this mission by the European External Action Service. Thus, the problems of the former Representative, which was evaluated as "a foreign policy spokesperson with no real resources or mandate"[69], were surmounted. However, a potential source of dispute may be the fact that the High Representative shares the function of external representation with the President of the European Council.

With regard to decision-making procedures, the Lisbon Treaty stipulates a bridging clause (*pasesrelle*) that allows for the European Council to extend, through unanimity, the area of QMV in the field of CFSP (but not in the field of Common Security and Defense Policy). "Thus, the Lisbon Treaty preserves a dynamic element in the CFSP by which the unanimity rule can be gradually restricted without needing to follow the procedure of treaty revision"[70]. Concerning implementation, a provision worth mentioning is the possibility to use enhanced cooperation in defence matters. Referring to the values and the identity of the EU, the Treaty formulates them as objectives that the EU should not only respect but also actively promote. Thus, we will have cases in which it will be necessary that the Common Commercial Policy "not only pursues trade-related objectives […] but takes into account and even contributes to other dimensions, such as human rights and sustainable development"[71].

Identity: explanatory factor or epiphenomenon

In one of studies concerning the CFSP, Smith[72] argues that interests also depend on social interaction and discursive practices, so that member states of the EU can find cooperative solutions even without a hegemonic leader of quid pro quo negotiations. As I've seen, IG stresses the fact that states behave in terms of narrowly defined rational instrumentality and their positions regarding policies derive from internal concerns of governmental elites. Smith argues that rather than following this path, EU member states have learned to define some of their foreign policy preferences, even if not all, in terms of collectively determined values and purposes. This does not mean that member states started to behave irrationally, but rather that the shared purposes of the EU have become part of their interest calculations because of the evolution of EPC/CFSP. In the latter case, the main reason for the gradual transition from the logic of consequentiality to the logic of appropriateness is the fact that the EU's institutional mechanisms discouraged the formation of fixed national preferences on a rising number of issues. These mechanisms also socialized the involved elites in the direction of articulating a common European policy on these issues.

According to the logic of appropriateness, the decision-makers and policy-makers do not just calculate which strategy is the best in order to promote their interests in a given situation, but also ask themselves which is their specific role in that situation and what obligations prescribes that role. Thus, the formation of preferences -which actors may pursue strategically – is endogenous to social interaction and to the process of identity and social role formation[73]. From this perspective, highly institutionalized social environments condition actors to rely on values, ideas and shared knowledge when they make a decision. When institutions are missing or weak, as was the case with the EPC, states resort to egoistical decisions based on their specific foreign policy traditions. Thus, while rational institutionalist approaches can explain the intergovernmental origins and the initial limited purpose of the EPC, its expansion, impact and results require arguments based on constructivist assumptions.

Unlike cooperation on economic matters where institutions often are a rational instrumental response to the problem of incomplete contracting, political cooperation does not involve a clear result that can be easily measured by participant states[74]. Thus, the CFSP is a model for positive integration, which involves more abstract and symbolic purposes, a domain in which preference formation and perceptions on social standards are at least as important as strategic action. Moreover, the fact that the CFSP area does not have clear boundaries (because issues from different domains are included in its framework) the limits of intergovernmental explanations become even more significant. As argued by Smith[75], the fundamental principle of cooperation in the area of foreign policy is that UE member states must avoid adopting fixed positions on important issues without previous consultation with their partners. This principle suggests we cannot view cooperation in this area as a rational instrumental process in which states bring their predetermined, fixed positions and preferences to the negotiation table. Rather, the reason that underlies CFSP decision-making is the gradual institutionalization of communicative processes directed towards "learning by action" and creative, incremental adaptation.

Smith considers that this type of interaction, that substitutes the actor-centred rational instrumentality, can be identified through three criteria. First of all, the way decisions are made is different: debate is privileged over negotiation; negotiating favours is not the main objective and participants try to find solutions based on the common definition of the problem. Even when states show a preference for status-quo and most of the others favour collective action, those that oppose

[72] Michael E. Smith, "Institutionalization, Policy Adaptation and European Foreign Policy Cooperation", *European Journal of International Relations* 10, 95 (2004): 95-136.

[73] Sedelmeier, „Collective Identity".

[74] Smith, „Institutionalization…", 101.

[75] Smith, „Institutionalization…", *ibidem.*

may accept a solution without resorting to negotiations. The result is an increased number of such middle positions that reflect the will of the group as a whole, not the lowest common denominator determined by the status-quo states.

The second phenomenon that may indicate the transition towards the logic of appropriateness refers to agenda setting and leadership. As noted before, versions of rational institutionalism, consider that the most powerful states have the last word on foreign and security policy. In cases where the logic of appropriateness plays a greater role, power is defined in terms of arguments, language and ideas oriented towards collective action. Thus, assuming leadership may come from any legitimate actor among states or EU institutions, not only from those with a greater material power.

One last element, indicative for the existence of a substitute for instrumental rationality, is linked to changing the institutions and policies. Thus, this will depend not only on the discourse of the participants, but also on the inclusion of new actors in the system and on the expansion and redefinition of common values. This type of change may indicate that state interests are not necessarily determined solely by the domestic contexts and that they are more flexible than rational institutionalists argue.

As we have seen, with the Maastricht Treaty and then with the Amsterdam Treaty, the foreign policy system of the EU, represented until then by the EPC of the EC, started to develop from being just a forum of debates mostly decentralized to a system with its own cooperation culture which involved standards of behaviour, shared meanings and a common language. Maastricht bought about the extension of representatives ("CFSP counsellors") in the COREPER and more representatives from other institutions such as the Commission and the General Secretariat of the Council of Ministers. Then, the Treaty of Amsterdam created the position of High Representative for CFSP and increased the number of special representatives for certain problems. These provisions increased the impact of communication through formal (like the COREU) and informal networks and encouraged the formation of epistemic communities of experts[76]. This system, supplemented by the rule of consulting the other states before adopting a decision in order not to take them by surprise, lead to the institutionalization of the "coordination reflex". As Hill and Wallace note: "The liberal institutionalists' image of rational policy-makers bargaining with each other within established regimes leaves too little room for this *engrenage* effect [...] Officials and ministers who sit together on planes and round tables in Brussels or in each other's capitals begin to judge 'rationality' from within a different framework from that they began with"[77].

In addition, concrete actions collective and common declarations increased in number since Maastricht, including positions that did not necessarily reflect the interests of the most powerful states. Among the most efficient and significant collective action generated by the creation of the CFSP and defining collective interests in the EU was the Stability Pact for Central and Eastern Europe[78]. This involved the cooperation of the Commission and the member states in order to pressure candidate countries in the area to solve problems related to borders and minorities. The most important treaties and agreements generated by the Pact were the so-called "good neighbour" treaties between Hungary and Romania and Hungary and Slovakia. Aside from the Pact, there have been other common actions, "most of limited scope but with considerable political impact" which included support for the Middle East and former Yugoslavia peace processes and for the democratic transition in the Russian Federation and South Africa[79].

[79] Cameron, "Building a common foreign policy…", *ibidem*.

Sedelmeier[80] illustrates the impact of the EU identity through some notable examples. I mention here only three of the most significant. The first of these examples refers to the diplomatic sanctions imposed on the Austrian government of 2000 which included the Freedom Party lead by Jorg Haider. Although this example concerns the foreign policies of the member states rather than the foreign policy of the EU, the reaction is hard to explain without referring to the impact of the identity of the EU as a promoter and defender of democracy and human rights. The governments that initiated the sanctions might have had instrumental reasons, aiming not so much at Haider, but at the domestic party politics, in an attempt to discredit extreme-right parties or centre-right that accepted cooperation with them[81]. Even from this perspective, it is difficult to understand the participation of all member governments without taking into consideration the role of the EU in the field of democracy and human rights and the fact that this role conferred a strong legitimacy to the initiative. It would have been problematic for a government to refuse to participate since this could be perceived as a refusal to act according to the EU's identity. Thus, even from the perspective of an analysis that focuses on instrumental motives, the instrumental use of references to the EU's identity worked only because the role of the EU had become taken for granted. Moreover, argues Sedelmeier, this example illustrates that "instrumental 'norm entrepreneurship', motivated by domestic party political struggles, can contribute to 'norm emergence' at the EU level."[82]

Another example cited by Sedelmeier is the collective endorsement by the EU for the military intervention in Kosovo. From a rational-instrumentalist perspective this is hard to explain considering that some of the EU states are neutral and in many cases the public opinion was critical of the NATO intervention. "Some policy makers were concerned that the bombing campaign would be counterproductive to achieving the declared goals, while others were concerned about the negative precedents it might set for the credibility of international law and the role of the UN."[83] However, it can be argued that the members of the EU that could have opposed the military intervention consented to the declaration of endorsement made by the European Council in Berlin because this document justified such an action by referring to the fundamental norms of the EU's identity.

The third example concerns the decision to collectively promote the abolition of the death penalty. Thus, the decision is difficult to explain on the basis of material incentives: there are few rewards from the public opinion and it creates tensions with states with capital punishment, especially concerning extraditions. Sedelmeier explains this decision by emphasizing "the legitimacy that the EU's identity bestowed on the arguments of these advocates as an important resource."[84]

As we can see from these empirical examples, identity can be used successfully as an explanatory factor both for the interactions between member states and for their relations with outside actors. Even though in some cases promoting policies based on norms may be motivated by egoistical interests of some governments, it is less likely that these policies are adopted collectively by all governments in the absence of some characteristics of the EU's identity such as safeguarding democracy and human rights. "Thus, while identity-based advocacy might have been used instrumentally, such instrumental use only induces compliant behaviour because EU identity has acquired a certain degree of taken-for-grantedness among the member governments"[85].

Conclusions

The aim of this paper was to present the debate between two theoretical approaches of European integration in the field of CFSP: rational institutionalism and constructivism, and the main schools of thought that use their analytical framework. I have noted that the assumptions underlying the two approaches and the explanatory factors they each emphasize are often different although some theoreticians stress the fact that they are not incompatible and try to use the in a complementary way. I've also noted that some policies, attitudes and declarations emanating from the CFSP are better explained by referring to the interactions between factors such as the identity, values and norms of the actors than by emphasizing power and bargaining games in which the maximization of the benefits of the actors is sought.

Even if interests, material and negotiation power and interests defined according to these factors are useful starting points in analyzing the potential influence of states on early institutional evolution, power alone does not explain the final outcomes of this evolution or of the policies pursued inside the CFSP. Moreover, we cannot explain the evolutionary stages, some of them of major importance, of the CFSP only by referring to the logic of consequentiality. The latter must be supplemented with the logic of appropriateness and with the emphasis on the transformational potential of actors' identities and interests in the process of socialization inside the EU.

In accordance with authors such as Meyer and Strickmann[86] or Fearon and Wendt, I also argue for a pragmatic approach that stresses the interaction between changing material structures and ideas because "rationalism and constructivism are most fruitfully viewed pragmatically as analytical tools, rather than as metaphysical positions or empirical descriptions of the world"[87]. Or as Ole Waever put it, even if power politics can explain the initial emergence of cooperation in the European area during the Cold War they might not explain much in the present because "situations can obtain different supporting conditions later on"[88]. Thus, in order to grasp the full dynamics of the European project we need to investigate its social construction and its interaction with all relevant actors.

INTERNATIONAL SECURITY RELATIONS AND POST-IMPERIAL ORDERS

RADU-SEBASTIAN UNGUREANU[*]

Abstract

This paper intends to investigate the relations between former imperial powers and new sovereign states succeeding an empire in the field of international security, particularly when involving the use of force.

Despite their stated attachment to the normative principles of what we usually call "Westphalian order", former imperial powers continue to interfere in the domestic affairs of these new states, especially those unable to exercise their sovereignty efficiently and legitimately. One could say that, by military interventions, these powers deny the sovereignty of weak states in the regions once under their control; but the preparation of these missions makes the actions not to be interpreted as expressions of an imperialist attitude.

I consider there are two major ideal-types that could better explain such interventions. In a power-oriented post-imperial order, the intervention of a former empire is the result of the projection of its national interests and identities. In a norm-oriented post-imperial order, the sense of moral responsibility of the former imperial power is the main reason for its interference. The intervention's legitimacy and suitability require domestic and international support.

This paper, grounded on a constructivist approach, intends to contribute to the understanding of international security issues in terms of a world shaped by actors' interests and identities and the dynamics of their relations. The identified ideal-types of post-imperial orders consider both material and cultural factors. The analytical elements that may link extremely different situations are the socially variable interpretations of past and present.

Keywords*: empire; hegemony; intervention; power-oriented post-imperial order (POPIO); norm-oriented post-imperial order (NOPIO).*

The term "empire" seems to have gained in recent IR literature an incredible spreading, its usage covering various interpretations of the contemporary social world, as for the expansion of the global capitalism, or the projection of American military and political power, or the leveling of political expectations worldwide, and so on. In spite of their different meanings, all the forms the term "empire" is used suggest the image of unity and of an (un)conscious march toward this unity, or the "imperialism". In this paper I use the term "empire" in a more narrow (and old-fashioned) way, as a territorial political entity.

Despite this precaution, to define an empire is not a simple task. In the last half of millennium, we have witnessed the progressive establishment of what it is generally called the "Westphalian" order, where the political space is divided into separate territorial sovereign states, interacting in an anarchical environment. At least since the end of the two World Wars, the dominant idea of the legitimate organizing principle of a sovereign state is the expression of the will of a political community shaped into a nation defined by the "self-determination" principle. It is precisely the claim of every nation to benefit from sovereignty that makes the system to be anarchic, in the absence of any authority capable to impose the order into the system, by power and legitimacy.

This conception is somehow misleading, because it is obvious that this legalistic point of view does not have an authentic correspondent in the political reality, for the contact between the nation-states. In fact, the supposed anarchy of the international realm should be considered in practice only

[*] Lecturer, Faculty of Social and Administrative Sciences - "Nicolae Titulescu University", Bucharest (e-mail radu.ungureanu@univnt ro). A previous version of this paper, entitled "Post-Imperial Orders in International Security Management", was presented at the "2nd Annual Durham International Affairs Conference, 'Informal Empires, Past and Present'", Durham, United Kingdom, 2009.

in part, the states observing several ways of dealing with the anarchy. Many factors, material and ideational as well, contribute to the formation of a much more complex international realm, in particular due to the way the political entities understand and exercise the sovereignty, inside the borders and during their interactions with others. In a famous article, Alexander Wendt points out that the anarchy has multiple meanings, which appear from the interactions among states.[1] By supporting a constructivist perspective toward International Relations, I take into account the importance of the interactions among actors in defining their interests and identities, in a mutually constitutive relation between structure (anarchy) and actors. I thus consider that the meanings of "security" and "sovereignty" are socially constructed, dynamic, and interconnected.[2]

It is not my intention to investigate all the social meanings of the sovereignty and security that occur during interactions among political entities, from the shared sovereignty of EU member states to the establishment of some sort or hierarchy. In this paper I shall focus on the interventions made by the former imperial powers, mainly with military means, in the territories that used to be under their control.

The starting points for investigating such a theme are three empirical observations. Firstly, the weak states facing an external intervention that I envisage are mainly those that used to be part of an empire, now part of what is generally known as the Third World. Secondly, the former imperial power tends to be the main subject (if not the only one) of the intervention, so that it can be granted a special interest in conducting the operation. The question that I raise is why precisely the former empire is taking the initiative in dealing with the situation and the answer I suggest is that happens because of the special links that bond the two actors. I group such links in a "post-imperial order". Thirdly, I consider that these interventions can be divided into two major categories: those designated mainly to protect interests of the former imperial patron and those that have as the prime objective to protect the lives and properties of the people living in the countries affected by the failure of the state.

Based on these three observations, I suggest in this paper that the post-imperial orders imply that the former imperial powers are in particular interested in interfering in those weak states that used to be under their control. The relations among states succeeding an empire would thus have distinguishing features from other kinds of international links. In my opinion, these special relations between the former centre and subordinated units of an empire, the post-imperial identities and interests, could offer some good answers for the study of contemporary international security issues.

In order to investigate the post-imperial orders, the first necessary step would be a definition of the empire and to distinguish it from other forms of political dominance over alien territories. Once we identified the empire, it is possible to discuss the post-imperial order. The third section of the paper is dedicated to identification and definition of two ideal-types of post-imperial order that I call *power-oriented post-imperial order* (POPIO) and, respectively, *norm-oriented post-imperial order* (NOPIO). As I suggest in the final part of the paper, these two ideal-types may be used when discussing various post-imperial approaches toward international security.

As from the theoretical and methodological approach, as already said, the paper should be considered in the light of a moderate form of constructivism. By this, I consider the importance of material and ideational factors as well, a double determination relationship between agents and structure, that the identities and interests of the actor should be considered in a relation of co-determination, and so on. Also, due to the permanent social interactions, I take into consideration a dynamic perspective on the institutions and meanings.

[2] I tried to demonstrate this idea in Radu-Sebastian Ungureanu, *Securitate, suveranitate şi instituţii internaţionale. Crizele din Europa de Sud-Est în anii '90* [*Security, Sovereignty, and International Institutions: The South-East European Crisis of the '90s*] (Iaşi: Polirom, 2010).

Empire and hegemony

Usually, a military intervention (as the acts of inter-state war as well) can be interpreted as a denial of the sovereignty of the object of intervention. What I have in mind are the interventions made on the territory of weak states, unable to enforce the sovereignty they enjoy in an effective and legitimate way, but only in a formal or legalistic manner. In these particular cases, the intervention is not seen as the expression of an imperialist attitude, as long as it is not designed to lead to the construction of an empire.

In such cases, we should reconsider the meaning of anarchy as a characteristic of international relations. In the field of the security institutions, in the military dimension of the term, David Lake considers that there are some sorts of arrangements where the anarchy is replaced by some forms of hierarchy between two sovereign states. He identifies in this respect several increasingly hierarchic security institutions, such as the spheres of influence, protectorates, informal empires, and empires[3].

Even if I consider that Lake is right in identifying some forms of hierarchy in these cases, I think that the empire should be distinguished from other forms, even informal, of hierarchic organizations. In my view, the main concurrent of the term "empire" in this matter is that of "hegemon". Both of these two concepts imply a form of dominance of a political centre over some foreign subjects and territories, but in a different manner. As a specific difference from "hegemony", an empire would be defined by the legitimate monopoly of one centre of power to generate and interpret the rules of the system in a given space (considered in territorial and/ or cultural terms). On the contrary, in the hegemony case the simple recognition of the sovereignty of the other part implies that this actor is entitled in formulating and enforcing some specific rules on his own territory. In other words, in the case of an empire, the dominance of the centre is inner-directed, while regarding the hegemony the dominance of the centre is an outer-directed one.[4]

The previous claim can be sustained if we consider two major features of an empire, that being its vocation of universality and unity (anti-entropy) over the particularities of national order (most empires), of the component states (as the German Empire – the Second *Reich*, where the previous existing political units, as the Kingdom of Bavaria, preserved some elements of statehood), religious, linguistic, etc, order, and a consciousness of the self-assumed mission. This second dimension – ideology – also legitimizes imperial expansion. On the other hand, following the views of well-known scholars of different orientations, as George Modelski[5], Robert Gilpin[6], or Robert Cox [7], we could state that the hegemony is generally considered as the capacity of a political centre to produce the most performing rules and to impose them in the international system in its own profit in a competitive manner. As Peter Taylor puts it, a hegemonic state is a counter-imperial project[8].

---

[3] David A. Lake. "Beyond Anarchy. The Importance of Security Institutions", *International Security*, 26 (2001): 132-133.

[4] According to Michael Doyle's well-known definition, an empire consists of the "effective control whether formal or informal, of a subordinated society by an imperial society" - Michael Doyle, *Empires* (Ithaca, NY: Cornell University Press), 1986,30. A different position is to consider several forms of exercising influence over subordinated societies beside the empire – dominions, suzerainty, and hegemony. A discussion on this topic can be found in Barry Buzan, Richard Little, *International Systems in World History. Remaking the Study of International Relations* (Oxford: Oxford University Press, 2000), 176-182. In my view, as I shall show, the sovereignty, norm monopoly, decision autonomy, responsibility and common project are main issues in differentiating an empire from other types of dominance, which I generally group in the hegemony family.

[5] George Modelski, "The Long Cycle of Global Politics and the Nation-State", *Comparative Studies in Society and History*, 20 (1978): 214-235.

[8] Peter Taylor. In Christopher Chase-Dunn *et al.*, "Hegemony and Social Change – The Forum", *Mershon International Studies Review*, 38 (1994): 363-364.

These two positions – of an imperial or a hegemonic state – can be fulfilled by the same political centre, but not necessary. By taking a look at the roles played by Britain during, roughly, the 19th century, we would find out that it was a participant at the European balance of power (a great power among others), the political centre of its empire, but the world's hegemon, as long as she imposed international rules such as the gold standard, the anti-slavery and anti-piracy policies, the free trade, etc, norms to be observed not only by the small states, but also by her competitors in the imperial project. One could also say that even the imperialist project was also a norm, to be followed by every great power of the time with the ambition of being treated as such. The Italian or German claims of a right in building a colonial empire in the pre-War World I era are eloquent in this direction.

The difference between empire and hegemony appears even clearer if we take a closer look to the specific orders they create. For the hegemonic power, the order is considered to address some sovereign units, so that at least formally one could say that it faces an anarchic order. On the other hand, in the case of an empire a metropolitan power imposes an imperial order over alien societies/ territories in two major ways. The first is the material and legal superiority in violent means, even if in many cases a monopoly in this matter is lacking. Secondly, an empire is a common normative system, both formal and informal, even if some local particularities are allowed.[9]

The normative monopoly seems to be the most important defining feature of an empire, the claim of the legitimate violent means being only its necessary consequence. In this respect, the influential *Empire* of Michael Hardt and Antonio Negri is very suggestive: "The concept of Empire is presented as a global concert under the direction of a single conductor, a unitary power that maintains the social peace and produces its ethical truths. And in order to achieve these ends, the single power is given the necessary force to conduct, when necessary, "just wars" at the borders against the barbarians and internally against the rebellious."[10] The "natural" expansionism of the empire is in intrinsic normative logic, so that it "exhausts historical time, suspends history, and summons the past and future within its own ethical order. In other words, Empire presents its order as permanent, eternal, and necessary."[11] For the Euro-centric world, the very model of the unity is the Roman Empire. The memory of its magnificence, civilization and glory mobilized every European imperial project since Antiquity, and each of them tried very hard to present itself as the legitimate Roman heir.

Compared with the imperial order, the hegemonic normative space is significantly less defined, mainly because of the anarchic order it describes, and so are the manifestations of its power. "Compared to empire, hegemony is commonly seen as a shallower and less intrusive mode of control."[12] Usually lacking a formal responsibility for the domestic politics of the states where it exercises its dominance, the hegemonic power has more freedom in selecting the nature and range of the intervention. But in order to preserve the legitimacy of its predominance (as a "counter-imperial project"), it also has to self-restraint in exercising its power. As Hurrell explains it, "stable hegemony rests on a delicate balance between coercion and consensus, a balance between the exercise of the direct and indirect power by the hegemon on the one hand and the provision of a degree of autonomy of action and a degree of respect for the interests of weaker states on the other."[13]

---

[9] It is a matter of investigation if the issue of collecting and redistributing the resources should be considered as a central feature of an empire. If the answer is no, then it does not fit the definition of the state, in its modern acceptation. The Holy Empire did not do it, but none doubted in its time about being an empire. The best understanding of the fact is offered by the constructivist approach, any given concept having several meanings that appear during the social interactions, and knowing chronological dynamics.

[10] Michael Hardt, Antonio Negri, *Empire* (Cambridge, MA; London: Harvard University Press, 2000), 10.

[13] Hurrell, *On Global Order*, 270.

By returning now to David Lake's classification of the hierarchic structures of the international realm, I believe that the first three forms (spheres of influence, protectorates, informal empires) could be considered as belonging to the family of hegemonic dominance. They are ordered according to the range of the involvement of the centre, being expressions of some sort of a soft, a medium and a hard hegemony in material, military terms. I tried to show that the empire is a different kind of dominance, and in what it follows I suggest that the post-imperial order can be seen as some sort of hegemony, but not necessary, only in those cases where the former metropolitan power imposes its own rules to the succeeding states.

In spite of the fact that there are authors convinced that a world-state is inevitable[14] or that empire is an immanent threat toward the freedom of the world's citizens[15], empirically one could observe that the fate the empires are facing seems to be their unravel (at least of the political units considered in this paper). It is now the moment to take a closer look to the relations built among the states that follow an empire or, in other words, to identify and investigate a post-imperial order, if possible.

Empire and post-imperial order

As I have shown, it is the intention of this paper to investigate and conceptualize the features and typology of the post-imperial orders. In this respect, I think that a brief comparative look to the British and, respectively, the Russian Empires could prove to be very fruitful. I am using the plural form when speaking about the Russian empire because I consider it in its both forms, Tsarist and Soviet. By doing so, I shall try to mark either the elements of continuity and specificity of both these two empires governed from Moscow.

There are at least two reasons for choosing them: firstly, they were the very embodiment of two different forms of imperialism, so that I formulate as a first hypotheses that the post-imperial orders that they generate would be quite different; secondly, they were the most powerful players in the imperialist game, and each of them managed, at the climax of their territorial expansion, to control roughly one fifth of the earth, so that the post-imperial orders that they eventually generated represented the widest spread.

The differences between a commercial, sea-born empire, on one hand, and a militaristic land-based on the other are quite known in IR theory. A classical geopolitical approach is visible in Dominic Lieven's commentary:

The contrast between British commercial and Russian military–dynastic empire overlaps with another distinction: the one between maritime and land empire. Since from the sixteenth century to the creation of the railway (and actually in many cases beyond) long-distance trade was far cheaper and quicker by water one reason for the overlap is clear. In the view of many scholars the contrast between maritime and land empire also entails the distinction between a far-flung collection of colonies in the former case, and a polity which is in embryo at least a unified state, and maybe even a potential nation-state. Added together, these contrasts are often summarized as the distinction between liberal, diffuse maritime power on the one hand, and autocratic, centralizing land empire on the other.[16]

Although Lieven's perspective is compelling, there are perhaps of making only two comments to add. First, the logics behind empire-building are quite different: in the British case, it was, for the most part of its history, an individualistic enterprise, where the state came lately into the scene. More or less, it was built on a bottom-up dynamic. For the Russian case, it was mainly a state-

[14] Alexander Wendt, "Why a World State is Inevitable", *European Journal of International Relations*, 9 (2003): 491-542

[15] Hardt, Negri, *Empire*.

[16] Dominic Lieven, "Empire on Europe's Periphery". In *Imperial Rule*, eds. Alexei Miller, Alfred J. Rieber (Budapest; New York: Central European University Press, 2004), 138.

guided effort, driven by territorial defense and expansion, so that it can be considered a top-down project.

The diffuse nature of the British Empire outlined by Lieven implies a much larger freedom for the colonies and territories[17] than for the Russian example. Even ideological, the British Empire envisaged in its late period its natural collapse as the moment when the indigenous people would be able of self-governing. The distinction between colonies and dominions is not only a matter of race, but also one of governmental aptitudes.[18] In the Russian example, the autocracy offered a much harsher political environment, so that the relations between the centre and the subjects can be considered strictly hierarchic.[19]

The second comment concerns the position of the centre inside the empire. Queen Victoria was Empress of India in her capacity of ruler of the United Kingdom, which had a distinct identity inside the empire, preceding, co-existing and succeeding it. His correspondent in Russia was "Emperor and Autocrat of All the Russias". Russia itself (Great Russia, distinct from White Russia – Belarus, and Little Russia – Ukraine) had not a distinct personality. Curiously, in Russian Empire's heir, the Soviet Union, the situation somehow perpetuated, at least at the level of ideological tools.[20] Russia *was* the empire, not (only) its core.

In these circumstances, Lieven's consideration of the Tsarist Empire as a "potential nation-state" should be considered with caution. This potential nation-state would have needed a nation, but a nation that contained the Russians in a larger political community. The Russians entered in nations' era not only without political instruments of building a "community of will", but, one can speculate, also without a socially relevant idea of imaging a history and a future separated from those of other such political entities.[21]

The Bolshevik Revolution, besides having as an immediate effect the dismantlement of the Tsarist Empire, brought a Marxist ideological dilemma in the issue of imperialism. On the one hand, there should be considered the self-determination right of the proletariat from the ancient exploiter, meaning the right to secession of the proletarians living on alien territories. On the other hand, the nation-state is, from a Marxist point of view, the expression of the interests of the exploiting upper-classes, and so the only legitimate country for the all the proletarians would be the Soviet Union. Eventually, the imperialist project won, and almost all the territories once part of the Tsarist Empire returned by violent means under Moscow's control.

The ideological factor had two important consequences for the imperial identity. Internally, it offered a much more powerful unifying tool in the hands of the political elite of the centre than the autocracy gave. Externally, while the Tsarist Empire was an accepted member of the international society, the Soviet Union, because of its revolutionary character, gained this status only in the eve of

[17] The histories of relations between London and the "white colonies", but also with the local rulers in India, are eloquent in this respect.

[18] See, for instance, the discussion of the inter-war period regarding India's capacity for gaining the dominion status.

[19] For a much detailed discussion over the social conditions in the British and, respectively, the Russian empires, see Lieven, "Empire on Europe's Periphery", 141-147.

[20] For instance, all the Soviet republics had their own Communist Party, except for Russia, where the Soviet Union's Communist Party (the "general" one) was acting. At individual level, it is also to note that many political leaders of the Soviet Union were born outside Russia. It is enough to mention in this respect the names of I. V. Stalin, a Georgian, and Nikita Khrushchev, a Ukrainian. Examples as such are indicators for considering that in the Soviet Union the Russian national political identity was to be subsumed to the imperial, Soviet, one.

[21] The above sentence should not be red as there was no Russian nationalism during the 19th century, but that it can not be compared with its contemporary counterparts in the terms of social relevance and political impact. For a good insight over the issue see, for instance, Alexei Miller, "The Empire and the Nation in the Imagination of Russian Nationalism". In *Imperial Rule*, eds. Alexei Miller, Alfred J. Rieber (Budapest; New York: Central European University Press, 2004)

the World War II. During the Cold War, the ideology was for the Soviet Union both a form of power, and an impediment in shaping social relations at international level.

The Soviet imperialist ideology was at least twice revised regarding its exclusive sphere of influence, the "external" or "informal" Soviet empire.[22] The first was represented by the moment when Moscow imposed friendly regimes in the satellite countries, in the period following the end of War World II. The second important moment came in the late 1960's, with the Brezhnev Doctrine. I should highlight the fact that the manifestations of projects in the political life should be considered as forms of hegemony. The imperialism is the ideology that made such policies possible, not the practices - a possible political unifying project that never came into fact, simply because the countries in question preserved their sovereignty. The perspective in its ideological dimension was formally ended with the announcement of the Sinatra Doctrine in 1989.

In brief, it can be said that there were some important differences between the British and Russian empires: maritime *versus* land, colonial *versus* territorial, liberal *versus* autocratic/ communist, state-core *versus* empire-core, etc. The brief comparative discussion above is not meant to exhaust the topic, but to offer a better understanding on two different kinds of relations that can emerge between the metropolis and its former alien subordinated units after the collapse of the empire. I intend to use this comparison in order to build two ideal-types of the post-imperial orders.

The ideal-types of the post-imperial orders

Part of the Weberian intellectual tradition of the Social Sciences, the constructivist approach underlines the importance of the comprehensive perspectives. Intellectual constructs as the ideal-types are meant to clarify the analytic effort of the researcher, even if the situations met in the real social, lacking the purity of the concept, can only approximate one pattern or another.

The main purpose of this paper is to offer a perspective on the involvement of the former imperial powers in their former colonies/ territories for a better understanding of some dramatic contemporary international security issues. I consider that some good answers can be found in the common past that provides special identities and interests.

In my view, these present special relations originating in the imperial past can be grouped in two main forms. In the first one, the attitudes, behaviors and policies of the former imperial power can be seen as designed to fulfill only its interests. The present sovereign states that used to be under its control are considered to be its "natural" backyard – if not in the empire, at least in its sphere of influence. Any external interference, particularly those regarding the hard security, are seen by the decision-makers of the former empire as menacing its influence, and consequently as unfriendly and veritable threats toward the international stability. In the relations established with the new independent states the former metropolis tends to act like a suzerain, and to replace the empire with a form of hegemony, mainly in its military dimension. The imperial dream is somehow still present in the most parts of the political class and inside the society as a whole, who tends to consider that period as the nation's "golden age". I name such a relations-complex (involving decision-makers, societies, states and other social actors) a *power-oriented post-imperial order* (POPIO).

In the second case, the former imperial power is somehow "ashamed" by its imperial past, in particular by the excesses, the most intrusive forms of its dominance of the life of its subordinated societies. If nothing can be made in order to remedy the errors of the past, a sentiment of responsibility toward the future of the former colonies becomes widespread in the society. The loss of the empire being accepted, the former imperial power also faces the failure of the claimed legitimate monopoly over the normative space. The imperial values should be replaced only by an even larger set (as the Human Rights doctrine), more universal, less controversial. In such a post-

[22] More considerations on this issue could be found, for instance, in Alexander Wendt, Daniel Friedheim, "Hierarchy under Anarchy: Informal Empire and the East German State". In *State Sovereignty as Social Construct*, eds. Thomas J. Biersteker, Cynthia Weber (Cambridge: Cambridge University Press, 1996).

imperial order, the external interference is accepted as long as the interventionist proves itself to be a valid interpreter of the norms. In this *norm-oriented post-imperial order* (NOPIO), the Civilized Other is accepted, desired, invited to observe, interpret and act.

In my view, one major difference between the two ideal-types of post-imperial orders can be seen as similar to those between multilateralism and bilateralism, but at the normative and, more important, the interpretative level. Thus, I extend John Ruggie's meanings of these terms from those interests and identities embodied in formal agreements[23] to encompass all kind of shared understandings and practices, many of them being visible only in the management of occurring crisis or other moments.

Some additional comments should be made. First, we could say that in a POPIO an empire's heir is considering itself a "genuine" nation state. The identities of such an actor are those shaped by the structural conditions of a state having to act in an anarchical environment. The new actor is supposed to have the usual interests of a nation-state in a Hobbesian world, where power and self-help are the governing principles of the relationships among sovereign entities. In a NOPIO, the universal project is preserved, but reconsidered – the failure of the normative monopoly does not meant that it has to be replaced by an egoistic set of values, but by a larger one, less ideological. The new identity being achieved, the possibility to make mistakes, the acceptance of the social change – all these would shape new interests toward the former colonies and territories.

I should also highlight the fact that these ideal-types refer to post-imperial orders, not actors. It is theoretical possible that the same former imperial power would build/ desire to build a POPIO in certain cases and a NOPIO in others. Such an observation could be considered illogic, or even hypocrisy, for certain theories, but the fact is consistent to the constructivist approach, where every actor knows a particular set of identities and interests, stable but not perennial. Generally speaking, certain stability in pursuing a specific post-imperial order is to be expected from each former imperial power (if we are not in front of a schizophrenic actor), but the exceptions would be not unavoidable. There are two situations, at least, to be noticed when such thing is possible: the evolution of the norms themselves and their socially recognized valid interpretation, on the one hand, and the situations when the actor would risk to act in a manner close to cognitive dissonance, so that it has to choose between becoming the "prisoner" of the norm, or to re-prioritize its identities and interests.

It is also possible to consider the two ideal-types as stages of the same process. Till now, there are too few examples in this field. As I shall discuss later, there are some indicators that one post-imperial order could replace the other. A constructivist perspective of this factor would take into consideration both material and ideational factors, continuous and slow changes of the interests and identities of the agent, and the dynamics of social structures. It should also be said that such process does not necessarily involve something inevitable or irreversible- the social-oriented approach rejects such a perspective. But if such a tendency exists, it should be discovered.

I consider that in the contemporary world the two forms of post-imperial orders coexist and produce social effects. In the next section of this paper I intend to comment some of their most visible manifestations and interactions in international security issues.

International security through post-imperial orders

It is a matter of empirical observations that in the last century the great powers progressively abandoned the imperialist projects and policies, in the conception considered here. Several explanations could be offered here, from the nature of military power (for instance, the significance of the nuclear factor) or the relative decrease of the importance of the territory till to the spreading of nation-state ideology, but it is not my intention to identify and investigate all of them. I want to point

[23] John Gerard Ruggie, "Multilateralism: The Anatomy of an Institution", *International Organization*, 46 (1992): 561-598.

out some changes in the political ideas governing the world. Martha Finnemore suggests that, in contemporary politics, "most states do not *want* more territory nor do they see force as an effective or legitimate means of obtaining it. More territory is no longer a marker of state success or state greatness".[24]

Finnemore's statement can be best understood in the context of her book. Attached to the constructivist approach, she underlines that the norms governing the international politics are in a permanent and continuous change. The argument is completed by saying that the above changes continuously produce new institutions of the world order, that exercise a structural pressure over all social actors. In my opinion, in a constructivist perspective the institutions and agents should be considered in dynamic co-determination relationship.

The fact that the great powers abandoned the imperialist policies does not mean that there are all considered in the same fashion. The interventions vary greatly in the terms of international support and legitimacy, and asking "why such a thing would happen?" is appropriate.

In domestic politics, the legitimacy of government is conferred by the objects of governing acts. By applying these observations to the international field, the legitimacy of an external intervention would be conferred by the two kinds of subjects involved: those who suffer it and the citizens of the interventionist state, to whom the decision-makers are responsible to. The anarchic nature of the international system – lacking a monopoly in issuing, interpreting and enforcing rules - makes such a judgment insufficient, so that the interventionist looks for some support of interpreting the rules even outside, from other nation states and from a inter-/ transnational public opinion.

POPIO

A POPIO could be considered today as the "wrong" way of understanding the international politics, due to the exclusivist claim of a single power to manage all the important matters in a self-designated sphere of influence. For instance, in Western opinion at least, Russia's treatment of the former Soviet space as her own backyard is usually considered both a threat to the address of international security and obsolete in its norms and practices.[25] Of course, one could say that this interpretation is only a form of the hegemonic power of the West in imposing its judgments on international level[26]. The correctness of this statement or finding a better explanation is not relevant to the aim of the present paper, since the fact that this position produces social effects is more important.

In my view, Russia's attempts to establish a POPIO are somehow predictable, because of the identity transformations she has suffered in the last twenty years. The end of the Cold War and the collapse of the Soviet Union were accompanied by the renouncement to the ideology, the imperial unifying factor. At that moment, Russia faced the imperative of building a state and even a supporting nation as soon as possible. As for her political identity in international relations, Andrei Tsykankov discovered in 1997 at least four different and colliding projects, each of them having its supporters in the political and academic circles: the international institutionalism, the defensive and offensive realism, and the revolutionary expansionism[27].

[24] Martha Finnemore, *The Purpose of Intervention. Changing Beliefs about the Use of Force* (Ithaca, NY; London: Cornell University Press, 2003), 140; emphasis in original.

[25] A huge bibliography is dedicated to this subject in recent years. For a short and suggestive description, see Andrei P. Tsygankov , "Projecting Confidence, Not Fear: Russia's Post-Imperial Assertiveness", *Orbis*, 50 (2006), 677-679. An extended investigation over Russia's foreign policy can be found in Roger E. Kanet (ed.). *Russia – Re-Emerging Great Power* (Basingstoke; New York: Palgrave Macmillan, 2007).

[26] On Western normative influence in International Relations see, for instance, Anthony Pagden"Human Rights, Natural Rights, and Europe's Imperial Legacy", *Political Theory*, 31 (2003): 171-199.

[27] Andrei P. Tsygankov, "From International Institutionalism to Revolutionary Expansionism", *Mershon International Studies Review*, 41 (1997): 247-268.

Almost a decade later, Andrei Tsykankov considers that it is a mistake to look at Russia as to an imperialist power, but to treat her as a state looking after its own national interests, the Kremlin's policies being "post-imperial and largely defensive. They seek to pursue opportunities for economic growth and stability and to address remaining security threats"[28]. Russia is using more and more the instruments of soft power, in Tsygankov's view, designed to project influence, not power, in the former Soviet Union. For Tsygankov, "strengthening Russia's ties in the former Soviet region does not require revising existing territorial boundaries, depriving neighbors of their political sovereignty, or taking on the burden of an imperial responsibility, successful application of soft power weakens the appeal of Russia's traditional imperialists and strengthens security in the region"[29].

Translating Tsygankov's 2006 analysis in his own 1997 terms suggests that in the last decade the liberal and revolutionary approaches became less influential in Russia, and that now her behavior could be best understood in the terms of some sort of realism. I think that Tsygankov is right in his argument and I shall try to put it in a theoretical manner, which would consider today Russia a unitary nation-state actor pursuing its interests in the anarchic environment in a selfish manner. The analysis is supported by events and processes at both internal and external level. Internally, the two Chechen Wars, for instance, were designed to ensure the rule of the central government over the entire territory of the state – violently affirming the statehood. Externally, the opposition made toward the "colored revolutions" (in Tsygankov's terms) and their political outcomes, to NATO's expansion or the Georgian intervention are all meant to formulate a sphere of exclusive hegemony, not a new empire, or a POPIO in the terms suggested by this paper. Nevertheless, this kind of management the sphere of influence is rejected by Russia's interaction partners as brutal forms of (re)imposing the hegemony. The Georgian crisis in the summer of 2008 is eloquent in this respect. This case also offers a good example for a previous statement I have made that that in a POPIO the hegemon do not accept Others' intervention. It is also to be said that the Others do not consider Russia's norm interpretation as valid (the parallel between the statehood of Kosovo on the one hand and South Ossetia and Abkhazia on the other being rejected).

The above discussion directs me to the next subsequent question, related to the different interpretations of the interventions in weak states. If the military management of international security in a POPIO looks today like a morally condemnable enterprise, one should ask how other interventions can appear as much more desirable. In other words, what makes an intervention made in a NOPIO to be seen as more legitimate than that in a POPIO?

I think that in order to answer this question it is necessary to look closer at the establishment conditions of a NOPIO, and the Western experience in this respect would offer a good insight. For instance, at the end of World War II, the British political elite contemplated both the inevitable march toward independence of some of the most important colonies and territories of the Empire (namely India) and the ambition of being one of the major powers of the world, comparable with the United States and the Soviet Union. The solution was to replace the imperial order with a hegemonic one, so that the British decision-makers made appeal to an older instrument, the Commonwealth, formerly opened only to the Dominions, the "white" part of the empire.

The modern Commonwealth was not the natural successor to the old prewar Commonwealth that had been held together by ties of kith and kin, common ideals, and partnership. This updated version was a Whitehall device to protect old spheres of interest from competing influences, including from the USA, to offer the new members some off-the-shelf international status and prestige, certain benefits in economic, trade and military assistance, and to prevent the spread of communism.[30]

[30] Krishnan Srinivasan,"Nobody's Commonwealth? The Commonwealth in Britain's Post-imperial Adjustment", *Commonwealth & Comparative Politics*, 44 (2006), 259.

Obviously, the United Kingdom faced the harsh pressures of the Cold War and had to renounce at the claims of being comparable with the two giants of the bipolar era. European empires were doomed in the nuclear age, crashed in the superpowers' collision. The threat of the communist expansion forced the European powers to search for the American security umbrella. As for the American strategy, even if the European colonies could prove important assets in the containment policy (the replacement of the French presence in Indochina after Dien-Bien-Phu, in 1954, by the American one), the post-colonial political identity of the United States was much too strong to sustain such a position for long period of times. The Suez Crisis in 1956 could be considered as the turning point of the United States' policy toward European empires, by deciding not to support them any more. The decolonisation was the major political process that accompanied the Cold War for political reason too, because

"[…] the Americans were coming round to the view that decolonisation was the best way to counter the spread of communist influence, and American pressure thenceforward became a factor in the independence timetable[31]

In brief, one could say that, under the structural combined pressures of both the Cold War conditions and the spread of nationalist ideas, the great European powers had to reformulate their empires, the British experience being accompanied by the similar experience of France, for instance (the Fourth Republic's *Union française* and *Communuaté française* of the Fifth Republic). Till now, it seems clear that the British and French Commonwealths could be interpreted as designed to embody the political exclusive sphere of influence of the former imperial powers or, in the terms of the present paper, as POPIOs. The question is how it comes that the POPIOs were transformed in a NOPIO?

NOPIO

I think that the fundamental reason of the explanation should be searched in the unique experience of the West in post-World War II era. Even if we consider Western Europe during the Cold War under a common and foreign hegemony, the main instrument of the American military presence in Europe – NATO – was an anarchic one, with decisions taken on consensus, unlike the similar Soviet instrument, the Treaty of Warsaw[32]. At the end of the Cold War period, the West noted that it formed a security community, whose member consider themselves linked together by mutual trust, based on common identities, values, meanings, norms and practices[33]. As for the European part of this security community, right at the end of the Cold War they institutionalized their relations even more, by forming the European Union.

The common identities, values, meanings, practices of the Western security community are, in my view, the very basis of the NOPIO in discussion. The European Union itself contributes to the building of this form of post-imperial order. Firstly, the shared sovereignty of the members is, I believe, conceivable only if a unity project based on common identities and interest, norms and meanings, is taken into consideration.[34] Secondly, this unity project is not exclusive for the Other.

[33] Emanuel Adler, Michael Barnett, "A Framework for the Study of Security Communities". In *Security Communities*, eds. Emanuel Adler, Michael Barnett (Cambridge: Cambridge University Press, 1998), 30-37.

[34] It should be noted that most discussion of a potential future "empire" (post-sovereign institutionalized form of political unity) are considering UN as the most used contemporary example (for instance, Hardt, Negri, *Empire*, 3-8). The sovereignty issue makes, I think, the EU a much more appropriate example. If so, one should also reconsider the imperial model in interpreting the EU. In spite of the common parallel between the EU and the Roman Empire, which is offering the very idea of European unity, I suppose that a more fruitful comparison would be with the Holy Empire. What do I have in mind is the permanent negotiation process among the political units, the relevance of the central

The aim of some of the most challenging component of the European project (the foreign and security policies, which directly address the meaning of the sovereign state) is to shape an European position in the international realm without denying the partnership with the United States, but making efforts to ensure that the transatlantic partnership is working, based, in spite of difficulties, on shared principles, meanings and responsibilities[35]. Special cautions are taken in this respect in particular by those EU members that are also NATO members[36]. I should note that the former imperial powers show the most visible interest in establishing an European international presence. I consider that this fact is due to their post-imperial identity, so that these historic responsibilities and interests define the NOPIO.

In my opinion, NOPIO should not be linked to a special international institution, as the EU. The EU independent external force projection has been very limited, in spite of the efforts made, and it should be noticed that the involvement is, till now at least, conceived in co-operation with other organizations such as NATO or UN.[37] This does not mean that the former imperial powers would fail to express their concern about the weak states that used to be under their control. For instance, Italia took initiative in solving the difficult situation of Albania in 1991 and later a UN mission in 1997, and so was France with regard to Lebanon in 2006. The instrument is less important than the objective. Moreover, the organisations established to embody the former selfish POPIO's have been transformed and become part of the NOPIO. It is enough to mention the present Commonwealth of Nations that can be compared only superficially with its ancestor (the *British* one) from the post – World War II period, but not in terms of the values, goals, and practices involved. The examples can continue in this respect, as the similar Francophone organisation, etc.

Domestic political interests should not be neglected when formulating the interventions, as the ones considered above. It is clear that the public opinion and immigrants from the former empire have their role in the crisis management. The public sensibility with regard to this subject and the presence of immigrants are precisely the signs of post-imperial order. What does it make a NOPIO is that the crisis management policies are grounded on responsibility and not on power interests. Multilateralism is also a key element of a NOPIO. Even if the regular allies and friends decide not to contribute to the operations (as the United States refused to interfere in Albania), they are consulted and offer the political support.

The last question I would like to address is the relationship between institutionalization and gaining the status of recognized norm generator and interpreter. In other words, if a post-imperial state like today Russia should became an institutionalized member of the West in order to consider her hegemony closer to a NOPIO than to a POPIO.

In my view, theoretically it is possible such a future evolution. A NOPIO is based on shared values, meanings and practices. In order to consider Russia's interventions legitimate in her former empire, they should be based on the norms and reasons as those of the West, that the Russian political system could be seen as a democratic one and that the decision-making processes are not

---

power in discussing the empire, and so on. It is also one more element that entitles the comparison, the normative dimension. For the first part of its history at least, in the Holy Empire it was only one hierarchic institution that functioned, a heritage from the Roman imperial unity: the Romano-Catholic Church, the main source for rules and also their main interpreter. In the present-day European Union, all the political processes are to be shaped by the common normative space, having its core outside the negotiated interests, but the common accepted basis – Human Rights doctrine, etc.

[35] Hartmut Mayer "The 'Mutual', 'Shared' and 'Dual' Responsibility of the West: The EU and the US in a Sustainable Transatlantic Alliance". In *A Responsible Europe? Ethical Foundations of EU External Affairs*, eds. Harmut Mayer, Henri Vogt (Basingstoke; New York: Palgrave Macmillan, 2006).

indifferent to the positions of domestic public, the subject of the intervention and of the international partners as well. In brief, a post-imperial nation-state, as social actor, should become contemporary in the political ideas and alike in her interests and identities with others in order to be no longer considered the Other. By retracing the already suggested parallel with the security community theory, the institutionalized membership to the West is not required *per* se in order to consider Russia's predominance in her former empire as closer to a NOPIO than to a POPIO, but her observance of the socially recognized legitimate reasons and ways of exercising the influence.

On the other hand, it should be said that very different evolutions could be made possible by the dynamics and mutual influence of material and ideational factors. The very status of great power or the rejection on identity basis of the Western interpretations, domestic or external events, processes, phenomena, agents' actions, etc, could drive to policies of various natures – as, for instance, to preserve the POPIO, to transform it, even to give it up, and so on. In spite of a two-century old dream, the future of the social realm is still beyond the prediction capacities of its observers and interprets.

Conclusions

In this paper I tried to show in a constructivist approach that it is possible to consider some military interventions made by the great powers in weak states in the light of their imperial past. In this respect, I differentiated the empire from other forms of political dominance, and the most important element seemed to be the sentiment of unity and common project. When the empires collapsed, each of them generated a post-imperial order, that is to say special links between the metropolis and the sovereign states once under its control as well as special interests and identities.

The next step in the investigation of the post-imperial interventions was to take a closer look to the possible meanings of post-imperial orders. I defined in this respect two ideal forms. The first one, i. e. the *power-oriented post-imperial order*, is defined by the interests of the former political centre of the empire. It considers that the former empire is to be transformed in a sphere of influence of its own, where its special interests should be protected from any external influence, in particular in high politics. On the contrary, a *norm-oriented post-imperial order* is based on a special responsibility of the former imperial power. The interactions are based on the over-sovereign norms governing the social interactions. The external influences are not only allowed, but even desired, as long as the other interventionists are considered valid interpreter of these rules.

In my opinion, these two ideal-types of the post-imperial order could be useful analytical instruments in discussing contemporary international security issues. There are intended to allow the avoidance of misinterpretations of the political projects and ideas behind great powers' interventions in weak states. In empirical situations, these terms can suggest some possible future evolution of the international security problems. Theoretically, some entrenched meanings of important concepts of International Relations are to be reconsidered, such as sovereignty or anarchy. In a constructivist perspective, neither the world, nor the actors' interpretations stop. The continuous social interactions generate new understandings that are to be conceptualized and analyzed, and this is the reason of the above paper.

CABINETS OPERATING RULES AND COALITIONN FORMATION IN CENTRAL AND EASTERN EUROPE

DANA IRINA IONIȚĂ*

Abstract
After the fall of communism in the late '80 in Central and Eastern Europe, due to the appearance of several political parties in each state, there was the need to form coalitions in order to provide support for the governments.
This paper aims to identify the institutional features that influence the coalition formation process using the rational choice institutionalism approach. In this case, the political parties, who seek to optimize their benefits in the government formation process, are constrained by the institutional environment. The institutional environment comprises the rules that determine how the governments are formed. Particularly, this paper aim is to identify how the cabinet operating rules affect the outcomes of the coalition formation process.
In order to do so, I will develop a quantitative analysis of 110 cabinets in Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovakia, Hungary, Slovenia, Romania and Bulgaria formed after the first free elections subsequent to the communist fall until the beginning of 2010. These countries represent the post-communist states that joined the European Union, finalizing the democratization process at least from a formal point a view.
This cross-country comparison tries to explain how some institutional features influence the formation of coalitions in new democracies. This research is valuable due to the lack of this type of comparative studies on Central and Eastern European states.

Keywords: *coalition formation, institutions, cabinet operating rules, Prime Minister, cabinet*

I. Introduction

The classical theories on coalition formation were trying to explain the best formula that a coalition must have in order to form governments. Thus, Riker, Axelrod or De Swan had in mind different assumptions about parties' motivations regarding government formation and built models like minimal-winning coalition, minimal connected coalition or minimal policy distance in order to explain the best formulae of the coalitions. The problem with this kind of models is that they offer a large set of viable coalitions that there were not suitable for predictions.

Once the institutionalist theories regarding coalition formation were developed this type of problem was no longer present. The institutional approach tries to explain the social outcomes not only taking into consideration agent's preferences and the optimizing behavior, but also taking into consideration the institutional environment that will optimize human actions in achieving their goals and it will shape the agent's behavior.[1] These theories have as main subject of study the rational agent, like the rational choice theory, but in the case of the institutional approach, the agents' actions are constrained by institutions.

In the case of the coalition formation process, the rational agents are the political parties that seek to optimize their benefits in the government formation process and the institutions are the

constrains imposed to the parties by the formal or informal rules characterizing a particular party system. In an article from 1994, Kaare Strøm, Michael Laver and Ian Budge identified five types of institutions that influence the coalition formation process: the ones that affect the cabinet formation, the ones concerning cabinets operating rules, the ones concerning the legislative rules, the ones concerning parties' politics of coalition and the ones concerning external veto players[2].

In this paper I shall analyze the way that cabinet operating rules as institutions affect coalition formation in ten states in Central and Eastern Europe. In order to do so, I develop a quantitative data analysis on the coalition formed in Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovakia, Hungary, Slovenia, Romania and Bulgaria.

Although there are a number of case-studies on coalition formation in the states from Central and Eastern Europe area, there are not many cross-country comparisons on this area.

II. Cabinets operating rules in Central and Eastern Europe

Cabinets operating rules as constraints that affect coalition formation refers mainly to decision-making rules within the cabinet. Their source stays within the doctrine of collective cabinet responsibility. "There are three key elements of collective responsibility, which concerns the Cabinet as an entity. The *confidence* element requires that the Cabinet must have the confidence of Parliament to remain in office, and must resign if it loses a vote of confidence. […] The *confidentiality* element requires that the proceedings of, and advice to, the Cabinet shall be confidential. […] The *unanimity* element requires all members of the Cabinet shall publicly support the decisions of the Cabinet or resign."[3] In the states where this doctrine is powerful there are better chances to form coalitions that include parties with close ideological positions. Instead, if this doctrine is weak the parties with strong preferences concerning public policies are not likely to become partners into a governmental coalition.

Thus, we have states where cabinet decision making is treated collectively and states where ministers responsibility is individual.

The effects of different cabinet operating rules can be noticed at the level of cabinet party composition, but also, in the way that different actors may influence decision-making process concerning a certain bill. Thus, John Huber and Nolan McCarty (2001) draft two models of how different cabinet operating rules work. First of all, the authors assume the Prime-Minister's power to act unilaterally in demanding the Parliaments vote of confidence and, secondly, the necessity of the Prime-Ministers to obtain cabinet collective approval before demanding Parliaments' vote of confidence.

Huber and McCarty, in developing their two formal models, take into consideration two different examples of cases concerning operating rules. First, they take into consideration the example of Norway, where the Prime-Minister "can act unilaterally to make a vote on a particular policy a vote on the continued existence of a government. In such systems, if members of parliament adopt or threaten to adopt a bill that the prime-minister does not like s/he can make his or her preferred policy a question of confidence. This forces the parliament either to accept the prime ministers policy or to bring the government down."[4]

On the other hand, in order to develop their second model the authors take as an example Netherlands where the decision of demanding a vote of confidence from the Parliament stands within the collective approval of the cabinet. "In such countries, if the partners in government withhold

[4] Huber John and Nolan McCarty, "Cabinet Decision Rules and Political Uncertainty in Parliamentary Bargaining", *American Political Science Review*, Vol. 75, no. 2, (2001), 346

approval, the prime minister cannot make the final policy a confidence issue. Instead, either s/he must resign (if s/he does not support the policy) or the bill proposed in parliament is voted against the status quo, and a defeat results in maintenance of the status quo (but not government failure)"[5]. Thus, in systems like the one in Netherlands, the problem of choosing a strategy stands mostly with the coalition partners than with the prime minister, accordingly with their position on a certain bill.

The formal models proposed by the authors assume the interactions between two players, the prime-minister *P* and the coalition partner *C*, which is a pivotal member of the governmental majority. In the unilateral model (where the prime minister can ask for a vote of confidence without cabinet approval), in the initial stage the coalition partner proposes a bill which takes effect if *P* does not invoke a vote of confidence. The prime minister may react at the proposal of the bill by the coalition partner in of three ways: (1) he can accept it (end of the game with the bill as an outcome), (2) he can resign (end of the game, with the maintenance of the status quo as an outcome) or (3) he may invoke unilaterally a vote of confidence for the proposal of any other bill. If the prime-minister uses the vote of confidence, then the coalition partner may either accept or reject the bill proposed by *P*. If *C* accepts the bill proposed by *P*, than the outcome will be the bill proposed by *P*. If *C* rejects the bill proposed by *P*, the government must resign and the outcome will be the maintenance of the status quo[6].

With regard to the 'collective cabinet' (where the Prime-Minister must obtain the cabinet approval in order to invoke a vote of confidence), the game begins with the proposal of a bill by the coalition partner. The prime minister may (1) accept this bill or (2) make a motion in the cabinet that another bill preferred by him be treated as a question of confidence. If P makes the motion, than C will have to decide whether to approve it or to reject it in the cabinet. If C accepts the motion than the outcome will be the bill proposed by P. If C rejects the motion, the prime-minister may allow either for the bill proposed by C to be debated in the Parliament or to resign, the outcome being the maintenance of the status quo[7].

The models formulated by Huber and McCarty have implications on the government termination and also on coalition formation. Concerning the latter, the models particularly refer to the prime ministers party identity. According to Lieven de Winter, the outcomes of the coalition formation process are the party composition of the government, the prime ministers party identity, the general orientation of the government's policy-making agenda, the allocation of the ministerial portfolios and competences between the parties in the coalition and the identity of the actors that will be given these portfolios[8]. Thus, "if the prime-ministers have significantly more power to influence policy outcomes under unilateral cabinet decision rules, then the costs to the governing coalition of selecting a prime-minister with extreme preferences will be significantly greater in unilateral than collective systems."[9]

The number of studies concerning the way cabinet operating rules influence coalition formation is generally low[10]. The main reason for this is represented by the fact that the constitutions of the states do not specify a certain type of rules concerning the way that a cabinet must make a decision and so, is assumed that once the cabinet it is formed it will act as an unitary actor. As Huber and McCarty demonstrated, the individual or collective action of the cabinet's members may influence both the government termination and the coalition formation.

Regarding the way cabinets in Central and Eastern Europe operate, the Constitutions of the states in this area are reserved concerning this problem. In order to identify cabinets operating rules in this area I have taken into account the constitutional provisions regarding the way that the cabinet functions.

The constitutions of Romania, Bulgaria, Poland, Estonia, Hungary and Slovenia are reserved concerning this problem. Thus, these constitutions only refer to the type of governmental acts that may be adopted, without mentioning the internal procedure of the cabinet[11]. Concerning the constitutions of Latvia, Lithuania, Czech Republic and Slovakia, it is explicitly mentioned the necessity of obtaining a majority inside the cabinet for all the acts of the government.[12]

Thus, we can distinguish between cabinets operating rules taking into consideration the way the decisions are made inside the cabinet. In the cases where the decisions may be made unilaterally by the prime-minister, we shall consider that the cabinets operating rules are individual, while in the cases where decision-making inside the cabinet assumes its collective approval – obtained through voting – we shall consider that the cabinets operating rules are collective. In table 1 we can observe the operating rules of the cabinet in the ten states studied.

Table 1

Cabinets operating rule	
Individual	Collective
Romania Bulgaria Poland Estonia Slovenia Hungary	Latvia Lithuania Czech Republic Slovakia

III. Research design and data collection

In this study I will analyze how the cabinets operating rules as institutions affect coalition formation in ten states in Central and Eastern Europe. In order to do so, I shall develop a quantitative data analysis on the coalition formed in Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovakia, Hungary, Slovenia, Romania and Bulgaria.

I will do so in order to verify the hypothesis developed by Strøm et.al according to which in the states where cabinets operating rules assume the collective action of the cabinet members the coalitions that are formed will include parties ideologically close to each other, while in the states

where cabinets operating rules assume the individual action of the cabinet members the coalitions that are formed will include parties ideologically distant to each other.

Thus, I shall consider as independent variable the type of cabinet operating rule and as a dependent variable the type of coalition formed in each state. Concerning the independent variable, I shall note with *1* the states where cabinets operating rules assume the individual action of the cabinet members and with *2* the states where cabinets operating rules assume the collective action of the cabinet members. Concerning the type of coalition, they can be either compact, noted with, *1* and distant, noted with *2*.

In order to establish the type of coalition, I shall use as an index the ideological distance between the most distant parties from the government. In order to estimate the latter, I shall use the 'Rile' (Right-Left) score of the governmental parties using the formula:

$$D_{GP} = |GP_H - GP_l|$$

where D_{GP} represents the ideological distance between the governmental parties, GP_H represents the governmental party with the highest Rile score or, other way said, the Right-est governmental party and GP_l represents the governmental party with the lowest Rile score or other way said, the Left-est governmental party.

In order to establish parties' ideological positions on the Left-Right scale, there one of these methods can be used: expert surveys, mass surveys and content analysis of parties' manifestos. The first two types of methods represent indirect sources of data regarding to the ideological positions of the parties. The content analysis of parties' manifestos is a direct one because is focused on parties' documents.[13] The Rile Score used in this study is established by using this last method. In this paper, I shall use the data provided by "Comparative Manifestos Project" (CMP) for the period 1990-2009.

This method assumes the division of the text into phrases or sentence that have policy content and that are named coding-units. These coding-units are assigned to a particular policy domain and policy category included into a predetermined coding scheme. Once the coding-units are included in the coding scheme, their number is standardized taking as bases their total number. Afterwards, they are transformed in percentages and so their sum will always be 100%[14]. (Grecu, 2008: 124).

The method of establishing the Rile index used at CMP was developed in 1992 by Michael Laver and Ian Budge. They developed a factor analysis of the seven index variables, public policy areas in the scheme of categories, including 28 points of reference units or coding units. From this analysis two factors were extracted corresponding to the distinction between Left and Right. All of the reference units or index variables were corresponding to either factor of the "Left" or factor "Right", were included in this scale. The final scale was constructed by subtracting the size of "Left" in size "Right"[15]

Concerning the data collection, I used the Constitutions of the studied states in order to identify the type of cabinets operating rules.

I have used the study by Courtenay Ryals Conrad and Sona N. Golder[16] in order to identify the coalitions formed in the states taken into consideration in this study after the fall of communism until 2008 and official websites states for coalitions studied by early 2010. I corroborated these data

[14] Grecu, "Party Competition in..., 124

[15] Dinas, Einas and Kostas Gemenis, "Measuring parties' ideological positions with manifesto data – A critical evaluation on the competing methods", *Party Politics*, OnlineFirst, published on December 3, 2009 as doi:10.1177/1354068809343107, 3

[16] Ryals Conrad, Courtney and Sona N. Golder "Measuring government duration and stability in Central Eastern European democracies", *European Journal of Political Research*, 49.

with the one existing in the database ParlGov. I excluded from this research the caretaker governments, single party majority governments and single party minority governments because cabinets operating rules as institutional constraints cannot be considered in their context. The types of coalition considered in this research are: minority coalitions, minimal winning coalitions and oversized coalitions.

Regarding the index, I used the Rile scores of the governmental party from the „Comparative Manifestos Project" database and I calculated the ideological distance of the governmental parties according to the formula mentioned above.

I.IV. Results

In this paper I analyzed 92 governments formed by coalitions in the ten studied states. They are found in table 2 where there are also mentioned cabinets operating rules.

Table 2

State	**Types of cabinet operating rules**	**Number of cabinets**
Bulgaria	1	3
Czech Republic	2	8
Estonia	1	8
Hungary	1	7
Latvia	2	17
Lithuania	2	7
Poland	1	13
Romania	1	11
Slovakia	2	9
Slovenia	1	9
Total		**92**

Thus, there are 54,3% (50 cabinets) from the studied cases that formed in states where cabinet operating rules assume the unilateral action of the Prime Minister and 42,7% (42 cabinets) from the studied cases that formed in states where cabinet operating rules assume cabinets collective approval.

Concerning the index used, the ideological distance between the most distant parties from the government, the 92 cases group themselves between 1,51 (the Slovakian governments lead by Vladimir Merciar between 12.01.1993-18.03.1993 and 17.11.1993-14.03.1994) and 75,67 (the Slovene government lead by Janez Drnovsek between 12.01.1993-29.03.1994). The mean of the ideological distances of the governmental parties is 21,17, while the median value in 17,79.

In order to do the division between the ideological compact coalitions and ideological distant coalition I took into consideration the average between the most extreme values of the index used, this value being 38,59. Thus all the coalitions whose value of the ideological distance between the most apart parties in the government is between 1,51 and 38,59 will be considered ideological compact coalitions and those whose value is between 38,59 and 75,67 will be considered ideological distant coalitions. We can observe their frequency in table 3.

Table 3

State	Types of cabinet operating rules	Types of coalition		Total
		Compact	**Distant**	
Bulgaria	1	3	0	3
Czech Republic	2	6	2	8
Estonia	1	8	0	8
Hungary	1	7	0	7
Latvia	2	14	3	17
Lithuania	2	7	0	7
Poland	1	10	3	13
Romania	1	11	0	11
Slovakia	2	9	0	9
Slovenia	1	5	4	9
Total		**80**	**12**	**92**

From the total of 92 studied cases, 87% (80 cabinets) fall within the category of ideologically compact coalitions and only 13% of studied cases (12 cabinets) fall within the category of ideologically distant coalitions.

From the 80 cabinets that fall within the category of ideologically compact coalitions 55% (44 cabinets) are coalitions that formed in states where cabinet operating rules assume the unilateral action of the Prime Minister and 45% (36 cabinets) are coalitions that formed in states where cabinet operating rules assume cabinets collective approval. Regarding the 12 cabinets that fall within the category of ideologically distant coalitions the proportion is equal between the two types of coalitions taken into consideration.

From the total of 50 cabinets that formed in the states where cabinets operating rules assume the unilateral action of the Prime Minister, 88% (44 cabinets) are ideologically compact coalitions while only 12% (6 cabinets) are coalitions that include ideologically distant parties. From the total of 42 cabinets that formed in states where cabinets operating rules assume the collective action of the cabinet approximately 85% (36 cabinets) are ideologically compact coalitions and only approximately 15% (6 cabinets) are ideologically distant coalitions.

The results of the quantitative data analysis confirms the hypothesis of Strom, Budge and Laver concerning the formation of compact coalitions in systems with collective cabinets operating rules, but not the part concerning the formation of coalitions in systems with cabinets operating rules that assume the unilateral action of the Prime Minister.

In order to verify this statement I correlated the two variables with regard to cabinet operating rule and the type of coalition. The results are found in table 4.

Table 4

		Cabinets operating rules	Type of coalitions
Cabinets operating rules	Pearson Correlation	1	,034
	Sig. (2-tailed)		,749
	N	92	92
Type of coalitions	Pearson Correlation	,034	1
	Sig. (2-tailed)	,749	
	N	92	92

Thus, it can be observed that the intensity between the two variables is very low, given the fact that the Pearson coefficient rather tends to 0. On the other hand, the fact that the value of the significance test of the correlation coefficient exceeds 0,1 demonstrates the fact that there is not a strong correlation between those two variables.

V. Concluding remarks

In this paper I analyzed how institutional constraints like cabinets operating rules influence coalition formation in ten states in Central and Eastern Europe. In order to do so, I took into consideration if the cabinet's members must approve Prime Minister's decisions in order to validate them or the Prime Minister can make decisions unilateral regarding the whole cabinet.

The analysis contains 92 cabinets that were formed through coalitions from Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovakia, Hungary, Slovenia, Romania and Bulgaria. In this paper I verified if Strøm et al. hypothesis regarding cabinets operating rules applies on the studied cases.

Following the results of the quantitative data analysis we can invalidate the assumption that ideologically compact coalitions will rather form in countries where operating rules require Cabinets collective approval in the decision-making process, while the ideologically distant coalitions will rather form in states where cabinets operating rules require the Prime Minister's unilateral action in the decision-making process. Moreover, this analysis shows that in the studied countries ideologically compact coalitions tend to form.

Following the correlation analysis between the two variables we can say that first of all the intensity between them is very low and, secondly that between them there is not a strong correlation.

Thus, we can conclude that on the set of studied systems, institutions like cabinets operating rules do not influence the coalition formation process.

DEVELOPING AN INSTITUTIONAL ANALYSIS FRAMEWORK IN STUDYING BUREAUCRATIC BEHAVIOUR IN GOVERNMENT AGENCIES FROM CENTRAL AND EASTERN EUROPE

ANDRADA-MARIA ALBESCU[*]

Abstract
The aim of this paper is to develop a comprehensive institutional analysis framework in studying bureaucratic behaviour in government agencies. Although the purpose is to outline a general framework for research, the focus will be on taking into account the specifics of the agencification process in states from Central and Eastern Europe. The paper is divided into three sections. In the first section I compare various neoinstitutionalist approaches in terms of analysing the processes and transformations in the institutional environment concerning government agencies as semi-autonomous bodies in state organization. I argue that the approach which has a greater potential in explaining the processes and transformations in the institutional environment in government agencies is rational choice institutionalism. The second section of this paper is focused on presenting several traditional bureaucratic models in studying bureaucratic behaviour, from the traditional approach to public choice ones, in order to determine their possible contribution in analysing officials behaviour in semi-autonomous agencies. Using these and the institutional analysis framework sugested in the first section of this paper I will focus on developing a model for studying bureaucratic behaviour in government agencies. The final section of the paper will be focused on the possibility of using the institutional analysis framework for studying bureaucratic behaviour in government agencies in Central and Eastern Europe and the challenges presented.

Keywords: *agencification, new institutionalism, bureaucratic behaviour, bureau-shaping models, government agencies*

Introduction

In this paper I focus on outlining an institutional analysis framework for government agencies in order to study bureaucratic behavior in these agencies. It should be noted that this study is part of a broader research on bureaucratic behavior and accountability in government agencies in Central and Eastern Europe. The aim in this study is to provide theoretical tools for understanding the agencification process in general and how the behavior of bureaucrats is shaped in such an environment.

I chose this topic due to its importance in understanding the complexity of the institutional design in the case of government agencies. Although there are several studies concerning the agencification process, they lack theoretical and methodological tools in order to establish a comprehensive analysis of bureaucratic behaviour in govenment agencies. In respect to the literature available on the agencification process, there are several empirical studies well known for focusing on how agencies are formed and how they are developing in Western democracies. Therefore, there is an abundant empirical data for consolidated democracies (i.e Pollitt and Talbot, 2004; Pollitt et al., 2005), but few on countries that face the democratization process. Hence, there are not many study cases for states from Central and Eastern Europe, and those that are available are more focused on legal, political or economic aspects than on institutional changes brought by agencification[1].

Hence, in order to design a model for analyzing the behavior of bureaucrats in government agencies I will attempt to answer to the following questions: 1. What are government agencies and what are their characteristics?, 2. How to build an institutional analysis for government agencies?, 3. How to build a model for analyzing bureaucratic behavior in agencies, taking into account the importance of institutions in shaping actors' behavior?

1. An institutional analysis of government agencies

Conceptualization and features of government agencies

An approach able to provide a clarification of what constitutes a governmental agency must follow two directions, namely conceptualizing the term "agency" and a taxonomy of agencies.

Agencies in the current studies have been described in various ways such as quasi-autonomous public organizations, non-departmental public bodies, non-autonomous quasi-governmental[2].

Thus, the term *agency* received a multitude of meanings depending on the organizational culture, legal system and political system.[3] An argument that supports the idea that it is necessary to present a comprehensive and concise conceptualization of the term is brought by Pollitt and Talbot, which highlight two issues in such action. First, there can not be reached a universal legal classification as national legal systems vary substantially from each other. Thus, both agencies and autonomous bodies may present any possible combination between public law and private law. Secondly, it is difficult to achieve standardization of functional classifications of relations since the constitutional and political system varies between systems that have a tradition of ministerial accountability and the individual ministerial accountability and those who lack the concept, between systems where the appointing officials in autonomous public bodies is based on a political criteria and where this practice is less[4] .

Given the considerations above, I chose to use the approach of conceptualizing agencies following the characteristics proposed by Pollit and Talbot. According to the authors an agency is an organization which should have the following features:[5]

1. to be as far away from the main chain of central ministries or departments of government;
2. to perform tasks at the national level(eg service delivery, regulation, etc.).

3. employees are civil servants;

4. to be financed mainly from state budget;

5. to follow to a certain extent legal rules and public / administrative procedures.

Following these characteristics Pollit and Talbot support the idea that there are three central elements of the agency, namely: structural disintegration and / or creating their own organizations with specific tasks, contracting performance (here the reference is to the existence of a set of performance targets and a process of monitoring and reporting them), deregulation (or rather re-regulation) in respect to the control regarding hiring employees, the budget and other issues related to management[6].

The characteristics above provide a context in which to place the concept of agency. Given the difficulties in placing the term of agency in a comprehensive definition that would help in carrying out empirical research on a variety of possible cases, I chose to look at the term government agency within the proposed features and aspects outlined by Pollit and Talbot.

I will follow the same logic presented in the preceding argument to discuss the definition of government agency. The reason is that the purpose of this study does not concern offering a comprehensive conceptual framework on the term of government agency. For this reason I consider only the foundations necessary for understanding their significance in the governmental sector. Thus, I will discuss the features and elements proposed by Pollit and Talbot for agencies to establish the significance of government agencies.

Regarding the specific characteristics of agencies in general, they are also traits that correspond to government agencies. However, I consider it necessary to emphasize two important aspects.

On the first feature concerning being as far away from the main chain of central ministries or departments of government, in respect to the government agencies there has to be a discussion regarding their degree of autonomy from the ministry. Laegried and Christensen argue that these agencies have some degree of autonomy from the ministries in areas such as policy development, decision-making process, hiring employees, budget and management issues. This does not mean they are totally independent. The reason is that the government has the ultimate responsibility for the actions of the agency[7]. This observation is useful in analyzing the behavior of actors in government agencies, because it shows the importance of understanding the relationship between the bureau and the ministry and its impact on the behavior of bureaucrats. In other words, although government agencies are relatively distant from the ministerial ladder there may be penalties coming from the ministry in cases such as lower performance level. An example in this regard is the fact that in case of a low leve of performance the agency's budget may be decreased.

A second observation is related to the feature regarding the fact that employees of government agencies are civil servants. Although this is one of the characteristics of government agencies, it should be noted that in most cases the appointment of officials is more likely to be achieve on political criteria, given the ruling parties.

A question that remains is how to explain the elements central to the concept of agency for government agencies?

The concept of disruption of structure applies to ministries being divided into a central body and several government agencies that each meet a specific task. Structured change characteristics are generally as follows[8]: 1. creating a separate organizational structure that can be identified and has its

[7] Christensen, Tom. Laegried, Per, „Agencification and Regulatory Reform" in *Autonomy and regulation: coping with agencies in the modern state*, Christensen, Tom and Laegried, Per (London: Edward Elgar Publishing, 2006), 12-13.

[8] Pollitt, Christopher. Talbot, Colin, *Unbundled Government: A Critical Analysis of the Global Trend to Agencies Quangos and Contractualisation* (Ed.Routledge, 2004), 7-8

own name, 2. providing a single set of functions or a lower set of functions 3. functions are primarily of delivery, execution and providing, they are less related to policy-making, 4. establishing a "constitution" in the form of legislation, or at least a framework document which formally specifies the objectives of the organization and the institutional arrangements 5. appointment of a chief executive responsible for management, 6. differentiation of staff from the majority of civil servants; 7.establishing formal reporting arrangements concerning the activity of the agency, including a separate audit.

In terms of contracting performance government agencies there is to be seen on the one hand what is meant by performance and on the other what contracting involves. Performance involves a system of targets that are set, and reporting on the work of the agency (which may or may not be made public). A noteworthy aspect is that if the proposed targets are not achieved there are likely to be discussions, negotiations and consensus if possible, and unlikely to enforce only sanctions (when such actions are taken they are usually in regard to the executive chief and not the agency itself). The term contract is used in a broad sense, in other words, it is not necessary to have a formal contract. Rather, contracting may take the form of any set of performance objectives for the agency, which can be self-generated, required or on which an agreement has been reached, and put into a specific agreement, contract, plan or a type declaration[9].

The idea of deregulation, or rather re-regulation is one of the most important core elements of the concept of agency. To see what re-regulation means in government agencies we have to see why it appears and what it means. Regulation requires standard operating procedures and existing rules in the government apparatus to show how public bodies operate. Due to an increased level of regulation, public organizations are characterized by an excessive bureaucracy (red tape), which hampers the management and operation. Creating separate agencies from the central body involves a high degree of deregulation. This situation occurs also in regards to the government apparatus and creating such agencies leads to a deregulation process. It addresses various functions, including for example personnel, budget and some management issues. Deregulation may lead to release government agencies from the rules enforced by regulatory bodies or central bodies (ministries), or both. However, regulation of public administration can not be eliminated, nor can it decrease to a certain level without causing difficulties in terms of public accountability, probity or ethics. For this reason when it comes to government agencies, there is not so much deregulation, but rather re-regulation. In this respect, two strategies can be identified: external and internal deregulation. In regards to external deregulation, it can be achieved by granting the agency a degree of autonomy. The level of autonomy may increase in some cases as it is established in time a certain level of trust between agencies and ministries. Regarding domestic deregulation, it may occur within agencies as they reach a degree of self-regulation[10].

From the discussion concerning the characteristics and specific elements of government agencies I have emphasized the importance that norms and rules have in creating an agency and in the changes that appear when the agency is functioning. Thus, in the process of creating agencies the institutions have an exogenous character and after the creation of these agencies there are exogenous institutions, but also endogenous ones. The latter appear thanks to a certain degree of autonomy from the ministry and self-regulation.

The work undertaken so far provides the necessary conceptual basis for shaping a model of institutional analysis of government agencies.

1.2. Institutional analysis of governmental agencies

Given the considerations above concerning the characteristics and elements of government agencies and given the purpose to elaborate a model of institutional analysis it will be necessary to follow the preceding steps to achieve this objective.

A first step is to clarify why I have proposed as a model for the study of government agencies institutional one. I started with the idea that modern governance processes occurr within and through institutions[11], hence, in order to study government agencies we must understand the institutional context. Here I am concerned with the institutional context in which government agencies appear, and also with the impact of the changes that take place over time in the institutional context.

To address the two issues I will begin by clarifying what I understand by the term institution, then I will present different neoinstitutionalist approaches. Using these approaches I will explain the institutional context in which the process of creating agencies occurs, and then I will present the manner in which institutional changes occur in government agencies.

Regarding the concept of institution, in the literature concerning the term, there are two basic meanings given: the first meaning is organization, and the second is rule, norm, practice, routine, etc.[12].

For example, from North's perspective institutions are rules of the game in society or, more formally, they are constraints that shape human interaction[13]. North distinguishes between institutions and organizations stating that both institutions and organizations provide a structure for human interaction, but if we follow the costs that appear as consequences of the institutional framework, it will show that they are not its results, but those of organizations that have developed as a result of the existence of that frame[14].

Another meaning of the term institution is offered by March and Olsen. They define the institution as a collection of rules and organized practices, embedded in structures of meaning and structure of resources, which remain relatively unchanged and relatively resistant to the preferences and expectations of individuals and external circumstances[15].

Another conceptualization of the term is given by Ostrom in which the institution relates to concepts shared by humans and used in repetitive situations, organized in rules, norms and strategies[16].

Adrian Miroiu argues that different theoretical perspectives focus on one way or another to define institutions, hence if institutions are understood as rules, norms, practices, routines, etc. their ontological aspect is not yet defined, since an institution can be understood as a real nomative order, and also as a symbolic or cognitive one[17] .

Among the meanings given above I chose to look at the institution as rules, regulations, norms, practices, routines.

Once established the meaning given to an institution I will present some of the neoinstitutionalist approaches. I will focus on presenting them on three dimensions, creating institutions, change within institutions and the impact on actors' behavior. This method will allow a

better understanding of the institutional context during the process of agencification, and it will also allow an understanding regarding institutional change in this environment.

"New institutionalism" is a term used increasingly often in political science. Although the term new institutionalism is frequently discussed, in particular it is unclear what this means, the difference between a neoinstitutionalist approach and other approaches that are addressing the promises and challenges involved. Many of the new institutionalism ambiguities can be clarified by stating that it is not a unified body of thought[18]. In this respect, it was noted that various theoretical trends specific to the new institutionalism should be viewed as complementary and not competitive in terms of explaining political phenomena. None of these perspectives can fully explain all political action, nor intend to do so[19].

Different approaches claimed to be neoinstititutionalist ones can be generally grouped according to three schools of thought, namely historical institutionalism, rational choice institutionalism and sociological institutionalism.

Historical institutionalism appears in response to theories of politics and structural-functionalist ones that were specific to political science in the 1960's and 1970's and borrows elements from both. From group theory, historical institutionalists accept the idea that conflict between groups competing for scarce resources is the center of politics. They seek better explanations for the distinctions between national political outcomes and inequalities that mark them. Historical institutionalism theorists have also found an explanation in the sense that institutional economics and political organization structure conflict in order to favor certain interests and to demobilize others. Historical institutionalists have been influenced by how structural functionalism perceive the political arena as a system of interacting parts. Thus, they perceive institutional organization of politics or political economy as the principal factor structuring collective behavior and generating distinct outcomes[20].

The main argument supported by historical institutionalists refers to the fact that structure and policy choices are made during the creation of new institutions and they will have a permanent impact on the duration of its existence. Thus, the core principle of this approach is the existence of a "path dependency"[21]. Under this principle, historical institutionalists view change in the institutional environment as highly unlikely[22].

Another aspect worth mentioning is related to the dimension concerning the processes that translate the behavior of actors in structure and rules, in that historical developments produce a particular set of preferences of actors[23].

Historical institutionalists put considerable emphasis on the contingencies of history. Thus, the understanding of individuals in regards to specific events and developments is constrained by the important role played by chance[24].

Based on these general assumptions I intend to follow the three dimensions agreed at the begining: the creation of institutions, institutional change and the impact on actors' behavior.

As seen above, historical institutionalists do not put much emphasis on the manner in which institutions are created, but rather their persistence over time. In this context, Peters[25] suggests that

---

[24] Immergut, Ellen, „The theoretical core of the new institutionalism", *Politics and Society* 26 (1998), 19

the emphasis on incorporating ideas into structures that support the institutions can be viewed in terms of historical institutionalism as a definition of forming institutions.

In terms of institutional change, as noted above, it is unlikely. One argument in favor of this idea is that all historical institutionalism analysis assume the existence of sustainability over time concerning the effects of institutional and political choices. In other words, this approach explains better the persistence of patterns, rather than changing them [26].

Another aspect that is not fully developed in this type of approach is the relationship between actors and institutions. Peters suggests that the reason is the implicit assumption made by historical institutionalists that actors who choose to participate in an institutional arrangement accepts the constraints imposed by it[27].

The considerations made above show that historical institutionalism does not offer enough tools to shape a model of institutional analysis of government agencies. The argument for this idea is supported by the presence of obstacles in providing comprehensive explanations both in terms of creating institutions and institutional change. Moreover, such an approach is difficult to use because it can not provide a clear understanding of the behavior of actors as shown.

Hence, given the fact that historical institutionalism can not serve in shaping a institutional analysis framework for government agencies I will seek to explain the other two types of approaches, starting with sociological institutionalism.

Sociological institutionalism emphasizes that many institutional forms and procedures used by modern organizations have been adopted simply because they were most effective in those tasks. Rules and procedures should be regarded as specific cultural practices, to be assimilated in the organization, not necessarily to improve the effectiveness of formal results, but as a consequence of such processes associated with the transmission of cultural practices. Thus, they argued that the apparent bureaucratic practices should be explained in cultural terms[28].

When talking about institutional change in this approach it can be viewed in two ways. Thus, institutional change is seen as occurring either through institutionalization or by de-institutionalization. In other words, the process of institutionalization refers to adding more roles or features, such as firm adhesion to the prevailing cognitive frames of the institution[29]. Another way to look at institutional change is adapting to changes in the institutional environment. In this case, the challenges from the environment are recognized and the focus is in finding ways in which the institution will comply with external forces[30].

To see how the relationship between actors and institutions is seen within this approach I will start with the following statement: central to sociological institutionalism is the idea that action is closely linked to interpretation. Thus, when faced with a situation, one must find a way to recognize and respond to it, because there are default patterns in the institutional environment that provide the means to achieve this task. The relationship between individual and institution is built on a type of practical reasoning in which the actor uses existing patterns of action[31].

A neoinstitutionalist perspective with roots in sociological institutionalism is that of March and Olsen, but it is rather considered belonging to a normative institutionalism approach. I chose to mention it, since its considerations are important. Thus, the two authors argue that there are two basic assumptions in the institutional approach. The first assumption is that institutions create elements of order and predictability. In other words, institutions shape, constrain and enable political actors to act in a "logic of the most appropriate action". The second assumption is that translating structures into political action and actions that lead to continuity and institutional change are generated by comprehensible routine processes. These processes produce recurring modes of action and organizational patterns[32].

Institutional change in March and Olsen's approach is not necessarily when there are external forces. Rather, there is internal pressure that can lead to institutional change, sustainable due to gaps between ideals and institutional practices. In addition, change may be governed by rules, institutionalized in specific units or sub-units, or it can be generated by interpreting routines or implementating rules[33] .

Another aspect worth mentioning is the relationship between actors and institutions. To understand this relationship, the authors stress that institutions provide codes of behavior. Thus, they believe that rules and practices specify what are the expectations and what makes sense in the community[34] .

Given the considerations above, we can say that sociological institutionalism approaches could provide a basis for shaping a model of institutional analysis of government agencies. However, I believe that such an approach would face some difficulties. First, considering the rules and procedures as specific cultural practices does not allow analyzing government agencies in countries in the process of democratization, since there is not a prima facie case in such practices. Another argument is related to the assumption that rules and procedures that are to be assimilated into organizations do not necessarily aim at improving the efficiency of the formal results, hence this assumption does not match the reality of government agencies. The reason is connected to one of the features mentioned regarding agencies, namely contracting performance. Thus, for example in a public agency whose task is reglementation, the assimilation of rules and procedures imply efficiency in terms of formal results. Hence, it is difficult to use this approach in building the analysis model proposed.

A third neoinstitutionalist approach is rational choice institutionalism. Institutional rational choice assumes that institutions are constructed by individual actors in the pursuit of rational goals and that these actors are involved in shaping and changing the institutional environment to serve their purpose[35]. Actors are seen as rational individuals with a fixed set of preferences and behave entirely instrumental in choosing the best alternative to achieve these preferences in a strategic manner. Thus, an actor's behavior is the result of a strategic calculus. This calculation is affected by the actor's expectations in relation to the behavior of other actors. Institutions shape such interactions by determining the structure and sequence of the alternatives available to the individual or by providing information and enforcement mechanisms that reduce the uncertainty regarding the behavior of other actors[36].

Rational choice institutionalism features several perspectives, including models which explain institutions based on the principal-agent relationship, on game theory and models of institutions based on rules. Although different, these perspectives present a number of similarities: a common set of assumptions and the fact that they all starts from *tabula rasa*[37] .

In respect to the set of common assumptions, they are: 1. individuals are the central actors in the political process; 2. individuals act rationally to maximize their utility, 3. institutions are an aggregation of rules that shape individual behavior, 4. individuals react rationally to the incentives and constraints set by these rules, 5. most actors are expected to respond in the same fashion to similar incentives[38].

Regarding the fact that all of these perspectives start from tabula rasa, this assumption refers to the fact that the formation of institutions does not depend on past institutions or organizations. The result of the institutional design is determined by the nature of the incentives and constraints[39] .

In order to gain a better understanding of these perspectives I will present them briefly below.

Principal-agent models are based on the idea that interactions between individuals can be seen from this perspective, but can also be used in relation to the organizations as a means of understanding the interaction between groups of public sector institutions. An example are the studies on the budget of a public organization, where the the top official can operate as an agent for the bureau[40]. Such a model is quite difficult to use in shaping a framework of analysis for government agencies. Although it offers a better understanding of the interaction between actors, this model does not provide the analytical tools needed to study institutional design in the creation of agencies and provides minimal knowledge on their behavior of bureaucrats within the office except the for officials who could be regarded as agents in relation to the ministry under which the agency is located.

Game theory type models are based on the issues of compliance with rules and regulations. Game theory suggests a set of strategic choices (games) in which actors seek to ensure compliance by other actors they interact with, usually bureaucrats who are considered to be seeking a higher degree of freedom in their actions. The problem of those who are designing this game is to build an array of incentives to ensure the compliance of the bureaucrats. It is also necessary to find a solution to the problem of ensuring the compliance of the actors to their part in this arrangement. If this game is played only once desertion and non-compliance do not involve very high costs for any of the actors. To establish better cooperation between the actors and a greater degree of compliance game must be repeated several times[41].

Shepsle argues that models using game theory have some problems in regard to institutions. This approach has focused primarily on how the structure of the game affects the choices of the players, and only secondarily on the process by which equilibrium outcomes are reached (the institution is an expression of equilibrium). Of course there are important exceptions such as Axelrod[42], Shepsle[43], Shepsle and Weingast[44]. Thus, in most analysis using game theory the

institutional arrangements are given, and the objective is simply to study the implications of those rules on the behavior and results. Secondly, the temporal persistence of the rules is not considered as part of the game because they are regarded as exogenous[45]. The main impediment is the difficulty of establishing the preferences of the actors involved in the formation of government agencies. Given these impediments, we considered that this model is not one that can be used in shaping the analytical framework of the agencies.

Models which view institutions as rules are based on the idea that rules are a means to prescribe, permit and constrain behavior. In this case institutions are regarded as the aggregation of rules, and member organizations agree to comply with them in exchange for the benefits they obtain as part of the structure. In this model rationality is distinguished by the fact that individuals can gain benefits from membership and are therefore willing to sacrifice certain latitude for their actions in exchange for these benefit. Among the most important of these benefits is a remarkable degree of predictability of the behavior of other actors[46]. Of the three models presented until now I think it has the potential to help in shaping the analytical framework of governmental agencies, as it allows easier handling of issues relating to development and change within institutions, unlike the first two perspectives which were mainly concerned with the interaction between actors and institutions. In consequence I will pursue the two issues in terms of rational choice institutionalism.

Regarding the emergence of institutions, Peters claims that they do not appear automatically because they are needed, but they have to be created [47].

Concerning institutional change the rational choice institutionalism perspective stipulates that an institution undergoes changes that are both endogenous and exogenous. Transformations that occur endogenously appear when rules and procedures are changed in a previously established manner, and exogenously when this happens as a result of an external factor or when there is a sudden change in the institutional environment[48].

From these arguments it results that the rational choice institutional approach has the potential to create a framework for the analysis of government agencies. The problem is that theoretical approach was shown to have potential to shape the analytical framework not in its entirety, but only through its general assumptions and models.

Given this situation we decided to follow the perspective of Krehbiel Diermier who propose viewing institutionalism as a methodology. The two authors state that institutionalism should guide the investigation as to which of a multitude of more or less stable features, which characterize collective choice arrangements are essential in understanding the behavior and outcomes of collective action[49]. In this respect, the authors suggest a method in four steps[50]:

1. The expression and maintenance of fixed postulates regarding the behavior of political actors in collective choice arrangements;

2. Formal characterization of existing institutions;

3. Deduction of the behavior that occurs in institutional arrangements, taking into account the assumptions regarding behavior and the characterization of the effects of said behavior;

4. The derived implications must be evaluated using empirical data.

This perspective is perhaps most useful in analyzing the behavior of bureaucratic government agencies because it allows both the use of an institutional approach to explaining the context, but also a model of bureaucratic behavior in that context.

The way in which institutions emerge and change is important because as we suggested in the beginning, the emergence of the institutional arrangements of government agencies is exogenous – it is represented by legal rules which create the government agencies and establish rules for their operation – while, in time, the internal rules of agencies are defined without external intervention. Thus, conducting an analysis of the institutional processes of government agencies offers an explanation of the changes taking place within them. This approach is needed to complete the second step of the method proposed by Diermier and Krehbiel.

Once acquired this knowledge to create a framework for analyzing the behavior of bureaucrats in government agencies it will be necessary to expose the assumptions on the behavior given the existing institutional arrangement. In this regard, it will be necessary to start from a bureaucratic model.

Thus, in what follows I will present various bureaucratic models and I will choose one that corresponds to the collective choice arrangement given, namely the government agency.

2. Approaches to bureaucracy: models of bureaucratic behavior analysis

In order to asses bureaucratic behavior in government agencies I have chosen to use the organizational and public choice perspectives on bureaucracy, and will discuss possible general models of analysis.

One of the most important theoretical models of the organizational approach was developed by Max Weber in his theory of bureaucracy. This approach rests on ideal types, meaning that it lists the abstract or ideal characteristics of a bureaucratic organization. The model of bureaucracy proposed by Weber is based on the concept of authority. There are three types of authority according to the author: charismatic, traditional and rational-legal. Charismatic authority means that the power of a leader is based on his extraordinary ability to attract supporters and to interact with them. This type of authority is very unstable as it can disappear if the followers are disappointed by the charismatic leader. Charismatic authority can be observed in certain religious cults where one person draws supporters and requests their obedience by the force of his personality. The foundation of traditional authority is a set of persistent beliefs about who should be in control and is often associated with certain positions within an organizational hierarchy. The best example is monarchies, where the king or queen's power in derived from tradition and not from their skills, actions or behavior. Rational-legal authority designates power based on the rational application of a set of rules constructed by reference to information and expertise. In the case of rational-legal authority power belongs to the individual whose hierarchical position of authority is a direct result of the law and of the rules designed in compliance with the law[51].

Max Weber writes that "each holder of power is legitimated by rational norms and his power is legitimate insofar as it meets the standard. Obedience is to the norm rather than to the person"[52]. Weber proposes six principles for the bureaucratic systems derived from the concept of rational-legal authority, as follows:

[51] Hughes, Owen. *Public Management and Administration* (Tornonto:St. Martin's Press, 1998),27

[52] Weber, Max, *Economy and Society*, Ed. Roth, Guenther. Wittich, Claus (Berkley: University of California Press, 1968), 95

1. Authority is derived from the law and the rules designed in compliance with the law.

2. The principle of a clearly defined hierarchy. This principle refers to the existence of a clear system of subordination where the higher hierarchical levels control the lower levels.

3. Bureaucracy is a relatively closed system. Where possible, the bureaucracy must be isolated from external environmental influences, given that external disturbances can adversely affect its operation. Furthermore, bureaucracy is an impersonal system, separate from the private life of its employees. The administration of the bureau is based on written documents which are kept. The persons in public office, together with the necessary equipment and documents constitute a bureau. Public funds and the equipment needed for bureaucratic activities are distinct from the private property of the person who performs a public function.

4. Bureaucratic activity requires specialized education.

5. Bureaucratic activity is a career and not a secondary activity.

6. The administration of the bureau follows general rules which are stable and comprehensive. Knowledge of these rules is a special type of technical education which a bureaucrat possesses.

In short, the bureaucracy in Weber's vision is a system based on impersonal rules.

The main criticisms of the model of bureaucratic organization proposed by Weber come from public choice approaches and were formulated by theorists such as Downs, Niskanen and Dunleavy. According to the standard assumptions of the theory of rational choice bureaucrats seek to maximize their utility or, more precisely, will seek more power, prestige and security, or a higher income by using the hierarchical structure for their own benefit, in detriment of the organization's goals. Weber's model is based on the assumption that bureaucrats are not interested in financial gain and are motivated by ideals such as service to the state. From the perspective of rational choice assumptions this type of behavior is illogical[53]. Rational choice theorists believes that maximizing individual utility (individual ambition) may lead to results that are not in the interest of the organization. Niskanen[54] (1973) argues that individual ambition leads to each bureau trying to maximize its budget. Thus, bureaucrats' personal benefits will increase if they are part of a bureau which obtains a larger budget because a budget increase can be translated into increases in salaries, public reputation, power and number of employees[55].

Such an interpretation may explain why high-level bureaucrats tend to always request more resources for the structures they head. In turn, Ostrom believes that bureaucratic organization is ineffective because large bureaucracies: a) impose ever higher social costs on the beneficiaries, b) fail to adjust supply to demand, c) allow for the degradation of public goods because they fail to stop the process by which using a public good for one purpose prevents it from being used for other purposes, d) are becoming increasingly prone to errors and uncontrollable to the point that their actions deviate dramatically compared to the rhetoric on public objectives and e) can lead to situations where an action aimed at improving a situation actually exacerbates the problem[56].

Another approach regarding bureaucratic behavior is the one based on the assumptions of rational choice theory. One model of bureaucratic behavior which follows this approach is that of Anthony Downs. The author presents the bureau as a particular form of organization where the organization is seen as a system of consciously coordinated activities that has been created specifically to achieve certain goals. An organization is a bureau in Downs's perspective if it has four basic features:

---

[53] Hughes, Owen. *Public Management and Administration* (Tornonto:St. Martin's Press, 1998), 47

[54] Niskanen, William A., *Bureaucracy: Servant or Master? Lessons from America* (London: Institute of Economic Affairs, 1973).

[55] Niskanen, William A., *Bureaucracy: Servant or Master? Lessons from America* (London: Institute of Economic Affairs, 1973), 23

[56] Ostrom, Vincent, The Intellectual Crisis in American Public Administration,(University of Alabama Press, 1974), 64

1. it is large, in other words members of the highest levels know less than half of the staff members;

2. the majority of the employees work full time and depend on their job in the bureau for most of their revenue;

3. the hiring, promotion and retention of the staff is based, at least formally, on a technical evaluation regarding their performance or their expected performance given the role they are expected to perform in the bureau rather than on predetermined criteria (religion, race, social class, etc..) or as a result of periodic elections by an external body;

4. The output of the bureau is not, for the most part, directly or indirectly assessed in open markets by means of voluntary quid pro quo transactions[57].

With this operationalization of the concept of the bureau, Downs defines a bureaucrat not only as a person working in a bureau, but rather as a person working for a large organization, who receives a salary from the organization – which represents most of his revenue - who is employed, promoted and maintained within the organization on the basis of his performance of his assigned task, and who produces results that can not be assessed on the market[58].

Downs' argument starts from the assumption that bureaucrats, like any other actors in society, are mostly motivated by their personal interests[59]. Following this assumption the author proposes three main hypothesis. The first hypothesis states that all bureaucrats seek to achieve their objectives in a rational manner, in other words the most efficient manner, given their limited capacity and the cost of information. Thus, bureaucrats seek to maximize utility. The second hypothesis refers to the fact that bureaucrats have a complex set of objectives which include items such as power, income, prestige, safety, loyalty (to an idea, institution, etc..), serving the public interest. The last hypothesis concerns the fact that the internal structure and behavior of each bureau is closely linked to interactions with the environment, each of these being interlinked with the other[60]. The three hypothesis proposed by the author lead to the conclusion that when it comes to analyzing bureaucratic behavior the institutional context in which they operate should be investigated. Thus, one must take into account the fact that bureaucrats seeks to maximize utility, the internal and external constraints on the bureaucrat's behavior as well as the impact of bureaucratic behavior on the office[61].

Another perspective on bureaucratic behavior is offered by Niskanen within the theory which describes the supply of goods and services by bureaus. According to the author bureaus are defined as those organizations that have both of the following characteristics: 1. employers and employees in these organizations shall not acquire any part of the difference between revenues and costs for personal gain; 2. part of the organization's income results from sources other than the sale of outputs[62] (Niskanen, 1994:15). In other words, the perspective proposed by Niskanen sees the bureau as a non-profit organization which is funded in part by loans or regular grants. The bureaucrat is thought to be a full time employee in a bureau, wether he is a public sector professional or directly appointed by the executive[63].

The approach proposed by Niskanen focuses on the relationship between the bureau and the environment, namely the governmental sector, and the consequences of this relationship on the bureau's budget and outcomes. The author points out that bureaus are specialized in producing goods and services in large quantities rather than demand per unit product (Niskanen ,1994:15-18). His argument is that bureaucrats try to maximize the total budget of the office during their leadership.

[61] Downs, Anthony, „A theory of bureaucracy", *The American Economic Reviw* 55 (1965), 444
[62] Niskanen Jr., William A., *Bureaucracy and public economics* (Ed. Edward Elgar, 1994), 15
[63] Niskanen Jr., William A., *Bureaucracy and public economics*, (Ed. Edward Elgar, 1994), 15-18, 22

The budget is subject to the constraint that it must be equal to or greater than the minimum total cost of supply as compared to the results expected by the body which finances the bureau[64].

The bureau shaping theory proposed by Patrick Dunleavy is built in opposition to the budget maximizing model proposed by William Niskanen. Dunleavy starts from the assumption that bureaucrats seek to maximize their personal utility when making official decisions. The general policy of a bureau is defined by a combination of individual decisions made by senior bureaucrats who act in it and their interaction with the structure the agency is subordinated to (interactions with the sponsor body). In general, the policy influence of the officials of the bureau is significantly structured according to rank, so that officials holding top-level positions will be the most influential. Structures acting as principal (sponsors) will depend to a considerable extent on the bureau (agent) in relation to information about the costs, benefits and results of the bureau, although they receive some general information from the public.

There are four reasons why rational bureaucrats should not act to maximize the budget: a) the collective action problems within bureaucracies have a considerable influence on the general behavior of the office, b) the extent to which the utility of the bureaucrats is associated with an increased budget varies depending on the different components of the overall budget and according to different types of agents, c) even if some bureaucrats act in order to maximize the budget, this process will continue only until an optimum level is reached and d) high-level bureaucrats try to maximize the utility of the type of tasks they carry out (work-related utilities) rather than the financial utility, in which case collective strategies for the remodeling of the bureau in which they work into other types of structures (agencies) may be the best alternative to achieve this goal. Whether high-level bureaucrats choose the modeling strategy or strategies to maximize the bureau's budget systematically vary depending on the type of bureaucratic structure[65].

Reasons for bureau shaping

Senior officials (who are in hierarchical positions where they can influence the policies of the bureau) acting to maximize their own welfare are mainly interested in securing a prestigious working environment and pleasant tasks for three reasons. The first reason is that high-level officials are less interested in financial components (income, job security) than lower-level officials, this is a general assumption of public choice literature. High-level officials are more interested in maximizing utility and non-financial status, prestige, influence and, in particular, the importance and interesting nature of the work they perform. Secondly, the design of the public sector imposes severe limits on the ability of officials to increase their financial utility (income) by using individual or collective strategies, whether it is the budget maximizing strategy or the use of discretionary funds for personal interest. The amount received as a salary is restricted by the use of a standardized cap. Thus, in public administration there are no consistent bonuses equivalent to the ones provided to the leadership of private corporations. In addition, general limitations imposed on the number of employees, centralized auditing systems, the prohibition of economic activities and the structure of careers are features that reduce the ability of government officials to pursue individual financial interests.

Similarly, non-financial but related benefits, such as company cars or equipment are also strictly controlled[66]. The third reason is the fact that utility maximization regarding the inherent characteristics of the tasks seems to be a major influence on how the bureaucracy works.

There is sufficient evidence that self-interested bureaucrats have strong preferences about the work they want to perform and the type of agency they want to work in. Clearly, there is a financial

[64] Niskanen Jr., William A., *Bureaucracy and public economics*, (Ed. Edward Elgar, 1994), 15-18, 42

[65] Dunleavy, P., *The bureau-shaping model in Democracy, Bureaucracy and Public Choice*, (Harvester Wheatsheaf, 1991), 97

[66] Dunleavy, P., *The bureau-shaping model in Democracy, Bureaucracy and Public Choice*(Harvester Wheatsheaf, 1991),117

component of the agenda of officials, an income level they wish to achieve, but there is a high probability that this component is not very important for officials which hold positions that allow them to make bureau policy decisions. In other words, senior officials have already reached the level of income they wanted to achieve so that the importance of this factor decreases the higher the hierarchical position. Consequently, rational officials want to work in small, collegial and elite bureaus who are close to the centers of political power and not to be in charge of large structures with many employees and large budgets, but with routine activities, with a conflictual environment and low status[67].

Collective strategies for bureau shaping

If officials want to maximize their utility regarding the characteristics of the tasks they perform the most effective strategy that is available is that of individual action, that is looking for jobs that bring them closer to the desired level and the desired agency.

However, once the individual alternatives are exhausted there are a series of collective strategies that can be used for shaping the bureau in order for it to become an increasingly accurate approximation of the type of elite agency, with has a friendly atmosphere and is close to the centers of political power. There are five ways to shape a bureau:

1. Major internal reorganizations. Changing the structure of the bureau on a regular basis may increase the degree to which it approaches the ideal of an elite agency that outlines policy directions. The number of posts dealing with public policy formulation increases, while the number of lower level positions that deal with routine activities is reduced and employees occupying these positions are separated from the upper levels. Sometimes this is a geographical separation.

2. Transforming internal practices. Senior officials (policy-level officials) want to maximize their work related utility and to increase their ability to control policies in a discretionary manner. The adoption of sophisticated systems of management and policy analysis (using electronic equipment for routine tasks, statistical models) can protect the bureau from criticism from rival bureaus, external partners and the structure they are subordinated to. There is also the tendency to change the composition of the staff, encouraging the employment of specialized professionals with technical expertise, which increases the agency's status and improves the nature of the tasks performed by members. The main feature of this strategy is the automatization or externalization of routine tasks allowing the use of staff for policy development tasks. After the completion of these changes the officials dealing with policy analysis tend to emphasize the collegial decision-making and teamwork methods which results in the dispersal of responsibility.

3. Redefining the relationship with external partners. In cases where the bureau interacts with external organizations on a regular basis, such as subordinate public agencies, subcontractors, organizations whose activity is regulated by the bureau or interest groups, these relationships can be readjusted so that the volume of routine tasks is reduced and the bureau's control over policy is maximized. The bureau tries to minimize its dependence on external organizations given that a high volume of control or management tasks can be a risk if the subordinate or external organizations refuse to cooperate. Replacing this type of tasks with a control mechanism which protects the bureau is usually a priority.

4. Competition with other bureaus. Bureaus always defend their ability to manage funds for subordinate bureaucratic structures. Government agencies at the same level compete with each other for responsibilities concerning the administration of lower-level bureaus and public policy areas that fit the profile of the agency type they wish to approximate.

5. Hiring external agents. The most radical alternative available to senior offices who want to redefine the functions of their agency comes from their ability to outsource functions inconsistent

[67] Dunleavy, P., *The bureau-shaping model in Democracy, Bureaucracy and Public Choice*(Harvester Wheatsheaf, 1991),118-119

with the ideal type of agency that senior officials want to approximate. Central government departments may transfer routine functions or activities to local government structures or such tasks can be transferred to the quasi-governmental agencies. The auxiliary functions can be outsourced to the private sector[68].

I believe that the model of bureaucratic behavior proposed by Dunleavy best fits the given collective choice arrangement, namely the government agency. One argument for this is that he refers to bureaus that have similar characteristics to those of governmental agencies. For example, in this model he shows that rational officials want to work in small, collegial and elite bureaus that are close to the centers of political power and not to be in charge of large structures with many employees and large budgets . This shows that the model can be applied to government agencies. The argument is that we can draw a parallel between the small, collegiate and elite bureau, that is not necessarily close to the main governmental hierarchy and the government agency which is usually positioned further away from the hierarchical structure of the central ministries and state departments. Another issue concerns the fact that self-interested bureaucrats have strong preferences regarding the type of work they want to perform and the type of agency they want to work in. This feature can be correlated with the fact that government agencies carry out public tasks at the national level.

In addition, the bureaus for which Dunleavy suggests this model are state financed and civil servants are employed, features also present in the case of government agencies.

3. Challenges in studying agencification and bureaucratic behaviour in Central and Eastern Europe

In terms of studying the agencification process in Central and Eastern Europe states there were difficulties regarding change in the government apparatus. To highlight this situation we should consider a brief description of the transition from a communist to a democratic regime in the countries from Central and Eastern Europe. It should be noted that the transition led to the significant changes on several fronts. On the one hand, the transition to a market economy led to significant changes in the structure and nature of the state, especially concerning privatization of public enterprises and also a public policy shift towards economic reform. On the other hand, there are political changes accompanying the process of democratization. In this context, concerns for economic and political reforms have prevailed in relation to achieving change in the government apparatus itself, particularly in relation to public administration. One argument in favor of this idea is offered by Barbara Nunberg who claims that public administration reforms have occurred at a much lower rate, a possible reason being the reluctance of foreign investors in supporting external programs to strengthen administrative capacity. This was largely due to the fact that attention was focused in particular on accelerating economic reforms, but also to some extent the appearance of a wave of anti-statist response to delegitimization of the communist state69.

In this context, in the countries from Central and Eastern Europe there are significant changes ocuring during the ongoing democratization process, these changes being incremental in nature. At the same time, there is the need to increase capacity for policy formulation and implementation of programs to strengthen and maintain the results produced by the aforementioned reforms. To achieve this goal the interest shifted towards producing changes in the government apparatus, specifically in regard to the transition from a centralized bureaucracy to a modern, efficient and focused one based

[69]Nunberg, Barbara. Barbone, Luca. Derlien, Hans-Ulrich, *The state after communism: administrative transitions in Central and Eastern Europe* (World Bank regional and sectoral studies, 1999), 1.

on performance70. From these considerations it is noted that in order to propose an analytical model of bureaucratic behavior in the governmental sector it will be required to draw a clear and comprehensive view regarding the institutional environment and the processes and transformations that occur within it.

Taking these into account it is necessary to follow the emergence of government agencies and the specifics of this process in Central and Eastern Europe states.

First, as mentioned above the changes in the government apparatus were performed in a slower pace during the process of democratization. Secondly, a large part of public organizations in these countries inherited legal personality since the communist regime, which resulted in procedural and formal consequences. In these circumstances, the creation of government agencies in Central and Eastern Europe involved the creation of new autonomous organizations to respond to new functions, but also a significant increase in legally separate autonomous.[71]

The challenge of studying the behavior of bureaucrats in government agencies from countries in the process of democratization in these circumstances is twofold. While there is a series of empirical research embodied in case studies concerning government agencies in some countries in Central and Eastern Europe (Beblavy, 2002, Pollitt, Talbot, 2004; Pollitt, Talbot, Caufield, Smullen, 2005, Van Thiel & CRIPO team, 2009, Hajnal, 2010), they focus primarily on providing research tools and methods and less on shaping a clear and comprehensive theoretical framework. For this reason, the challenges of such a study leads to highlighting the similarities and differences in creating agencies between democratic states in relation to the ones in the process of democratization. Through this method there will be provided a better understanding of the complexity of the institutional environment. Moreover, such challenge of sketching a theoretical framework and outline a model involving the analysis of bureaucratic behavior will become more clearly defined.

Considering the challenges presented above in studying bureaucratic behaviour in agencies in Central and Eastern Europe states I consider that the method developed in this paper has a real potential. An argument in this sense is that by developing a institutional analysis framework for studying bureaucratic behaviour there are several aspects covered. First, it offers a strategy to create a formal characterization of the existing institutions in government agencies in general. Second, by viewing institutions as rules, norms and procedures it helps to highlight the institutional arrangements in the moment of creating the agency and the changes that occur in time. An important aspect possible to be observed is the process of auto-regulation which appears when agencies obtain a certain degree of autonomy. Hence, the approach suggested outlines exogenous institutional arrangements and how they shape the agencies when they are created and also endogenous ones which are established during the lifespan of the agency. These dimensions are important in tackling the challenges presented above in studying agencies from Central and Eastern Europe states.

Conclusions

This study shows that in order to create a framework for analyzing the behavior of bureaucratic governmental agencies two steps need to be taken.

A first step is the formal characterization of the existing institutions within government agencies. We have shown that it can be done by using the rational choice institutionalism type approaches. From this approach we found that the model which defines institutions as based on rules as having the best potential in characterizing the institutional context which corresponds with the formation and operation of government agencies.

---

[70] Nunberg, Barbara. Barbone, Luca. Derlien, Hans-Ulrich, *The state after communism: administrative transitions in Central and Eastern Europe* (World Bank regional and sectoral studies, 1999), 1-2.

[71] Beblavy, Miroslav, „Understanding the Waves of Agencification and the Governance Problems They Have Raised in Central and Eastern European Countries" (OECD Journal on Budgeting, 2002), 121.

A second step regards the choice of a bureaucratic model that can be used in explaining bureaucratic behavior in government agencies, taking into account the institutional context in which they are placed. Completion of this approach has led to exposure in the behavior postulates on collective choice arrangement gives (government agencies).

In conclusion, to draw up a comprehensive framework for the analysis of bureaucratic behavior in government agencies is necessary to rely on a method to consider institutional arrangements as they occur and at a later stage of their operation, but to consider and a bureaucratic model to answer this question on the influence of institutional context to the internal and external rules of bureaucratic behavior.

The implications of using an institutional framework for analyzing government agencies in Central and Eastern Europe states are as suggested in the third section of the paper that the researcher is offered a comprehensive strategy in studying bureaucratic behavior. Also, the study shows that the challenges presented by researching bureaucratic behavior in agencies in Central and Eastern Europe states and the difficulties in finding common ground in this area are better faced if we are equipped with theoretical and methodological tools from an institutionalist perspective.

In this respect, as mentioned at the beginning of the paper, developing an institutional analysis framework in studying bureaucratic behavior in government agencies is a step for a future research concerning public accountability and bureaucratic behavior in agencies in Central and Eastern Europe. Hence, this study represents the foundation on which there will be conducted the research mentioned, that will put an emphasis on institutional arrangements and how they affect bureaucratic behavior in terms of public accountability.

A FUTURE APPROACHES, SOCIAL ORGANIZATION AND THEIR ECONOMIC CONSEQUENCES OF THE INFORMATIONAL SOCIETY – KNOWLEDGE SOCIETY

PROF. NICULAE DAVIDESCU[*]
PROF. DELIA BĂBEANU[*]

Abstract
The paper is the result of scientific study under doctoral thesis "Information Society and its Economic Effects" and contains seven sections:
-section 1: "Globalization, Development and Information Society";
-section 2: "The Impact of the "Digital Divide" and "Digital Inequality" Phenomena" ;
-section 3: "Information Society –Knowledge Society, Definition, Objectives and Strategies" ;
-section 4: "Social Structures and New Life Patterns in Information Society" ;
-section 5: "Virtual Organizations, Activities and Businesses" ;
-section 6: "Strategies, Programmes and Courses of the Information Society Approach" ;
-section 7: "The Economic Effects Foreseeable through the Implementation of Information Society–Knowledge Society".

Keywords: *Information Society, Knowledge Society, Society of Truth, Spirit, Conscience and Morality(STSCM), IT&C, Digital Divide, digital inequality phenomenon, SITM, LONG-LASTING SOCIETY, Tele Centre, Cybermarketing, TeleEducation, TeleShopping, TeleMedicine, e-goverment, e-commerce, e-banking, entertainment systems, teleshopping, telelearning, mobile telephony, virtual telecommunities,Telecottage, Electronic Village Hall, Community Telecommnications Center, Distance Education, Distance Learning, Open Learning, Open and Distance Learning, E-education, Virtual Organizations, virtual team, electronic business solutions (EBSP), leap-frogging.*

1. Section 1, entitled "Globalization, Development and Information Society", represents the level of knowledge and contains the description of the amplitude of the globalization phenomenon, the interconnections globalization-global economy substructure, the analysis of the phenomenon concerning the development of the electronic industry and IT&C and also the situation of the world countries facing the accomplishment of the Digital Economy and Information Society. Subsequently, the problematics concerning the world countries vs. the development tendencies of the IT&C field are presented. The conclusions that are presented in this section, concerning the phenomenon of globalization, refer to the following aspects: (a) the dramatic increase of the information transfer flow at the global level, at the same time with the exponential development of the IT&C components and the global substructure of telecommunications, among which the main part is played by the Internet system; (b) the massive increase of the international cash flows and ISD; (c) the significant increase of the international trade volume; (d) the rapid development of the global financial markets, considered to be a "weightless economy"; (e) the creation of "Porteris clusters", a new "digital geography", generated by innovation and technological clusters, actually made up of interdependent assemblies of competences, capability and local capacity; (f) the decrease in action and importance of the economically developed countries, in the favour of STNs and international bodies (UNO, IMF, Global Bank, OMC, OECD etc.), at the same time with the increase

[*] Ph.D., Professor, Department of Management Information Systems Academy of Economic Studies of Bucharest. (e-mail: nicolae_davidescu@yahoo.com.)

[*] Ph.D., Professor, Department of Management Information Systems Academy of Economic Studies of Bucharest.

of the STN importance for the global trade; (g) the externalization of the activities of marketing, production and services, the creation of a new international financial and industrial structure; (h) the increase in number, applicative and restrictive force of the universally applicable standards; (i) the increase of legal and especially illegal migration of people and labour force, at the same time with the accentuation of "brain migration" to the most economically developed countries; (j) the optimization of the cultural relations at the global level, the informatic facilitation of the access to the universal cultural values, by implementing the concepts of "multiculturality", "mobility" and "interchangeability"; (k) the universality of the English language and Anglo-Saxon concepts. In this section, are also presented the drives of globalization: scientific and technological innovations and the ampleness of the development of the electronic industry (drive I), the implementation and generalization of the usage of Digital Economy (drive II), the present politics of a neo-liberal type, considered to be the motive power of the globalization phenomenon (drive III), and the implementation and generalization of the usage of IT&C (drive IV).

2. Section 2, "The Impact of the "Digital Divide" and "Digital Inequality" Phenomena" starts with the analysis of the "digital divide" phenomenon, regarded as the virtual distance between individuals, generally considered, or geographical areas, seen at various economic and social levels, from the viewpoint of the common perspective on their opportunities, depending on the access to the facilities provided by IT&C and the usage of the Internet system for the whole range of human activities. These reasons have led us to the solution of treating this phenomenon from the viewpoint of the following essential aspects: **(a) the "digital divide" phenomenon and its impact on the contemporary world; (b) the ampleness of the "digital inequality" phenomenon and (c) the effects of the "digital inequality" phenomenon.**

The conclusions concerning the "digital divide" phenomenon, refer to analysing the level of access to the communications technology, basing the "digital divide" phenomenon on the dynamics of access to the Internet system – competition is the key to the Internet access –, studying the cost of the access to the residential and business phone systems and the reason of the decline of the Internet access costs. In this section, are presented the analysis indicators of the "digital divide" phenomenon: the ethnic factor and division are apparent in "digital divide", the usage of the IT&C facilities and the Internet system by the industrial and business sectors, the access to the IT&C technologies and the Internet in the urban and rural regions, the access to the IT&C facilities and the Internet by the urban and rural regions, alternatives of access to the IT&C technologies (cable and satellite broadcasts and access). From the viewpoint of rendering the "digital inequality" phenomenon, we have presented the ampleness of the "digital inequality" phenomenon, its features, the present inequities in using the Internet, the differences in the on line usage capacity and the influence of the education level. The effects of the "digital inequality" phenomenon are rendered by the analysis of the population access to the Internet, the analysis of telephone usage, the analysis carried out in respect to age, the analysis of the access to electronic services and the usage of the Internet system in respect to the statistic indicators of population, at the same time with the usage of the Internet system at the level of governmental, corporatist and social structures (under the influence of some representative factors: the general usage of the Internet system, the usage of the Internet system in kindergartens, public libraries and communitarian centres, the typology of the equipment of access to the Internet, the type of the Internet provider, the analysis of the Internet usage at home/ outdoors, the accomplishment of the on line confidentiality and the promotion of competition and universal services.

3. Section 3, "Information Society – Knowledge Society, Definition, Objectives and Strategies", contains the analysis of the human society evolution, seen as a systemic complex of interpersonal relationships, a historically determined uniform assembly, resulted from mankind's activity to produce material goods and spiritual values, necessary for the individual and collective living. The Informational Society is strongly marked by the revolution in the IT&C domain, the

political actions and the innovative spirit. The revolution in the IT&C domain was foreseen by the predictions of the sociologist Alvin Toffler, concerning the society of The Third Wave, characterized by some defining elements: **(a) the complex phenomenon of knowledge; (b) the process of demassifying the markets, investments and production; (c) the essential role of the dynamic and continuous innovation flows; (d) the rapid and complete integration of the technical and economic systems; (e) the training of the digital technologies of information storage, transformation, processing and communication, seen, in their turn, by the quintet of data-knowledge-messages-images-sounds; (f) the usage of the technologies that will decisively determine the evolutions within all the fields of human civilization; (g) the complex and complete usage of the Internet system in non-academic fields, by involving a large number of users**.

The innovative policy and spirit imply the activity of innovation and usage of the essentially new ideas and concepts, seen as an integral part and coordinate of the present governmental and entrepreneurial policies; these policies lead to the general progress of society, by renewing, optimizing, transforming or converting the present techniques, technologies, products, components and services. There have appeared and been implemented new concepts and technologies, related to the field of socio-economic informatics and dedicated to the access of state institutions, companies and ordinary people to the networks of computers and distributed DB of all kinds. These transformations have generated new terms, in connection with that of information society, such as Information Technology-IT. Moreover, IT&C is present in many new fields: DB management, consumer services, office work, long-distance open learning, publicity, data and information transfer, commercial and bank transactions, insurance-reinsurance, telework, entertainment systems, teleshopping, telelearning, mobile telephony, medical services etc.

Information Society will ensure the democratization of the association, agreement and co-operation, by means of global data communications, public data and information transfer at a world level, on line co-operation by means of the Internet and/or other types of networks and IS[1] with a global character, with a view to achieving complex data processing, addressed to all the categories of professional/non-professional users. This society has as its main target the systematic improvement of people's living and working conditions, irrespective of their nationality, by development and intellectual stimulation, by indiscriminative and co-operative on line access to the IT&C facilities, by the access to the national and/or global data networks, to the Internet. The third millennium will bring the creation and effective usage of the knowledge society (SC), which will include the Information Society as well, given the fact that we can consider knowledge as the result of the action of some convergent factors – the semantics and action of information – for which reason the knowledge society will be based on IS-KS, which is a broader concept than SC, as a result of the primordial role granted to the tandem of information-knowledge in human society.

The concept of KS (knowledge-society) revolves around the society based on knowledge (knowledge-based society or knowledge-based economy).

Dependent on the phenomenon of knowledge, Knowledge Society has the following particularities: **(a) the extension and thorough study of scientific knowledge and the truth about knowledge; (b) the usage of knowledge management by organizational and technological knowledge; (c) the approach and implementation of technological knowledge production by the phenomenon of innovation; (d) the maximum dissemination of knowledge for all people, mainly by the Internet, electronic books and e-learning; (e) IS-KS is represented by the parallel concept named "the new economy"**, characterized by profound innovation processes, defined by the assimilation and transformation capacity of the innovative knowledge, for developing new products, services and symbols; innovation will be the powerful and profound determinant in SC, by aiming at increasing productivity in respect to the energetic, material and natural resources and the

[1] IS-information System

protection of the environment, for which reason, in this new society, the companies that bring technological innovation, on the basis of some proper and particular knowledge structures, will be favoured and determinant; the innovative companies will be created by the co-operation between the companies of different sizes and academies, private/governmental research institutes etc.; **(f) "the new economy" is focused on maximizing the influence and usage of the Internet system,** seen as the principal market for IS-KS, at the same time with increasing the importance of the value of assets, within which knowledge will play a special part; **(g) IS-KS will be of an ecologist type,** because it will lead to developing goods, services and symbols by scientific and technological knowledge, plus their combined management, with a view to implementing some technological and biological organizations and transformations, meant to save the accomplishments of the human civilization; **(h) IS-KS will be a new stage in the human culture**, given the fact that the culture of knowledge will become primordial, at the same time with the involvement of all the forms of knowledge (technical, economic, architectural, literary, artistic, philosophical etc.). In the future, mankind has to approach and think over the perspective of founding a society of the second generation, the society of truth, spirit, conscience and morality (STSCM).

Knowledge Society will be based on certain fundamental vectors, seen as instruments capable of allowing and ensuring the assimilation and transformation of the society into the Information Society, subsequently acknowledged by the acronym IS-KS. The technological and informational vectors of IS-KS are represented by the Internet, extended and developed in time and space, the e-book technology and the intelligent agents. The main managerial, cultural and social vectors are: the knowledge management for organizations of any type, kind or size, the management of moral usage of knowledge at a global level, the educational system based on the IS-KS methods (e-learning), the healthcare system at the social/individual level, studies of biological knowledge of genomic interest, the increase in using some fundamental factors of human knowledge, the protection of the environment, meant to ensure a LONG-LASTING SOCIETY, by increasing the usage of the management specific for knowledge.

The organizational and functional vectors of IS-KS are new methods concerning the development of the activities at home. The implementation of the e-activities of a virtual community type, Tele Centre, Cybermarketing, TeleEducation, TeleShopping, TeleMedicine, the implementation of the adaptations made by using computers, telephony or digital television, at home or at work, the information state.

IS-KS will be able to be achieved under the conditions of the existence of an "Information State" that will use the concept of "e-government", by means of which will be developed and used new technologies in the fields of data communication and information technology at a national, regional or global level, addressed exclusively to the functions of the state and oriented towards the information requirements of the citizen; there will be used the concept of "e-commerce" by which the techniques of e-purchase will be monitored, at the same time with the usage of some specific technologies and an adequate pan-European legal frame. The information state will dispose of an intelligent transport system, connected to a global system of modern transport, which ensures the technical and economic optimum and the general security, by rapid and reliable access to the new communication systems and pan-European/global digital services.

The citizens of this state will be provided with on line healthcare, the usage of some medical technologies of an intelligent type, the health condition monitoring at a national level, including the total access to BDD with a medical specificity or for monitoring the critical situations concerning the health condition of the population. The information state will be characterized by the concept of "e-participation", addressed to the people with disabilities, and by the access to the communication, media and information substructures for people with disabilities.

There will be implemented **home activities addressed to the citizen**: **(a) new forms of working (telecommuting, virtual office, telework etc); (b) e-activities (virtual community, TeleCentre, Cybermarketing, TeleEducation, TeleShopping, TeleMedicine etc).** The Internet

will be architecturally, operationally and functionally complemented by the satellite systems: Intranet and Extranet. The information state will act through the government, agencies, companies, social institutions, schools, universities, cultural institutions, churches, dwelling places etc. Information services, such as e-goverment, e-commerce, e-banking, entertainment systems, teleshopping, telelearning, mobile telephony etc. will be implemented.

The information state will be based on the idea of "Internet Society", which, in our opinion, will be a virtual construct, made of electronic media of transmission and operating systems of the "self-aware" type. The approach scale is universal, for which reason the information state will be connected with the universal political, economic and spiritual media, by activating a theoretically infinite number of computers used for providing on line data and information worldwide. Briefly, the information state will be characterized by new basic concepts, out of which we mention: cheaper Internet, e-research, e-security, e-education, e-working, e-accessibility, e-commerce, e-government, e-health, e-content, e-transport etc. The information state will be non-exclusivist, because it will provide a society for all the citizens initiated in handling data and information stored in various BDD in time and space and operational on various heterogeneous NC , at a national, regional, European or global level. IS-KS will be based on the market opened by the Internet system, for which reason we can talk about new connected concepts: Internet economy, new economy or digital economy.

The actual creation of the new economy takes into consideration the following elements: (a) knowledge becomes an economic factor, which leads to the increase of the importance and usage of the intangible assets within the production of economic value; (b) information in general and the Internet system in particular will significantly influence the companies in the market economy; (c) the development of a sustainable economy must be done only within IS-KS, by re-orienting the economic thinking. The new economy is characterized by some fundamental aspects: (a) creating the premises for the implementation of IS-KS and reaching a stage of an ecologically sustainable society; (b) creating and using knowledge in the economic field, especially by involving the innovation phenomenon; (c) the development of innovative companies, mainly created by joint-venture between companies-universities-governmental/public/academic research institutes. "Knowledge economy" is dependent on the increase of the role and ampleness of using the information concept.

In our opinion, it comes out that the "knowledge-based economy" has the following **features: (a) the focus on the electronic market of the Internet type[2]; (b) the legislative and economic encouragement to found companies that induce technological innovation on the basis of some proper and particular structures of knowledge; (c) the usage of knowledge management under the reign of the organizational and technological knowledge; (d) the prevailing completion of the production of technological knowledge by means of innovation; (e) the increase in importance of the value of intangible assets, especially of knowledge, at the same time with using these goods at full capacity, according to a new spirit; (f) the maximisation of the influence and usage of the Internet system, seen as the main market for IS-KS; (g) the development of some profound innovation processes, by means of the innovative knowledge capacity to assimilate and transform; (h) the development of new products, services and symbols; by the decisive contribution of innovation of all kinds, with the declared purpose to increase productivity in respect to the energetic, material and natural resources and the protection of the environment; (i) the creation of a society of the ecologist type, by implementing some technological and biological organizations and transformations, with a view to preserving the accomplishments of the human civilization; (j) the maximum usage of scientific knowledge and the truth about knowledge; (k) IS-KS will ensure the premises for a rapid approach of the society of truth, spirit, conscience and morality (STSCM)[3]; (l) the**

[2] Davidescu, N – Generalisable Programme-products, Concepts and Development Methods, Scientific Symposium, ASE, Faculty of Accounting and Management Information Systems, 1998

[3] SASCOM: the Society of Truth, Spirit, Conscience and Morality: STSCM

maximum dissemination of knowledge for all the citizens (the Internet system, electronic book, e-learning etc); (m) IS-KS will be a new stage in the human culture, by the predominance of knowledge culture and the involvement of all forms of knowledge; (n) the intense and intensive usage of knowledge, applied in the field of economics, especially by encouraging the phenomenon of innovation; (o) the provision of IS-KS sustainability in respect to the priorities of preserving a non-polluted environment; (p) the development of a new economic thinking and new economic rules, applied in accordance with the semantics and specific phenomenon of IS-KS accomplishment.

4. Section 4, "Social Structures and New Life Patterns in Information Society", approaches the time-space paradigm of IT&C, which will allow for every "user" to be connected to a SI[4] of a certain level, size and complexity; deep changes will take place within the fields of organization and work processes, by the introduction of some new social structures and life patterns. IT&C and IS-KS will induce fundamental changes within all the fields of the economic and social activity, by altering life and work style, at the same time with recording some beneficent influences on personal and social life.

IT&C will imply various changes of a physical, functional or organizational nature within all the structures of society, by changing the social structure, workday, work form structure, governmental, business, commercial, educational, informational and organizational structures[5].

The interaction between IT&C and the flexible work forms induces a triple perspective: organizational, temporal and spatial. The new work forms are influenced by IT&C through: work flexibility, the quantity of teleworking, the time vector, teleworking and voyages. There will emerge new forms of interior design, endowment with computing techniques and telecommunications, including the emergence of new transport solutions for eliminating the time and space restrictions of the telecommuters' circulation, with foreseeable implications, in time, on the dimension and structure of the transport systems. The influence of IT&C on social change leads, in our opinion, to the emergence and strong influence of social informatics, seen as the science that uses a finite set of concepts, technologies, CASE design instruments, Internet software facilities, computing systems-telecommunications of national nature, associated software-firmware technologies, specialized staff, elements that allow the design of IS and their usage in the field of IT&C, in interdependence and dynamic-functional connection with the social, cultural, institutional, organizational, managerial environment, the public access to information of social nature, scientific communication by e-journals, the public access to the Internet system, the usage of this system for performing some activities of social nature, e-activities (e-commerce, telework (for managerial and commercial purposes, telephone operators and offices etc.), telecommuting, cyberMarketing, teleShopping, teleEducation, teleMedicine etc.), new organizational structures (virtual office, virtual community, teleCentre etc.)[6].

Social informatics will impose e-commerce in respect to the classical markets, the possibility to facilitate the disappearance of the Gutenberg civilization and its replacement with the von Neumann civilization, the assertion of long-distance open learning, the achievement of an informational boom concerning e-journals, the global implementation of virtual libraries, the global generalization of the virtual government, including the development of various SIG types[7]. Major

[5] Rosca Gh. Ion, Marian Stoica, New Work Forms and Activities in the Knowledge and Infromation-based Society, in the volume "Information Society-Knowledge Society, Concepts, Solutions and Strategies for Romania", Expert Publihing House, 2001.

[6] Davidescu, N., Internet-Shopping Operations by Local Virtual Networks (VLAN), Informatic Opportunity for Developing Countries, 2005

[7] The Bologna Declaration of the ministers of education from 28 European countries and the majority of the candidate states, June 19th 1999

changes will occur in the community life and at the social level; competitive and efficient bidirectional relationships between IT&C, social informatics and social organization will be implemented.

In our opinion, social informatics will allow the multidisciplinary application of the design and usage of IT&C in a dynamic and functional interaction with the social, cultural, institutional, organizational, functional managerial environment etc. Social informatics will influence public life at a global level by the worldwide usage of the Web technology, by means of which people everywhere will access and get the information they need, in different forms and formats, in real time, at minimum costs and delivery time; the total replacement of the classical education by the active instruction with on line access to the Internet is to be expected. It will thus lead to the design and implementation of some IS based mainly on the facilities of the Internet system and IT&C, seen as technical-social-virtual networks (RTSV), which will ensure the development of some informational and electronic spaces, the generalization of e-journals, the extension of the discussion forums, electronic systems of teleconferences etc. It is expected to emerge practical solutions concerning the info-social-virtual cells of administration (CIVA), made of various elements, fundamentally based on the facilities of the Internet system: human structures, informational structures, organizational structures, managerial structures, training structures, information structures of the hardware type, information structures of the software type, usage techniques and methods etc. In our opinion, we can talk about various types of social access to the IT&C and Internet resources: social access at the personal, organizational, regional, departmental, political and scientific level.

Telecommuting is a multiply characterized concept: (a) telecommuting means "working a day or two per week in a secondary office or at home, being electronically connected to the headquarters"; (b) telecommuting is considered to be a long-distance work form; (c) telecommuting is working at distance, which means that a person can perform their work from a different place than the one where is/are the person/people who directly monitor them and/or pay them for the work they performed; (d) telecommuting is working at distance, combined with telework; (e) SCAQMD and TAC define telecommuting as "homework or work in a satellite work centre (an alternative workplace), by using means of electronic communication or of any other type for staying in touch with the regular workplace"; (f) "Telecommuting is homework or work in an alternative workplace, by using means of electronic communication or of any other type for staying in touch with the regular workplace, instead of the physical movement to a farther workplace".

The virtual office is a work system that allows the performance of activities in a distributed way in time and space, by changing the proportion between working at the headquarters and working in satellite spaces, at the same time with the intensive and extensive usage of the Internet-Intranet-Extranet systems by the employees, in many places and at different moments[8]. The notion of virtual office defines a series of domains based on the concept of telecommuting, being an alternative solution of various work patterns, with a relative degree of mobility of action at a certain stable workplace; the essential ways to reflect the virtual office in respect to the employee's amount of freedom: telecommuting with complete mobility, homework, telecommuting with flexible hours, semi-mobile telecommuting, random telecommuting and the telecommuting completely distributed in time and space.

Telework implies using IT&C and NC[9] with the purpose of replacing/reducing the standard work pattern performed by the big companies, by the fact that the telecommuters from various fields of activity (management, accountancy, financial audit, services etc.), physically and logically interact with people/goods in an insignificant proportion of the daily/monthly working hours. Conceptually

[8] Rosca Gh. Ion, Marian Stoica, New Work Forms and Activities in the Information- and Knowledge-based Society, in the volume "Information Society-Knowledge Society, Concepts, Solutions and Strategies for Romania", Expert Publihing House, 2001.

[9] NC-network Computers

speaking, telework has three components: flexwork, homework and telecommuting. In our opinion, telework is a spatial and temporal distribution method of a company by means of which is implemented the concept of "virtual organization", which is meant to allow overcoming the restrictions of time and space that exist in a standard way; telework can be regarded, in a complementary way, as a method used by the managers with a view to improving the performances of the companies and to adapting to the conditions provided by the environment.[10] Briefly, telework is a contemporary form to re-organize the organizational structures, by which the development of the "virtual organizations" is ensured.

The e-activity of the Cybermarketing type is based on the development of virtual marketing, which preserves the techniques specific for the classical marketing, but, besides, has a series of operational and analytical advantages, focused on specific methodology, interaction with the organization and client-orientation. Cybermarketing is objectively client-oriented and thanks to the facilities, costs and efficiency of the virtual world based on NC placed all over the world, the marketers have new opportunities and can address to new market shares, in accordance with the demands of the clients and global markets; in their turn, clients widely use the Internet services for obtaining information about the market, products, services, prices, delivery terms, financing systems, service, repairs etc. The main objective of the cybermarketing activity is providing the best conditions for making and developing some on line offers of products-services, by complying with the following parameters: (a) using the Web technology; (b) using the static/dynamic mathematical models specific for the pure theory of the marketing science; (c) using some diversified methods and models of message communication within the complex processes specific for cybermarketing; (d) implementing the best communication options.

The e-activity of the TeleEducation type is the technology of transferring information of a formative-professional nature, exclusively by the Internet-Intranet-Extranet systems, as a result of overcoming the factors related to time and space, in which the assimilation process gets focused on the learning phase, to the detriment of teaching and knowledge transfer process.[11] The e-education system has had a rapid development by the emergence of new technologies: (a) "Distance Education" and "Distance Learning" of the synchronous/asynchronous type; (b) "Open Learning"; (c) "Open and Distance Learning"[12].

E-education makes some fundamental demands: (a) to actually use the IT&C technologies in all the institutions of academic education; (b) to redefine teachers' activity and to change their attitude towards the e-education technology; (c) to change the structure of the teaching materials, to create and use virtual courses; (d) to change students' attitude towards the general approach to tele-education, the system of consulting the virtual materials and the virtual systems of preparation-examination; (e) to create and actually use some organizational structures that are new from the viewpoint of their role and functionality (virtual schools, high schools and universities, tele-education centres, tele-classes etc.); (f) to stimulate students'/graduates' desire for continuous study.

The e-activity of the Teleshopping type performs the selling and purchase of goods and services, know-how, software, firmware, by the massive, complete, efficient, operative and competitive usage of the IT&C elements and Internet-Intranet-Extranet services; due to extensively and intensively using the facilities of the Internet system, this activity could be also named

[10] Rosca Gh. Ion, Marian Stoica, New Work Forms and Activities in the Information- and Knowledge-based Society, in the volume "Information Society-Knowledge Society, Concepts, Solutions and Strategies for Romania", Expert Publihing House, 2001.

[11] The Bologna Declaration of the ministers of education from 28 European countries and the majority of the candidate states, June 19th 1999

[12] www forrester.com: the site of the Forestre Research magazines, which publishes articles in the field of e-learning

InternetTeleshopping. Teleshopping is structured in e-sub-activities[13]: tele-selling and tele-purchase. The social and psychological premises take into consideration the study of some dual coordinates: the social approach and the psychological approach, based on studying the social impact of teleshopping, its usage area, functioning mechanism at the macro-, mezzo- and microeconomic level, as well as establishing the strategies, methods and techniques of the social adaptation of the citizens to the new information technologies, overcoming the social conservativeness, including the elimination of the cognitive, social, informational, behavioural, emotional, traditional disabilities etc. The minimal structure of the systems based on Teleshopping must contain the following standard sub-systems: cybermarketing, presentation, input transactions, supply-transport, storage, distribution (output transactions), invoicing-deduction[14], computerized accountancy, IT financial accounting audit[15] and DB administration.

The e-activity of the TeleMedicine type is the technology that allows medical data exchange, by means of IT&C and the Internet-Intranet-Extranet services, with a view to increasing the quality, capability and capacity of the medical act, medical education of the citizens or provision of top-quality healthcare services; from another point of view, telemedicine is the process of using medical information and services, in conditions of professionalism, rapidity, selection, efficiency and cost-effectiveness of the IT&C conditions and the Internet-Intranet-Extranet services, by fully complying with the scenarios of modern medicine: (a) the implementation of a selective and professional monitoring of medical data; (b) the beneficent usage of IT&C in the field of modern medicine; (c) the instauration of a modern management addressed to increasing the rapidity, efficiency and quality of the medical act; (d) the provision of an information system meant to bidirectionally transfer medical data from one location to another.

The main objectives of telemedicine are: (a) to increase the evaluation quality of the medical act, medical diagnosis and long-distance treatment; (b) to virtually overcome the distances between the doctor-case-patient-treatment-post-treatment, by non-differentiating the close cases from the distant ones; (c) to provide a quality medical act, in the conditions of a minimum response time, information on the patient's state in a record time, providing treatment by means of the Internet-Intranet-Extranet systems and the interactive monitoring of the patient's post-operatory condition; (d) to increase the efficiency and accuracy of the medical act; (e) to provide medical treatment as close as possible to the patient's workplace/ residence; (f) to provide continuous professional training of the medical staff (doctors and nurses); (g) to provide a quality medical expertise, based on the data offered by means the Internet, in an appropriate time for patients, irrespective of the distance between the doctor and the patient; (h) to efficiently use the complete/insufficient medical resources; (i) to increase the response rate of the patients in difficulty; (j) to offer the possibility to ignore the time and space factors by means of the IT&C factor; (k) to ensure the security, protection and confidentiality of the data concerning patients' health condition.

In order to complete the IT projects of telemedicine, we propose a creation-implementation methodology, by covering the following stages: (a) Programming the accomplishment of the telemedicine IT project, elaborating the feasibility study, completing the business plan, contracting the necessary work to carry out the IT project, allocating the financial funds, establishing the beginning terms, local responsibilities, coordination from the specialized minister; (b). SITM[16] completion; (c). The stage of SITM implementation; (d) SITM current exploitation and (e). The development of new constructive versions of SITM.

---

[16] SITM: IT system of telemedicine

The technical and economic evaluation of the telemedicine IT projects is appropriate in the case of running complex telemedicine projects, carried out by many medical organizations, for which reason their acceptance and actual usage are imposed by the following requirements: (a) to use the IT&C substructure; (b) to maximize the security and confidentiality of the data concerning the patients, cases and treatments; (c) to have a medical licence; (d) to supervise the telemedicine policies; (e) to elaborate standards and protocols related to the medical field; (f) to obtain a maximum reliability during the actual work; (g) to sort out the economic, technical and legal aspects; (h) to adopt a payment system addressed to remote communities and to people with a minimum living standard.

5. Section 5, entitled "Virtual Organizations, Activities and Businesses", brings to the foreground the concept of virtual organization (OV), also known as e-organization. OV represents complex configurations of dynamically structured companies, geographically dispersed, with a variable degree of independence, which generate superior performances by adapting to the dynamics of home/international markets, as a result of strongly involving the IT&C facilities and the variability of the organization forms and manifestation typology of the network-like organization and the digital economy. OV is a system by means of which the component functional entities have potency and multiple superior capacities, due to a synergetic adaptive and dynamic phenomenon[17]. OV is based on several fundamental elements[18]: (a) objective; (b) connectivity; (c) technology; (d) delimitation; (e) information substructure and (f) meta-management. OV is a co-operative form, focused on common interests and agreements concerning dynamic businesses, in which the co-operative units provide the specific competences, which can be disseminated by means of some co-operation on the vertical and horizontal scale, so that, during the OV performances, it could be perceived as a unique homogenous and particular entity. OV has the capacity of self-organization, a phenomenon according to which the e-organization and its members dynamically and automatically interact, thanks to a mutual co-existence, based on the optimum balance between meta-organization and the creation of some socially acknowledgeable values[19]. The OV characteristics consist in adaptability, dynamics, organizational optimum, the involvement of common synergies. The minimum conditions for providing OV inter-operationality are the following: (a) the identification and attribution of a profitable business, compatible with the potential OV members; (b) the acknowledgement of synergic competences; (c) the co-operation and mutual trust of the OV members; (d) the possibility of the maximum usage of IT&C for rapid and efficient connection of the OV members; (e) the possibility to implement new virtual organization solutions: virtual teams, virtual projects, temporary/permanent OV, minimum/average/maximum virtualization, OV made of company networks, virtual industrial company, virtual corporation.

Virtual activities esentially contain virtual work and virtual team, elements focused on virtual work organization, regarded as an optimizing planning of business networks, meant to bring a maximum degree of virtualization in the form of OVs, being a basic component in the so-called "business network" system, by which we understand cooperative strategy elaboration and management, and innovative strategies quantification. Under such circumstances, there appear and develop the network organizations (OR), which have as essential objectives the creation and transfer knowledges, regarded in the sense given by IA. The ORs accomplish the role of creating an environment for social exchanges, being tributary to some fundamental principles that allow the

[17] Bogdan-Ghilic Micu, Marian Stoica, Virtual Organization, Economic Publishing House, 2004

[18] Rosca Gh. Ion, Marian Stoica, New Work Forms and Activities in the Information- and Knowledge-based Society, in the volume "Information Society-Knowledge Society, Concepts, Solutions and Strategies for Romania", Expert Publihing House, 2001.

[19] Stoica Marian, Ghilic Micu Bogdan, Types of Work and Informational Activity, ASE Printing House, 2000, ASE Library, quota 122140

conceptual definition of virtual work: (a) integration levels; (b) voluntary connections; (c) OR members; (d) multiple leaders; (e) cooperation. The OVs are able to develop strategic partnerships focused on the co-evolution of synergic community members, through business ecosystems; the "eco" attribute defines the efficient collaboration substructure of the OVs, from the viewpoint of attracting competences, skills and global opportunities, accomplishing objectives, lowering costs, permanent transformation, trans-frontier action, global presence.

The new developing tendencies of the OVs have led to the conceptualization of a business network model that holds some essential characteristics: client, dealer, integrator, business system and electronic services. The educational process in the OV is a strategic component, being given the fact that for having a value, the information must be processed in knowledge, after which they are translated into processes and results. Organizational education is the product of imposing some ideas resulted from the large spectrum of the following disciplines: management science, production management, strategy, sociology, organizational theory, cultural anthropology and informatics etc.; organizational education is perceived as a social construction that converts the information (data plus knowledge) generated at individual level, into explainable and operational actions usable for achieving purposes and objectives of the OV. The organizational education takes into consideration the process (education is a process with an unlimited time and space progress) and the effects (we take into consideration the elements accumulated by the study system). The education approach in OV is a process of tacit and outspoken information generation and spreading.

The virtual team (EV) is generated for carrying out some complex projects at the OV level and characterized by using some collaboration tools (telephone, e-mail, NC , DB of any type). The EV is a system of solving some social/particular character activities through the highest involvement of e-activities (e-commerce, telework, telecommuting, cybermarketing, teleshopping, tele-education, telemedicine etc.), of some new organizational structures (virtual office, virtual community, telecentre etc.) or of some new classical information concepts (SI, NC , SC, information processes, Internet, Intranet, Extranet, FS, WS, etc.). EVs are interdisciplinary work teams, inter-organizational or inter-sectorial, organized at the OV level, in order to accomplish some strategic objectives.

The specialized aid software for virtual system work is globally called "groupware", being addressed to providing on line multidisciplinary interactions in real time, by web-conference, e-mail etc.; groupware contains software support modules focused on the implementation of the following essential functions: (a) the dynamic and convergent administration of the electronic documents; (b) the interdisciplinary on line dynamics (electronic messenger, software instruments for simultaneous on line communication, conversation progress through typical Intranet system instruments); (c) the AI development (the automation of production flows, the computerization of the OV staff's training activities, the implementation of multimedia applications, virtual usage of writing boards, the usage of audio-video technology, the implementation of "virtual reality" typical elements).

The essential characteristics of the EV are[20] 1: (a) EVs are created according to the principles, structure, organization and management of the real teams; (b) EVs are partially made up of truly virtual elements; (c) EVs guarantees the finalization of the contracted projects; (d) the assignment of a maximum importance to the trust in the hired staff. EVs mainly use telework through which fixed costs may be minimized (rents, running costs, parking etc.); working in an EV may bring substantial benefits to commercial, bank businesses, insurances, local management units etc., by optimizing the communicational relationships between the client and the hired staff. Furthermore, the Internet paradigm eliminates the logical signification of geographical limits, time restrictions or national/regional aspects; the EV is the best example of no frontier community or time restrictions, the fundamental role resting with the construction, maintenance and development of the trust between the EVs members, regarded as a defining feature of virtual collaboration. Trust is associated

[20] Stoica Marian, Ghilic Micu Bogdan, Types of Work and Informational Activity, ASE Printing House, 2000, ASE Library, quota 122140

particularly with the security in usage of communication systems and between the EV partners. These EVs must dispose of an associated management controlled system, with the increase in importance of the OV's culture and values.

"Outsourcing" and electronic business refer, in the virtual context, to the specificity of electronic business and to the universal standards of electronic business for reporting, informing and analyzing.

There appears the orientation towards electronic businesses addressed to clients at a global level (AFE), derived from technological platforms that came from the OV's exterior or contracted from the exterior, through the phenomenon called "outsourcing"[21].

The "plug & play" abilities especially created for business software become available and ready to be delivered by service dealers – (ASP) or for electronic business solutions (EBSP). The successful AFE models can be applied to all the dimension areas of products, processes and distribution channels, if they deliver innovative and competitive solutions for clients; the organizational culture and the technological smart type synergies may bring high performances for the AFE through the efficient signalization of changes in the business model and through the activation of dynamic connection processes.

Evolutions towards a new AFE generation are recordd over the actual e-commerce paradigm level, towards a model delivered by AFE, focused on the solution of value chains and goods-services. These solutions use independent and ultra-fast applications and connections, meant to allow adaptation and connection to adding new connexions, at the same time with the possibility to delete other connexions in real time, on the basis of a well-balanced calculation model (EDM), which mixes the best solutions focused on NC , FS, or WS. The inter and intra-organizational design must consider the structure and the influence of cultural, strategic, technical, organizational or geographical agents, which will lead, in our opinion, to the definition of the next AFE strategies[22]: (a) AFE strategy conception; (b) knowledge management strategy; (c) self-control management strategy; (d) structural innovation strategy; (e) strategy of the income increasing economy; (f) performance control strategy; (g) organizational culture strategy.

The fundamental tendency of the OV development consists in moving towards the implementation of process - oriented network businesses; the OV's transformation into a network organization (OR) may be accomplished by giving a structure to the business relations strongly based on the IT&C usage and co-operation between internal/external partners, at the same time with the involvement of the highest abilities in information age.

The AFE's transformation into a network and the specification of the IT&C's role for the course of this complex process have as a starting point the OV's computerization degree, which describes the number of computerized charges at the OV's level through an integrated SI. The stages of carrying out the OV's computerization process are: (a) computerization of elementary functions; (b) computerization of functional domains; (c) integrated processes designing; (d) global integration at the OV level; (e) global integration and network substructure establishing.

The universal standards of electronic business for reference, informing and analysis, make the semiotic approach possible, while the business reference is seen as the "public reference of the financial and business company operation data"; there are two types of business reference: the internal and the external reference.

The origin of OV reference processes resides in the typical primary activities and operations that set the system of creation-supply of the financial reports. They are particularly used at a global level the GAAP, IAS and IFRS accountancy standards which present considerable layout and content differences; the financial statements have a different significance, which implies making some

[21] Business services and European Integration, 1999, ASE Library, quota 108713

[22] Stoica Marian, Ghilic Micu Bogdan, Types of Work and Informational Activity, ASE Printing House, 2000, ASE Library, quota 122140

conversions between the standards, with a view to guaranteeing the comparability between the financial reports obtained through various standards. Business globalization demands a similarity between the semantics of financial indicators and reports, even if these are obtained by applying some different standards of reference. The syntactical level considers the methods of registration, presentation and transfer concerning the financial informing, while the empirical and physical levels are ensured through the technical structure employed by AI developed on the Internet. The thesis proposes the usage of the XBLR electronic business standard.

The reference oriented on the XBLR standard employs the financial report concept created and compatible with the Internet/Intranet/Extranet systems[23]. XBLR is a system of reports, totally compatible with the capacities of the Internet system, being the result of some professional organizations' research, the most representative baing ICPA/IACP[24].

The "Electronic commerce" technology contains digital technologies and intelligent agents (software agents) used in the Internet e-commerce operations which are models of operation specific to the informatic applications of electronic commerce, techniques and associated methods. The concept of electronic commerce considers the financial and the operational commercial transactions through electronic methods, the electronic transfer and exchange of data, the transfers of capital, as well as the activities specific to the operations using credit cards.

The electronic commerce may be synthetically defined as the modern technology exclusively focused on businesses that may be automatically developed between consumers, organizations and dealers and that generate the automation of commercial processes, the increase of developing speed and service – product quality, the minimization of transaction costs and fixed prices, in terms of a maximum transparency, an acceptable security and a minimum response time, at the same time with offering some maximum possibilities of locating commercial data and exhaustive processing of all these, through the activation of the Internet/Intranet/Extranet systems and the utilization of the NC , at the same with the involvement of some competitive informatic technology and new models of e-commerce (B2B, B2C, C2C, C2B, G2C, G2G, non-business, collaborative) and with the maximum security of the transacted data.

The purpose of the electronic commerce consists in integrating the networks of businesses, corporations, governmental agencies, independent dealers/ clients/ collaborators into a unique community, able to determine the unique management, communication and controllability, with the help of the local NC , no matter what hardware/software platforms are used at the local level; the integration demands to stock the data on a digital format, at the same time with the necessity of ensuring the quality of the used human resources.

The electronic commerce mainly includes the informational processes of selling-purchase, products-services-information barter, through the NC and the Internet/Intranet/Extranet systems, trained as a follow-up to using some dedicated components[25]: (a) on line component; (b) communications' component; (c) services' component; (d) business processes component. The electronic commerce minimally contains the following elements[26]: (a) typical substructure; (b) e-commerce users; (c) dedicated AI; (d) typical payment methods; (e) principles and solutions regarding the design of dedicated informatic applications; (f) creation of Web-BD interfaces; (g) implementation of some typical e-commerce models; (h) utilization of some e-commerce standards; (i) involvement of some methods and techniques for the informatic applications of the e-commerce type; (j) specificity of data security in e-commerce systems; (k) legislation specific to the e-

[23] Intranet Product Site, http://tips.iworld.com/_frames.shtml/main/html

[25] Stoica Marian, Ghilic Micu Bogdan, Types of Work and Informational Activity, ASE Printing House, 2000, ASE Library, quota 122140

[26] Rosca, Ion Gh., Cristina-Mihaela Bucur, Carmen Timofte-Stanciu, Octavian Paiu, Mirela Visean, Electronic Commerce. Concepts, Technologies, Applications, Economic Publishing House, Bucharest, 2005

commerce operations. The concept of e-commerce has determined the emergence of some other complementary notions, such as the e-business and the mobile-commerce.

The digital technologies and the intelligent agents (software agents) used in the on line e-commerce operations contain elements of hardware, software, firmware, IA, communication systems, standards, norms, security, specific websites and legislation systems associated to the domain etc. The e-commerce systems use two models of on line commerce: B2B and B2C.

The operation models specific to the informatic applications of electronic commerce are the following[27]1: (a) Business-to-Business (B2B), Business-to-Client (B2C), Consumer-to-Consumer (C2C), Consumer-to-Business (C2B), non-profit organizational businesses (non-business), intra-organizational businesses (Intra-Business), Government-to-Citizen (G2C), Government-to-Government (G2G), Government-to-Business (G2B) and collaborative. These models are described in details in the contents of the thesis.

The manageable element in payment systems consists of electronic money ("digital cash"/"electronic cash"), considered as electronic transactions accomplished through any type and architecture of NC , used in the transfer of financial funds or of electronic payments between partners, seen as societies, and the OFBM; the electronic money may be seen in two manners: as a debit or as a credit, while the concept of digital cash is used as a different currency and the transactions associated to this type of cash are perceived by means of an external exchange market. The electronic money is of the following categories[28]: (a) credit/debit card; (b) e-cash; (c) digital checks; (d) electronic coupons and tokens; (e) bank checks; (f) smart cards. The basic features of the electronic money are: (a) on line authorization; (b) issuer's nature; (c) transferability; (d) money format; (e) loading variants; (f) valuing financial currency data. The OFBM accredited to manage the AFE, the dealers, the issuers and the intermediary firms actually meet different types of risks, among which the most important refer at the next elements: (a) transaction abandoning; (b) risk of fraud; (c) message modification; (d) operation errors; (e) duplication/ spoliation of devices; (f) theft. The typology of electronic payment systems is given by: (a) on line payment systems using electronic currency (e-Cash); (b) payment systems using smart/ debit card; (c) payment systems using electronic checks; (d) payment systems focused on bank cards through the SET option (Cyber Cash); (e) payment systems using micro-payments with memorized debit/ smart card sums[29]. The domains of activity associated with the systems based on electronic money are: (a) effective electronic transactions (depositing and payment operations); (b) obtaining, collecting and operating; (c) clearing.

The economic implications that the creation of the electronic commerce applications implies, contain, in our opinion, the elements that refer to the stages of creating the informatic applications of on line commerce, the economic-financial establishment of e-commerce projects through the E-commerce Business Plan and the SWOT analysis, the intention of creating projects of on line commerce through the Cash Flow report, the use of synthesis financial-accounting indicators of the e-commerce companies through the "Balance Sheet", the offer of dividends to the e-commerce companies' shareholders through the "Shareholders' Equity" report.

We suggest that the e-commerce systems' implementation should be made by taking the following steps: (a) establishing the implementation strategy, (b) selecting the e-business solutions with respect to the companies' typology, (c) choosing the model and the architecture of implementing the BD, (d) quantifying the demands for creating the electronic commerce websites, (e) implementing e-commerce applications of the B2B type, (g) the economic and financial

[27] Intranet World Online site, http://www.internetworld.com

[29] www fv.com: the site of the First Virtual payment system by cards with a value stored on smart card/debit card

implementation of the e-commerce systems projects through the E-commerce Business Plan and the SWOT analysis. We foresee for the "start – up" companies the use of e-commerce Business Plan and the SWOT method, by following the next stages: (a) defining the SWOT analysis usage steps; (b) identifying the target market segment; (c) establishing the analysis indicators of the e-commerce business; (d) determining the security segment; (e) calculating the level of cost-effectiveness; (f) making a synthesis of the e-commerce business plan; (g) establishing the contents of the e-commerce business plan (mostly containing the description of the e-commerce business, the marketing plan, the operational plan, the management and the reorganization of the business, identification and analysis of the SWOT's risks, the financial plan); (h) monitoring the activity of the e-commerce companies: the cash flow from investing activity[30], the cash flow from financial activity, the effective discounted net cash flow (DNCF) statistics of the on line commerce project (TFNND), the cash flow statistics, the synthesis financial accountable indicators of the e-commerce companies through the balance sheet.

6. Section 6, entitled "Strategies, Programmes and Courses of the Information Society Approach", starts with the description of the RNSI project, which determines the implementation in the National Society of Romanian Post Office of a computerized network created for "pay desk" operations with national practicability; the RNSI network will computerize periodical and random activities specific to the National Society of Romanian Post Office. The regular activities computerized through the RNSI will consist of payments of toll and tax, payments for water and sewage services, payments to the suppliers of electric power and thermal energy, gases, sanitation, and will consist as well of the creation of some payments for commercial services (such as the selling of products and services, the progress of some saving and consignment operations, the FBM services, the selling of insurance products and pensions, the transactions for mutual/investment funds etc.); the payment to the providers of fixed and mobile phone communications, Internet services, radio-TV, CATV programmes, of local-urban-interurban transport services, associations, the payment of some leagues-clubs dues will also be computerized. The RNSI will ensure the payment of individual fees for postal services, contravention fines, registration taxes/ stamps, entry/ participation taxes, as well as payments for renting/ making reservations for trip tickets, hotel suites, tourism agencies, sell/ reservation of concert - show tickets, lottery tickets etc. The random computerized activities through the RNSI will be the distribution of owner/ investor certificates or the distribution of subventions at different economic moments, the census of the population or the organization of referendums on various topics.

We further describe the main projects, systems and services computerized in Romania among which we mark: the informatic services of information dissemination, the project called "The Implementation of Evaluated Technologies of Communications", the information system concerning the labour force, the information system for the electronic referendum, the informatics system concerning the public acquisitions (e-ap), the project concerning the creation of on line video conferences, the informatic project concerning the creation of "Cyber Centres", the information system concerning the customs services, the information systems dedicated to management processes modernization, the information systems for invoicing with the help of web technology, the project called "The Implementation of Digital Data Funds and The Creation of Digital Libraries", the information integrated systems of the local public administration, the government focused on the IS-KS ("e-government") and the computerization of the FBM domain. This computerization of domain is focused on the following objectives: payment methods computerized through the electronic currency, the use of SWIFT system, the systems of the dealer account and the electronic checks, the use of smart cards, the operation of FBM transactions using electronic money (it implies the use of

[30] www.corpvs.org: the site of CORPVS for accounting and legal consulting, contacts with lawyers, notaries, taxation consulting and consulting for owner associations etc

some technologies exclusively dedicated to the IS-KS: ATM, electronic wallet, virtual wallet and e-cash), the implementation of the electronic wallet card manageable in the European Community (CAFÉ), the implementation of the virtual store, the use of digital signature in the FBM and the financial accounting domains, "the electronic office holder" (electronic- banking, Internet-banking, mobile-banking, UniBank, e-Bank) and the TeleBanking services.

For each of these computerized systems and services, the Ph.D. candidate integrally presents some original solutions that consist in principles, objectives, utilized concepts, roles, computerized functions and processes, direct advantages, long term anticipations, constructive premises[31], informatic solutions and suggestions, constructive versions, beneficiaries, the applicability area etc.

This section continues to describe the concept, features, functions and the system's functional variants, the international standards and principles of e-learning worldwide accepted. In our opinion the complete definition for the e-learning system may be: the system that allows learning that concentrates on information technologies, being the system able to deliver information (data, knowledge, media etc.) on all types of hardware systems (any type of computers, NC , Internet, Intranet, Extranet) and software tools (BD, BC, BF, BG, indexes etc.), by means of technical data supports (hard-disk, floppy-disk, memory-flash, video-cassette, CD etc.), with a view to implement an on line learning system (on line learning/ web learning), and with the implication of some actors (teacher, tutor, instructor, pupil, student, master, doctor, trainee etc.) and some classical education systems (schools, high schools, universities, national academies, research institutes etc.)

The characteristics of the e - learning systems are: (a) providing multiple interactions between learning and informatics; (b) using the IT&C coupled with other informatic elements; (c) the possibility of trans-academic and trans-national relation with other educational actors; (d) providing the minimum time of assimilation, distributed training, low costs of the operative working, style and productivity in the assimilation processes, learning efficiency, group learning possibility, but only through an organized national/international system, (e) access to the information stored and applied in a large variety of formats and appearances, in the form of data, knowledge, media.

The main purpose of the e-learning system is to ensure an integrated initiative meant to determine the implementation of the following key-functions: (a) the implementation of an e-learning system in the areas of management, business and competitive development; (b) the adequate implementation of some direct programmes of LeaderShip and Business Management; (c) the creation of a programme exclusively associated with the development of functionality, efficiency and modernization of the client company executive which will regard the centre of the managerial competences by activating a strategy game based on the company's initiatives, anticipations and fundamental changes, parallel to the possibility of applying the e-learning processes; (e) the formation of a professional management-decision making team; (f) on line support for the employees of the beneficiary company, for the managers and the functional services employees (it is carried out through the dynamic, continuous and real time interaction with the instructors of the organization which delivers relied services for the e-learning processes).

The e-learning implementation models are based on the IS-KS educational system paradigm focused on three e-learning implementation models: distributed rooms (dri), independent education and long-distance open education. The international worldwide accepted standards of e-learning are the ADL, IEEE, IMS (the fundamental pilot-standards of the Advanced Distributed Learning), which are described in detail in the thesis.

The defining elements of the e-learning standards and norms initially refer to the e-learning standard objectives: (a) elaboration and spreading for the public interest of the e-learning standards which will be used in designing, implementing and unitarily exploiting the e- learning systems; (b) the designing firms, dealers and clients of the e-learning systems must develop the specific activities

[31] www forrester.com: the site of the Forestre Research magazine, which publishes articles and reviews in the field of e-learning

of design, implementation and exploitation through harmonization and collaboration, in order to maximize de use of e-learning systems; (c) we propose founding a worldwide council of designers, dealers and e-learning system users which will have to deal with mutual arrangements integrally accepted by the actors who operate in the activity of on line learning; (d) the members of this worldwide council (hereafter called "Council") must support the activity of this global organization through the following actions concerning the guarantee of the conformity between the council's technical directives, the international newly designed e-learning and AI standards, at the same time with the accomplishment of the co-work between the council, auditors and users. The specific principles applied in the design, implementation and unitary exploitation of the e-learning systems are: (a) the usage of some concepts, global standards and solutions of designing, creating, implementing and exploiting, accepted by the council's members; (b) levelling the usage of international on line learning standards; (d) development of some unitary e-learning concepts (UC, US, OE etc.); (e) unitary training of specific demands (reuse, reproducibility, neutrality of informing methods, interoperability and maintenance, personalization, compatibility, completeness, formalization, pedagogical flexibility, clear classification of educational objects, life cycle etc.).

The design of on line learning systems focused on the strategic correlation between the business's objectives, the system's infrastructure and the staff training results' evaluation must start from the premise that in the actual process of instruction, the companies' staff exclusively operates with hardware, software and firmware instruments, for which reason the creation of these systems must be based on four important elements of the instructional design, the large dimension systems' development and implementation[32]: (a) performances' quantification in relation with the accomplishment of the business objectives; (b) establishment of the objectives and the instructions specifications; (c) the design of the e-learning system, the creation and check of the e-instruction results.

This section also contains the use of the Six-Sigma methodology, the preoccupation for recovering the investment of e-learning systems, the steps to follow in the quantification of the cost-performance proportion, the paradigm implementation and the on line learning advantages, the specific requirements of the e-learning applications and the on line learning advantages, as well as the viewpoint of the national project concerning the computerization of the education process.

7. Section 7, entitled "The Economic Effects Foreseeable through the Implementation of Information Society–Knowledge Society" contains the description of some effects that we consider IS-KS will be able to generate and that will have or not a beneficent role on mankind. It has been observed a number of **14 effects that include in their turn other effects**. The synthesis of these effects is the following: **(1) general economic effects; (2) digital business organizations in virtual organizations, in the context of digital economy and IS-KS; (3) initiation of some alternative economic systems and the comparative and competitive advantage that the electronic commerce generates; (4) the change of the game's rules in the prices fixation at the same time with the electronic commerce influence on the consumers in the age of globalization and IS-KS; (5) the emergence of the cybernetic consumer and the role of the Internet-Intranet-Extranet tandem; (6) the change of the competition's character in IS-KS, at the same time with the emergence of a new tendency towards monopolization and fusion in the field of IT&C; (7) the diversification of the electronic markets, media manipulation and Internet subculture; (8) the maximization of the role of intangible assets and their management, as well as the amplification of the role of knowledge and knowledge management; (9) the influence of the creative work and new perspectives concerning the work in e-economy, as well as the change of the character of the financial markets and the emergence of "competent money"; (10) the emergence of the**

[32] www forrester.com: the site of the Forestre Research magazine, which publishes articles and reviews in the field of e-learning

creative age and economy, at the same time with the maximization of the intellectual property's area and influence; (11) perspectives of the "leap-frogging" division and the "next generation" networks; (12) the economic, social, juridical and psychological effects of the new labour forces; (13) the economic effects of the electronic commerce applications; (14) the initiation and application of some innovation policies, integrated at the level of the European Union (the Lisbon Strategy and the Barcelona Objective).

IS-KS, the defining of some IS dedicated to IS-KS, the legislation specific for the IS-KS's design, creation and implementation and the characteristics of the new forms of work, the specificity and typology of the e-activities, the social, economic, juridical, psychological effects of the IS-KS. There are also presented the fundamental elements for the chosen theme, among which we mention the virtual organizations and activities, the "outsourcing" and the virtual businesses, the e-commerce technology, the electronic payments or the economic implications of carrying out the applications of electronic commerce.

The development of a pertinent inference is employed to specify the globalization's multiple senses, the concept of a system, to define the Internet's contribution, the reasons concerning the opportunity and the creation of the IS dedicated to the IS-KS implementation, the new forms of work, the concepts relative to the virtual community, the virtual organization, the virtual activities, the "outsourcing" and the electronic businesses in the virtual context, the payments made in the systems of electronic commerce or the economic implications of carrying out electronic commerce applications in the IS-KS.

The global number of people with superior education and experts increased, but mankind has more problems. If refer to the TeleMedicine technology, be may acclaim that there are multiple opportunities, complex medicines, but in fact, people suffer from health problems. In the same context, the extremely efficient and competitive e-commerce technology, has not generated richness for the majority of the inhabitants of Earth, the major part of Mankind being poorer and poorer.

On the contrary, mankind has recorded so many problems, that the dream to live in IS-KS or STSCM becomes almost utopian, although, on the whole, the technologies necessary to the complex and total computerization of the human society have been conceived or the e-education Technology can rapidly generate the long awaited lift up in the superior education of individuals, given the fact that there are people who read very little, watch TV a lot or have a minimal degree of knowledge flattened by the massive access to the Internet; writers to write in the last 50 years were many, yet study goes worse and worse. People are obsessed and tired of other occupations, such as the increase of the billionaires and millionaires reported to a global level or to nations, while the number of true values continuously and surely, alarmingly decreases. In addition to that, Mankind has complex ethnic and religious problems consuming the financial, human and spiritual resources, the latter ones having the possibility to be used, as an optimistic alternative, to the approach and insertion of IS-KS and STSCM.

Mankind considers, through the organisms with mondial calling, objectives regarding welfare, happiness or cooperation, but records problems most of the times insuperable and to the highest extent unsolvable. Mankind has found, after important efforts, the way to achieve welfare, but it does not know how to obtain a global context axed on cooperation, commerce, information and knowledge, elements which scale off the opportunity of achievement of STSCM, axed on a society of second generation, which will demand pretentious edges called truth, spirit, conscience and morality. Humans have conquered the outer space, since they reached the Moon or other planets, but they did not succeed in getting the profound cognition of all defining elements of peoples and ethnics; we could support the idea that humans have remarkable accomplishments regarding the cognition of the structure of the atom and global atmospheric climate, but they do not have arguable results concerning the cooperation of any type and nature. A fortiori, mankind desires to create a DURABLE SOCIETY of second generation, -STSCM-; in this regard it learned to make ample and utopist plans, on the background of some global achievements with a minimal degree of complexity,

while mankind hurries without preparing before and waits for the favorable moment to implement IS-KS and IS-KSOM, as long as it is optimally necessary. By means of IS-KS, mankind will use computers at a global level, due to some global systems, suggested in the thesis, it will possess multidimensional and exhaustive information, but it will have to solve problems concerning intercontinental, interregional, interreligious or interracial communications. Problems concerning the role and application of great personalities, the discharge of the possibity to obtain important and rapid profits, the atrophy of superficial and petty relations between individuals, leaders or nations will have to be rapidly, totally and ultimately solved, in parallel with the existence of the times when the necessity of sincere actions among global actors has to become omnipresent.

On the contrary, mankind will be able to find enough time to solve all the difficult problems, in order to trip rapidly and soon the IS-KS coordinates; in the present context, the nations of the world have to start qualitative actions and projects regarding qualitative mutations of all types and categories.

Prima facie, the factors of decision of mankind will have to act in such a way so that the entire world might be seen as one person, and a certain person be seen as the entire world; moreover, mankind does not need to regret the faults of the past, because these belong to the past. We mush be happy they happened, because this is the only way the nations of the world can be convinced that the effective achievement and operation of the IS-KS and STSCM characteristics and performances will be approached with trust, hope and optimism. We consider that mankind does not have to bustle much, given the fact that the global events favorable to the global development, causa finalis, IS-KS and STSCM, will be accomplished when human society least expects, considering that "everything happening has a reason"(Garcia Marques, Reflexiones).

CULTURAL IDENTITY AND CITIZENSHIP. THE CASE OF THE ROMA MINORITY IN ROMANIA

VALENTIN QUINTUS NICOLESCU[*]

Abstract
My paper focuses on the intersection between the Roma cultural-identitary construction and the political concept of citizenship, trying to reveal if such an approach can prove itself helpful in providing a better understanding of the unilaterality of the majority-Roma relationship. By unilaterality I understand the particular model in which the Roma-Romanian relationship has structured itself overtime. It mainly consists of a segregationist view that stresses the majority's responsibility with the minority's integration process and the failures to promote a partnership with the minority. This approach tends, in my opinion, to treat the minority in absentia, producing therefore the well-known effects of the so-called "Roma problem". On the other hand, the idea of empowering the Roma minority is also seen as being fundamentally within the majority's attributions, therefore contradicting the very essence of the concept. My approach seeks to apply a theoretical framework developed first by Gramsci and later by Boudieu to this particular situation. Thus I hope to be able to provide a better understanding of both the history and the present of majority-minority relations and to highlight possible directions or outcomes relating to the dichotomy of integration/communitarian privacy in the case of the Roma minority.

***Keywords**: Roma minority, cultural identity, citizenship, Gramsci, Bourdieu*

Motto: „Large scale immigration, within a society so *well fettled* as ours, can only be positively perceived provided that the immigrants have a solid background and that their religion and race do not prevent them from marrying and mixing with members of the host-population „
The Royal Commision on Population, 1949[1]

I. Introduction

I came up with the idea for this paper on the basis of an event that took place not so long ago on the streets of Bucharest: coming back home one afternoon I saw an elder Roma woman, poorly dressed, going from one passer-by to another and addressing them. People were reluctant, turned their head away or even changing their path. I couldn't hear what the woman was saying to the others, but the situation seemed to confirm the supposition that she was begging. I went about my way until I inevitably got in her path: "Would you happen to know which is the way out of the passage that gets me to the University bus station?". I pointed her to it and went about my way home somewhat displeased with the fact that, although I often bear witness to such contexts, although I try to learn about what is commonly known as "The Roma Problem", I have not succeeded in finding appropriate answers to such otherwise legitimate questions as: What are the causes to such rejections? To what does this "Roma Problem", which is ever more frequently mentioned in Romania and Europe, amount? Can it be conceived in terms of "solutions"?

[*] Lecturer, Faculty of Social and Administrative Sciences, "Nicolae Titulescu" University, Bucharest; Ph.D. candidate with National School of Political Studies and Public Administration (NSPSPA), Bucharest (e-mail: valentin_nico@yahoo.com), beneficiary of the project "Doctoral scholarships supporting research: Competitiveness, quality, and cooperation in the European Higher Education Area", co-funded by the European Union through the European Social Fund, Sectorial Operational Programme Human Resources Development 2007-2013.

The main categories of answers usually arise either from the domain of a genuine mythology (both popular and academic), unavoidably leading to the constitution of a stereotypy which is completely useless scientifically and whose main discursive feature is in most cases negative with respect to the perception of the Roma, or from an academic field which thrives in hyper-specialization and value-bias. We are talking here about a positively meant bias, in the sense of political-correctness, but which produces (probably) involuntary justifications of the popular models – such as, for example, explaining crime through the lack of education or through extreme poverty, labeling Roma as the most genuine expression of poverty, derived from the discriminating politics and attitudes by the majority on historical level[2].

In other words, the most common claim regarding the Roma "problem" would be that all its stereotypical and prejudgemental *avatars* derive from a history of misunderstanding, misperception and refusal by the Europeans to understand the *other*, situation inexorably leading to the marginalization of an entire ethnic group, placing it outside of the *politeia*, fact that also brought about the waiver on its civic and political integration[3]. This commonly held approach, starting from the acknowledgement of the secular repression of the Roma, also sets forth a compensative formula, conceived of as a mixture of multiculturalism and cosmopolitan illuminism, attempting to stress the importance of the cultural dimension but on the basis of the assertion of education (which is thought of not as mere alphabetization, but in its civic and political dimension as well) as representing the link which is needed in order to ensure a solid base for the cohabitation of Roma and majority, whatever such may be. This pluralistic formulation, in the purest sense of the word, which aims at bringing the Roma on the common ground of the shared socio-political values, is still hindered by the persistence of a segregationist *forma mentis*, both with minority as with majority, abided by its very long use. The Roma, on the other hand, seem not to prefer integration and participation within the societies they reside in, instead choosing the closed environment of their own communities, fact usually explained in the same terms of majority-originated segregation.

At the same time, this type of strategy is, in my opinion, fallaciously designed, as it throws all responsibility on the shoulders of the majority ethnic group, while treating the Roma *in absentia*. Here lies the very core of this paper, which *aims at studying whether the cross-point between the cultural-identity construction of the Roma and the political concept of citizenship can offer suggestions with regard to the unilaterality of the relationship between the majority ethnic group and the Roma.*

II. Thesis and theoretical perspective

As such, my paper aims at observing the intersection of two distinct conceptual pathways: cultural identity, on the one hand, citizenship, on the other, while attempting to analyze the extent to which their superposition could offer a clearer picture of the socio-political problems the Roma have to face, not only in Romania, but on the European level as well. More to the point, our main concern would be the extent to which the historical construction of the Roma identity, as considered from a relational-subjectivist perspective, can, once subjected to the modern civic and political concepts, carries forth within this intersection area the element or the elements leading to the alleged insolvability or persistence of the Roma "problem". This paper was not intended as an attempt at reconciliation between the multicultural and the liberal-pluralist theories, but rather as a political and

[2] These historically determined conditions determine Emanuelle Pons to say that in Romania "the Roma loose on account of their mentality and analphabetism, leading to a lack of knowledge with respect to the rights and facilities they, as any other citizen, are entitled to in keeping with the law". According to this logic, the centuries of exclusion are the ones that keep Roma parents from letting their children "to attend school" - – Pons, Emmanuelle, Țiganii din România – o minoritate în tranziție (The Gypsy in Romania – A Minority in Transition) (Bucharest: Compania Publishing, 1999), p. 157.

[3] István Pogány, The Roma Café.Human Rights and the Plight of the Romani People (London: Pluto Press, 2004), p. 2.

historical analysis of the two aforementioned dimensions, on the basis of a *conceptual framework* established by Gramsci and fundamentally developed by Pierre Bourdieu. Therefore, I will follow the interdependent evolution of citizenship and nationality in the modern western societies through the construction of a cultural-political model indigenous to this context, by combining the conceptual apparatus developed by Antonio Gramsci –especially the concept of *hegemony*- refined with Pierre Bourdieu's contribution, namely the concept of *habitus*[4] and his theory on the administration of the symbolical goods[5].

In the second stage, I will subject this entire conceptual framework to the specificities of the Roma cultural identity, as it has been shaped by the relations between the minority and the majority ethnic groups in the last hundreds of years, thereby attempting to identify the causes leading to the aforementioned unilaterality-feature with respect to the Roma integration process in the contemporary political societies.

III. Historical Construction of Citizenship

Modern societies regard citizenship as the cornerstone of their specific socio-political inclusion, any form of civic participation being conditioned by acknowledgement (either by birth, or by attainment through *ius sanguinis* or *ius solis*) of the citizenship or nationality[6]. Modern citizenship is understood in opposition with the old forms of socio-political inclusion – related to the membership within specific socio-economical organizations, such as guilds or states that were inherently very selective in nature, essentially depending on the inherited social status[7] - as an extremely inclusive formula, and not by the mere fact that it eliminates the traditional membership criteria, but by the fact that it replaces these with the formal and universalistic view of certain specific political values, resulting in rights and obligations supported by the core-unity of the centralized national state. Citizenship is thereby equally attributed to all individuals, but only provided their being members of a nation-state[8]. This form of inclusion which is grounded on the fusion between state and nation – later on also ideologically framed – can be traced back to the French Revolution in 1789, when the state, which had been already centralized by the absolute monarchy, becomes also ideologically labeled with the concept of nation. The most pertinent example is probably the 1789 Universal Declaration of the Rights of Man and of the Citizen that establishes the right of every individual to belong to a nation, while at the same time asserting the sovereignty of the nation resulting in the sovereignty of the law[9]. At the same time, a second element which is relevant to the subject matter of this paper, brought about by the citizenship and its correlative rights is the establishment of the ownership right (and its protection) as being essentially related to the development of the political system, element that will implicitly differentiate among the citizens

[4] Defined as „systems of transferable long term dispositions, structured structures predisposed at functioning as structurating structures, that is as generative and organizing principles of practices and representations that can be objectively adapted to their purpose, without requiring the conscious determination of the purposes and the explicit mastery of the operations needed to attain them" – Bourdieu, Pierre, apud Cuche, Denys, Noțiunea de cultură în științele sociale (The Notion of Culture in Social Sciences) (Iași: Institutul European Publishing, 2003), p. 119. Also see Bourdieu, Pierre, Economia bunurilor simbolice (The Economy of Symbolical Goods) (Bucharest: Meridiane Publishing, 1986), pp. 84-85.

[5] I also find Jürgen Habermas' contribution to be of use, especially with regard to the historical construction of citizenship and its relation to the nation - Habermas, Jürgen, The Inclusion of the Other: Studies in Political Theory (MIT Press, 1998).

[7] Idem, p. 514.

[8] [8] Idem.

[9] Touchard, Jean, Histoire des idées politiques (Paris:PUF, 1970), Vol. 2, p. 461. The law being the fundamental institution defining the aspects of citizenship.

between "active" and "non-active" (or *passive*, as the historians would have it) with respect to their involvement in the political life.[10]

The final stage of this nation - citizenship dialectic resulted in the emergence of a civil society which is capable of politically dominating the state[11]. Citizenship and political nation are inextricably linked, reciprocally influencing each other along their evolution. As Miroslav Hroch has put it, constructing a nation has three indispensable requirements: 1. The memory of a common past, regarded as the "destiny" of the group in cause, 2. A dense network of linguistic and cultural relations that facilitate a high level social communication rather within the group than outside of it and 3. *A concept of in group equality of all its members organized as civil society*[12]. As this latter aspect is definitive of national citizenship, it reflects the two main European models for nation formation, which, put in a nutshell, would sound something like this: "the nation creates the state", respectively "the state creates the nation".

Obviously both claims are empty of real substance, representing mere conceptual constructs that can be useful in identifying the *type of ideological discourse* elaborated by some political and cultural elite that ushered the fusion of the two concepts in a single one, namely that of the nation-state[13]. That which previously bore the name "People"-in all its correlative expression forms prior to the age of nations: serfs, krüner (old german name for the inhabitants of the city of Braşov - Kronstadt), subjects, clergy etc.- has been redefined according to certain criteria as *nation*, perceived as a group which is wider and more comprehensive than any other form of community, permanently homogenous and only superficially divided by status, class, residence or (less frequently) ethnic boundaries[14]. The citizenship is a civic-political concept associated with that of nation, that tends to follow a similar constitutive pathway, thereby representing *a concept of its time*- in keeping either with the French model of the civic nation synthesized in Renan's thesis of the "daily plebiscite"[15], or with the German ethno-cultural one grounded by Fichte, which is mainly voluntaristic and grounded on the concept of "educability"[16]. Citizenship is antinomically conceived with respect to the local and localist-centrifugal culture, as an access way to the "universality" of the nation as centripetal and unitary whole with respect to the common civic and political values which are definitive of the identity of the individual and of the community. Seen in these terms, citizenship was also conducive to a certain model for making politics and conceiving the political, which resulted in the creation of the very western European tradition of thought, criticized by Kymlicka from his liberal position for being difference-blind[17].

---

[10] A distinction which has been fiercely criticized ever since its beginning, on the grounds of its limitative view on political inclusion - Sutherland, D.M.G, The French Revoluton and the Empire, The Quest for a Civic Order, (Oxford: Blackewll Publishing, 2003) p. 83.

[11] Idem, p. 382.

[12] Hroch, Miroslav, „From National Movement to the Fully-formed Nation: The Nation-building Process in Europe", în Balakrishnan, Gopal (Ed.), Mapping the Nation (New York and London: Verso, 1996), p. 79, .

[13] See Habermas, Jürgen, The Inclusion of the Other: Studies in Political Theory (MIT Press, 1998), p. 105. Also see Benedict Anderson's contribution, Imagined Communities. Reflections on the Origin and Spread of Nationalism (London: Verso, 1991), revised edition, pp. 6-7.

[14] Greenfeld, Liah; Chirot, Daniel, „Nationalism and Aggression", în Theory and Society, Vol. 23, No. 1, (Feb., 1994), p. 79.

[15] Apud Girardet, Raoul, Naţionalism şi naţiune. (Nationalism and Nation) (Iaşi: Institutul European Publishing, 2003), p. 19.

[16] Idem.

[17] Ethnic, gender etc., conceiving the political in idealized terms that imply citizens with common lineage, language and culture. Even in the cases in which the respective schollars were living in multy-language empires ruling over numerous and various ethno-linguistic groups, such as the Habsburg/Autro-Hugarian Empire, their claims about the politeia were still made in terms of the cultural homogenity corresponding to the Greek city-states - Kymlicka, Will, Multicultural Cityzenship. A Liberal Theory of Minority Rights (Oxford: Clarendon Press, 1995), p. 2.

The ideological artisans of the nation state and of national citizenship are, in the case of the West (corresponding to the "state creates nation" model) lawyers[18], diplomats and military officers belonging to the royal administration, actors of the weberian style rational state bureaucracies[19], while for the Central and East European space, they were writers and historians, intellectuals in general, that "formed the grounds on which some such as Cavour and Bismark realized state unity by propagating the more or less imaginary notion of the unity of the cultural nation"[20]. The construction of nation and nationalism "reflects choices made by its (*ideological*) architects and not an 'objective reality' of some sort"[21]. We are speaking here of a certain class of intellectuals that, either after, either before the actual fact and its correlative political decision, they ideologically brought about the national identity and consciousness as political symbolical goods[22], which were consciously integrated with the collective habitus by the use of symbolic violence[23] in view of attaining specific political objectives.

In nuce, citizenship as a western political concept, despite its universalistic aspirations resulting from its correlative rights, must be considered primarily in historical terms, namely in light of the evolution of the nation as its political assertation, be it civic-individualistic (as in the Anglo-Saxon case), civic-collectivistic (the French case) or ethnic-collectivistic (the German and the East-European model par excellence)[24].

Secondly, the duality citizenship-nation objectively represents the intellectual creation of some particular social groups, reflecting the ideologically grounded construction of some concepts that were destined for assimilation in the habitus of various social classes and groups for the purpose of its modification in accordance with the aim of creating a society which is wider and more inclusive. At the same time, the particular view on citizenship as an avatar of the nation leads to an explanation of the first part of the problem of this paper, namely explaining the integrative responsibility felt by the majority group with respect to the Roma minority in the sense of subjecting it to the "ideological treatment" with respect to education, rights etc. or even the multicultural passion that tries to double this process. However that which this first section of my paper does not account for is why the Roma appear to be so resentful and uncooperative with respect to the efforts that the majority ethnic group make for their sake, why the relation between the two groups seem to unfold, as I was previously saying, in the absence of the Roma.

IV. What is a Roma?

Some time ago, during a meeting regarding the stereotypes related to the Roma in general, Roma women in particular I witnessed a fierce debate between a few of the Roma women participants on the subject of Roma identity. More exactly, how can one tell a "true" Roma? The dialogue ended before the listener or the participants could retain any clear notion on the grounds of which to answer this real challenge. Obviously, a similar question can be asked abut the Romanians as well – how can one identify a real Romanian? The answer is simple – it is not necessary, he/she

[18] For example, speaking of the political system that emerged after the French Revolution, Sutherland stresses the fact that the administration –especially the elective one- was dominated by lawyers, although the membership right belonged to the nobility as well – Sutherland, idem, p.84.

[19] Habermas, op.cit., p. 105.

[20] Idem.

[21] Greenfeld &Chirot, idem, pp. 83.

[22] Bourdieu, Pierre, *Economia bunurilor simbolice* (*The Economy of Symbolical Goods*) (Bucharest: Ed. Meridiane, 1986), p. 31

[23] by association to the state political power, in the sense of symbolic violence i.e. „any authority that succeeds in imposing meanings and imposing them as legitimate", definition that establishes the relative autonomy and relative dependence of the symbolic relations along their interaction with the power relations - Bourdieu, Pierre, Passeron, Jean Claude, *Reproduction in Education, Society and Culture Theory* (London: Sage Publications, 1996), p. 4.

[24] Greenfield&Chirot, idem, p. 82.

does it by him/herself. The Romanians (for example) have the apparently trivial notion of personal origin, that is conscious, voluntary and clearly defined. The Romanians are backed by those national traits that facilitate identification: common language, shared history, common territory, *a concept of in group equality among all the members of the group organized as civil society* etc., to which the aspect stressed in Renan's definition can also be added – the will of living together. I believe that here lies the answer to the second part of the question I asked at the end of the last section.

The first step must consist in identity definition and in this case I would rather go with a subjective-relational model, that is time changing[25]. Therefore, by observing the diachronic evolution of the dynamic of the relations between the Roma ethnic group and the nationals of the various European states, we can find that they follow a line that has physical extermination at one end (for example the Roma holocaust – *Porajmos*[26]) and extreme tolerance at the other, especially present during the Middle Ages. The history of these relations revolves around a *deaf struggle* whose main actors are the political authority (feudal or modern) explicitly seeking first the sedentarization and later the assimilation, or even extermination[27] of the Roma and, on the other hand, the Roma minority, perpetual rambler, caught in an eternal cat and mouse game with the authorities, preserving their life style at any cost – from lying and forgery[28] to seeming surrender to the indigenous normative codes – legal or otherwise. Could we point out a specific identity element during all this period? At a first glance, we could say that nomadism –therefore the lifestyle- could be such an element, thereby representing the very key to understanding the Roma identity. But history also shows us that Roma chose not once to become sedentary when and where favorable conditions were met. In my opinion, their nomadism can be regarded not as a mere aspect of their identity, but as a consequence of some other element, which is much more important with respect to the specific nature of the Roma identity: the *legal system*. Along their history, the most frequent request by the Roma populations in relation to the authorities concerned the acknowledgement and observance of their judicial and jurisdictional autonomy, namely the acknowledgement of the Roma communities' right to solve transgression and crime issues according to their own practice, even if the accused had not committed their deeds within the Roma community but in that of the indigenous population[29]. But while in the feudal period, corresponding to the traditional state, such requests could appear reasonable, the emergence of the modern sovereign state after Westphalia and the English Revolution made such claims appear as being fundamentally undermining with respect to the legitimate authority, therefore anti-systemic. We can therefore infer, as a first step, that one of the most characteristic Roma identity features, also relevant to our discussion, is the claim of *romany*

[25] See Barth, Fredrik, *Ethnic groups and Boundaries . The Social Organization of Culture Difference* (Boston: Little, Brown&Co, 1969), especially pp. 9-39; 117-134.

[26] See especially Lewy, Guenter, *The Nazi Persecution of the Gypsies* (Oxford University Press, 2000).

[27] The problem regarding the physical elimination of the Roma does not emerge during the nazi period, its roots run much deper – for example in 1714, in the Mainz Archibishopry the summary execution of all dishonest gypsies and drifters it is declared, without any trial, based solely on their forbidden life style: in 1725 Friedrich Wilhelm II imposes a decree by which in Prussia all gypsies above 18 –men and women- could be hanged without trial. Such examples can also be found in the Netherlands, Spain or Great Britain - Fraser, Angus, *Țiganii* (*The Gypsies*) (Bucharest: Humanitas Publishing, 2008), p. 169.

[28] As in the case of the „Great Scheme" or *o xonxanó baró* in Romani – counterfeiting the documents needed for getting through the customs during the Middle Ages and taking on identity as an „Egyptian" in order to obtain favors with the local population by posing as a pilgrim - Fraser, Angus, idem, pp. 73; 75-98.

[29] For example the right of free pass given by Sigismund King of Hungary to Ladislau, the King of the gypsy in 1423: "we hereby expressly command our loyal subjects here present to support and shelter the aforementioned King Ladislau and his gypsy subjects, without any resistance or confinement. Should any quarrel or problem arise among them, none other than the same Ladislau shall have the right to judge and forgive" - Fraser , Angus, idem, p. 88. There are many more such cases and they are not restricted to any geographical or temporal frame. Also see Weyrauc, Walter O., *Gypsy Law. Romani Legal Traditions and Culture* (Berkeley&Los Angeles: University of California Press, 2001), especially Chap. 2 Weyrauch, Walter O.; Beli, Maureen Anne, „Autonomous Lawmaking: The Case of the ‚Gipsyes'", pp. 11-87; Cap. 6: Fraser, Angus, „Juridical Autonomy among Fifteenth and Sixteenth Century Gypsies", pp. 137-149.

precedence over the local legal systems. And this element inexorably opposes the Roma to the Western political and legal constructs, especially those related to citizenship, conceived as an expression of a structured system of legal norms implying rights and obligations. This element however does not fully account for the absence of the Roma from the official decision processes regarding their own situation, for example, or for the reluctance in basically assuming their rights as citizens.

Secondly, as I have previously attempted in showing, citizenship represents a construct which can be understood only in relation to the concept of nation and its corresponding evolution. And here we are forced to come back to the issue we discussed in the beginning of this section: considering that, by virtue of the way in which the main features of the European *politeia* evolved in time, state authority can answer to claims made only by clearly defined and identifiable groups, stating their claims through leaders which are found to be legitimate by the system, *what are the Roma* with respect to their potential relation to the institutions of the majority ethnic group?

Some may think it is easy to identify someone who is Roma, by race traits for example: Roma have darker skin. But not all Roma correspond to this taxonomy and, on the other hand, Sicilians or Turks are not Roma. Obviously, they have a common language, fact that would make them discernable – notwithstanding the fact that there are a lot of persons who claim to be Roma but who don't speak Romani, the Romani language is nothing but an immense collection of dialects that would render the understanding between, say, a Swedish *Tattare* and a Turkish or Spanish Roma almost impossible[30]. Also, the cultural identity features – from clothing, religion to music belong to a similar tendency towards extreme variety (from traditional Balkanic gypsy music to the Spanish flamenco, for example), to which we must also add the preconceptions of the majority ethnic group with respect to them[31]. The message of such a fragmentary community can be neither coherent, nor intelligible for the institutions of the majority.

V. Conclusions

Briefly put, the Roma population did not undergo a process of cultural unification and identitary reconstruction as the Europeans did, therefore lacking a specific identity which is capable of manifesting itself politically, as in the case of the other European minorities. And this aspect derives from the fact that the Roma still lack, while the other European nations do not, a legitimate intellectual class acknowledged as such by the very Roma community, capable of producing the kind of cultural and ideological goods assumable by the Roma habitus with the clear purpose of producing political effects. The Roma intellectuals which presently constitute their interface with the majority ethnic group are not the organic product of their own community, thereby reflecting its characteristics in their ideological production, but the results of the assimilation of the values of the majority group[32] and therefore the Roma manifestation within the civil society is next to null. Adding to that the informal persistence of the old *romanya* "legal" system, fundamentally producing a rejection by the Roma of the rights and obligations involved with citizenship and membership to the state, I consider that our study has also attended the last of the elements which are required in answering the problem at hand – the non-participation by the Roma to a dynamic, constructive and mutually beneficial relationship to the majority ethnic group. The answer lies mainly in the specific nature of some of the defining characteristics of Roma culture – traditional judicial autonomy directly opposing the European

[32] Bearing in fact the distinct name of *Romanized*.

construct of national identity – and, secondly, Roma community's incapacity in producing an authentic intellectual class capable of becoming involved with the discussions with the majority ethnic group and also producing, on ideological level, the desired identity project, compatible with the European civic and political thought and capable of discussing its fundamental values.

From this perspective, the greatest chance of the Roma could be the launching of a real debate over the European citizenship, offering the Roma leaders the opportunity to propose a reconfiguration of the concept of citizenship in such a way as to include their community as well. The partnership with the majority ethnic group, that I mentioned in the beginning of this paper, can only be realized from *equal positions*.

THE PARTNERSHIP BETWEEN CHINA AND INDIA AFTER 2005

MIHAELA PĂDUREANU[*]

Abstract:
In 2010 China and India celebrated 60 years of diplomatic relations. Both countries are fast growing economies, which are increasing military spending that is why they are the two main powers in Asia. China and India fought a war in 1962 and still have disputed land borders. Economy and military spending are not the only elements that should be observed when we talk about these countries. Another important element is Pakistan's role in the region. India disclosed its concerns regarding especially the closeness between China and Pakistan in security and nuclear matters. Resources, disputed land borders and Pakistan's role are the three elements that make the relationship prone to difficulties. Both could choose to cooperate - by finding common interests and instruments to obtain these interests or could choose to have a difficult and unpredictable relation. The main purpose of this paper is to analyze the relationship between China and India after 2005, when they have signed the "strategic partnership", which creates the legal framework for cooperation to see if they have the same relation when it comes to regional issues as when it comes to global problems. The second propose is to explain the differences or the similarities between their behaviour. In the first part I'll focus on the economic dimension and on how increasing cooperation in this sector can promote a stable and comfortable foundation for both of them. In the second part I'll explain how they relate to land borders disputes. In the third part I'll present the current situation between Pakistan and China and on the other hand between India and Pakistan. In the last part I'll identify and interpret the causes that are leading to similar or different actions.

Keywords: *China, India, Pakistan, South Asia, security.*

Introduction

As India and China are emerging as regional and global powers they are changing the perceptions regarding Asia's security. Their relation, which has been a difficult one for a long time can explain matters regarding the security problems for the whole region. This paper will discuss the relation between India and China, showing the difference between how they approach the economic and trade relation and how they respond to the security matters. Important actors, whose relations to China and India should be discussed as well are Pakistan and US. Pakistan has been supported by China for a long time with the main purpose to balance India's growth. On the other hand, US have tried to improve its relation with India, mainly after 9/11 seeing in India a partner in fighting terrorism. The second reason was US's interest in gaining an ally in Asia.

This subject is important because will show how the security matters influence the institutional framework in which these states act and how they perceive each other. To present their relation I'll identify the areas in which there are likely to cooperate and share mutual interests and matters in which they have suspicions regarding the other's intentions.

The paper will focus on analyzing of the essential documents, such as Joint Statements and official's speeches. Other sources utilized include papers from Chinese and Indian perspectives**.**

The China – India Partnership

India and China both have emerging economies, nuclear weapons and expanding military budges. They are increasing their influence in Central and Southeast Asia[1] while developing their

[*] Ph.D. candidate within the "Doctoral Scholarships for a Sustainable Society" project, funded by the EU through the 2007-2013 SOP Human Resources Development at National School Of Political And Administrative Studies (NSPAS). (e-mail: mihaelapadureanu@gmail.com).

hard-powers capabilities and that's why they are named rising powers[2]. In their recent history, China and India have experienced a complex relation. They shared a mutual background in 1940-1950 which left them with unresolved border issues. Their territory is the first dimension where China and India do not agree. After they fought a war in 1962, India and China were left with world's longest disputed border line; China is claiming 92.000 km that now belong to India. The first claim is on India's western part, on Aksai Chin in the northeaster section of Ladakh District, in Jammu and Kashmir. The second claim is on the Arunachal Pradesh state, in eastern part where is the monastery that has the most important role in choosing the new Dalai Lama incresing the area's symbolic role[3]. In the same time this position is of major importance for China's influence over Tibet. India has claimed that should receive the parts that the British Empire had occupied on Chinese territories. After defeating the Indian forces, China withdraw 20 km further from the McMahon Line to what was called „the line of actual control" in the Eastern sector and 20 km behind its latest border in Ladakh, called "the line of actual control" in the Western Sector[4]. Since the 1980s there have been mutual efforts to recognize the Line of Actual Control (LAC), which now defines the border[5]. The officials from both countries don't seem to agree on what part of the border they actually need to debate. While Chinese Prime Minister, Wen Jiabao was visiting India in December, the state-owned Chinese media referred to the border as nearly 2,000 km. The Indian ambassador, S Jaishankar had another opinion and said that „We have a long common border of 3,488 km"[6]. After Wen Jiabao`s visit, China and India agreed to sign a joint statement by which reaffirmed their support for a peaceful solution to this problem. They continue to approve the Agreement on Political Parameters and Guiding Principles for Settlement of the Boundary Question agreed in 2005 and the process of negotiations being undertaken by the Special Representatives with the aim to offer an „acceptable solution"[7]. For now, their goal is to maintain peace on the border.

Others saw China and India as becoming *Chindia*[8]. *Chindia* indicates a form of cooperation in which interdependence is so deep that the relation between the two parts can only be a peaceful one. Its primarily meaning refers to an economic coalition, but can refer to trade and economic development, energy, environment, social advancement and security matters[9]. That's why through cooperation in the economic area, China and India could improve their partnership in other matters like security or energy sector.

The second problem they have refers to terrorism. India and China announced their opposition against any form of terrorism and their commitment to countering terrorism including by supporting implementation of UN resolutions[10]. One of the mentioned resolutions, 1267 lists as terrorists JuD and Hafiz Saeed. Hafiz Saeed founded Jamaat-ud-Dawa (JuD) and is the master of Mumbai terror attacks. But China has not agreed to add Masood Mazhar, founder of terror group Jaish-e-Mohammed to the terrorist list[11]. The document doesn't mention the Mumbai terror attacks or Pakistan's role in countering terrorism in the region. China signed in April 2005 a treaty with Pakistan - Treaty of Friendship, Cooperation and Good-neighbourly Relations between the People's Republic of China and the Islamic Republic of Pakistan (Treaty) - by which mutual support is provided for protecting their national sovereignty and integrity. In the China-Pakistan Joint Statement signed after Pakistani President, Asif Ali Zardari visit to China, Pakistan considered its relation with China as „the cornerstone of its foreign policy"[12] . It seems that this document signifies an alliance between China and Pakistan. The Treaty mentions a close cooperation between Defence Ministers and between the two armies[13]. Another legal document was established in 2006, when the Framework Agreement on Cooperation between the Defence Ministry of the People's Republic of China and the Defence Ministry of the Islamic Republic of Pakistan was signed. Their Treaty suggests that common problems should be addressed by mutual cooperation under a bilateral and multilateral framework, in order to maintain regional peace, stability and security. China seems to sustain Pakistan's involvement in Asia's institutional framework and has welcomed Pakistan's membership in ASEM, while expressing its willingness to work together in other organizations such as SAARC, ACD, ARF, SCO and ASEM[14]. In the 208 Statement, Pakistan recognizes and supports the one-China policy. Pakistan and China announced that they'll cooperate not only to maintain stability in the region, but also to increase their trade and economic relations[15]. The most important problem for India is China's nuclear assistance to Pakistan. If India will perceive this as a threat, an arms-race could start between Pakistan and India because both of them will want to increase their power to ensure their security. On the other hand, China might be interested in maintaining India busy with Pakistan so it could sustain its influence in the region.

China also has close relations with Myanmar, Nepal, Sri Lanka and Bangladesh[16]. Nepal and Burma have been considered buffer states between South and East Asia and that's why is important to see if the balance in this region was changed in some way[17]. If their role will increase through some instruments provided by China, then the balance can be challenged. China's increasing pressure in these countries can be perceived as a threat to India because it offers China a greater role in the region. When China entered SAARC, in 2005 as an observer, Pakistan saw this as an opportunity to counterbalance India's role in South Asia[18].

The last sensitive domain between them concerns the so-called One China policy. The One China policy affirms that Taiwan and Tibet is part of China. India's support for this policy hasn't been mentioned on the joint statement because India wanted Chinese to recognize One-India policy which states that Jammu and Kashmir are part of India just as Taiwan and Tibet are part of China. China's visas policy for those Indian states has irritated India. Chinese agreed to have official talks over that matter[19]. This is the first time since 1988 that the one-China policy is not included in a joint statement between China and India. However, officials have mentioned that India does recognize Tibet Autonomous Region as part of China[20]. It seems that this is the area where the relation between China and India is different from that between China and Pakistan, because India didn't mention the one-China policy as Pakistan did. Since 1988 India and China have managed to separate the border issue from other bilateral matters[21].

In the same statement they managed to identify a few areas were they were found on the same side. The first refers to China's support for a permanent seat for India in the UN Security Council while sustaing a stronger role for the Security Council. Premier Wen Jiabao reaffirmed China's position through the following statement "China attaches great importance to India's status in international affairs as a large developing country, understands and supports India's aspiration to play a greater role in United Nations, including in the Security Council"[22]. Strengthening India's role in the region is motivated by the fact that both of them have „common interests and similar concerns on major regional and international issues"[23] should engage in a greater cooperation through multilateral forums. Some of these common interests refer to climate change, the Doha Development Round of WTO, energy and food security, international financial and economic reform are a particular focus for closer cooperation. Although climate change has been recognized as a common thereat, India doesn't want to reduce its emissions until industrialised countries don't take more serious actions and China has the same opinion reaffirming the need for "common but differentiated responsibilities"[24]. As Indian Prime Minister, Manmohan Singh declared the industrialised countries have polluted for a century while the third world countries have just beginning to use their "share of the global atmosphere"[25]. As emergent economies they both are on the same side and will only sign a climate deal when a common global per capita emissions target has been established[26]. Their argument must be considered because you can't expect to have the same actions against climate change if you don`t take into consideration their objections. Industrialised countries should make sure that they'll find a way to convince the emergent economies that they will not lose if they'll agree on cutting their emissions.

Another sector where India and China have a strong partnership is the economic one. Economy, as the most approachable sector for cooperation is used to mediate between both of them. That's why India and China have signed a trade agreement, which will increase their economic

change up to 100 billion dollars by 2015. Although it had rejected a regional trading arrangement with China, India has asked for a greater access for its products and services on Chinese market. Foreign secretary Ms Nirupama Rao said that „there is a big imbalance in the trade and that we would like a little more market access in areas like pharma, agro-products and IT services…please take this message to China"[27]. They agreed to „establish a Strategic Economic Dialogue to enhance macro-economic policy coordination, to promote exchanges and interactions and join hands to address issues and challenges appearing in the economic development and enhance economic cooperation"[28]. As in the environmental sector, they encourage a pluralist management for economy's recovery and for greater cooperation in the G20 framework aiming to improve "global economic governance" and assure „balanced development and shared benefits"[29]. Beside G20, another institution that should influence cooperation between China and India is BRIC.

In the last years China had another reason to improve its relations with states from different regions, especially those from Southeast Asia and it has close ties with Myanmar, Nepal, Sri Lanka and Bangladesh[30]. The reason was its fast economic growth - China needed resources and these resources were attainted from very different regions from South America - Venezuela, Brazil - and from Africa. Not only that the trading has been improved, but China has become the most important donor and investor in Africa. India and China are in the same time competing for export markets.

Because they are neighbours in Asia share a mutual interest in the stability, prosperity and security of this region. India and China are committed to cooperation on a cross-regional, regional and sub-regional process in Asia. The multilateral framework for this aim includes East Asia Summit, the Asia-Europe Meeting, the Shanghai Cooperation Organization, the Russia-India-China trilateral cooperation mechanism and the South Asian Association of Regional Cooperation (SAARC). The Indian Prime Minister stated that „A strong partnership between India and China will contribute to long-term peace, stability, prosperity and development in Asia and the world".[31] Their future cooperation will influence not only Southeast Asia, but the whole Asia-Pacific region. This argument for multilateralism has already been used by India with its Look East Policy. Through this policy – which began in 1991, after the end of Cold War - India wanted to develop a new relation with the ASEAN states because needed new resources and new markets to supply Soviet Union's collapse, which was its trading partner[32]. India has been trying to become a global economic actor through this policy.

China and India realised their important role in Asia and signed two significant agreements. One in 2005 and is called Strategic and Cooperative Partnership for Peace and Prosperity and Political Parameters and Guiding Principles for Settlement of the Boundary Questions and the second in 2008, Shared Vision for the 21st Century. Last year China and India celebrated 60 years of diplomatic relations. Their new partnership was based on India's independence and China's liberation[33]. They have even declared 2011 as "Year of India-China Exchange" aiming to increase the relation between their civil society organisations, youth, media, scholars, think-tanks. They decide to improve confidence building measures through a mechanism of regular exchange of visits

between Heads of State-Government, a telephone hotline between the Prime Minister of India and Chinese Premier and a future mechanism of annual exchange of visits between the two Foreign Ministers.

China's recent announcements that will build two new aircraft carriers and that already has one - Varyag - under construction will allow China's People's Liberation Army-Navy Marine to patrol South China Sea, Western Pacific and Indian Ocean (Sharma, 2011). Of course, China's increasing capabilities are worrying India as the Indian Ocean is an important subject for India's national interest mainly because 95% of its exports are shipped through Indian Ocean. India used naval diplomacy for this region and signed cooperation agreements with all island states in the Indian Ocean. India used soft power to increase its influence in the region when has offered to help those countries in their humanitarian crisis. India was active in Africa too when in 2004, was involved in African Summit in Mozambique[34].

A threat for India is China's arming. India has already developed 3500 KM Agni-III that might be operational by 2011 and is supposed to test 5000 KM Agni-V within a year. Agni V will allow India to hit any city in China and Pakistan. After this test the Chinese press was asking about how India will use its growing power.

India established a new framework for cooperation with other countries, including France, US and Russia[35]. All the actions that India has made in the last years, regarding its military capacities - including a nuclear deal with USA and the launch of its first nuclear submarine, display a realistic approach on the security problems in the region. Russia supported the submarine building and the aircraft carriers that were brought by India. The Indian missile defence system may use Russian GLONASS system to improve the hitting capacity and may use the American GPS for defence purposes and is working on improving its GPS system[36]. We should view these steps through regional lens. In 2010 it was an increase of 34% for the Indian defence budget[37]. This means that India spends between 3% and 3.5% of its GDP on defence more exactly 32.7 billion dollars.

Indian military doctrine has included asserts as: two front simultaneous wars with both China and Pakistan and a pro active war strategy which could allow army's fast mobilisation. For this fast mobilisation the Indian army aims to obtain the capacity to get into the enemy's territory within 96 hours. For this T-90S tanks and upgraded T-72 M1 tanks are going to be used[38]. The carrier that has been brought from Russia is aimed to obtain the interdependence that army, navy and IAF need. India's actions have already been perceived by Pakistan as hostile and it has asked for the right to use nuclear energy for civil purpose. The stability in South Asia may depend on these perceptions. Pakistan's defence budget, thou lower than India's budget it also has the help provided by the

Coalition Support Fund for its support of the operations in Afghanistan[39]. If Pakistan will want to consolidate its capabilities then this should be seen as a very reasonable action. Is through this actions that the danger of escalation may be identified. Although India's foreign secretary, Nirupama Rao met Pakistani foreign secretary, Salman Bashir on 25 of February, 2010 no progress was made between the two states[40]. The meeting even brought more accusations from the both sides: Pakistan blamed India for supporting the militants and terrorists in Afghanistan. On the other hand India asked for a greater effort on the part of Pakistan in punishing those guilty for attacks in Mumbai in 2008.

China and India both have major treaties with third parties India with US and China with Pakistan which ensures their stability and increase their power. A Strategic Partnership with India was analysed by the Bush administration in 2001 and in 2004 the U.S.-India 2004 Next Steps in Strategic Partnership (NSSP) tool announced cooperation in civil nuclear technology as a main goal of India – US relation. In 2005 president Bush announced that he will work to obtain "full civil nuclear energy cooperation with India"[41]. In 2008 the Congress approved the document called United States-India Nuclear Cooperation Approval and Non-proliferation Enhancement Act. The Act could justify China's intention to supply Pakistan[42]. While their bilateral relation is a positive one, India and US both want to have a special relation with China based on cooperation.

Conclusions

As long as China and India aspire to become the most important powers in the region, US seem to have an important role in making sure that none of them will obtain this. In the meantime India's defence budget has not been debated by the civil society and its goals might therefore be questioned. China and India both have major intern problems. For India is the major poverty issue, although is the world's largest democracy, while China is an authoritarian state who lacks internal legitimacy[43]. India is prone to be a status quo power while China might become a revolutionary power. The power that China and India are gaining leads them to seek resources and maybe methods to dominate the region. First and foremost, they both are facing the same challenges in climate change and security matters. The most likely issues of cooperation will continue to be trade and economic matters. They face a border issue that seems far from being clarified. At a South Asian level China and India don't agree on Pakistan's role. China supports Pakistan through economic measures strengthening its role as India's neighbour while India, on the other hand used it relation with US to increase its presence in the region. On a global level, China has a more stable economic growth although it is limited by its authoritarian regime and India might have more values in common with the West states. China has tried to increase its global role primarily through economic measures. Despite their economic and trade cooperation, China and India's relation should not be viewed through the lens of neo-liberalism but more through a realist perspective.

After his visit in India, in December 2010, Chinese Premier said: "The China-India boundary question has a historical legacy. It will not be easy to resolve this; it requires patience. Only with sincerity, mutual trust and perseverance, we can get a fair, reasonable and mutually acceptable

solution"[44]. India can be US's important partner for stability in South Asia in the meantime China can use Pakistan to balance with India's rising. Anyway, it is certain that the both countries maintain a realistic approach[45] to their relation increasing their military spending because they don't have that mutual trust. However, their relation can still be improved through cooperation in a larger institutional framework such as SAARC or ASEAN.

WOMEN'S AUTONOMY AND THE FAMILY IN RECENT ROMANIAN POLICY-MAKING

ALICE IANCU*

Abstract

In my paper I aim to provide an analysis of the relation between women's autonomy and the family in Romanian recent policy-making. I will focus primarily on policies developed by the Romanian state after Romania's integration in the European Union with regards to the family and family-related policy domains.

My analysis will focus on several variables: 1. the theoretical instruments available for analyzing women's autonomy in relation to state policies 2. the understanding of the family in Romanian policy-making 3. the interplay between women's autonomy and the family and how policy-making influences the relation between the two. The analysis will take into consideration the specific Romanian socio-political context in terms of economic conditions, ideological influences and gender relations.

Political theory is no stranger to the issue of individual autonomy. In my paper I will focus on recent feminist political theories on gendered accounts of autonomy. These accounts modify the understanding of autonomy and focus on conditions and aspects of autonomy relevant to women's lives and experiences. The current financial crisis and recent developments in Romanian policy-making will be analyzed in terms of how they affect women's autonomy. Since much of Romanian policy-making still avoids including gender and gender relations into its explicit justifications, provisions and evaluation, referring to the family as a basic social unit, the gendered consequences for women's autonomy of such an approach need to be understood and acknowledged.

In my analysis I will use both Romanian and European recent policy papers, as well as recent data obtained through social research.

Keywords: *Women's autonomy; family; Romanian policies; feminist theory*

Introduction

Autonomy is what Gallie would call an essentially contested concept. Essentially contested concepts are the ones "the proper use of which inevitably involves endless disputes about their proper uses on the part of their users" [1]. Political theorists have long debated its meaning or its "proper use" and no end to the debate is in sight. If anything, feminist political theory has added to the fire and produced its own set of interpretations. This is not an article focusing on these theoretical debates to great depth[2].

Rather my aim in terms of the political theories of women's autonomy is to identify the main accounts proposed by feminist theorists. I will do this by focusing on two main accounts and how each would relate to the family, and specifically on how it interprets the relation between women's autonomy and the family.

The final part of the paper is then dedicated to identifying how policy-makers in Romania understand such a relationship, implicitly or explicitly, by analyzing recent Romanian policies. I will focus on explicit family-oriented policies, although conceptions about the family and autonomy are present in many areas of policy making.

* Lecturer, PhD, "Hyperion" University, Bucharest, (e-mail: alice_iancu@yahoo.com).

[2] For my own in depth analysis of the current debates n autonomy see Alice Iancu Alice Iancu *A Conceptual Approach to Social Exclusion*, PhD. Thesis, Bucharest, National School of Political and Administrative Studies, 2010 (unpublished)

1. Women's Autonomy- theoretical overview

A minimal and general account of autonomy

Autonomy is a concept mostly associated with the liberal theoretical tradition. A simple general approach would describe liberalism as tied to three basic principles:

1. Only individuals matter[3]. Social arrangements, institutions and policies are to be evaluated starting from the effect they have on individuals[4]. Also, "the only information *directly*[5] relevant for evaluating alternative political and social arrangement is information about their impact on individual human beings"[6]. If, for example, some cultural practices or privileges would facilitate or allow discrimination against women or a deprivation of their rights, than the institutional arrangements should use this as a tool for assessment and not the culture's presumed values or social prominence.

2. The second principle constitutes what Johnson names "the equality stipulation" [7]: Everybody counts as one, nobody as more than one[89].

3. The third principle refers to the fact that individuals are considered to have agency, where "By an "agent" I mean a being who is capable of conceiving values and projects, including projects whose fulfillment may not be within the range of the being's immediate experience"[10]. This does not presuppose the idea that people will act in an altruistic fashion, for example, but that they are capable of it because of the values they hold, not merely because they feel like it.[11].

---

[3] In light of recent communitarian and feminist critics, it is also useful to state briefly that such considerations about the individuals as a criteria for evaluation do not presuppose anything about the individuals themselves. In Johnson's words, such an approach is based on individuals' intrinsic value because they are individuals, not on their character. While some liberal theorists do speculate about either the desired or the actual character or nature of the individuals, these in no way constitute a condition of their value. See Johnson, David,: *The Idea of a Liberal Theory. A Critique and a Reconstruction,* (Princeton: Princeton University Press, 1994), 19

[4] One of the methodological consequences of this is that social exclusion is evaluated by aggregating exclusions at the level of individuals. This is already one of the principles informing the choosing of relevant indicators of social exclusion (Atkinson, Cantillon, Marlier and Nolan, 2003, p. 29)

[5] Author's emphasis

[6] Johnson, David,: *The Idea of a Liberal Theory. A Critique and a Reconstruction,* (Princeton: Princeton University Press, 1994), 22

[7] This could also be referred to as *basic equality.* A basic egalitarian account maintains "the idea that at some very basic level all human beings have equal worth and importance and are therefore equally worthy of concern and respect" (Baker,Lynch,Cantillon,Walsh, 2004, p. 23). Essentially, it is "a rather minimalist idea" (Baker,Lynch,Cantillon,Walsh, 2004, p. 23). Liberal approaches to equality, apart from generally subscribing to the basic conception of equality, widely vary in terms of which are the important inequalities and how they should be addressed. What is distinctive about this approach is that it does not take every type of equality as being unfair and it more readily accepts the idea that certain inequalities are unavoidable. A liberal approach is distinguished by some theorists from the *equality of condition* approach, aiming to eliminate what it deems significant inequalities (Baker,Lynch,Cantillon,Walsh, 2004, pp. 24-46).

[8] Johnson, David,: *The Idea of a Liberal Theory. A Critique and a Reconstruction,* (Princeton: Princeton University Press, 1994), 21

[9] I also see it as a precaution against arguments that liberalism *strongly* prefers some sort of individuals, in terms of character, for example, over others. By "*strongly* prefers" I mean that this preference comes to determine the way political principles and institutions are conceived and would end up directly or indirectly favor some individuals over others, leading to unequal access to rights or privileges within the political arrangements.

[10] Johnson, David,: *The Idea of a Liberal Theory. A Critique and a Reconstruction,* (Princeton: Princeton University Press, 1994), 22

[11] Johnson offers two illustrations of what in fact are two different aspects of agency: acting because of values and engaging in projects that are not about one's own experiences. For example saving somebody from drowning because of a feeling of sympathy is not an instant demonstrating agency. However, saving that person because one thinks human life is of value and worth the risk is an action illustrating agency. People can also engage in projects that would be fulfilled beyond their lifetime, like achieving gender equality. Because an agent is passionate about this she engages in research or activism regarding one particular subject, even though she will not experience the fulfillment of

There have been many liberal accounts focusing on autonomy, starting from John Stuart Mill. Mill's concern for autonomy was based on a concern for individual liberty, understood as self-determination. Mill's account of autonomy lists both the characteristics one needs to be considered autonomous as well as the conditions one needs to become autonomous. In *On Liberty* the main critique and the main argument is meant for society as a whole and for penalties of society "of law or opinion."[12] that impede individual autonomy[13]. Since Mill liberal accounts have been developed by a variety of theorists. These accounts focus on what is needed for individual autonomy, that is, on the necessary conditions, may these be absence of coercion, education or some type of resources.

1.2. Feminist Accounts of Autonomy

Feminist theorists have not been particularly enthusiastic in the face of liberal autonomy[14], as it has been traditionally understood. However some believed the concept of autonomy holds great potential for gender research. Two strands of feminist research regarding autonomy can be identified: one liberal strand, maintaining much of the more traditional accounts and applying them to women's experiences, and one strand focusing on relational autonomy[15], a vastly modified concept compared to the mainstream liberal ones.

The liberal strand encompasses feminist theorists who have argued for a renewed attention on the concept of autonomy, some in the particular context of Eastern Europe[16]. Marilyn Friedman argues for autonomy's value invoking several arguments: it is useful for social criticism and contestations of the status quo, it allows for greater expression of women's many voices and experiences and it promotes mutual individual respet for autonomy[17]. Autonomy is essentially based on self-reflection and freedom of the individual to both reflect on her desires and choices and

---

the project. See See Johnson, David,: *The Idea of a Liberal Theory. A Critique and a Reconstruction,* (Princeton: Princeton University Press, 1994), 22-24

[12] Mill, John Stuart "On Liberty" in John Stuart Mill On Liberty edited by Bromwich, David and Kateb, George (New Haven: Yale University Press, 2003), 78

[13] On discussing the tyranny of society over individuals Mill argues that

"its means of tyrannizing are not restricted to the acts which it may do by the hands of its political functionaries. Society can and does execute its own mandates: and if it issues wrong mandates instead of right, or any mandates at all in things with which it ought not to meddle, it practices a social tyranny more formidable than many kinds of political oppression, since, though not usually upheld by such extreme penalties, it leaves fewer means of escape, penetrating much more deeply into the details of life, and enslaving the soul itself." See Mill, John Stuart "On Liberty" in John Stuart Mill On Liberty edited by Bromwich, David and Kateb, George (New Haven: Yale University Press, 2003), 76

[14] At this point a distinction needs to be made between liberal methods of knowing and liberal principles or to express this more clearly, between liberal epistemic preferences and liberal political morality. Methodological individualism is a method of knowing and of researching. It designates a particular unit of analysis (individuals) and whatever other traits are assigned to that unit, they are secondary to the main principle. I will quote Lukes more extensively here since he insisted precisely on this idea and his account is prior to any care-oriented feminist criticism on the matter :"Methodological individualism, therefore, is a prescription for explanation, asserting that no purported explanations of social (or individual) phenomena are to count as explanations, or as rock-bottom explanations, unless they are couched wholly in terms of facts about individuals" See Lukes, Steven, 1968: "Methodological Individualism Reconsidered", in *The British Journal of Sociology*, Vol. 19, No. 2 (Jun., 1968), 121.

[15] For my own more in depth analysis of relational autonomy see see Alice Iancu *Relational Autonomy: New Perspectives in the Care/Autonomy Debates,* in *Perspective Politice,* Year III, Vol. III, no. 1, 2010, 13-26.

[16] See Cornell, Drucilla. *At the Heart of Freedom. Feminism, Sex and Equality,* Princeton: Princeton University Press,1998; Friedman, Marilyn,: *Autonomy, Gender, Politics*, New York: Oxford University Press, 2003; Friedman, Marilyn. [17] Friedman, Marilyn,: *Autonomy, Gender, Politics*, (New York: Oxford University Press, 2003), 56-73

to act upon the desires and choices one believes to be important to one's self[18]. Such freedom is referred to by some researchers as a "space" for our own self definition[19]. Accounts of self-reflexivity may emphasize reason, imagination, empathy or any combination of the three.

The liberal feminist theories of autonomy and the relational autonomy perspective have a radically different outlook on the family. The liberal strand is more prone to skepticism regarding the family, as it often constitutes one of the many social institutions perpetuating women's subordination. Mackenzie underlines for example how socialization can disrupt autonomy on three different levels: by shaping our beliefs, by determining our skills and abilities and by restricting a person's actions[20].

Friedman identifies four strategies that an individual could use in the face of domination: to outright resist the impositions, to pretend to accept them but secretly resist, to detach from the oppressive environment or change one's preferences and develop "adaptive preferences"[21]. The last option comes at a high cost: "This measure, however, results in social isolation, something that many people find unbearable."[22]

The relational autonomy strand stems from the main feminist critique of liberal autonomy, one that argues that the very concept of autonomy is based on a male-modeled subject, disconnected from others[23], and that this inherently causes it to fail when addressing women's lives and experiences, particularly care-taking activities, in need of re-evaluation and valorization, including political and financial valorization[24].

Mostly what matters here is that the self is socially constituted, therefore it cannot be taken as forming and existing separate from others "the focus of relational approaches is to analyze the implications of the inter-subjective and social dimensions of selfhood and identity for conceptions of individual autonomy and moral and political agency." [25] Such an approach values the family, or at least it's potential, highly and tends to see the relationship between autonomy and the family less in terms of conflict and skepticism. Rather it focuses on potentialities- the potential of the family to strengthen autonomy and the other way around. Autonomy is socially taught and learned and thus institutions contributing to this learning need to be supported and valued. Caring especially is seen as intrinsically linked to autonomy[26].

These two strands of feminist theorizing on care and autonomy entail common relevant dimensions, rather the interpretation is different. They do not function as dichotomous categories. Neither one of these approaches values the family as it functions in a patriarchal society. They both reject it, albeit in a different ways. The liberal feminist approach pays particular attention to obstacles in the way of autonomy such as coercion, manipulation or lack of information. The relational

perspective focuses more on how the patriarchal family can be modified in a way that values women's work and takes into account that interdependence is a basic human reality. The focus of some dimensions is thus what is clearly different, not the dimensions they address themselves. Figure 1 illustrates the dimensions in focus for each approach and their interpretation.

Relevant Dimensions of the Family	Liberal Autonomy Feminism Position Variables	Relational Autonomy Feminism Position Variables
A. Power relations	Freedom from manipulation	Relations should reflect mutual valorization of human interdependence
	Freedom from structural or individual coercion	Relations should reflect empathy and interdependence
	Decision-making and acting on one's choices should be free and not impeded on account of gender…	Decision-making and acting on one's choices should be free and the result of empathic communication and negotiation
B. Education	Equal Education	Education for both men and women should promote care and care-taking activities and an interdependent understanding of the self
C. Division of Work	The quality and quantity of work should be distributed in an equitable fashion- in terms of financial pay, social prestige, effort and knowledge	Care-taking activities and women's activities in general should be valued both financially and socially
D. Resources	General equal access to resources	Resources should be allocated to care-taking activities and care-takers

1. The Family-Autonomy Dilemma: Recent Romanian Policy Making

What exactly are we talking about? The Romanian Family during Transition

Romanian family life and family structure remain deeply patriarchal. This is reflected in the division of work, power and resources within the family. Romania presented similarities with other countries within the post-communist region, including the prevalence of nationalist and traditional rhetoric[27]. Since my purpose here is not to offer a comprehensive account of the present Romanian family, I will focus on briefly illustrating the key variables identified in Figure 1.

A. Power Relations

Freedom from manipulation By manipulation I name actions that obscure or falsely represent women's choices. Women in Romania face manipulation in public discourse and in the public education system. Both manuals and teachers contribute to the entrenchment of gender

[27] Lukic, Jasmina; Regulska, Joanna; Zavirsek, Darja "Introduction" in *Women and Citizenship in Central and Eastern Europe*, edited by Lukic, Jasmina; Regulska, Joanna; Zavirsek, Darja (USA: Ashgate Publishing Company, 2006), 6

stereotypes[28]. The traditional discourse was often framed as a reaction against previous communist gender policies and it meant "to drive women back into their "natural/domestic roles and "re-give" them their reproductive rights"[29]. The rhetoric supporting "caring mothers" and "income-earning fathers" has been probably one of the most disconnected discourses from actual empirical reality, since the reality is that few Romanian families could have a decent living with only one income, even if they intended to[30]. Almost one in five Romanians lives in poverty, according to 2008 ratings[31] more women than men, with some groups of women particularly vulnerable. Data taking into account the present Romanian political and financial crisis, as well as the Government's latest policies, is yet to be available. What is clear is that this traditional rhetoric ignored or devalued women's significant presence on the labor market in the communist years and since, and disregarded the obvious absence of a "traditional" reality, with most Romanian households needing two incomes to live above the poverty risk threshold. Thus the return to a "traditionalistic" rhetoric simply meant that women took on a double burden and faced additional barriers in the market (both cultural and resource related, especially in terms of time), while men were "freed" from domestic responsibilities.

Women in Romania rarely have access to different types of discourses or to data illuminating the actual consequences of the choices presented to them. Public rhetoric, in the media or advertisement is only traditional in relation to household tasks and power. It is far less traditional in relation to sexual representation of women: available attractive women's bodies are highly present. The types of women that Romanian women very rarely see in the media are the students, the professional and active women. Women in the Romanian media are wives, lovers and mothers and they take up their roles within the family with no apparent contestation.[32]

Freedom from structural and individual coercion By structural coercion I refer to those institutional, social and cultural factors that severely reduce the number of reasonable alternatives available to women. One example would be that women after divorce have a higher chance of difficulty in founding a new family, especially since they are the ones taking care of children resulting from previous marriages. In this case "Blackmail about divorce" is favoring the man and the feminization of poverty among one-parent household confirm this reality."[33] By individual coercion I refer primarily to the use of any type of violence (symbolic, verbal, and physical). Available data shows a rising trend in domestic violence against women in Romania and an overall significant level of violence in general, with four new cases reported every 24 hours[34]

Decision-making While gender-based hierarchies might often manifest themselves more or lest subtly, Romanians explicitly endorse them. The usually associated dichotomy public/man and

private/woman breaks down in terms of decision-making. Women are "private" in their work, not in terms of power. In 2000 38.5% of men and 27.6% of women stated that men should *lead*[35] in the family. Only 57% of men agreed that women are "the rulers in the home". 85.8% of men and 85.1% of women believe that the man is the head of the family. 82.1% of men and 74.8% of women believed a woman should follow her man[36]. The numbers are telling and they indicate a deep hierarchy within the family in terms of decision making.

B. Education

Equal Education The horizontal segregation in the education system, leads to women and men gaining different skills. Statistically, young women graduate mainly from high-schools while young men graduate mainly from vocational schools. Women who fail to go to the university are practically pushed towards a housewife status or towards very low-paid jobs. This translates into differences in their marketable skills, making it so that failing to continue with a higher education degree after graduating from high-school, drastically diminishes women's chances of getting a well-paying job or of getting a job at all[37]. Vertical segregation reveals lower access of women in postgraduate studies. Women enter the educational system in higher numbers but end up in fewer numbers at the MA or PhD levels[38]. The content of the education supports gender stereotypes, as mentioned earlier.

C. Division of Work In terms of care, traditional rhetoric and the lack of institutionalized care[39] implied a worsening of women's double burden. A national-wide research showed that in 2000 70% to 80% of all households task were performed by women [40]. For men, traditional gender roles meant they were only marginally regarded as having caring responsibilities within the family (other than earning an income). A significant part of women with dependents in their care declare they have no income, thus raising the question of how or if access to the labour market is made available to them[41]. While men and women may declare that in principle domestic work should not be segregated on account of gender, in fact actually work is segregated as such[42].

D. Resources Within the family and outside it, women have fewer resources. In the market they face the gender pay gap, horizontal and vertical discrimination leading to inequalities of income. Children in the household lead at the European level to lower incomes for women "if one compares the **employment rate of women and men with children** under 12 to care for, this gender gap is

[41] According to the data obtained through a national-representative survey conducted as part of the CNCSIS project *Gender, political interests and European insertion* (developed by the National School of Political Studies and Public Administration and coordinated by Prof rd. Mihaela Miroiu), 61per cent of women living in a household with dependants declared that they do not have their own income; in households with no dependents only 38per cent of women declared the same thing

[42] Pasti, Vladimir, 2003: *The Last Inequality (Ultima Inegalitate),(* Iasi: Polirom Publishing, 2003) 119

almost doubled. Also, the employment rate of women falls by 12.4 points when they have children, but it rises by 7.3 points for men with children reflecting the unequal sharing of care responsibilities and the lack of childcare facilities and work-life balance policies"[43]. In terms of resources within the family, the early transition years showed that resources within the household were gendered: television sets, for example, took precedence over vacuum cleaners or other items that would have eased women's work[44]. Gender differences in income were clearly influenced by state policies since the 1990. Then policies reflected what Miroiu calle "state's men, market's women"[45]

After this brief presentation it becomes apparent that no dimension of autonomy is addressed for women in Romania in relation to the family, may it be from a liberal autonomy standpoint or from a relational autonomy standpoint. Romanian family remains deeply hierarchical. Care work is not valued (since it is not correlated with gain of resources or power and status within the family) and is rarely shared. Women's avenues of contestation and freedom from coercion are reduced. In Romania women are subjected to public discourses loaded with gender stereotypes.

No actual conditions for autonomy are fulfilled. Self-reflection, lack of cohersion or the valuing of their own autonomy are absent for women in Romania, thus failing any liberal feminist test. Care work and women's work in general is devalued, unpaid and set on a lower scale of evaluation, thus failing the relational autonomy test. Women learn about and internalize patriarchal structures within Romanian families, not empathy, interdependence and mutual valorisation. All this however has not deterred some Romanian social researchers, after reviewing some of the same data presented here, to conclude "The important thing is that the majority of women, not only the majority of men, believe that housework and childcare are their duty, which demonstrates the *complete and voluntary acceptance*[46] of this role identity within the family"[47]. However such statements show the gender blindness in Romanian social research, not the autonomous choices of women. The next section will address how/if the same gender blindness is present at the public policy level during the last year.

Romanian Recent Policy Making- Ignoring Gender as Much as We Can

Since an official updated strategy of the Government is yet to be made public, I will focus in this part of my analysis on policy measures undertaken, public declarations of political representatives and older policy papers (when available). Data continues to be scarce and difficult to pinpoint.

In Romania law 202/2002 art.2 stipulates "The measures for promoting equal opportunities between women and men and eliminating direct and indirect gender based discrimination are applied in the field of labor, education, health, culture and information, decision making process, as well as in other fields regulated by special laws."[48]. However the responsible state agency for monitoring and promoting its implementation, the National Agency for Equal Opportunities for Women and Men, has been disbanded in 2010.

In policy areas related to **education** no progress has been made in terms of gender stereotypes and no sign of future progress exists. In relation to ensuring women's **freedom from coercion and violence** the Romanian state's already questionable commitment to addressing it actually decreased, the National Agency for Family Protection was also disbanded in 2010, while at the same time domestic violence is increasing.

[48] Law 2002/2002 *www.iwraw-ap.org/resources/documents/GE_Romania.doc*

In terms of **manipulation in public discourse** 2010 proved a most illuminating year. It was a complicated year for Romanian policy-makers and political representatives. Romania faced a political and financial crisis. The response was to implement massive budget cuts, especially in domains where women work. It was also a time for a brand new discovery in Romanian political discourse: the working woman became a hot topic. If throughout transition terms such as "women's emancipation" and "women's careers" were largely absent from public discourse, in 2010 Government representatives and the Romanian president embraced them.It soon became apparent that state feminism had not conquered Romanian politics, but rather pragmatic budget cuts were making their mark on political discourse.

In mid 2010 the Romanian Government cut both the parental leave period and child-support benefits, and Government representatives and the president invoked the necessity of budget cuts. The Labour Minister Ioan Botiş declared „our goal is the reintegration of mothers in the labour market"[49]. President Băsescu declared „my wife returned to work three months after having our children"[50]. What both the Government and the President ignored was that 1. The cuts were announced with only a few weeks beforme being implemented, thus severly affecting families and pregnant women's plans. 2. Women lacked access to affordable child-care and thus adequate altertatives. Mr. President's wife had had her children in a time where child-care state facilities were double in number. Although official prior documents stated that child-care facilities were a state priority it "During 2008 – 2010, the development of family policies shall focus on promoting measures to encourage women's participation on the labour market by developing child care facilities and developing day-care centers to ensure the return of mothers to their jobs"[51], in reality little if any progress has been made in this area. Private facilities are almost unreachable for the majority of the population. Finally after much debate, at the end of 2010 a new law was adopted instating an optional system- parents could have the option of both a shorter and a longer child-care leave, with different paying options. Other cuts, such as the state benefit given to new families on getting married were also cut and payments ceased[52]. The Labour Minister Ioan Botiş declared that additional benefit cuts were intended for families, such as the cut for families with children having low „behavior grades"[53], meaning below 8.

What transpired in 2010 was how political representatives think about childcare and mothers in general. First, even from older policy documents what was clear was that **the division of care work** and **the hierachy within family decision-making** is supported by the state. Women's care work within the family was clearly expected by the state to be unpaid and apolitical**: „**Most of the dependant elderly benefit from the care services provided inside the family. This reality raises numerous problems that need to be solved. Most family carers are women, wives or daughters. Many

[53] "Behavior grades" are grades Romanian children receive in school measuring how well-behaved they are. This is an overall grade and is separated from other grades. The range is from 1 to 10. How exactly such grades reflect on Romanian children's freedom of exercise in contestation and debate with authority figures such as teachers, especially girl's contestation of social norms, is something that could be studied in the future to much use.

carers are in their turn elderly persons and may become dependant. The family care is ensured mainly in the rural area, where the traditions and moral values are maintained to a higher extent."[54]

The prime-minister himself, Emil Boc, just as mothers in Romania were protesting cuts in their benefits, advocated for „christian-democratic values" and argued for a system based on personal responsibility and a merger of liberal economy and christian-democracy[55]. Even if he was careful to mention that solidarity still is important, there was an obvious move in Romanian political discourse towards a clear and transparent reduction in the already low politization and public valorization of care work. It became clear such work is viewed by the government as designated to the family, which means the women in the family, since the „traditional values" invoked by policy makers maintain both **the division of labour within the family and hierarchy in decision-making.**

Conclusions

Women's autonomy is not accounted for by Romanian policy-makers within any of the dimensions of analysis set forth by feminist political theorists. Both liberal feminist autonomy and relational autonomy reveal that women's autonomy is absent from Romanian policy-making.

Even more, the current Romanian policies not only fail both feminist accounts of women's autonomy, they fail even the first minimal principle of liberalism stated at the beginning of this paper „only individuals matter". While invoking liberal economy Romanian policy-makers use the term „liberal" as they please, since not even a minimal understanding of liberalism would endorse the promotion of „christian-democratic values" at the expense of women's autonomy, as Johnson's account presented previously shows. And while the financial crisis provided policy-makers with a pretext for not politicizing and valueing women's care work, and for ignoring the patriarchal make-up of the Romanian family- deeply hostile to women's autonomy, recent policy-making has not come as a surprise. Public policies and public discourse in Romania had not favored women's autonomy much in the past. 2010 just allowed for a greater transparency of the disconnect between women's lives, on one hand, and the policies that affect them, on the other.

MACROECONOMIC POLICY GUIDELINES IN THE EUROPEAN UNION COUNTRIES

ALEXANDRU PĂDUREAN[*]
ELENA BUGA[*]

Abstract
In recent years, some European Union countries have made progress in economic convergence plan, but in others some special challenges took place. Economic and financial crisis has intensified some of the problems faced by these countries, causing undesirable developments. Measures taken by Member States differ from state to state, depending on the economic reality of each.

Keywords: *inflationary phenomenon, convergence criteria, sustainability, price stability, macroeconomic policies*

Introduction

This paper covers a brief analysis of the macroeconomic policies in the European Union countries in terms of the economic convergence process and the progress in achieving economic convergence in the new EU Member States. The economic convergence presents specific features depending of the countries and their seniority as a Member State of European Union.

We consider important the theme of this article because the convergence criteria are intended to ensure balanced economic development within the EU, and preventing any tension in the Member States. Adopting euro would be a stabilizing force, but it is possible that adopting euro by new Member States is too fast after their entry into the EU, as required by the euro changeover criteria are too strict, and somewhat inappropriate for emerging economies in accelerated growth. Also, the euro is still a potentially unstable monetary system, and the last thing any of the countries of Eastern Europe needs is more instability.

We try to answer to the issue of this article following the analysis made on the progress in achieving economic convergence. Some countries were analyzed in terms of economic convergence progress, but in other countries there were some problems, resulting mainly by increased inflation.

The relation between the paper and the already existent specialized literature is that in theory all Eastern European countries integrated in the EU should prepare to become members of the euro zone. For many years politicians and the money markets have seen the memberships of the euro area as a force for stability in countries still struggling to remove the legacy of decades of state planning. Investors are eagerly waiting the changeover, but the changeover is pushed to a distant future in most new Member States.

Convergence criteria

Overall, in recent years, an increase of the phenomenon of inflation in all new Member States has been reported. Poland and Slovakia are the only ones that recorded levels below / to the reference value. The main risk posed by developments in inflation expectations is affected, with repercussions in the medium and long term, through induced side effects.

[*] Master Student, Economic Sciences Faculty, „Nicolae Titulescu" University, Bucharest (email: padureanalexandru@yahoo.com)

[*] Master student, Economic Management Faculty, „A.S.E" University, Bucharest, (email: elena_buga@ yahoo.com)

Factors that have contributed to increased inflationary pressure in the new Member States were: (internally: private consumption growth, labor shortages, adjustments in administered prices and indirect taxes, external: increasing food and energy prices). The evolution of inflation is different, and each country has a different trajectory, due to their "model" of the domestic economy. The worst developments were recorded in the Baltic countries and Bulgaria, and on future developments of this variable, there are no optimistic views.In Hungary there was a moderation of inflation in 2008, while inflation in recent years remains quite high.

Measures to reduce the phenomenon of inflation in these countries should move towards the implementation of monetary policy oriented towards price stability, accompanied by fiscal measures to support the non-inflation. Of great importance is the promotion of structural reforms to improve productivity of production factors, and conditions in the labor market.

To achieve the convergence criterion on inflation in the old Member States was particularly important to adopt a monetary policy geared to price stability, which lead to stable exchange rates, slower growth in labor costs and even reduce them, and reducing budget deficits. Also, fiscal policy was needed to temper rigid-driven inflationary pressures easing of monetary conditions in order to meet the convergence criteria necessary for joining the E.M.U. Therefore, inflation depended in the old Member States on the credibility of the strategy implemented by the authorities and the default fiscal policies and structural reform to improve the functioning of labor and goods market.

Analyzing the evolution of nominal convergence indicators in the old member states it has been noted that in addition to the interest rate criterion, which has not been exceeded, all countries have passed at least once a benchmark for other indicators.

A definitive conclusion is that the new Member States are entering a world that works with completely different expectations and entering with the same step is sometimes quite difficult.

During the period April 2005 - March 2009 average interest rates on long-term in the new Member States have not exceeded the reference values (except Hungary and Romania). Maintaining average interest rates on long-term product value is determined also by the increasing growth and current account deficits, rising inflation and risk perception on a continuing weak economic expansion in the case of Hungary.

In the subject of the exchange rate in the Baltic countries involved in MRS II, the central parity has not suffered a significant devaluation in recent years.

Bulgaria, Romania, Czech Republic, Hungary and Poland are still not in MRS II.
According to Fitch Agency, Estonia will not adopt the euro before 2012, Bulgaria, Latvia and Lithuania not before 2013, Hungary not before 2014 and Romania not before 2015. On the other hand, a Reuters poll in April, it was estimated that Romania will be the last State of the candidates who will adopt the single currency.

It is possible that the euro embracing by new Member States, could be a little soon after their entry into the European Union, because the criteria imposed on the changeover, are too stringent, and difficult for emerging economies.

The new European Union member states will adopt sooner or later the European single currency, the necessary condition being rated criteria listed in the Treaty of Maastricht.

For monetary integration to be sustainable, it is necessary to achieve real economic convergence with the euro area countries, with the possibility to make it long term. In this context, it is important to long-term vision of convergence. Follow the short term, using discretionary measures (to make progress "artificial" for short), will not only hinder real integration potential of these economies with the euro area, but it really could seriously undermine macroeconomic stability in those countries.

Macroeconomic policies

National macroeconomic policies, monetary and fiscal are "modeling" tools of the process of nominal convergence, a process meant to sustain real convergence. The main objective of monetary

policy strategy, price stability, supports the nominal inflation criterion, and the national central banks focus on the issue of maintaining or reducing, as appropriate, the inflation expectations, contributes to the nominal long term interest rate criterion.

Countries that have opted for the strategy of targeting the exchange rate had initially succeeded in stabilizing inflation expectations at lower levels (after they have experienced hyperinflation). Nonsynchronisation of business cycles of these countries, with those of the euro area and that the ECB's monetary policy is not always the best for countries that have anchored to the euro currency, explains why some countries in the region have experienced levels of real interest rates close to zero or even negative. These low levels of interest rates have boosted credit growth, domestic demand and hence the current account deficit. Monetary policy in these countries has compensated the lack of interest rate as a mean of limiting interest rate and credit demand pressures through application of discretionary measures and administrative measures in this direction.

In countries that have adopted inflation targeting, in these days of increasing international mobility of capital flows, the advantage of an independent monetary policy is questionable, even if the nominal exchange rate against the euro is flexible. Financial liberalization and technological progress have contributed to the development of global speculative operations, "carry trade" type, through which it can transfer liquidity from one country to another. If a country maintains its interest rates at relatively high level to reduce inflationary pressure, this situation induce large capital inflows in the short term, with repercussions on the exchange rate.

In the current global financial crisis, the new Member States may be the target of speculative attacks by "investors" foreign (non-financial institutions) aimed at obtaining liquidity in these markets, then transferring it to the "mother country".

The main challenge for monetary policy in those states in the next period is not only a nominal criteria at a given time, but especially to maintain over time, a situation which should reflect the sustainability of economic convergence with the euro area countries. The challenge, of course, is not confined to monetary policy, but also takes into account fiscal policy and structural reforms in the economy of the new European Union member states.

Baltic countries' experience shows that current account deficits that coexist with high rates of economic expansion, not necessarily lead to major imbalances in the economy. As long as there is a significant correlation between the size of foreign reserves and current account deficit is not cause major corrections on the exchange rate.

The high level and trend of widening current account deficits in the new Member States, as well as associated external financing needs, the rapid expansion of bank credit and external debt risk amplification generates a sudden stop of capital inflows, followed by a downturn economic.

In the new Member States, although there have been important steps to implement measures to provide better integration of labor market and social policies, it appears that the results are below expectations.

It is noted that in all new Member States, the labor market has suffered a series of structural changes. The labor force was concentrated on attractive areas were seen in the greater flexibility of wages and lower employment.

In the current financial crisis and global economic growth rate and inflation in the new Member States has adversely affected the evolution of real incomes and employment. In this manner, more than the modest steps taken by governments, those of a gradual increase in the minimum wage and average salary, will not be found in a statistical increase. Drastic measures, of income reduction on different social groups and increasing taxation, accompanied by inconsistent policies, led to an economic and social chaos in a number of EU countries, and also in Romania.

As a result of the restriction of activities in Western European countries and even in the U.S. who have been along time net user of workforce coming from Central and Eastern Europe, the immigrant population has faced massive layoffs, are determined to return to the countries of origin, thus leading to increased unemployment in the new Member States.

Given current conditions, it is imperative that the Governments of the Member States to take urgent measures to combat the negative influences, with long term impact. This can be achieved only by promoting economic and social policies consistent, tailored to the needs and problems of each country.

In determining the scope, it is desirable to enforce the role of economics in relation to politics, thus ensuring a better redistribution of public financial resources, especially targeted towards support for priority areas of expenditure (education, health and employment).

It is important to realize that the transition countries path through this period of economic crisis, will generate different costs and these are the realities of economic, political and social development of each.

Overcoming the crisis can only be done by accepting and respecting the rules of market economy by stimulating savings and loan recovery, focusing on individuals and businesses to restore confidence in banks, monetary and fiscal policies consistent with that motivate investors to engage in infrastructure projects.

In all new Member States, the most important and urgent measures be taken to strengthen tax, intended to lead to inflationary pressures on the demand and macroeconomic imbalances and structural problems of the labor market. Measures taken to increase the quantity and quality of labor supply, quality adjustment should include training to labor market needs, developing training programs and incentives that lead to regional mobility. It requires that wage settlements in labor productivity reflect the realities of the labor market and developments in competitor countries.

Fiscal policy has an important role in bringing the work of evasion, by providing a sustainable tax system, while ensuring that tax cuts are accompanied by expenditure restraint.

Such measures, coupled with an effective monetary policy will contribute to a sustainable environment of price stability and to promote competitiveness and increasing employment of labor. The authorities of each Member State should consider fulfilling the convergence criteria by achieving this goal sustainable.

Conclusions

Following the analysis made we conclude that in some countries we found progress in terms of economic convergence, but in other countries there were some problems, mainly resulting in increased inflation.

Sustainability is crucial when we analyze the degree of fulfillment of the convergence criteria. Adopting the euro is an irrevocable process and must be sustainable convergence, will not be valid only within a certain time. In order to achieve a high degree of sustainable convergence, the efforts by all member countries should be intensified, particularly in regard to the necessity of achieving and maintaining price stability and achieving and maintaining the optimal level of public finances.

In order to achieve a more complete resolution regarding this issue, the future researchers should analyze the evolution of all nominal convergence indicators of evolution for a period of three years for the new Member States that have not yet adopted the single currency and the related benchmarks.

THE MANAGEMENT OF THE FLOW OF INFORMATION IN MILITARY ENVIRONMENT. NATO - NOW AND TOMORROW!

GEORGE MARGARIT NEGRU*

Abstract
The strategy of the North Atlantic Treaty Organization (NATO) is composed into a document known as „The strategic Concept for the defence of the North-Atlantic area". The first concept was developed between October 1949 and April 1959 considered that the Alliance „established a strategy of operations at large scale for territorial defence ". The New Strategic Concept „NATO 2020: Active Engagement, Modern Defence'' implies more than analysis, strategies, but reshaping of what it is today and what will be tomorrow. In the „knowledge based society'' of the XXIst century - 2nd decade, the flow of the information seems to be crucial. Who can predict the next path of the direction to follow? ... How to do it better? ...

Keywords
Management, information, security, strategy, knowledge.

1. Introduction

Motto:

„*ANIMUS IN CONSULENDO LIBER*''[1]

The organizations, no matter what are their objectives, what them treats and in which domain are situated, in our opinion have to have first of all a perceptive organisational aim.

Secondly, the aim of the institutions has to be achieved by a disciplinary status and coherence.

Thirdly, plans and policies of each institution must be alive through the vision of the managers and leaders, both the team members in the same time.

Nonetheless, the role of the information, doesn't matter the brand or the domain of the organization, is crucial.

More than this: the management of the flow of information able tailored is one of the arts of dealing with the success achieving on the „ markets''.

Nations, alliances, organisations, institutions depends on the information and on the behaviour of how the information is managed in order to be useful.

In the military environment information has one of the top positions in the entire system of evaluating the „battle field''.

Successful use of this strategic resource, information, in conditions that have already become recognized "right time, right place, and right people" is to achieve the objectives.

Inside the organizations such as the military, along with specific knowledge of tactical, command and control, the new realities of the XXI century with its new paradigm of approaches arising from asymmetric events that occurred, as opposed to those of the past century have imposed a multidisciplinary treatment based on technical knowledge, information, as well as those in communication, negotiation, creation and management of a team, adaptability, continue understanding of global processes, and the political-military trends and strategies.

Information is one of the fundamental elements for the existence and the future of an organization that operates in a global society, in which everybody exchanges information with each

* Romania, MND, Bucharest (e-mail: george_negru_2003@yahoo.com). All this article / paper contains only unclassified information from open sources, books, articles as are described in the references.

[1] ("l'esprit libre dans la consultation";"in discussion a free mind") according to http://www nato.int/multi/animus htm, Motto of the NATO, accessed on 03rd of June 2010.

other. To do this, is needed to quickly process extremely large volumes of information, distribute them in an effective and efficient, while ensuring their safety, security and protection (especially in the military).

As a part of our history, the North Atlantic Treaty Organization (NATO) represents an example of organisation that until now, starting from it's beginning, has lived with new challenges and dynamic engagements, dealing in a relevant treatment of the information, and managing a performing flow of the information system.

The New Strategic Concept[2] of the Alliance established and agreed in Lisbon, Portugal in November 2010, named ,,NATO 2020: Active Engagement, Modern Defence'' implies more than analysis, strategies, but reshaping of what it is today and what will be tomorrow.

This military and political document has the ability in our opinion that is relevant for the explanation of the next decade in our Euro-Atlantic, and democratic nation's lives.

It became a clear certain fact that "information is power ".

Handling, securing, protecting and using it for the preserving of the values and principles of democracy and human rights, peace between nations it is a necessity and an art.

In the actual perspective the world has to face at many situations, threats challenges, and in our geopolitical space NATO has an important role in this environment. At the question ,,- How the Alliance can predict, avoid, and/or deal with all these?'', in our opinion, one of the answers consists is the possession of a good management of the flow of information and an analyzed policy in it's new strategic concept.

2. The flow of the information. Risk management. Military considerations.

Improving the management of the flow information from executive personnel to decision making and policy makers, on one hand, and at the horizontal level between the workers and collaborative personnel, on the other hand, is a key focus for many organizations, across both the public and private sectors.

The majority of organisations is eager on to dispatch integrated information management system and enhance environment.

Valuable information management is not undemanding. There are numerous aspects to integrate into systems, a substantial variety of information needs to meet, and to direct into the flow, following specific path and exactly ways, but also multifaceted organizational and cultural issues to address.

However, some effects of the strategy and objectives are more difficult to achieve, or are not achieved just because of the specific characteristics of distinct patterns and systems.

Thus, when the organization can not assume that the objectives and therefore can not perform, it is necessary and appropriate to an analysis of the factors that have contributed in a negative way and prevented the smooth running of things.

The management of the information it is being focused by a variety of features, including a request to develop the effectiveness of company processes, the difficulty of conformity policy and the wish to deliver new services. In some situations, information management has to ask the deploying of new technology solutions, such as content or electronic document management systems, data bases or IT[3] applications and solutions.

[2] http://www nato.int/cps/en/natolive/official_texts_68580 htm accessed on 15th of February 2011.

[3] Information technology (IT) is the acquisition, processing, storage and dissemination of vocal, pictorial, textual and numerical information by a microelectronics-based combination of computing and telecommunications. The term in its modern sense first appeared in a 1958 article published in the *Harvard Business Review*, in which authors Leavitt and Whisler commented that "the new technology does not yet have a single established name. We shall call it information technology." – in accordance with http://en.wikipedia.org/wiki/Information_technology accessed at 19th of February 2011.

„Risk management is the identification, assessment, and prioritization of risks – as it is defined in ISO 31000[4] as the effect of uncertainty on objectives, whether positive or negative - followed by coordinated and economical application of resources to minimize, monitor and control the probability and/or impact of unfortunate events or to maximize the realization of opportunities.'' [5]

A risk analysis of any kind, either at an individual or an organization to address the phenomenon requires understanding, knowledge, identification, assessing and countering the negative effects, and establish mitigation options and opportunities avoidance, prevention and / or disposal.

Thus, the question is: „- What is a risk?".

„ In the classical sense of decision theory, risk is identified as an element that appears uncertain but potentially permanent process of social and human activities which are damaging and irreversible effects''.[6]

To be successful, an institution must be prepared to solve problems of risk management, would ever occur. An effective risk management is an essential component of any *successful management strategy*.

Also, a measure of seriousness and responsibility of an institution is given the way they develop procedures for identifying and analyzing information about potential risk

The flow of information, as a process, implies the communication as a course of action.

Also, the management of the flow of information realizes the centralization, the evaluation, the filtration of information in order to sort them and to disseminate the information for decision. This is done in the same time with the insurance of the presence of the analyze elements and prediction results.

The strategic image is obtained with the principal instrument that sustain the political and military decision process, the totality of data and information from de security perspective, and not only, domain that ensure the optimal level of knowledge at the decision makers level.

So, efficient information administration is not simple. There are many systems to put together, a massive variety of dealing requests to meet.

As we already told, the information flow is about communication. A kind of system can be considered de IT that is the transporters of the data. The information flow is the amount of information that travels between sender and recipient. The information flow is characterized by content, purpose, frequency, length, speed, reliability, and cost.

The Internet was founded in 1969, following a program of the U.S. Department of Defense, and it is known as the ARPANET[7]. The project was funded by Advanced Research Projects Agency. Designed in order to automatically spread the network information traffic when there are problems connecting or transmitting information systems needed to keep. The network running the ARPANET was primarily to establish a system that works even when major components of the them were inoperable.

The risk management of the information in the military environment is treated with very high attitude. In this regard, as an example, on 6 and 7 Oct 2010, the NATO Command and Control Centre of Excellence have hold information and knowledge management workshop together with

---

[4] According to http://en.wikipedia.org/wiki/ISO_31000 accessed at 19th of February 2011, *ISO 31000* is intended to be a family of standards relating to risk management codified by the International Organization for Standardization. The purpose of ISO 31000:2009 is to provide principles and generic guidelines on risk management. ISO 31000 seeks to provide a universally recognized paradigm for practitioners and companies employing risk management processes to replace the myriad of existing standards, methodologies and paradigms that differed between industries, subject matters and regions.

[5] http://en.wikipedia.org/wiki/Risk_management accessed at 19th of February 2011.

[6] Prof. univ. dr. NICOLAE ROTARU, *Managementul riscului* (curs esențializat), Academia Națională de Informații – MISN, București, 2009.

[7] http://www.dei.isep.ipp.pt/~acc/docs/arpa--1 html accessed on 15th of February 2011.

Spain. Experts from the Centre's sponsoring nations and other NATO entities examined a sort of information and knowledge management themes, including success stories, proposed concepts and future developments.

The experts approached the subjects in military operations, because the Alliance today faces daily challenges in efficiently managing an increasing amount of information and knowledge. Effective management of this information and knowledge can help to increase commanders' and military personnel's situational awareness, enabling them to make better decisions with a greater understanding of a particular context.

In that forum was initiated the sharing national approaches to information and knowledge management and reviewing NATO's information management practices and guidance. Also, the groups of participants explored key topics of the issues.[8]

Saying that this is an aspect which it can't be avoided in the risk management discussions; the protection of the classified information. In this regard at national level we can emphasise that the provisions are in line with the NATO and European Union (EU) directives.

The precondition for access to classified information is why holding a security clearance, corresponding to the category and classification level of information that is required to have access.

The categories of classified information to which access is conditioned by the possession of a security clearance document are:

- national classified information;
- NATO classified information;
- EU classified information.

The equivalence of national classified information on grading with the EU to NATO classified information classified is given in the table below:

National - Romania		**NATO**		**EU**
Strict Secret de Importanță Deosebită	⟷	NATO Top Secret	⟷	Tres Secret EU
Strict Secrete	⟷	NATO Secret	⟷	Secret EU
Secret	⟷	NATO Confidential	⟷	Confidentiel EU
Secret de Serviciu	⟷	NATO Restricted	⟷	Restreint EU

Without having an equivalent value system of classification of documents, as described above, under the Romanian Law no. 182/2002 on the *protection of classified information*[9] (published in Official Gazette no. 248 April 12, 2001), we would be able to discuss about the existence of cultural difference in security risks and data protection.

One can conclude that there is an equivalent, such as that described above, may be one of the levers necessary to avoid the existence of disparities and differences in organizational culture. In the absence of working procedures in the field of security incidents could occur, some unwanted effects to the national interests and / or the prospect of partnership alliances.

Figure no.1

Information era features that distinguish it from previous ones are: the emergence of information-based society, organizations are dependent on information technology in specific activities (management accounting, human resources records, etc) place transformation of work processes to enhance productivity, business success is largely determined by the efficiency with which information and communication technology is used, information and communication technology is increasingly embedded in many products and services.

As an example of information flow it can be seen in the picture below (figure no.1) that depicts the phases of the evolution of concepts and society, and the path to wisdom and conscience society.[10]

The word "information'' is generally used to define many aspects of the spectrum in which the communication of information and knowledge which ,, pyramid''[11] (hierarchy) is shown in figure no. 2.

Taking into consideration the military aspect of the topic of this paper and the tactical level, we can focus at one of the types of information flow, as depicted in the next figure no.3.[12]

[10] http://www.uvvg ro/studia/economice/plugins/p2_news/printarticle.php?p2_articleid=201 accessed at 10th of February 2011.

Figure no. 2

Figure no. 2

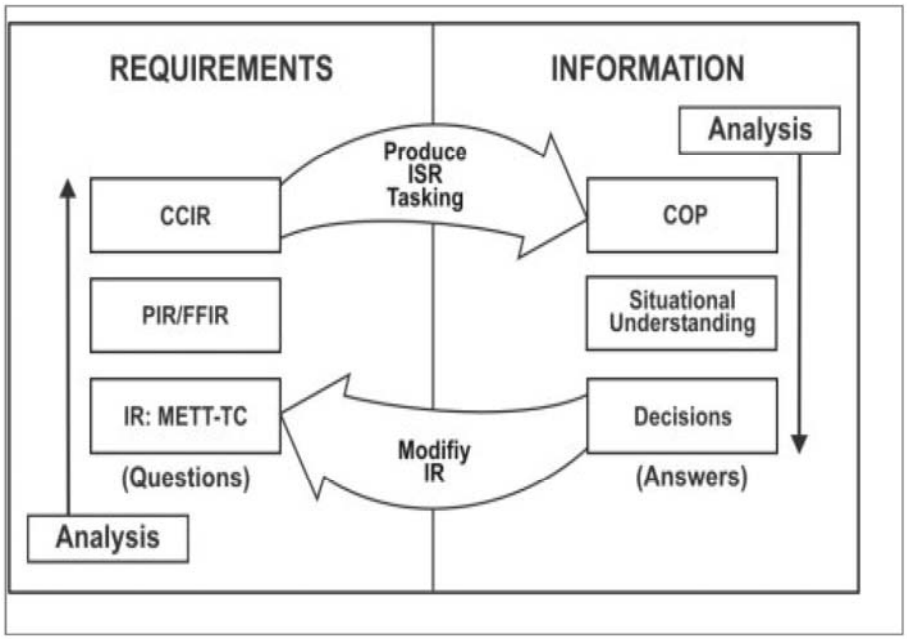

Figure no. 3

So, CCIR = *Commander's critical information requirements* are elements of information required by commanders that directly affect decision making and dictate the successful execution of military operations.[13]

PIR = *Priority intelligence requirements* are those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decision making.[14]

FFIR = *Friendly forces information requirements* are information the commander and staff need about the forces available for the operation.[14]

COP = all information, collectors should focus, as much as possible, only on data needed to determine the information required to build the *Common Operational Picture*.[15]

METT-TC = mission, enemy, terrain and weather, troops.[16]

ISR = intelligence, surveillance, and reconnaissance.

IR = the joint definition of *information requirements* includes only intelligence requirements.[17]

Information management is a *dynamic process* that supports military leaders in the rapid and harmful operational situation.

Based on the information available, throughout operations, the answers to the CCIR, contribute to the assessments that are introduced in the decisions by the staff officers, military leaders and commanders.

These decisions and assessments generate fresh questions that address the changed situation and future command decisions. And the cycle is continuing.

The information flow can be better understand in military environment, at a glance, watching at the next picture (figure no.4) where is illustrated the relationships among the cognitive hierarchy, IR and CCIR.

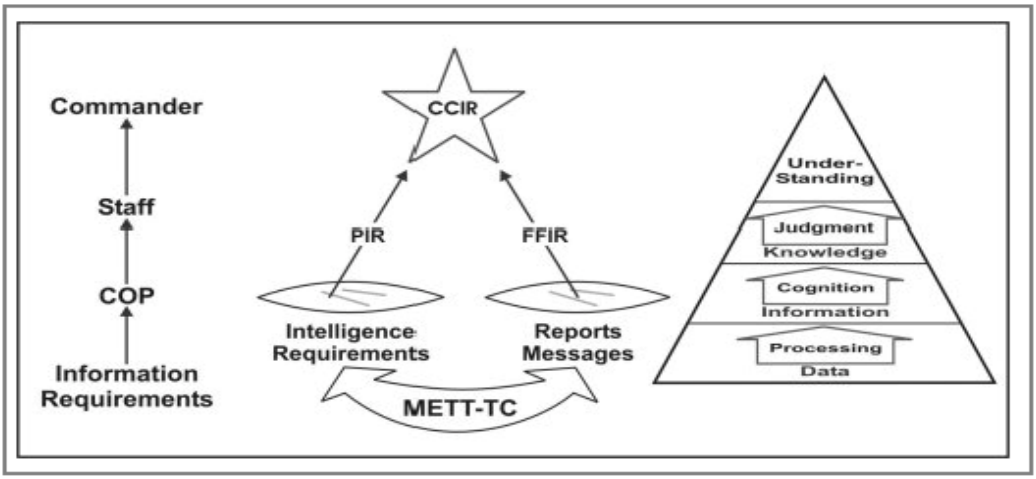

Figure no. 4

[13] According to *FM3-0, Operations*, 14 June 2001, published at http://web7.whs.osd mil/corres htm and http://www.globalsecurity.org/military/library/policy/army/fm/ 6-0/bib htm#fm3-0 accessed at 19th of February 2011.

[14] According to JP 1-02, *Department of Defense Dictionary of Military and Associated Terms*, available online at http://www.dtic mil/doctrine/jel/doddict/.

[15] http://www.globalsecurity.org/military/library/policy/army/fm/6-0/appb htm#figb-2 accessed at 19th of February 2011.

[16] Idem 15

[17] Idem 15

The chain of command demonstrates where meaning is added to data as the C2 (Command and Control) system processes it. The C2 system collects data from various sources to answer IRs.

And this is, let say, at the tactical and operational level in military environment. For the strategic and political level we can analyze the strategic concept of NATO a little bit later on.

The power of information consists in the fact that the political and military actions are necessary directions based on knowledge.

All the leaders that obtain information have the responsibility to do not ignore them, to analyze them and it must remove any lack of knowledge for the developing of the decision process.

„*When the information are precise and appropriate the chances for the decision makers to have a prompt reaction are raised, and some threats, just intuited, are eliminated. Also, some particularities of the risk factors are better understood and it confers to the decision act a value of the proportions*.''[18]

„*Thus, with all the asymmetric threats, from the nations actors and non-nations, can consists the most important and probable security risk, NATO has to have the capacity for conducting operation of highest intensity, in order to react for much robust and unexpected threats*.''[19]

„*The time, between the risk and threat anticipation and the execution of a course of action, must be shortened*.''[20]

„*One of the last important factor of the waste of the time is the bad functioning of the informational system*.''[21]

Combining the four quotas above we can summarise and emphasize the fact that the speed of the receiving, analyzing and taking the decisions is critical in good flow of information system and the decision making process in military environment and not only.

The New Strategic Concept NATO

The strategy of the North Atlantic Treaty Organization (NATO) is consists into a document known as „*The strategic Concept for the defence of the North-Atlantic area*". The first concept was developed between October 1949 and April 1959 considered that the Alliance „*established a strategy of operations at large scale for territorial defence* ".

The New Strategic Concept (NSC) „*NATO 2020: Active Engagement, Modern Defence*'' implies more than analysis, strategies, but reshaping of what it is today and what will be tomorrow.

„*For more than 60 years, NATO has proven itself as the most successful alliance in history. It's defended the independence and freedom of its members.[…] At no time during these past six decades was our success guaranteed. Indeed, there have been many times when skeptics have predicted the end of this alliance. But each time NATO has risen to the occasion and adapted to meet the challenges of that time. And now, as we face a new century with very different challenges from the last, we have come together here in Lisbon to take action in areas that are critical to the future of the alliance.*''[22]- said the president of the United States of America, HE, mr. Barack OBAMA, after de Summit in his press conference at Lisbon, Portugal.

After analyzing of the NSC it can be observed that the document contains the policies and the new principal directions of the Alliance that will be exposed in the next stage of this paper.

The Heads of State and Government of the Allied nations determined that *NATO will continue to play its unique and critical position in ensuring the common defence and security* approved the document that will guide the next phase in NATO's evolution, so that it continues to be effective against new threats, *with new capabilities and new partners* as it is described below:

- it reconfirms the connection between all NATO nations to defend one another against attack;
- it commits the Alliance to prevent crises, manage conflicts and stabilize post-conflict situations;
- it offers to the Allied partners around the globe more political engagement with the Alliance, and a substantial role in shaping the NATO-led operations to which they contribute;
- it commits NATO to the goal of creating the conditions for a world without nuclear weapons – but reconfirms that, as long as there are nuclear weapons in the world, NATO will remain a nuclear Alliance;
- it restates our firm commitment to keep the door to NATO open to all European democracies that meet the standards of membership, because enlargement contributes to our goal of a Europe whole, free and at peace;
- it commits NATO to continuous reform towards a more effective, efficient and flexible Alliance, so that the taxpayers get the most security for the money they invest in defence;
- the citizens of NATO countries rely on the Alliance to defend Allied nations, to deploy robust military forces where and when required for the security, and to help promote common security with thr partners around the globe.

The *core tasks and principles* as them have been established in the Lisbon NATO Summit are:

1.NATO's fundamental and enduring purpose is to safeguard the freedom and security of all its members by political and military means. Today, the Alliance remains an essential source of stability in an unpredictable world.

2.NATO member states form a unique community of values, committed to the principles of individual liberty, democracy, human rights and the rule of law. The Alliance is firmly committed to the purposes and principles of the Charter of the United Nations, and to the Washington Treaty, which affirms the primary responsibility of the Security Council for the maintenance of international peace and security.

3.The political and military bonds between Europe and North America have been forged in NATO since the Alliance was founded in 1949; the transatlantic link remains as strong, and as important to the preservation of Euro-Atlantic peace and security, as ever. The security of NATO members on both sides of the Atlantic is indivisible. We will continue to defend it together, on the basis of solidarity, shared purpose and fair burden-sharing.

4.The modern security environment includes a broad and evolving set of challenges to the security of NATO's territory and populations. In order to assure their security, the Alliance must and will continue fulfilling effectively three essential core tasks, all of which contribute to safeguarding Alliance members, and always in accordance with international law:

a. ***Collective defence***. NATO members will always assist each other against attack, in accordance with Article 5 of the Washington Treaty;

b. ***Crisis management***. NATO has a unique and robust set of political and military capabilities to address the full spectrum of crises – before, during and after conflicts;

c. ***Cooperative security***. The Alliance is affected by, and can affect, political and security developments beyond its borders. The Alliance will engage actively to enhance international security, through *partnership* with relevant countries and other international organisations; by contributing actively to arms control, non-proliferation and disarmament; and by *keeping the door to membership in the Alliance open* to all European democracies that meet NATO's standards.

5. NATO remains the unique and essential transatlantic forum for consultations on all matters that affect the territorial integrity, political independence and security of its members, as set out in Article 4 of the Washington Treaty.

6. In order to carry out the full range of NATO missions as effectively and efficiently as possible, Allies will engage in a continuous process of reform, modernisation and transformation.

The Security Environment

Today, the Euro-Atlantic area is at peace and the threat of a conventional attack against NATO territory is low. That is an historic success for the policies of robust defence, Euro-Atlantic integration and active partnership that have guided NATO for more than half a century.

However, the conventional threat cannot be ignored. Many regions and countries around the world are witnessing the acquisition of substantial, modern military capabilities with consequences for international stability and Euro-Atlantic security that are difficult to predict.

The proliferation of nuclear weapons and other weapons of mass destruction, and their means of delivery, threatens incalculable consequences for global stability and prosperity. During the next decade, proliferation will be most acute in some of the world's most volatile regions.

Terrorism poses a direct threat to the security of the citizens of NATO countries, and to international stability and prosperity more broadly. Extremist groups continue to spread to, and in, areas of strategic importance to the Alliance, and modern technology increases the threat and potential impact of terrorist attacks, in particular if terrorists were to acquire nuclear, chemical, biological or radiological capabilities.

Instability or conflict beyond NATO borders can directly threaten Alliance security, including by fostering extremism, terrorism, and trans-national illegal activities such as trafficking in arms, narcotics and people.

Cyber attacks are becoming more frequent, more organised and more costly in the damage that they inflict on government administrations, businesses, economies and potentially also transportation and supply networks and other critical infrastructure; they can reach a threshold that threatens national and Euro-Atlantic prosperity, security and stability. Foreign militaries and intelligence services, organised criminals, terrorist and/or extremist groups can each be the source of such attacks.

Key environmental and resource constraints, including health risks, climate change, water scarcity and increasing energy needs will further shape the future security environment in areas of concern to NATO and have the potential to significantly affect NATO planning and operations.

Defence and Deterrence

The greatest responsibility of the Alliance is to protect and defend our territory and our populations against attack, as set out in Article 5 of the Washington Treaty. The Alliance does not consider any country to be its adversary. However, no one should doubt NATO's resolve if the security of any of its members were to be threatened.

Deterrence, based on an appropriate mix of nuclear and conventional capabilities, remains a core element of our overall strategy. The circumstances in which any use of nuclear weapons might have to be contemplated are extremely remote. As long as nuclear weapons exist, NATO will remain a nuclear alliance.

The supreme guarantee of the security of the Allies is provided by the strategic nuclear forces of the Alliance, particularly those of the United States; the independent strategic nuclear forces of the United Kingdom and France, which have a deterrent role of their own, contribute to the overall deterrence and security of the Allies.

Security through Crisis Management

Crises and conflicts beyond NATO's borders can pose a direct threat to the security of Alliance territory and populations. NATO will therefore engage, where possible and when necessary, to prevent crises, manage crises, stabilize post-conflict situations and support reconstruction.

The lessons learned from NATO operations, in particular in Afghanistan and the Western Balkans, make it clear that a comprehensive political, civilian and military approach is necessary for effective crisis management. The Alliance will engage actively with other international actors before, during and after crises to encourage collaborative analysis, planning and conduct of activities on the ground, in order to maximise coherence and effectiveness of the overall international effort.

To be effective across the crisis management spectrum, the Alliance will enhance intelligence sharing within NATO, to better predict when crises might occur, and how they can best be prevented.

Also, in this direction, further develop doctrine and military capabilities for expeditionary operations, including counterinsurgency, stabilization and reconstruction operations will be established.

Promoting International Security through Cooperation

Arms Control, Disarmament, and Non-Proliferation

NATO seeks its security at the lowest possible level of forces. Arms control, disarmament and non-proliferation contribute to peace, security and stability, and should ensure undiminished security for all Alliance members.

The Alliance will explore ways for our political means and military capabilities to contribute to international efforts to fight proliferation.

National decisions regarding arms control and disarmament may have an impact on the security of all Alliance members. We are committed to maintain, and develop as necessary, appropriate consultations among Allies on these issues.

Open Door

The door to NATO membership remains fully open to all European democracies which share the values of our Alliance, which are willing and able to assume the responsibilities and obligations of membership, and whose inclusion can contribute to common security and stability.

Partnerships

The promotion of Euro-Atlantic security is best assured through a wide network of partner relationships with countries and organisations around the globe. These partnerships make a concrete and valued contribution to the success of NATO's fundamental tasks.

Dialogue and cooperation with partners can make a concrete contribution to enhancing international security, to defending the values on which our Alliance is based, to NATO's operations, and to preparing interested nations for membership of NATO. These relationships will be based on reciprocity, mutual benefit and mutual respect.

Cooperation between *NATO and the United Nations* continues to make a substantial contribution to security in operations around the world.

An active and effective *European Union* contributes to the overall security of the Euro-Atlantic area. Therefore the EU is a unique and essential partner for NATO. The two organisations share a majority of members, and all members of both organisations share common values. NATO recognizes the importance of a stronger and more capable European defence. For the strategic partnership between NATO and the EU, their fullest involvement in these efforts is essential. NATO and the EU can and should play complementary and mutually reinforcing roles in supporting international peace and security.

NATO-Russia cooperation is of strategic importance as it contributes to creating a common space of peace, stability and security - NATO poses no threat to Russia.

Reform and Transformation

Unique in history, NATO is a security Alliance that fields military forces able to operate together in any environment; that can control operations anywhere through its integrated military command structure; and that has at its disposal core capabilities that few Allies could afford individually.

NATO must have sufficient resources – financial, military and human – to carry out its missions, which are essential to the security of Alliance populations and territory. Those resources must, however, be used in the most efficient and effective way possible.

So, all these values and objectives are universal and perpetual, and determine the defence through unity, solidarity, strength and resolve.

3. Conclusions

Information is one of the fundamental elements for the existence and the future of an organization that operates in a global society, in which everybody exchanges information with each other. To do this, is needed to quickly process extremely large volumes of information, distribute them in an effective and efficient, while ensuring their safety, security and protection (especially in the military).

But in personal or in organizational communication, who receives the information, may understand it or not!

The risk analysis of the flow of the information can be based not only on purely cultural aspects, but also based on elements from organizational, marketing, communication diplomatic representation, military, cultural semiotics and symbols.

Handling, securing, protecting and using it for the preserving of the values and principles of democracy and human rights, peace between nations it is a necessity and an art.

Understanding the risks, de principles of the avoidance of these, and an effective applicability in the information analysis process can improve in real way the quality of the flow of information.

The power of information consists in the fact that the political and military actions are necessary directions based on knowledge.

All the leaders that obtain information have the responsibility to do not ignore them, to analyze them and it must remove any lack of knowledge for the developing of the decision process.

One of our conclusions is the fact that in the ,,knowledge based society'' of the XXIst century - 2nd decade, the information is crucial.

A well organized, administrated and executed flow of the information could and can conduct to decisional supremacy, first of all, secondly, to a celerity of command act – both in military and politically panels, and thirdly to the reduction of the reaction time for execution of the decision makers and leaders direction and patterns to follow.

The speed of the receiving, analyzing and taking the decisions is critical in good flow of information system and the decision making process in military environment and not only.

Maybe is very difficult to forecast the future, but at least the leaders can and should be prepared and well structured in order to do not be surprised and to have a reply for defend the democracy and to do this in a better way.

The Strategic Concept is an official document that outlines NATO's enduring purpose and nature and its fundamental security tasks. It also identifies the central features of the new security environment, specifies the elements of the Alliance's approach to security and provides guidelines for the adaptation of its military forces.

So, the political leaders of NATO, are determined to continue renewal of our Alliance so that it is fit for purpose in addressing the 21st Century security challenges. NATO is firmly committed to preserve its effectiveness as the globe's most successful political-military Alliance. The Alliance thrives as a source of hope because it is based on common values of individual liberty, democracy, human rights and the rule of law, and because our common essential and enduring purpose is to safeguard the freedom and security of its members. These values and objectives are universal and perpetual, and determine the defence through unity, solidarity, strength and resolve.

While the world is changing, NATO's essential mission will remain the same: to ensure that the Alliance remains an unparalleled community of freedom, peace, and security with shared values.

In summary, combining a good flow of information from military environment, and not only, with the biggest politically and military Alliance New strategic concept, create us the opportunity to emphasize the need of having a good partnership between information and strategy in order to better cope with the XXIst Century challenges.

Post-scriptum of this paper:

….the world is changing in a hustle dynamics with large events….*Jasmine* Revolution, „bloody velvet'' Egyptian Revolution, and Libyans unrest, but Humankind, be careful with the Nature, … earthquakes, tsunamis! Unfortunately…..Japan is today! What will be and how will be the day of tomorrow?

THE PUBLIC OFFICER - THE ACTIVE SUBJECT OF A CRIME

NICOLETA-ELENA BUZATU[*]

Abstract
The present study intends to analyze the active subject of the crime committed by an individual - the public officer, for example - during his daily duty program or with reference to the attributions he has versus the public office he holds, in the light of the regulations provided not only by the Penal Code in force but also by the future New Penal Code, as, among the important amendments it provides, the definition of the public officer is also mentioned. In the case of such a trespassing, the active subject shall hold the quality of a public officer the way this quality is regulated by the Penal Code, even if the definition is much ampler as compared to the one given by the Statute of the Public Officers. According to Art 147, paragraph 1 Penal Code, a public officer is any individual who permanently or temporarily exercises - irrespective of his/her rank or of the way this office was appointed, a paid or unpaid task of no matter what nature or importance - in the service of a department Art 145 refers to. The regulation proposed in perfect agreement with the solutions offered by other international legislations and conventions in the domain, the definition of a public officer refers to the individual who - permanently or temporarily appointed, paid or unpaid - shall exercise attributions specific to the legislative, executive or judiciary powers, a function of public dignity or a function of any other type - alone or in a group - within a self-governing management of another economic agent or of a legal person with a whole or a greater capital, or belonging to a legally declared person capital or to a legal person considered to be of public utility - attributions connected with the object of the latter's activity.

Keywords: *office, public officer, crime, responsibility, accountability.*

1. Introduction

The public officer is considered to be the juridical institution of the Public Law - in general - and of the Administrative Law - in particular; this type of institution has finally established its authority at the end of a continuous dispute between doctrine, jurisprudence and regulation.

This kind of dispute is to be met with not only in the practice of some European countries boasting with an efficient public administration, in spite of the differences existing in their specific juridical systems, but also in the Romanian doctrine, jurisprudence and legislation, irrespective of the fact that it appeared and developed as a coherent system later than in other countries, that is after the constitution of a unitary Romanian national state.[1]

The term 'public office' is frequently used in the vocabulary of the specific public law as it is connected with the activity carried on within the public administration department. Any public authority is defined by three attributes: competence, personnel, and material and financial means.[2]

The public officer is being defined by art 2, paragraph 2 of the Statute of the Public Officers[3], as the *person appointed in a public office in conformity with the law.* Yet, *the person removed from the public office and maintained in the reserve body of the public officers can keep his/her attribute of a public officer* - art 2, paragraph 2, second thesis of the Statute.

[2] Ion Rusu – *Administrative Law*, (Bucharest: Lumina Lex Printing House, 2001), p. 259.

[3] Law No 188 of December 8, 1999 regarding the Statute of the Public Officers, published in the Official Gazette No 600 of December 1999, republished.

Unlike the regulation stipulated by the Statute of the public officers, the Romanian Penal Code in force grants a larger interpretation to what the public officer really means. In conformity with art 147, paragraph 1 Penal Code, a "public officer" can be *any person who permanently or temporarily, irrespective of title or of the way he/she was appointed in the office, can exercise a task of any type- paid or unpaid - in the service of a unit art 145 refers to.* "An officer" is supposed to be *the person mentioned in paragraph 1, as well as any employee who develops an activity in the service of another legal person, other than the one stipulated by the above mentioned paragraph.*

The word "public" is defined in art 145 of the Penal Code and refers to *whatever regards the public authorities, public institutions or any other legal persons of public interest, the administration, the use and the exploitations of the public goods, public services and any kind of goods that, according to the law, are considered to be of public interest.*

In the regulation presented by the New Penal Code, in agreement with the solutions regarding other international legislations and conventions in the domain, the "public officer" will be the *person who - permanently or temporarily, with or without payment -: a) exercises attributions specific to the legislative, executive and juridical power; b)exercises an office of public authority or of any other public nature; c) exercises solely or within a group - in the case of a self-governing management company, in the case of an economic agent or in the case of a legal person having total or greater official capital or in the case of a legal person known to be of public interest - attributions connected with the carrying out of their respective purposes. Still, with respect to the penal law, a public officer is also considered to be that person who exercises a public office service for which he/ she was appointed by the public authorities, or who is subjected to the control and supervision of these public authorities until the fulfillment of the respective public service.*

Consequently, different from the Statute - in the vision of the Penal Law - for the condition of a public officer to exist, it is not relevant the title of his task, neither the way of his being appointed in the office, but it is sufficient that the active subject of the transgression to generate such a task in the service of a public authority, public institution or another legal person of public interest.

2. Paper content

The importance of the public officer for a present time Romanian developing state of law resides in the fact that in his/her quality of an instrument through which the administration achieves its attributions and public authority prerogatives, the public officer is the one who, after Romania's adherence to the European Union, will substantially contribute to turn into practice the values of the European Union, to guarantee the fundamental rights of the citizens - among which the right to a good administration and the right to a good governance.[4]

The transgression is a behavior act forbidden by the incriminatory norm, an act committed by a person, breaking his/her own obligation of not committing it, against the social value whose titular a person is. Such persons involved in a juridical report of a penal conflict are subjects of a transgression.

In other words, the subjects of the transgression are those individuals involved in the commitment of a crime, by either committing the act or by bearing its consequences derived from the very transgression.[5] The specialized literature makes a distinction between the active and the passive subject of a transgression.

The natural person shall also meet a series of general, cumulative conditions, such as: *the required legal age* from which a person can appear in a penal court is 14; *responsibility* - that is the

[4] Verginia Vedinaș – *Considerations on the Draft of Law for the Modification and Completion of Law No 188/1999 regarding the Statute of Public Officers*, in RDP no. 2 (2006), p. 68.

[5] See Constantin Mitrache and Cristian Mitrache – *Romanian Penal Law. General Part* VIIth edition, (Bucharest: Universul Juridic Printing House, 2009), pp. 120; Costică Bulai – *Penal Law. General Part* (Bucharest: All Printing House, 1992), p. 81.

person's ability to conscientiously coordinate his/her will in connection with the above mentioned conditions;[6] *the free will and action* - meaning that the person could have had the opportunity to freely decide the committing of the deed.

As the New Penal Code stipulates, the active subject of a transgression is the natural or legal person who commits a transgression and is asked to respond in front of a penal court. Art 135, paragraph 1 of the New Penal Code stipulates: "*Any legal person - with the exception of the state and of the public authorities - is demanded to appear in a penal court for the transgressions meant to achieve the activity in view, or those committed in the name of the legal person's interest.*" Any transgression makes the committer become a subject of the respective transgression, or a transgressor proper. Any person who commits a transgression - an already committed one or a punishable attempt to which he is a participant as either the author or the accomplice or instigator - is considered to be either an active subject of the transgression or a transgressor, as stipulated by art 174 of the New Penal Code.

The name of an active subject of a transgression characterizes his/her anti-legal attitude that breaks the provisions of the law and the social discipline with his/her dangerous behaviour and creates an irreducible conflicting situation that makes him/ her responsible in front of the penal court.[7]

The active subject for whom a special condition is necessary to be carried out is called a qualified active subject or a circumstantiated active subject.

The existence of certain transgressions is conditioned by the quality of the active subject of the transgression, alongside with the fulfillment of the other conditions, among which: office abuse against the interests of the person, office abuse in obstructing certain rights, office abuse against public interests, office negligence, abusive behaviour, negligence in keeping state secrets, conflict of interests, receiving or offering bribe, denunciation of professional secrets, fraudulent management, dilapidation, stealing or destroying documents, forging official documents, defalcation of funds, etc. In the case of all these transgressions, the active subject shall be a public officer, as stipulated by the Penal Code, even if the area is much larger that the one delimitated by the Statute.

The legal ground is given by art 140 Penal Code that provides that whenever the penal law makes use of the terms includes in Title VIII of the Penal Code, their meaning derives from these articles. In practice the exceptions of non-constitutionality of the dispositions included in art 147 of the Penal Code were abolished, but not rejected by the Constitutional Court.

In as far as the Administrative Law is concerned, the public officer is considered to be the person who was appointed in a public office. The person whose office attributions ceased - from imputable reasons - still keeps the quality of a public officer, continuing to be a member of the public officers reserve body. In its addenda, Law No 188/1999 presents a list of all public offices, although it is far from being exhaustive. On the other side, some norms that regulate the activity of certain categories of persons do not grant them the quality of public officers, as for example the teachers; still, in the view of the penal law, all these categories are considered to be public officers. The Labor Law does no longer make a difference between employee and officer, as in the period between the two World Wars. The employee is the natural person who works on the ground of an individual labor contract. [8]

The quality of a public officer involves the existence of an office responsibility - as a factual case - or, is the consequence of a concluded labor contract with a unit, in the virtue of which the subject exercises his/her real office attributions. His/her responsibility can be permanent or temporary; what it matters is the fact that the respective person shall become part of the work team of

[6] George Antoniu – *On the Transgressor, the Transgressing Act and Culpability*, in RRD no. 8 (1969), p. 80.

[7] Alexandru Boroi – *Penal Law General Part. In the Light of the New Penal Code* (Bucharest: C.H. Beck Printing House, 2010), p.152.

[8] Răzvan Popescu – *Elements of Penal Law*, (Bucharest: Universul Juridic Printing House, 2008), p. 108.

one of the units provided by art 145 and subject to the inner order rules regulating the organization and the discipline of the respective activity.[9]

In order to define the quality of a public officer, the title of his/her duties or the modality of his/her being appointed (appointment, repartition, election or contest) is not relevant.

It is sufficient for the active subject of a transgression to exercise a certain duty in the service of a public authority, public institution or of any legal person of public interest. At the same time, there is not at all relevant the validity of the labor report, and there is not necessary any labor contract or appointment in the office; it is sufficient for his/her exercise the respective office be a factual reality related to the required attributions. In such a case, the tacit or expressed agreement of the unit-staff is compulsory in as far as the person can exercise the attributions of the respective office.[10] Those persons who have certain duties within one of the units art 145 refers to, have the quality of being public officers irrespective of their being paid or not.

By considering art 2, paragraph 2, these I and II we draw the conclusion that in the conception of the Statute, the persons who hold offices by nomination have not the quality of public officers and, consequently, they are not applied the provisions of the Statute. In the same way, the provisions of the Statute are not applied to all persons appointed in a public office, because art 6 enumerates a series of categories of persons who, although belonging to the public authority or to administrative public institutions and are appointed in the office, they are not considered to hold the public offices, and so, they do not have the quality of a public officer.

For example, the magistrates, the teachers, the employees working in the cabinets of the high officials in the basis of their personal proposals and agreement (secretariat, protocol, administration, maintenance, supply, guardianship as well as other categories) and employed in the personal apparatuses of public authorities and institutions, but who do not exercise public authority prerogatives, are not submitted to the regulations of the Statute of Public Officers.

There are commentaries within the doctrine in connection with the definition of the public officer as reported to certain categories of professions - liberal professions - as: lawyers, notaries, doctors, etc. Mention shall be made that a distinction shall be made between those lawyers who have only the quality of being members of the Bar - on the ground of which they are enabled to exercise the profession of a lawyer - and those lawyers elected in the leading staff of the Bar. In the meaning of the legal provisions, only the latter category can be considered active subjects of office transgressions. As for the doctors, the penal doctrine considers - corroborating the provisions regarding the medical assistance with the penal provisions - that only those doctors who work in the State sanitary network are public officers, as stipulated in art 147, paragraph 1, of the Penal Code. As for the quality of a public notary to be considered a public officer, the penal doctrine underlines the fact that although they exercise services of public interests, they are in the service of neither public nor private unit.[11]

The New Penal Code[12] opted for the assimilation of the natural persons who exercise a profession of public interest that requires a special qualification from the part of the public authorities and which is submitted to their control (notaries, bailiffs, etc). Although these persons are not public officers proper, they are invested with a public authority, granted to them by a State competent authority and are submitted to their control; this justifies for their being assimilated to the category of

[12] See the Justifications of the New Penal Code.

public officers. As it resides from the content of the special part, then when certain incriminations are not compatible with the statute of the above mentioned category, or when their being confronted with a certain incriminating text was not meant, it was particularly provided the non-appliance of the text regarding the above mentioned persons.

3. Conclusions

If correlating all branches of Law, one can underline the fact that a public officer - in the light of both penal and administrative law - excludes the quality of an employee. The penal law term about the public officer includes both the public officer proper and the employee who exercises an office task that is, that of a private officer. So, the Penal Law includes all persons who perform any kind of activity on the ground of an individual labor contract or work-report; the definition of a public officer includes all the persons who exercise a public task in the frame of public authorities, public institutions or legal persons of public interest, irrespective of the way they were appointed or of their being paid or unpaid. The definition of the public officer given by the Administrative Law is not to be confounded with the one given by the Penal Law which is much ampler. The Penal Law, for example, admits the status of a public officer for certain persons, irrespective of the conditions imposed by the Administrative Law; the Administrative Law speaks, for example, about a "legal appointment" as compared with the Penal Law that speaks about the "indifferently how he/ she was appointed." The Administrative Law presupposes competence and a certain authority, as compared to Penal Law that presupposes only a "no mater what task." The Administrative Law requires that the person should be a member of the administrative body, while the Penal Law admits "any person," that is unsalaried.

THE DECISIONAL TRANSPARENCY IN PUBLIC ADMINISTRATION

OCTAVIA MARIA CILIBIU[*]

Abstract
The principle of decisional transparency is one of the principles of good administration, fundamental principles of public administration and it is enshrined in the law of many European Union member states, including our country. In their work the public authorities must show transparency reflected by the active involvement of citizens in administrative decision as its primary beneficiary. The citizen information, consultation and his stimulation to participate actively in the elaboration of draft normative acts for their preparation and before that by bringing them to public knowledge, are tasks of the public authorities which exceed the limit of the obligations imposed by internal rules and are significant efforts to modernize the public administration and rallying to the administrative structures.

Keywords: *transparency, public administration, information, citizen, decision*

Introduction

This study aims to address the issue of decisional transparency in public administration issues, one of the principles of good governance, fundamental principles of government.

Research of issues decisional transparency in public administration is topical and important in several respects.

First, the importance of our country's status is determined by the European Union member state and European law enshrines the principle (Treaty on European Uniunuu Regulation no. 1049/2001 of the European Parliament and the Council of 30 May 2001 on public access the European Parliament, Council and Commission, the Treaty establishing the Constitution for Europe). Also, transparency in government decision making is established, the law of many Member States of the European Union.

Secondly the research is important to demonstrate openness and transparency of public administration to manage those.

Thirdly transparency in government decision-making leads to confidence in the strength and importance of normative acts. Public confidence in the legal compliance results, with positive consequences on economic development and maintaining cooperative relationships between government and society.

Research is important in terms of developing national doctrine.

Scientific research was done based on research of national legislation, European legislation and the implementation of transparency in some public authorities law and literature approach.

Transparency in government decision-making approach is based on the value of the work of specialists in administrative law, public administration, most authors on the importance of transparency going on in government decision-making, the general rule being that government policy should be an open and transparency. I agree with this view given the fact that transparency in government decision-making is the most important premise of a democratica and accountable governance.

[*] Lecturer, Juridical Sciences and Letters Faculty, "Constantin Brâncuşi" University of Tg-Jiu, (e-mail: taviamara@yahoo.com).

Paper content

Transparency in government decision-making involves opening the government to manage the authorities by informing the people on matters of public interest, public consultation on draft laws and their right to participate actively in taking administrative decisions and in the process of elaborating normative acts. Transparency of decision "means the degree of openness for an election or a check"[1].

Openness and transparency in public administration serve two specific purposes. On the one hand, they protect the public interest as they reduce the risk of maladministration and corruption, and on the other hand, they are essential to protect individual rights because it provides the necessary reasons for administrative decisions, and help the parts concerned to exercise their right to appeal[2].

It is desirable to provide transparency of public administration, participation in decision making in an appropriate manner, of persons whose rights and interests are at stake, communication to those interested in the criteria for making decisions, reasoning required decisions etc.[3].

„Change is not possible without difficulty, even in the worst prospect of better. Currently, Romania faces many changes and the responsibility is shared"[4].

As a general rule „gouvernment policy should b eone of openness and transparency"[5]. In their work public authorities must show transparency reflected by the active involvement of citizens in administrative decision as its primary beneficiary.

The principle of transparency in government decision-making is a mechanism by which the right to information provided by art. 31 of the Constitution is exercised.

Citizen information, consultation and his stimulation to participate actively in the elaboration of normative acts projects for their preparation and before that by bringing them to public knowledge, public authorities are responsible for obligations beyond the boundaries imposed by internal rules and approaches are significant efforts to modernize public administration and rallying the administrative structures.

Transparency of decisions is necessary to show even more in the local public authorities as, in accordance with the principle of subsidiarity, these authorities are closest to the citizen[6].

Transparency of decisions is any social mechanism in a democratic society to ensure effective participation of citizens and legally recognized organizations in public life and completes the formal process of election or designation of representatives of institutions and public authorities[7]. This mechanism is regulated in Romania by Law no. 52/2003 on decisional transparency in public administration [8], with subsequent amendments[9].

Law transparency throughout the project

In November 2000, IRIS Center Romania started the project "Transparency in government activity" that addresses both central and local government.. At the central level there were held numerous meetings and seminars attended by public institutions, business representatives and NGOs in order to obtain amendments to the draft proposed legislation.

Since December 2001 IRIS Center has begun consultations with the Ministry of Public Information on the drafting of this bill. It was brought to the public on 16 April 2002 by means of a press conference. On April 22, 2002, the Ministry of Public Information with IRIS Center organized a public debate on the bill presented by the Ministry. In addition to the amendments made in the debate, IRIS Center Romania and Transparency Association sent in writing to the Ministry of Public Information, a series of suggestions to improve the draft law[10].

The main purposes which the law aims to achieve are:

- Increasing the accountability of government for the citizen.
- Stimulating the active participation of citizens in administrative decision-making process.
- Increasing transparency throughout government.

Law on transparency of decisions addresses to: citizens, NGOs and business associations.

The principles governing decision transparency in public administrastion are: informing the people on matters of public interest, public consultation on draft legislation and active participation of citizens in the decision-making process and in developing legislation.

Prior information is that the government authority must publish a notice of the contents of a draft law (including Background Notes, the Explanatory Memorandum, Approval Report, the full text of the draft, the date and the deadline by which suggestions or amendments can be submitted). The notice must be published on the Authority website and at its headquarters and transmitted to central or local media (if applicable) at least 30 days before submitting the project for consideration, approval and adoption. The authorities must send the notice to the legally constituted associations which have requested this in advance.

Public consultation on draft legislation takes place through the establishment of a period of at least 10 days from the date the notice was published in which citizens and legally constituted associations may submit written proposals, suggestions and opinions worth recommendation which have to be taken into account when finalizing the final text and sending it for approval and adoption.

Active citizen participation takes place through public debates on the project submitted to transparent procedure. The public authority is obliged to hold a public debate where a legally constituted organization or another public authority requests it in writing. Discussions should be recorded and made public through the minutes of the meeting. The final decision on the recommendations and suggestions in the consultation or public debate belongs entirely to the public authority.

Law transparency of decision should not be confused with the law on access to public information. Transparency law does not give citizens the right to make final decisions on regulations that would be adopted, this belonging to government authorities who will decide whether or not to include draft regulations information and suggestions.

Article 12 of Law no. 52/2003 introduces an obligation for all public authorities to draw up an annual report on the transparency of the decision containing the following information: the number of recommendations received, the total number of recommendations included in draft legislation and the content of the taken decision,the number of participants in public meetings, the number of debates organized publicly on the draft regulations, where state authority was sued for obeying the law, its own assessment of partnership with citizens and their associations legally established, the number of public meetings and incentive closed restricting access.

* Data are taken from reports made by public authorities, published on their websites, and where it is – there is no information.

The observed low level of active participation of citizens in decision making, but public authorities and lack of properly prepare the annual report on transparency of decisions, there are no certain information in the report heading.

Despite the crystallization of a formal framework that can ensure transparency in decision making and access to information of public interest, there is still in Romania a state of inertia in the fieldof citizens' involvement in decisions affecting the public interest. The local government gives us many examples[11].

[11] **Emil Bălan**, *Transparenţă vs. opacitate în administraţia publică*, International Seminar „Transparency and participation for the government closer to the citizen", 5-6 december 2005, SNSPA Bucharest.

Transparency law provides for three types of mechanisms to punish those who neglect their obligations:

- the possibility for citizens to challenge government authority in court, if it violates the rights provided by law.
- the possibility of official sanction restricting the full exercise of rights provided by law by citizens.
- the possibility of penalizing those persons participating in public meetings that do not comply with them.

Knowledge of public administration to citizens and their participation in decision making for public administration has some advantages[12], as follows:

- restores and builds trust between government and citizens;
- helps the administration to identify community needs faster and with greater satisfaction for citizens;
- provides free information to the public administration regarding the decisions to be taken;
- leads to community consensus and not to conflict;
- government and citizens are able to jointly address problems and opportunities in a much more creative way.

Article 5 of the Law sets out exceptions in applying the Law of transparency. Thus, there has been a consultation process for developing legislation that provides information on national defense and public order, the strategic, economic and political interests of the country as well as information on personal data.

Treaty on European Union enshrines the concept of transparency in the art. 1, para. 2, stating that "this treaty marks a new stage in the process of creating an ever closer union among the peoples of Europe, in which decisions are taken as openly and as closely as possible to the citizens"[13].

Transparency of decision making in European institutions is guaranteed by the provisions of Regulation no. 1049/2001 of the European Parliament and the Council of 30 May 2001 regarding public access to the documents of the European Parliament, Council and Commission[14].

The beneficiaries of this regulation are all citizens of the Union and any natural or legal person, resident or having their headquarters in a Member State (Article 2, section 1).

Transparency helps to ensure better participation of citizens in the decision-making process, ensuring greater legitimacy, effectiveness and accountability of government towards the citizens in a democratic system. Openness contributes to strengthening democratic principles and fundamental rights, as defined in Article 6 of the European Union Treaty and the Charter of Fundamental Rights of the European Union (section 2 of the preamble of the Regulation).

Regulation no. 1049/2001 establishes the principle according to which the documents held by an institution that is prepared or received by it and in its possession, in all areas of EU activity should be accessible to the public. Are there, however, exceptions to this principle as follows:

The institutions shall refuse access to a document where disclosure would undermine the protection:

(a) the public interest as regards:

- public safety
- defense and military issues
- international relations
- the financial, monetary or economic politics of community or of a State Member

[12] Romanian Association for transparency and Pro Democray Association, *Ghidul transparenței decizionale în administrația publică*, Publishing Tranger Printing , Bucharest, 2006, 14.

[13] Enhanced version of the Treaty on European Union publiched in the Official Journal of al UE C115 of 9. 05. 2008.

[14] Published in the Official Journal L 154 of 31. 05. 2001.

(b) privacy and integrity of the individual, especially in accordance with data protection legislation.

The institutions shall refuse access to a document where disclosure would undermine the protection:

- Commercial interests of a natural or legal person, including intellectual property;
- Court proceedings and legal advice;
- the purpose of inspections, investigations and audits, unless an overriding public interest in disclosure of that document.

Access to a statement from an institution for internal use or received by an institution and an issue on which the institution has not yet taken any decision is denied if its disclosure would seriously undermine the decision-making institutions, unless there is an overriding public interest in disclosure of that document.

A Member State may request the institution not to disclose a document originating from that without its prior consent

Requests for access to documents shall be made in writing, including electronically, in one of the languages of the Member States and in a sufficiently precise way to enable the institution to identify the document. The applicant is not obliged to give reasons for the request (Article 6, section 1 of the Regulation). Whenever an application is not sufficiently precise, the institution shall ask the applicant to clarify and assist in this purpose, for example by providing information on the use of public registers of documents.

The deadline for resolving the request for access to documents is 15 working days from the date of filling. The institution may grant access to documents requested and provide such documents, or reject in whole or in part the request, pointing out reasons for rejecting the applicant, and also informing him about his right to enter a confirmatory application asking the institution to reconsider its position.

Confirmation request is nothing more than a purely administrative appeal, an administrative gracious appeal and settled gracefully within 15 working days after filling the application. In case of rejection of all or part of the application the Regulation establishes the remedies available to it the applicant, that of the appeal court and / or complaint to the European Ombudsman.

On this occasion we must mention the words addressed by Mr. Nikiforos Diamandouros, during his reelection to the post of European Ombudsman: “I will ensure that EU citizens will take full advantage of the Treaty of Lisbon. It is the right to good administration, the right of access to EU documents and the right to engage in dialogue with EU institutions. For me it is extremely important to strengthen "service culture"within the EU administration, this approach include greater transparency and fair, impartial and speedy civic affairs”.

European Ombudsman examines coplaints about maladministration in EU institutions and bodies. Most complaints received by the Ombudsman refers to the lack of transparency in EU institutions.

Before the Ombudsman investigate the complaint of an authorized plaintiff regarding the maladministration within a European institution or body must meet the criteria of admissibility. These criteria, laid down in the relevant articles of the Statute of the European's Ombudsman[15], read as follows:

- Author and subject of the complaint must be identified, the author may request that the complaint remain confidential [Article 2 (3) of the Statute];
- The Ombudsman may not intervene in cases pending in court or bring into question the merits of a decision [Article 1 (3) of the Statute)];

[15] Adopted by decision of Parliament on 9 march 1994 (JO L 113, 4.5.1994, p. 15) and amended by its decisions of 14 march 2002 (JO L 92, 9.4.2002, p. 13) and of 18 june 2008 (JO L 189, 17.7.2008, p. 25).

- The complaint must be filled within two years from the date on which the facts justifying the applicant are brought to the attention of [Article 2 (4) of the Statute)];

- The complaint should be preceded by appropriate administrative approaches to the institution or body concerned [Article 2 (4) of the Statute)] and

- For complaints about the working relationship between institutions and bodies and officials, their internal administrative channels have to be exhausted to resolve the claims or administrative complaints before submitting the complaint [Article 2 (8) of the statute)].

Article 195 of the EC Treaty provides that the Ombudsman "conducts inquiries for which they claim to be appropriate." In some cases, there might not be sufficient grounds for the Ombudsman to initiate an investigation, even if the complaint is admissible. For example, if a complaint has been considered as a petition by the Committee on Petitions of the European Parliament, the Ombudsman considers that there is normally a justification for an investigation of the Ombudsman, unless new evidence is submitted.

For example, in total, 42% of eligible cases handled in 2007 were considered unjustified to start an investigation.

Since the establishment of the Ombudsman institution, the situation of complaints relating to transparency, including refusal of information is as follows.

Year	No. complaints registered	No. investigations initiated	% investigations relating to transparency, including refusal of information
1995[16]	298	131	22%
1996[17]	842	207	14%
1997[18]	1181	196	30%
1998[19]	1372	170	40%
1999[20]	1577	201	32%
2000[21]	1732	223	42%
2001[22]	1874	204	41%
2002[23]	2 211	222	41 %
2003[24]	2436	253	34%
2004[25]	3.726	351	36%

2007[28]	3.211	303	71%
2008[29]	3.406	293	36%
2009[30]	3.098	335	36%

In order to ensure the democratic nature of the European Union and the Union closer to citizens, there are set a series of principles of functioning of the Union [31], including the principle of transparency.

At European Union level, the measures to enhance transparency and openness, clearly underline the importance of these two principles[32], on the European Transparency Initiative (ETI-European Transparency Initiative), introduced by the European Commission launched on 3rd, March 2005 and adopted the 9th, November that year to increase transparency, openness and accountability of governance processes of the European Union, noting that "transparency has passed from being a subject of public debate on the priority agenda of European politicians, achieving a highest possible degree of openness and transparency is one of the main objectives of the Commission in the period 2005-2008".

In May 2006 the Commission published a Green Paper on European Transparency Initiative which was intended to initiate a debate with stakeholders on how to improve the transparency of EU funds, to increase consultation with civil society and create a framework for the role of lobbies and NGOs in European Union decision-making by institutions.

ETI concept itself was developed in response to the need to "reconnect Europe with its citizens and put an end to both physical and mental differences that make it difficult for people to understand what Europe does and why it matters". ETI objectives therefore were "to increase openness and accessibility of European Union institutions, having the power to increase the use of European Union budget and to make European Union institutions more accessible to the public" with the intent to promote transparency in European Union decision making.

The principle of transparency is reflected in the Treaty establishing a Constitution for Europe art. I-50 - Transparency of procedures of the institutions, organs and bodies of the Union. Paragraph 1 of this Article provides that "In order to promote good governance and to ensure the participation of civil society, institutions, bodies and agencies working Union respecting the highest principle of openness." Also, " any citizen of the Union or any natural or legal person residing or having its registered office in a Member State has the right to have access to the institutions, organs and bodies of the Union" (par. 3, art.I-50).

The treaty establishing a Constitution for Europe provides on art. 1 - 47 the participative democratic principle which states that institutions shall maintain an open, transparent and regular dialogue with representative associations and civil society. In order to ensure consistency and transparency of European Union action, the Commission shall carry out broad consultations with the concerned parties.

Lack of transparency in decision-making, among other shortcomings of the regulatory activity, leads to low confidence in the strength and importance of company laws. Absence makes the rules consultations to be frequently modified or replaced, and this causes a sharp legislative instability.

Confidence in the legal framework will result in a greater degree of compliance with positive consequences on economic development and maintaining cooperative relations between your government and society.

Conclusions

Research of the principle of transparency in government decision-making results highlight the importance of this principle for both public administration and citizens, the principle of transparency in government decision-making leading to improved citizen-government relationship.

Transparency in government decision-making is one of the values that have an impact on the democratic process, the most important premise of a democratic governance. In any democratic state should encourage transparency in government decision-making, lack of transparency leading to maladministration.

In the future, require increased transparency in public administration, ensuring the maximum level of transparency as the degree of transparency is much higher public administration is closer to citizens, the principle of transparency in government decision making closer to citizens and public administration leads to removing any corruption or suspicions thereof. Transparency in government decision-making is a principle of proximity, helping to improve the quality of the administration the benefit of citizens.

THE JURIDICAL REGIME OF SANCTIONING THE PERFORMANCE OF AN ACTIVITY FOR THE BENEFIT OF THE COMMUNITY

NICOLAE GRĂDINARU[*]

Abstract
The sanctioning of performing an activity for the benefit of the community is always established alternately with the fine or penalty and certain deeds that constitute contraventions are sanctioned. This sanction may be applied only by the court.
The activity for the benefit of the community is performed in the field of public services, for maintaining the places of recreation, parks and roads, for maintaining the cleanliness and hygiene of the localities, for conducting activities for the benefit of hostels for the elderly and children, for the orphanages, nurseries, kindergartens, schools, hospitals and other social-cultural establishments.
It is prohibited to oblige the child to perform an activity involving risks or is likely to affect his/her education or to harm his/her health or his/her physical, mental, spiritual, moral or social development.

Keywords: *offense, community service activities, irrevocable, supervising the execution, contravention, working programme.*

Introduction

Contravention imprisonment was introduced into the Romanian legislation by Decree no.329/1966 on sanctioning some deeds that constituted contraventions to the rules of travelling by train.[1]

It has first appeared as an exception to the common law, but then more regulations regarding the law stipulated the punishment of certain deeds with contravention imprisonment, although Law no.32/1968, which was the framework law on the contraventions regime, this sanction was not taken in the system of contravention sanctions.

Among the concerns of finding some alternatives to the sanctions involving deprivation of liberty on short term, which could protect the offender from imprisonment was Law no.82/1999 on the replacement of contravention imprisonment with the sanction of obliging the offender to perform some activities for the benefit of the community.

By GO no.2/2001 on the juridical regime of contraventions, both contravention imprisonment and performing some activities for the benefit of the community were stipulated as the main sanctions.[2]

Due to the dysfunctions reported in the practice of the courts of law on the application and enforcement of these sanctions, this area was covered by special law, GO no.55/2002.[3]

[1] Decree no.329/1966 on sanctioning some contraventions regarding the rules for travelling by train, published in Of.B. (Official Bulletin) no. 21/03.05.1966, repealed by Law no.158/2004 concerning the declaring of certain normative acts as repealed, published in the Of.G. (Official Gazette) no. 467/25.05.2004.

[2] GO no. 2/2001 on the regime of contraventions, published in Of.G. no. 410/2001, Law no. 180/2002 published in Of.G. no. 268/2002, amended through GEO no. 108/2003 published in Of.G. no. 747/26.10.2003, Law no. 526/2004 published in Of.G. no. 1149/06.12.2004, Law no. 182/2006 published in Of.G. no. 443/23.05. 2006, Law no. 352/2006 published in Of.G. no. 640/25.07.2006, GO no. 8/2006 published in Of.G. no. 78/27.01.2006, Law no. 353/2006 published in Of.G. no. 640/25.07.2006, Law no.293/2009 published in Of.G no.645/01.10.2009, Law no.202/2010 published in Of.Gno.714/26.10.2010.

In the ordinance it is stipulated that the sanction of the performance of an activity for the benefit of the community can be provided only in laws or ordinances of the Government, through which certain deeds constituting contraventions shall be established and sanctioned.[4]

The sanctioning of performing an activity for the benefit of the community is always established alternately with the fine or penalty and certain deeds that constitute contraventions are sanctioned. This sanction may be applied only by the court.

The activity for the benefit of the community is performed in the field of public services, for maintaining the places of recreation, parks and roads, for maintaining the cleanliness and hygiene of the localities, for conducting activities for the benefit of hostels for the elderly and children, for the orphanages, nurseries, kindergartens, schools, hospitals and other social-cultural establishments.

The local council establishes through a decision the fields of the public services and the areas where the offenders will perform activities for the benefit of the community.

The mayor is required to carry out the mandate of execution.

The sanctioning of performing an activity for the benefit of the community is carried out after the working programme, or, according to each case, the school programme of the offender, for a period between 50 hours and 300 hours, maximum of 3 hours a day, and during the non-working days of 6-8 hours per day.

If the offender has the opportunity to execute the penalty every day of the week, and local public authorities, through the persons empowered, are able to supervise the offender's activities, the maximum duration of the working time cannot exceed 8 hours per day.

The sanctioning of performing an activity for the benefit of the community can also be applied to minors, if the crime was committed at the time they reached the age of 16 years. The activity is performed on a period between 25 hours and 150 hours.

It is prohibited to oblige the child to perform an activity involving risks or is likely to affect his/her education or to harm his/her health or his/her physical, mental, spiritual, moral or social development.

The procedure of applying the sanctions

In the case of contraventions for which the law provides for sanctioning with the fine alternately with sanctioning the performance of an activity for the benefit of the community, if the fact-finding agent considers that sanctioning with the fine is sufficient, he/she applies the fine in accordance with the provisions of the GO no.2/2001 on the contraventions regime.[5] If, in relation to the seriousness of the crime, it is considered that the fine is not sufficient, the fact-finding agent shall write a fact-finding report on the contravention and shall submit it, within 48 hours, to the court of justice.

The jurisdiction belongs to the court in whose district the offence was committed.

The president of court fixes an emergency term, citing the offender and the fact-finding agent.

[3] GO no. 55 of 16/08/2002 on the juridical regime of sanctioning the performance of an activity for the benefit of the community and contravention imprisonment, published in the Official Gazette no. 642 of 30/08/2002, approved by Law no. 641/2002 published in the Of.G. no. 900/11.12.2002, amended by GEO no. 108/2003 published in Of.G. no. 747/26.10. 2003, Law no. 42/2007 published in Of.G. no. 163/07.03.2007, GEO no. 78/2008 published in Of.G. no. 465/23.06.2008.

The dispositions of the ordinance is supplemented by the provisions of the Code of Civil Procedure.

[4] Example - Law no. 61/1991 to sanction the acts of violation of some rules of social coexistence, of the order and public order, republished in Of.G. no. 387/18.08.2000, with subsequent amendments.

[5] GO no. 2/2001 on the contraventions regime, published in Of.G. no. 410/2001, Law no. 180/2002 published in Of.G. no. 268/2002, amended by the GEO no. 108/2003 published in Of.G. no. 747/26.10.2003, Law no. 526/2004 published in Of.G. no. 1149/06.12.2004, Law no. 182/2006 published in Of.G. no. 443/23.05. 2006, Law no. 352/2006 published in Of.G. no. 640/25.07.2006, GO no. 8/2006 published in Of.G. no. 78/27.01.2006, Law no. 353/2006 published in Of.G. no. 640/25.07.2006, Law no.293/2009 published in Of.G no.645/01.10.2009, Law no.202/2010 published in Of.Gno.714/26.10.2010.

The bench is composed of a single judge.

The offender can be assisted by the defender.

If the offender is a minor, legal assistance is required. The court calls for the summoning of the parents or of the legal representative of the minor.

Participation of the prosecutor is required.

The court considers the legality and reliability of the reports or minutes and delivers one of the following solutions:

a) applies the sanctioning with the fine;

b) applies the sanctioning of performing an activity for the benefit of the community, if it considers that the application of the contravention fine is not sufficient or the offender does not have material and financial means to pay it;

c) cancels the minutes or the report.

If a person has committed multiple offences, found through the same report or minutes, in case for all the facts or only for some of them it has been stipulated the sanctioning of performing an activity for the benefit of the community, the sanctions added without being able to exceed the overall maximum established by the law.

These provisions shall apply as appropriately and in the situation in which the concurrent contraventions were found through different minutes or reports.

The decision through which the sanction was applied for the performance of an activity for the benefit of the community is irrevocable.

In all cases, the court may, by resolution, determine the nature of the activities to be performed by the offender for the benefit of the community, based on data provided by the mayor of the locality where he/she has his/her domicile or residence, taking into account his/her physical and mental skills, as well as the level of professional training.

The enforcement of the sanctions

The sanctioning of performing an activity for the benefit of the community is placed into execution by the court of law by issuing a writ of execution.

A copy of the decision, with the writ of execution, shall be communicated to the mayor of the territorial-administrative unit and to the police station in whose territorial range the offender is domiciled or resident, as well as to the offender.

The writ of execution shall be made in 4 copies and include:

- the court which issued it;
- the date of the issue;
- number and date of the decision that is being executed;
- the personal data on the offender: name, date and place of birth, domicile and residence, if necessary, and the personal code number; - the length and nature of the work to be performed by the offender.

The sanctioning of performing an activity for the benefit of the community is executed within the range of the administrative-territorial unit in which the offender resides or has his/her domicile.

The mayor is required to carry out the writ of execution.

In carrying out the writ of execution, the mayor establishes a once the type of activity to be performed by the offender, the conditions under which he/she executes the sanction, as well as the working hours, making the unit where the activity shall be performed aware of the measures taken.

When establishing the type of activity to be performed by the offender, the mayor will take into consideration the professional training and the offender's health, evidenced by documents issued according to the law.

It is forbidden to establish for the offender the performance of work underground, in mines, in the subway or in other such places with a high risk in performing activities, as well as in dangerous

places or which by their nature can cause physical suffering or can produce damages to the person's health.

The sanctioning of performing an activity for the benefit of the community is executed in accordance with the rules of labour protection.

If the public service within which the offender performs work was granted to a company entirely owned or partly private, the counter value of the performed activities is paid at the territorial-administrative unit's budget in whose range the sanction is being executed.

The mayor, in carrying out the obligation to bring out the writ of execution, establishes the type of activities, the conditions under which it is done and the working programme of the minor.

The supervision of the enforcement of the sanctioning the performance of an activity for the benefit of the community is ensured by the mayor of the locality or by the mayors of the sectors of Bucharest, through authorized people, helped by the police stations, in whose territorial range the sanction is being performed.

The division of tasks and the coordination of the actions undertaken by the persons authorized by the mayor, as well as the ways of granting support by the police units in order to enforce the surveillance of the execution of performing an activity for the benefit of the community is done with the help of a program of supervision and control established by the mayor, with the agreement of the police unit in whose territorial range the offender is domiciled or resident. A copy of the program remains in the local authority's evidence and in that of the police unit with territorial competence.

Providing work for the benefit of the community is executed on the basis of guiding rules on work established by the mayor, making it possible to exercise control, at different time intervals, by those authorized with supervising the execution of the sanction.

The unit from the public service field in which the offender is executing the sanction is forced, at the mayor's request, to communicate the data and information required on the execution of the sanction.

The offender shall go immediately, but no later than 3 days after receiving the writ of execution, to the mayor of the administrative-territorial unit in whose range the offender is domiciled or resident, for being registered and for executing the sanction.

The beginning of executing the sanction consisting in performing an activity for the benefit of the community is made no later than 5 days after receiving the writ of execution.

The mayor has the obligation to provide records of the sanctions applied to the offenders and of the execution of the sanctions to enforce the sanctions, under this ordinance.

If the offender, malevolently, does not go to the mayor for being registered and for executing the sanction, avoids the execution of the sanction after the beginning of the activity or fails to fulfil the duties incumbent upon him/her at the workplace, the court, upon the mayor's notification, of the police units or of the unit's management at which the offender was required to go and provide community service activities, may replace this sanction with the sanction of the fine.

The execution of the sanction of performing an activity for the benefit of the community is prescribed within 2 years from the date of the remaining irrevocable of the court's decision that applied the sanction.

If until the enforcement of the writ of execution of the sanctioning of performing an activity for the benefit of the community or if during the execution of the sanction of performing an activity for the benefit of the community an irrevocable conviction decision has occurred concerning a freedom-privative, with execution, the contravention sanction shall not be executed anymore.

The fine is executed under the provisions on the enforcement of budget claims.[6]

[6] GO no. 92/2003 on Tax Procedure Code published in Of.G. no. 941/29.12.2003, approved by Law no. 174/2004 published in Of.G. no. 465/25.05.2004, republished in Of.G. no. 560/24.06.2004, as amended by GO no. 47/2007 published in Of.G. no. 603 of 31/08/2007, GEO no. 19/2008 published in Of.G. no. 163 of 03/03/2008, GEO no. 192/2008 published in Of.G. no. 815 of 04/12/2008.

Against the measures taken on the content of the activities, on the conditions under which it is being performed, as well as to the way in which the supervision is carried out, the offender may make a complaint, which is submitted to the mayor or, according to each case, to the police station to whom belongs the police officer who is in charge with the surveillance of the activity.

The complaint together with the verification of the issues apprised are submitted, within 5 days of registration date, to the court in whose district or range the sanction is being executed.

The complaint shall be settled within 10 days of its receipt.

If the court finds that the complaint is based, it provides, if necessary, the modification of the activity or of the surveillance measures.

The decision of the court shall be irrevocable and shall be communicated to the mayor or to the police unit to which the offender has lodged the complaint, as well as to the offender.

Conclusion

Under the provisions of Article 9 paragraph 5 from GO no. 2/2001, the contravention fine could have been replaced in case of non-payment, with a sanction for performing an activity for the benefit of the community, but this measure being subject to the consent of the offender[7] was never applied because no one ever gave their consent in this sense, they did not have incomes and were expecting for the prescription to intervene.

If the offender does not pay the fine within 30 days, the court shall replace the fine with the mandatory sanction to provide a community service activity, with his/her consent.

The replacement of the contravention fine with a sanction to perform an activity for the benefit of the community was subject to the consent of the offender, which lead to his/her exoneration of any other sanction, assuming that he/she did not have enough income that could be pursued, and closely connected to, under the conditions shown, the annulment of the contravention imprisonment is likely to deprive the state of the power of coercion to ensure the compliance with law.

This conditioning on the offender's consent is liable to deprive of efficiency the penalty imposed for committing an antisocial deed, with the consequence of violating the stipulations of Article 1. (5) from the Romanian Constitution, according to which "In Romania, the observance of the Constitution, of its supremacy and of its laws is mandatory."

In this respect there are also the similar provisions requiring the offender's consent to performing an activity for the benefit of the community which are found in Article 1 (3), Article 8 Paragraph (5) letter b) and Article 13 of Government Ordinance no. 55/2002 regarding the juridical regime of the sanction on performing an activity for the benefit of the community.[8]

These texts have the following content:

Article 1 paragraph (3): "The sanction on performing an activity for the benefit of the community can be applied only if there is consent of the offender."

---

[7] GO no. 2/2001 on the contravention regime, published in Of.G. no. 410/2001, Law no. 180/2002 published Of.G. no. 268/2002, as published by the GEO no. 108/2003 published in Of.G. no. 747/26.10.2003, Law no. 526/2004 published in Of.G. no. 1149/06.12.2004, Law no. 182/2006 published in Of.G. no. 443/23.05. 2006, Law no. 352/2006 published in Of.G. no. 640/25.07.2006, GO no. 8/2006 published in Of.G. no. 78/27.01.2006, Law no. 353/2006 published in Of.G. no. 640/25.07.2006, Law no.293/2009 published in Of.G no.645/01.10.2009, Law no.202/2010 published in Of.Gno.714/26.10.2010.

[8] GO no. 55 of 16/08/2002 on the juridical regime of sanctions for the performance of an activity for the benefit of the community and on the contravention imprisonment, published in the Official Gazette no. 642 of 30/08/2002, approved by Law no. 641/2002 published in the Of.G. no. 900/11.12.2002, amended by GEO no. 108/2003 published in Of.G. no. 747/26.10. 2003, Law no. 42/2007 published in Of.G. no. 163/07.03.2007, GEO no. 78/2008 published in Of.G. no. 465/23.06.2008.

Article 8 paragraph (5) letter b): "(5) The court considers the legality and reliability of the minutes or report and delivers one of the following solutions:

b) the application of the sanction on performing an activity for the benefit of the community, with the consent of the offender, if it considers that the application of the contravention fine is not sufficient or that the offender does not have the material and financial means to pay it;

Article 13: "In all cases, after taking the consent of the offender, the court of justice, by resolution, determines the nature of the activities that will be performed for the benefit of the community, based on data provided by the mayor of the city where the offender has his/her domicile or residence, taking into account his/her physical and mental skills, as well as his/her professional training level."

In this regard the Constitutional Court through Decision no. 1354/2008[9] found that the phrases "***with his/her consent***" in Article 9 of the Government Ordinance no. 2 / 2001 on the juridical regime of contraventions, as well as the phrases "***only if there is the consent of the offender***," "***with the consent of the offender***" and "***the taking the offender's consent***" of Article 1 paragraph (3), Article 8 paragraph (5) letter b) and, respectively, Article 13 of Government Ordinance no. 55/2002 regarding the juridical regime of the sanction on performing an activity for the benefit of the community, as amended by Government Emergency Ordinance no. 108/2003 on the abolition of contravention prison are unconstitutional.

THE EVALUATION OF THE INTERNET USAGE HABITS OF PUBLIC EMPLOYEES IN KASTAMONU

ERSIN KAVI[*]
ORHAN KOÇAK[*]

Abstract
Changes in the last 10 years in information technology have increased the use of computers and internet. The changes brought about fundamental changes the way we do business and behave in social life from communication and reaching information to daily habits. Effective use of the information technology, which has become the main condition of being competitive at work, has required all employees in public and private sectors to improve themselves in the computer and internet usage. In addition, the public sector also encourages the use of internet via e-government applications. Thus, the computers and internet play a big part in the work of public sector and its employees as well.
The usage of computers and the internet in working places not only have changed the way we do business also have changed some ethical rules and issues. They brought some complicated problems for people, organizations and states. Online fraud, carelessness, negligence, viruses, system crashing, broadcasting personal information are among the most well-known ethical problems related to computers and internet and caused by employees. In addition to these, personal use of computers and internet by employees for their private usage during working hours create another problem.
The objective of the study is to reveal the internet usage habits and behaviors of public employees at work, using a field research that was carried out in Kastamonu that is a city of north of Turkey. It is especially of interest how and for what purposes the chat programs, which encourage the use of internet, are used. The results are analyzed from the point of view of public ethics. The data is collected from the state servants in Kastamonu and is analyzed on SPSS statistic program.

Keywords: *Ethic, Internet, Instant Mesa, public ethic, information technology*

I. Introduction

Today, to reach and have information technologies is easier than before because of technological advances. Everybody in every class and age in society is using computer and internet. When the Turkish Statistical Institute's databases are investigated, we see remarkable results. According to the Turkish Statistical Institute's databases, the rate of computer usage of people between 16-74 ages is 38% and the rate of the internet usage is 35% in 2008 (tuik.gov.tr,2008). These increasing rates show the same levels with the rates of the usage of computer and the internet in businesses. Especially, the developments in services sector have been positively affecting the usage of computer and the internet or vice versa.

Computers, the internet and e-mail are modern communication techniques used in businesses to communicate and to deliver information rapidly to the workers and customers. By using these new technologies, current works will be finished so quickly and correctly that productivity will be better than before. As a matter of fact that many firms and companies are now using computers and the internet as a standard and necessity. In this sense, the opportunities the internet provides are increasing day by day are affecting individuals' daily life. The internet as a communication interface

[*] Lecturer, Ph.D. Economics and Business Administration Faculty, Department of Labour Economics, Yalova University (e-mail: ekavi@yalova.edu.tr).
[*] Lecture, Ph.D. Economics and Business Administration Faculty, Department of Labour Economics, Yalova University (e-mail: okocak@yalova.edu.tr).

has become widespread and people started to reduce face to face communication and increase the usage of digital media. This process is seen not only between two people or group also between workers who work in the same workplace.

Also, with the increasing role of the usage of the computer and internet, doing jobs both in workplace and at home and the spreading of home-offices and teleworkings have made workplace-free working much easier. But this development has caused some discussions in terms of ethics in the work life. Our job environments generally offer the cheap, fast and easy internet. So, we can carry on any task which we started at home,at our workplace, or we can we can continue any task we started at workplace, at our home. For that reason, our private jobs and works related to business, will possibly be intermixed and be done both at workplace and home. For instance, while a teacher can be prepared for courses and enter students' marks from the internet at home, s/he can use the internet for his or her private investigations through internet at school. (Hartman, 2001:8). Because of online medium's difficulties, both private and public sectors' workers are going to be subjected some restrictions because controlling this process is not easy. Therefore, the way to deal with this process in an ethical point of view and the way for it to organize differs from one sector to another and from a profession to another. In this study, we generally examined the data of public servants.

II. Paper Content

1. The Ethics of Public Management and the Usage of the Internet

Ethics is defined as philosophy and science of morals and also considered as a discipline that tries to determine what is right and what is wrong (Arslan, 2001:7). In addition to that, ethics is completely related to the rules that explain or advice people what to do or what not to do. In this sense, the ethics of public management firstly means that public workers' behaviors should be in accordance with laws, the codes of ethics and rules and secondly it means that they should act by taking the individual and moral assets as reference (Özdemir, 2008:182).

Especially, the item 12 of the code 657 (The Civil Service Act) explains and organizes the individual responsibility of the state workers. Also, the item 125 arranges disciplinary punishments for the state workers and behaviors and actions which require disciplinary punishments. Namely, the items mentioned in the code 657 are related to the ethics.

Emergence of the ICT and the Internet, not only offered a lot of opportunities for the people and states, but also created some problems. Especially, the usage of the internet and ICT with the private aims is an important one. According to the investigations, done in different countries, 90% of the workers also use the internet in the workplace for private aims and its cost for companies is about 50 billion Euros. The private usage of the internet can be restricted since it takes work time of the workers and causes some problems such as virus and software and hardware in computers (Okur, 2005:48).

Also, one of the most important aims is the communication by using e-mail and other methods on the internet. Gallup is an investigation company, has done a survey related to e-mail usage and it shows that a worker spends his or her time between 49 minutes and 4 hours for e-mail transactions and the most of these e-mails are about private life or humour (Keser, 2005:65).

When we look at the state workers in the state workplaces, there is no any direct restriction about the subject mentioned above. On the other hand, in the item 125 of the code 657 it is explained that "using the official car, tools and such things which belong to the state for private aim requires disapproval punishment". Therefore, the usage of the computers and the internet which belong to the state instuitions can be commented in the same manner.

However, putting the issue in order technically requires some regulations in the related codes and instructions which explain the rules of working in the state institutions. Insomuch as that, some public institution use their special packet software belongs to the state. It is not applicable or legal to use some extra software which belongs to the workers. In the same manner, the private internet usage

is possible by workers in the public institutions. This may be restricted by using some methods such as filtration and blocking so that state workers can enter only some sites which are allowed by the institution.

Moreover, the workers can be traced as online by using logs which save what the user does or clicks or computers can be checked after work hours. But, tracing the usage of the net or checking the computers mean the intrusion of the privacy of private life which is not a good behavior and can't be acceptable in terms of ethics and laws. Also, while trying to determine the faults or wrong transactions on online medium, it is possible to be an offender.

As a result, that kind of restrictions or prohibitions may not be put for every public worker or may not be necessary for all workers. Some of the workers make analysis as decision makers and they have high education level, qualifications and position. For that reason, it is not practicable to restrict or forbid the internet and computer for qualified workers since the productivity and motivation will go down. Consequently, some measures should be considered regarding the functions of the department, the qualifications of the workers and the type of the occupations.

There are a lot of reasons which increase and encourage the usage of the internet and computers for the workers of public institutions privately. One of the reasons is virtual chat which provides communication with other people around the world and on the internet. According to the Turkish Statistics Institution's investigation, 70% of internet freaks use it for instant messaging programs such as windows live messenger and skype (tuik.gov.tr, 2008:1). They may use the internet not only for the benefit of their works but also for individual aims. That is why, it needs to be investigated whether they use for work or for individual aims. After the determination of the usage aims, some restrictions can be done without prevention of the workers' independency and work necessities. For example, virtual chat which is one of the means of communication is much cheaper, faster and than the other means so that it increases the productivity and the efficiency. For that reason, every public institution should investigate in that way to regulate the internet usage by workers in the public institutions. But the regulation should be in terms of the departments, functions and qualifications otherwise it may harm the productivity and efficiency in the public institutions.

2. Research

2.1.1 General Framework of The Research

The Aim of The Research

To determine the tendency of the usage of the internet and instant messaging softwares by the government employees in Kastamonu and to associate this topic with the ethic of the public in this context is the aim of this work.

2.1.2 Content and The Limit of The Research

The related research has been done upon nearly 1000 people chosen among 10.120 public servants who work in Kastamonu city through the method of exemplification. Among these surveys, 300 of them which are received and approved for evaluation are included for the work. The research has been implemented on the workers who are in the boundaries of Kastamonu city. The reason is that, we want to form a judgement revealing the ethical behaviour related to this topic in this city. Also it is possible that, it can have similarities with the other cities as a lot of public servants in this city have come from different cities. On the other hand, the effect of the place they live shouldn't be disregarded.

2.1.3 The Method of The Research

Qualitative method has been used for the research. An survey for of the 19 questions has been executed on the test subjects. Multiple questions have taken place in the survey form. The first six questions include personal information, seven questions of the remaining 13 includes the usage of computer and internet; six of them are related to the usage of instant messaging softwares

1.2 Analysis of the Research

2.2.1 Demographic Results

Table1: The Gender of Respondents

Sex	**Valid Percent**
Male	74,7
Female	25,3
Total	100,0

¾ of the respondents of the research are males and ¼ of them are females.

Table 2: The Age Range of Respondents

Age	**Valid Percent**
20-30	8,7
31-40	44,0
41-50	39,7
51 and over	7,7
Total	100,0

Considering the age range, %84 of the respondents are middle ages.

Table 3: The Graduation of Respondents

Graduation	**Valid Percent**
Primary School	2,0
Secondary School	3,3
High School	39,0
College	50,3
Undergraduate	5,3
Total	100,0

When considering their educational state, they are to a great extent high school and college graduates. The percentage of university graduates are lower than expected.

Table 4: The Marital Status of Respondents

Marital Status	Valid Percent
Married	86,0
Single	14,0
Total	100,0

The respondents of the survey are majorly married. This is parallel to the age range.

Table 5: The Tenure of Office of Respondents

Tenure of Office	Valid Percent
1-5	12,7
6-10	15,0
11-15	13,7
16-20	19,7
21-25	20,7
More than 25	18,3
Total	100,0

Tenure of office of the respondents are similar to each other. But nearly %50 of them have 16 years of service.

Table 6: The Titles of Respondents

Title	Valid Percent
Civil servant	66,7
Chief	10,0
Asistant manager	1,3
Manager	3,0
Worker	19,0
Total	100,0

2/3 of the respondents are civil servants. Also almost %20 of them are workers. Consequently %85 of the respondents have lower titles.

2.2.2. The Results Related to The Usage of Computer at Workplace.

Table 7: The Usage of Computer at Workplace

Do you use computer at your workplace?	Valid Percent
Yes	94,3
No	5,7
Total	100,0

A great ratio as %94 of the employees use computer at workplace as expected.

Table 8: The Usage Status of Computers

The status of the computer been used	Valid Percent
Institution computer given for personnel use	81,4
Institution computer given for joint use	15,8
Personnel computer used at work	2,7
Total	100,0

Nearly %82 of the workers use computer given for personal use. This lets most of the employees feel comfortable when using internet and instant messaging software.

Table 9: The Usage of Computer at Home

Do you use computer at your home?	Valid Percent
Yes	74,3
No	25,7
Total	100,0

%74 of the respondents use computer at home too. This result shows that the respondents are interested in using computers.

Table 10: The Status of Internet Connection at Workplace

Is there an internet connection at your workplace?	Valid Percent
Yes	98,0
No	2,0
Total	100,0

%98 of the respondents have internet connection at their workplace. This shows that usage of internet is widespread and can cause some ethical problems.

Table 11: The Status of Internet Restriction at Workplace

Is there any restriction on the internet used at your workplace?	Valid Percent
Yes	34,0
No	66,0
Total	100,0

It is interesting that nearly 1/3 of the internet connection at workplaces have got restrictions. Public institutions are also gradually being sensitive about these regulations.

Table 12: The Places That Are Connected to Internet

Where do you usually connect the internet from?	**Valid Percent**
Home	33,1
Workplace	65,2
Internet Cafe	0,7
Other	1,0
Total	100,0

A major part like %65 of the respondents connects the internet usually from home. This makes it necessary to arrange some regulations related to the usage of internet.

Table 13: The Length of Connection of Internet at Workplace

How often use the internet at your workplace?	**Valid Percent**
0-2 hours	51,6
3-4 hours	32,5
5-6 hours	2,4
More than 6 hours	13,5
Total	100,0

The length of the usage of internet at workplace is usually less than 4 hours for %84 of the respondents. This makes the half of the working hours taking the 8 hours of working into account.

Table 14: The Purpose of Internet Usage

What is the main purpose of your internet usage?	**Valid Percent**
For work and professional use	76,8
To gather information about personal interests	7,2
For e-learning	1,7
Only for communication	2,7
To read the news	11,6
Total	100,0

The purpose of the internet usage is usually for work and professional use. So, this result shows that internet is used in accordance with its aim.

2.2.3. Results Related To The Usage Of Instant Messaging Software

Table 15: The Ownership of Instant Messaging Account

Do you have instant messaging account?	**Valid Percent**
Yes	78,9
No	21,1
Total	100,0

%79 of the respondents have instant messaging accounts.(msn,yahoo etc) This show that employees use internet for social reasons when needed.

Table 16: The Frequency of Instant Messaging Usage

How often do you instant messaging?	Valid Percent
Every time I use my computer	11,7
Everyday but not often	23,0
Sometimes	16,7
Only when I need to	48,5
Total	100,0

%48 of the ones who have instant messaging accounts mentioned that they used instant messaging software when needed. However the ones who use it frequently have a ratio of %35 which cannot be undervalued.

Table 17: The Purposes of Instant Messaging

What is the main purpose of chatting?	Valid Percent
For personnel problems	27,2
For my profession and business	61,9
For meeting new people	2,1
Other	8,8
Total	100,0

As instant messaging is carried out for professional and business reasons, it may not be necessary to restrict it. However this ratio is not satisfactory. Its being used for different purposes may make it necessary to restrict it.

Table 18: The Instant Messaging Environment

With whom do you usually chat with?	Valid Percent
With my family members	24,3
With my colleagues	55,2
With my relatives	3,8
With my friends	15,9
With a person who I met in the internet	,8
Total	100,0

%55 of the respondents mentioned that, to a great extent, they this software in order to talk to their colleagues. The result is parallel to the result that they use instant messaging software for professional and business purposes.

Table 19: The Time for Instant Messaging at Workplace

When do you chat at your workplace?	Valid Percent
When I am working	21,3
After finishing my work	51,0
Only in breaks	7,9
I never chat at work	19,7
Total	100,0

Nearly %79 of the employees either don't instant message or they instant message after finishing their work. Consequently, as this won't impede the job, it can be seen positive.

Table 20: The Status of Instant Messaging Restriction at Workplace

Are there any restrictions about chat at your workplace?	Valid Percent
Yes	24,3
No	75,7
Total	100,0

%24 of the respondents mentioned that there are restrictions related to the usage of internet and instant messaging software. This result is a lower ratio compared to the restriction of internet usage. Perhaps, because instant messaging programs are used for communication, they are not restricted.

2.2.4. Results of Cross-Tabulation and Mann Whitney U Tests

2.2.4.1. The Relationship Between Personal Features and The Purpose of The Usage of The Instant Messaging Software

Table 21: Gender and Purpose of Internet and Instant Messaging Usage

	For work and professional use		For personal interests		For e-learning		Only for communication		To read the news	
Gender	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.
Male	74,4%	61,5%	8,2%	27,4%	2,3%		2,3%	8,4%	12,8%	
Female	83,8%	63,3%	4,1%	26,7%	,0%		4,1%	10,0%	8,1%	

It's seen that women use internet for work and profession a bit more than the men, taking the gender into account for the purpose of the internet usage. On the other hand, men use internet for researching about personal interests, education, education and reading the news more than the women do. As for the instant messaging software, they are used less for professional reasons compared to the internet usage, however, it brings up an interesting result that both groups use instant messaging software to get information about their personal interests.

When we subject the related factors to Mann Whitney U test, the value of Asymp.Sig (2 tailed) for internet usage is 0,112 and for instant messaging it is 0,994. This, as a result shows that,

taking the gender factor into account, there is no significant difference between internet and instant messaging software usage.

Table 22: Age and Purpose of Internet and Instant Messaging Usage

	For work and professional use		For personal interests		For e-learning		Only for communication		To read the news	
Age	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.
20-30	61,5%	54,2%	15,4%	33,3%	,0%		7,7%	8,3%	15,4%	
31-40	80,2%	65,5%	7,6%	25,0%	,8%		,8%	7,8%	10,7%	
41-50	76,3%	61,8%	5,9%	28,1%	2,5%		4,2%	7,9%	11,0%	
More than 50	77,8%	40,0%	,0%	30,0%	5,6%		,0%	30,0%	16,7%	

Taking the age and the instant messaging usage into account, generally all the age groups use it for work and profession. However, the interesting result is that, the employees who don't use internet for personal interests may prefer instant messaging software. Also, it is again interesting that none of the respondents of 20-30 age range use internet for educational purposes. Despite that fact, that ratio is high among the ones over 50.

Table 23: Graduate Level and The Purpose of Internet and Instant Messaging Usage

	For work and professional use		For personal interests		For e-learning		Only for communication		To read the news	
Graduate	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.	Internet	Inst. Mes.
Primary School	83,3%	75,0%	,0%	,0%	,0%		,0%	25,0%	16,7%	
Secondary School	71,4%	,0%	14,3%	57,1%	,0%		14,3%	28,6%	,0%	
High School	75,2%	69,1%	8,8%	23,5%	3,5%		3,5%	4,9%	8,8%	
College	76,2%	59,5%	6,6%	28,2%	,7%		2,0%	10,7%	14,6%	
Undergraduate	93,8%	68,8%	,0%	31,3%	,0%		,0%	,0%	6,3%	

When we look at the relationship between the usage of internet and instant messaging software in parallel with the graduate level, we see that undergraduates use them for work and profession much more than the others do. Also we see that instant messaging software is used by the secondary school graduates remarkably for personal interests. Consequently the usage of differs according to the graduate level and this, from the institutional angle makes it necessary arrange some regulations.

2.2.4.2. Institutional Features and Results Related to the Usage of Internet and Instant Messaging Software

- Considering both the usage of instant messaging account and the people who are messaged, we see that %74 of talks realized for exchange of vocational knowledge, to a great extent. This result shows that instant messaging software is used mainly for work and exchange of vocational knowledge with colleagues.
- When considering the title, purpose of internet and instant messaging software usage and their usage length doesn't differ significantly.

• Considering the tenure of office, as long as the tenure of office increase, the frequency of internet usage varies. In other words, it is possible to act more comfortably.

• Considering the restrictions related to both the usage of computers and the internet together, it is mentioned by the %86 of the respondents that there is unrestricted connection and there is no restriction related to instant messaging. So, the regulations in the institutions are parallel to each other.

• %30 percent of the ones who connect internet mostly at home, use internet mostly for more than 6 hours at workplace. This result should be dwelt on from an ethical point of view.

III. Conclusions

The result of the research study is that it is inevitable to use computer and internet nowadays. In so much as that, almost all of the test subjects use internet at work place and more than %80 of the respondents have instant messaging account. These results, therefore, as we mentioned before, cause some ethical problems.

In this context, ethic is the science that tries to determine what is right and what is wrong and so, at first sight, it seems that it is wrong to use internet for personal reasons at workplaces. However we can see some positive effects when we deeply think about it. It has been determined that the usage of internet for personal interests makes the employees concentrate on their job, otherwise they lose their enthusiasm for their jobs. Consequently, it is beneficial for employers to show flexibility for their employers. (Okur, 2005;71). A similar idea must be valid for the government employees too, because the internet environment gives different opportunities to the individuals. Reading the news, having information about a topic, could make the public service be realized better.

However, taking the research results into account we see that government employees use internet instant messaging software for work rather than personal interests. So, if restrictions take place, they won't be used for these purposes either and it will cause productivity fall. Also when they physiologically feel that their right is taken away this will affect their productivity in a negative way.

At the same time, if the instant messaging software is nonstop online and they correspond, it leads to great advantages. However even the usage of it for their personal interests might be effective to decrease the work stress of the employees. Because sharing the problems relaxing effect for people.

The results also show that the majority of the workers (%51) chat after finishing their work. In this context, the right thing that should be done is checking whether the employees have done their assigned duties or not. Also, this can make the employees who want to have more free time for them to work faster and more effectively. So it can be taken as a way of rewarding.

Also, as long as it doesn't affect the performance, there is no restriction or prohibition in most of the public corporations which also support our idea. Insomuch as that, if there were any negative effects, there would absolutely some restrictions.

At the same time, in accordance with the age, gender, tenure of office and title, the internet and instant messaging software usage may have some differences. Especially regarding the age group, it is possible that the younger ones use it more frequently. Also according to the tenure of office and title, differences may appear as the superiors may take their ease. In terms of gender, men sense a stronger bias to chat over internet. In one research, the ratio of the women who chat over internet is %50 and the %70 of men chat over internet. (Tarcan 2005;59)

However, we didn't come across significant differences in terms of these factors, so the ones who work in public sector showed different results from the general impression. This can be the result of public pressure.

On the other hand, these results shouldn't make us feel too comfortable about this issue. Insomuch as that, there may be costs and damages causing by the usage of internet and instant messaging software for personal interests.

Consequently, it is not possible to speak clearly about and pass judgement on the usage of internet and instant messaging software in public service environment or their personal usage. The thing that should be done is determining a policy in accordance with the features of the institution, professions, works and employees. Objective evaluation should be done about the reasons it should be allowed, the employees for whom it should be prohibited. For example, no restrictions could be made for the academicians, whereas it could be applicable for the administrative personnels.

"IS THE LABOUR RELATION OF THE CIVIL SERVANT AN ADMINISTRATIVE CONTRACT?"

LIANA-TEODORA PASCARIU[*]

Abstract:
Nowadays, public institutions have contractual employees, hired on the basis of the Labour Code, and public servants, appointed on the basis of the Civil Service Statute. If the labour relation of the public servant is not qualified as a labour contract, what is its juridical character? This paper tries to demonstrate that the civil servant develops labour relations under different circumstances, i.e. on the basis of an administrative contract.

Keywords*: contractual employees; public servants; labour contract; administrative contract; juridical character*

Introduction

The Romanian doctrine has provided that, as far as the employment relation of civil servants is concerned, "the juridical fact that generates the employment relation is not the at will agreement but the unilateral willingness of the authority that appoints" [1]. Only "the issuing of the appointment decree generates the public service employment relation"[1].

Following the enactment of the Civil Service Statute of 1999, the juridical literature hasn't ceased to define the juridical nature of civil servants' appointment. The first studies on the subject have concluded that the employment relations of the civil servant are mainly related to private law, since they are quite similar to the employment relations defined by labour law. This statement has been further developed and the logical outcome was that the employment relation is, in fact, a juridical labour relation with typical features generated by the specific incidence of certain public law provisions.

The present analysis mainly focuses on the present research advancements in employment relations of civil servants, starting with the interpretation of their juridical nature. The main questions lead to the two types of relations defined by private and public law analysts. On the one hand, there is clear proof supporting the idea that these relations are mainly governed by labour law, resembling the employment contract; on the other hand, it is equally true that the public service is related to public law, subsequently complying with specific juridical standards.

The very title of the paper may seem to favour the administrative contract nature of this type of relationship, but the conclusions will further develop these ideas and employ an original method in the attempt to define the juridical nature of the public service.

The juridical character of the labour relation of the public servant

The confirmation of the administrative contract nature of this juridical relationship came with the adoption of a resolution reached during a relatively recent appeal of the High Court of Cassation and Justice[2], postulating on the fact that the difference between the employment relations of the public service and the labour relations of employees is that the civil servant is the conveyor of the public power that he employs within the limitations set by his specific duties. Therefore, civil

[1] Verginia Vedinaş, "The civil service statute, Comments, Legislation, Doctrine, Jurisprudence," (Bucharest: Universul Juridic Publishing House, 2009), 35.

[2] Decision no. 14/18.02.2008 of ÎCCJ.

servants do not perform under the stipulations of an employment contract but have employment relations based on the administrative appointment decision and do not fit the category of employees as defined by Art.1 of the Law 142/1998.

The main difference between the employment relations of the public service and those of employees is the fact that the civil servant is the conveyor of the public power that he employs within the limitations set by his specific duties. The appointment decision issued by the public authority, accompanied by the request or/and the prospective civil servant's acceptance of the position make up the at will employment agreement, i.e. the administrative contract.

The specific difference between the employment relations of the civil servant and those of employees is mainly related to the establishment of the juridical relationship based on which the services are provided and also makes reference to the fact that the civil servant is the conveyor of the public authority, while the employee is not. The civil servant is a public law entity, whereas the employee is a labour law entity.

Clearly, civil servants do not perform their duties in compliance with an employment contract, since they are in an employment relation derived from the administrative appointment decision but, this appointment decision, alongside the request or/and the prospective civil servant's acceptance of the position make up the at will employment agreement, i.e. the administrative contract.

The employment relations of the civil servants and labour relations are differentiated by the juridical framework based on which the services are provided, as well as by the fact that the civil servant is the only conveyor of the public authority.

Labour law analysts[3] have embraced the viewpoint of the High Court and argue that the employment relations of civil servants are contractual in nature, given the existence of two distinct circumstances for the enforcement of the at will agreement expressed by the subjects of the employment relations: a) the inclusion among civil servants in an executive public position defined as "apprentice", when the employment relation is established by the candidateship in the recruitment competition and the appointment in that public position, issued by the public institution or authority; b) the accession to the civil servant body in a specific executive public position, when the employment relation is defined by the appointment in that public position, issued by the authority or the management of the public institution and accompanied by the candidateship in the recruitment competition, followed by the professional oath taken by the appointed civil servant.[4]

Should we choose to share these ideas, the contract signed by the parties would appear as an adhesion contract, since the only option would be to agree or disagree with the working conditions and the salary. Such circumstances, *de lege ferenda*, would demand the alteration of Article 4 of Law no. 188/1999, through the introduction of Article 4^1 that would stipulate the following: *"the appointment decision, accompanied by the request or/and acceptance of the position by the prospective civil servant, make up an at will employment agreement that is known as the administrative contract"*.

The jurisprudence of lower courts seems to embrace this vision: for instance, the decision no. 941/2006 of the Court of Appeal Bacau, stipulates that the juridical employment relationship between the civil servant and the authority or the public institution of the central and local authority has been controlled by the Law no. 188/1999, with its subsequent alterations on the Civil Service Statute.

[3] Şerban Beligrădeanu, Ion Traian Ştefănescu, "Mutual civil liability between the parties of the contractual employment report of civil servants", Dreptul 4(2009): 78-79; Şerban Beligrădeanu, Ion Traian Ştefănescu, "Theoretical and practical studies on Law no. 188/1999 on the Civil Service Statute" Dreptul 2(2000), 7-14.

[4] Alexandru Ţiclea, Laura Georgescu, Ana Cioriciu Ştefănescu, Barbu Vlad, "Public labour law", (Bucharest: Wolters Kluwer Romania Publishing House, 2010) 29-30.

Indeed, in the case of civil servants, Law 188/1999 exceptionally stipulates the functional competence of the administrative contentious court in the settling of conflicts of rights, but this competence is not fully granted by jurisdiction but is limited to a certain category of labour conflicts, strictly defined by the special law.

As a consequence – as stipulated – by virtue of the absolute nature of functional competence regulations and the principle „exceptio est strictissimae interpretationis", any other disputes qualified as labour conflicts as defined by article 281 of the Labour Code fall under the jurisdiction of the courts stipulated in article 284, paragraph 1 of the Labour Code and not under the jurisdiction of Administrative contentious courts.

The analysis must start from the premise that the regulations related to the civil servant statute belong to the organic law, thus emphasizing again the special role played by the public service and the civil servant in the legal and constitutional system.

The public service describes the juridical status of the natural person legally empowered with responsibilities in fulfilling the competence of a public authority that consist in the aggregate rights and obligations that constitute the complex juridical contents existing between that particular natural person – the civil servant, and the authority that empowered him.

The public service cannot be the subject of an agreement between parties, it is the result of a universal at will employment act, thus defined by the legal empowering provided to the person who deploys the prerogatives of the public power and, at the same time, the public service is available to all citizens, under legal provisions.

The civil servant is appointed by the competent public authority and is legally endowed with the responsibilities of a public service in order to perform activities directed at the continuous fulfilment of a public service. Civil servants are appointed by an administrative unilateral appointment decision. The appointment in a public position endows the civil servant with a legal statute that stipulates his rights and obligations.

Unlike civil servants who are appointed, have an employment relationship and are governed by a special law – Law no. 188/1999 on the civil servants statute – it must be noted that contractual employees perform their duties based on the Labour Code and have an employment relationship established by an individual employment contract. The public service relationship is established only by the issuing of the appointment decision; the civil servant statute is acquired at the moment of appointment and is enforced after the oath has been taken.[5]

The contents of the individual employment contract comprise the aggregated rights and obligations of the parties as stipulated by the law or agreed upon by the parties.

The rights and obligations of the contracting parties and making up the contents of the individual employment contract are expressed in the clauses inserted in the contract as they constitute the material structure of the agreement between the parties and establish their rights and obligations.

Similarly, the Labour Code provides the freedom of negotiation and therefore the parties can enclose in their individual employment contract – defined as the "law of the parties" throughout the development of the juridical employment relationships – any clauses they may think necessary, complying with the legal provisions, the public order and good morals. Public institutions may be allowed an exception in the negotiation of an employment contract, applied to salaries and other benefits that have not been established by the wage and salary laws of the public sector.

These contracts do not allow the negotiation of clauses related to rights whose conferral and quantum have been established by legal provisions. The contractual personnel does not benefit from vacation premiums, while civil servants who take a leave of absence receive an amount that equals the salary they had received a month before taking the leave. Apart from certain circumstances, civil servants enjoy workplace stability whereas contractual personnel do not.

[5] Verginia Vedinaș, "The civil service statute, Comments, Legislation, Doctrine, Jurisprudence," (Bucharest: Universul Juridic Publishing House, 2009) 35.

A recent study[6] of a renowned author revisits the juridical nature of the employment relationships of the civil servants and sheds a new light on previous studies that argued that the employment relationship of the civil servant is a typical manifestation of a juridical labour relationship which, even if different from the individual employment contract (archetype of the juridical labour relationship), is not essentially different from the latter and therefore, from a logical and juridical viewpoint, the employment relationship of the civil servant is a fundamental element of labour law (regulations). The author also emphasizes the fact that, from a legal viewpoint, the difference between the juridical employment relationships of employees and those of civil servants has gradually diminished.

The author continues with an account of the typology of the current juridical employment relationships, as follows: the juridical relationship of employees (generated by the signing of the individual employment contract, governed by the Labour Code); the juridical employment relationship of civilian civil servants (generated by Law no. 188/1999 on the Civil Service Statute or by certain statutes related to special categories of civil servants, such as police officers, diplomats and consuls, customs officers, etc); the juridical employment relationship of professional military personnel (officers and non commissioned officers – Law no. 80/1995); the juridical employment relationship of public officials; the juridical employment relationship of magistrates (governed by Law no. 303/2004); the juridical employment relationship between the cooperative retail society and its members (Law no. 1/2005).

In reference to this typology of juridical employment relationships, the author believes it wrong to limit the subject of Labour Law exclusively to the juridical employment relationship of the personnel (governed by the Labour Code), and strongly argues that all juridical employment relationships mentioned above are, in his monist labour law standpoint, elements of the Romanian labour law, whose *summa divisio* is made up of the common labour law (on the juridical employment relationship of employees, based on the individual employment contract mainly governed by the provisions of the Labour Code) and, on the other hand, of the special labour law (which includes the juridical employment relationships of civilian and military civil servants, of public officials, of magistrates and cooperative retail society members). The special labour law is based on different provisions of the Labour Code, nevertheless governed by the latter as common law.

Labour law analysts[7] are ones who strongly argue that the employment relations of civil servants are contractual in nature, as typical employment relations which, even if not rooted in the individual employment contract (archetype of the juridical labour relation), do not necessarily differ from the latter.[8]

The same authors argue that employment relations designate: *"the juridical labour relation created as a result of the agreement between the public authority or institution and the civil servant"*. The contractual nature of the employment relations of civil servants is also adopted, as previously stated, by the High Court of Cassation and Justice.

Basically, there are two distinct instances for the at will employment agreement manifesting the willingness of the subjects of the employment relation:

a) the first instance refers to the admission among the civil servants body on an executive public position professionally defined as "apprentice", when the employment relation is established by the candidateship in the recruiting competition and the appointment in that position, issued by the authority or the public institution;

---

[6] Şerban Beligrădeanu, "Studies on the juridical labour relations of civil servants, as well as in relation to the typology of juridical labour relations, with a monist standpoint on the object of labour law", Romanian Private Law Journal 3(2010).

[7] Şerban Beligrădeanu, Ion Traian Ştefănescu, "Mutual civil liability between the parties of the contractual employment relations of civil servants" Law 4(2009): 78-79.

[8] Alexandru Ticlea (co-ordinator), Laura Georgescu, Ana Cioriciu Stefanescu, Barbu Vlad, "Public labour law", (Bucharest: Wolters Kluwer Publishing House, 2010) 31.

b) the second instance applies to the admission among civil servants, on a permanent executive public position, when the employment relation is established by the appointment in that public position, issued by the authority or the public institution and through the candidateship at the recruitment competition, followed by the oath taken by the appointed civil servant.

It must be noted that the juridical fact that generates the position relation is not the at-will agreement but the unilateral volition of the authority making the appointment, as argued by the eminent professor Iorgovan[9].

That is why the opinion according to which the common law juridical procedures applied to civil servants are mainly similar (as juridical bodies) to those applied for employees, that the special regulations for civil servants are similar, that the similarities are normal since the employment relations of civil servants are located at the interference of labour law and public law (mainly administrative law) – is not entirely realistic, from our standpoint.

We can therefore acquiesce, with the following suggestions, on the subsequent fundamental elements:

- the appointment of a person in the position of civil servant is carried out only with the consent or by an individual act of appointment in a certain public position; the consent of the civil servant is given gradually, the final phase being the oath;

- there is an at-will agreement, a contractual statute, without being an individual employment contract, as defined by the Labour Code, *but a* contract *of public law, an* administrative contract, *where the contractual freedom of the parties is compensated by the legislator*. We are talking about a contract: unnamed; with specific clauses both for stipulation acts (mainly) and for subjective acts (in those areas where negotiations are allowed by the law); solemn (the written form of the appointment decision, the taking of the oath); binding; onerous; with gradual execution; signed *intuitu personae*;

- upon signing the at-will agreement, the responsibilities of that specific position cannot be negotiated individually, as they are established – objectively and objectionably – by the law (by the authority or the public institution for each public position, in compliance with the law);

- the relation created upon signing the administrative contract – the employment relation (i.e. the relation between the civil servant and the authority or the public institution) – displays the specific traits of a juridical labour relation (the object and the cause corresponding to those of any juridical labour relation); both the civil servant and the employee are in a typical juridical labour relation; the civil servant, alike the employee, is subordinate to the one he is working for (the authority or the public institution).

Nonetheless, it is difficult to grasp how the employment relations of civil servants – juridical labour relations – are a vital in analyses and in labour law, but only as comparative benchmarks opposite the labour relations of employees, provided that their particular characteristics are noted, emphasized and regulated by public law provisions. It is equally difficult to understand why labour law exclusively deals with the juridical labour relation between the civil servant and the public authority only from the standpoint of comparisons with the labour relations of employees.[10]

We believe that, when identifying the juridical employment relations of civil servants, ne must start with the criteria used to define a contract as being administrative. The doctrine[11] emphasized a series of specific traits of administrative contracts that would define their juridical nature, as opposed to other types of contracts governed by private law:

- The juridical inequality of the parties, induced by the need to defend the general interest by the public authority, thus outranking the co-contractor;

---

[9] Antonie Iorgovan, "Administrative law treatise" (Bucharest: All Beck Publishing House, 2005) 582.

[10] Ana Cioriciu Stefanescu, http://www.avocatnet ro/content/articles/id_19003/Raportul/de/serviciu/-/conditia/acordului/de/vointa./Consideratii/inedite html#ixzz1EFqXoKnO.

[11] Ioan Alexandru et al., "Administrative law" (Bucharest: Lumina Lex Publishing House, 2005), 412-414.

- The status of authority of the public administration or its proxy, held by at least one of the parties;
- The limitation of the public authority's free will, through legal provisions;
- Serving the public interest, by the public authority, thus endowing it with a special purpose;
- The extended interpretation of the contract, pertaining to the prevalence of the public interest of the administration;
- The strict performance of the obligations described in the contract, both by the private party and by the civil servant;
- The *intuitu personae* nature of the contract.

After a close inspection of these characteristics, one can easily qualify the employment relation as an administrative contract to the full extent of its significance. When defining a contract as being administrative, one can be guided by several criteria, as the differentiation serves the purpose of establishing the juridical standards to be applied. The easiest way of pinpointing the distinction is by identifying the law, where the law specifically defines a certain type of contract as administrative, without leaving any room for interpretation of its juridical system. The Romanian legislation uses this identification criterion only indirectly, by assigning contract litigations to administrative contentious courts.

The second method of defining a contract according to its juridical nature – which is our case in point – is the jurisprudential determination, where juridical literature[12] identifies two situations: one in which the interpretation of the contract is made by each court, after settling a dispute brought before it and a second case, when the interpretation results after the settlement of an appeal in the interest of the law by the High Court of Cassation and Justice. So far, the High Court has made indirect comments on the juridical nature of the employment relations of civil servants, in the above mentioned decision.

Conclusions

Our attempt so far was to briefly describe a part of the contemporary doctrine that alternates between the two contradicting statements: on the one hand, the affiliation of the civil servant employment relations with labour law, as far as identifying an employment contract in these relations and, on the other hand, the inclusion of employment relations in the category of administrative contracts.

When establishing the juridical nature of the institution taken into account, we believe that one must start from the fact that the civil servant appointed in the public position performs the state power prerogatives on behalf of the authority (institution) that appointed him and thus expressing the competence of the latter.

The concluding opinion that this type of employment relation is an administrative contract is drawn by extrapolating the French model where, apart from determining the law, the description of a contract is also done in a jurisprudential manner, by establishing two criteria used to identify the administrative nature of a contract: an organic criterion that requires the presence of a public official as a contractor and an alternative criterion that makes reference either to the presence of exorbitant clauses from common law or to the provision of a public service as object of the contract. This opinion has led the doctrine to establish another definition for the administrative contract: any contract signed by a public official or on behalf of a public official can be qualified as administrative if it includes derogatory clauses from common law or is concerned with the provision of a public service.[13]

[12] Dragoş Dacian, "Administrative law concepts. Coursebook for the academic year 2008/2009" http://apubb ro, p. 2.

[13] Phillippe Foillard**,** "Administrative law*"* (Paris: Paradigme Publishing House, 2008) 224.

We conclude with the following suggestion we have anticipated in the introduction and we intend to study thoroughly in the future: the employment relations of civil servants are qualified as an administrative contract, governed by public law, but of a mixed juridical nature, and the enforcement of labour law as *lex generalia* can only be performed when there is no other special provision that expressly regulates a component of the juridical relation.

MODELING AND SIMULATION OF QUEUE WAITING THROUGH THE CONCEPT OF PETRI NETS

EMILIJA KAMCEVA [*]
FILIP TANCEV [**]

Abstract
Petri Nets-PN are a graphical formalism which is gaining popularity in recent years as a tool in Matlab for the representation of complex logical interactions among physical components or activities in a system. This notes are devoted to introduce the formalism of Petri nets with particular emphasis on the application of the methodology in the area of the performance and reliability modelling and analysis of systems. A technique is presented whereby queueing network models and generalized stochastic Petri nets are combined in such a way as to exploit the best features of both modeling techniques. The resulting hierarchical modeling approach is useful in the solution of complex models of system behavior.

Keywords: *Petri nets, modeling and simulation, toolbox PNTool 2.3, queue.*

Petri nets

Petri Nets offer profound mathematical background originating namely from linear algebra and graph theory. Various Petri Net tools offer convenient graphical environment and sometimes they provide complex simulation and analysis of various high level Petri Net classes.

Petri Net (PN) is mathematical and graphical modeling tool well suited for describing and analyzing discrete events systems (DES). PNs allow to model and visualize systems, which contain concurrence, resource sharing or synchronization. These possibilities allow them to be used for various applications in areas including computer systems, communication protocols, flexible manufacturing systems and software verification.

Within the mentioned context, the initiative of developing instruments for simulation, analysis and design of PNs under MATLAB brought remarkable benefits for training and research because Control Engineering people are familiar with the exploitation of *Graphical User Interfaces* (GUIs)[1] based on this popular software. Although a recent list of the programs developed for PNs includes many resources (Mortensen, 2003) running under different operating systems, our initiative was successful due to the large preference shown for MATLAB.

It is worth separately mentioning that the overall design and implementation philosophy that sustains the ***PN Toolbox***, as well as the integration with MATLAB, allow further developments in the modern direction of studying hybrid dynamics involving both DES and ODE models.

After ending a simulation experiment, several *Performance Indices* are available to globally characterize the simulated dynamics. Some of the indices recorded for the transitions of the net refer to: the total number of firings during the simulation

(*Service Sum*), the mean frequency of firings (*Service Rate*), the mean time between two successive firings (*Service Distance*), the fraction of time when server is busy (*Utilization*). For the places of the net, the recorded indices refer to: the total number of arrived (*Arrival Sum*) and departed

[*] Faculty of Information and Communication Technology, FON University, Skopje, Macedonia (e-mail: emilija kamceva@fon.edu.mk)

[**] Faculty of Information and Communication Technology, FON University, Skopje, Macedonia (e-mail: tancev_filip@yahoo.com)

[1] The GUI gives the possibility to draw PNs in a natural fashion and allows a straightforward access to various commands starting adequate procedures for exploiting the PN models.

(*Throughput Sum*) tokens, the mean time between two successive instants when tokens arrive in (*Arrival Distance*) and depart from (*Throughput Distance*) the place, the mean time a token spends in a place (*Waiting Time*), the average number of tokens weighted by time (*Queue Length*).

Only for timed or (generalized) stochastic PNs, the time evolution for both current and global values of a *Performance Index* may be displayed dynamically while in the *Step* and *Run Slow* simulation modes by means of the *Scope* command. Another facility available only for timed or (generalized) stochastic PNs is *Design*, which can be used for the synthesis of the models. One or two *Design Parameters* varying within intervals defined by the user can be included in the model. For each test-point belonging to this (these) interval(s) a simulation experiment is performed in the *Run Fast* mode. The dependence of a *Design Index* on the *Design Parameter*(*s*) can be visualized as a graphical plot (2-D or 3-D, respectively).

QUEUEING THEORY

Queueing theory is the mathematical study of waiting lines, or queues. The theory enables mathematical analysis of several related processes, including arriving at the (back of the) queue, waiting in the queue (essentially a storage process), and being served at the front of the queue. The theory permits the derivation and calculation of several performance measures including the average waiting time in the queue or the system, the expected number waiting or receiving service, and the probability of encountering the system in certain states, such as empty, full, having an available server or having to wait a certain time to be served. Queueing models are generally constructed to represent the steady state of a queueing system, that is, the typical, long run or average state of the system. As a consequence, these are stochastic models that represent the probability that a queueing system will be found in a particular configuration or state.

2.1 M/M/1

The basic queueing model is shown in figure1. It can be used to model, e.g., machines or operators processing orders or communication equipment processing information.

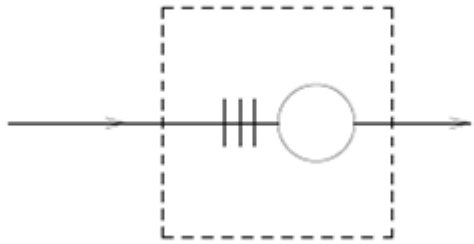

figure 1: Basic queueing model

Among others, a queueing model is characterized by:

- The arrival process of customers.
- The behaviour of customers.
- The service times.
- The service discipline.
- The service capacity.
- The waiting room.

We analyze the model with exponential interarrival with mean $1/\lambda$, exponential service times with mean $1/\mu$ and have a single server. Customers are served in order of arrival. Service rate is $\rho = \frac{\lambda}{\mu} < 1$.

The required characteristics are of great importance can be obtained theoretically for arbitrary values for λ and μ.

The following table shows basic formulas for calculating the important characteristics of the queues.

Performance Measures	$M/M/1$	$M/M/c$	$M/M/1/K$
Traffic Intensity ρ	$\frac{\lambda}{\mu}$	$\frac{\lambda}{c \times \mu}$	$\frac{\lambda}{\mu}$
Utilisation U (per server)	ρ	ρ	$\rho(1 - \frac{(1-\rho)\rho^K}{1-\rho^{K+1}})$
Prob. system is idle π_0	$1 - \rho$	$\left(1 + \frac{(c\rho)^c}{c!(1-\rho)} + \sum_{n=1}^{c-1} \frac{(c\rho)^n}{n!}\right)^{-1}$	$\frac{1-\rho}{1-\rho^{K+1}}$
Prob. buffer non-empty B	ρ^2	$\frac{(c\rho)^c}{c!(1-\rho)}\pi_0$	
Mean no. in system N	$\frac{\rho}{1-\rho}$	$c\rho + \rho B/(1-\rho)$	$\frac{\rho}{1-\rho} - \frac{(K+1)\rho^{K+1}}{1-\rho^{K+1}}$
Mean no. in buffer N_b	$\frac{\rho^2}{1-\rho}$	$\rho B/(1-\rho)$	$\frac{\rho}{1-\rho} - \rho\frac{1+K\rho^K}{1-\rho^{K+1}}$
Mean response time R	$\frac{1}{\mu(1-\rho)}$	$\frac{1}{\mu}\left(1 + \frac{B}{c(1-\rho)}\right)$	$\frac{N}{\lambda(1 - \frac{(1-\rho)\rho^K}{1-\rho^{K+1}})}$

table 2 Basic formulas

The following examples are examined theoretical and simulation values of the queue M/M/1 and M/M/3. Made a comparison of theoretical and simulaciskite values and received a percentage of error.

We consider several cases for M/M/1 queue with Petri nets. Modeling is done and shown in the following figure.

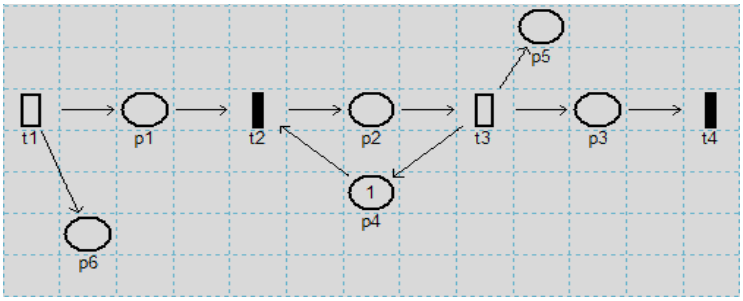

figure 2 Petri nets model on M/M/1

M/M/1	λ	μ	ρ	po	p1	p2	p3	E(X)	E(S)	E(W)
theoretical	0,100	0,400	0,250	0,750	0,188	0,047	0,012	0,333	3,333	0,833
simulation	0,101	0,375	0,269	0,731	0,197	0,053	0,014	0,368	3,645	0,980
percentage of error	0,820	6,213	7,498							

table 3

M/M/1	λ	μ	ρ	po	p1	p2	p3	E(X)	E(S)	E(W)
theoretical	0,100	0,220	0,455	0,545	0,248	0,113	0,051	0,833	8,333	3,788
simulation	0,100	0,219	0,456	0,544	0,248	0,113	0,052	0,837	8,400	3,828
percentage of error	0,312	0,573	0,262							

table 4

M/M/1	λ	μ	ρ	po	p1	p2	p3	E(X)	E(S)	E(W)
theoretical	0,100	0,120	0,833	0,167	0,139	0,116	0,096	5,000	50,000	41,667
simulation	0,100	0,119	0,837	0,163	0,137	0,114	0,096	5,127	51,366	42,983
percentage of error	0,178	0,592	0,416							

table 4

We can be concluded that the percentage of error is less than 10%. Therefore I believe that the simulation values obtained are accurate.

We consider several cases for M/M/3 queue.

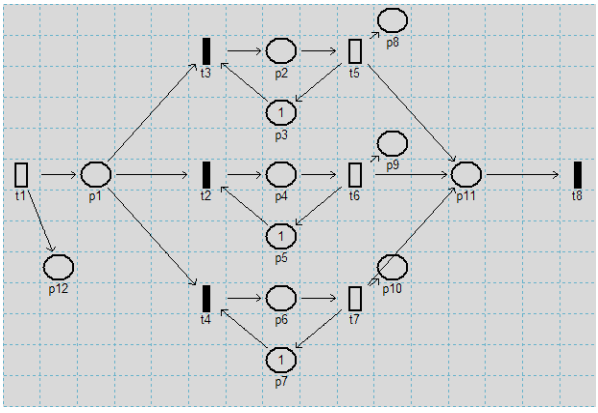

figure 3

M/M/3	λ	μ	ρ	po	p1	p2	p3	E(U)	E(X)	E(S)	E(W)
theoretical	0,100	0,667	0,050	0,868	0,130	0,010	0,000	0,150	0,150	1,500	0,000
simulation	0,100	0,675	0,049	0,870	0,129	0,010	0,000	0,148	0,148	1,481	0,000
percentage of error	0,003	1,250	1,231								

table 5

M/M/3	λ	μ	ρ	po	p1	p2	p3	E(U)	E(X)	E(S)	E(W)
theoretical	1,000	0,351	0,950	0,004	0,012	0,017	0,016	0,328	0,328	3,178	3,178
simulation	1,020	0,327	1,041	0,003	0,009	0,013	0,014	0,342	0,335	3,397	3,465
percentage of error	1,990	6,928	9,581								

table 6

M/M/3	λ	μ	ρ	Po	p1	p2	p3	E(U)	E(X)	E(S)	E(W)
theoretical	1,000	0,337	0,990	0,001	0,002	0,003	0,003	0,332	0,332	3,302	3,302
simulation	0,990	0,330	1,000	0,000	0,000	0,000	0,000	0,333	0,337	3,367	3,3338
percentage of error	0,987	1,990	1,023								

table 7

We can be concluded that the percentage of error is less than 10%. Therefore I believe that the simulation values obtained are accurate. The simple queue of waiting has formulas that can be obtained theoretical values, but for complex queue there are no such formulas. Because the simulation values have a small percentage of error for simple queue are true, then will believe that is correct simulation values wide following a complex queue.

Example: Show Petri net model of queue 3*M/M/1

Abstract
The world crisis that began in 2008 has negative influences over financial and economical-social structures, mainly affecting the young working population. The most affected by the current economical and financial crisis is the youth. Jobs offer for young people seems to have decreased to a significant extent, while they of all categories of job candidates are the most affected precisely due to their lack of experience and to the high costs for training new employees under the current competitive labour market conditions. Data from a study by the National Employment Agency indicate for 2010 that only 6.36% of young unemployed (under the age of 25) found jobs within the first three months. In the same time, the main specializations for which personnel was still being recruited at the end of 2010 were IT, outsourcing, accountancy, engineering, retail and pharmaceuticals, according to recruitment agencies.

Introduction

In Romania, a country continuously troubled by transition, reforms, motions and internal crises, all overlapping on the global financial and economic crisis, we are beginning to wonder whether we are somehow too many or too young or untrained for finding our purpose within this system. The consequences of the global economic crisis triggered in 2008 are being felt worldwide economic.

Thus, the unemployment rate among young people increased in all the Member States of the European Union. At European level, university graduates face the greatest difficulties in finding a job to be appropriate for their training level. In early 2009, approximately 17.5% of young Europeans did not have a job, compared with 14.7% in early 2008.

The labour market deterioration in Romania occurs in the third consecutive year of recession, amidst an unprecedented austerity plan. In November 2010 35.6% of young people aged between 15 and 24 years were unemployed, compared to 27.8% during the same period of last year. Women are more affected by unemployment than men, with an unemployment rate of 17% in 2010 compared to 13.3% in November last year. According to a study made by the European Space Agency, the number of unemployed in 2010 was 692,577, meaning it was increasing with 30.2% compared to the previous year.

The purpose of this paper is not to provide solutions, but to determine, based on statistical data, the critical situation in which most graduates are found in Romania, and we are also trying to analyse some of the causes of this situation.

Literature review

The economic development, the evolution of the labour market, issues of integrating youth into the labour market and the migration of work force phenomenon represent issues that are viewed with great interest by economists and sociologists. Economic literature has gained over time from many studies of famous authors including economists such as: Theodore W. Schultz ("Investment in Human Capital") – Nobel Prize winner, Gary S. Becker ("Human Capital: A Theoretical and empirical Analysis, with Special Reference to Education") and GJ Stigler who are also Nobel Prize winners in Economics, Angel de la Fuente and Rafael Domenech ("Human capital in growth regressions: how much difference does data quality make? An update and further results"), studies of the European Council, EUROSTAT, as well as numerous surveys performed by agencies such as Daedalus Millward Brown, Catalyst Solutions and Instituto Nacional de Estadistica of Spain. In our country, the works of Ionel Muntele („Migrations internationales dans la Roumanie moderne et contemporaine"), Daniela Nicoleta Andreescu and Aurel Teodorescu ("Romanians' work migration after 1990") are significant, as well as the studies prepared by the National Agency for Employment, National Institute of Statistics, International Labour Organization and the Credit Risk Control of The National Bank of Romania.

Theoretical background

Employability of youth in a downturn society

The global crisis that had been triggered three years ago has negative influences on the financial, economic and social structures affecting primarily the young population that is fit for work. Young people are the most affected by the current financial and economic crisis. Job offer for them was significantly reduced and they are among the most affected category of candidates, because of lack of experience and very high costs for training new employees under the present conditions of competition on the labour market. In the European Union there are currently 96 million young people between 15-29 years, which means almost 20% of the Union's total population[1].

Thus, young people from European Union become an increasingly valuable resource being essential to providing work force for national economies. For every young person the chance to receive a quality education means the opportunity to develop his skills at a higher level, to take advantage of professional counselling and guidance and thus to have increased opportunities to be employed. Increased investment in education and initial training, generate the most important gains in the future participation of the individual on the labour market, which makes social integration through work to represent an important part of the efforts to reaffirm their opportunities. But given the current downturn economy, safe jobs are increasingly scarce, many young people of the European Union being forced to accept temporary jobs or poorly paid compared with their training. Frequently, in the desire to find a job, young people do mind their specializations and apply for a job at any company that accepts their CVs. A study conducted in Romania, based on the "Job-Shop" Fair, organized by the Board of European Students of Technology Bucharest, shows that in 2009 young university graduates accepted wages that were lower up to 40% - 60% than those requested in the previous year. In the same time, graduates of the last two years of master's degree agree to accept jobs that do not require higher education, but rather high school education. These compromises determine many young graduates to have difficulties providing for themselves, without having the opportunity to become economically and socially independent and without being able to fully integrate into society.

In this period of downturn, job vacancies do not offer attractive wages, according to the youth's aspirations. However, according to statistics, many young graduates want to work. Also,

[1] Marioara Ludusan, Monica Angela Bara, "1 decembrie 1918" University of Alba Iulia in Centre for Social Research, Political and Administrative Sciences, Society and Politics no. 1, April 2010

skills and competences acquired by young people are not always fully relevant to labour market demand, which contributes to higher unemployment.

Unemployment among young people age group between 16 and 24 has increased in all Member States of the European Union (data from 2008), except for Bulgaria, where it decreased from 13.9% in the first quarter of 2008 to 13,5% towards the end of the year. At European level, young graduates face the greatest difficulties in finding an appropriate job. The same statistics show that in early 2009, approximately 17.5% of young Europeans did not have a job, compared with 14.7% in early 2008. This value of the analyzed indicator represents more than double of the unemployment rate in the EU, which, for the same period (2008 - 2009), has increased from 6.8% to 7.9%. After three years of sustained economic growth, while the indicator has decreased, the unemployment rate among young people began to grow in the first quarter of 2009 so that in the States of the European Union that have adopted the Euro currency, the seasonally adjusted unemployment rate among young people, was of 18.4%, twice higher than the European average of 27 countries (8.8%), the Euro area recording 3.1 million unemployed youth compared to 5 million unemployed youth in the European Union.

According to a study conducted by EUROSTAT[2], in 2007 (interestingly, this study provided for 2009 a youth unemployment rate of 60% at European level - 35.7% for women and 22 2% for men) the overall unemployment rate in Romania has remained stable compared to 2006, 7.2%, but it has evolved to 7.6% at the end of 2009. Recent data of the National Agency for Employment (NAE) show that the number of unemployed reached 601,673 at the end of August 2009 compared to the 403,400 level recorded at the end of 2008. In July 2008, in Bucharest the number of unemployed exceeded 18 200 persons, of whom 1,500 (8.2%) were university graduates. However, alarming statistical data are in regards to youth unemployment rate, which is a continuously increasing indicator, increasing from 17.2% in 1999 to 23.8% in 2005. In 2010, data from a study of the National Agency for Employment show that only 16,500 unemployed youth (under 25) have obtained jobs within the first three months of 2010, a total of 105,007 young graduates being registered as unemployed, more precisely a percentage of 6.36. The number of university graduates who receive unemployment benefit has reached almost 53,000 in September, the highest level of post-December period, taking into account that every year, approximately 100,000 Romanian graduate a higher education institution.

The number of unemployed persons with higher education[3], has tripled in the last three years, given the fact that in 2008 there were two generations of graduates (with undergraduate studies of three and four years), following the conclusion of the Bologna Convention which provides the length of undergraduate of 3 years and 2 years for the Bachelor's degree. The employability rate of graduates has decreased as a result of the fact that private universities have lost credibility because of issues regarding the legality of the diplomas. The education system is the only one to blame or is there a combination of factors which contribute to this state of affairs?

It should be noted that in the European Union are currently 6 million young people who manage to complete only the maximum compulsory education (14.28% of youth aged 18-24 years). In the same time, approximately 108 million people have a low education level, which represents approximately 33% of the European Union workforce. Also, those in a high percentage who failed to complete high school have fewer opportunities to participate in lifelong learning. Challenges exist for preschool education also as in EU countries one of seven children aged 4 years is not attending pre-school, the majority of them coming from families with a precarious socio-economic status.

There are similar, but somewhat different, issues depending on the geographic area within the EU countries. Romania is in a disadvantageous position compared both to the average European, as well as the former states from the Eastern European space.

[2] Fewer people outside the labour force in 2009 - Issue number 57/2010
[3] Ziarul Financiar, September 2009

Romania is far from achieving in 2010 the targets established by the Treaty of Lisbon for four of the five agreed performance standards: skills in reading / literacy, reducing the share of young people who drop out prematurely the education system, increasing the number of those who complete upper secondary education and participation in lifelong learning. At the same time, at European level, only the objective regarding literacy skills is unlikely to be achieved.

As can be seen in the EUROSTAT data, Romania is far from the goal set for young people aged 18-24 who have left early the education and training system and have completed at the most the compulsory education. Although there has been a slight improvement compared to 2000, our education system faces a serious challenge represented by nearly 20% of young people aged 18-24 who leave the education system without having at least a mid-level qualification. Comparative data on the indicator of early leaving the education and training system of young people show that Romania continues to place well below most of the countries that recently joined the EU such as Poland (5.0%), Czech Republic (5.5%) and Slovakia (6.4%), etc.

Table 1. The performances of the European education systems for the indicators adopted as reference level in Lisbon (2007)

European Union Countries	Mathematics, science and technology aduates as percentage of the total higher education graduates	The percentage of those who participate in lifelong learning	The percentage of opulation aged 20-4 having completed e upper-secondary education	The percentage of opulation aged 15 having low performance in literacy
European Union Objectives	**Maximum 10.0**	**Increase by 15% compared to the reference year**	**At least 85.0**	**Decrease by 20% compared to the reference year**

Source: EUROSTAT, 2008

However, one must not forget the fact that our country is facing now (like most European countries) issues related to aging population, significant emigration, youth lacking family support and an acute lack of professional qualifications.

In these precarious circumstances and influence of economic recession in which the labour market in Romania is becoming also a market which increasingly emphasizes high skills, one may believe that in the future years, population with low professional qualifications, will be more and more disadvantaged. Until the labour market record positive developments, young graduates in Romania can choose from the few options offered by the labour market in areas such as manufacturing industry, finance, insurance, real estate or the distribution of electricity, water and gas sector.

A similar situation is found in the case of the indicator on the share of youth who have completed upper secondary education. For this indicator, there is a negative deviation of 10%

between the target set at Lisbon and the performance recorded by the Romanian education system in this regard. Although the number of Romanian youth attending a higher education institution has significantly increased in the last couple of years, the number of those who fail to complete the upper-secondary education is still high.

Our country is far from the EU average in terms of participation rate in education of 5-29 age group people. Meanwhile, other East European countries are close or even exceed this average (see Lithuania, Poland and Slovenia). This means that Romania still has one major disadvantage compared to the other countries within the European Union.

Another handicap is represented by the structure of migration by age group which is highlighting a higher tendency to migrate of young people of working age, those who actually have the best chance of professional achievements. Thus, approximately 50% of migrants were young people aged 26-39 years, who were already qualified and had a high potential of employment. In the last years, "the migration of clever minds" determined that the share of population aged 18-24, that were graduates or in the last years of studies, with high employment prospects or potential, to increase to 14%. Romanian higher education graduates represent approximately 10-12% of all legally immigrated persons, and this process has direct implications for young manpower resources in Romania. Immigrants with high technical and professional studies represent about 9% of the total. A third of all Romanian immigrants is held by persons who have completed only primary school or secondary school, and among them a significant share is held by children and adolescents who have emigrated with their family.

A comparative estimate demonstrates that the number of Romanians who left to work abroad in 2009 is somewhere between 2.8 million and 3 million people. However, the statistical data published in our country regarding the status of the migrated persons are outdated and they often underestimate the real situation because only those that have migrated abroad and whose residence is also abroad are being registered. Thus, according to the Statistical Yearbook of Romania from 2008, the number of immigrants is 8.830 in 2007 and from 2002 to 2007 their number is 65,874 people, which means approximately only 10.000 immigrants annually. How many Romanian citizens left to work abroad in 2009? To answer this question we can analyze two appraisal variants: one that is based on official statistics of the main countries of emigration, supplemented by survey data, and another that has as starting point surveys whose data are correlated with official data. Although the official statistical records are not updated, information known about Romanian migrants represents a valid basis for estimating. According to official statistics, requested by the CURS and provided by the Instituto Nacional de Estadistica from Spain, there were 731,806 Romanians in Spain in early 2009, of which 190.000 in the capital area of Madrid (Instituto Nacional de Estadistica:[4]). According to the latest Caritas Report "Romani a Immigrazione a Lavoro in Italia", in early 2008 there were 1.016 million of Romanian immigrants in Italy (of which 749.000 Romanian workers - 73.7% 239 000 family members - 23.5 % and 28.000 - 2.8%, other categories).

The values shown represent significant increases compared to statistical data from 2006, due in particular not so much to the new wave of immigrants, as to the formalization or legalization of the situation of many emigrants after Romania joined the EU in 2007. We can assume that in 2009 the total of emigrants remained approximately the same, the arrivals of new immigrants being practically cancelled by returning home of some of those affected by the economic recession. The official statistic, however, must be regarded as minimum values for the proportion of migrants from Romania. Statistical surveys of CURS from 2008 conducted at the request of the Metropolitan Library of Bucharest, in the capital areas of Madrid and Rome, show that approximately 35% of the Romanian workforce in these cities is working without a contract or work permit, some of them even carrying out criminal activities. Also, 20% of Romanian citizens who have emigrated abroad say that they are living illegally in these countries. Thus, to those approximately 1.75 million people

[4] http://www.ine.es/

emigrated from Romania that are officially registered in Spain and Italy, we can add about 350 thousand, meaning 20% (the percentage of those who live and work illegally). It results approximately 2.1 million Romanian immigrants in Spain and Italy. In other words, even for a minimal estimate, in these two countries are currently at least two million Romanians. The official statistics of EUROSTAT (Labour Force Survey) shows that the share of Romanian workers in Spain and Italy is about 80% of Romanian residents in the European Union. The data from the CURS survey in 2009, based on information gathered from people in migrants' households, reveal that the share of those two reviewed countries is 70% of total of people that left Romania to work in the European Union and about 60% of emigrants for employment worldwide.

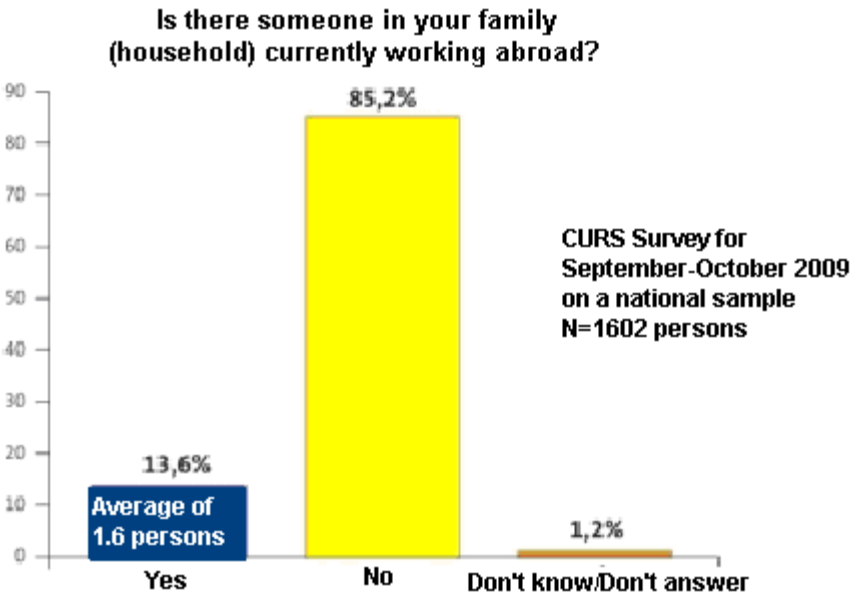
Thus, if we accept an average share of immigrants from Western Europe by 75% in Spain and Italy (2.1 million people), to determine the actual volume of immigrants from Europe we must add to this number another 25%, meaning 0.7 million people, thus resulting a total of approximately 2.8 million Romanian immigrants left to work in European countries. According to the same CURS polls, the share of Romanian immigrants in other countries than those from the European Union is approximately 14% of the total migrants. Thus, given that 86% of immigrants are in the European Union, shows that approximately 0.45 million of Romanian immigrants are at work in other countries than those from the European Union, so as we can estimate the number of Romanian immigrants to over 3.25 million in 2009, of which over 2.8 million are in the European Union countries.

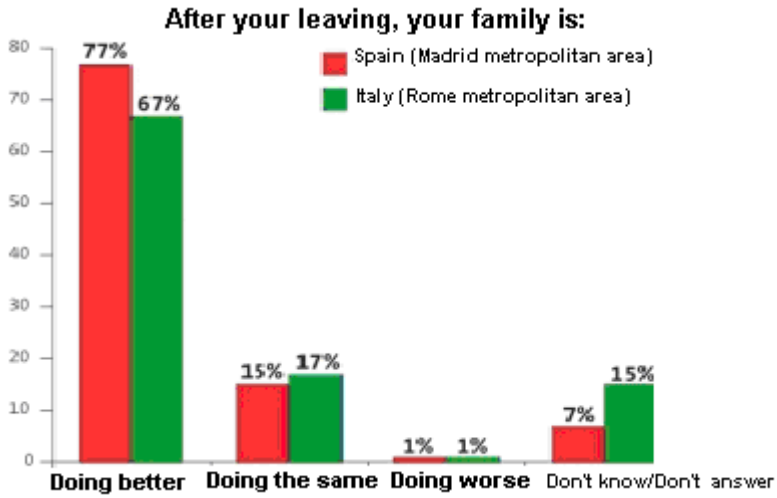
These citizens are temporarily living and working outside Romania. The forecast for the number of migrants abroad based on information provided by various surveys is based on three indicators:

- Volume of individuals and families (households) who have all members gone to work abroad, at least temporarily;
- share of households with people who have currently gone to work abroad, of all existing households in the country;
- Average number of persons per household, gone to work abroad from households that have members left to work abroad.

According to surveys conducted by CURS, in 2008 in Spain and Italy, the volume of people gone to work abroad that no longer have a household in Romania is about 40% of the total migrants. In this category are included the reunited families: husband and wife, husband, wife, plus children, but also single people, especially young people. Believing that in other countries with Romanian immigrants the situation is similar, to an average percentage of minimum 40% compared to the approximately 3 million estimated migrants, the volume of this category of people who have no household in Romania is amounting to 1.2 million. At an average number of persons per household of only 2.5, one can estimate that abroad are approximately 480 thousand households of Romanian immigrants, which were not accessible to the conductors of this study, more precisely they were not in Romania at the time of the CURS survey.

From the survey data conducted by CURS (at the request of the Jurnalul National newspaper) it results that the share of households with at least one member who went to work abroad is of 13.8%. Therefore, 13.8% compared to 6.84 million households currently existing in Romania (7.32 million existing households in Romania, according to the census of 2002, of which we subtract 480 thousand households temporarily moved abroad altogether) results a number of approximately 943 thousand people (with at least one member of the household left to work abroad). However, as shown in the chart below, the average number of people left to work abroad per household is 1.7. Thus, the number of people who are working abroad, but keep their households in the country, is over 1.6 million. In other words, in this minimal estimation variant (which considers both households that have left the country altogether, as well as the share of the households that remained in Romania and which have at least one family member left), we can say that the number of people going to work abroad is about 1.2 million plus 1.6 million, resulting in a total of 2.8 million people.





According to the data of the National Agency for Employment, the unemployment rate among young university graduates reached at the end of September 2010 to 7.9%. By comparison, in 1991 the unemployment rate was 2.3%, corresponding to 8000 unemployed university graduates. Since late 2008, most private companies have started to reorganize and to recruitment budgets in order to be able to keep business running at a medium level, operating massive costs cuts. This means that in Romania in 2010 there are 53 000 licentiates who do not have a job. And these observations reflect only the data recorded. The actual number of young university graduates without a job is much higher.

Most university graduates have failed to get a job because companies that still had vacancies have had a broader range of experienced candidates, who came from those over 570 thousand people that had been fired since the economic crisis began.

Under these conditions, university graduate receive this year (2010) due to the austerity imposed by the economic crisis an unemployment compensation of 255 lei, 15 percent less than last year for a period of six months if they submit the documents to the agency for employment within 60 days from the date of graduation.

Approximately 20% of the employees with higher education had pay cuts within the company they work for, and for 10% of them working hours have been reduced or are in temporary layoff, according to a survey conducted in March 2009 by Daedalus Millward Brown and Catalyst Solutions, on a sample of nearly 1.160 employees with higher education.

The main specializations for which personnel was still being recruited at the end of 2010 were IT, outsourcing, accountancy, engineering, retail and pharmaceuticals, according to recruitment agencies. If we analyze the ad submitted by Com Invest/Work -Study Abroad which selects university or college graduates for the training program in the U.S., we observe that the main areas of interest are: Hospitality Management, Food and Beverage Management, Information & Communications Technologies, Management/Business/Finance, Business, Sales and Marketing, Engineering. Com Invest/Work - Study Abroad also states methods to access and draw up the appropriate documentation because it considers that on the European level there is a lack of information in regards to writing a resume or a letter of intent.

Following this analysis, there appear contradictory aspects, on one hand young people's discontent with employment conditions, on the other hand their need to attain higher education, regardless of the profile. It is noted, in these circumstances, the absence of vocational schools as an alternative for higher education. At the same time the labour market suffers from the shortage of highly qualified work force and the Romanian secondary and university education produce “experts”, however something different from the most important requirements of the labour market: ceramic tile fitters, construction and civil engineering electrical wiring plumbers, installers specialized in heating systems and home networking, etc. Meanwhile, at all job fairs the demand for skilled workers is of 80%.

Conclusions

Creating new jobs represents an European goal of most importance. At European level there has been significant progress: the employment rate, which reached 66% in 2008, had advanced the 70% target set in Lisbon for 2010. However, the spread of financial crisis and the associated downturn imply that European countries should review their policies and to renew their efforts to return to the path of increasing employment, particularly for youth.

There are currently in Romania many families without children, but also families with three or four children, of whom one is emigrating and another is dropping out of school. Unfortunately this alarming situation is not occurring only in Romania, but, as we tried to demonstrate within this paper, it extends to other European countries. Then a question with disturbing implication rises: is the current global crisis just the precursor of the real social crisis that will trigger due to “aging population”?

This paper is part of a broader study of sociological research[5] conducted in collaboration with a group of teachers led by University Professor Elena Nedelcu, PhD. The average age of those involved within this research project is 40 years. Generation of 40-year-old is the “children of the

[5] Contract no. 1/02.06.2009 “Study on subjective professional skills and employability of students”

decree" generation, those with 20 years of service. This is a generation which for 20 years has contributed consistently to the social insurance funds and also a generation that will be close to retirement in 20 years from now.

A STUDY OF SYMBOLIC RELATIONS IN PUBLIC TRANSPORT

ANDREI BĂLAN[*]

Abstract
This paper presents an anthropological, exploratory study of the microsocial world of public transport. Our research focuses on the symbolic relations that are being established (verbally or nonverbally) between urban transport travellers that do not know each other and the consequences these relations create. Modern urban configuration forces large numbers of individuals to share public space every day. When this space becomes restrictive, symbolic relations and interpersonal behaviors such as territoriality and personal space management become clearer. Due to overcrowding, public transport is the scene of one of the most restrictive public spaces in a city. The challenge was to observe and interpret daily, casual behaviors through a sociological and psychological scheme, following the methodological tradition established by Erving Goffman and the other symbolic interactionists. Finally, our study generates a number of hypotheses and explanatory models for common practices and behaviors in trams and metros regarded from a symbolic perspective.

Keywords: *public transport, symbolic relations, symbolic interactionism, observation, interpretative scheme*

Introduction

As Marc Auge stated, we live in an era of scale reversals[1]. Along with the other social sciences, anthropology enrolls in this logic, practicing with ever-more perseverance the attention for present and proximity. The accent increasingly falls on *daily* and *contemporary "in all the aggressive and disturbing aspects of reality at its most immediate"*[2]. The scale overturn that leads to the emphasis of the *daily* is interpreted by Michel de Certeau as distancing from the hegemonic and generalizing[3] discourse that used to dominate the social sciences. Vintilă Mihăilescu regards the rediscovery of the *daily* as *„a way to bring forward and put under spotlight everything that was left behind, neglected or deemed insignificant by the grand theories"* [4].

Auge discusses the difference between what anthropology describes as *places*, as opposed to simple *spaces.* Thus, places are relational, historical and concerned with identity, while simple spaces are recognizable by the absence of social and symbolic relations. Consequently, these become *non-places*[5]. The economic and social dynamics that are specific to supermodernity create *non-places* such as the transit spaces, which people use for functional reasons determined by the urban configuration. [6]

Practicing the same dedication to microsocial, this paper sets to investigate the nature of the relations that occur between individuals in such *non-places*, or transitory spaces that simply connect places and are described by the absence of the intentional social relations. In a synthesis about the progress in the sociology of transportation Glenn Yago underlined the absence and necessity of research on the psychology of personal relations in public transport. [7]

The subject of this paper is, therefore, the psychological and symbolic interpretation of daily personal interactions that take place in public transport. We see public transport as a space of routine

and somewhat ritual interaction, which makes a fertile study material for the researcher interested in what is common and daily. Our ethnographic observation sets to create an explanatory model for the aforementioned type of interactions and bring new data in this field by generating a number of new hypotheses and explanatory models. We sought to conduct a microsocial, interpretative analysis of social interactions following the flexibly-structured research method "patented" by symbolic interactionists such as George Herbert Mead and Erving Goffman. Our main hypothesis before pursuing the study was the existence of symbolic relations and of a certain spatial structure of the means of public transport that was derived from the constant negotiation of power between individuals.

Paper content

Regarding from an evolutionary perspective, the natural type of human community is the tribe. The closest correspondents in present times are the rural communities, where "everybody knows everybody". Desmond Morris[8] demonstrates the city is a modern, artificial construct that forces individuals that do not know each other to manage and share a multitude of common or *public* places. An interesting sort of dynamics occurs: the way people handle each other`s presence when they do not know each other, they have no preset rapports, but only a common space that needs to be shared. But what happens when that space becomes narrow, restrictive? In this case the symbolic relations of power become more noticeable. These relations occur, most of the times unconsciously, between individuals forced by the urban configuration to relate to each other`s presence. They have no other reason to interact but their very presence in the same space.

Starting from Auge`s vision of *places* and *non-places*, we sought to investigate, through an ethnographic study, the human relations and symbolic dynamics generated by the public transport. Albeit these relations are not intentional, we will seek to demonstrate they are inevitable, and to investigate the rules by which the simple presence of several individuals in the same space will start a process of symbolic negotiation of their relations.

The role that Max Weber ascribed to sociology was to analyze and interpret human behavior and interaction. Symbolic interactionism, one of the dominant sociological paradigms of the 20th century, states that daily life consists of interactions based on exchange of symbols. The research method put forth by the most prominent symbolic interactionist – Erving Goffman – was largely based on observation and interpretation through dramaturgic methaphors and parallels with theatre. This research approach has created perhaps the most original, popular and relevant forms of symbolic interactionism. The research we have conducted is part of the same observative – interpretative tradition started by the symbolic interactionists. Another important methodological aspect linking our study with this paradigm is the generation of multiple and dynamic hypothesis.

Discussing the role of the public transport system, Yago stated: "*Transportation centrally affects the relationship between physical space and society. (...) changes in transportation affect the organization of human activity in urban and regional space, structuring the built environment, spurring urban growth, and ordering the relationships among cities in a national urban system*"[9]. The urban transport network is a good indicator of the spatial limits of a city. Usually, when a certain transport system reaches its limit and cannot match the growth rhythm of the city anymore it is complemented by a different mean of transport that is able to cover the new city limits.

The means of transport are selected by the city dwellers through a rational process influenced by their social and spatial ranking in the urban configuration. Yago shows that, for example, the wealthier dwellers have a smaller probability of using public transport, choosing to travel by car, instead.[10] In the absence of similar studies about the Romanian urban communities, we find ourselves

[8] Desmond Morris, *The Human Zoo* (London: Jonathan Cape, 1969), 55
[9] Glenn Yago "*The Sociology of Transportation*". Annual Review of Sociology, Vol. 9 (1983): 171
[10] Yago, "*The Sociology of Transportation*", 176

constrained to extrapolate the findings of usually American studies, such as Yago`s. However, Bucharest`s polynuclear configuration as well as the high variations in architecture and social structure lead us to the assumption that the travel routines of Bucharest residents are probably more manifold than those of American dwellers living in more simply-structured cities. Identifying the dominant travel corridors would presumably be more difficult as we would have to deal with three different means of public transport and a private one.

Several studies conducted in the last decades were aimed at discovering the effects if public transport on city dwellers. Bateman and Brown show that overcrowding, traffic congestion and subway breakdowns create dehumanizing environments that may erode urban dweller`s sense of identity. [11] Milgram shows transportation-related stress, overcrowding, traffic congestion and noise may contribute to *psychic overload*[12]. Stress is also responsible, by Lundberg, for much of the aggressive or inappropriate behaviors that occur in public transport. [13]

Another interesting study regarding social interactions in public transport belongs to Susie Tanenbaum*[14]*. Her ethnographic study was conducted for three years in the New York subway and followed several categories of subjects, from musicians and simple dwellers to salespersons and the subway staff. One of the main findings was that subway music performers facilitate social interactions by creating connections between strangers that would otherwise have no pretense to interact.

As we have already mentioned, the main methodological inspiration for our ethnographic study relies in the model that was promoted and enhanced by symbolic interactionism. This was synthesized by Herbert Blumer through the following phrases: "*Symbolic interactionism is a down-to-earth approach to the scientific study of human group life and human conduct. It lodges its problems in the natural world, conducts studies in it and derives its interpretations from such naturalistic studies. If it wishes to study religious cult behavior it will go to actual religious cults and observe them carefully as they carry on their lives*".[15] He also underlines society exists *in action* and this is how it should be researched. This should be the starting point of any empirical study[16]. The observational research „borrows" its exploratory character from the anthropological tradition: the researcher seeks to discover new data without „tying himself" to a rigid set of hypothesis. He tries to respect the natural world conditions and to not induce any major changes through his presence. His interest is diffuse at the beginning. Any aspect of the group`s life can fall under the researcher`s scrutiny. [17]

We, therefore, chose to conduct an exploratory research of the everyday, casual interactions in public transportation, namely trams and metros. These two means of transport were selected because they are perhaps the two most representative spaces of public transport in Bucharest. They were also relevant to our research due to their fundamental difference: one travels underground while the other travels above. Our starting point consisted in the analysis of the interactions and nonverbal behavior.

While we had almost no rigid hypothesis besides the existence of symbolic relations that may determine a certain perception of the spatial structuring, we decided to follow a few dimensions:

- The natural display of individuals; possible grouping criteria (such as age, gender, social status)
- The existence of possible variations in the homogeneity or disparity of travellers in different areas of the city
- The occurrence and functioning of prosocial and antisocial behaviors
- Possible patterns in the emergence of social interaction between strangers
- Attitudes and behavior towards individuals with a special status: baggers, security staff and ticket inspectors
- The management of impression (in Goffman`s terms) and the management of the personal space

The study was conducted over a period of six months and it resulted in a larger quantity of data, out of which we will only present the most relevant part.

The means of transport were selected with regard to the length of their route and the variations in the areas they cross. We sought trams that would offer a convenient posture for observation and note-taking, and that would cover several socially-diverse areas. We finally selected three main tram lines (55, 5, and 21) that cover a large part of the city and offer a center-outskirts transition. In selecting the metro lines we used the same criteria that would maximize the variation of the individuals, the attitudes and the behaviors we would observe, but in the end we conducted our observation along all the city`s metro lines.

The research findings

Much of the social scene of the public transport can be explained through age and status. The first notes of our observation show a traveller`s placement inside a tram is closely determined by these factors. This becomes visible when a traveller has to choose a seat inside the tram when there are many empty seats to choose from in all areas. Younger people are more likely to select the back segments of a tram, while the front segment tends to be preferred by the elderly. In the center segment of a tram you will most often find younger people, and also the *white collar class*, active people involved in intellectual activities. The *blue collar* workers (the ones involved in physical labor) would usually choose the back segment.

At the metro, while on the waiting platform, the most hurried travellers are more likely to sit next to the platform limit. The same pattern is also present inside the metro, the most hurried choosing to sit near the exits. The management of the personal distance is highly visible inside the metro. The metro travellers seem to be more permissive in this regard compared to the tram travellers. Overcrowding seems more tolerable inside a metro. Nonverbal cues of territoriality and the protection of one`s personal space are less present when compared to a tram. We hereby advance the hypothesis of an unconscious acceptance of reclusion which is driven by the closed configuration of the metro space. The perception of architectural closure weakens one`s expectations of personal space. This would explain why the same level of overcrowding will produce less conflict (verbal or nonverbal) in a metro than in a tram.

The “social landscape” inside a tram is somewhat more heterogeneous than in a metro. The easier access inside a tram (the possibility to travel without a ticket) and the absence of the guards (who patrol some of the metro trains) can explain the presence of individuals from more social categories inside a tram. We have found a category of “travellers without a destination” that use the tram as a shelter. They often travel until the end of the tram`s route where they are coerced to exit, only to take the first tram coming from the line`s end.

Observing the prosocial behaviors inside the tram we found their frequency is higher in the front and median segments of a tram. Two indicators pointing towards this conclusion are the level of cleanliness and the number of the seats offered to other people. The elderly and the physically challenged individuals will very often choose to sit in the first segment of the tram, denoting a more or less conscious knowledge of this fact. The “renegades”, the socially marginal (such as the

"travellers without a destination" category) or the baggers will most often choose the back segment of the tram. The metro seems to spatially repress the marginal individuals towards the front and back limits of the wagons.

The people in the back segment of the tram are more likely to use a louder voice. They also are more likely to be more expressive through the use of inflexions and imitative words. Besides the social and demographic factors we have already mentioned as influencers of one`s position in a tram, there still is not enough to explain why people in the vicinity of the driver`s cabin will usually talk lower than in other parts of the tram. Thus, we presume this fact is explained by the functional authority of the tram driver. This allows him to monopolize the aggressive behaviors. In the cabin`s area the driver will often be the loudest and most expressive individual. The travellers behind the cabin will quietly accept his informal leadership and unconsciously seek the protection that comes from the leader`s proximity. This self-preservation behavior could explain the higher frequency of the older travellers in the first segment of the tram, near the driver`s cabin. The elderly are generally less able to protect themselves of aggression, thus they are more prone to look for exterior protection. Also, the marginal individuals, the ones that feel in opposition to the social norms (such as beggars) are more likely to choose the back side of a tram because the driver`s authority is weaker in there. Because of the inhibition of aggressivity determined by the driver`s authority in the front segment, the nonverbal dominance and aggressivity cues are usually more present in the back side of a tram. The personal space is also larger in the back side. People will usually seek to distance them more from the others compared to the front side. We believe that can be seen as a more intense need of protection that translates in a need for a larger "buffer zone". Again, the need for protection is smaller in the front side of a tram because of the driver`s authority.

Aside from their perceived authority and aggressive monopoly, the driver`s involvement in the "tram`s social life" is limited. On the contrary, most of them use different tactics of isolation from the people behind, by covering the cabin`s interior window with clothes or ornamental objects. If their concern with the world behind is uncertain, there is a certain preoccupation for taking hold of the cabin space through various forms of personalization, often religious. We assume this practice carries indicators on how the driver would like to be treated when working, and, consequently, how the travellers should behave in his tram. We hold as an argument Rapoport`s point of view expressed in a study on the effects if built environment on human behavior: *"people react to environments in terms of the meanings the environments have for them"* and *"the meaning of an environment is generated through personalization, through taking possession, completing it, changing it"*.[18] He underlines the social character of symbols and their role in connection to status, social order and the individual`s place in it: *"the basic point that symbols communicate, that they are social, that they are related to status and represent the social order and the individual's place in it, are all notions that can be studied in other ways-notably through nonverbal communication*"[19].

The metro drivers do not seem to have a similar status or influence on what happens behind them, compared to the tram drivers. In their case the authority does not seem to bypass the limits of their cabin. There are two hypotheses we have in this regard: their posture is not elevated, compared to the tram driver, so they lack an important cue of domination. Also, their perceived authority derived from the driver`s role is divided by two, because the metro drivers always work in pairs. The metro requires two people to perform the same role for which the tram requires only one.

Observation of nonverbal behavior in public transport will generously show cues of territoriality and protection of personal space. There are a number of behavioral patterns that accompany the breach of one`s personal space. Most often this state of perceived inadequacy is minimized by eluding the intruder or intruders` look, like a symbolic negation of the uncomfortable

[18] Amos Rapoport, *The Meaning of the Built Environment - A Nonverbal Communication Approach*. (Tucson: The University of Arizona Press, 1990), 21

[19] *Rapoport, The Meaning of the Built Environment - A Nonverbal Communication Approach*, 48

position. Besides the gestures that indicate a desire to escape, individuals offer cues of nervousness and self-preservation. For example, overriding one`s personal space will usually result in a more alert rhythm of breathing.

We have identified two forms of isolation in travellers: spatial – when one chooses to stand in the most remote area of a tram or metro wagon - and social, when one avoids interaction with others by exhibiting specific indicators of reclusion, such as headphones, handling the telephone or "diving" into the lecture of newspapers or magazines. These types of isolation cues are much more present in the case of younger travellers compared to the other age groups. Another reason for the desire of isolation seem to be the "overloads". The travellers carrying heavier objects usually enter the back segment of the tram because they estimate they would be less likely to disturb the others in that side. However, when entering an empty tram, two people carrying a large box will almost always sit in the back. If the same people would enter the tram without any overload, their placement option will most likely be different. One possible reason for this is the perceived association of overload with lower status and manual labor, which would influence the individual into thinking his most appropriate position at that moment is in the back segment of the tram (the *blue collar* segment).

The metro clock has facilitated the investigation of a specific dimension of the perception of time: the attitude towards waiting, or towards "useless time". The waiting generates nervousness signals that climax when the clock resets, after ten minutes from the departure of the last metro. There are several approaches in handling the waiting stress. They are influenced mostly by how much each individual values his time in that moment. Thus, the travellers that value their time most tend to look more often to the metro clock and stand closer to the platform limit. The others are more likely to rest on the chairs while waiting for the metro. Another nonverbal pattern is linked to the relief gestures when the train`s arriving sound is heard from the tunnel. Such gestures are groans or sudden turns of the head.

Beggars and ticket inspectors represent the social types of exclusion and coercion. The travellers tend to regroup and rethink their territoriality when confronted with their presence, and seek to avoid contact through such gestures as turning the head away in a symbolic denial of their presence. In the *intruders'* category also fall the travellers that force their entrance in an overcrowded tram or metro. Confronted with the intruder`s entrance efforts, the travellers inside the tram or metro will adopt a *team behavior* (in Goffman`s terms) or solidarity by spontaneously generating a group norm that defines the acceptable crowding degree and sanctioning the intruders. Once they manage to force their way into the tram or metro, the former outsiders will adopt the same team behavior and sanction the ones that try to enter after them.

Ticket inspectors usually tend to avoid the back segments of the tram, probably sharing the same perception of a higher risk of aggression and deviance. Together with the drivers, the ticket inspectors are the only ones that share a formal role in the tram space, and the only ones that rely on a formal authority. However, if the inspector`s authority is coercive, the driver`s formal authority is more reminiscent of a *low-status gatekeeper*. Returning to Auge`s terms, we may observe the tram represents a *place* for the driver and the inspectors, and only a symbolic space for the rest of the travellers.

Conclusions

In decoding the symbolic relations established in public transport we left from a set of dimensions that were extended over the course of the research. The study generated an important number of hypotheses and explanatory models for some of the behaviors that were observed. A simple passage through Bucharest by public transport will, in most cases, offer an image of the social diversity of the city. Travelling and observing frequently and persistently the same means of

transport will emphasize, in time, recurring behaviors of the same individuals and offer different cues for interpreting these.

The main findings of this study rely on the symbolism of the relations established inside means of public transport. The spatiality specific to trams is mostly induced by the driver`s perceived authority. Also, the isolation and self-preservation behaviors are some of the most relevant findings that would benefit from further research.

We sought to test our hypotheses by discussing with a number of frequent travellers, but their inputs were merely seldom relevant. Much of the behavior we observed and interpreted proved to be unconscious and instinctual, rather than rational and intentional.

The natural follow-up to this study would be extending it to even more means of transportation from different cities and eventually verifying the hypotheses through experimentation and quantitative data.

MAIN TYPES OF VIOLENT BEHAVIOR IN THE CONTEMPORARY SOCIETY

MARIA LULESCU[*]

Abstract
The proposed scientific theme is going to approach and study the violence phenomenon as a contemporary social matter, from a conceptual and etiological perspective. Firstly, the violence phenomenon is explained from multiple angles: legal, psychological, socio – political, anthropological and last but not least sociological ones. Secondly, I am going to analyze the main violence types encounted in contemporary society; this approach also implies the study of the way each violence type is expressed, and the discovery of the causes that determine the commission of such acts. Thirdly, the main types of violence existing in sport are presented, this phenomenon being frequently encounted in contemporary society, while converting a sport game into a real battle – a situation which is frequent both among athletes and especially supporters.

Keywords: *the concept of violence, types of violence, violence etiology, violence among athletes, violence caused by supporters.*

Introduction

Violence represents a complex social phenomenon encountered more and more often in contemporary society. Representatives of international organization, specialists, governmental and non-governmental institutions and ordinary people, express their concern and opinion regarding the increasing number of violent actions and their varied manifestation, and no less concern about the citizens' insecurity in different social environments. Violence represents an area of large interest, on which most researchers have closely looked upon lately, with a special interest in its causes, manifestations and especially the procedures to prevent and combat.

In Romania nowadays, violence as a form of behavior represents a complex social problem, whose form of manifestations, social consequences and possible solutions are of great interest for institutions representatives responsible for social control as well as the public opinion. It is very important to take into account the fact that social inequalities among people and different social groups, economical crisis, inflation, poverty, unemployment generate social tensions and conflicts.

This paper defines in its first part violence as seen from World Health Organization perspective, with a special view of the definitions given by sociologists and researchers. The violence phenomena are presented not only from legal perspective, psychological aspects, political sociology, but also from cultural anthropology point of view.

The second part of this work, which represents the core of the paper, presents types of violence encountered in contemporary world using the existing classification provided by modern sociologists.

In the third part of the paper, a conceptual approach of the violence phenomena in sport was presented as this is the main subject in my research project. I have studied the type of violence identified with sport violence in contemporary society and I have presented the two types of violence, identified by the researcher Jean –Yves Lassalle: those of the sportsmen and of the supporters as well.

[*] Assistant, Ph.D. candidate, „Nicolae Titulescu" University, Bucharest (e-mail: marialulescu@gmail.com).

1. Conceptual perspective on violence

World Health Organization has defined violence considering all possible situations which may be characterized as violent actions. According to this international organization, the violence is the result of "*intentional using or deliberate threatening using physical strength against your own self, against other person or against a group or community, which produces or is on the point of producing a trauma or a death, a moral prejudice a trauma or a deficiency*"[1].

In the Explanatory Dictionary of Romanian Language, 1984 edition, violence is "*the property, character of what is violent (1); power, intensity, strength (2) lack of self control in speaking or in actions, vehemence, anger (3); the fact that brutal force is used, constraint, raping, law infringement (4); violent, impulsive action (5)*".

Nowadays, the meaning of word *'violence'* has received new aspects in Dictionary of Romanian Language for Students and specifically, "violence" represents firstly a "*feature, character of what is violent; big power, intensity, strength"; secondly "lack of self control in communication and deed, vehemence, anger"; thirdly "the attitude to use brutal force, constrain, violence"*.

The phenomena is generalized and is present in any society, either occidental or ex-communist, but making clear that the increase of violence is definitely higher in all ex-communist countries, compared with the other countries. Even more worrying is the increasing rate, changes presents in the structure of criminality, toward high criminality and especially violence.

Violence is seen as a manifestation where force and constrain is used by an individual, group or social class in order to impose on others. The term "violence" gains particular meanings according to context of reference where the meaning is found[2].

From legal point of view, *violence* defines physical force or personal authority usage in order to produce a prejudice, or an injury upon personal integrity of a person (criminal **violence**, homicide, voluntary hurting, rapes etc).

In **psychology**, *violence* defines aggressive behavior, usually displayed as a result of frustration (from Freud's point of view "Oedipal conflict" the example is accompanied by unconscious desire of a child to kill all those who stay against his maternal affection). Frustration tendencies can be a self-aggressive behavior which defines people presenting suicidal tendencies, suicide representing a type of **violence** so called non-criminal, private which has as a main purpose voluntary suppressing a person's life.

In **political sociology**, *violence* signifies an important means to establish social dominance or in order to obtain a dominant position, materialized through conquering wars, international terrorism etc.

In **cultural anthropology**, violence is the equivalent to the constrain applied by a cultural community on another or by a norm system on other, through repressive agents having economical, political or moral character to act in favor of the dominant model.

Last, but not least, in **sociology**, *violence* is not considered only a resource of a powerful social class or some privileged groups, but also a compensatory means used by social classes and unprivileged groups (especially when their interest are not fulfilled through "normal" legal procedures) pushed toward the edges and constituted from people lacking resources, not properly integrated in society or just partly integrated. Their behavior is a reaction to compensate their own diverted status. Without having access to institutionalized methods to fulfill their social purposes they use illegal, illegitimate, and sometimes violent means, in order to obtain access to some 'social opportunities'. R.A. Cloward and L.E. Ohlin, inspired by Merton's[3] paradigm regarding anomy, have introduced the 'differentiated opportunity' notion represented by the procedures used by social

[1] Etienne G. Krug, Linda L. Dahlberg, James A. Mercy, Anthony Zwi, Raphael Lozano-Ascenio, „*Rapport mondial sur la violence et la sante"*, Organisation Mondiale de la Sante, Geneve, 2002, p.5

[2] http://www.dictsociologie netfirms.com/Termeni htm

groups to fulfill their desires. According to these opportunities, legitimate or not, the positions occupied by members of society in the 'opportunity structure' are defined.

Violence is a consequence of disregarding the social disorganized processes, of social anomy and lack of social integration and is manifested by aggressive behavior which bends the law or unwritten codes. Violence is not a new phenomenon, though its presence and evolution are close related to people, groups, organizations, institutions and human societies's evolution. This is one of the reasons some specialists and researchers appreciate that violence is a permanent feature of humanity, close related to human being and to society functions. Defining violence has proven to be a difficult attempt. This can be due to the complexity of the phenomena, and the great variety of its form of manifestation as well.

Violence as a notion is analysed in a close relationship to aggressivity. Aggressivity is defined as any deed which has as a main purpose to produce e prejudice to a certain target. The Latin root of the term violence is '*vis*', which means 'power' and induces the idea of power, domination, using physical superiority against someone else.

ERIC DEBARBIEUX (1996), a specialist in the problems related to violence in schools, gives a definition where he surprises violence as a whole: "*violence is the brutal disturbance or continuously of a personal, collective or social system that may be translated through integrity loss, integrity which may be physical, psychical or material. This disorganization can be treated through aggression, using conscious or unconscious force, but we can discuss also about violence from victim's point of view, without aggressor's intention to hurt anyone*[4]".

YVES CHAUD appreciates that: "*There is violence during an interaction when one or more factors act in a direct or indirect manner, concentrated or distributed, bringing others prejudices of different intensity, affecting either their physical or moral integrity, their possessions, or in their representations either symbolic or cultural*".[5]

2. Typologies of violence in contemporary society

Violence's forms are becoming more and more diverse during human society evolution and get larger and larger amplitude despite the means and costs involved in fighting against them.

The manifestations of violent deeds are different according to epoch, culture, circumstances, but especially related to moral and spiritual evolution of the communities. Violence is a variable phenomenon. It can take forms from obvious violence to a hidden one. What is called violence has a larger area than those defined by criminology.

The types of violence encountered in contemporary society are the following:

A. Direct structural and cultural violence

The Norwegian researcher, **Johan Galtung** has studied the most subtle forms of the violence and has offered a new perspective on the phenomenon according to social reality of the XXI century.

"I understand the violence as a *deterioration of fundamental human needs which can be avoided*, or more general, a *life impairment* which decreases the degree where people are able to fulfill their needs at a certain level or *potential* possible. Even *threatening* is violence too."[6]

The majority of analyses support the idea that the aggressivity is more related to instinct, while the violence is close related to culture, education and context.

According to the modalities, the violence is presented and in order to understand its whole nature in contemporary society, Galtung has found out that there are three types of violence: **direct**, **structura**l and **cultural**.[7]

[6] Johan Galtung, *Kulturelle Gewalt*; în: Der Bürger im Staat 43, 2/1993, p. 106, http://articole famouswhy ro/definirea_termenului_de_violenta/#ixzz14mo83MVA

[7] Ibidem

1. Direct violence is related to physical images: blows, wounds, injuries on the physical body generated by another person directly or indirectly and is related to hurting and injuries intentions.

2. Structural violence is the common one, without intention, where all society members are involved. This type of violence is applied, according to Galtung, to all social and economical exploitation systems which affect basic needs of people, identified in: surviving, wellbeing, identity and freedom needs.

Structural violence is presented in two main forms:

• ***Vertical structural violence*** – which implies exploitation (economical power) repression (political power) and alienation (cultural power) and which affect basic needs as wellbeing, liberty and identity;

• ***Horizontal structural violence –*** implies keeping people together despite the fact that they do not want to, or to part them when they want to live together.

Social isolation or pushing people toward social limits, stopping them to have the possibility to access knowledge and culture, manipulating, any other form of action, social structure or ideological conception which narrow the possibility to satisfy basic necessities is called structural violence too. In this respect are noted structural violence phenomena such as[8]:

Poverty – in modern countries structural violence is manifested when government politics worsen the disadvantaged social classes and multiply the privileges for the rich people in society and in this way the gap between poor and rich is enlarged.

Death – when industrialized countries, on their run to obtain profit, deeply affect planetary system and produces major climatic changes with fatal effects on people's lives.

Suffering – people's inability to satisfy their need of recognition or self esteem, due to a society which reduces any possibility to distinguish, generating a great frustration or unfulfilling feeling.

Galtung uses the term structural violence in a way synonym with 'social injustice'. Thus, Galtung's analysis is related to criticism towards the capitalism in the countries still in a development process. It legitimates their fight against unjust social systems (guerilla etc) even though these mostly renounce to direct oppression methods.[9]

3. Cultural violence is that one which considers as good and righteous the other two forms of violence. "Cultural violence is not visible, but has clear intention to hurt, even indirectly kill through words and images, in a way, symbolic. This is priests' violence, intellectuals' or professionals' violence." Cultural violence refers to ideologies, traditions, knowledge, beliefs, all ideological systems which make possible and justify direct or structural violence.[10]

"Through cultural violence we understand those culture aspects that could be used in order to justify or legitimate direct or structural violence. Stars and stripes, the hammer and the sickle, crosses, flags, hymns, military parades, the omnipresent portrait of a leader, heated discourses as well, are included in this category."[11]

"Cultural violence is even more problematic than structural violence because is in all of us, not only in some, so called, bad actors (…)

The structures are seen as something external, but culture is internal, feeding our hearts with religion/ideology, the language of rough culture which forms or identity".[12]

[10] Sorin- Tudor Maxim, op.cit, Publisher. All, 2006, p.55

[11] Idem

[12] Johan Galtung,"*Conflict Transformation by Peaceful Means"*,Unitated Nations,2000

Considering a turning point Galtung's definition (people's basic needs deterioration) and adding four new need groups to the two already mentioned, we will have the following typology:[13]

Typology of violence by Galtung	**Needs groups**			
	suvival (denying: death)	**prosperity** (denying: poverty, illness)	**identitity / purpose** (denying: alienation)	**liberty** (denying: oppression)
Direct violence	murders	Injuries siege, penalties, poverty	de-socialise, re-socialise, second hand citizens	repression, inprisonment, expulsion, deportation
Structurală violence	exploatation A	exploatation B	penetration, segmentary	marginal, fragmentarye

We have seen Galtung's typology of violence, and we have to explain the terms from the last row of the table – what is exploitation (A and B), what is penetration, segmentation, marginalization and fragmentation.

Exploitation represents the core of an archetypal structure of violence. Galtung makes reference to an "unequal exchange" realized between the two social categories, named by the Norwegian researcher: *topdogs* – those that take most advantages from the system and the *underdogs*, the opposites.

Exploitation type A. The so called *underdogs* can be so disadvantaged thus they can even die because of that (due to famine or epidemic diseases).

Exploitation Type B means to leave the *underdogs* to permanently support unwanted poverty, which naturally includes underfeeding and disease.

"All these take place inside some complex structures and at the end of some long and extremely complicated causal cycles. A violent structure leave marks not only on human body, but also on their minds and soul.

The following four terms can be understood as constituent parts of exploitation or as components having an amplifying value inside its structure. Their function is *to hinge conscientious* formation and also its *stimulation*, two essential ingredients for a real fight against exploitation."[14]

Penetration, segmentation, marginalization fragmentation. An *underdog* conscientious is *penetrated* by *topdog*'s ideology elements, this being accompanied by a *segmentation* which does not open to *underdog* anything but a limited vision of reality. Segmentation is just a result of two processes, *marginalization* and *fragmentation*. *Underdogs* are pushed towards edges, being convicted to be unimportant, parting them from one another. These four concepts, actually describe the forms of structural violence."[15]

B. Interpersonal and collective violence

Etienne G. Krug and his team have worked to realize the *World Report on Violence and Health* have included in the area of violence, interpersonal violence deeds, action of violence against own self, but collective violent deeds as well.

Interpersonal violence includes violent activities among people no matter their relationships. Thus, in this category there are presented two subtypes of violence considering the relation between aggressor and his victim and the space where aggression takes place:

1. "*Violence in family and violence among partners* is manifested among people where there are family relationships (maltreatment applied to a child, partners or elderly people);
2. *Violence in community among people without any family connection* – takes place in other spaces than victims or aggressor's residence, among people knowing each other or not (young

[13] http://articole famouswhy ro/definirea_termenului_de_violenta/#ixzz14mo83MVA
[14] Johan Galtung, *Kulturelle Gewalt*; în: Der Bürger im Staat 43, 2/1993, p. 107
[15] Ibidem

people violence, rape and sexual aggression committed by unknown persons, or violence in institutions)."[16]

Violence against own self (intrapersonal) represents a category where the authors include suicidal and self mutilating behavior. It has been noticed the way how specialists from World Health Organization understand to define suicidal behavior, including not only suicide, but also the "precursor's activities of the suicidal action (thoughts and actions regarding suicide, identification of the necessary means to prepare the suicide)."[17]

Collective violence includes violent manifestations which are identified with a group against another group in order to obtain political, economical or social advantages. In the area of such type of violence there are included violent deeds of an army against another or against population, actions considered genocide, actions which implies fundamental rights of individual infringement, terrorist activity or violent actions included in organized criminality.

The specifications brought by the authors in their report allow understanding that the World Health Organization suggests violence should be approached not only from the aggressor – victim perspective and place where the aggression takes place, but also considering the type of action against the victim. As a result, considering the type of action upon victim, violent deeds can be "physical, sexual, psychological, or can involve deficiency or carelessness."[18]

From this perspective Gilles Ferreol and Adrian Neculau, have established the following typology of violence:[19]

1. Private violence

a) Criminal violence
- Deadly - killing, assassinating, poisoning, capital punishment

b) Noncriminal violence
- Suicide and suicide tentative
- Traffic and work accidents

2. Collective violence

a) Citizens' violence against political power
- Terrorism;
- Revolutions and strikes

b) Violence against citizens
- State terrorism
- Industrial violence

c) Paroxysmal violence
- War

There is another typology of violence, elaborated by Dan Baciu and Sorin M. Radulescu who differentiate between:[20]

a) Primary violence – usually occasional, accidentally, casual characterized by uncontrolled and outbursting reactions of some people, general reaction promoted by criminal opportunities (alcohol consumption, conflicting relationships with the victim etc);

b) Passion violence – generated by revenge, jealousy, humiliation usually characterizing people manifesting egocentric and autistic feelings, or that prove emotional instability and a clear diminish of voluntary mechanism of self-control and self-adjustment;

c)Utility violence – generated by purposes that follow a profit, material interests, goods and services met in thefts accompanied by violence, robbery and mugging;

d) Pseudo legal violence –generated by purposes that follow to repair the damages and to punish the author of a murder, rape or robbery by a group or community that substitute to the legal system (it is the case of vendetta, lynching etc);

e)Symbolic violence – generated by some codes, messages and symbols that act as triggering factors produced by some people against others;

f) Rational violence – characterizing organized crime and criminal activities, having as final purpose to obtain high illegal profit (murder and kidnapping people, people trading, coercion and physical and moral blackmailing, weapons and hallucinogen substances trading etc.).

C. Physical, economical and moral violence

Jean Claude Chesnais, trying to establish semantics areas included in definition, has established a geometrical representation three circles.[21]

As core, the first circle, there is **physical violence**, which is considered by the author the most serious, as it causes body injuries or even death of the attacked person. This is the most savage and brutal form.

The second circle, and larger, is represented by **economic violence**, related to all prejudices and frustrations on personal belongings and having numerous forms. In a high developed industrial society is difficult to make a difference between what you own and what you are, because the person is mostly identified with what belongs to him/her as a means of subsistence. In this way the violence is confused with delinquency.

The third circle is represented by **moral violence**. To talk about violence in this respect, states Chesnais, is a linguistics abuse in nowadays conditions, when ambiguity, regulation and aggression, organization and aggression are mistakenly taken for one another.

D. Physical violence, psychological and verbal violence

The sociologist Daniel Welzer-Lang appreciates that the most important forms of violence manifested in a society are: physical violence, psychological violence, verbal violence, sexual violence, violence against animals, violence against children, economical violence, violence against oneself and street violence.[22]

Physical violence is represented by "any physical contact on someone else's body". Welzer-Lang includes in the area of this type of violence, actions whose gravity and intensity are different: "pulling someone's hair, scalding using water or oil, violent gestures having as a main purpose to frighten someone, bouncing someone's head to walls, tearing someone's clothes, forcing someone to touch an electric wire, electrocution."

In area of **physiological violence**, the author includes all actions that affect or try to affect physical or mental integrity of a person, such as "self-appreciation, confidence, and personal identity". In this category there are included: "verbal abuse, ungrounded critics, browbeating, bullying, threatening with raping or retaliations, blackmailing, blackmailing someone with suicidal action, threatening someone to leave, over controlling someone's program".

The previous mentioned actions emphasize the idea that psychological violence is a result of the message conveyed to victim by the aggressor.

Conversely, **verbal violence**, is expressed by verbal flow, violence in the voice, pitch, crisis, in another word is related to "authoritarian tone used in order to ask something, interrupting the interlocutor and reproaching, avoiding some topics to discuss, totally denying, listening or answering to the interlocutor and frequently usage of verbal abuse during discussion."

E. Sexual violence

[21] J.C.Chesnais,1981,pag 32 apud Gilles Ferréol Adrian Neculau, pag 122,123;

[22] http://tahin-party.org/textes/impp50-85.pdf

World Health Organization defines sexual violence as "any sexual action performed by someone against someone's sexuality, or attempt to have a sexual intercourse, comments or sexual attempts, trading actions or other actions using force, no matter his/her relationships with victim in any context, without being restrained to the place of living or work."[23]

F. Financial violence

Noël Flageul is one of those who supports the idea of violence in financial world, referring to "actions based on force or brutal manifestations which affect people or goods".[24] Considering financial violence, the main reference is "money laundering, tax frauds, stock transactions offences, card frauds, fictive finance-accounting procedures, bribing or illegal funding of political parties". Thus, violence takes the appearance of the "lack of balance in real economy, taking into account the more and more close connection among states and globalization".[25]

G. Criminal violence

Canadian criminologists Jean Proulx, Maurice Cusson and Marc Ouimet include in this type of violence "actions forbidden by law and liable to penal punishment".[26] There are included here murders, sexual aggressions, robberies injuries and corporal aggressions.[27]

Criminal violence particularities

There is a methodological necessity to make some clarification regarding violent criminality. Jean Proulx, Maurice Cusson have appreciated that it is necessary to distinct between:

1. "*predatory aggression*, justified by the desire to obtain money or goods and *clash violence* justified by revenge or defense desire;

2. *severe violence* (murder and murder tentative) and *less severe/critical violence* (injuries and others); theories that explain delinquency and theories applied to violent criminality only".

Mihai Ralea, who has approached violence as a phenomenon since 1931, supports the idea of violence manifested in large groups and formed through contamination, meaning that those ruled in their life by thinking and rationality, once settled in a group, lose their self-knowledge. This phenomenon is named "contagiousness" and can reach anyone.[28]

It happens very often to see on stadiums people swearing and having a violent behavior, but in their daily life to be a real model for their politeness and respect.

World Health Organization launched in 1996 a four level risk program to prevent violence:[29]

a) **Individual level**, where risk of violence is given by previous abuse and antagonistic experiences, mental disturbances and illness as well. Prevention at this level will develop as a target self respect development;

b) **Interpersonal level**, where violence risk is given by the alcohol or drugs intake, by the man's control over family's goods, but also by conflicts inside the family;

c) **Institutional level,** which has as causal factors for violent behavior the following: low level of socio-economic status, unemployment, women social isolation and violent families, joining to men's delinquent groups. In order to build prevention at this level a target should be established in attending schools and programs with educational profile and community cohesion development as well.

d) **Structural level,** where the risk of violence is close related to cultural tolerance of violence in controversy solving, rigid gender model promotion and encouraging male as a dominant element.

H. Anomic violence

Raymond Boudon and Francois Bourricaud appreciate that the anomic violence is "the proliferation result of aggressive relationships in disturbed areas of the society".[30]

Violent anomic forms are given by the possible types of anomy in a society: "legal, political and moral anomy." Legal anomy encourages aggression against a member of the society and his or her belongings as a result of loosened legal norms.

Political anomy concurs with insecurity generalization which brings increasing number of self-defence actions and repression institution support. Legal anomy combined with the political one lead to exceptional situations. Moral anomy demolishes the individual respect for law and customary law and invite to a "save whoever is able" generalised state.

According to the authors, there are two cases where violence is manifested in different forms:

- *Totalitarianism*, defined by disorganized violence"manifested by a society against its own members in order to prevent any preferences (verbal or nonverbal)".
- *War*, defined by organized violence "war representing an organized and driven exercise and its strategists do not intend to kill, but to break the political will of an opponent, to destroy it not as a living person, but as a political combatant".

I. Conflicting violence and predatory violence

According to Maurice Cusson[31], conflicting violence involves the existence of conflicting relationships between aggressor and his/her victim previous the conflict (murder in a married couple), while in the case of predatory violence there are no relationships among the people involved in aggression (for example murder in a case of stealing or raping an unknown woman).

Conflicting violence implies a conflict understood as a "disagreement between two parts which end by hostilities exchanges." It the case of conflicting violence is difficult to distinguish victim to aggressor as the two exchange their parts during the conflict. Also, conflicting violence usually takes place when the people involved live in a social and physics proximity: live in the same house, are colleagues or neighbours.

Predator violence is manifested one-sided; one person being aggressed and the other is the aggressor.

Proulx and his collaborators have identify some of the characteristics of the two types of violence starting from information close related by the purpose of violence, the role of victim and aggressor, their experiences and development (see Table 1).

Table 1. Predatory violence and conflicting violence characteristics

Predator violence	**Conflicting violence**
Example	Example
Armed robbery ordered murder, murder associated with stealing, rape against an unknown person, „charging"	Alcoholic fight, family arguments, murder in a married couple
Violence purpose	Violence purpose
The aggressor wants to constrain the victim, to take his/her money to take advantage of it	Anyone of those implied wants to punish the other, to revenge, to save himself/herself, to defend
The aggressor and victim's role	The aggresor and victim's role

[30] Raymond Boudon, Francois Bourricaud, *"Dictionnaire critique de la sociologie"*, 2004,p. 672,675,678

[31] Maurice Cusson,*"* ***Criminologie actuelle",*** 1998,p.22-35

The aggressor is the attacker, he/she attacks firs without being provoked; proactiv. The victim supports the attack	Sometimes is difficult to distinguish between aggresor and victim. The damages are shared. The opponents exchages blows, everyone with defence or retorting feelings
Emotions	*Emoţions*
Indifference concerning the victim. Justification	Furry, hostility, hatred, fear, unjustice feelings, humiliation
Development	*Development*
Preparing, attacking, running.	Mistake or insult, ultimatum, denay excuses,arguments accompanied with fight.

Source:According to Jean Proulx, Maurice Cusson, *Que savons – nous sur la violence criminelle?,* în : Jean Proulx, Maurice Cusson, Marc Ouimet : *Les violences criminelles*, Les Presses de L'Universite Laval, 1999, p. 21

J. Symbolic violence

French sociologist Pierre Bourdieu, starts his theory from the fact that members of any society are hierarchically placed based on their economical resources, social, cultural which any of them owns.

Any person is supposed to accede to a higher position throughout his/her life generating tensions among interpersonal relationships. In a so called „game for domination" anyone will take advantage of his or her assets and, according to the situation, will convert so that to obtain maximum satisfaction with the least effort. There is in the whole process a value resource, a symbolic asset which provides the biggest and most secure income and this one is associated with prestige, honour and respect.

It is a hidden violence, which is not necessary related to hatred, furry, slaughtering cruelty or collective attrociousness. This „soft" form of violence is presented under different forms of economical, cultural or social domination, not obvious in daily life.[32] Bourdieu states that symbolic violence is one "censored and euphemistic, meaning unrecognizable and acknowledged."

It cannot be discussed about symbolic violence if the participants in such action have different semantic codes. Thus, the process of symbolic impose of power is preceded by creation of some cognitive schemes in a person's mind to force him/her to see things in a certain way.[33] In this equation, the role of the state and also politics is an essential one, because being "empowered by gathering and exerting its power it is enabled with means to impose and inculcate such long lasting principles".[34]

Imposing implies an aggressive and violent language with Manichaean accents: "those who are against symbols are covered by negative appreciations and those who accept and conform receive the praises."

3. Typology of violence in sport

Even though there is no exact definition of the concept of sport violence, the phenomenon as such has been carefully studied, typologies of violence in sport have been studied, identified violent actions that are the object of this research and causes that determine aggressive behavior have been investigated.

Georges Vigarello, for example, estimates that there are four dimensions of the violence in sport concept: "*symbolic violence, direct violence of the actors, direct violence of the audience,*

[32] Sorin Tudor Maxim ,"*Violenţa în sport"*, Published bu Suceava University 2006, p.132-133
[33] Elisabeta Stanciulescu, "*Teorii sociologice ale educatiei"*,Polirom, Iasi, 1997,p.171
[34] Pierre Bourdieu," *Ratiuni practice"*,*Publishe*a Meridiane, Bucharest, 1999,p.85

indirect violence of both, those of the accidents, of disasters or of the organizational failures of any kind liable to determine bloodshed".[35]

The contemporary analysts Beatrice Abălașei defines violence in sport as: "*behavior manifestation which consists of explosive actions spontaneous or premeditated, which violate moral rules, physical integrity and social rights of peoples.*"[36]

As it was previously presented, there are numerous typology of violence, according to different forms of social organization, but they are not encountered in daily life in a pure form. Sports represent the symbolic form, but its effects become visible only through physical violence, this being able to influence collective violence appearance. Sports represent a confrontational state, whose purpose is to win or support the symbolic defeat, honour or contempt being shared among community members.

Jean-Yves Lassalle has analyzed violence in sport phenomenon from sociologic perspective and appreciated that two types are distinguished: **Sportspeople's violence** and **Supporters' violence.**[37]

1. **Sports people's violence** can be direct or indirect, voluntary or involuntary according to the type of sport. There are sports with a high level of violence such as box, wrestling or martial arts. There are also sports with a lower level of violence: chess or tennis, but not this type of violence is a problem for the society. The regulations for different sports, even those that imply a high level of violence, have been trying to diminish or even eliminate the violence consequences.

The majority of sociologists have concluded that violence gives rise to violence. Despite the fact that regulations for different sports have been devise so that to narrow or to eradicate the phenomenon, infringing them by players of a certain sport, new forms of violence are born, sometimes with disastrous consequences on participants. Thus, even any organizational effort regarding the event became useless.

2. The phenomenon which has captured the attention regarding violence in sport is **supporters' violence**. This phenomenon takes place most of the time on stadiums and outside them with worrying consequences as there are injured people and material goods destructions. Football is on the first place in this respect. In order to explain this phenomenon some factors which should be considered are related to supporters' personality on one side and on the other side are connected to social and psychosocial features. The beginning of research on supporters' and hooligans' violence on the football stadiums has implied to determine demographic and social coordinates of the violent groups of supporters (age, sex, profession, level of education etc). Having these elements clearly established, the researchers have deepen the study regarding the supporters' violence and have investigated causes related to lack of social integration, some dwellers marginalization, a certain degree of subculture. The sport event becomes a fight, individual or collective, against some obstacles or enemies, becomes an inner war for a spectator, that one indirectly implied by choosing a favourit, either an athlete or a team which represents the club, the city or the country.

Conclusions

Contemporary society evolution emphasizes the fact that despite the intensified measures and interventions of the specialized institutions in controlling delinquency and criminality deeds, in many countries a recrudescence and increasing number of violent attitudes and aggression are encountered in economical and financial-banking areas, fraud, blackmail, bribery, corruption as well. Violence is not a new phenomenon, its advent as its evolution as well being close connected by people, groups, organizations and humane society's development. This is one of the reason for which some

[35] Sorin Tudor Maxim ,"*Violența în sport"*, Publisher Suceava University 2006, p.70
[36] http://www.sportsisocietate ro/articol/violen-a-i-spectacolul-sportiv-o-perspectiv-psiho-social/48
[37] Idem, ,"*Violența în sport"*, Publisher Suceava University 2006, p.71 -72

researchers estimate that violence is a human permanence, close connected to human being and society development.

In conclusion, as it has emphasised in the present paper, in the contemporary society there are numerous forms of violence, but never in a pure form. Violence in sport is emphasized as symbolic violence, but this one can degenerate into other forms of violence. Most of the time, violence, in sport, a symbolic violence, becomes physical violence, primary which becomes conflicting, collective, communitarian violence.

POPULATION POLICY OR SOCIAL POLICY?

ANDREI STANOIU*

Abstract
After 1989, the demographic situation of Romania population experienced a dramatic, very concerning and dangerous evolution trend. One of the first measures of the new political power was to abolish the very restrictive, anti-human and abusive legal regulation adopted in 1966 by the communist regime concerning abortion and the whole old demographic policy. As a result of this measure and of the worsening economic and social situation of the great majority of Romanian population, the birth rate declined sharply and, from 1992, the natural demographic growth rate became a negative one. The absolute number of Romanian population decreased more and more and, if nothing changes, in the next few decades it will be no bigger than 15 million people.
At the same time, the process of demographic ageing of population will accentuate, generating serious problems from demographic and social-economic point of view,
Taking into account the present demographic situation and, especially, the foreseen trend of evolution, it is more than clear that there should be taken some urgent, coherent and consistent measures in order to stop this dangerous demographic evolution, until it is not too late, and to avoid, as much as possible, a potential demographic disaster.
The problem is: what kind of measures should be taken and what kind of policy should be adopted? Some social scientists believe that a new population policy should be adopted; some others believe that rather a social policy should be adopted.
The purpose of my paper is to analyze this different opinions and to show that, behind the dispute on the terminology, should be taken consistent measures, at governmental level, in order to assure a substantial improvement of demographic situation, not only from a quantitative, but from a qualitative point of view as well, and to identify some of these kind of measures.

Keywords: *demographic transition, demographic increase, social policy, population policy, ageing process*

Introduction

The trend of demographic evolution of Romania population after the Second World War proved that our country entered, even if later, the process of demographic transition from high and oscillating levels of birth and death rates to a more and more lower ones. But, due to the specific social-economic and political situation of Romania, this process was very oscillating and contradictory. It was significantly influenced by social-economic, political, demographic and legislative factors (the rhythm of changes in social-economic structures, the demographic effects of the First and Second World War and the legislative measures taken in 1957, 1966 and 1984, especially regarding abortion).

Demographic policy promoted by Communist Party after 1966 intended to increase the birth rate in order to sustain such a rapid demographic growth as the Romania population to number at least 25 million people in 1990 and about 30 million people in 2000. This goal was intended to be achieved almost exclusively by very hard and anti-human legal measures. The results were very far from what was expected and, at the end of 1989, the birth rate was only about 16‰ and the population number – about 22 million people.

The failure of this policy proved that, in order for a demographic policy to be a successful one, it should be based on a scientific analysis of all factors (objective and subjective) that influence

* Associated Professor, Ph.D., "NICOLAE TITULESCU" University, Bucharest (e-mail: andreistanoiu@ yahoo.com).

the demographic evolution of population and to use a large variety of measures, especially stimulator and not punitive.

In this paper I intend to review the main changes that took place in Romania demographic situation (a high contribution in this field had demographer and social scientists like Vladimir Trebici in "Is it Necessary a New Demographic Policy in Romania?", Vasile Ghetau in "Population Number Decrease and Demographic Ageing – one of the Biggest Challenges of Romania at the Beginning of 21st Century", Traian Rotariu in "Demography and Sociology of Population", Catalin Zamfir in "Demographic Transition and Associated Social Problems" and so on), to analyze the actual and potential effects of these changes and to propose some measures that could stop the negative evolution of demographic situation in our country.

I. Demographic Changes After 1989 and Their Effects

December 1989's events were the beginning of a very profound, difficult and painful process of transition from a highly centralized economy to a free market one, from an authoritarian, dictatorial to a democratic political regime that implied great changes in social-economic and political structure, in the family life, in its structures and functions, in the field of human behavior and human relationships and in the whole social life.

Some of the most significant and dramatic changes took place in the field of reproduction behavior of the population. These changes and their long term consequences were analyzed by some outstanding demographer and social scientists, as already mentioned in the Introduction above. They also tried to answer the following question: what could and should be done in order to improve the present and foreseeable demographic situation?

The problem is very complex and an adequate answer is very difficult to be found. As a matter of fact, there are some different possible answers, but nobody can say for sure which one is right and which is wrong. The problem is also very important and very concerning because, after 1990, the result of Romania population's evolution trend was a continuous worsening of demographic situation.

The most important phenomenon was the sharply decrease of birth rate from 16‰ in 1989 to 11.4‰ in 1992, with a tendency to remain relatively constant (around the value of 10.5‰) until now. If, during the last years of Communist regime, the number of children born every year in Romania was between 370.000 and 380.000, in the recent period this number was only about 210.000, that means less than 60% from the previous level.

This evolution was determined by different factors, like: abolishment, by the new political power, of very restrictive anti-human and abusive legal regulations adopted by the Communist regime concerning abortion; giving the population unlimited access to contraception and abortion; the decreasing number and the worsening age structure of fertile feminine population; the worsening economic and social situation of the great majority of Romania population, especially of the young people and so on.

As Traian Rotariu said, the birth rate seems to stabilize at the level of about 11% and the mortality, measured by crude death rate, is not expected to reduce too soon because of population ageing process, "so it is expected that demographic decrease of our country to continue, even if the possible measures of demographic policy could determine a rise in fertility rate"[1]. He also considered that "the possible measures of fertility reestablishment will have a small influence on population evolution in the next years, but they could have important consequences on medium and long term (if

[1] Rotariu, Traian, "Demography and Sociology of Population. Demographic Structures and Processes", "Polirom" Publishing House, 2006, pag. 211

they determine durable effects)"[2]. There is also a sign of abandonment of traditional Romanian reproductive behavior and adoption of western reproductive behavior.

At the same time, mortality rate tended to slowly rise, mainly because of the worsening economic situation and medical assistance and also because of the process of population ageing (specific mortality rates for older people being naturally higher).

The mortality rate level became in 1992 higher than the birth rate and the situation hasn't change by now. As a consequence, natural demographic increase became permanently negative, its level being between 1-2‰.

The most important effects of this birth and death rates' evolution are:

a) The continuous decrease in absolute population number from about 22 million people in 1990 to 21.6 million in 2005 and 21.4 million in 2010. If nothing significantly changes, the decrease will continue so that the Romania population will have, according to different projections, the following values[3]:

Year	V. Ghetau (million people)	United Nations Organization (million people)	EUROSTAT (million people)
2025	20.2	19.9	19.7
2050	16.7	16.8	17.1

The tendency of decreasing in population number is clear, but nobody could say for sure how much will be this decrease. This demographic evolution trend is also influenced in a significant way by external migration. It is important not only the migration increase rate, which was permanently negative (out-migration being higher than in-migration), but also the age structure of out-migrants. According to Vasile Ghetau[4], in 2002, the percentage of Romanian out-migrants between 20 and 40 years old reported to the total number of Romanian out-migrants is two times higher than the percentage of stable Romanian population in the same range of 20 – 40 years old reported to the total number of Romanian stable population.

It is probable that the tendency of decrease in population number will be reversed if birth rate begins to rise (which is highly improbable) and if the trend of external migration changes, so that Romania to become more and more an in-migration area, the in-migration level becoming higher than the out-migration level. But such evolution of external migration, even if possible, will certainly have very serious effects on social and cultural life, on population's lifestyle. It is possible to appear serious difficulties in social integration of in-migrants, ethnical and racial tensions, some social turbulence and so on. By now, it is almost impossible to estimate the nature and the magnitude of these effects.

b) The accelerated process of population ageing, of growing proportion of older people in total population. It is estimated, for example, that the average age of population will be 40.8 years in 2025, the proportion of all old population will be about 21% and of young population only 15%. This process has a lot of demographic and social-economic consequences.

First of all, fertility rate has small chances to recover or, at least, to remain constant. This is because this process affects not only the number and proportion of fertile females in total population, but the age structure of this category of population too. Under these circumstances, not only crude

[2] Idem, pag 212

[3] Ghetau, Vasile, "Our Necessary Children and the Future of Romania Population. A 2007 Perspective of Romania Population in 21st Century", "Romanian Sociology" magazine, 2007, tome 5, No. 2, page 74

[4] Ghetau, Vasile, "Population Number Decrease and Demographic Ageing – one of the Biggest Challenges of Romania at the Beginning of 21st Century", "Population and Society" Magazine, Supplement No. 1/2001

birth rate will tend to go down, but also the crude fertility rate (the age specific fertility rates being lower as women age increase). In order to maintain at least the present level of birth and fertility rates, a highly improbable substantial increase in specific fertility rates at all ages would be necessary.

Secondly, the crude death rate will tend to increase or at least to remain relatively high despite of the fact that life expectancy at birth has a moderate tendency to increase. One can expect, in the best case, a somehow lower age specific death rates and a higher life expectancy in the next years, as a result of improvement in social-economic life standards and in medical assistance quality. But this is not enough to compensate the effects of ageing process on the crude death rate, which will tend to remain at the current level or to slowly increase.

But this ageing process will probably have very serious effects on the whole social and economic life. With respect to these effects, there are different points of view.

For many demographers, there is no doubt that the mentioned effects of demographic evolution after 1990 are mainly negative and that this trend should be stopped. As Vasile Ghetau said, "the negative potential of demographic evolution after 1990, dominated by decreasing natality, will materialize its negative effects on long and very long term and maintaining present parameters and characteristics of demographic situation will only aggravate this potential"[5], but "the natality decrease had on short and medium term incontestable beneficial effects like an important reduction of some high costs that individual, couple and society support for pregnancy, motherhood, child arising and taking care of, education"[6].

Maybe he was right in what he said, but the trend of natality decrease is very difficult or even impossible to be reversed if there are not taken measures to stop it in a reasonable period of time the temporary benefits could generate very high costs later.

Some of the most important social-economic consequences of the population ageing process mainly determined by natality decrease could be considered:

- Continuous decrease of the number and proportion of economical active population in the total population and growth of old economical inactive population;
- The bigger pressure on state retirement system. More and more retired people will have to be economically sustained by a fewer and fewer economically active people;
- The bigger pressure on assurance and medical system;
- Serious consequences on the social and cultural life, on the population's state of mind, on the inter-generations relationship and the life pattern and so on.

Some authors[7] consider that the consequences are not so severe and some of them could be counteracted if the productivity of social work will grow significantly, if the retiring age increases up to 70 – 75 years or more, if the quality of life shows a very significant improvement, if the population health (especially of the older people) is continuously improving and so on.

From theoretical point of view, these opinions could be right, but in Romania it is almost impossible for these conditions to be fulfilled in a reasonable horizon of time.

With respect to the decreasing number of Romania population, different opinions are also expressed. If some social scientists consider that this process is really concerning and dangerous because of demographic and social economic consequences it implies, some others have different opinions. For example, Traian Rotariu said that: "Personally, I don't see arguments for big anxiety with respect to the evolution of the country's population number by itself. At the contrary, I strongly believe that it is more important for governmental policies to focus on the quality of state's <<subjects>> rather than on their quantity"[8]. More than that, if there is a small chance for natural

[5] V. Ghetau, op cit, pag 2
[6] Idem
[7] Rotariu, Traian, op cit
[8] Rotariu, Traian, op cit, pag 214

increase to have a significant contribution to a positive evolution of country's population, the solution for stopping the decrease of population number would be a positive migration increase in the next years. But, as the above mentioned author said, "Replacing migration could be an acceptable solutions for the country who receives migrants, if 1. It satisfies in the first place the economic requirements and 2. If the number of yearly in-migrants is small enough to make possible their social and cultural integration"[9].

Unfortunately, nobody can say for sure what evolution will have the external migration on long and very long term and what consequences it will have.

II. What could be done to stop this trend of demographic evolution?

Even if, as I already mentioned, there are differences between opinions expressed about the demographic evolution of Romania population, almost all demographers and sociologists agree that these evolutions are concerning and dangerous enough and some measures are needed to stop this evolution and to reestablish as much and as soon as possible the demographic situation.

Some social scientists and demographers[10] think that the only solution is to adopt a new demographic policy adapted to the new social-economic and political conditions existing in Romania. Some others consider that, even if a new population policy seems to be necessary, it is neither opportune nor suitable in the actual conditions, but a social policy focused on children and friendly from a demographic point of view is urgently needed[11]. The main argument is that "a policy of natality direct stimulation cannot have rapid results without a massive material support and it is not possible to be applied because of severe shortage in economic resources. And, even if a special effort is made in order to assure important economic resources for this purpose, the result will be rather modest and counterproductive. Instead of this, the negative effects will immediately appear: the increase of social dependency of families with many children from marginalized environments. In these conditions, the only possible demographic policy is an indirect one: a policy of family and children support"[12].

V. Ghetau has almost the same opinion: "Reestablishing fertility at a level which makes possible to stop demographic decline and to assure population number stabilizing or even a moderate growth couldn't come only from a different economic and social context […]. Only a well projected, efficiently applied and carefully monitored in its effects demographic policy will be able to lead to the established goal. But, until then, from a strictly demographic perspective, nothing can be done. Any measure taken in the actual social-economic context for natality stimulation will have undesirable consequences. This doesn't mean that social protection measures focused on families with children wouldn't be welcome"[13].

It is difficult to make a clear distinction between demographic and social policy and to choose between them. If a demographic policy has mainly quantitative goals (to influence the population number and the rhythm of population growth, especially by trying to influence natality), a social policy focused on family and children, demographic friendly, has mainly qualitative goals (to assure a better quality of population, with a higher life standard, a better health and higher education level and so on).

[13] Ghetau, Vasile, "Population Number Decrease and Demographic Ageing – one of the Biggest Challenges of Romania at the Beginning of 21st Century", "Population and Society" Magazine, Supplement No. 1/2001

Both goals are equally important, so an acceptable demographic policy should be integrated into a larger social development policy and considered as an important part of this policy. Consequently, this demographic policy should aim not only to assure a desired population number and a well-balanced age structure, but also to create such social-economic, cultural, educational circumstances necessary to guarantee an adequate quality and well-being of population.

The question is: what kind of measures should be taken in order to achieve these goals? It is very difficult to answer this question because a demographic policy should meet some important conditions in order to be a successful one.

First of all, it should have a scientific ground. One of the most important impediments in promoting a successful population policy is a cognitive one. In order for someone to take measures able to significantly influence natality, it is necessary to know the different factors which determine fertility, which are the motivating factors of different population categories' reproductive behavior. Until now, it is difficult for someone to say that these factors are known, that it is clearly identified what their role and importance are in influencing the fertility level. It is probable that these factors differ from one specific population group to another, so the measures taken should be adapted to the specificity of each group. At the same time, should be clearly established the target population of these measures, especially the population which should be encouraged and sustained to increase its fertility and the efforts and resources should be focused on this population. For example, if families with enough resources to arise children and to assure them an adequate level of education, professional qualification, health and so on have only few children (1-2 children like in Romania), these families should be primarily the target of these measures, adapted to their specific.

Secondly, because the population policy is usually quite expensive, society should have enough financial and material resources to promote it. Of course, a population policy could be promoted not only by economic means, but in any case the costs of such policy are relatively high. If the demographic situation is so deteriorated that taking measures to improve it cannot be postponed too much and the society doesn't have necessary resources for this (and this is the case in our country), the governmental decision makers, if they are responsible enough, should consider solving the population problem as a high priority and act accordingly, if they want to avoid very dangerous future demographic evolution.

Finally, in promoting a population policy, ethical impediments should be also taken into account. That means the measures taken shouldn't affect in any case human dignity and the freedom of marital couples or women to decide the number of children they want to have . As Kingsley Davis wrote, the main difference between family planning and population policy is that, if in the first case parents or women have the right to take any measures they want in order to achieve proposed goals, in the second society doesn't have the right to take any measures considered necessary to obtain the number of the population desired.

Conclusions

The demographic situation of our country and the established trend of its evolution are very concerning and require urgent, coherent and well sustained measures in order to significantly improve this situation. Consequently, a new well designed and scientific based population policy should be adopted, as a part of a larger social-economic policy. The objectives of this policy should be not only to assure the desired number of population and a well balanced age structure of it, but also an adequate quality of population (a higher life standard, a better state of health, education, professional qualification and so on). Further researches would be necessary in order to clearly identify the specificity of the new reproductive behavior and the factors which influence it, in order to determine the measures that should be taken on short, medium and long term. At the same time, all governmental and political decision makers should understand how dangerous and concerning the present demographic situation is and prove more responsibility in taking measures in order to improve this situation until it is too late.

ACADEMIC PERFORMANCE THROUGH COMMUNICATION-ORIENTED MOTIVATION

LUMINIȚA RADU*

Abstract
Researchers' focus on academic performance brings forth the "quality of academic life" and it's highly positive correlations with "students' welfare" as well as with certain personality features such as "self-respect" and "positive affectivity" alongside negative correlations such as „academic stress" and "negative affectivity".

Key-words: *motivation, communication, performance, educational relations, academic environment.*

Introduction

An academic welfare index is the "academic satisfaction/dissatisfaction", as a result of the educational policy and hence of the *training style* focused on students' development, on their involvement in the training practice, on their relations with teachers and colleagues as well as on the emotional support provided throughout the training process.

Therefore affective comfort will imply a sense of affective safety, of accepting and recognizing a human being as valuable to the group of colleagues and teaching staff, whereas the lack of a concord between *students' expectations and teachers' high expectations* as regards academic performance and discipline might affect the relations among them, engendering dissatisfaction on both sides. Furthermore the educational process would provide a strenuous environment conducive to students' negative satisfaction.

The **main objective** of our **study** which is part of an ampler survey carried out on a **sample** of 336 students of the Faculty of Law in an University, was to scope students' motivations for and interests in learning foreign languages as a means of attaining performance in foreign language communication. The underlying hypothesis was that if the motivating factors used by foreign language teachers to induce a certain learning conduct are articulated in a consistent set, then communicative-professional competence increases with the linguistic performance defined as a) linguistic skills acquisition and b) operational linguistic efficiency. Direct qualitative and quantitative investigation tools have been used in the survey such as Student questionnaire/adapted form: CH-MSA-IN 2006 a focus group with high academic performance students, a focus-group with foreign language teachers, co-participative observation, evaluation scales (applied in the view study), structured essay, case study, quantitative and qualitative analysis of documented foreign language study evidence (notebooks, reports, rolls, tests), statistical mathematical methods (statistical correlation, Pearson linear correlation coefficient – r).

From the analytical viewpoint the study of causative, conditional and methodological factors, which are instrumental in developing a thorough and efficient study of foreign languages has an open structure. For pragmatic reasons we have only dealt with factors that are extremely motivating and of topical interest for the present essay.

Performance Impact Variables

Academic Self-efficacy is the confidence in own capability of mobilizing cognitive and motivational resources towards attaining academic performance. It therefore implies the measuring

* Lecturer, Ph.D., "Nicolae Titulescu" University, Bucharest (e-mail: l radu@ymail.com).

of the capacity of performing activities rather than personal qualities and links to the criterion of *personal power* in fulfilling tasks. It is measured by the *degree of certainty* with which an individual can fulfill a task at the highest level. The measurement of self-efficacy hinges on the academic evaluation context and must be done before students achieve activities likely to bring about alterations in the perception of the academic self.

Schunk et al (1989) have shown that signals of academic progress towards performance are capitalized by setting up confidence in personal efficacy. This is proved by the efficiency with which students use their skills. Irrespective of such skills, psycho-social influences alongside evaluative feedback and social comparison will enhance self-efficiency confidence.

Building on **Bandura'**s *hypothesis* (1977) that *"self-efficacy confidence have an influence on the level of effort, persistence and choice of activities",* Schunk et al. (1985) have noticed students' progress in acquiring skills through a methodical qualitative approach and through the development of confidence in own problem solving abilities. As a result, increased efficiency brings forth success expectation which further generates perseverance against students' issues. Perseverance may thus lead to success, which enhances self-efficiency confidence in similar circumstances.

Self-efficacy confidence acts by the *motivational mechanism*. If students' trust in their self-efficacy is poor, then the resources they will be putting into academic work will be quite scarce, which will most likely bring about failure and the sense of self-inefficiency. This feeling triggers states of ruminative affectivity, absenteeism, aggressiveness, and training discontinuity. Students' confidence in their efficacy in achieving their academic tasks has an influence on their emotional states, motivation and hence their success and performance.

Performance expectations are crucial in the "*input effort-output result*"e equation. *Teachers' expectations* may thus become predictions which come true, endowing students with *self-efficiency confidence* which they so much need. Or, on the contrary, they may deliberately deprive students of self-efficiency confidence, which will affect their motivational, cognitive and emotional processes, influencing their behaviour both directly and indirectly, via their effect on the regulating mechanism built on personal performance standards and goals. Starting from the teacher's beliefs, some distortions may emerge in his/her relations with the students and even in the relations among students, which impairs on the educational environment and hence on the chances of academic performance.

ON THE EDUCATIONAL SIDE Albert Bandura (1995) advises teachers to focus more on the enhancement of students' self-efficacy and to take care of self-confidence of both teachers and students.

Perceived self- competence is a psychological construct directly related to self-efficacy. Originally conceptualized as *an internal impulse generating the sense of competence*, perceived self-competence facilitates the development of confidence in personal capabilities.

ON THE EDUCATIONAL SIDE The teacher should help his/her students to realize that same skills may be applied differently according to contextual circumstances, to become aware not only of their own cognitive and behavioural skills but also of the motivational management aptitude as well as resistance to problem-induced stress.

Locus of control is **Julien Rotter**'s concept (1966). *Internal locus of control* implies the belief that personal strength and control can influence life outcomes and events, whereas *external*

locus of control implies that personality force has a minimal effect on life events which are caused by chance or others' power.

ON THE EDUCATIONAL SIDE The teacher should attach importance to this concept since a dictatorial climate at class or even by successive evaluation against increasing exigency may induce to students the sense of a limited control over their activity level and self-inefficiency, which will focus them on fear of failure rather than on task requirements.

The self-image (the Self-Concept or the "g" Factor) is the central nucleus of personality with a major role in selecting values and goals; it is the mirror of representations of own skills, attitudes and behaviours. Deemed to be multi-dimensional and hierarchically structured, it integrates the "social Self", with the "academic Self", the "emotional Self", the "competence Self", the "physical Self", the "family Self". **Bracken et. al** (2000) have confirmed that these dimensions contribute to the structuring of the global image of personality.

The Self-image (the Self)
Analysed though the real Self, the future Self, the ideal Self

The real - actual Self derives from experiences which we have lived within the socio-cultural milieu we have been living in and it comprises: "*the physical Self*", "*the emotional Self*","*the academic Self*", "*the competence Self*", "*the family Self*", "*the social Self*".

The physical Self structures the development, the acceptance of own corporality, the manner in which an individual perceives itself and believes s/he is perceived by the others.

The emotional Self brings together an individual's experiences by reference to her/himself, to the others and to the future. If the emotional Self is stable, then the world will be perceived as a safe environment which does not threaten the self-image.

The *academic Self* refers to the manner in which the self receives and integrates information contents about itself and the world, the manner in which these operate. The more the self-image is kept at the positive pole, the higher the individual's performances rise. **Parsons et al.** (2001) building on the approach of other authors (James Marcia, 1980 ; H. March, 1989 ; Marsh and Jeung, 1997) on the multi-dimensional features of the Self-Concept, focus their entire research on the "*academic Self*", on the ***relationship between school performance and the academic Self***, on working techniques and on training activity design. These recent studies have drawn attention to the impression which school leaves on each individual's self-image.

The *competence Self*, of the action possibilities, refers to an individual's clear awareness of her/his own skills - relational, assertive communication, career planning, By putting face-to-face people's assessments about the self with the actually obtained performance, the image of own competences will be shaped.

The *family Self* expresses the emotional comfort felt by reference to the family members.
The *social Self* includes the personality dimension which we reveal to the others alongside our responses in our inter-action with them.

The ***future Self*** refers to the manner in which an individual perceives her/his personal development potential by projecting her/himself into the future. It consists of the *desired Self (*all projectible aspirations, motivations and goals) as well as the *anxious Self (*what an individual does

not wish to be – both of them resulting from a combination of representations of the past with those of the future. The desired Self yields joy and self-confidence, while the anxious Self releases fury, anxiety and depression.

The ***ideal Self*** refers to what we would like to be, and for which we are concerned with identifying the necessary resources. Orientation and domination of the self-image by the ideal Self when remotely placed from the real, may induce unhappiness and frustration.

ON THE EDUCATIONAL SIDE it is important that we make students aware of the value of the *possible Self* which is attainable and highly energizing. Thus, the ideal Self will mark the roadmap of the possible (future) Self. The teacher should bear in mind the fact that the self-image may be a personal construct with a regulating function in action programming and setting aspiration levels. But s/he should also take into account that an individual's subjectivity and the others' subjectivity – which are two intertwining, key elements – may parasite the ideal image.

As concerns the role of *expectations* in the academic outputs, adepts of social-cognitivism have shown that teachers' expectations shape students' behaviour and *performances*, harmonizes their *self-image*. As a result avoidance of negative labelling and differentiated approach become prerequisites of students' personality evolution.

Self-image is not static; it has got its own dynamics underpinning the assertion of the *self-image* (*self-assertiveness*) and *defence of self-image*. A student's positive self-image is a pre-requisite of his/her physical and psychological health.

Self-esteem is *the evaluative and affective mirror of the self-image*; it is the manner in which we assess ourselves by reference to our own expectations and to the others. A high-level self-esteem expresses optimism, self-appreciation and self-confidence, while negative life experiences will entail decreased self-esteem and a sense of devaluation accompanied by emotional states such as sadness, anger and even anxiety.

Competence (cognitive skills), *merit* (physical, psychological or moral traits), *power* (ability to influence others), *attribution* (internal or external) of academic failure, *acceptance* (respect, admiration) are the main dimensions influencing stability and the self-esteem level. The flow of academic successes and failures stabilizes self-esteem; also, comparison to others or reference to the social context has its significant role because for a student signals from the teacher, the colleagues or the family can equally be a powerful catalyst and a source of blockage. The teacher can assist students in the development of their self-esteem by focusing on their positive aspects, giving appreciation to their individual efforts rather than to their skills, offering options and opportunities for getting involved in the planning of learning activities and in making decisions, but not before delineating expectations according to their levels.

ON THE EDUCATIONAL SIDE Trust, autonomy and positive enhancement will be given to students with a view to developing **internality** - a dimension which stimulates students' activism, affective welfare and energetic support needed for reaching high academic performance. Self-esteem which defines the degree of an individual's tendency to positive self-evaluation and to rejection of positive attributes, becomes an index of the welfare which a teacher aiming to attain high performance with those students should make them aware of.

Factors highly motivating thorough and systematic study of a foreign language
With values between: **80%-70%**

- Scientific competence of the foreign language teacher

With values between: **75%-60%**

- Self-confidence in the acquisition and command of a foreign language;
- The actual (or correct) image of the performances to be attained in the study of a foreign language;
- Types of behaviour self-control in foreign language training;
- Open communication style in foreign language training;
- Positive educational relations;
- Tonic academic environment.

Stimulating academic style – tonic academic environment

a) The study of correlation matrices (Pearson method) revealing the whole item grouping range and therefore the location of key factors, elicits in student's view, the following significant value hierarchy for their academic success:

1st degree: **"stimulating academic style" – "tonic academic environment"** (r = 0.893);
2nd degree: **"tonic academic environment" – "contents student's needs"** (r = 0.862);
3rd degree: **"compensatory valences and learning style assurance/differences" – "cross-disciplinary content**" (r = 0.822).

The 1st degree correlation coefficient with the highest, thus the most significant, value, r = 0.89, is the correlation **"stimulating academic style" – "tonic academic environment".** This shows that higher-education activities through the way they are unfolded, primarily contribute to the quality of the academic environment of the particular university faculty and consequently to academic and professional success. It is absolutely evident that a systematic, democratic, satisfaction-yielding, autonomy creating, modeling, safeguarding, efficient style is what students appreciate as positively stimulating in their studies, in maintaining optimal student-student, student-teacher relationships as well as contributing to a tonic academic environment beneficial to their success.

b) Another key factor in maintaining an academic environment favourable to student's academic success is the *curriculum*, its contents – particularly those meeting students' needs – and the way it is devised, built and implemented. We specifically refer to the use of some criteria of which essential for students are "cross-disciplinary contents" and "compensatory valences and learning style assurance/differences"

c) It is certain that students are very interested in their academic, and implicitly professional, success. A lot of correlations mentioned by them refer to this in various ways along each correlation range from each of the 3 value-descending levels.

Thus, on **level 1** the correlation coefficients range between **r = 0.893 and r = 0.891**, that is between the correlation pairs "stimulating academic style" – "tonic academic environment"; "wide scope of training methods" – "tonic academic environment".

From the analytical view point, within the correlation coefficient range of this level between the above mentioned extreme correlation pairs the following significant value hierarchy is elicited:

TABLE I Correlation coefficients at level 1 of statistical representation

Current no.	Correlation coefficient	Correlation
1	r = 0.862	tonic academic environment – contents which meet students' needs
2	r = 0.822	Compensatory and diferentiated valences – cross-diciplinary contents
3	r = 0.809	Wide training method range - stimulating academic style
4	r = 0.806	stimulating academic style - contents which meet students' needs

These correlations show that for academic-professional success students believe that alongside the curriculum (especially "contents"), which meets their needs and interests, as well as "compensatory and differentiated values" by reference to study styles "cross-disciplinary contents" is another criterion practically significant for the design, build and didactic implementation of the teaching-learning units, which shapes into teaching strategies conceived and used in alternatives adaptable to the characteristics of the student groups., Noteworthy is the fact that such contents meet students' needs, impose a certain style to academic performances, endow them with a stimulating and efficient tone. For instance, this applies to the correlations "wide range of training methods" – "stimulating academic style", having the correlation coefficient r = 0.809. and "academic stimulating style" – "contents which meet students' needs", having the correlation coefficient r = 0.806. All this in so far as "stimulating academic style" correlates to "contents which meet students' needs" as well as to "wide range of training methods"; and consequently "contents which meet students' needs" correlates to "wide range of training methods".

Level 1 of the correlation degrees reflects therefore the high significance which students attach to the teacher's academic style and to the academic environment for their higher education and professional success. These factors have actually very high close-value correlation coefficients. A stimulating, energizing motivation engendered by a comparable academic style and environment will contribute to the maintenance of academic success at a top level. In this respect the correlations fall under the pair **"stimulating academic style" – "tonic academic environment"**

Thus, level 1 correlations confirm students' belief that crucial for their academic success is the quality of the academic environment in the university/faculty/course or seminar. The most essential factor underlying this is a stimulating academic style, rendered both by a suitable cross-disciplinary curriculum, and by the availability of compensatory tasks for personalized assistance.

The scientific competence of the foreign language teacher

The *scientific competence of the foreign language teacher* is perceived as highly motivating for students. It imposes respect and adequate conduct towards a thorough, systematic study of a foreign language. This factor is in their opinion at the higher level of the evaluation rates, between 70% and 80%, specifically 72.3%, with 243 of the students *mostly agreeing* that the scientific value of their teacher's qualification determines their response to their professional training challenges, where command of foreign languages ranks quite high. Thus a total of 91.3% of the respondents (i.e. 307 students) *mostly agree* and *quite agree* with the above-mentioned response.

This fact is confirmed by the large number of correlations where a **foreign language teacher's scientific competence** occurs, specifically 14 correlations at levels 1 + 2 plus their

varieties. This shows that students agree with the role played by a teacher by virtue of his scientific competence in the entire educational component of the teaching, learning and evaluating act, both in what s/he achieves with students and how s/he leads them to the aimed performances. Noteworthy are the following ways mentioned by students: "feedback", "organized style", "systematized content", "adequate strategies", "clear goals", "progressive and stimulating tasks", "high learning skills", "elimination of any learning issues or teaching-derived misunderstandings" in addition to elements which define "evaluation and set up of high output levels" as well as "teacher's progressive control". Last but not least, educational relations appear as relevant: "teacher-student" relationship, "student-student" relationship, "cooperation relationships", "positive competitiveness" relationships alongside those pertaining to the "understanding of students' needs".

For instance students are appreciative of a teacher's open, exciting, stimulating communication style, which helps them to acquire and improve their foreign language communication competences necessary in their future profession. This is how the teacher's scientific competence influences the entire educational act. Worth noting here is the hierarchy of students' preferences.

It can be stated that:

a) students are motivated by a competent foreign language teacher who provides the teaching-learning feedback, also maintaining the actual image of the performances to be attained.

The following correlations are detected at the level of degree hierarchy:

1st degree: "**teacher's scientific competence" – "feedback provision"** ;
2nd degree: "teacher's scientific competence" – "actual performance image" ;
3rd degree: "teacher's scientific competence" – "set up of high output levels" ;

b) immediately following is students' appreciation of the teacher's contribution to their qualification as high professionals in their fields of choice, self-confident, confident in the communication competences acquired at the level required by their professional accomplishment.

An illustration of the above mentioned is the following order of degrees:

4th degree: "teacher's scientific competence" – "types of behaviour self-control";
5th degree: "teacher's scientific competence" – "self-confidence" ;
6th degree:"teacher's scientific competence" – "communication competences"

c) an additional observation to the above refers to students' interest not only in what and how much to learn but also in how to learn, which denotes "*a cognitive-emotional-attitudinal synthesis*" so necessary in the profession they are training for.

Self-confidence in the study of foreign languages

Education specialists, and in our study students as well, regard the role of *Self-confidence* as essential in ensuring personal, social and professional success. Students thus feel motivated by the foreign language teacher who enhances their positive thinking, builds up a rich knowledge pool, makes them masters of their own forces and therefore "free". This is why this sub-item has been regarded as a key motivating factor by 206 of the students, i.e. 61.3% of the respondents, with an opening towards a large number of correlations with appropriate correlation coefficients.

Among students' options "self-confidence" is primarily connected to "communication competences" acquired in foreign language learning, then in descending order, to the "type of behaviour self-control" over foreign language learning, to foreign language "learning skills" and to the "actual image of the performances" to be attained in a foreign language. This reveals the fact that students are interested in ***how*** to inter-relate and inter-communicate, how to learn and raise to the performance level required by a proper command of a foreign language. As a result, highest appreciation appears to be given to the foreign language teacher who teaches them "how to do" not only "what to do" and "how much to do". The bifactorial relationships are dominated by the following correlations:

Self-confidence
(1) **"self-confidence" – "communication competences"** (r = 0.770) ;
(2) **"self-confidence" – "types of behaviour control"** (r = 0.769) ;
(3) **"self-confidence" – "learning skills"** (r = 0.750) ;
(4) **"self-confidence" – "actual performance image"** (r = 7.39).

Students are aware that "self-confidence" indicates how much they feel they "command" a foreign language and their intercommunication and relational efficacy in a foreign language. This is why this sub-item correlates to whatever belongs to the foreign language educational act: the manner in which feedback is provided in the teaching-learning process, realistic set up of desired output levels, resolution of learning issues, educational relations which ought to exist between teacher and student, student and student, teacher's competence, cooperation relationships, teacher's efficacious, crystallized and organized style.

Herewith our findings in order of options:

Self-confidence:
(1) "self-confidence" – "feedback provision" ;
(2) "self-confidence" – "set up of high output results" ;
(3) "elf-confidence" – "resolution of learning issues" ;
(4) "self-confidence" – "positive educational relationships" ;
(5) "self-confidence" – "teacher's scientific competence" ;
(6) "self-confidence" – "cooperation relationships" ;
(7) "self-confidence" – "organized teaching style".

The actual image of performances in foreign language training

Students are interested in the image of the performances to be attained in a foreign language which provides their confidence in and satisfaction with their personal, social and professional success. This is why they consider that in order to own and turn such an image into reality, to reach professional satisfaction, a solid knowledge and management of their own foreign language vectors is needed: "efficient manners of behaviour self-control", high quality "self-confidence", proper "learning skills", "high communication competence". This engenders a steady quest for "self-improvement ", stake raising, "intercommunication stimulation", all in an educational process where the " teaching-learning feedback" operates on expected parameters and "educational relationships" are optimal.

The most apparent factorial pairs with very good correlational values are given below in descending order:

Actual performance image:
(1) **"actual performance image" – "types of behavior self-control"** (r = 0.792);
(2) **"actual performance image" – "communication competence"** (r = 0.778) ;
(3) **"actual performance image" – "set up of high output levels"** (r = 0.761) ;
(4) **"actual performance image" – "feedback provision"** (r = 0.754) ;
(5) **"actual performance image" – "self-confidence"** (r = 0.739) ;
(6) **"actual performance image" – "learning skills"** (r = 0.705) ;
(7) **"actual performance image" – "communication stimulation"**(r = 704) ;
(8) **"actual performance image" – "positive educational relations"** (r = 0.700).

According to student' opinion, in order to turn the performance image into reality the foreign language teacher's competence underpins both the teaching act ("organized style", "teaching strategies", "avoidance of teaching misunderstandings") as well as the learning act ("learning issues") and not least evaluation, especially "progressive checking/controlling". Noteworthy is also the teacher's tactfulness in developing and maintaining "cooperation relationships and circumstances" so necessary to an efficient intellectual work climate.

We are listing below the factorial pairs as evidence for the above assertions:

Actual performance image
(1) "actual performance image" – "teacher's scientific competence";
(2) "actual performance image" – "cooperation circumstances";
(3) "actual performance image" – "resolution of teaching misunderstandings" ;
(4) "actual performance image" – "progressive control" ;
(5) "actual performance image" – "organized teaching style" ;
(6) "actual performance image" – "resolution of learning issues" ;
(7) "actual performance image" – "teaching strategies".

A challenge for students is to get performance outputs in a foreign language. The clarity and actuality of a performance image is directly related to the extent to which the performance is understood and acknowledged as well as to its attainment motivation. Hence the requirement that a foreign language teacher should be open in communication, active, indefatigable and continuously exciting, able to determine competitive circumstances, designer of progressive, stimulating tasks, an excellent manager, well organized and systematic in content value presentation, properly responsive to individual needs.

Efficacious types of behavior self-control in foreign language training

"*And if there are two moral attitudes which our times might need, they are definitely self-control and compassion*" says Daniel Goleman in his "Emotional Intelligence".

Indeed, self-control is one of the supportive pillars in the emotional architecture of our professional behavior; it is the skill with which we place reasoning on the scales when emotions are too heavy on the soul platter; it is the IQ with which we try to honour the new paradigm of our times which advises us to "harmonize the mind with the soul".

Therefore, the teacher has the noble mission of channeling towards this fundamental ability so much needed for maintaining the harmony of feelings and emotions which sometimes may become far subtler and rigorous than words.

Let us not ignore the cries and whispers of emotions which may induce not only power but also weariness; nor should we ignore their beauty or "non-beauty" which may surge or lower; let us learn how to recognize them within ourselves and in the others, let us learn how to channel them towards noble goals such as success and performance.

The surveyed students have given "*great*" attention to self-control in foreign language teaching/learning, which is most necessary for the new generation behaviour and life style.

The manner in which students manage their cognitive and emotional powers regarded as "types of self-control in foreign language teaching/learning" is connected to their *challenge* level and hinges on how well their targeted foreign language performance is *known* and *acknowledged*. To this a key factor in reaching and even exceeding the performance should be added, namely "students' self-confidence". This is why students consider that it is only a proper management of the training act in the foreign language classes that can provide the "so much necessary teaching-learning feedback", that can determine "the actual output levels", can provide them with the exact manner in which "learning skills" and "communication competence" are acquired. Additionally it can boost "their self-confidence", it can show "the targeted performance".

The correlations are given below in descending order:

Types of behavior self-control
(1) **"types of behavior self-control" – "actual performance image"** (r = 0.792);
(2) **"types of behavior self-control" – "communication competences**" (r = 0.780);
(3) **"types of behavior self-control" – "learning skills"** (r = 0.775);
(4) **"types of behavior self-control" – "self-confidence"** (r = 0.769);
(5) **"types of behavior self-control" – "feedback provision"** (r = 0.737);
(6) **"types of behavior self-control" – "set up of high output levels"** (r = 0.722).

Students have a high opinion of foreign language teachers who have a rich teaching experience and scientific competence, who quite tactfully manage to set up and maintain positive educational relationships, who stimulate inter-communication within proper limits, who appreciate competitiveness as a positive boosting factor, who eliminate any teaching cognitive disruptions, who balance teaching/learning issues.

Other significant correlations are:

Types of behavior self-control
(1) "types of behavior self-control" – "communication stimulation";
(2) **"types of behavior self-control" – "teacher's scientific competence**";
(3) **"types of behavior self-control" – "competitive circumstances**";
(4) "types of behavior self-control" – "educational relations";
(5) **"types of behavior self-control" – "resolution of learning issues**";
(6) "types of behavior self-control" – "resolution of teaching misunderstandings".

Open communication teaching style, an optimal prerequisite of foreign language training efficacy

An open communication style actually designates a *style open to an optimal communication circumstance*. This is considered both from Rogers' *nondirectivity* approach (including "unconditioned acceptance of the others", "benevolent neutrality", "authenticity", "empathy") as well as from Porter's *active listening* approach by which the less we interpret the more we allow others to express themselves in a personal and profound manner (first rule of non-interpretation), the less we evaluate somebody the higher his/her possibilities of authentic expression (second rule of non-evaluation), the less we counsel somebody, the wider his/her possibilities of real expression (third rule of non-counseling), the fewer questions asked, the wider his/her possibilities of free expression (fourth rule of systematic non-questioning), the more we wish to facilitate others' communication, the more we should show that we are interested in what s/he is telling us and that we are listening in order to understand, not to judge, him/her (fifth rule of understanding).

The students' answers to the questionnaire prove that they have not felt judged or guided, but simply listened to as regards their view on the place and role of foreign language training which should be as high as possible for ensuring their personal, social and professional successes. The findings point to the value of the "open style" in which they have communicated own opinions about foreign language training: the significance of "positive educational relations" and of "cooperation relations", "understanding of professional needs", "teaching strategies", "progressive control", "progressive and stimulating tasks" , "elimination of teaching misunderstandings and of learning issues", "teacher-induced stimulation", "competitive circumstances", "organized and systematized contents".

Observing the two levels also indicated in data processing, we reach the following values of the correlation coefficient (Pearson model) which reflects the above statements.

At level 1:

Open communication teaching style

(1) **"open communication teaching style" – "progressive control"** (r = 0.799);
(2) **"open communication teaching style" – "teaching strategies"** (r = 0.754);
(3) **"open communication teaching style" – "resolution of learning issues"** (r = 0.734);
(4) **"open communication teaching style" – "resolution of teaching misunderstandings"** (r = 730);
(5) **"open communication teaching style" – "teacher's understanding of student's needs"** (r = 0.718);
(6) **"open communication teaching style" – "set up of cooperation circumstances"** (r = 714);
(7) **"open communication teaching style" – "educational relations"** (r = 0.713);
(8) **"open communication teaching style" – "progressive, stimulating tasks"** (r = 0.702).

Positive educational relations in the foreign language class – an efficacy generator towards academic success

The academic environment addresses relations between students and teachers, among students, among teachers, between teachers and students. Its openness can be ensured only through an optimal communication style underpinned by appropriate educational relations.

By virtue of his/her main activity, which is training, the university teacher is a highly prestigious scientific personality, a true hallmark in the taught subject. Through training a teacher conveys knowledge to students, shapes students' skills and attitudes needed in their future profession so as to enable them to perform as specialists, with professionally typical competence, and sets up formal, non-formal and informal contacts. Hence the significant role of pedagogical and educational aspects in the teaching and coaching processes. A key aspect is obviously the balanced choice between student's adaptation to the teacher's demands and the adaptation of a teacher's style to the features of a certain group of students. The decision is at the discretion of, but not only of, the teacher, who should know best what exactly of the taught subject should be transmitted to students and particularly how, through which relations and, last but not least, how open these relations should be.

It is only appropriate relationships that enable reciprocal understanding. Through such relations students gain confidence in asking questions to the teacher in order to clarify their uncertainties, as well as in unleashing their curiosity, creativity and willingness to face and overcome challenges, which leads to improvement of training activities.

In the teacher-student relation, the student influences directly but also indirectly the teacher's training behavior. This relation cannot be sustained unless the teacher is a "model", a lively personality with whom students can *communicate permanently*. The relationship will be quite special, endowed with a strong psycho-affective trait, by means of the most natural gesture of the *hand put out…. in search of support…*, by means of the most human gesture of the *hand put out… to provide the searched support… whenever needed.*

The foreign language teacher is regarded by students through various quality angles as a reflection of his/her own personality. Thus students believe that teacher-student educational relations are positive only if they rely on "teacher's competence" of providing students' actual performance image, on the professionalism with which the teacher manages and organizes his/her training activity ("organized teaching style", "teacher-induced excitement", "communication stimulation"), on the "openness with which the teacher resolves teaching misunderstandings", on the teacher's responsiveness to novelty and relational openness towards cooperation and dialogue ("open communication style", "set up of cooperation circumstances").

Below are given the correlation values of this factorial group:

Positive educational relations

(1) **"positive educational relations" – "communication stimulation"** (r = 0.799);
(2) "**positive educational relations" – "set up of cooperation circumstances"** (r = 0.735);
(3) "**positive educational relations" - "resolution of teaching misunderstandings"** (r = 0.732);
(4) "**positive educational relations" – "teacher-induced excitement"** (r = 0.730);
(5) **"positive educational relations" – "organized teaching style" (**r = 0.717);
(6) **"positive educational relations" – "resolution of learning issues"** (r = 0.714);
(7) **"positive educational relations" – "open communication style"** (r = 0.713);
(8) "**positive educational relations" – "actual performance image"** (r = 0.700).

Conclusions

The conditional-motivational factor approach in the academic study of foreign languages at university-level – equally rich and complex – is located at the top of the evaluation scale of students'

performance and success. The range of students' choice of factors motivating both their foreign language-related behaviour and other players involved in the teaching-learning-evaluation process elicits a refined, creative and creational process inherent to the human value space. Its variations refer to values dependent on clarity of objectives, content organisation, quality of the subject curriculum and, not least, the teacher's personality, who stands for a model to be followed in all aspects.

The basic factor correlation enabling the study of foreign langauges should combine a tonic academic environment, with a stimulating teaching-learning style based on a rich array of educational methods and techniques apt in delivering a curriculum appropriate to the students' professional needs.

Students believe that 'the ability to communicate and inter-relate' are instrumental to successful performance which depends on higher methodological competences and self-evaluation skills, more diversified study methods and techniques as well as a wider freedom of choice – all enabled by a stimulating academic environment.

A curriculum that responds to the students' needs is the model of the essential factor correlation accounting for students' academic success. It should be based on well-designed training-learning methods, with adaptable alternatives, delivered through all facilities towards better information and documentation (full study support: auxiliary materials, internet, magazines, books), in a performance-oriented tonic academic environment, which, with systematic student-oriented curriculum contents, should be adding to the pedagogical methods and teaching materials.

The way in which students have responded to the delivered questionnaire proves that they have not felt judged, analysed, interpreted or guided but simply listened to with much understanding. Hence the value of the open style in which they have communicated their opinions about the significance of positive educational and cooperative relations, the understanding of professional needs, teaching strategies, progressive control, progressive and stimulating tasks, elimination of teaching misunderstandings and of learning issues, teacher-generated stimulation, competitive situations, well-organized and systematic contents.

The surveyed students consider as key factors in determining positive teacher-student relations the teacher's competence in providing an actual, correct picture of their performance, the teacher's professionalism in managing and organizing the teaching activity; the teacher's willingness to openly resolve any teaching-related misunderstandings; the teacher's responsiveness to novelty; and the teacher's relational capacity open to cooperation and dialogue (open communication style which facilitates cooperative circumstances).

The success of a higher education teacher within a tonic background able to yield "academic satisfaction", can be attained through a teaching activity which creates "performance-related" values as regards the "students" factor. Students expect the training style to be focused on ensuring their "academic welfare"; "the teaching strategies" to be designed in as wide a scope as possible, with alternatives adaptable to the students' characteristics and needs; the compensating and/or assisting tasks to be differentiated and even personalized as appropriate and the difficulty progression criterion to be observed.

The insertion in the questionnaire of a whole range of motivational factors implemented further on in the study of *academic performance by motivation towards communication in a foreign language* has enabled a quite interesting array of responses whose distribution and hierarchy could indicate "pools of interest" for foreign language teachers, for students as well as for foreign language curriculum designers and decision makers.

THE LEGITIMACY OF INCLUDING THE SOCIAL PARAMETERS IN EVALUATING THE HEALTH STATUS IN THE SOCIAL ASSURANCE SYSTEM

MIHAI NEDELCU[*]
ELENA NEDELCU[*]

Abstract
The social state crisis encouraged a reductionist tendency which had recently developed in the evaluations of the health status in the social assurance system. A holistic, psycho-medical approach, which took in consideration the implications of the social factors regarding disability, was confronted with a strictly medical model, in which the illness is exclusively considered a person's problem; therefore, the references towards the „social" are irrelevant. In this context, the present paper states the question of the legitimacy of using some sociological concepts, in medical expertise, considered relevant in this area, such as: „occupational access" or the „social functioning of the person". The present study doesn't stop at offering as arguments of legitimacy the authority of some recommendations regarding the use of the social-medical model, including the evaluation of the health status, recommendations received from the behalf of OMS and the European Council (see CIF). The paper presents the construction of specific evaluation instruments and tries to identify the sense in which using the references regarding the „social" could influence the pressures in the social assurance system.

Keywords: *social parameters, health status*

I. Introduction

In this paper we attempt to find an answer to the issue regarding the inclusion of certain social components in the health assessments that are applied in the social security system.

Clarifying the chosen subject is particularly important now since – considering the existing crisis that affects the "welfare state" – there is a more and more frequent tendency towards understanding and assessing "illness" from a strictly medical perspective. The reason for narrowing the perspective on illness, which means giving up the complex biological, psychological and social factors it involves, lies in the fear that such a complex approach would lead to the appearance of "medically illegitimate cases".

There are at least 3 sources on which we rely to prove the legitimacy of connecting social parameters for assessing health in the social security system:

- Scientific
- Normative
- Praxiological.

The present study doesn't stop at offering as arguments of legitimacy the authority of some recommendations regarding the use of the social-medical model, including the evaluation of the health status, recommendations received from the behalf of OMS and the European Council (see CIF). The paper presents the construction of specific evaluation instruments and tries to identify the sense in which using the references regarding the „social" could influence the pressures in the social assurance system.

II. Paper content

Scientific legitimacy

The increase of life expectancy in the countries which have seriously developed from an economic and social point of view during the last 200 years has led to successive changes in the health evaluative concepts and indices. Thus, specific indices – such as the "surviving" ones, i.e. morbidity or mortality, as well as the rigid nosological categories – have been replaced by assessments of the individual's daily life performances so that today there is a dynamic and holistic approach which insists on the individual's "welfare" and "quality of life".

By following this tendency we shall be able to find in special literature several paradigms which explain and define health and illness. Some of the best known are: the medical pattern and the medical-social pattern.

According to the "medical pattern", illness is strictly a problem of the individual. His life context, no matter how pathogenous or obstructive it is, appears as irrelevant and is ignored. Individual healthcare is the only subject for curing or treating the illness.

Morbidity and mortality indices are specific to this pattern (these indices do not measure the health state, but the bad health state, which is a negative measurement), alongside with the division in nosological categories and clinical assessments which do not involve any reference to the individual's current life environment.

On the other hand, the medical-social pattern makes use not only of strictly medical information regarding the existing health problem, but also of information regarding the functioning of the individual.

The definition for health given by World Health Organization – as "the complete physical, mental and social welfare, and not just as the absence of an illness or impairment" – has led to introducing positive health indices referring to the three dimensions: physical, mental and social.

We shall briefly present the assessment types accomplished in conformity with the medical-social paradigm for the period of 1950-2000.

Besides the scale types used for measuring physical impairment, such as the PULSES profile, one can state that the first scales used for assessing individual state of health were the ADL scales (Activities of Daily Living)[1]. Using the concept of functional liability, one has tried to answer to the question: which are the normal limits of individual functioning when the latter takes care of the daily activities? From this perspective, **an individual is healthy only if he is physically and mentally able to do the things he wants and needs to do**.

ADL indices have been developed by Sydney Katz starting with 1959 and they basically refer to the patient's capacity to deal with his basic hygiene, the ability to take care of oneself, as well as the patient's mobility abilities. These indices can be expressed as an **impairment index**. Katz used the functional level as a marker that indicates the existence, the severity and impact of the illness; this level makes it possible for the measurement to be made even if, sometimes, nothing is known about the etiology of the illness. So, ADL scales measure the patient's degree of independence in performing activities such as: getting dressed and undressed, washing, using the toilet, personal care, mobility and eating.

Especially after 1970, the ADL scale has been applied to persons living in a community (family, work) – within which they perform different roles. This scale has been named IADL (Instrumental Activity of Daily Living). IALD methods include indices which bring into evidence an enlargement of the impairment issues with reference to the elements specific to a largely used concept – at least up to the year 2000 – i.e. the concept of handicap. More and more extensive scales have been created to record the factors that can explain different levels of handicap, for one kind of

[1] Ian Mc Dowell, Claire Newell, *Measuring Health*, Oxford: Oxford University Press, 1987, pp 5-22;

impairment or another, e.g.: the type of work performed by the subject, his house etc. This extension will lead to creating indices known as "social and emotional functionality indices."

Assessment scales mentioned in specialized literature have made use of a large range of indices: psychological, social, life quality etc., which are often vaguely defined and difficult to be applied: "welfare state", "welfare", "life quality" etc.[2] Despite of several imprecise definitions, the use of the mentioned concepts has made it possible to create measurement instrument, which can point out not only the illness symptoms, but also positive states that are specific to the illness.

A remarkable valorization of the medico-social pattern was accomplished in the book: The International Classification of Functioning, Disability and Health (ICF)[3].

Far from being a simple catalogue for classifying and codifying illnesses, ICF is a real paradigm on health and people with health problems, while offering the conceptual frame and the necessary operational definitions. ICF requires the development of research activity for improving "assessment procedures", appreciating that "empirical research will lead to … a clearer operationalization of the notions."

A fundamental concept in the medical-social paradigm used for explaining the illness (in ICF) is the bipolar concept of functioning-disability.

Disability (term opposed to functioning) is understood not only as an impairment of the whole functional body integrity, but also as activity limitation and a participation restriction to daily activities.

Disability (fig. 1) is a general term for *impairments, activity limitations and participation restrictions*. It denotes the negative aspects concerning the interaction between *the individual (who has a health problem) and the contextual factors (environmental and personal factors).*[4]

This concept juxtaposes social disfunctionality and body disfunctionality and it also establishes a connection between them. Consequently, the definition given to disability makes reference to the daily consequences of the impairments, consequences that are expressed as activity limitations and participation restrictions. Moreover, the consequences cannot be mechanically deduced from "body impairments", because the **functioning/disability** of a person is seen as a dynamic interaction between health problems (illnesses, disorder, lesions, traumas etc.) and the existing contextual factors.

ICF pays maximum attention to context in assessing the individual health state. Contextual factors are, in ICF, "the basis on which health states are founded."[5]

Now we could conclude that the difference between the two paradigms – the medical pattern and the medical-social pattern – relies on two key words: "**illness**" and "**disability**".

While the "ill person" is "seen" and his/her state of health is evaluated in the clinic and the lab, the "person with disabilities" is "seen" and evaluated taking into consideration his/her life style, the social "current environment", because his/her way of expressing himself/herself, as well as his/her abilities, are due both to his/her impairment and to his/her life conditions. "Two persons with the same illness (serious illness, author's note) may function differently, exactly as two persons who function in the same way must not necessarily have the same state of health".[6]

By means of these theoretical clarifications – brought by ICF– and also by means of the constructs conceived before ICF, as well as after the publication of this paper. I have conceived two

[6] Idem p. 4;

questionnaires that are basically meant for documentation and specific assessments in the social security system.

I refer to *The Social-Professional Assessment Instrument (S-PAI)* and *The Social Functioning Assessment Instrument (SFAI).*

a) ***S-PAI*** combines qualitative and quantitative information. Thus, we accomplish a presentation of the subject's social situation: occupational status, professional career, family, living conditions, living standard and an evaluation made according to the concept of "*occupational access"*.

"*Occupational access***"** is not mentioned as such in ICF, but it is rather considered as a synthetic, "resumative" indicator[7], which joins variables from different categories, such as: environment and social factors, as well as "activities and participation" factors.[8]

We have showed that contextual factors (environment and personal factors) are an essential ICF component. They interact with the other "functionality-disability" components and they *facilitate* or *block* the impact of the physical and social world, as well as people's behavior.

The expertise of the work capacity consists in wholly evaluating a person's health state in order to establish if and to what extent this person is compatible with one or another kind of activity, as well as with taking up an occupation (workplace).

But, access to a workplace of persons with medical problems does not depend either on that person's medical status, on the diagnosis, on the impairment itself or on that person's "availability" to work. In many cases non-medical factor – contextual factors – are involved. According to the above presented theory, these factors can reduce or increase the disability, facilitate or block access to work.

The complex, evaluating concept "occupational access" – presented in S-PAI – includes the following variables: age, duration of unemployment, household activities, occupational trust-mistrust in relation to the economic characteristics of the residential area, availability to work.

The "Occupational access" indicator and its variables are congruent with the medical-social paradigm of functioning-disability.

b) ***IEFS*** is a social assessment instrument. Its role is to bring into evidence and in a quantifiable form the activity limitations and participation restrictions that may appear in different life areas, while indicating the most important limitations, the situations in which the person with disabilities needs support from other persons. The necessary social services are evaluated taking into consideration the degree to which the disabled person depends on help from someone else.

This indicator is based on the functioning-disability bipolar concept. The result may be presented as a general score, a sum of several sectorial scores.

Normative legitimacy

In the last 50 years, as a consequence of the tendency manifested by the World Health Organization to define and evaluate health state, one has noticed a move from the static approach to the individual (who was placed in a nosological category) towards a more dynamic one (which places the individual within the context of his/her daily capacities and functional performances).

Since this tendency became prominent, in May 2001, at the 54th session, the World Health Organization approved the International Classification of Functioning, Disability and Health[9] and recommended the member states to use ICF "in research, surveillance and reporting…"

Romania has been a WHO member since 1948.

---

[7] Idem p. 172;

[8] Idem p. 124;

[9] Clasificarea internațională a funcționării dizabilității si sănătății – Organizația internațională a sănătății, București: Editura Marlink, București, 2004, pag. 25;

EU Directives – e.g. Directive 2000/78 in favor of equal job opportunities – set forth the main concepts and the objectives of the Sectorial Operational Programs, on the basis of which EU allots structural and cohesion Funds for: social economy development, development of programs for reintegrating persons with disabilities, supporting the creation of new workplaces in factories, improving access and participation of vulnerable groups. All these programs are elaborated in the spirit of the medical-social pattern, whose conceptualization and operationalization have been significantly improved by ICF.

The above mentioned terms and objectives do not fit within the strict limits of the medical pattern.

Romania has been a EU member state since 2007.

Praxiological legitimacy

The term "disability" is a generic one. It might replace the notions of handicap and invalidity, which are regarded as being "pejorative" by ICF. Thus, the significance and implications of the concept of disability are not only semantic or ethical, but they can also influence organization, social policy, legislation and the financial sector.

Undoubtedly, there are cases in which participation limitations are due not only to the incapacity caused by the illness/impairment, but also to the environment, including the social restrictive attitudes. However, the major role of the social enterprise is not to replace medical criteria or to eliminate them, but to provide information that might help conceive solid and functional social medical policies.

Introducing or accepting social references are meant to complete medical information which will be useful and adequate to a large number of applications including for the social security system. ICF offers the information conceptual frame that can be applied to personal health problems, including for preventing illnesses, promoting health, improving participation (by elimination or diminishing obstacles and by offering support as a facilitation factor or social level).

The aim of this activity is to reduce disability, impose social and professional participation and inclusion, finally to reduce the financial assistance expenses.

III. Conclusions.

Since the medico-social paradigm is recommended by the WHO in an official document (ICF), it results that it is legitimate according to the international scientific community and it is fully compatible with the EU values; at the same time, the Romanian present norms regarding the granting of medical pensions is tributary to a medical federalist model in which connections between "the biological" and "the social" are annihilated."

The fear that this connection might lead to an increase in the number of persons retired on medical grounds is not justified because this scientifically and normatively legitimate type of documentation and evaluations is crucial for conceiving authentic social medical policies. It is this type of solutions that can "reduce the pressure" existing on the security system.

THE ROLE OF THE UNIVERSITY IN THE KNOWLEDGE SOCIETY: ETHICAL PERSPECTIVES ON ACADEMIC RESEARCH IN THE AGE OF CORPORATE SCIENCE

MARIA CERNAT*

Abstract
Knowledge society lies on the ruins of national culture that thought people to function in a single universal form of science. This type of society is tightly related to a post-national multicultural world that nourishes the erosion of classical (Kantian and Humboldian) cultural and scientific foundations of the university. We are now witnessing it's transformation into a "multiversity" dominated by the competitive international academic market for students and scholars and "commodified" knowledge. The fiscal crisis of publicly financed universities forced them to constantly pursue other forms of income, the industry being the most obvious solution. In the place of universities of reason and culture the drastic decrease of public funding generated the commercialization of the universities. This is because there is an "asymmetric convergence": while universities are adopting corporate values and principles the industry itself is not influenced by the academic values and norms. The pursuit of knowledge for mere intellectual curiosity and also the conception of the knowledge as a public good have been abandoned in favor of applied research serving corporate interests. The resulting academic capitalism is far from being the best solution to budget cuts and this study is trying to highlight some of advantages but also the most important shortcomings of this present trend in our universities.

Keywords: *knowledge society, commodified knowledge, academic capitalism, corporate interests, research limitations*

Introduction

During the last decade one of the most heated debates regarding academic freedom took place in USA. It was caused by an extremely controversial agreement signed between two important institutions: a famous land-grand university and the biggest pharmaceutical and biotechnological corporation. The fierce debate remained known as the Berkeley-Novartis Controversy. I chose this very interesting chapter in the industry-university relation as a starting point of my research as a result of a peculiar situation regarding the way this controversy was reflected in the mainstream press. When theorists made an inquiry on the most debated themes in mainstream journals, the general ethics issues came in the fourth place after corporate control, general research and economic concerns themes. It is not my intention to reshape the current interpretations of this particular event but to prove that this controversy is also important on a different level. I consider that the Berkeley-Novartis Agreement epitomizes a very controversial relation between corporations and universities and I think this should be the starting point for further analyzing the ethical challenges the university has to address in the present knowledge society. The long debated Berkeley-Novartis Controversy is only a result of a much deeper crisis threating the academic world. The long praised academic Ivory Tower is currently under attack from many directions. It is my intention to bring forward some of its enemies by highlighting some of the dramatic transformations taking place in university of the knowledge society.

In the first section of my paper I shall present some of the key moments in the transformation of the university. The university has been for centuries the sole producer of knowledge and this is only of the many reasons it was built as an intellectual Ivory Tower now under siege. Nowadays

* Lecturer Ph.D, Journalism, Communication and Public Relations Faculty, "Spiru Haret" University, Bucharest, (e-mail: macernat@gmail.com)

there are numerous knowledge producers and knowledge users and the knowledge society is also a society of huge corporation deeply connected to the neoliberal political agenda. This is why I think it is very important to put the university into a historical and political context in order to see whether the university lies in ruins, as Readings[1] would say or whether it can serve a more important role in the global context by linking the knowledge to its users as Delanty[2] would argue.

The second section of my paper I shall analyze some of the most important theories regarding the penetration of the managerial ethos in the academic space. The growing importance of the corporations as major sources of income for universities generated different theories trying to describe the complex relation between industry and university.

Finally in the third section of my paper I shall take a closer look to the Berkeley-Novartis Controversy in order to pinpoint the important ethical implications of the so-called academic capitalism dominating the university in the knowledge society. Although it is a recent development in Romanian academic world, academic capitalism is been largely promoted in the past decade through policies and practices designed to build a closer relationship with the economy in the context of deregulation and fierce competitiveness. This is why I think that before embracing this type of perspective a closer analysis of its most important implications is in order.

1. The historical evolution of the university

In an extremely well documented work Gerard Delanty brings forward some of the most important moments in the transformation of the university. I shall follow in this section some of the directions he is analyzing. During medieval times the university was closely related to the idea of a universal truth offered by the Christian theology. It was an austere place resembling the literary myth of Castalia where an order of intellectuals lived for the discovery of the ultimate Truth. Since this was such an abstract quest anyone could participate in it and the result was the scholars all over the world gathered in the university offering it a cosmopolitan character. The medieval institutions were even more cosmopolitan than those functioning today. The Bologna's ten thousand students came from all over Europe. But this was not the only aspect giving them a privileged position in the medieval academic world. We may ask ourselves what was so interesting about our Christian University. During medieval times important universities flourished outside the Christian world. Twenty-five thousand students learned in the Muslim university of Timbuktu, for example. It was the incredible dynamics of the European university that help it develop in a way that Hindu, Muslim or Chinese universities where not able to since they were imprisoned by a very strict curricula. The continuous specialization in the curricula of Christian universities helped them make such important progress. During those times Latin was the official language of the university. The lack of technological means of communication made this process very difficult. Knowledge was the privilege of a very few scholars able to learn the languages of Antiquity in order to have access to its manuscripts. The relation with the public was quasi inexistent due to the cultural, economic and political characteristics of medieval society. Thus, knowledge was the delight of some privileged individuals able to learn the dead languages of Antiquity. This privileged stance of medieval scholars was praised or criticized by different philosophers analyzing knowledge and its evolution. The literary myth of Castalia can be contrasted to the cynical perspective offered by *Il Nome della Rosa*. Auguste Compte is underling the fact that it was this peculiar social situation that made knowledge metaphysical (separated form society). In other words, knowledge was not metaphysical by itself: the social context made it so. This is a recurrent theme in the philosophy of science and this is not the place to analyze it any further. The rise of modern university is closely related to the struggle of institutionalizing knowledge. The university was trying to escape de dominance of the Church and

[1] Bill Readings, *The University in Ruins*, Harvard University Press, 1996

[2] Gerard Delanty, *Challenging Knowledge. The University in the Knowledge Society*, Open University Press, 2001.

find refuge under the wing of the absolutist state. Due to its cosmopolitan nature the university managed to escape the absolute political control and this is why theorists venture to say that it was the unique milieu where "culture was never fully dominated by power". [3] The relative autonomy of the university was also a result of a particular social and political context: while the authority of the Church was declining the modern state was not fully established. In between those two powerful institutions, the university was able to gain some academic freedom. The university was often developed as an autonomous association of scholars able to grant important privileges to its members. This is why the common understanding of the university was that of a "republic of letters" or a "republic of science" where knowledge was considered an end in itself. Using the capitalist terms, Delanty is describing this situation as one where "knowledge became a site to be inhabited by a knowledge producing and consuming elite. Unlike today, those who produced knowledge were also the chief consumers of knowledge."

The Enlightenment was the period where the historical alliance of the university with the state was largely established and accepted. The academic institutions were central to the consolidation of the national state. The very essence of the Enlightenment was the belief that knowledge has an emancipatory power. The modern state was build up on the firm ground offered by the rationalistic and technocratic values of the Enlightenment. The belief in the emancipatory power of knowledge made it possible for the masses to have access to formal education. It was the time where the school became financed by the state and where everyone was granted access to some form of education. Unfortunately this came with the cost of destroying the old medieval universities. Not surprisingly, this side effect was most visible at the hart of the Enlightenment movement, that is, in France. This was the country with the most collateral damages as a result of Napoleon's project of creating *les grandes ecoles* responsible for doing most part of the research, the teaching activity being main task of the universities.

Another key moment in the development of the university was the rise of positivism. It was for the first time in the history of the university where the culture of experts was opposed to the culture of intellectuals. More precisely with the rise of positivism came the exile of the intellectuals populating the salons and not the university that was conquered by experts and scientists. Despite the conflict between scientist and intellectuals they all shared the monastic belief that knowledge is autonomous and that they are the producers and owners of knowledge. This situation was not common to all the European states. In Germany, the Enlightenment had a slightly different understanding. The French version of the Enlightenment considered knowledge able to help cultivate the people and to substantially contribute to the progress of the society. In Germany the emphasis was on the culture as the main element responsible for the self-construction. German university also benefit from the presence of one of the most important philosophers of all time, Immanuel Kant. In 1978 he published the famous plea to the Prussian king *The Conflict of Faculties*. Those were glorious days for philosophers, who, benefiting from the presence of such a powerful personality found themselves in a privileged position, that of servants of reason and truth. It was perhaps a unique moment when the apparent lack of immediate utility of philosophy was transformed in such a huge advantage. Not only philosophy was to be tolerated although it did not serve am immediate political or social goal, but it had to be accepted as the most important of the faculties exactly for its fully commitment to superior values such as reason and truth. The philosophers were not the only ones to take advantage of this perspective. It was the starting point for the justification of the pursuit of knowledge as an end in itself.

The case of England was slightly different since Oxbridge was designed to educate clercs and gentlemen rather than experts and intellectuals. The conservative attitude of England's most famous universities reflected in an anti-industrial values. This is why they adapted later to modernity and its values.

[3] Gerard Delanty, *Challenging Knowledge. The University in the Knowledge Society*, Open University Press, 2001.

The most influential intellectual whose work and ideas contributed decisively to the creation of the first modern university was Wilhelm von Humbolt. He was one of the most important supporters of the academic freedom. Instead on being a place where civil servants trained, the university has to be the institution having the important spiritual role of cultivating the entire nation. Humbolt defended the university against the bourgeois utilitarian conception of knowledge so largely accepted in present times. He considered that the university should take the huge responsibility of offering spiritual guidance, therefore taking the place of the Church. Those were the glory days for those cherishing the utopian perspective of the university as a "Republic of Letters". This perspective had the peculiar side effect of allowing theology to come back into the university as an important field of knowledge. The true enemy of the "Republic of Letter" was not the Church, but the utilitarians. The University College London was founded by important utilitarians such as Jeremy Bentham and they denied the right of theology to consider itself a cognitive science. The struggle to maintain the university as the institution fully committed to the idea of searching knowledge as an end in itself was not an easy task. There were important intellectual figures to maintain the idea that knowledge has to be useful for the society. Herbert Spencer for example was very prompt to adopt a perspective favoring science and socially useful knowledge and not humanities.

This type of civic responsibility was partly cherished by American pragmatists such as Peirce, James and Dewey but their commitment was mostly directed towards the community. Thus American academic institutions found themselves closer to their cities and their region than to the state or the empire. They mostly provided useful knowledge for those in need of vocational training. Their commitment locally directed is perhaps the main reason for their surviving in the initial form in the Globalization era. Since they were never closely related to the nation state and they never assumed the responsibility of spiritually guiding the nation and pursue knowledge as an end in itself they were able to survive de decline of the national state.

Many cultural wars occurring in modern times influenced the faith of the university. The numerous attempts to reconcile all knowledge with the Christian doctrine, for example, represents yet another battle shaping the form of today's academic world. We can still sense the echoes of those heated debates. The Natural Theology is far from its glory days, but there are still Protestant Colleges in the USA where teaching the evolution theory is forbidden by their founding members.

The history of the university represents a fascinating subject interesting by itself. I only used it to place the debate about the academic capitalism in a historical context. The medieval and modern legacy left us with an unsolved conflict between the cultural-liberal perspective and the modern perspective on the role of higher education. The first one stresses the role of humanities and of pursuing knowledge as an end in itself while the former is committed to the scientific progress and the usefulness of knowledge.

The debate between liberal and modern perspectives on the university did not forbid the state to be for a very long period of time the sole financial provider of academic institutions. Even after the world wars the state was greatly supporting universities and was the main source of income for research programs. Although there were a lot of criticisms related to the fact that most research programs were related to the army and the Cold War the universities received great financial support from their government. This was, along with the technological progress, one of the key factors leading to the unprecedented development of the university. This development meant the appearance of a large number of new academic institutions and the transformation of the university form an elitist site to a mass form of education. As we all know higher quantity almost always means lower quality and this is the main reason this recent development of the university is not always accepted as the best direction to follow.

The seven decade of the last century bought along with important students protests major changes in the way universities are financed. The 1968 revolt was the moment where it became clear that the university was no longer an ally of the national state. Although it received most of its funds from the government the university was no longer offering spiritual guidance to the nation. On the

contrary, it became a site of intellectual revolt were the very foundation of the modern state were questioned. The financial problems of the eighties reflected in an important decrease in federal funds. Consequently the old and the newly created universities found themselves functioning on their own in a very competitive environment. The end of the Cold War was the second important factor determining the state to retreat its financial support. The development of huge corporations able to invest important amounts of money into research and the university's search for funds were the elements contributing to the emergence of academic capitalism. One of the first books written on the subject offers the following definition: "institutional and professorial market or market-like efforts to secure external moneys" [4] This is one of the two most important enemies of the academic Ivory Tower. The other one is cultural relativism. The capitalist approach to knowledge transforms it into useful information that can be transformed in intellectual property. This perspective that leads to the instrumentation of knowledge finds a very powerful ally in the postmodernist cultural relativism. In other words, the cultural relativist assumption is that there is no such thing as the ultimate truth. Everything is culturally determined and there are many competing truths equally legitimate. The feminist movement and the minority struggles contributed to the erosion of the idea of a unifying culture supporting the national state. In the absence of an ultimate truth to be pursued for its own sake the knowledge as an end in itself cannot exist anymore. This way only the useful knowledge should be taken into consideration. This assumption has many implications: the final victory of the modern perspective of the university with its emphasis on science but also the victory of applied research over fundamental research. Some of those implications are analyzed by numerous theorists and I shall present the most important perspective in the following section of my paper.

2. Theories of universities in knowledge society

Since knowledge should not be pursued as a mere intellectual curiosity but serve a superior goal, that is the social progress no advantages could be granted to researchers and professors. They have to be socially responsible. This is translated into the accountability of their work. Nobody seems to be willing to offer money for a research project that has no immediate and measurable results. This is why universities have to justify every penny they receive and this is paving the way for the development of the so-called "audit society". The managerial ethos is penetrating academic space and values such as efficiency, profit and low production costs are undermining the academic ideal of a "Republic of Letters" or a "Republic of Science" governed solely by the rules of Reason. Several theories have been developed in order to explain this situation. They include private versus public interest science (Krimsky, 2003), academic capitalism (Slaughter, Leslie, 1997), the triple helix (Etzkowitz, Leydersdorff, 1997), public private isomorphism, (Hackett, 1990), asymmetrical convergence (Kleinman, Vallas, 2001).

The public –private interest theory is underling a very important aspect regarding the research conducted in universities. Nowadays science requires a huge amount of technological tools. Nobody can conduct an important research project without being granted access to the sophisticated laboratories and the state of the art technological tools. Since the state is no longer the sole provider of those research instruments universities turn to private investors. The raising problem is that those private investors will not be interested in making the results of the scientific research available to the public. This can have extremely dangerous consequences if we think at the microbiology research. In a very pessimistic perspective we shall all be eating deadly "franken-foods" since the results of the research made in this field would not be available for the public. The big corporations are only interested in transforming the knowledge into intellectual property by patenting the scientific discoveries and selling those patents. The capitalist approach is focusing only to one aspect of accountability, that is explaining why and how money is being spent. In the audit society the

[4] Sheila Slaughter, Gary Rhoades, *Academic Capitalism and the New Economy: Markets, State and Higher Education*, John Hopkins University Press, 2004.

universities are accountable, but only for the money they use, not for the public they should inform. They are fiscally but not socially accountable and this way it is not at all clear whether their research is in fact socially useful or not.

The academic capitalism theory was developed by Sheila Slaughter and Gary Rhoades. They define academic capitalism as the pursuit of profit using the well-known market means. Thus universities compete not only for the *best* students but for *enough* students allowing them to secure their profit from tuitions. Also universities are competing for research grants allowing them to gain profit from the results of scientific discoveries.

During modern times the university found itself in the middle of two other important powers: the Church and the national state. The triple helix theory is emphasizing the fact that nowadays universities are found themselves again at the intersection of two important powers: the government and the industry. The federal funds often came with political strings attached: most part of the research conducted after World War II was related to military objectives. The corporate funds have their own strings attached: there is no possibility for the university to do research questioning the corporate interests on its own money. The research agenda is no longer freely established.

The isomorphism theory and asymmetrical convergence theory are both underling the fact that universities and industry institutions are becoming more alike since the penetration of managerial ethos in the academe. The asymmetrical convergence theory is trying to show that there is an asymmetrical relation between industry and university since the university is more likely to be influenced by the industry by accepting is norms, values and procedures. Efficiency, low production costs, managerial hierarchy, audits are only a few of the industry's values adopted by contemporary universities.

What I shall try to do in this paper is not a comparative analysis of those theories. My intention is draw a list of the most important moral issues generated by those current developments in contemporary university.

3. Berkeley-Novartis Controversy

This very interesting episode in the history of contemporary university marks the beginning of the serious debate on the social accountability of the university. To the present day, universities were only to account for spending government or corporate money. They had to produce commodified knowledge to the profit of the state or the corporation. This was about to change when one of America's biggest land-grand university – Berkeley – signed a research agreement with the largest pharmaceutical company Novartis. The University of California was a "land-grant university". That is, the 1862 Morrill Act established that every state would preserve at least 40 acre of land for a university that would teach and disseminate information to the laboring masses. The land grant university served two traditions that theorists call the progressive and the populist traditions[5]. The progressive trend was represented by wealthy bankers and land owners who tried to improve the production mode. The populist trend was represented by left or right wing politicians or intellectuals trying to defend "the little guy" form major corporation interests. Those two traditions functioned together until the infamous agreement was signed. The university of California was largely perceived as representing mostly the populist tradition trying to develop research projects that would take into consideration the influence of major changes in agriculture would affect the farmers, for example.

The chronology of events that took place at Berkeley show us how a team of researchers at the Plant and Microbial Biology Department tried to find alternative research funds. First they tried to make the private corporation give them money with no strings attached: the university would have complete freedom in choosing the research agenda, the results of scientific research were to be made public, the faculty shall be rewarded according to the criteria established by the university. Of course,

[5] Dawn Coppin, Jason Konefal, Bradley T. Shaw, Toby Ten Eyck, Laurence Busch, *Universities in the Age of Corporate Science*, Temple University Press, 2007.

none of the corporation was interested in signing such a contract. Several years later the demands regarding academic freedom and autonomy were dropped and the board of professors settled for only four criteria to be met by any corporation willing to invest in research. Those criteria included the alliance with only one industrial partner, use traditional competitive means in order to encourage bidding among the willing corporations. The fact that a whole department was involved in a contract with the higher bidder was often called, especially by those opposing this type of agreement, "the auctioning of the deparment". Thus in 1997 a committee of four was established. The same year Plant and Microbial Biology Department contacted nine companies insisting that a large number of faculty members could be interested in an alliance with a single industrial partner. From the six companies responding to the offer the committee selected Novartis in 1998. A first draft of the agreement was ready the same year. On August 1998 the Academic Senate was contacted about this contract. Several months later a non-profit organization, Students for Responsible Research presented the Academic Senate a petition with 400 signatures asking for the delay of the signing of the agreement. On November 1998 the agreement was signed despite the student's efforts to delay it. During the following years there attempts have been made to externally evaluate the agreement. In November 2003 the contract expired.

The most controversial aspect surrounding dis agreement was the interesting tenure case of Ignacio Castaneda. In 1997 Castaneda was an untenured member of PMB. He was also a critic of the agreement. In 2001 he published along with David Quist, a graduate student, an article that received more attention than most scientific articles often do. He was stressing the fact that in Mexico the maize landraces contained transgenic DNA constructs and that those were unstable. A heated debate started in the academic community. The controversy was fueled by the findings of the newspaper *The Guardian* that provided evidence for the debate on Castaneda's article being initiated by some fictious scientist traced back to a public relation firm owned by the biotechnological corporation Monsanto. The same year the intensely debated article was published began the evaluation of granting tenure to Castaneda. The first committee voted overwhelmingly for granting tenure (32 to 1). The dean forwarded this case to an ad-hoc external committee for further review. At this point a very unusual decision was made by the chair of the ad-hoc committee asked that the members of this board had nothing to do with the Berkeley Novartis agreement. The ad-hoc committee recommended tenure. The case was sent back to the committee for further review. The chief of that committee resigned. Than Castaneda's case was sent to the Academic Senate Committee were Jasper Rine was a member on the Advisory Board of B-N agreement. This Committee denied tenure to Castaneda in 2003 who began a legal action against the university. In 2005, after headed debates and important support of faculty members (more than three hundred faculty members signed a petition) Castaneda was finally granted tenure.

4. The ethical issues generated by the entrepreneurial perspective of universities

After setting the historical context and presenting one of the most controversial corporation-university agreement we are able to detect the most important ethical issues deriving from the penetration of the managerial ethos into the academe.

a.The first ethical problems relates to academic freedom. A cherished valued for several centuries, academic freedom means that university professors and researchers should be free to decide what are the most interesting research themes and establish the curricula according to their wishes. This is maybe only an ideal that was never fully realized. Every historical period had its examples of occasions where this imperative was not applied. I is my intention to show who overrides today this ethical principle. The academic capitalism has its own flaws in terms of accepting academic freedoms. Embracing efficiency as its main value the entrepreneurial university is not interesting in critical thinking or on debates since it has to take decisions fast. The Academic Senate is a time and money consuming in terms of decision making. Thus, the hierarchy present in corporations tends to replace the democratic method of making decisions in the entrepreneurial

university. Since the profit is the only legitimate goal those in charge of university's destiny resemble more to the managers than to the professors.

b. Closely related to the first problem is the way work is being evaluated in the university. Since it is very difficult to deal with "tenured radical" the whole process of granting tenure is designed to be very complex. More than fifty percent of faculty members hired in major universities are not tenured. This is partly because the tenured radical has a great power: he is well trained, possessing important knowledge, having important critical thinking skills and strong beliefs. In other words he is the nightmare of any manager seeking efficiency: that is the rapid implementation of his decisions by the obedient subordinates. This is probably why tenured was abandoned in some countries such as England. The faculty members have to be efficient. Thus, the industry of producing articles was born. Everybody is engaged in a desperate quest for more and more published articles. This creates an inflation of articles.

c. The third ethical challenge regards the way research is conducted in contemporary university. The Berkeley-Novartis controversy showed us how difficult someone opposing corporate control was granted tenure. It is also important from other points of view. First of all setting the research agenda should be entirely the task of the university. But how can some scientist develop a research project opposing the corporation funding the department objectives? Today's research implies access to extremely sophisticated technological instruments and it is by no means the work of the solitary scientist. The Berkeley Novartis agreement was a dangerous and unprecedented step since a whole department found itself at the mercy of a unique huge industrial partner with hundreds millions of dollars at its disposal. Given those circumstances, how can anyone develop research projects affecting the financial interests of the corporation?

d. The forth ethical dilemma is also related to scientific research. From another perspective, the commodified knowledge is the result of transforming the scientific discoveries into intellectual property afterwards sold by the industrial investor. But what if the scientific discoveries were to affect the public? Is the university only accountable for the way it spends corporate money or is it also accountable for the way its research affects the public? The common assumption of the "absolute relativism" is that there is no ultimate truth but only partial truths and that there is no such thing as fundamental research. The relativism and instrumentalism are combining giving birth to the situation where those partial truths are transformed into the intellectual property. The objective of making knowledge useful to society can no longer be met since, in the era of academic capitalism, the university is only accountable for the money it spends. There is simply no way of determining whether the scientific research is useful or not since for the sole reason that it is not available for the public. The problem is even more complex when it comes to universities still receiving government funds. If the university is using also government money and is then transforming the scientific findings into the intellectual property of the corporation the academic institution find itself in the position where it is using government funds to transform public knowledge into intellectual property.

e. The third moral challenge regards the "conflict of faculties". One of the main reasons the university loses its importance is the transformation of the national society into the knowledge society. The technological progress and the globalization process based of the generalization of financial capitalism made it possible for knowledge to be incorporated in every aspect of our society. Since the decline of the national state the university is no longer the unique provider of knowledge. But this is not the only major transformation: there are also numerous knowledge consumers. In this context the battle between the liberal and the modern perspective on university is finally decided. "The Republic of Letters" is finally defeated by "the Republic of Science". In the knowledge society is easier to survive if you are a scientist. Even if you have to make important compromises you can still have a successful career as a scientist. This is not the case of those working in the humanities. Philosophy or history are both tolerated in the academic institution seeking profit at all costs.

Conclusion

Knowledge has no value in itself in the knowledge society. There are theorists trying to prove that there is still room for the university role in this type of society. Gerard Delanty stresses that the major contribution con contemporary university is to diminish the growing gap between knowledge producers and knowledge users. I think that this is too optimistic. What we are experiencing in terms of defining the university status is a mixture of postmodern cultural relativism, utilitarianism and positivism. Given these circumstances we, as intellectuals working in humanities, are risking to be facing the same abominable imperative of a not so long ago abolished social order. That is: intellectuals are not productive. The scientific findings of a philosopher or a classical language professor cannot be transformed into the intellectual property on any corporation. It has no potential consumers since the interest in those fields is constantly dropping. The knowledge we are offering cannot be sold to anyone so why bother to produce it?

THE OZ BEHIND THE CURTAIN EFFECT: ETHICAL PERSPECTIVES ON THE ASSESSMENT OF SCIENTIFIC MERITS

MARIA CERNAT*

Abstract
There is a genuine desire in Romanian research institutions to follow the rules of scientific evaluation tested over the decades in stronger academic and scientific communities such as those in the USA or the Western Europe countries. The main objective of our paper is to show that before enthusiastically embracing such rules of scientific merits evaluation a closer analysis of those norms is in order. Although the peer review system is the best method used so far, we have to analyse it and even criticize it in order to improve it. There are two points to be discussed in view of offering the right perspective on how the rules of scientific merits evaluation function: the peer-review system and the number of citations criterion. In the first part of our paper we shall investigate the shortcomings of the peer-review and the particular situations proving that the double blind review system does not always work to the benefit of scientific progress. In the second part of our study we shall examine the formalism undermining the number of citations criterion and show that we can find better alternatives. Those alternatives are not mere speculations: even prestigious institutions such as "Natural Science and Engineering Research Council of Canada" for example are giving up on the "classical" way of evaluating the scientific merits of researchers by shifting towards the content of the articles and not the number of their citations.

Keywords: *scientific research, the evaluation of scientific research merits, the peer-review system, the number of citations criterion, criticisms of the peer-review system*

Introduction

Each state in the European Union has institutions that govern the research by establishing research merits criteria and funds distribution rules. The process of evaluating the importance of research is based on several elements. The most important are: publications in prestigious academic journals, winning research grants and established reputation in the field. A century ago, when the scientific community was small there was no need for objective criteria in establishing one's research merits. The growing number of universities and research institutions as well as the allocation of important amounts of money in the science field called up for objective rules of establishing the importance of scientific research. The three elements mentioned above are to be translated into quantifiable terms in order to obtain objective criteria of evaluation. For instance, what does "prestigious" mean? A century ago, there was no challenge into giving a largely accepted meaning to this term. Nowadays, "prestigious" could mean a lot of things, not all of them being close to scientific research. This is why the above mentioned institutions have to come up with objective and relevant means of establishing the criteria an academic journal has to follow in order to be prestigious, or what it means for a researcher to have a good reputation. The main purpose of this paper is to prove that, although the intentions may be honourable, the result of translating terms like "prestigious" or "good reputation" into quantified parameters has its shortcomings. Thus, the most important weakness of this system is the fact that it relies on quantity instead of the quality of scientific endeavour. Those three elements mentioned above are closely connected to each other. Thus in order to gain a good reputation, a researcher has to publish, (or else *perish*) in prestigious journals. Moreover, the researcher's articles must have enough citations for his/her research to be considered important. After gaining a good reputation based on the type of journals the articles are

* Lecturer Ph.D, Journalism, Communication and Public Relations Faculty, "Spiru Haret" University, Bucharest, (e-mail: macernat@gmail.com)

published in and on the number of citations, the researcher can send applications to receive funds to support his or her scientific projects.

2. The Oz-Behind the Curtain Effect and the Peer Review System

The peer-review system is important also for the academic journals as well as for gaining access to research grants. This is why we think that it is crucial to have a debate over this way of evaluating academic journals and scientific applications. Maybe we could say the same thing about the peer-review as Churchill said about democracy. That is, "the worst form of government except all those other forms that have been tried from time to time". But since it represents such an important element in establishing what is the relevant research, how articles are selected and who is to be considered an important researcher, we consider it is vital to have an ongoing debate on the ways of criticizing and improving it.

First of all we should explain what the term "peer-review" means. This term is used to designate a way of self-regulating used by a certain profession. The term "peer" means „One of the same rank, quality, endowments, character, etc.; an equal; a match; a mate"[1]. The term review means „A critical examination of a publication, with remarks; a criticism; a critique"[2]. The meaning of the two terms leads to the understanding of this collocation: the peer-review system refers to the situation where people having the same academic rank are asked to read and make a fair evaluation of an article recommending its publication or rejection. This works the same for the scientific projects that are evaluated by the same system. It now becomes clear that the judgements of colleagues play a crucial part in the way grants are distributed and articles selected in order to be published, and eventually on the way individual careers might evolve.

There were numerous scandals undermining the ethics of the peer review system. Several examples proved the system to be failing when it was put to the test. A famous cardiologist cooked his data but the study was published in the most prestigious medical journal. A famous researcher intentionally published a study based on data that proved to be bogus and the peers reviewing it failed to see that. It was only after his self-denouncement that the scientific community realised the failures of the work. Are those isolated situations or is the system responsible for those failures? In order to answer this question we have to take a closer look to the way this system works.

The Oz-behind the curtain effect refers to the fact that the peers reviewing the scientific articles are working anonymously. The main reason academic journals use this particular procedure is due to the fact that by hiding the identity of the peers those academics will be protected against any kind of influence by their colleagues. But this is a blade cutting both sides: while protecting the referees it offers them the possibility, while hiding their identity, to act arbitrarily. This is the reason why in the United States even the Congress investigated the peer review system, which had been seriously questioned after a series of frauds and unethical scientific behaviours.

As Tom Abate points out, "whether grading grants or screening articles, a peer reviewer must preserve scholarly integrity by rising above the three deadly sins of intellectual life: envy, favouritism, and the temptation to plagiarize"[3] This is an example where the pure proceduralism encounters its main obstacle: no matter how well designed the procedure may be, the persons implementing it have to possess important moral traits in the absence of which the procedure has no chance to be successful. There are two ways of establishing scientific merits: by relying on authority, thus turning to important personalities in the field, or by relying on colleagues to fairly review the scientific articles. The peer review system finds itself closer to the second way of establishing scientific merits. But this procedure is not by itself enough to ensure an objective way of screening scientific articles and projects. Moreover, "the persons most qualified to judge the worth of a scientist's grant proposal or the merit of a submitted research paper are precisely those who are the scientist's closest competitors"[4] The hidden philosophical assumption of the peer-review system is that relying on a procedure is better than relying on authority. The ethical problem resulting from this assumption parallels the one encountered by one of the most important philosophers of the twentieth

century, John Rawls. When trying to sketch an *outline of a procedure decision in ethics*[5], Rawls wanted to rely only on the fairness of his procedure but soon found himself in the difficult position of assigning a long list of intellectual and moral traits to those appointed to implement it – the moral judges.

It was precisely the unethical behaviour of the reviewers that called for the Congress investigation. Thus in 1994 the General Accounting Office, an investigating department of the US Congress, issued a 133 page report regarding the peer-review system. The report was the result of the examination of 246 winning and rejected grants and of interviewing 1.400 reviewers. The auditors found most of the criticism as being well founded, but that the system was functioning reasonably well. A first measure to be taken in order to improve this system was to add more women and representatives of the minorities in the review process. A second measure taken at the end of the Second International Congress on Peer Review in Biomedical Publication in 1993 was the blind review procedure that will grant the researchers the opportunity of a fair trial as a result of the fact that the identity of those applying for grants or sending articles to be published was to be hidden from the reviewers.

3. The Peer-Review System and the Case of Analytical *versus* Continental Philosophy

There is a case where even this improved peer-review system does not work. It is the case of philosophy, where most of the academic journals favour the analytical way of philosophical investigation. This is a situation that calls for a closer look since it is the perfect example that proves the fact that the peer review system is completely failing. If the other cases are notorious scandals that can be considered as exceptions to the rule, the case of analytical philosophy is a field where this procedure proves to fail systematically.

For decades analytic philosophy has been the main way of doing philosophy in English speaking countries. Recent history of philosophy places us in front of a distinction between two types of wisdom loving, separated not only by a theoretical boundary but also by a spatial delimitation: analytic philosophy (specific to North American and British space) and continental philosophy. Throughout the century numerous conflicts emerged between the representatives of the two philosophical trends, which have considerably undermined the possibility of a constructive dialogue. Based on solid knowledge of mathematical logic, most analytic philosophers consider that the sole task of philosophy is to investigate the language for the therapeutic purpose of preventing us from attempting to solve problems or, more exactly, pseudo-problems such as the existence of good, of divinity or the existence of beauty. The war declared to all types of metaphysics regards the exclusion from the field of serious philosophical concerns of all problems this venerable discipline has tried to find an answer to for centuries. To ask ourselves what reality is or what reality looks like is a pseudo-problem which, at most, has the chance to *charm our intellect by means of our language.* The correct way of approaching this matter is to investigate the latent ontological presuppositions of a statement about reality. What differentiates, however the analytic philosophers from the representatives of phenomenology (especially from the works of Martin Heidegger) is not only a net detachment from metaphysical problems. The direct consequence of reducing metaphysical attempts to find answers to pseudo-problems is completely ignoring the history of philosophy. For centuries philosophy has been associated with the assimilation of important works of predecessors but the 20th century meant for the North American and British philosophers an almost total exclusion of endeavours connected with the study of ancient or modern philosophers. Phrases of the type „he who doesn't know his history is forced to repeat its errors" do not seem to represent a serious threat. Since all metaphysicians' problems are pseudo-problems, the investigation of ancient, modern or even analytic thinkers is, at most, a historical effort, labelled as philosophical history and not as authentic philosophy.

However strange it may seem for a person educated within an academic environment such as the Romanian one, where a special importance is placed on the study of the significant works in the

field, in the United States it is possible, at least theoretically, to reach the highest academic distinction (PhD) without reading a single page of Aristotle or Kant. The programmatic and complete isolation from the philosophical past represents a completely exceptional fact in the history of philosophy. It is unlikely that one might identify such a programmatic detachment from the significant works of the past in any of the other sciences, be that exact or humanistic. Lost in sterile disputes, most of the times dominated by personal egos, phenomenologist and analytic philosophers seem to ignore this very extraordinary fact. Since this way of doing philosophy has managed to keep the most important American and British philosophers *captive* for a century, one should initially look not only for the social but for the theoretical resources that made this thing possible.

Another unprecedented element is the fact that debates represent an essential feature of analytical philosophy. However, attempts to make an analysis of the analysis, a criticism of analytical philosophy, emerged only recently, accidentally or not, their appearance coinciding with the *pluralist revolt* in 1978. The history of analytic philosophy made by analytic philosophers is, in general, an enumeration of important philosophers, of the works and their significant contributions in the field. There are, of course, notable exceptions: M. Dummett (trying to determine the origins of analytic philosophy), P.F. Strawson,(interested in identifying the Kantian roots of analytic philosophy)[6], J Floyd (who focuses on early analytic philosophy)[7], D. Follesdal, (trying to offer a historical explanation for the analytic philosophy domination in USA)[8]. Still, critical approaches to this type of doing philosophy, a self-criticism, from the perspective of philosophical or metaphilosophical history, are, as previously mentioned, recent attempts. Criticisms coming from those who chose another way of looking at this issue are extremely vulnerable. As previously mentioned, in 1978 a conflict emerged in the United States, which has been imprinted in the history of philosophy as the *pluralist revolt*. We can not offer here a detailed account of this outstanding event of the recent history of philosophy. Nevertheless, we shall use this situation to attract attention on the incommensurability of the philosophical paradigms, which make even reciprocal criticism impossible. During this revolt of the phenomenological philosophers against the analytical philosophers, Bruce Wilshire, a professor at Rutgers University since 1970 and a promoter of the revolt, launches himself in a dispute with Quine: "I myself get a frigid letter from Quine. Its reasoning was so elaborate, condensed, and mathematical that I hat great difficulty following it, though I read it several times. I am unable to judge the validity of his argument. Perhaps he intended to teach me –existentially, so to speak, or as a Zen master might – that I was incompetent"[7]. This dialogue between philosophers coming from different schools shows that the best way to investigate what we actually mean by the concept of *analytic philosophy* and the potential problems arising in the approach to doing philosophy is represented by the efforts of somebody with a background in this philosophical tradition.

If we were to follow the Rawlsian idea stipulating that an essential condition for the possibility of solving a conflict is each adversaries' capacity to formulate criticisms in terms acceptable to the other, we could notice that it cannot be respected by the representatives of the two traditions. A close analysis of the "inner criticisms" is much more fertile because it can reveal elements pertaining to the theoretical resources that enabled analytical philosophy to settle comfortably in the North American and British space for almost a century.

The explanations offered for this unusual turn generally give a privileged position to the social, historical and institutional conditions which lead to the sometimes arbitrary acknowledgement of a single trend in the philosophical investigation. This is about analytical philosophy representatives holding leadership positions for decades within the most important professional association (American Philosophical Association), which is very influential in controlling the distribution of funds for research or the labour market for philosophers. In this context one could also consider the above mentioned *pluralist revolt* which included, among others, the possibility to do another type of philosophy in the US and to offer students other approaches to philosophical reflection.

This heated debate between the two types of wisdom lovers shows us how the peer-review system is failing to do them justice. That is, it was not the persons the main analytical journals turn their criticism to, but a way of doing philosophy. This way, if a philosopher wanted to write something on Plato's dialogues or Aquinas's theological arguments, it was the very nature and content of their study that made them not eligible for publication in mainstream journals. Even if famous analytical philosophers gave up their previous convictions and joined the phenomenologist in their way of doing philosophy their articles could not be published in prestigious journals since the academic world in United States was dominated by analytically oriented philosophers.

This arguments show that this peer review system represents a proceduralistic perspective in assessing the scientific merits that is not at all unerring so one might take a closer look to its criticisms before embracing it.

4. The Number of Citations Criterion

Another important tool in the research evaluation process is represented by the number of citations. This is an instrument that tries to complete the peer review system. That is, even if a study is published in a mainstream academic journal, if it does not leave a trace, if it is not acknowledged as such by the large academic community it is not considered a relevant research. That is, in order to ensure a more "democratic" way of evaluating important research results we should "let the community decide, depending on citation, what would become permanent electronically or be published."[10] This is the most formal and arbitrary criterion leading to unacceptable situations in the scientific community. This criterion resembles the high audience criteria in evaluating the quality of a TV Show. As the recent media history showed us the quest for higher audiences only lead to dramatic decrease of the quality of media shows. The same way, the rating of an article is a criterion that cannot function by itself. Someone could intentionally write unsubstantiated claims in order to attract criticism, and therefore, a large number of citations. Could such an article be considered more important or relevant from the point of view of scientific research? If, of the other hand, someone writes about using nanotechnology in finding treatments for rare diseases and the article is not cited enough does this make the article less valuable and less notorious? This situation made important institutions such as Natural Science and Engineering Research Council of Canada to abandon such formal and arbitrary criteria. Let us take into a closer consideration the following rules issued by NSERC:

"To focus the assessment of excellence of the researcher on the quality and impact of recent contributions to research, applicants are asked to identify up to five of their most significant research contributions in the last six years and to explain how these contributions have influenced their field and/or she activities of users.

Selection committees and panels are advised by NSERC to neither rely on numbers of publications in their assessment of productivity nor create or use lists of "prestigious" or "unacceptable" journals in their assessment of quality. The quality of the publication's content is the determining factor, not that of the journal in which it appears, and the onus is on the applicant to provide convincing evidence of quality".[11]

These regulations are the expression of the justifiable discontent with the previous standards used to evaluate the quality of research, such as the prestigious peer-reviewed journals and the long list of citations. A common sense observation could justify such a stance: the quality of the journal cannot and should never replace or stand for the quality of the article. The *form* – that is the prestigious journal – as well as the *content* should be of importance in assessing the merits of scientific research.

5. Conclusions

The peer-review system is subject to numerous criticisms since it leads to the Oz-behind the curtain effect and to a form of systematic discrimination, the same as in the case of analytical *versus* continental philosophy. As for the number of citations criterion, the way of establishing the quality of an article based solely on its higher rating is a case where even common sense intuition can prove to be right in rejecting it. Although it can offer an important instrument for assessing the impact and visibility of a scientific article it can be completely independent of the article's quality. Scientific research is the field where it is not important how many people read you, but essentially who are those people reading your article. Pure academic proceduralism and the complete disregard for authority is a mere abstraction leading to unacceptable situations in the scientific community.

GOVERNANCE ON THE INTERNET. MEASURING THE PERFORMANCES OF E-GOVERNANCE IN BUCHAREST MUNICIPALITIES

ANDREI ELVADEANU[*]

Abstract
This paper analyzes the electronic governance and how it's functioning in Romania. Being part of a larger institutional reform process, the electronic governance represents a new approach of the relation between Government and the citizen, with the purpose of increasing the participative dimension of the politic action, and as a way to provide more efficient services by the public agencies. E-governance uses information technologies (especially the Internet) in the public sector, in order to improve the activity of bureaucratic institutions and encourage citizen participation. This paper analyzes the concept of electronic governance and with a focus on the obvious differences between the ideal model and the way in which these policies are actually implemented in Romania. The analysis was made for the 6 town-halls in Bucharest, but can offer a good sample of how e-governance is made in Romania. The instrument used for measurements is the comprehensive Rutgers e-governance performance index, covered in detail in the article. The areas taken into consideration were the public services offered by the institutions, the usage degree by the citizens and the civic participation dimension, understood as a bi-directional communication between the institutions and the citizen. The final part of the paper is dedicated to explaining the results, with recommendations for the Romanian public institutions. The research has its limits, but the results can draw attention over an institutional process that can represent a huge positive change in the way that governance is usually understood to be made in Romania and a very important improvement in the relation between state and society.

Keywords: *e-governance, risk, security, electronic services, citizen participation*

Introduction

The goal of this paper is to assess the current state of e-governance on a local level in Romania, mainly the six district municipalities of Bucharest.

Electronic governance means providing citizen with online public services in order to improve the quality of those services. These services can vary from posting useful information on the internet, to paying taxes online and online decisional process with consultations between government and citizens. (Sharma, 2006). Additional definitions can be found on (www.worldbank.org) (AOEMA report) and (www.unpan.org) (AOEMA report).

The electronic governance's main goal is improving the effectiveness of the governance by using information technologies, especially the internet. These technologies would help improving the services offered by public institutions, as well as inducing greater citizen participation to the decision process. But electronic governance means more than building a web site. (Pardo, 2000). It's not only about using informatics technologies, but transforming the way through which the governance process is carried, from the services offered to the degree of usage of these services by the citizens. To reach its objectives, e-governance implies efforts from the authorities and citizens with an open mind.

[*] Ph. D. candidate, SNSPA, Bucharest (e-mail: andrei_elvadeanu@yahoo.com) beneficiary of the project "Doctoral scholarships supporting research: Competitiveness, quality, and cooperation in the European Higher Education Area", co-funded by the European Union through the European Social Fund, Sectorial Operational Programme Human Resources Development 2007-2013.

It's not very clear weather we should use the term e-governance or e-government (see Kettl, 2002, and Riley, 2003 for the difference between government and governance) but there seem to be a consensus regarding the benefits of e-governance in generating major political changes (Norris, 1999) such as reducing bureaucracy (Moon and Bretschneider, 2002) and, why not, improving democracy (Pardo, 2000).

This study consists in a web-site examination of the six Bucharest municipalities by applying the Rutgers E-Governance Performance Index. (Holzer 2009). The results are consistent with the studies of Holzer (2009) and Stoica & Ilas (2009).

A taxonomy of electronic governance services

There are three target groups that need taking into consideration when we speak of electronic governance: the Government, the citizen and the business class. These relate with three dimensions or relations on which we can build an analysis model of e-governance (Backus, 2001). The first dimension is built on the relation *Government to Citizen* (G2C) and contains the activities through which the Government offers online access to information and services to the citizen. In other words, citizen can ask questions on the public institutions websites and receive answers, can download forms, pay taxes and fines, renew their driver's licenses, make appointments, etc. The institutions can also disseminate information, offer online support and so on.

The second dimension of e-governance is that of *Government to Business* (G2B). It mainly focuses on private companies that are selling products or services to the public institutions and it translates through publicly-private partnerships in which private companies implement informatics solutions inside institutions, or the public institutions externalize some informatics services through private companies.

The third dimension of e-governance, that Backus presents, refers to the *Government to Government* relation (G2G). This dimension points towards those activities that take place between various institutions/agencies and implies using the information technologies to improve those institutions activities.

There is a fourth dimension too (Palvia & Sharma, 2007). It refers to the relation between the Government and the electorate (E-democracy). It involves online campaigns, electronic vote and online political engagement (actively participating to political debates on the internet).

Within all three dimensions discussed above, Mary M. Brown (2003) argues there are three types of actions that take place.

1. Posting information on the internet – i.e. information about the institution, work schedule, services, etc.

2. Bidirectional communication between the institution and the citizen, companies or other agencies. This way, the electronic services users can post comments or ask questions online.

3. Online transactions – tax payments, fines, etc.

Backus (2001) also considers four phases through which e-governance must pass on its way to maturity, three of which correspond to the model proposed by Brown (2003)

1. In the first phase, e-government means "being present on the internet, offering the public (G2C and G2B) relevant information" (Backus, 2001). This way, argues Backus, the first step for the public institutions web pages is to have a format similar to that of brochures, their main value being that of making information accessible online.

2. In the second phase, the interactions between the public and the Government grow through various facilities. People can ask questions, can use search engines, download documents etc. The big advantage of these facilities is that they can be used anytime, not only during the work schedule of the institutions.

3. In the third phase, the complexity of used technologies grows, but so does the added value of the offered services. The citizen can now make complete transactions online, without being forced to go to the public office. He can pay taxes, fines, permits, etc.

4. The last phase is complete when all informational systems are integrated, and the citizen can benefit from all services having to use a single virtual office.

Measuring the performances of electronic governance

The e-governance is a complex process, and trying to measure its performances can be a very provoking task. An exhaustive measurement attempt is both legitimate and costly. The research methods can vary from official statistics to qualitative and panel studies. International and regional comparative studies can also be carried on.

There are though some established research and study methods that have been carried on globally or locally. Still, there isn't a relevant study for Romania yet.

On an international level, there are a number of e-governance indexes. One of them is *The Telecommunication Infrastructure Index* (Palvia &Sharma, 2007). This index measures a country's ICT capacity: PCs/100 persons, internet users/1000 persons, telephone lines/1000 persons, online population/1000 persons, mobile phones/1000 persons, TVs/1000 persons. Another popular index is the *UN E-Government Index*[1]. This index is built by analyzing the governmental web pages at a national level. It measures aspects regarding site navigation easiness, offered information and services, participation and security. Romania is ranked on the 51st place from 191.

Research methodology

The instrument that I used for evaluating the websites of Bucharest municipalities replicates the method used by Holzer, *et al* (2007, 2009) and Stoica & Ilas (2009). It's a comprehensive index that contains 98 measures on 5 distinct categories: 1. Security/privacy; 2. Usability; 3. Content; 4. Service; 5. Citizen Participation (e-democracy). Table 1 summarizes the measures used and the Appendix A contains an overview of all the indicators. The maximum possible raw score is 219 and the weighted score is 100. Even if the number of questions differs for each dimension (18-20) and so does the raw score (25, 32 48, 59, 55), they received equal weight, so the maximum weighted score will be 20 for every one of them.

[Table 1] E-Governance Performance Measures (Holzer 2009)

E-governance Category	**Key Concepts**	**Raw Score**	**Weighted Score**	**Keywords**
Security/ Privacy	18	25	20	Privacy policies, authentication, encryption, data management, cookies
Usability	20	32	20	User-friendly design, branding, length of homepage, targeted audience links or channels, and site search capabilities
Content	20	48	20	Access to current accurate information, public documents, reports, publications, and multimedia materials
Service	20	59	20	Transactional services - purchase or register, interaction between citizens, businesses and government
Citizen Participation	20	55	20	Online civic engagement/ policy deliberation, citizen based performance measurement
Total	98	219	100	

[1] http://unpan1.un.org/intradoc/groups/public/documents/UN/UNPAN028607.pdf

43 items are dichotomous. These were coded with 0/1 and a few of them with 0/3. The other items were evaluated on a 3 or 4 steps scale (0, 1, 2 or 0, 1, 2, 3) where 0 indicates that for the respective site there is no information regarding the asked question; 1 the fact that information does exist; 2 the fact that the information can be downloaded (files of folders, audio or video documents); and 3 indicates the possibility of on-line transactions (payments for goods or services, applications for permits, the existence of certain data bases where information can be searched for, the possibility of using an electronic signature).

Here is the breakdown of the 5 dimensions used for the evaluation of the municipal websites.

Security/Privacy. This section regards two main areas: the existence of a privacy policy and the security of data on user authentication. I checked if the websites had a privacy policy, if it stated the intended use of gathered data or if it identified the institution that collected the data. Equally important were the protection of personal information when the user filled in online forms, storing information on secure servers, the use of cookies or web beacons or the disclosure of personal information to third parties.

Usability. Each web page should have been easy to use and easy to understand, fulfilling conditions such as a home page, navigation bar, site map, less than two pages length (the user should not have to scroll down more than two screen lengths). In addition, I looked if the page had search capabilities and advanced search features, such as search on specific departments (e.g. public works) or sorting of the search results.

Content. This dimension contains five key areas: access to contact information (phone numbers and/or e-mail addresses), public documents (budget, minutes of public meetings, multimedia materials (e.g. video records of meetings), disability access (for blind, deaf), and time sensitive information (last actualization of the website, up to date information).

Service. This area represents the ability of municipalities to provide their citizen with online services such as paying taxes online; pay fines online; filling online forms; apply for permits; the possibility of creating an online user account; downloading forms; a FAQ section, etc.

Citizen participation (e-democracy). This is maybe the most important dimension of all. On one hand, I checked for technical means offered by the municipalities to engage citizen such as discussion forums, the possibility for users to provide comments and feedback, the existence of online polls on specific matters or citizen satisfaction surveys. On the other hand, it was important to see if there was real participation and collective action through online petitions or online discussion groups between citizens and elected officials. Other issues addressed were the provision of a newsletter or bulletin boards and if there were any performance measures of the online activity.

For a detailed list of all five dimension indicators, see Appendix A.

Results

Table 2 shows the results of the evaluation for the six municipal websites in Bucharest. I also included in the evaluation the general city-hall for comparison purposes. As seen below, the general municipality (GM) obtained the best overall score (49.83) and also the best score on each of the five dimensions, except the "Content" dimension.

From the six district municipalities, District 3 has the best score (34.93), while District 5 registers the lowest score with 19.38. The overall average score was 32.02, the General Municipality included. This average is consistent with both the data obtained by Holzer, *et al* (2007, 2009) and Stoica & Ilas (2009), who used the same measure instrument.

[Table 2] E-governance rankings for Bucharest municipalities

Rank	District	Total	Security	Usability	Content	Service	Participation
1	GM	49.83	10.37	16.88	7.3	8.2	7.08
2	D3	34.93	0	16.25	7.3	7.21	4.17
3	D2	33.19	4.44	10.63	8.89	5.9	3.33
4	D1	31.52	2.96	11.25	7.3	4.59	5.42
5	D6	27.68	0	13.13	6.98	5.9	1.67
6	D4	27.61	0	13.75	6.35	4.59	2.92
7	D5	19.38	0	12.5	2.86	3.61	0.42
-	**Average**	**32.02**	**2.53**	**13.48**	**6.71**	**5.71**	**3.57**

Legend: GM – General Municipality; D1-6 – District 1-6

Looking at the table of results, we can easily observe that the "Usability" dimension received the highest scores for every district municipality and for the General Municipality, with an overall average of 13.48 points; whereas the "Privacy/Security" dimension registers the lowest scores, with an average of 2.53.

The very low scores in "Privacy/Security" (an average of 2.53 out of 20) show that there is almost no concern for personal data protection or for confidentiality. Four out of six district municipalities didn't even have a privacy policy, nor any security features for protecting the information required for filling out forms, for example. The ones that had a privacy policy had only a few features, none of them stating if the data gathered was stored on a secured server or if there were using cookies or web beacons to monitor and track the user's activity.

On the other hand, "usability" registered the best scores, showing that the first condition met is the technical one, most sites being user friendly and easy to use. Almost all of them had a site map, a home page, consistent color scheme throughout the page or a search button. The search button however was rather limited, without providing any options for advanced search or for sorting the search results.

In terms of "Content" the websites score also very low. There are downloadable documents and forms, some municipalities offer minutes of public meetings or information about the yearly budget. There can also be found contact numbers or email addresses in some cases. However, none of the sites provides searchable databases, format for persons with disabilities (blind, deaf), mobile versions or multimedia materials. The information was usually up to date, but it consisted in news about recent achievements such as festivities or national holidays. None of the websites offered up to date announcements such as calamities or traffic deviations.

The "Service" dimension scores low points too, with an average of 5.71 out of 20. None of the websites offered the possibility to pay utilities, fines or taxes directly on the homepage. In some cases (District 1 and 4) there is an electronic payment system but is either clearly stated that is not working or it cannot be accessed. Others don't have any electronic payment system or simply offer a physical address where taxes can be paid (District 5).

The last area is "Citizen Participation" or e-democracy. With an average score of 3.57 we can barely speak of citizen participation. Only the website of the General Municipality offers a discussion forum, and the site of District 1, where citizens can post comments on the mayor's blog. There aren't any features for making e-petitions (an online petition signed by a group of citizens) or discussion groups for online decisional process.

Discussion

The overall average of 32.02 (from a possible maximum score of 100) represents a rather low score, placing Bucharest on the 42nd place in the global ranking made by Holzer (2009). Seoul occupies the first place on this ranking system, with a total score of 84.74 points, while Baku (Azerbaijan) occupies the last place (87th) with an overall ranking of 7.78 points out of 100. The first European city is Prague, with 72.84 points and the last is Chisinau with 20.31 points. Among European cities, Bucharest's score is comparable to that of Copenhagen, Riga, Amsterdam, Sofia, Zurich and Istanbul (maximum difference of 5 points up and down) (Holzer, 2009). Table 3 provides an overall ranking of e-governance for European capitals, using the same measurement instrument.

[Table 3] E-governance rankings for European cities (Holzer, 2009)

Rank	City	Total	Security	Usability	Content	Service	Participation
1	Prague	72.84	16.7	17.62	13.02	13.86	11.64
2	Madrid	55.59	11.2	14.38	13.2	13.9	2.91
3	Vienna	55.48	16	11.88	12.8	6.44	8.36
4	Paris	52.65	12	13.13	12.4	7.12	8
5	Bratislava	52.51	13.6	17.5	9.2	7.12	5.09
6	London	51.96	13.6	15	8.8	9.83	4.73
7	Zagreb	50.16	9.6	13	12.8	7.12	7.64
8	Ljubljana	49.39	8	13.13	11.6	10.85	5.82
9	Lisbon	48.82	8.8	15	10.8	9.49	4.73
10	Brussels	48.01	12	16.25	11.6	7.07	1.09
11	Vilnius	47.5	10	13.44	11	7.97	5.09
12	Helsinki	45.61	10.4	13.75	13.2	6.44	1.82
13	Dublin	45.16	12	12.5	9.6	10.51	0.56
14	Oslo	44.76	2.4	15	12.8	9.83	4.73
15	Berlin	42.9	12.8	10.63	7.6	6.78	5.09
16	Stockholm	41.79	5.6	13.13	10.8	6.44	5.82
17	Warsaw	41.66	12.4	9.2	8	9.15	2.91
18	Tallinn	41.57	0	11.88	16.4	12.2	1.09
19	Moscow	40.1	4.8	12.5	8.8	7.46	6.55
20	Copenhagen	37.78	3.2	15.63	8.8	5.42	4.73
21	Riga	36.88	5.6	12.5	10.4	4.75	3.64
22	Bucharest	34.65	2.4	15.63	8	6.44	2.18
23	Amsterdam	34.27	2.4	13.13	8.4	7.8	2.55
24	Sofia	33.13	6.8	8.75	5.8	8.14	3.64
25	Zurich	32.65	0	15	7.6	6.78	3.27
26	Istanbul	30.93	0	6.25	11.6	10.17	2.91
27	Belgrade	28.65	0.8	14.38	6	4.75	2.73

28	Rome	26.85	6.4	8.13	7.4	2.37	2.55
29	Skopje	26.56	0	12.44	5.1	7.22	1.8
30	Kiev	25.45	4	8.75	4.8	6.44	1.45
31	Minsk	25.4	2.4	10	6	3.73	3.27
32	Athens	24.84	3.2	13.75	4.4	2.03	1.45
33	Budapest	24.76	2.4	9.38	7.6	1.02	4.36
34	Chisinau	20.31	1.6	9.38	7.2	0.68	1.45

The e governance score of Bucharest municipalities places the Romanian capital on the 22nd place among European cities, any score below 40 being considered as poor. (Stoica&Ilas, 2009). With an average of 32.2, Bucharest falls below the European average of 40.3. But the most interesting finding of this measurement is the distribution of the dimension averages which could point to a stadial evolution of e-governance.

The Bucharest municipalities score follows the following pattern: the best score is obtained by usability (13.48), followed by content (6.71) and service (5.71). Participation is fourth with 3.57 points and last comes Security with 2.53 points. While it seems normal for usability to have the best score, since it represents the first step to e-governance by first building a website, it also seemed that participation should have the lowest score, as the last step of e-governance. But the curious finding on Bucharest municipalities was that the security dimension came last. The security dimension is actually very important if all the other areas of e-governance are to work. Without the protection of personal information, neither participation, nor the providing of services can occur. The first two dimensions – usability and content represent only the first step of a two steps model: posting information on the internet and, second, interacting with the citizens. Providing services and electronic participation represent the second step of this model, personal data being needed to fill out forms, pay taxes or participate in online forums. As I was saying, usability and content are the easiest steps to reach, since it only involves the activity of the institution. For services and online participation, both people and institutions are involved. If the government provides electronic payments features, citizen will use them sooner or later, out of need or commodity. Participation comes a little later, since it requires a democratic and participative culture that can't evolve over night. But these two dimensions – services ad participation – can't occur if the personal information required isn't properly stored and protected.

To test if the distribution of the dimensions is resembles with other cities, I compared the Bucharest municipalities' averages with the European averages from Holzer's study (2009). Table 4 presents the results of the comparison.

[Table 4] E-governance dimensions distribution

Bucharest		**Europe average**		**Top 19 (above average)**		**Bottom 15 (below average)**	
Rank	**Score**	**Rank**	**Score**	**Rank**	**Score**	**Rank**	**Score**
Usability	13.48	Usability	12.7	Usability	13.62	Usability	11.54
Content	6.71	Content	9.51	Content	11.28	Content	7.27
Service	5.71	Service	7.27	Security	10.1	Service	5.18
Participation	3.57	Security	6.85	Service	8.92	Participation	3.57
Security	2.53	Participation	3.98	Participation	4.93	Security	2.47

Europe average – the average scores on all five dimensions for all European municipalities that had a website. Europe overall average is 40.3

Top 19 – the overall averages of the first 19 cities situated above 40 points

Bottom 15 – the overall averages of the cities situated under 40 points, Bucharest included

As it can be seen above, usability registers the best score on Europe average, as well as for the first 19 and the last 15. The same applies for content. The participation dimension comes last on the European averages score and the top 19 cities. Security comes last on Bucharest municipalities and on the bottom 15 cities. However, even if participation ranks better in the 5 dimensions distribution than in the European average and the top 19, the absolute score is still lower.

The concern for privacy and security seems to be lower on cities in early stages of e-governance development. The hypothesis I am proposing is that the higher the security score is, the higher the scores of the other dimensions will be. Looking at the table 4, the average security score for the first 19 cities is even higher than the services score. Usability remains relatively stable, but all the other absolutes scores are higher. This hypothesis would need further testing of course, but we can advance a simple explanation in this moment.

E-governance is not as simple as it looks. And it's doesn't come without risks either. We can speak about two types of risk: intrinsic risks and perceived risks. The intrinsic risks are the actual risks of e-governance. Online transactions involve always a degree of risk: the internet is not always stable; the web pages could be hacked etc. The storage of personal data is also a delicate matter. The law demands the protection of personal data and storing databases of user information online means a great responsibility from the institutions.

The perceived risks refer to the risks that users are or are not willing to take when using public online services. They can consider that the information offered is not accurate or reliable, could choose not to trust the security of the online transactions or the confidentiality of their personal data. All these perceptions of risk and trust issues can and probably have an impact over the usage of online services by users. These questions need another study besides this one, but they remain legitimate and could offer possible explanations on the electronic governance's performances in Romania and worldwide.

Other explanations for the overall low usage of electronic services can be the low internet penetration, low internet usage or the fact that citizens simply don't interact that much with public institutions. For data regarding this subject see the Agency for Governmental Strategies (2007).

One last possible explanation could be the fact that citizens consider using online public services as too complicate and, corroborated with the relatively rare usage, prefer to go in person to the institution building. (Dunleavy & Margetts, 2007)

Conclusion

Looking at the data presented earlier in this paper, we can see that the six Bucharest municipalities have a rather low score as compared to other European cities, being situated in the lower half. Even though they scored well on the "usability' dimension, this only represents the beginning in the road to successful e-governance. I keep the belief that the security dimension is the key to e-governance success. The low score in security and privacy could mean a refusal to govern through electronic means. The several privacy policies that I Identified stated clearly that the institution doesn't assume any responsibility regarding the loss of personal data, nor it can guarantee for the accuracy of the presented information. Failing to provide the security dimension, the service and participation dimensions cannot and will not evolve.

This paper has its obvious limitations and the explanations that I propose need to be tested using other methods too. The analysis of municipal sites can offer insightful information, but it doesn't cover many aspects such as the citizen's point of view, or the public institutions employees.

In addition, the analysis only covers the municipal websites in Bucharest and it doesn't have the pretention to represent the state of e-governance in Romania. What it does however, is to offer a small piece of a larger picture that is e-governance in general and in Bucharest municipalities in particular.

DISPUTE RESOLUTION AND MEDIATION ON CAPITAL MARKET

CRISTIAN GHEORGHE[*]

Abstract
Capital Market is usually depicted as a place for experts, for people with high trading skills. This is a half truth. There are entities established and functioning under strict scrutiny of Romanian National Securities Commission (RNSC), in compliance with Capital Market Law and regulations. There are also the investors, in many cases individuals involved in shares/financial instruments trade. In both cases disputes can rise. Disputes are inevitable a part of human interaction, hence the need for dispute resolution. First option is the judicial court system. Alternative dispute resolution comprises arbitration and mediation. Arbitration is an alternative choice to provide simpler, speedier and more accessible justice than ordinary courts as well as expertise in matters that are technical in nature and require special knowledge to adjudicate upon. Capital Market environment provides an institutional arbitration court for all participants, including investors. In many cases the agreement executed between participants under RNSC scrutiny The other option for settling disputes outside the court is mediation. Mediation can provide a much cheaper and quick extrajudicial resolution of disputes in commercial matters without time consuming procedures and rigid rules. Agreements resulting from mediation are more likely to be complied with voluntarily and are more likely to foster the commercial relationship between the parties. The interaction between investors and brokerage houses is based on investment services agreement concluded by parties. This is the usual framework for disputes between parties and the usual "landscape" for mediation on capital market.

Keywords*: alternative dispute resolution, regulated market, mediation, capital market, investment services agreement.*

Introduction

1. European laws and regulations lay down detailed rules regarding financial instruments trade, regulated market and investment firms. Directive 2004/39/EC, on markets in financial instruments (MiFID), was sought to establish the conditions under which authorised investment firms and banks could provide specified services in Member States. Following this European framework the Romanian law on capital market (Law no 297/2004) enacts certain rules regarding the interaction between investment firms and clients.

The document concluded by and between the firm and the client set out the rights and obligations of both parties and other conditions under which the investment firm will provide services to the client. The rights and duties of the parties to the contract may be incorporated by reference to legal texts. Our paper is intended to observe disputes that can arise from this business relationship - investment services agreement concluded by investment firms with their clients – and mediation alternative dispute resolution.

The subject is important because disputes are expenses and time consuming and clients need effective redress for their losses in order to remain interested on capital market trading. Mediation can satisfy investment firms as well as clients, preserving even their business relationship and "appetite" for trading on regulated market.

The contract between the investment firms and clients contains certain obligations prescribed by law. Investment firms shall establish and implement effective arrangements regarding an order execution policy to allow them to obtain, for their clients, the best possible result. Further, in order to enable clients to assess at any time the terms of a transaction in shares that they are considering and

[*] Lecturer, Ph.D., Faculty of Law, "Nicolae Titulescu" University, (email: cristiangheorghe.law@gmail.com).

to verify afterwards the conditions in which it was carried out, rules should be established for the publication of details of completed transactions in shares and for the disclosure of details of current opportunities to trade in shares. In this framework we intend to reveal circumstances in which disputes can arise and mediation can intervene.

Despite the extensive regulation of the financial services and the rules laid down for investment services agreement consisting in rights and obligations of the investment firms und the client for pursuing transactions in shares, the nature of this contract is still disputed by scholars. Some scholars consider the brokerage house is acting as a proxy for its client[1]. Others embrace the different legal status: the agent (investment firm) acts in his name, but on client's account[2]. Thus this investment services contact need scrutiny as well as mediation in such specific framework.

Investment services agreement – ground for disputes in Capital Market domain.

2. The investment firms defined by Capital Market Law has the exclusive right to operate on regulated markets, to provide one or more investment services to third parties and to perform one or more investment activities on a professional basis (investment services and activities means any of the services and activities listed in Directive 2004/39/EC, on markets in financial instruments (MiFID), Section A of Annex I relating to any of the instruments listed in Section C of Annex I).

Investment services contract entered into by investment firms and investors is the only framework in which investors could have their market orders executed on regulated market or MTS (multilateral trading system). This investment services agreement is a compulsory premise, the preliminary step for participants to enter trading ring in order to sell or purchase financial instruments.

Investment services agreement is a *sine qua non* condition in order to access the regulated market. On the other hand this contract is the ground for the most common disputes on the capital market, the disputes between clients and investment firms. The alternative dispute resolution for such situation can rest in mediators' hands.

The Bucharest Stock Exchange offers a regulated framework for dispute resolution: Arbitration Chamber of Stock Exchange[3]. Its regulations set the procedure for settling cases borne by operations concluded on regulated market or on alternative trading system (ATS) operated by BSE between participants (authorized firms) on trading system of BSE, between participants and issuers which securities are admitted to regulated market operated by BSE and between clients and participants (investment firms)[4]. The last situation is borne by investment services business relationship. Besides the arbitration, mediation is an alternative approach for such dispute resolution.

The content of the investment services agreement.

3. Investment firms can be authorized to execute orders on own account or on behalf of their clients. In such cases firms should implement procedures which provide for the prompt, fair and expeditious execution of client orders und they should undertake a bundle of obligation laid down in a predefined contract. The regulation on investment services and activities[5] aims clients' protection and market integrity. According to relevant provisions an investment firm shall provide investment

[4] Participants are the investments firms authorized to operate on a specific market.

[5] RNSC Regulation no 32/2006.

services according to a contract "in written form, on paper support or other durable support" which shall comprise rights and obligations of the firm and client[6].

The minimum content of the contract laid down by the law encompasses the framework within which the firm-client business relationship shall evolve.

Investment services and activities provided and financial instruments traded[7]. Investment services agreement shall have a defined object agreed upon by parties concerning the investment services and activities and the securities such services applied on (this should include appropriate guidance on and warnings of the risks associated with investments in those instruments or in respect of particular investment strategies)[8]. The contract shall include the types of securities (shares, bonds, and derivates) without specifying an individual financial instrument. This last one will be pointed by orders given to broker on the basis of the contract, orders that represent part of a transaction concluded on a regulated market.

Rights, obligations, term and other conditions under which the investment firm shall provide client with investment services. Specific rights and obligations can be added to legal framework of the investment services contract the clauses will reproduce the appropriate legal provisions. Regulation states already the behaviour and the minimal content regarding the parties' rights in the investment services contract. If special communication channels are intended (i. e. phone orders or orders via e-mail) parties should expressly agree such alternatives (including electronic signature if applicable) including recording and preserving these orders for proofing purposes.

Investment firm have to ask the client to provide information regarding his knowledge and experience in the investment field so as to enable the investment firm to assess whether the investment service or product envisaged is appropriate for the client or not. In case the investment firm considers, on the basis of such information, that the product or service the client asks for is not appropriate to him, the investment firm shall warn the client or potential client about this risk[9].

Interests, currency exchange, estimated charges. Investment services contract shall comprise in a comprehensible manner all the ancillary obligations as well as the interests accrued to sums deposited by clients, currency exchange rates, etc.

Investment services agreement shall include clauses regarding investment services agreed upon by parties including the broker's fee and other estimated costs and associated charges incurred by orders execution.

General conditions for alteration and termination of the contract shall be included too.

Without prejudice to the right of client to bring their action before the court, the regulations encourage private bodies established with a view to settling disputes out of-court[10]. Parties can agree upon arbitration clause, denying court jurisdiction and ensuring out of court dispute resolution. Such clauses exclude legal "ability" of a court to exert jurisdiction over parties and reveal the parties' appetite for alternative solution, including mediation procedures.

The consequences of client-firm business relationship based on investment services agreement. The agent's duties and disputes that arbitration or mediation can deal with.

4. The record of the client-firm business relationship comprises the extent of the outcome of the contract, rights enjoyed by parties. Such extent of rights and obligations governs the future

[6] Directive 2004/39/EC („MiFID"), Art. 19, para. 7. The investment firm shall establish a record that includes the document or documents agreed between the firm and the client that set out the rights and obligations of the parties, and the other terms on which the firm will provide services to the client.

[7] RNSC Regulation no 32/2006, Art. 110, 119.

[8] Ibidem, Art. 19 para. 3.

[9] Ibidem, Art. 19 para. 5.

[10] See Commission Recommendation 98/257/EC of 30 march 1998, on the principles applicable to the bodies responsible for out-of-court settlement of consumer disputes.

behaviour of the parties and arbitrates the disputes that orders execution can arise. The clients could claim that the agent breach the contract and could find out remedy for their inflicted damage.

Damages inflicted by breach of contract usually applied to agent's behaviour contrary to client's best interest in orders execution on market or in financial instruments portfolio management.

The investors can fill with the court or access out-of-court procedure like arbitration or mediation. Investment services and activities record covers the obligations of both parties. Investors shall cover all costs and associated charges revealed by agent and shall comply with all requirements to support the agent in providing his services. Most of the disputes in this domain are borne by failure of the agent to comply with legal standard laid down for executing clients' orders. Mediation procedure can support the process of indemnifying investors for their losses as a result of misleading behaviour of the agent or his brokers.

5. The obligation of investment firm to act honestly, fairly and professionally in executing the client's orders. The most important obligation of the investment firm consists in receiving and executing orders communicated by clients and fulfilling the procedure requested for securities transactions on behalf of client. The investment firm receives specific orders that conclude a sell-purchase agreement in the form accepted by a regulated market. The brokers receive orders in a form established by regulated market rules (limit orders, stop losses orders, market orders, etc.) and are supposed to execute them in accordance with the best interests of clients.

Following the principal agent theory, the broker acts in his name (or in the client's name) but on the client's account. The property of securities as well as the price to be paid stands finally for the client. He remains the beneficiary of the bundle of rights incurred by fulfilled transactions.

6. A possible conflict can arise in case of "self-contracting" situation, when the investment firm acts both on behalf of its client and on own account, in the same transaction. That means, for example, that investment firm is buying what client selling or firm selling what client is buying, client being represented in transaction by the same firm.

In case of "self-contracting" situation the investment firm aims for maximum consideration in exchange for its offer. Generally speaking such expectation can conflict with the interest of the counter-part whose interest should be defended by "opponent".

In such situation dispute resolution and particularly mediation should start from observing the market quotes made public by market operator on a reasonable commercial basis.

In this case, concerning a regulated market that makes public quotes based on independent transactions, good commercial practice accepts this kind of contract[11]. In this situation the investment firm can deal directly with its client. The balance of consideration given by parties is verified by full disclosure in the benefit of the client who have to be inform about the particular transaction and be able to evaluate personally the protection of his interest in that transaction[12]. These are the reasons why "self-contracting" situation is allowed in this domain, the client's interest being observed with no effort by the client itself.

Any discrepancy between the quotes revealed by the market operator and the reported price entitles the client to indemnification, dispute that can be solved in a mediation framework.

[11] Commercial Code, Art. 411. Romanian provisions regarding commission (agency like) agreement: When the agent is ordered to buy or sell bill of exchanges, T-bonds or other bonds, existing on the market and goods, with quotation prices on an stock exchange or market, he can provide such titles or goods on his name as a seller or to receive on himself as a buyer such goods he was ordered to sell on principal account paying current price notwithstanding his payment, if principal doesn't forbid such operations.

[12] Law no 297/2004, Art. 27, para. 1: „... to reveal to clients all the material information regarding agreements in which the agent is contracting on his own account".

7. Conduct of business obligations when providing investment services to clients. Obligation to execute orders on terms most favourable to the client. The agent should carry out his obligations "in good faith and at professionally standard" - requirements stated by scholars as a distinctive agent's obligation[13].

On the capital market this obligation is transposed in the principle of "best favourable execution" of orders the investment firms are receiving from their clients. Investment firms should take all reasonable steps to obtain, when executing orders, the best possible result for their clients, taking into account price, costs, speed, likelihood of execution and settlement, size, nature or any other consideration relevant to the execution of the order[14]. Investment firms are obliged to establish and implement effective procedures and order execution policy to allow them to obtain, for their client orders, the best possible result[15].

The order execution policy implemented by investments firms will allow them to act honestly, fairly and professionally in accordance with the best interests of clients as well as ensuring an equal treatment of them[16].

Any failure in implementing such principles can create disputes between investment firm and clients. The client can employ the services of a mediator in order to settle such conflicts.

Other examples of inappropriate agent behaviour are: client financial instruments or pecuniary resources theft, unauthorized borrowing, surety or any kind of encumbrances on client financial instruments undertaken by investments firm, disposing without written consent of the client, direct or indirect, of his assets, executing market orders with sole intention of misleading on proprietor real identity.

Some revealed agents' or brokers' behaviour is prosecuted as criminal offence.

8. There are fraudulent practices of the investment firm that harm the clients' interest. So called marketing techniques or even (dishonest) advertising which are widespread in commercial practices are strictly forbidden on capital market.

Other illicit agents' practices can encompasses providing information from undisclosed sources as confidential information in order to deceive clients and make them give market orders, providing misleading, incomplete or exaggerated information about a financial instrument in order to determine client to pursue transactions regarding such instrument, false promising or guaranteeing the client future profit from transaction executed on market, etc. Securities industry doesn't support common commercial ad and prohibits misleading investors and client enticement. Investment firms are obliged to provide investors public, correct and documented information.

Against good practices in domain are such practices too: the priority given to own agent's order against previous clients' orders, excessive trading on clients account with sole end of generating trading cost for the firm, using clients assets for fulfilling agent's obligation, any payment (reward, bonus, etc.) in the benefit of the broker aside the framework of the parties contract, etc[17].

9. Conflicts of interest. Investment firms shall take measure to identify conflicts of interest between themselves, their managers, employees and tied agents, or any person directly or indirectly linked to them by control and their clients or between one client and another that arise in the course

[13] St. D. Cărpenaru, *Romanian Commercial Law*, (Bucharest: All Beck, 2004), 479. Capital Market Law asks for agent to act „honestly, impartially and with professional care in order to protect investors interest and uphold the market integrity" (Law no 297/2004, Art. 27 al. 1).

[14] MiFID (Directive 2004/39/EC), Art. 21. Nevertheless, whenever there is a specific instruction from the client the investment firm shall execute the order following the specific instruction.

[15] RNSC Regulation no 32/2006, Art. 137.

[16] Ibidem, Art. 102.

[17] Ibidem, Art. 163.

of providing any investment and ancillary services, or combinations thereof[18]. We have two kinds of potential conflicts of interest: between investment firm and clients and between different clients working with the same agent.[19]

In order to avoid such conflicts of interest the law enforces simple rules: clients order have higher priority than own agent's orders and the investment firm shall execute received orders from clients on chronological basis: first received order shall be first initiated and executed in regulated marked[20].

Even so, whether the internal regulations made by the investment firm in order to avoid or manage conflicts of interest "are not sufficient to ensure, with reasonable confidence, that risks of damage to client interests will be prevented, the investment firm shall clearly disclose the general nature and sources of conflicts of interest to the client before undertaking business on its behalf"[21].

10. The agent's obligation to report operation executed on client's behalf. The client must receive adequate and detailed reports on the services provided by the investment firm on his account[22]. Such obligation is ordinary in agency theory law. Agent shall inform principal on all operations pursued in his account[23].

Reports concluded by investment firm shall include all relevant data and, where applicable, the costs associated with the transactions and services undertaken on behalf of the client.

Reports shall be made available for investors on contractual basis. Competent authority will be provided with detailed reports too, in order to ensure transparency and to uphold the market protection. Investment firms shall keep at the disposal of the competent authority, for at least five years, the relevant data relating to all transactions in financial instruments which they have carried out, whether on own account or on behalf of a client. "In the case of transactions carried out on behalf of clients, the records shall contain all the information and details of the identity of the client The reports shall, in particular, include details of the names and numbers of the instruments bought or sold, the quantity, the dates and times of execution and the transaction prices and means of identifying the investment firms concerned"[24].

From contractual perspective client is entitled to receive from his agent adequate reports describing operations executed on his behalf. Although, the investment firms keeps his position of services provider who doesn't guarantee the executing of orders irrespective of regulated market evolution. In fact the fulfilling of orders stand for other participants: central counterparty, clearing house, etc.

Conclusions

11. The business relationship between investors and their brokers is governed by the investment services contract, an agent-principal relationship type. The best favourable execution, the obligation to execute orders on terms most favourable to the client can rise disputes between client and broker. Mediation can be a solution for any situation when broker fails to comply with professional and contractual standards.

Clients are put in the position to defend their rights as they receive full report concerning order execution and they are in the position to observe and compare their concluded transactions with market quotes displayed by market operator. This comparison should represent a tough ground for

clients' rights defence. Mediation renders an appropriate framework for dispute settlement and confidentiality the parties are seeking for.

Investment firms are keen to mitigate the echo of their disputes with clients and on the other hand these clients appreciate a rapid and fair redress for their losses. Nevertheless the capital market is a specialized domain that needs expertise of an arbiter or mediator rather than a common commercial court expertise.

However present law asks for conciliation prior to filing with the court in commercial disputes, conciliation that can be realized through mediation procedure.

Investment services agreement and obligations borne by it can be the framework for pursing a success mediation process and rendering a solution equitable for both parties involved: investment firm and clients.

ENVIRONMENTAL CONFLICT MEDIATION

GABRIELA G. MIHUT*

Abstract
At a time of global economic crisis followed by resource crisis, a period in which the world seeks alternative resources through eco-investment, environmental conflicts are inevitable. Romania is among the few countries that do not pay enough attention to environmental conflicts and to the advantages to of solving them through mediation procedure. The present paper deals with areas in which conflicts can be applied in environmental mediation and its benefits.

Keywords: *environment, mediation, conflict, gases, pollution*

Introduction

Permanent changes of the economic, standing controversy between the right to economic development and the right to live in a space that continues to provide optimal living conditions led to the emergence of environmental conflicts.

To conserve resources and to ensure optimum life of the inhabitants of the planet, international organizations have developed the principle of sustainable development.

Sustainable development is development that allows the current needs of present generations without jeopardizing the ability of future generations to meet their own needs.

Such a development aimed at equitable and balanced use of natural resources. Any unfair or unbalanced use can give rise to a environmental conflict.

Conflict resolution becomes necessary when resource area priorities conflict.Confrontation polarizes parties that need to sit together, to communicate in order to find resolution. Most of time communication communication was in the form of public participation, this being the form of solving conflicts.It must be stressed that most of the time it has been one-sided that is why conflict were not solved. That is why most of the countries began to orient themselves to resolving conflicts through mediation. Mediation , a form of alternative dispute resolution [1]allows the presence of a third party that supports communication between the parties.

Alternative Methods of Dispute Resolution – ADR were originally defined as means of resolving disputes outside the state judicial system through procedures conducted by a neutral and impartial third party.

In recent years, in many states, have been established the legislative or by rules of the arbitration court, two of alternatives methodes of dispute resolution such as mediation and judicial conciliation.

Section 1 Classification of ADR-s

In the wide acceptance, ADR includes mediation, conciliation, mini-trials (mini-Trials), assessments done by experts (Expert Determination)[2] , arbitration, etc.

* Lecturer, Ph.D.,Faculty of Law, "Nicolae Titulescu" University, Bucharest, Romania (e-mail: gmihut@ mihut ro, www mihut ro).

[1] ADR

[2] Expert determination (ED) is a voluntary process in which a third party which is usually an expert specialized in the dispute arose giving a solution that binds the parties.Unlike the arbitrator, the expert is not bound by the rules of procedure, excepte the rule of having a proper behavior.ED is common especially in the construction industry.

But most authors provides a clear demarcation between the ADR and arbitration and therefore a narrow definition has been formulated excluding arbitration and expert assessments from the category of proceedings, called ADR.

In U.S. ”dispute resolution” gradually includes various alternative methods of dispute resolution depending on the requirement of the other party and third party participation and the rights and obligations of the last.

In practice are considered alternative methods different types of procedures annexes to judicial courts or abitration.

1.1 Types of Alternative Methods of Dispute Settlement

It seems extremely interesting how ADRs evolved in US and types of ADRs. We still intend to present these forms.

It is appropriate to takeover this by the Romanian system too, as much more, now, when in Romania was regulated by the law 192/2006 only mediation.

1.1.1.Inaction

Inaction is the most commune form of dispute resolution and consists in voluntary withdrawal of at least one of the parties in dispute.

Given the fact that any dispute involves two parties, when one party, the injured,is not seeking for the other than the dispute is resolved. This part choose the method of dispute resolution and its solution.

Another form of inaction is to be completed by the attitude of a party to sit and wait to see what happens. The other party may choose, consciously or unconsciously,the inaction or may choose a method of settlement that would lead to a better solution for it.

Finally,*inaction* may occur as a result of abandoning negotiation and claims by one of the party.In this case the parties begins to negotiate and the injured party formulates claims that the other party can reject them.The injured party withdraw deciding in this manner dispute resolution.

Not only the injured party can use inaction as a method of settling disputes.Even the party that caused the injury can use inaction but,in this case,inaction takes the form of expectations to see what happens. This method is effective only if the other party decides not to act.

The party knows the loss that will suffer but knows the fact that the action to obtain compensation is not without risks and costs.

1.1.2. Compliance / Total Concesivity

Compliance may take the form of action or inaction. This occurs when one party requests the other to act in a certain way and the second complies and does what was asked or refrain.

1.1.3 Compliance and Negotiation

Although the two alternative methods of dispute resolution might seem similar however they differ significantly whereas,in case of negotiation,if the parties agrees than there is a contract which is based on an exchange of positive or negative counter-prestations.In compliance the party that formulates the claims has no obligation.

1.1.4 Self-help

This method is to satisfy their own interests by the party who is injured, without court intervention.The action to meet the claims on its own has to be legal.

A concrete example would be the beneficiary that claims non-conformity of construction work and withheld the last rate of payment that would have to pay as compensation or of the bank that takes possession of the property purchased from the loan(mortgage or pledge)to cover part of the prejudice.

Very interesting is the practice of the Anglo-Saxon legal systems that divides this form of ADR in one based on status and one based on common law.

In the US is considered, especially, provisions of the Uniform Commercial Code which for example,authorizes the buyer who has accepted goods to use self-help under revocation form of the

acceptance of the goods delivered and their return to the seller if non-conformity substantially diminishes the value of goods.

1.1.5 Negotiation

Negotiation is seen as being the form of ADR involving two warring sides, that tries to seek resolution of their conflict without using a third party. In this case, the parties are involved in a process that involves compromise on their part.

In identifying possible solutions, the parties shall consider the facts and the legal provisions.

The parties will think which should be strengths or weaknesses of their position in the event of a dispute.

The agreement concluded by the parties has the value of a contract in which each party undertakes to do, to give or not to do something in exchange for consideration of the other party. (quid pro quo[3]).

1.1.6 Early Neutral Evaluation -(ENE)[4]

ENE is a procedure for specific purposes other than those that are meant to enable parties to reach settlement of their dispute.

It has its origins in 1985 in northern California where district court provided the parties neutral evaluation procedure.

ENE's stated goals are:

1. determination of the parties to confront the strengths of their positions with those of the opposing party;
2. identification since the beginning of the parties dispute of the facts and the law;
3. provide an objective evaluation of the case;

ENE can be organized as an independent procedure that takes place after a party brought an action in court or can be incorporated into a court-sponsored mediation procedure.

In the first case, after placing the action, parties follows an evaluation session led by a lawyer named by court which makes an objective assessment of the case.

If the assessment is incorporated into the mediation procedure, the mediator will establish a private meeting with the parties and their lawyers.In this meeting the mediator assess the strengths and weaknesses of the case and predict the result of the dispute. As a result of this anticipation,the mediator can push the parties to reach a solution.

This type of mediation is different from facilitative mediation where the mediator doesn't push but encourages the parties to discuss possible solutions.

1.1.7 Trial by Jury Summary(TJS)

Represents legal proceedings ordered by the judge in those cases where the state court case and no applications were filed.

It is headed by a judge or magistrate and start by choosing a jury. Counsel for parties submit the case and evidence to the jury obtain a verdict from them.

The entire procedure is brief and lasts two days. The verdict is advisory and doesn't bind the parties.

This trial is recommended especially in cases where the parties have unrealistic expectations regarding the solution.

Parties may choose for a private summary trial with jury. This type of trial is different from the previously indicated by the fact that in this case the parties are those who chooses the rules of conduct of the proceedings.

---

[3] Martin A. Frei –*Alternative Methods of Dispute Resolution*, Ed.Thomson,Delmar Learning, 2003,pag.101;

[4] In England ENE may be conducted by a person possessing legal knowledge but also by a person who does not possess such knowledge. It is clear that in assessing strengths and weaknesses of the position of the parties, assessor shall not consider and legal provisions applicable in case, as it proceeds in case of self-help but and summary trial - see in this respect Hazel Genn – *Mediation in Action. Resolving Court Disputes without Trial*, Ed.Caloust Gulbenkian Foundation, 1999, pag.15 ;

Very interesting seems Trial by Jury Summary where conflict is serious and the stakes are high.In this case,one party may request to TJS that the other party cannot participate. The purpose of such judgments would be to test the jury to see their reaction to their own case and their own expectations.

1.1.8 Ombuds

It is a procedure involving a third party which doesn't represent any person and to whom it is addressed by a person a specific problem.

Ombuds has its own independence and must be impartial and maintain confidentiality of information available when they carry out informal investigations.

Ombuds institution's takes three forms:

1.1.8.1*.the form of classic ombuds*

In case of this form,the third party is officially named and is attached to a state or federal administrative agency.

Its role is to assist the public in how to deal with the thicket of rules and administrative procedures of the institution. Moreover, it addresses to the relevant institutions issues raised by the public about the actions or policies of public institutions or individuals within those institutions without their advocacy.

1.1.8.2 the form of *organizational* ombuds

The third is an employee of public or private organization that reports directly to the people in the organization's management.

It receives complaints of members of the organization (employees, contracting parties, students, educational institutions, etc.).and help them resolve informally and respecting the principle of confidentiality. It also alerts the organization's top management on major issues.Neither in this case the third party doesn't argues in favor of applicants.

1.1.8.*3* *the form of ombuds defender* in which the third party contractor, named in public or private section,pleads in favor for those who requires their services.It is often met in medical field and of licensing,etc.

Ombuds after hearing the party,gathers the information and helps it to clarify the problems and to find possible solutions to resolve the conflict.

Although it is not intended to resolve the problems of the party that notifies it, however, dispute resolution can be achieved after discussions with the party that caused the problem.

1.1.9 Private mediation

Private mediation is the consensual process,planned,led by a neutral and impartial third party *facilitating* discussions between parties in an attempt to help them to resolve their dispute by concluding an agreement.

In some systems the mediator is more active by proposing solutions to the parties.

The mediation is called private because it is entrusted to a private mediator and it is not held under the the auspices of the court.

1.1.10 Mediation Funded by the Court

It is the type of mediation, known in some legal systems such as the Anglo-American, where the procedure is conducted by a judge, a magistrate or a special mediator appointed by the court.The last one,usually, sometimes, is the mediator called adjunct settlement judge(ASJ).

This type of mediation was ADRs which enjoyed its greatest success in the U.S.

1.1.11 Mini - Trial

Mini - Trial is the type of procedure used in solving disputes between companies.

The procedure consists in an abbreviated trial, reduced, taking place in front of a presidium composed of three persons, one representative of each company, part of the conflict and a neutral third party.

The procedure takes place in two stages.In the first stage the presidium listens to the lawyers arguments of the two companies and attend a formal presentation of evidence.

Later, the Presidium has the opportunity to interogate the parties.

The company representatives,being in presidium,hears mostly, for the first time the details of the dispute from its own lawyers as from the lawyer of the opposing party.

The end of the procedure runs between the two representatives of the parties from presidium without the participation of the lawyers of both companies.

The involvement of the neutral third party in procedure differs from a mini-trial to another.Sometimes it has an active role and in other cases the role of consultant.If our neutral third party is there when the two representatives are meeting to negotiate a solution than he will have the role of mediator between the two.If the third party is not there the two representatives will negotiate directly with each other the solution.

The third party can have many roles:may advise the parties regarding technical and legal aspects, may question witnesses and parties lawyers, may prepare a summary or analysis of the case etc..

This procedure seems very interesting. It is interesting the changing position of representatives of both parties,from leader to „judge"or adminstrator of the procedure in the second phase of the mini-trial.

It is also interesting the role of the third party in this procedure that depends on the will of both parties involved and progressivelly evolvs from a passive attitude (that of consultant if the parties requires opinion)up to a very active one,being able to interogate witnesses,lawyers of the parties,etc.

This procedure is different from *negotiating session(settlement conference)*in which the third neutral party negotiates with the parties and mediates between them and of *summary trial by jury* where the advisory jury pronounce a consultative decision.The difference is in the fact that in this case the two representatives of the presidium of the parties are those who solves their dispute.

We cannot avoid mentioning the fact that, this procedure shows the great disadvantage of the fact that in the situation in which the parties don't reach an agreement, risks disclosing their strategies to the other party.

It also appears as being interesting the fact that,this procedure of ADR is the only one applicable or especially in commercial disputes and,more accurate,in those in which the parties are the companies.

1.1.12 Private Arbitration

Private Arbitration is that procedure by which the parties refer to a third party, a group of neutral third parties or an institution that examine evidences and issue a decision based on law.

The parties are usually those that sets the arbitration procedure and the decision of the arbitrators is mandatory for the parties.

In this procedure the parties are entitled to decide that this decision is not compulsory for them.

The decision pronounced by arbitrators is final and can not be appealed only on grounds of unconstitutionality of the procedure or abuse of arbitrators consisting in violation the obligation of discretion. [5].

1.1.13 Arbitration courts handed

It is defined as a form of arbitration that has become a public process because of their takeover by the courts.

The procedure is common in some states in the US that have developed special programs of arbitration and, unlike private arbitration which is voluntary, this is mandatory.

The procedure starts after the introduction of legal proceedings and takes the form of an abbreviated process.

The arbitrator is appointed by the court from a list of arbitrators accredited by it.

[5] Martin A. Frei - op.cit., pag.223

Unlike the private arbitration this type of arbitration is compulsory and follows the procedure established by the court(not chosen by the parties)and the pronounced decision is not compulsory for the parties.

They may ignore the decision and request the court the proceedings from the beginning as no arbitration had occurred.

We will not insist on this type of arbitration being seen only in civil actions not in the commercial one that is the subject of this report.

1.1.14 Mediation-Arbitration (MED-ARB)

It is a procedure composed from mediation and arbitration.

In MED-ARB,the parties agrees that the procedure to begin with a private mediation and if the conflict between them cannot be stopped with an agreement to continue with a private arbitration.

Depending on the agreement of the parties,the arbitrator may be the same person with the person of the mediator.

The particularity of this procedure lies in the fact that priority is given to parties's agreement and in the end of the procedure,if such an agreement is not established,the conflict will be settled by an arbitration decision.

1.1.15 Litigation

It is not considered as a general rule, a form of ADR.

1.1.16 Private Judgement (RENT-A - Judge)

It is that procedure, considered as the ADR right, in which the parties choose to submit the conflict between them to a private trial conducted by a neutral third party, usually a former judge, a law professor, lawyer, etc.

Private Judgement may be under a contractual provision or the permission of such judgments may result from the law.In this last case, the parties addressed the court for appointment of the third party who will lead the proceedings.

Such a "judge" doesn't have the power of a court judge. In addition, the trial procedure is determined by the parties, parties may limit the decision rendered by setting financial limits minimum and / or maximum, that will determine whether the decision of the judge is mandatory or not, if it is motivated or not, etc..

If the decision is mandatory it can not be appealed by neither of the parties because of error or misapplication of the law by the judge.

British legal system knows the following forms of ADR:arbitration, early neutral evaluation, conciliation and mediation.

Section 2 Environmental Conflict Mediation

2.1. Definition of mediation

Mediation is defined as an unofficial procedure / informal in which a third party, called mediator, assist parties in reaching an agreement that will lead to dispute settlement.

The mediator has no power to take decisions or to give solutions which obliges the parties.

2.2 Areas in which mediation takes place in Romania

Mediation can be performed areas like : waste management, water pollution and air pollution, environmental damage on urban issues (cutting of trees, construction, development of parks, etc.), infrastructure management, collaboration with public sector institutions, public services (sewerage, water supply, etc.), etc.

Mediation or Arbitration, are possible in those conflicts that aims the rights that the parties may have.

Mediation is not recommended in clear cases, in those in which the party does not want mediation but wishes to obtain the opinion of a third party or a public rehabilitation.

In contrast to these cases, that misses the purpose of using the mediation procedure or the good faith that is necessary to such procedures, it is found that it is useful in cases in which parties

are involved in a business relationship because usually they want to continue business and not getting justice, reason that will make concessions to reach a compromise, a mutually satisfactory solution (ie - parts of a license agreement).

2.3 Mediator

Complex environmental conflicts are most often related to social, economic and cultural. Therefore, such a conflict mediator must be a highly qualified person, to have knowledge in the field and ability to work with specialists. Most often such conflicts necessitate an evaluation of environmental management, requires the opinion of a chemist, engineer, etc.

Law 192/2006 does not provide additional conditions to the general ones to give mediator the right to mediate such kind of conflicts. Therefore, any person who has lawfully acquired the status of mediator could mediate un environmental conflict**.**

In fact, such a mediator will not have the necessary skills to support the parties in finding a mutually satisfactory and lasting solutions.

2.4. The type of mediation which can be use in international and in Romanian conflict

Countries as Austria, USA, Germany offers both the evaluative and facilitative mediation. Romania allows only facilitative mediation.

Facilitative mediation, the only one known by our legal system is that the mediator offers or provides to parties an assessment of the situation that is not meant to bind parties.

In *evaluative* mediation, the mediator has the power to assess the situation and propose a solution in which parties may accept or reject it.

Although the law 192/2006 does not offer this option, in practice is used more frequently this type of mediation rather than the facilitative mediation. The explanation would be that skills in communication, empathy and negotiation of the Romanian side involved in the conflict are not developed, lacking the ability to defuse the intra-and interpersonal conflict itself and finding a solution. Therefore, the mediator finds itself forced to overcome the limits of facilitating a discussion, to support the parties in finding a solution and him providing potential solutions.

INSURING CONSISTENCY WITHIN THE WIPO'S UDRP DECISIONS ON DOMAIN NAMES LITIGATIONS

BEATRICE ONICA JARKA *

Abstract
The paper presents the need of insuring consistency within the domain name litigations starting with the adoption of the UDRP as a mean to insure uniform dispute resolution and continuing with the creation and application of the different practical instruments of insuring consistency identified and used by the few providers of UDRP services. The paper shall focus on the UDRP's application by the WIPO Mediation and Arbitration Center and the consistency issues under UDRP, by analyzing the working instruments of insuring this consistency at the level of Administrative Panel's decision and how these instruments are thought within the UDRP WIPO's practice. Further the paper shall analyze the correspondence between the independence of the Administrative Panel and the consistency issues and shall conclude on the need to insure consistency as a prerequisite for predictability and stability of the domain names dispute resolution.

Keywords*: UDRP, practice, consistency, methods, Administrative Panel*

Introduction

Since its creation by ICANN[1] in 1999, the Uniform Dispute Resolution Policy (further called UDRP) have become a constant alternative dispute resolution for the solving the disputes in connection with the domain names. The scope of the UDRP is limited to the abusive registration of the domain names with the infringement of third parties trademarks rights. According to the UDRP, in case that an infringement of the trademark rights occurs by the registration of a domain name, the trademark holder may ask, based on UDRP: the transfer or cancelation of the disputed domain name. The Administrative Panel appointed by the UDRP providers based on a UDRP complaint, shall grant the request for transfer or cancelation if three conditions are cumulatively fulfilled: the disputed domain name is similar or identical with a trademark in which the complainant has rights, the respondent has no rights or legitimate interests in the disputed domain name and the disputed domain name had been registered and used in bad faith.

The UDRP had been thought as an instrument universally applicable for the trademark infringements by an abusive registration of a domain name. Such universality was meant, considering the universality of the internet virtual space, from different legal perspectives, namely the UDRP provisions have no national law reference, the lists of Panelists available on domain names dispute resolution providers websites contain reputable specialists in intellectual property all over the world, therefore with different backgrounds corresponding to different law systems, the Rules for UDRP (further called as "the Rules" as the UDRP itself do not include national law reference and the

* Lecturer, Ph.D, Faculty of Law, „Nicolae Titulescu" University, Bucharest (email beatrice.onicajarka@ cunescu ro)

[1] ICANN stands for Internet Corporation for Assigned Names and Numbers. ICANN was formed in 1998 as a not-for-profit public-benefit corporation with participants from all over the world dedicated to keeping the Internet secure, stable and interoperable. It promotes competition and develops policy on the Internet's unique identifiers. Through its coordination role of the Internet's naming system, it does have an important impact on the expansion and evolution of the Internet. Following WIPO conducted consultation process on domain names including the dispute resolution and the recommendation of WIPO for the institution of a policy to be followed uniformly by all registrars in the .com, net, and .org TLDs, ICANN approves on 24th of October the UDRP and the implementation documentation. WIPO becomes the first provider of UDRP. For more details see information available at http://www.icann.org/ en/udrp/udrp-schedule htm

Supplemental Rules adopted by each dispute resolutions services providers[2] do no make more national specific the application of the UDRP. Therefore, the universality of the UDRP has to be supported also by a consistency in application of the said rules so no fundamentally contradictory decisions would rise at least from the application of the UDRP, the Rules and Supplemental Rules as applied firstly from different national law perspectives and secondly based on each Administrative Panel's personal understanding perspective of the UDRP.

The need for consistency in the UDRP practice appears not only in the application of the UDRP by each international provider but also from the perspective of general UDRP practice at the level of the four international existing UDRP providers.

The consistent UDRP application has a strong relevance also considering the provisions of paragraph 4 j[3] from UDRP which provides for the availability of Court procedures, before or after the administrative proceedings initiated by the domain name holder takes place. The initiation of the recourse to the Court proceeding, after the UDRP proceedings, suspend the implementation of the UDRP decision by the Registrar until the Registrar receives (i) evidence satisfactory to it of a resolution between the parties; (ii) evidence satisfactory to it that the domain name holder lawsuit has been dismissed or withdrawn; or (iii) a copy of an order from such court dismissing the domain holder lawsuit or ordering that the unsatisfied party do not have the right to continue to use the disputed domain name. In other words, the holder of the domain mane unsatisfied with the UDRP decision has the possibility to address the Court of competent jurisdiction for an independent dispute resolution from the UDRP application.

Moreover, the need and scope of consistency is determined, as in any dispute resolution practice, either ADR or judicial, by the need of predictability of the UDRP practice.

This article shall analyze the need and scope for consistency within the UDRP practice of first approved by ICANN of the four international providers of domain disputes resolution – the WIPO Center for Mediation and Arbitration, the practical implementation instruments initiated by the said provider to assist the UDRP practice itself in building its consistency, while comparing with the others providers implementation and focusing on the internal as well as external determinations and effects of such consistency.

---

[2] Complaints under the Uniform Dispute Resolution Policy may be submitted to any approved dispute-resolution service provider as approved by ICANN. The list of approved providers by ICANN at February 20th , 2011 available at the internet address: http://www.icann.org/en/dndr/udrp/approved-providers htm ,

The Czech Arbitration Court Arbitration Center for Internet Disputes, Dispute Proceedings/Decisions: http://www.adr.eu/adr/decisions/index.php

[3] According to paragraph 4 letter j from **UDRP:** "*The mandatory administrative proceeding requirements set forth in Paragraph 4 shall not prevent either you or the complainant from submitting the dispute to a court of competent jurisdiction for independent resolution before such mandatory administrative proceeding is commenced or after such proceeding is concluded. If an Administrative Administrative Panel decides that your domain name registration should be canceled or transferred, we will wait ten (10) business days (as observed in the location of our principal office) after we are informed by the applicable Provider of the Administrative Administrative Panel's decision before implementing that decision. We will then implement the decision unless we have received from you during that ten (10) business day period official documentation (such as a copy of a complaint, file-stamped by the clerk of the court) that you have commenced a lawsuit against the complainant in a jurisdiction to which the complainant has submitted under Paragraph 3(b)(xiii) of the Rules of Procedure. (In general, that jurisdiction is either the location of our principal office or of your address as shown in our Whois database. See Paragraphs 1 and 3(b)(xiii) of the Rules of Procedure for details.) If we receive such documentation within the ten (10) business day period, we will not implement the Administrative Administrative Panel's decision, and we will take no further action, until we receive (i) evidence satisfactory to us of a resolution between the parties; (ii) evidence satisfactory to us that your lawsuit has been dismissed or withdrawn; or (iii) a copy of an order from such court dismissing your lawsuit or ordering that you do not have the right to continue to use your domain name*"

The consistency subject is of utmost importance within the UDRP practice as it is in general within the ADR and judicial practice, as consistency represents the basis of creation of confidence and stability in the dispute resolution. Moreover the consistency implementation instruments created by the domain dispute resolution providers may serve, despite of being determined by specific causes as the generally common regulations of the trademark rights and by the universality of internet, as a good model which adapted would be able to be function also within the national legal orders.

1. Legal framework

The legal framework shall consider the UDRP, the Rules and the Supplementary Rules adopted by the WIPO Mediation and Arbitration Center in respect to the domain name dispute resolution as well as the practice of the Administrative Panels under the UDRP within the Center.

2. Consistency created by UDRP practice itself

The UDRP, the Rules and the Supplemental Rules adopted by the WIPO Mediation and Arbitration Center provide any express requirement for consistency.

The UDRP represents a common body of substantive and procedural rule rules.

In addition to UDRP, the Rules and the Supplemental Rules provide for the procedural framework in which the UDRP cases are considered by the WIPO Mediation and Administrative Center.

The UDRP had been thought as a hybrid mediation/arbitration scheme[45] operated primarily by private entities based on a contract – the Registration Agreement- concluded among the parties responsible for the registration of the domain name: the registrant, the registrar and ICANN. The contractual nature of the UDRP supplemented by ICANN with the Rules and further by each dispute resolution providers with the Supplemental Rules created a significant freedom of appreciation by the Administrative Panel of the domain names disputes.

In this sense, the UDRP provides at paragraph 10 the general powers of the Administrative Panel, which instructs the Administrative Panel to

- conduct the administrative proceeding in such manner as it considers appropriate in accordance with the Policy and these Rules.

- to treat and ensure that the Parties are treated with equality and that each Party is given a fair opportunity to present its case.

- to determine the admissibility, relevance, materiality and weight of the evidence.

Moreover, according to paragraph 15 letter a from UDRP, the Administrative Panel shall decide a request under a complaint on the basis of the statements and documents submitted and in accordance with the Policy, these Rules and any rules and principles of law that it deems applicable. Such freedom of appreciation provided for the Administrative Panel by the UDRP may be considered to create apparently the premises for inherent inconsistency among the UDRP decisions.

The determinations of such inherent inconsistency are related to the universal character of the UDRP together with a flexible wording of the UDRP, the globalization of the trademarks and the last but not the least to the freedom of legal appreciation that an UDRP Administrative Panel has in deciding an UDRP case. While UDRP creates substantive rules based on which an Administrative Panel has to decide the transfer or cancelation of a disputed domain name namely the identity or similarity between the disputed domain name with a trademark, the lack of the rights or legitimate interest of the disputed domain name holder, the registration and use in bad faith of the disputed domain name, the universal character of the UDRP leads to the application of such substantive rules

[4] For more details see David W. Maher, The UDRP: The Globalization of Trademark Rights, IIC, The International Review of Intellectual Property and Copyrights Law, Max Planck Institute for Intellectual Property, Competition and Tax Law, Vol. 33, 8/20, pp 924 -948, ©Verlag, CH Beck, oHG, Munich available at the internet address: http://dmaher.org/Publications/globaliz.pdf.

in connection with two different determinations: the national law background of the trademarks registration and the national law background of the Administrative Panel which resolve the domain name dispute. Such determination cannot be avoided despite the universal UDRP application and universality of the internet virtual space. Apparently, there is no room for creating a consistent UDRP practice under the said determinations. Moreover, the lack of any consistency requirements under the UDRP, the Rules and the Supplemental Rules may weaken the chances for a coherent consistent UDRP practice within the same dispute resolution provider. An example of the flexibility of the UDRP language which would encourage inconsistency is the provisions at paragraph 11 – language of proceedings –letter , which states that "*unless otherwise agreed by the Parties, or specified otherwise in the Registration Agreement, the language of the administrative proceeding shall be the language of the Registration Agreement, subject to the authority of the Administrative Panel to determine otherwise, having regard to the circumstances of the administrative proceeding*". It is evident that the rule of having the administrative proceedings conducted in the language of the Registration Agreement has different exceptions which give the Administrative Panel the freedom and flexibility to decide in any way based on the circumstance of cases even against the rule.

While, internally, within each UDRP dispute resolution providers there is no rule providing for consistency, externally the existence of four different UDRP dispute resolution providers may worsen the situation, as no specific instrument contractually provided requires the insurance of UDRP decisions consistency among the decisions issued by the different providers.

The UDRP, the Rules and the WIPO Supplemental Rules present the flexibility and a reduced formalism specific to ADR which makes the ADR preferable to the judicial dispute resolution.

As presented, the administrative proceedings under UDRP contain all the internal and external determination possible to result in an inconsistent practice.

In spite of such determinations, consistency had been initiated through the UDRP practice itself. It cannot be denied that an important body of Administrative Panelists on WIPO Administrative Panelists list[6] came from the common law systems which valuate the precedent as a source of law. This body of Administrative Panelists marked the UDRP practice and initiated the consistency practice. Moreover the need for predictability and stability in their own legal systems became more and more important in the Administrative Panelists[7] with German Law background and contributed to a convergence of opinion in continuation of the trend of the consistency within the UDRP practice.

It was the UDRP Administrative Panels that considered that UDRP should not be a roulette wheel[8]; that they should aim for a high degree of consistency (which is the basis for predictability).

From the WIPO case, 3636275 Canada, dba eResolution v. eResolution.com, D2000-0110**[9],** the WIPO UDRP decisions had initiated and valuated the precedent considering that "*The jurisprudence which is being rapidly developed by a wide variety of Panelists world-wide under the ICANN Policy provides a fruitful source of precedent*". In the case, Time Inc. v. Chip Cooper[10], D2000-1342, which decided the transfer of the disputed domain names "lifemagazine.com", "lifemagazine net", lifemagazine.org", the Administrative Panels went further and has underlined the consistency which imposes itself from the need of predictability and stability of the UDRP practice: "*The majority believes that the UDRP procedure should be governed by the rule of law, rather than*

[8] See information available at the internet address: http://udrpcommentaries.wordpress.com/2010/09/30/predictability-and-consistency-in-application-of-udrp-jurisprudence/

[9] The decision is available at the internet address: http://www.wipo.int/amc/en/domains/decisions/html/2000/d2000-0110 html

[10] The decision is available at the internet address: http://www.wipo.int/amc/en/domains/decisions/html/2000/d2000-1342 html

by the individual consciences of the Administrative Panelists. If a principle enunciated in a decision is well-reasoned and repeatedly adopted by other Panels, the majority believes that absent compelling reasons which require a determination otherwise, the rule established should be respected. The majority believes that potential users of the UDRP are entitled to some degree of predictability. Counseling one who is considering filing a Complaint should consist of more than, "It depends what Administrative Panelist you draw."

Nowadays, the consistency is also valuated in the UDRP jurisprudence as an act of control in the case, Pantaloon Retail India Limited v. RareNames, WebReg[11], D2010-0587 (WIPO June 21, 2010, the Administrative Panel considered that: "*There is a substantial consensus among Administrative Panelists that the acquisition and offering for sale of domain names and/or using them to provide links to other sites may well (provided it is not directed at trademark misuse in breach of the Policy) be a legitimate business, a business engaged in not only by Respondent but by other operators who acquire and "warehouse" domain names which they think others might consider valuable. Whether that consensus is justified may be a matter for debate, but in the opinion of the Administrative Panel there is a strong body of precedent which, though not binding, is strongly persuasive*".

The UDRP practice serves as a good example of the self-imposed limitations of the Policy dictating the judgments under the UDRP.

Self building of such role by the UDRP WIPO practice determined the administrative management of the WIPO Mediation and Arbitration Center to identify, in consultation with the Administrative Panelists and develop instruments to ease the application and following up of the consistency. In this sense the Center developed chronologically in this order the full on line posting of all decisions at http://www.wipo.int/amc/en/domains/decisions.html, Center's online Legal Index of WIPO UDRP Administrative Panel Decisions at the address: http://www.wipo.int/amc/en/domains/search/ **,** Search WIPO Cases and WIPO Decisions at address: http://www.wipo.int/amc/en/domains/search/, the WIPO overview of WIPO Administrative Panel Views on Selected UDRP Questions at the address: http://www.wipo.int/amc/en/domains/search/overview/index.html and finally the Selection of UDRP related cases at the address: http://www.wipo.int/amc/en/domains/challenged/ . These instruments represent equally the framework and the means to insure the persuasive body of precedent necessary to maximize consistency within the WIPO UDRP practice.

4. WIPO consistency implementation instruments

Self building consistency within the WIPO UDRP practice has been facilitated and increased by the implementation instruments analyzed below. It is necessary to note that all these instruments may be used in supplementing each other with the final purpose to enhance predictability and stability within the WIPO UDRP practice through consistency.

4.1. The posting of all WIPO decisions

The Center provides for the online posting of all WIPO decisions. The Decisions are organized and posted per years with the indication of the case number.

4.2. Index of WIPO UDRP administrative panel decisions

The index of WIPO UDRP Administrative Panel Decisions represents a valuable instrument useful in the UDRP practice equally to the Administrative Panelist but also to the dispute parties. The index offers identifications on two main categories of all the WIPO UDRP decisions: decided WIPO Cases by domain names categories and a legal index. The Legal Index contains also supplementary

[11] The decision is available at the internet address: http://www.wipo.int/amc/en/domains/decisions/text/2010/d2010-0587 html

an identification of the WIPO decision considering legal categories under UDRP as the legal categories under UDRP substance or UDRP procedure.

4.3. Search WIPO cases and decisions engine

The search WIPO cases and decisions instrument creates several search engine which facilitates the identification of an WIPO decisions considering criteria as full text search on WIPO Administrative Panel Decisions, search WIPO Cases by Domain Name, or search by named complaint or by the named respondent.

4.3.WIPO overview of WIPO administrative panel views on selected UDRP questions

One of the most useful instruments in assisting equally the Administrative Panelists and UDRP applicants in the consistent application of the UDRP is the WIPO overview of Administrative Panel views on selected UDRP questions. While for the Administrative Panelists the WIPO overview is a mean to identify the majority Administrative Panel views on legal issues which commonly arise, in the interpretation and application of the UDRP for the latter is a mean to stability and predictability of this practice. The WIPO overview is deemed to be an informal overview of Administrative Panel positions on what is considered to be key procedural and substantial issues.

According to the information available at the address http://www.wipo.int/amc/en/domains/search/overview/index.html, the WIPO Overview uses questions andimplies and evaluation of opinions based on the 7,000 UDRP cases the WIPO Mediation and Arbitration Center has administered through February 2005.

This instrument is clearly stated as having a non binding nature, as it is the nature of prior Administrative Panels decisions. Each Administrative Panel is free to make its judgment in the particular circumstances of each individual proceeding and each case party is responsible for making its own independent assessment of decisions relevant to its case.

4.3. Selection of UDRP related cases

As mentioned above consistency implementation instruments serves building consistency among the UDRP decisions based on the persuasive although non - binding nature of the UDRP precedent. In addition the Center created a further instrument, this time external for creating the consistency through the posting of selection of UDRP related cases in the national Courts. The effects of such selection of related UDRP cases represents an useful instrument to consider the UDRP decisions from the perspective of the external effects of such decision in case of Court challenge under the national jurisdiction

5. Other UDRP CONSISTENCY IMPLEMENTATION INSTRUMENTS

Other UDRP providers offer to their UDRP Administrative Panels data base of all cases under their administration with specific search engines which facilitates the identification of the decision. National Arbitration Forum is going even further in assisting the Administrative Panels in their work for building the consistency and supplements the Administrative Panel appointed in an UDRP case with a memo with the possible legal standings on the three cumulative conditions for the transfer or cancelation of disputed domain name according to the specific elements of the case. The memo is drafted by the National Arbitration Forum and documents the eventual legal standing on prior UDRP Administrative Panel decisions. It has to be noted that the National Arbitration Forum memos are always documented not only on the NAF UDRP Administrative Panels decisions but also on decisions adopted by the UDRP Administrative Panels under all the domain name disputes resolution providers. As in WIPO case, neither the prior NAF Administrative Panels' decisions nor the memos are binding for a Administrative Panel appointed in a domain name dispute.

6.The need for consistency and the independence of the Administrative Panel

The Rules contain at paragraph 7, express provisions regarding the impartiality and independence of the Administrative Panels solving the domain name disputes, and the mandatory disclosure of any circumstance giving rise to the justifiable doubts as to such impartiality and independence.

While the matter of independence has generally the meaning of absence of any bias deriving from direct prior activities of the Panelist appointed, a question arises also as to the biasing nature of the self built consistency within UDRP practice. May any one say that the self stated consistency need, the persuasive nature of the precedent may be considered a bias to the appointed panelist? Could a panelist be kept by the body of precedent in taking the decision under UDRP?

The instruments presented above are clearly stated as having a non binding nature. Finally it is the UDRP, the Rules and The Supplemental Rules which governs the adoption of the UDRP decision by the Panel, and they do not impose consistency and offer enough flexible wording to allow the Panel to decide even against the acknowledged UDRP practice if the circumstances of the case and his understanding of the case represent the basis of solid line of reasoning. This is ultimately the beauty of the UDRP which allows for the building of an extensive UDRP practice enriched with the valuable national law systems diversity.

7. Conclusions

Drawing conclusions on the consistency within UDRP practice, it s worth to underline that in spite the lack of specific rules for insuring consistency, the practice itself built such consistency from a natural need for stability and predictability. It was the merit of the UDRP services providers to identify and develop the necessary practical instruments for assisting the Administrative Panel in further building consistency with the UDRP practice, while leaving the legal creativity of the panelists to add value to the different questions of interpretation and application of UDRP.

There is a lot to learn from the model initiated by WIPO as an UDRP provider for encouraging the consistency. While developed for the specific circumstances of the trademark rights globalization under UDRP, the WIPO model could be adapted and used for the implementation of consistency at national level.

MANDATORY CLAUSES IN MEDIATION CONTRACTS

VERONICA STOICA*

Abstract
The mediation contract – a contract by which conflicting parties agree, in conjunction with a mediator, upon conflict resolve in an amiable manner through the agency of mediation, under due efforts on the mediator's part, in exchange for payment of a fee by the parties – must contain a set of mandatory clauses in compliance with legal provisions, Article 45 of Law no. 192/2006. In the absence of one of said clauses, sanction by absolute annulment is imposed.

***Keywords**: mediation contract, mandatory clause, mediation agreement, mediant, mediator.*

Introduction

In a society where conflicts[1] are increasingly numerous and complex, and their resolve does not yield solutions compatibile to the developmental degree of our society, enforcing a law that create prerequisites for improvement of judicary activity and ensure the nascence of a space of liberty and security for citizens becomes imperative. Accordingly, by dint of Law nr. 192/2006[2], the legislator considered that, via mediation, dialogue should be brought back into society and solutions in differences found according to a win-win type, not a win-lose type of scenario. One of such modalities to solve extant conflicts between two parties is constituted by mediation, that presents itself under the form of a contract[3] legalising the will of parties to prevent or extinguish a conflict.

Presentation

The mediation contract is a contract by which the parties at conflict agree, in a presence of a mediator, to resolve the differences in an amiable way, under assistance of a mediator, under due diligence on the mediator's part, in exchange for payment of a fee by the parties.

Any contract, therefore, also a mediation contract, is subject to several types of legal rules: some are general, notwithstanding the contract category, whereas others pertain to a specific contract category[4]. The Civil Code includes a corpus of rules applicable to contracts in general (Book III, Title III, Art. 942 and following), and, accordingly, to mediation contracts, setting forth the valid

form (consent, capacity, object, cause, formal conditions). Concurrently, Law no.192/2006 covers rules exclusively applicable mediation contracts

Article 45 in the Law imperatively ennumerates the clauses to be mandatorily included in mediation contracts.

The first clause to be included in a contract is in reference to the identity of the conflicting parties or, as is the case, their representatives (Article 45 letter 'a' in the Law). Accordingly, mention must be made of the following: last name, first name, domicile (registered office, should one of both parties be a legal person), as well as any other data deemed by parties as necessary or an aid to assure celerity and efficiency in conflict resolution. We notice that the lawmaker only makes reference to the "identity of the parties at conflict", not to the person assisting in conflict resolve, i.e. the mediator, who, in his/her turn, is a party to the contract. As a result, albeit not provided by the law, identification data of the latter must be included[5]. There are situaitons where one of the parties is unable to physically attend mediation; in such cases, the Law allows for representation via proxy[6]; in this case, personal data of the representing party must be included.[7].

Article 45 letter 'b' of the above Law provides a further mandatory clause on contract type or object. Mediation addresses any type of conflict[8] lending itself to this manner of resolve, thus the parties must, in conjunction with the mediator, clear the aspects in the case that shall be subjected to mediation procedure. The contract shall include the actual state of conflict, accurately described in order to allow for identification of main aspects, to prevent, should confusion or doubt arise, interpretations that could jeopardize the resulting solution.

A further clause to be included in the mediation contract is in regard to "a statement of the parties ascertaining prior information on the mediator's part on mediation, the effects thereof and the applicable rules thereto." (Art. 45 letter 'c' in the Law). This clause is aimed at constituting a guarantee to the fact that parties have freely opted for mediation and that the mediant has met his/her obligation to inform the parties. To this end, the mediator is under obligation of granting clarifications to the parties regarding the act of mediation, i.e. to offer information as to the aim, rules and effects of mediation, on the relations constituting the object of mediation.[9] With regard to the effects of mediation, the scope must be significantly extended than in the case of trial, due to the fact that, as a result of mediation, the parties may resume or cease their relations in an amiable and mutually advantageous manner. In addition, the mediator must explain the principles and procedures

[5] To exemplify: Office for Mediation….. founded by Decision of Mediation Council No.……of ….. with a registered office in ……street…no....bl…..county…. Tax Code No.….and bank account ……..opened at…..via mediator….;

[6] The situation commonly arises in conflicts where one or both parties are legal persons;

[7] A party's proxy is not to be confused with a person allowed to be present in mediation, along with the parties (Art.52 in the Law);

[8] Types of conflicts that may be extinguished by resort to mediation procedures are, as follows: mediation of insurance conflicts (e.g. interpreting and seeing through an insurance contract, cautions in absence of payment, conflicts between insurance companies), mediation in the area of consumer protection, relevant should the consumer claim the existence of damages following purchase of e.g. flawed products or services; mediation in the labour area (co-worker relations, employer-employee relations); mediation in the family area (divorce, child custody); mediation in the business environment, in the sphere of intellectual property, in the educational area (relationship teacher-student), in criminal litigations, in the medical area. It must be mentioned that, in mediations involving children, mediators should primarily have the prevalent interest of the child at heart, which a.o. implies the right to benefit from protection by mediation. The European Network of Mediators founded in 1997 is aimed at the implementation of the Convention of Childrens' Rights in Europe.

[9] Expert literature makes reference to "informed consent" , i.e. consent granted by a person in order to facilitate an event; it is based on a selective presentation of facts needed to consciously take a decision (G.Falk, G. Koren, Kommentar zum ZivMediatG, Verlag Österreich, Wien, 2005, p. 537);

surrounding mediation, his/her and the parties' role in the procedure, highlighting the parties' right to decide decide in a mediation process[10].

The fourth clause included in the Law makes reference to "the obligation of the mediator top safeguard confidentiality and the decision of the parties on keeping confidentiality, if need be" (Art. 45 letter 'd'). By the very nature of his/her profession, the mediator is a repository of the conflicting parties' "secrets" subject to mediation, and, at the same time, is the "addresee" of comunications of a private nature. Incidentally, a relationship of trust must be established between the mediator and the parties; in the absence of a confidentiality guarantee, trust cannot persist. As a result, the professional secret is acknowledged as a fundamental right and duty of a mediator; this obligation must not extinguish at the time of mediation cessation and is permanent (Art. 32 of Law no. 192/2006). The same confidentiality obligation rests with the parties, bearing in mind that they are for the first time confronted in order to identify the roots of their conflict; thus, the lawmaker must allot increased attention to the patries' private lives.

A further clause that must be a mandatory part in a mediation contract is relative to "the commitment of conflicting parties to observe the rules appliocable to mediation" (Art. 45 letter 'e'). The conclusion of a mediation contract is based on agreement of parties to resort to said procedure and, accordingly, to abide by the rules imposed under law in amiable conflict resolve, in order to reach a solution convenient to both conflicting parties.

The next clause that constitutes due part of a contract covers "the obligation of conflicting parties to pay due fee to the mediator and the expenses incurred by him/her on behalf of the parties, as well as the ways of deposit and payment of said amounts, including cases of mediation forfeit or insuccess, as well as the ratio to be covered by the parties, considering their social standing, if possible. If not agreed upon otherwise, the amounts under issue shall be covered by parties in equal amounts".

The mediator is entitled to receiving payment of a fee[11], fixed in negotiation; this fee must be reasonable[12] and take into account the following criteria: the nature, the novelty and the object of the conflict subject to mediation, time alloted by the mediator to the mediating sessions[13], the importance of interest under question, the results obtained to the parties' benefit; this must unfold relative to the number of parties, upon consensual agreement therewith. As a consequence, a mediator's activity is lucrative; to this end, the contractual parties must agree with the mediator upon his/her due fee. However, concurrently, other expenses incurred in the process of mediation must be provided for[14], as well as ways of deposit and payment of said amounts. Under law, the parties are given leeway in establishing the quantum of the fee to be payed by that each one; if the parties have not agreed therein, the fee shall be paid in equal amounts. The right to receive a fee is guaranteed under

[10] In the The Code of Ethics and Deontology, under 2.1.3 it is shown that: "The mediator shall inform the parties, at the onset, of the scope and nature of his/her activity and on the fact that the final decision lies exclusively with the parties; in addition, the parties are allowed towithdraw from mediation procedure at any time."

[11] In actuality, the right to receipt of fee is regulated under provisions of Art. 26 in the Law: "The mediator in entitled to payment of a fee fixed with the parties via negociation, as well as to refund of expenses incurred during mediation";

[12] In *The Mediator's Code of Ethics and Deontology* under 2.7 it is stipulated that: "Mediators shall inform the parties with regard to their fee, whereas the total value of the fee and expenses incurred during mediation procedures must be fair and justified. They shall explain to the parties the manner of calculation and the value of the fees, as well as the refund of expenses.";

[13] By way of example, Art. III.10 of *Recommendation (2002) 10 on Mediation in civil matters by The Minister's Committee of the Council of Europe*: "Should mediation imply expenses, then these expenses must be reasonable and on a par with the importance of disputed matters; at the same time, they must take heed of the work load on the part of the mediator.";

[14] Thus, added expenses incurred in the act of mediation shall be covered by the parties (phone, fax, means of transportation), based on receipts, whereas contingencies (hiring experts), payed to the parties' benefit and on their approval, and shall be presented in detail, e.g. in an annex to the contract;

provisions of Article 48 in the law; according to this article, with regard to the parties' obligation to pay the due fee, the mediation contract has an imperative character, which allows for the legal exercise of force in the absence of voluntary delivery of obligation. We deem that, in order to increase the dimension of an act of justice and of the citizen's trust[15], mediation - in order to receive wider recognition - should, at least in the beginning, be partly free of charge, or the fees lower, to encourage a justice seeker to gain more courage in resorting to this procedure.

Should mediation be forfeited or terminated, payment must be partly refunded, under conditions stipulated in the mediation contract, and not in direct ratio to the undergone mediation stages, as provided under the prior law, that has seen no amendments under Law nr. 370/2009.

A further clause that must be included in a mediation contract is with regard to "agreement of the parties on the language of the emerging mediation" (Art. 45 letter 'j' in the Law). The lawmaker has included said clause into the category of mandatory clauses, given the option that some of the differences (commonly, in the field of family law or commercial law) bear an international trademark, bestowed by the nationality of the legal person or by the citizenship of the natural person; as a result, mediation must take place in a language known both to parties and mediator. This is imperative, as, in mediation, a resolve convenient to all conflicting parties implied must be reached.

The penultimate mandatory clause in a mediation contract is with regard to "the number of copies in which the agreement shall be drafted, ahould this agreement be in a written form, corresponding to the number of signatory parties to the mediation contract".

Should the conflicting parties reach a consensus via mediation, this may assume the form of a written agreement, to comprise all the clauses agreed upon; these clauses shall not touch upon the rule of law and public order. The agreement is commonly drafted by the mediator and has the value of a writ under private signature. Moreover, the agreement represents the result of common efforts on behalf of the parties opting for mediation procedure, who, with the competent aid of the mediator, have reached a negociated and unanimously accepted agreement. The agreement shall be drafted in a number of copies tantamount to the number of parties involved in the mediation process.

The last mandatory clause in a mediation contract refers to "the obligation of parties to sign the procesul verbal drefted by the mediator, noywhjistanding the way in which a mediation is concluded". In observance in the Law of symmetry, a mediation procedure ceases as it has commenced, i.e. by an consent of will of parties and mediator. The minutes constitute a distinct writ of potential agreement between parties. Altough not provided by the law, the minutes must contain the data of parties, the mediation result, expressed will of parties to end the mediation process, as well as the parties' signatures. The minutes must be issued in a minimum of as many copies as the number of signatory parties.

As is apparent a.o. from the contents of Article 45 of the Law, the absence of one of the afore-mentioned clauses in a mediation contract is sanctioned by relative annulment. By amendment in the Law no. 192/2006, the lawmaker has offered a more amiable solution, by mention of the sanctioned compared to absolute annulment previously stipulated; we deem the prior sanction excessive; absolute annulment is meant to safeguard the general interest and therefore allows the opportunity for a vast number of persons seek cessation of the concluded legal act by defeating norms created to protect this interest. By contrast, relative annulment may be cited, as a rule, solely by the person in the interest of whom the legal sanction has been ruled. Wee deem the enforcement of the latter sanction as more natural, as the very reason behind the act of annulment is safeguarding a private interest. The affected contract party is the most knowledgeable to ascertain whether his/her interest has or has not been affected as a result of unobservance of legal provisions created for his/her protection and thus, is the person of the utmost competence to ask for protective annulment.

[15] Thus, if a large number of conflicts is solved by way of mediation, it follows that the courts of justice face a smaller file load, thus enabling magistrates to allot more time to the case study and, as a result, rule with significantly increased chances of committing legal errors.

Conclusions

As a conclusion, the mediation contract must formally observe both general conditions dictated the Civil Code, mandatory in any legal act, and certain specific conditions imposed by the regulating Law. Such conditions are meant to highlight the peculiarities of the mediation contract, a distinct legal form aimed not solely at engendering social relations but also at predecessing the extinguishment of a legal conflict relation through a third party agency. Under consideration of the fact that the conflicting parties wish to settle their conflict in resorting to negotiation via mediator, it has to be made clear that they have neither forfeited, nor intend to forfeit a private interest, which lends a markedly personal character to rights nascent of their voluntary agreement. Thus, the necessity of mandatory clauses to individualise the mediation contract arises (e.g. the mediator's obligation to safeguard confidentiality, and the parties' decision on safeguarding confidentiality, if this be the case, Article 45 letter 'd' of the Law). Moreover, the involvement of a mediator in resolving a difference can not be deplete of legal consequences.

The mediator, a legal expert, does not have to play an active role in the mediation activity; thus, the necessity of further specific mandatory clauses in individualising a mediation contract arises (e.g. a parties' statement ackowledging prior information on the part of the mediator, with regard to mediation, its effects and applicable rules, Article 45 letter c'' of the Law).

Imposed under reservation of annulment, these clauses are mandatory and meant to induce to the parties circumventing legal dispute the confidence that resort to mediation is an apt, efficient and convenient means to protect and meet personal a interest.

PRACTICAL ASPECTS OF MEDIATION

IULIA FLOCA *

Abstract
Today the Romanian state gives some advantages to those who use mediation. If the Romanian state would take further steps, mediation would work as in the countries with old tradition. The article refers to success and failure got in the two years of practice. The mediation can be seen in two aspects: The first aspect regarding the mediation itself can lead to a mediation agreement. The mediation agreement gives both winnings to the conflict parts and professional satisfactions to the mediator. The second part concerns the mediation contract. It is very important for the mediator who wants to practice and to gain money. The mediation will work in Romania when the mediator passes from the pro-bono stage to winnings. The article refers to the conditions of the appearance of mediation in Romania, the purpose for which it was founded, the usefulness of mediations to relieve the number of court cases and increase the efficiency of the courts, as well as the results obtained from the adoption of the mediation laws until now. The practical aspects leading to the mode in which Romanians perceive mediation and wish to participate or not in the sessions of mediation Recommendations for promoting mediation in Romania

Keywords: *mediation, mediator, conflict, contract, law*

1) Introduction

Mediation is a new domain in Romania, which has bearing on legal and social matters and that gave birth to a new profession, namely the profession of the mediator.

This paper tries to answer why it is so important to know the advantages of mediation, to know the progress made by mediation but also to know the difficulties encountered and their causes.

The work of a mediator is described in a couple of words. There are also many advantages, which the Romanian state can grant to those who wish to resort to mediation and sanctions for those who do not wish to respond to an invitation to mediation to address the other side of the conflict. The article gives a concrete answer in regards the aspects that make mediation difficult. Diverse theories have appeared n specialized literature regarding mediation. This work is the result of practices in mediation by an authorized mediator and tries to be one of the first works regarding the aspects of practice in this new domain. The work proposes and indicates legislative proposals aiming to promote mediation and real functions of mediation in Romania.

2) The Conditions for the Emergence of Mediation

Romania had to meet certain obligations imposed by the conditions of accession in order to join the European Union.

One of these obligations was the adoption of the Law 192 / 2006 on mediation which defines mediation as "an optional way of settling disputes amicably, with the help of third party individuals specialized in mediation, in conditions of neutrality, impartiality and confidentiality and with the free consent of both parties".[1] Article 1 paragraph 1 Law 192/2006

Under the authority of the European Commission to streamline the justice system, measures were initiated to identify how the European Union's recommendations on mediation were put into practice, starting with a monitorization program of many states, among which Romania was included.

* Lawyer; Office of Mediator Iulia Floca (e-mail: flocaiulia@yahoo.com).
[1] Article 1 paragraph 1 Law 192/2006

Under these conditions, Romania has had to adopt a series of legislative measures able to integrate mediation as a new profession that can increase efficiency and relieve the courts, improving the quality and efficiency of the justice system.

Mediation is a new profession, which with difficulty is making its place among the other known professions in Romania.

There have been many events organized to promote mediation, but the procedure is still unknown to the general public.

There exists a difference between the understanding of the word "medium" in the Romanian language and its meaning "something brought at medium level" and the understanding of the word "mediation" as an alternative dispute resolution procedure.

In legislation terms such as school mediator, health mediator worker or family mediator have appeared, but they have nothing in common with the significance of the word that denotes the new profession of mediator.

Today in Romania mediation is still perceived as a compromise.

Mediation is not a compromise, mediation is a procedure by which independent parties, with the help of a third party, come to realize the source of the conflict between them and identify possible ways to stop the conflict, and from this, through mutual agreement they choose a convenient solution.

"Mediation is based on the trust the parties have for the mediator, as a person able to facilitate negotiations between them and support them in resolving the conflict by reaching a mutual, convenient, efficient and lasting solution"[2] Article 1 Paragraph 2 of Law 192 / 2006.

" Mediation is completely voluntary and any resolution must be acceptable and agreed upon by all the parties to the mediation. Mediation offers the advantage of informality, with reduced time , as well as minimizing workplace disruption. All discussions are held in the strictest confidence, no records or files are maintained by the Alternative Dispute Resolution Office. All notes taken by the mediator or the parties to mediation are destroyed at the conclusion of the mediation and prior to departing the location of the mediation. Sometimes it may be helpful to share information with the other party in order to facilitate resolution of a matter. However, this will not be done without the party's express permission to do so. Mediations are usually conducted in the conference room at the Alternative Dispute Resolution Office in order to promote the neutrality and confidentiality of the process.

The process occurs in a very private and informal setting. Typically the parties as well as the neutral sit around a table. The mediator makes an opening statement including the establishment of ground rules regarding the process and conduct to be followed by the parties. Then each party will have an uninterrupted opportunity to present the issue from their point of view. Once the issues have been defined, the parties generate settlement or resolution options. The mediator may ask clarifying questions or meet with the parties jointly or separately, in what is called a caucus, in order to help them explore settlement possibilities. If resolution is attained, the agreement is formalized in a written Resolution Agreement, which is a binding agreement.

The mediator does not have the authority to impose a settlement or resolution on the parties but will attempt to help them reach a mutually satisfactory resolution of their dispute. The mediator is authorized to conduct joint and separate meetings with the parties. The mediator is authorized to end the mediation whenever, in the judgment of the mediator, further efforts at mediation would not contribute to a resolution of the dispute between the parties."[3]

[2] Article 1 Paragraph 2 of Law 192 / 2006.

[3] Mediation Preparation- http://www.cdc.gov/od/adr/medprep htm

3) Two aspects that can be regarded as mediation

Mediation, as a process, can be viewed from two viewpoints

4) The first aspect—The activity of the mediator during the procedure of mediation

The first refers to the activity of the mediator that takes place in the presence the parties engaged in conflict. Activity that aims to end the conflict and concludes in an agreement, while the second refers to the completion of the mediation contract between the mediator and the parties in the conflict as the primary and essential element of mediation, without this mediation would not be able to exist.

The professional mediator represents a neutral, impartial, third party, professionally trained to help the parties solve the conflict, maintaining confidentiality of the information discovered out during the mediation activity.

Whatever the nature of conflict, mediation implies the following five steps:

1) Process Overview
2) Identifying problems
3) Exploration of interests
4) The parties generate options and identify possible solutions
5) Conclusion and Agreement

This can be done in one session of mediation, or more, depending on the complexity of the matter and the ability of the parties to hold a constructive dialogue.

A mediation session may last up to 3-4 hours.

Although we are inclined to believe that a decision would be the logical consequence of thought, it is clear that emotions influence decision-making during mediation.

The mediator is actively listening to the story of the conflict, showing empathy for both sides, he will help them understand the boundary between the emotions and anger with which they came and their interests which should be followed.

The mediator is a peacemaker that diffuses conflict step by step.

The mediator plays the role of a psychologist and a real questionnaire is given to the parties in order to understand the motivation of their actions.

He follows the interests of the parties to find a solution to a painful problem, a solution that does not come into conflict with the interests of other parties.

Forced to defuse the situation, the mediator will use his entire life experience to build a positive, affective atmosphere. He will use any method of encouraging positive behavior.

The mediator will hold plenary meetings with the parties but very often he will talk confidentially with both parties, helping them to understand the favorable aspects; and when necessary breaks will be taken.

During the entire procedure, and particularly when the agreement is made, the mediator must be particularly attentive to the legal language used, especially if the agreement serves as a transaction that will be approved by a court.

The agreement must be designed in legal language to fit the legal documents of a court decision.

But aside from the specialized professional knowledge, the mediator must prove above all, a moral character and the inclinations of the profession.

Perhaps more than other professions, the mediator's mood affects the result of the mediation itself.

It was found that a good-humored mediator succeeds to induce cooperative behavior in the disputants.

The mediator must be available to be able to help the parties when they have reached a certain level of finding a solution; the agreement could fail just because of the mediator's lack of time to draft an agreement.

For this reason it is important that the mediator be only a mediator and nothing more.
I personally still have not met mediators who can maintain the profession.
The mediator from his own funds often subsidizes maintaining the costs of an office.

5) The second aspect—the closing of the contract of mediation as a vital condition for the existence of government-employed mediators in Romania.

The pecuniary aspect of the mediation process is connected to the second stage of mediation, which refers to an essential and vital element for the development of mediation, and I refer to the closing of the contract between the mediator and the involved parties.

Mediation, as a procedure, is non-existent in the absence of mediation agreements.

Mediation will never exercise its role in the view in which it was adopted, to relieve and to increase the efficiency of the justice system and thus reduce budgetary expenditures relating to the justice system, so long as no one will close the contracts for mediation.

6) Some of the reasons why Romanians do not resort to mediation

1) because they do not know what mediation is and they perceive it as a compromise and not as an alternative way of resolving the conflict
2) because it is not mandatory
3) because they are too tired of the failed negotiations before the introduction of the action in court
4) because they do not see another mode of resolution than what they have already foreshadowed mentally
5) because they do not want to show any sign of weakness in front of the opposite Party.
6) because often they are not aware of their framing of the problem as having a false impression that they will win
7) because mediation costs more compared to criminal courts that are completely free and to civil courts where many cases suitable for mediation are taxed at low judicial stamp value.
8) because the agreement does not have the value of authentic document

7) What advantages does the Romanian state give the litigants?

a) Free local information services offered by the mediator, the mediator does not charge a fee for a briefing as a result of the obligation imposed by Article 614 Code of Civil Procedure

b) Pecuniary benefits available for all litigants provided by **Law 192 / 2006**.

"At the request of parties who have resorted to mediation proceedings shall be suspended in civil cases by the courts or arbitration under the conditions stipulated in article 242 paragraph 1 section 1 of the Code of Civil Procedure and if the mediation agreement is not achieved, the application for reinstatement for the judicial duty stamp is free".[4]

"If the dispute is settled through mediation, the court will rule on the request of the parties, a decision according to art. 271 of the Code of Civil Procedure"[5]

"With the ruling the court shall order, at the request of the interested parties, a refund of the tax paid for this investment "[6]

c) Pecuniary benefits stipulated by **GEO 51/2008** on public legal aid for legal services are granted to those who meet the conditions for public legal aid.

[4] Article 62 Law 192/ 2006
[5] Article 63 paragraph 1Law 192/ 2006
[6] Article63 paragraph 2 Law 192/ 2006

Public legal aid is granted to litigants who earn less than 200 euros a month per family member.

Art 20" If the person meets the requirements for obtaining public legal aid proving that, before the beginning of the process he went through the process of mediation for the dispute, he also benefits through the reimbursement of fees paid to the mediator."[7]

"The same legal benefits are given to a person who meets the provided conditions for receiving public legal aid if they solicit mediation after the beginning of the process, but before the first day of appearance." [8]

8) What happens if one party declines the offer of mediation by the other party?

In this case the judiciary public support may be denied.

9) Results obtained

Following mediation, agreements were concluded in 70-80 % of mediated cases.

The biggest problem is the participation of both parties.

10) Constructive solutions to promote and increase the efficiency of mediation

a) Mandatory participation of both parties involved in the briefings for cases of family law, civil law, commercial litigation and administrative law

b) Recognition of mediation as a public activity not only scripting (Article 4 paragraph 1 of Law 192/ 2006) [9]and also paying the mediator for the sessions from the same fund from which the legal system functions.

c) The introduction of mediation as a mandatory step after the introduction of the notary application for divorce at the court or city hall, the stage in which the mediator will be able to fulfill one of the activity's objectives which is misunderstanding between spouses regarding continued marriage[10] If after attending the mediation procedure and deadline of three months, the two were not reconciled, then the decision to divorce through the simplified procedures provided by the law

In this way, mediation will be making its contribution to fulfilling the promise held by the statute of Romanian state *"In Romania, the state shall protect marriage and family, he supports, by economic and social development and family strengthening."*[11]

11) The social implications that can make the procedure of mediation mandatory in the following cases of divorce.

The proposal made in 10 paragraph c is also especially beneficial to Romanian society also in cases of marriage where children that are minors exist. These innocent children suffer from the misunderstanding between their parents who with ease can dissolve their marriage often leaving no place for the children. Outside of a lack of material necessities, which leave an imprint on the physical and psychological development on the children. These children can become violent or in time they can lose faith in the institution of marriage and not take part in family life leaving the birth rate to decline alarmingly. In this way all Romanian society as a whole has something to lose.

To quote a colleague that is a mediator as well as a family counselor[12]

[8] Article 20 paragraph 2 GEO 51 / 2008

[9]Article 4 paragraph 1 of Law 192/ 2006)

[10] Aricle 64 paragraph 1 law 192 / 2006

[11]Article 1 Family Code

[12] Gheorghe Surtea - mediator Email to the author 18 02 2011 The easy way in which the couples get the divorce mediatori@googlegroups.com mediatoriautorizati@googlegroups.com

" Unfortunately families with the civil registrar, many of them realized in front of an altar stating "till death do us part" can not always be maintained, proving once again that life is very complex or that people are too weak, proud, too ambitious or too unforgiving toward their spouse to whom they swore eternal love. This is when divorce appears. Sometimes it can seem inevitable, but in many cases with preventative help it can be avoided, or the two individuals can continue to have a nice life. When I say this, I say it from my experience as a family counselor. From this position I have helped to reconcile many families and to avoid divorce, even in families where divorce had already been announced. Well, the measures taken by Law 202/2010 in regards to divorce do not appear to me to protect marriage and family. The ease with which a marriage can be dissolved, whether in front of a public notary or by administrative action, seems to me to be more of a stimulant for the dissolution of marriage and a motive for less responsibility and seriousness when founding a marriage. The foundation of a family was always regarded as a serious business and that those who do not want a clear responsibility preferred cohabitation. Now, on the contrary people prefer to marry for their own advantages, however if it doesn't work out, with a modest tax or even for free in some municipalities one can have a divorce certificate in one's pocket in 45 days. These legal provisions in their actual form are a big hit to families, if not also for society as a whole. Once again, I don't believe that the phenomenon of divorce will ever disappear and I am also not a supporter of divorce with scandal in the courts. Here's what I think is missing from the new provisions contained in Law 202/2010, **the absence of mediation and the mediator**. Not in the sense that the mediator would decide the divorce. Frankly, personally I would not have wanted something like that. But lacking the mediator, as an attempt to mediate and reconcile the parties before the divorce, even possibly on amicable terms"

Conclusions

Relieving the courts is a necessity for improvement of the justice system, both in terms of accuracy and attention given to cases brought to the legal system and in terms of reducing budgetary expenditures.

The lost cases of the Romanian State at the court in Strasbourg put heavy burdens on the shoulders of Romanian citizens, supplementing the already excessive budget for maintenance and operation of the legal system. Romania has fulfilled the requirements of mediation for which it was adopted to become a member of the EU, but if mediation is to move past being a checked measure on paper the conditions for its existence must be assured

THE INVESTMENT IN HUMAN CAPITAL, AN INTRISIC FACTOR OF THE SUSTAINABLE ECONOMIC GROWTH

CRISTINA TEODORA BĂLĂCEANU[*]
DIANA MIHAELA APOSTOL[*]

Abstract
The educational system will need to direct its actions and programs towards the identification of the current and future values of the labour market, starting from the existing and potential labour resources, anticipating first and foremost the adjusting of the economy to fast-developing fields and domains, put forward by the State via the Fast-developing Field Strategies or even via the Fast-developing National Strategy. It will accordingly generate a binder between the demands of the labour market as a response to the developing necessities of the economy, and the training/specialization of the labour force as offered by the national syllabus. By these means the educational system would create a labour force compatible with the labour market, which is both a premiss for the increasing level of employment and for the sustainable economic growth. Our task is therefore to provide a concept of education related to technological progress, based on the model of Nelson and Phelps, and a suggestion for investments and education policies.

Keywords: *education, human capital, labour market, technological progress, investment policies*

Introduction

Education and training converge, ultimately, to find a job whose usefulness is maximal in terms of restrictions which refers mostly to the absorbtion of the labour market, labour productivity and economic competitiveness of goods produced.

Currently, education and labour market are two different sets that interact only at the declaratory; action is necessary for interaction through cooperation and coordination, competition in the domestic labour market providing the binder between higher levels of efficiency and competitiveness of the workforce. Education market provides input for the labour market, which would require a training strategy linked to labour market trends and changes at work, on the one hand, and the needs for development of a region / economic zone (economically -entrepreneurial and social-investment), on the other side.

The development of contemporary society, the educational system that will serve the workforce needs of employers and future economy is based on smart growth[1] which requires intensive growth of labour and capital inputs with bonding technology innovation which, combined, increases total factor productivity.

We will exemplify with a model based on Cobb-Douglas production function with returns to scale assumption, $\boldsymbol{Q = A\, K^{\alpha}\, L^{\beta}}$, where K is the capital employed, and L is the volume of labour.

This shows that if the quantities used of the two factors of production, labour and capital, increases in the same proportion, the report of the marginal productivity does not change[2]. However, if L and K show a proportional increase then income growth (Q) is greater or less than proportional,

as $\alpha + \beta > 1$ or $\alpha + \beta < 1$. In the theory of production, α and β express the elasticity of production in relation to production factors.

Considering a state of technological capital, what can increase production / productivity is the investment in human capital / education. Therefore, if the volume of capital and labour remains constant, it may get a boost production by increasing the sum of the elasticity of production factors, α and β. If α, the elasticity of production related to capital is considered constant, it is sufficient to increase β, the elasticity of production related to work, to get an $\alpha + \beta > 1$, and hence increased production and increasing returns to scale.

Our task is therefore to provide a concept of education related to technological progress, based on the model of Nelson and Phelps, and a suggestion for investments and education policies. The need of a new concept of education integrated in a model that emphasizes the development of technology is irrepressible.

Education and technological progress: a new perspective on a concept of education

For a concept of education[3], we shall go on studying the formalization of a way explaining the technological progress. The model introduces a specification in the technological factor *A* that separates *practical technology* (used technology) from *the theoretical technology* (the new technology under study to be implemented), which is going to be introduced according to the progress related to education/ skills, considering the gap between technologies[4]. The model aims mainly at explaining the irreducible relation between education/ skills and technologies in the technological progress. The model is a double one, but I shall resume only to the first variant. For simplicity we renounce to the specifications α and β.

Nelson and Phelps consider that human factor is crucial in increasing rate/ level of technological progress. It does not mean that payoff in education (or even modifications at the level of education) is independent to the technological developments- it is trying to correct this situation. They suggest a double model that correlate the diphase time between the moment in which a technology is produced and the time when education is implemented. Thus, output *Q* is a function of *K(t), L(t)* and *A(t)*:

$$Q(t) = F[K(t), A(t)L(t)]. \quad (1)$$

Where *K* stands for capital, and *L* for the labour that use it. *A* indicates the best way of practical use of the given technology. If we name *T(t)* the theoretical level of technology, which is new technology that is studied and is to be implemented, *T(t)* becomes:

$$T(t) = T_o e^{\lambda t}, \lambda > 0 \quad (2)$$

where λ represents the rate with which the theoretical level of technology advances. To find the role that education plays, *A(t)* becomes:

$$A(t) = T(t - w(h)), w'(h) < 0 \quad (3)$$

where *h* indicates the average level of education or intensity of human capital, and *w* – the lag. Tightly reformulated, the above equations 2 and 3 become:

[3] See Diana Apostol, "Knowledge, Education and Technological Progress in the New Economy", Metalurgia International, Issue No.5, Vol. XIV.

[4] Nelson, Richard R. Edmund S. Phelps: "Investment in Humans, Technology Diffusion, and Economic Growth", Cowles Foundation Paper 236, Reprinted from *American Economic Review*, 56(2), 1966.

$$A(t) = T_o e^{\lambda[t-w(h)]} \qquad (4)$$

If *h* is constant, it results that: a) the index of practical technology increases with the same ratio λ, technology theoretical index; and b) the level of technology in practice is a increasing function of *h*, because an increase of *h* shortens the gap between *T(t)* and *A(t)*[5]. Simultaneously, the investment return in education is even higher, faster the theoretical level of technology advanced. Thus, the effect on *A(t)* of a marginal increase of *h* is an increasing function of *λ*, when we have *A(t)*, and it is positive whether λ > 0, which means that rate or theoretical level advances or is higher than zero. It means that:

$$\frac{\partial A(t)}{\partial h} = -\lambda w'(h) T_0 e^{\lambda[t-w(h)]} = -\lambda w'(h) A(t) \qquad (5)$$

The level of the marginal product of education is visible in the base equation and can be formed as it follows considering the relations (1) and (4):

$$Q(t) = F[K(t), T_o e^{\lambda[t-w(h)]} L(t)] \qquad (6)$$

from where:

$$\frac{\partial Q(t)}{\partial h} = \lambda T_0 e^{\lambda[t-w(h)]} L(t)\left[-w'(h)\right] F_2 = -\lambda w'(h) \times Wage \quad Bill \qquad (7)$$

Thus, marginal productivity of education is a increasing function of *λ*, considering *the wage bill*, and it is positive only if *λ > 0*. Nelson and Phelps states that, correctly, this approach is not found in the conventional treatment of education[6].

The second model introduces a correction in the first model, starting with two problems: "It is unreasonable to suppose that the lag of the best-practice level behind the theoretical level of technology is independent of the profitability of the new techniques not yet introduced. Further, it is somewhat unrealistic to suppose that an increase of educational attainments instantaneously reduces the lag"[7]. Thus, the correction implies that the increasing ratio of the technology theoretical level reflected in practical technology depends on the educational level and the gap between the theoretical level of technology and the practical level of technology. In the first model, the inherent difficulties of any lag are not well stressed. But as long as we are interested only in the way in which education and technological progress can be formalized to indicate how the combination between education and technology results in the progress of the technological factor A, we shall not insist on the development that the second model introduces in the first one. The basic equation to say only this can be made up as it follows:

$$A(t) = \Phi(h)[T(t) - A(t)] \qquad (8)$$

Thus, the ratio of technology increase in practice is a function of education and proportional to the lag: *(T(t) – A(t)) / A(t)*[8]

[5] idem, p. 72.
[6] ibid, p. 72.
[7] ibid, p.72-73.
[8] ibid, p. 73.

Generally, the lesson about the model of Nelson and Phelps is like *theoretical technology* or the rate with which the gap between *the theoretical technology and the practical technology*, which is $\lambda > 0$, is reduced, it is a function of the rate with which the education gap *w(h)* is over passed, according to the equation number 4. What is significantly is that *w(h)* is not isolated from the *theoretical technology*, considering the equation number 3. The conventional treatment of labour excludes a differentiated approach on education (ordinary jobs versus jobs with high level of adaptability at other levels) and implies that marginal values of education may stay positive if technology is stationary[9]. Nelson and Phelps make clear that the payoff of education is an increasing function of the *theoretical technology*, which means $\lambda > 0$. Thus, the lesson is that if education high adaptability to change results in more rapid rates of technological progress, the gap *w(h)* or the level of education intensity is also an increasing function of the *theoretical technology*.

In addition, some implications from our analysis, e.g. macroeconomic policies, the future of technology[10] etc. Essential to the implementation of the sustainable economic growth in the society are:

-Macroeconomic stability ensured by a set of macroeconomic policies aimed at implementing prudent fiscal and monetary policies to keep inflation relatively low and stable and to prevent the decrease in economic activity to affect the long-term economic growth;

- technological progress that requires continuous innovation and not reproduction;

- emphasizing the role of human capital to propel the implementation of conditions for sustainable growth;

- identify specific framework of each nation which establish an optimal relationship of proportionality between natural factors, social, political, educational converging towards a system based on a sustainable economic growth, in line with present and future needs of the population;

- identify those occupations and professions which converge to a new level of sustainability of the labour market, result of changing perceptions of entrepreneurship on expectations of workforce training and ability to contribute to increasing productivity and increasing returns of the production function.

Thus, universities can play an important role in shaping the future business. These are centers where there are huge accumulations of specialized knowledge, and students are a valuable resource to explore areas of science and technology already known or even novel, whose impact on the labour market is analyzed differently, depending on societal resources, the degree absorption of labour market and its level of liberalization. University education system has not always come to anticipate the requirements of employers, which makes supply-demand relationship in the labour market to converge to a price not desirable, namely to a coverage of labour market needs as high. Thus, according to societal needs, we can distinguish several types of university programs focused on:

- technologies of the future in the fields of nanotechnology, nanoenergy, biotechnology, neurotehnology, infotehnology;

-incorporation of the knowledge and innovation economy in the behavior of organizations and economic entities in general, considered a convergent force of the economy, democracy, trade and technology leadership that determines the future of nations, business productivity and wealth of individuals, global poverty reduction, promote trade without borders, or democratic reforms[11];

- improving the performance of human capital, effect of investment in convergence areas as nano-bio-IT-neurotehnology which will play a vital role in safeguarding the future evolution of the global economy, creating new jobs, companies or fields[12];

- stimulate creativity in the technical areas and entrepreneurship by developing the capacity of young people to innovate, stimulation of free enterprise and create a reward system for motivation;
- innovation is the essential connection between knowledge characterized in an invention and the successful implementation of that invention to market.

Conclusions

Probably, the trump of the model of Nelson and Phelps consists of stressing the irreducible nature of the established report between education and technological progress. Thus, if progress in education results in technological progress, then, in its turn, education exhibits a positive payoff if technology develops permanently. The changes generated by ICT/new technologies at the level of production function results in technological progress and economic growth. Nelson and Phelps clearly state how important the techno-human gaps are in the process of technological change; they cannot be identified but in a strict reciprocal relation. It must go without saying that there is not any better possibility of discussing about increasing the performances of the inputs related to the process of production. At another level this model has implications for public policy. So education and schooling need to be complementary to technological change and productivity in advanced manufacturing and services sectors[13], because of the labour market conditions - are selected workers with high potential productivity largely reflected by the nature and specificity of the education incorporated in the educational system.

THE ROLE AND THE TECHNIQUES USED BY THE MEDIATOR IN THE MEDIATION PROCESS

SEPTIMIU STOICA *

Abstract
The present work aims to emphasize the complexity of the mediator's activity during the mediation process, as an extra – judicial alternative dispute resolution methodology. Different mediation schools have launched different mediation models in terms of theoretical and practical approach of the matter. So one can note on brief the facilitative, the evaluative, the transformative and the narrative mediation, for example. It is not our goal to praise one of the above mentioned paradigms or to suggest a hierarchy among them. We think that each of these models is valuable and has a potential utility. The most important achievement is to solve the conflicts and to obtain the parties' agreements, based on mediation generated solutions. It seems in this respect that different mediation models fit differently in solving specific cases. To reach the solutions of their conflict, the parties have to follow the mediator through a difficult and complicated route. It can be made easier by the mediator himself if he adapts his role and techniques according to the specifics of the parties and of the case. We assume that he can be more efficient if he will use a proper role from an appropriate model for a definite and concrete conflict or type of conflict. Even he may try to play a multiple role, changing its characteristics dynamically as the mediation process flows. The present work identifies some of the key roles that can be played by the mediator during the mediation process. Only based on these we can select, explain and analyze the specific or common techniques used by a mediator. Our point is that for his new case the efficient mediator must be flexible, knowledgeable and able to decide, select and perform a dedicated role or roles, same time or successively, and accordingly and dynamically use the adequate mediation techniques, which will be also summarized.

Keywords: *Mediator, role, technique, negotiation, solution*

Introduction

The most important aspect of the mediation, as an alternative solution of resolving disputes, its core, is how the mediation process is conceived and applied as such by the mediator. The process is structured, often individualised, conducted by the mediator and consisting in sequences and sub-sequences, with decision points and recurrences. During each stage, the mediator accomplishes specific functions. The functions that the mediator must carry-out are multiple, different, specialised. To carry-out each function supposes to initiate certain actions, using techniques that are appropriate to it, but also to the sequence and subsequence reached.

However, the mediators' activity becomes confusing sometimes. The stages, functions, techniques and actions are frequently mixed up. In complex cases, or when the parties prove to be resistant or not cooperating enough, the mediation tempts to reach a deadlock. This paper refers to the issue of improving the mediator's activity in relation to preparing and conducting the mediation process.

Much talking about the mediation's advantages is more and more present. There are increased expectations and a change of the paradigm is discussed in relation to resolving the conflicts. The development possibilities are huge, also in countries such as Romania, which have adopted just for a short period and quite timidly such solution. But the mediation practice by itself is hardly keeping the pace with the development of this field. The model of the mediator who empirically settles some simple issues is not enough; it relates to the beginnings of such study field. It is necessary to make the step towards maturity. The urgent conception of some new models and techniques is extremely

* Of counsel SALANS Bucharest (e-mail: septimiu@now ro).

important and represents the condition for consecrating the mediation and the mediator in the society. Thus, the aspiration to successfully settle an increasingly larger number of conflicts under mediation is achieved.

This paper intends to offer solutions for the issue mentioned above, by structuring the mediator's activity and by enlarging the mediation concept. We believe that structuring the mediator's activity naturally follows structuring of the mediation process *per se* and is based on the allotment of a role to each function or congruent group of functions carried-out by the mediator. Thus, a range of roles is configured and is available to the mediator. Specific techniques are identified for each role, as taken-over from its performance field and adapted to the specific nature of the mediation. The paper's aspiration is to identify as many roles as possible at a first sight and, for some of these, it formulates even the basic techniques. Formulating a broader concept regarding the mediation, besides its own answers for the issue, allows identifying some additional roles. The suggested technique aims, at practical level, to offer additional instruments to the mediators so they be able prepare, carry-out and conduct the mediation process, and, at doctrinal level, to deepen and refine the mediation concept.

We think that the paper is in harmony with the structured approaches of the mediation process studied in the main existing works of specialty literature. The analysis of the stages used to carry-out the mediation process and the emphasis on the complex activities of the mediator as presented in such manuals are those aspects that drew our attention regarding the multiple roles this one has to play. Starting from this point, our survey has been subsequently developed and may now replenish the scene of a structured process with a structured performance of the mediator, designed and carried-out in correlation, but separately. Also, our suggestion for broadening the mediation concept may complement, if accepted, the range of the existing definitions, having important theoretical and practical consequences.

Role and techniques used by the mediator.

Despite the tradition called upon in various cultures regarding the attempt to conciliate the parties in dispute by open-minded and powerful people in the community (proto-mediators), the mediation in modern society, used as an alternative technique of resolving conflicts, represents a new field of study for assistance granted to the parties in conflict. Neither the time, nor the restraint of some norms succeeded to deplete its freshness. This means and is seen in the diversity of the theoretical and practical approaches, which actually leads to a certain laxity but also, in return, to a useful flexibility.

We believe that this is mainly in favour of the mediation, even only for allowing creative and individualised approaches, depending on the parties and the situations. This entails the mediator's different attitudes, techniques and actions that may not be found in all the sequences of the mediation process or in all mediation cases. Therefore it leads to individualisation.

But how are these going to be selected for a specific case and during a certain case? By intuition? In the more complex cases, the mediation process would then become chaotic. Or, at the opposite pole, based on a generic *master plan*, structured by sequences, of an abstract process? But how would this be in harmony with the diversity of the situations as formulated?

As for our opinion, the solution is to accept the fact that the mediator can and sometimes must accomplish several functions and, therefore, play several roles[1] during the mediation process, and the actions and especially the techniques used are specific for each role separately and are dictated by the same. In general, in public life (or even in private life, although such aspect is not included in this paper's purpose), the activities of the same person may cover several functions (roles, if the related functions are not close connected, but mainly different). To be aware of such aspect and to identify

[1] Moore, Cristopher, *The Mediation Process – Practical Strategies for Resolving Conflict*, 3-rd Edition (San Francisco:Jossey-Bass, 2003), p. 19.

the roles is useful both as analytical approach, and at the practical level, exceeding the experimental, natural approaches, when meticulously preparing and planning the future professional performances.

The paper intends to offer an approach of the mediation from the perspective of the roles likely to be undertaken by the mediator, to identify the most important ones and to underline, for certain aspects presented as examples, the underlined techniques. Based on these ones, a definite structure may be defined for each case and, in particular, the strategic approach, selected to be used, may be designed.

We do not imagine and not believe as being mandatory for a mediator to be able or to try to play in its practice all the possible roles in mediation. There could be professionals who shine only in some, who choose a unique, minimalistic and – maybe efficient – format for carrying-out the process[2]. In the same manner, other mediators have the freedom, as already mentioned, to elaborately tune their instruments to the specific nature of the case, playing several and different roles. Then, even the fact that a role is played does not automatically mean one should excel or use the entire range of its related techniques. Moreover, among the techniques related to an independent abstract role, only some of them are fit to be taken-over in the mediation process.

But the identification of the roles and of their related techniques seems to be, in our opinion, suggestive as regards the instruments and generates clarifications as regards the approach both of the mediation process in general and of the actual cases in particular.

We think that the starting point for the identification of the roles can only be the origin, *id est* the definition of the mediation itself. We'll briefly present some of the valid definitions and then we'll risk our new 0.own definition, for support.

The most concise definitions are similar to:

- Mediation is "a process of assisting the negotiations of others.[3]"

- "Mediation is any process for resolving disputes in which another person helps the parties negotiate a settlement.[4]"

Than, more complex:

Mediation is "the intervention in a negation or a conflict of an acceptable third party who has limited or no authoritative decision – making power, who assists the involved parties to voluntarily reach a mutually acceptable settlement of the issues in dispute.[5]"

According to the Romanian law the mediation represents a voluntarily friendly conflict resolution process based on the assistance of a third party in his mediator capacity, in a neutral, impartial and confidential context.

Of course, it could not be otherwise, because the definitions are correct. But, in our opinion, not complete too. We believe that they do not catch either the novelty, or the essence, or the possibility to extension, or the theoretical developments of the concept, but only its original and immediate expression. We think it is necessary to have a broader, more generous definition, able to cover not only the classical definitions, as a particular case, but also the possibilities of the concept that were already explored or that could follow.

Without claiming to have found the best solution, we venture to suggest a new one, for work purposes. Thus, we see mediation to be **the process for the construction in three of a way to surpass a conflict occurred or a deadlock where the relation between two of them is in**. Obviously, in order to simplify things, we limited to the dispute between two parties.

This is neither the place nor the subject of the discussion to insist on such definition: what does it bring new, how is it related to the previous ones, what are its advantages. This will be probably the topic of a future paper. We refer here only to one of its consequences which is beneficial for our current subject: identification of a more diversified range (and therefore with a higher degree of completeness) of roles in the virtual portfolio owned by the mediator.

The unanimously accepted roles of the mediator are those of a **facilitator/catalyst of the communication** and of a **facilitator of the negotiation**. We'll hold both and we'll add, naturally, the fact that in order to be successful in facilitation, the mediator himself must communicate and negotiate. With the parties, but also on the parties' behalf. Sometimes, not as an accessory to a more important mission, but as part of an independent stage. That means roles of **communicator** and **negotiator**.

However, because it is rightfully deemed that the parties themselves have to communicate and build/negotiate the suitable solution, they must often be encouraged, prepared for such action. It results the mediator's role as an **assistant** of the parties (under its both accepted meanings, of a **trainer** and a **coach**).

A role which is delicate, discussed and debatable from the mediator's main viewpoint, but undeniably efficient, is that as a **persuader** of the parties as regards the acceptance of the options under debate.

Another role generally accepted and played, either consciously or not, by the mediator during the first stages of the mediation is that as a **confessor** and as a **therapist** for the parties, treated individually and not as a group. It is especially the case of the initial releases and venting of strong negative emotions as a result of the conflicting tensions that were accumulated.

The mediation process, as understood in contemporary times, supposes the mediator's assuming the roles of an **organizer** and virtual **host** of the meetings and of a **leader** and **manager** of the entire process. This one becomes more and more complex and specialised, with a structured conception and approach. To the extent it supposes individualization, the mediator may play a role as a **designer** of such individualised structure, as a **guide,** but also as (only) a **companion** of the parties on the designed paths, but also incidentally occurred during mediation.

The roles identified above mostly relate to the canonical approach, with a facilitating nature and understanding of mediation. Our opinion is that in many circumstances such approach must be, if not replaced, at least complemented by evaluative elements. This is congruent with the definition of the mediation itself that we have formulated. Some new roles for the mediator emerge in this complete approach, namely that as an **investigator**, a **diagnostician** (of the case under mediation), an **expert** (in law, but maybe also a technical one in the field of the case analysed or in other related fields), a **consultant** of the parties as a group, a **resolver** of issues (if, at the limit, this would be the case), as **explorer** and **assessor** of the options and solutions. This is, we know, a controversial subject in the mediation theory, but sustainable as long as we agree that the essence of this activity is the search in three of a solution for two.

The mediation practice identifies however other roles too, some of them being conjectural, for the mediators. Thus, we may add the roles as an inter-cultural **interpret/translator** between the parties, as a **supporter** of the parties in difficulty, as person confirming the legitimacy, as provider of additional resources during the process, as agent of reality, as animator and lightning rod, ultimately as scapegoat, etc.

It should be mentioned that to identify a potential role for the mediator does not mean to assimilate the mediation *per se* to the function and activity specific for such role. The fact that the mediator communicates does not mean that the mediation represents just communication, as it does not mean only negotiation, even if it's being assisted. The coincidence that the mediator listens to the parties and allows their feelings to be released does not transform the mediation into psychotherapy. As the mediator makes available to the parties its legal or technical knowledge does not mean that the process represents an assistance procedure or a legal assessment.

Thus, a mediator is not only a facilitator, or a communicator, or a negotiator, etc., but all these as an entirety and even more than that, in a combination of these basic roles, in which the result is more than and different from the amount of the terms.

The meaning of using the roles model and carrying-out the related techniques is that of using various and often non-homogenous instruments by one and only skilled professional in order to reach the target of building an acceptable solution also accepted by the parties. The synthesis itself of such techniques represents the colossal value added by the mediation as a service, which converts it into a unique alternative of indeed resolving in an optimal and individualised manner the conflicts and of surpassing the deadlock.

Among the roles that a mediator may exercise, some roles, very important ones, are specific only to mediation. Thus, there are the roles related to the organisation and management of the process, to the stimulation of formulating options, to their being tested and even the role as a resolver. The others are mostly borrowed but strongly adapted.

In their dynamics during a mediation process, the mediator's different roles:

a) may either follow one another;

b) or are alternative;

c) or coexist.

In the first case, the roles are changing as the process evolves. In the second category, the roles are adopted depending on the mediator's approach (facilitating, evaluating, combined) or on the case. The third one marks the existence of some roles constantly and simultaneously used during the process or in the multiple stages of its development: communicator, facilitator, supporter, negotiator, etc. A survey about these is to be drafted. A map of the techniques used is going to be enclosed thereto, as already mentioned.

The succession of the roles during an actual mediation process depends on the strategy adopted and, naturally, on the tactics used in order to play them. The speciality literature underlines some stages that the mediation process follows. One or several roles impose during each stage. The process may be seen as a series of stages, but also as a series of functions/roles. The stages are assigned to some objectives to be reached, but the roles shape the kind of performance that the mediator must accomplish. The complete plan for carrying-out the process should therefore include the path structured by stages, objectives, **roles**, techniques to be used.

In practice though, it is obvious that the mediator's roles often soften and mingle into a complex performance. At least that is how the parties feel. We believe it is worth that the roles be however individually perceived by the mediator who plays them, not (only) by the systematisation sake, but for allowing a rational, planned preparation and approach both of the professional preparation of the mediator, of its specific training, as well as of carrying-out the mediation process in practical cases.

We are convinced that the short list of roles above may be complemented. The mediator may be and must be someone else in different moments in time. This one plays a role or other roles in the same time. It is important though not to mistake them, to know exactly at any instant who is he at a certain moment, why is he what he is, what and how he has to do accordingly. The specific functions he has to accomplish are related to the role played and it also identifies the techniques available.

We sustain that when studying, but also when practicing, the mediation it is useful **to deconstruct the generic and complex role of the mediator**, as resulted from its definition (according to the classical definition, the person assisting the parties during the negotiation, or, as we suggested, the person building the solution along with the parties) into elementary (sub) roles, which entail their own, specific implementation techniques. We use the term *deconstruction* not according to the meaning given to the text by literary theory sustained by Derrida, but as a mental decomposition of a complex object under analysis into its component elements. In the case at hand, the complex role as a mediator into the fundamental roles forming it and which have constructed it.

We have underlined hereinabove – as in very few professions – more than twenty roles that a mediator can play, in different approaches and stages of the mediation process. Like an athlete of decathlon *sui generis* of the services, mentioning that, at the limit, it must though be able to perform honourably in more than ten disciplines!

For each of these roles, one can identify specific techniques. Trying to cover all of them, to the extent this could be possible, would exceed this paper's size. Therefore, we'll make reference hereinafter to some of the most important techniques available to the mediator, depending on the main roles played during the mediation process.

The mediation is still representing an activity which is not completely formalised, and we repeat that some of its strength and seduction reside in that. Consequently, we do not believe in recipes in this field, but in learning an efficient way to approach the profession, which could be a **multi-role** one. The existence and the acceptance of the roles played by the mediator during the mediation process represent, in our opinion, a technique that can be taken-over (or not) by each professional separately. In case such opinion is accepted, the mediator may chose those roles it deems appropriate for its qualities and possibilities or for the requirements of the case, and then to select and develop certain techniques fitted for the roles under the same circumstances. Not to mention the fact that the same role may be played at different tonalities, with different nuances and objectives. Here begins, even within the same accepted model, the demarcation between the mediators, each one's skill, art, and performance.

It is then, at least and at a first approximation, a question of **method**. We'll be able afterwards to plan an applicative synthesis, but also a specific approach of this field, trying, by the explored consequences of the model suggested, to identify new valences of this field. We also believe that learning to mediate during the professional training of the future mediators as well as to perfect the qualities and skills of the already professionals may be dealt with from such (new) perspective too. Also, we think that the number of the mediation techniques will increase accordingly, as there will be capitalised and included new techniques specific for the new roles identified as to be played by the mediator. There are far few techniques of pure mediation, many being borrowed techniques, because the function of a mediator – as we prove it now – is a synthesis function.

But for this paper, we stop to the importance of the existence of the roles and techniques that may be related thereto. We'll refer hereinafter to some main roles that a mediator may play, namely as an organiser of the mediation process, an investigator, a therapist, a communicator and a facilitator of communication, a supporter of the parties during the process, a persuader, a negotiator and a facilitator of the negotiation, lastly of the leader of the structured mediation process, and we'll try identify some of the techniques that may be used under such circumstances.

Thus, the role of an organiser refers mainly to preparing the mediation meetings, including the technical accessories related thereto. Among the preoccupations related to such role, one may find for example those regarding the optimal arrangement of the participants and the mediator's seat at the negotiation table[6]. A special technique was developed for helping the mediator's strategy, depending on the parties, conflict, status of the conflict, and the way the technique chosen is carried-out during the mediation process. It's about the existence, the size and the form of the negotiation table, the arrangement and the occupation of the seats, the size of the space left between the seats.

There are scientific researches regarding such aspects, which only seem insignificant. The adversaries tend to place themselves on opposite positions, but this keeps them in an animosity condition, accentuating the initial polarity.

Again, for example purposes, we mention some possible options:

- the version of marking the equality, by the symmetrical radial distribution of the parties, but close to one another;

[6] Beer, Jenifer et al, *The Mediator's Handbook* 3-rd Edition, Revised and Expanded (Gabriola Island, Canada: New Society Publishers, 2009), pp. 29-30.

- the version of placing the parties at a certain distance from one another, separated by the mediator;
- the version of giving up the separating table;
- the version of placing the mediator at the head of the table and the parties laterally, facing each other;
- the version of placing the parties close to one another, on the same side of the table;
- the version of placing the parties at right angle from one another;
- the version of arranging the parties on the bias.

All these arrangements create a certain relation between the parties and serve a specific approach of the case by the mediator. Placing and – we'd suggest – re-placing during the process, depending on the successes on the way to reconciliation, thus represent mediation techniques, developed within the mediator's role as an organiser of the meetings with the parties and enclosed thereto. This may influence the dynamics of carrying-out the process and even its results.

As regards the mediator's role as an investigator, this refers mainly to its efforts to obtain and to filtrate the relevant piece of information regarding the parties and the case, beyond what they are willing or deem necessary to offer. We do not think it is still necessary to underline the importance of the information in the mediation process. It is essential for the mediator to understand the case in order to design and carry-out the process. This one cannot work with impressions or with data that are voluntarily or involuntarily distorted. Even if, under such circumstance, some solutions would be found, they could not last in time.

The techniques used for the investigation activity are based on interviews structured and not structured, generally conducted with the parties being separated[7]. Open questions are used as well as closed questions. The questions used refer mostly to subjects not to chronology. The answers are construed, but also the hesitations, the silences. A special technique implemented is the active listening. The non-verbal messages are additionally studied[8].

It is a controlled crescendo in the investigator mediator's technique to seek information from the parties. The start point is open, for example "listen, learn and discover" and then slides to a direct approached, focused on clearly defined subjects and aspects, some of them painful.

Having a particular meaning for the use of the same instrument (the interview)[9] as a technique for playing several roles, we may notice that among the interviewing techniques used during the entire process, several kinds of interviews may be activated: the interview for the mediation seen a support for resolving the issue, the interview as a purely investigation instrument, the interview as a persuasive instrument. That is why not the mediation technique *per se* is important (the interview as such), taken separately, because its contents and finality differ, but the technique within the role undertaken at a certain moment given by time.

One of the most significant aspects of the mediator's role as an investigator is however the disclosure of the parties' hidden interests[10]. This operation is useful not only for the mediator, but for the parties themselves, which sometimes also conceal them, hoping to obtain in this way a better result of the negotiation, but in other situations are purely and simply unable to becoming aware of them. The entailed techniques are related not only to the collection of data, but also to psychological, social, economical aspects, as well as to the capacity to jointly develop arguments. Thus, some direct and indirect procedures may be identified for searching and discovering hidden interests. It is essential to become aware of them, as long as the mediation is focused on interests and not on positions.

[8] Beer, Jenifer et al, *The Mediator's Handbook* 3-rd Edition, Revised and Expanded (Gabriola Island, Canada: New Society Publishers, 2009), pp. 68 – 70.

[9] Frenkel, Douglas et al, *The Practice of Mediation* (New-york: Wolters Kluwer, 2008), pp. 131 - 134

[10] Moore, Cristopher, *The Mediation Process – Practical Strategies for Resolving Conflict*, 3-rd Edition (San Francisco:Jossey-Bass, 2003), pp. 252 – 268.

As regards the therapeutic role, especially during its first stages of the mediation, the technique used by the mediator is noticed in order to allow releasing the parties' feelings, paying the attention and undertaking the precaution measures necessary in order not to escalate the conflict. A correct alternation technique of separate meetings (caucases) with the usual common meetings is extremely necessary[11].

To accept and to listen to the parties' stories, their frustrations and positions, the attention, the understanding, the compassion are essential techniques to be used during the process. The techniques are useful for capacitating the complete expression and for sublimating the emotions, in order to prevent violent and aggressive effusions, to control the negative emotions, to develop positive emotions, to overpass wrong representations, the stereotypes and the lack of trust, to change, to open and to transform emotions.

The communicator and communication facilitator's role is probably the most played by the mediator. The entire mediation process is actually based on communication, and the lack of communication or the incomplete communication explains many conflicts. There are things known and generally accepted, so we'll not insist on that. We only mention among the frequently used techniques those based on active listening, underlining the consent points, rewordings, clarifications, productive use of strong emotional moods, deciding and consecrating some basic communication rules.

The role of communicator is often closed to the persuader[12]. In this role, the mediator tries to move the parties away from the area of perceptions based exclusively on the subjective reasons of the conflict and of the inflexible positions. It is the matter of insinuating in their conscience of a standpoint which is alternative from that already conceived. This takes place mostly by suggestions and questions than by enunciations, potentially imperative, or by decisions. Among the persuasion techniques that may be used and thus becoming mediation techniques one may notice the persuasion based on empathy (by role change), persuasion by reconciliation (apologies), persuasion by revealing the actual interests, persuasion by doubt.

As regards the roles, at their turn consecrated, as negotiator and facilitator of the negotiation played by the mediator, there are specific techniques of their basic field also attached to them. One can mainly find among such the competitive negotiation techniques, the integrative negotiation techniques (based on resolving the issues), the methods for surpassing the strategic, psychological and cognitive barriers.

Finally, in the chosen selection of roles, the position of leader of the process [13]is a decisive one for the mediator, especially within the concept of structured negotiation process. Both the control of the dialogue, as well as the evolution during the mediation process, take place upon initiative and on the impulse of the mediator.

Among the process' stages, as well as when passing from one stage to another, the mediator initiates specific actions. Some of these, the non-contingent ones, relate to the generic mediation process and represent general techniques of the mediation as such. Others, the contingent ones, meet the case's requirements and represent special mediation techniques, such as interventions meant to manage the anger break-outs, the bluffing, the negotiation in bad faith, the mistrust, the lack of actual communication, etc.

A special importance for conducting the process has the technique of alternating the usual general meetings with the individual meetings, as well as the management of the deadlock situations, of the blockings[14].

---

[11] Beer, Jenifer et al, *The Mediator's Handbook* 3-rd Edition, Revised and Expanded (Gabriola Island, Canada: New Society Publishers, 2009), pp. 84 – 89.

[12] Frenkel, Douglas et al, *The Practice of Mediation* (New-york: Wolters Kluwer, 2008), pp. 227- 243.

[13] Beer, Jenifer et al, *The Mediator's Handbook* 3-rd Edition, Revised and Expanded (Gabriola Island, Canada: New Society Publishers, 2009), pp. 89 – 99.

[14] Frenkel, Douglas et al, *The Practice of Mediation* (New-york: Wolters Kluwer, 2008), pp. 260- 269.

Interesting and spectacular techniques, essential during the process, are related to the core itself of the mediator's activity, to its basic role and not to the borrowed one that were added to it. It is the case, for example, of the stimulation of generating options[15], of their virtual assessment and testing, of their dynamic selection and remodelling. Such techniques become more special as the mediator's implication is higher, combining aspects of facilitative mediation with elements of evaluative mediation, as already presented above[16].

Thus, finally, we have developed and exemplified by the above mentioned our initial assertion according to which the mediator's performance may be analytically studied and planned by first of all identifying the functions (the roles) that this one carries-out during the mediation process, and then adding specific techniques from which result the actions performed by the mediator during the stages of the process and form one stage to another. We believe and try to demonstrate that such model gives a clearer image of the position and complex performance of the professional mediator within the mediation process.

Conclusions

Determining the parties under conflict to meet, to have a conversation, to negotiate, to find together a solution, to accept the solution they've chosen, represents a very difficult process, the more so as it is conducted by one person only. The process is complex, going through different stages and levels, and the mediator's performance is the same. The activities, the attitudes and the techniques used are complex and various, the mediator showing several faces and skills during the process. Starting from this, our analysis under this paper reveals as its main result the possibility for the mediator to play during the mediation process several roles. Becoming aware of this fact and conceiving a start for the survey of roles, as a second result of the research, represents the main approach of the paper.

Starting from the roles, the mediation techniques may be organised by categories and systematised. Moreover, new techniques may be identified and attracted to the process. The paper's result is also the identification, for some of the main roles formulated, of certain representative techniques.

In order to complement the list of the potential roles, the paper suggests and has as a different result a development of the mediation concept with evaluative elements at instance, offering the mediator the possibility to be more actively involved in the selection process or in the construction of the solutions for resolving the conflict or surpassing the deadlock.

The mediators interested in the results of the research under this paper may complement the general view of the structured mediation by structuring the specific performance of the mediator himself. This represents an additional instrument both for conceiving the mediation process to follow, as well as for a better control and exercise of its own activity. Distributing the functions by component elements, these may be better prepared and complemented with new techniques, in the field of reference of the undertaken roles. Also, when approaching a case, appropriate roles are selected as well as their sequence.

In the field of improving the mediators' training, new implications may be foreseen. The improvement may start with or include workshops and specialisations for different roles that must be covered and may rely on acknowledging and exercising their specific techniques.

As regards the doctrine-related aspect of the mediation, both the "theory" of roles as well as the new, broader concept, as suggested, based on the joint search of a built solution may lead, if

[15] Moore, Cristopher, *The Mediation Process – Practical Strategies for Resolving Conflict*, 3-rd Edition (San Francisco:Jossey-Bass, 2003), pp. 269 – 296, 297 – 308.

[16] Frenkel, Douglas et al, *The Practice of Mediation* (New-york: Wolters Kluwer, 2008), pp. 71 – 86.

accepted, to a remodelling of the mediation activity, at its turn with substantial practical effects in increasing the process' chances to succeed.

Future researches may be developed and studied in detail as conceptually described in this paper. Thus, we intend to emphasize in the future the corresponding aspects between the mediation stages and the roles. Also, to create a detailed inventory and as complete as possible of the techniques used or that might be included in the mediation process depending on the mediator's roles.

An interesting aspect is the choice and the configuration of the roles' range and sequence for the mediator, according to the typology of cases under mediation (family, inter-community conflicts, civil disputes, commercial conflicts, labour conflicts, etc.).

Finally, a major field of our future research, as inspired by the above-detailed model of roles and complex functions of the mediator, is the deeper analysis and the development of the mediation concept (optional as compared to the classical ones) that we have suggested herein, based on the active performance of the mediator as regards the construction of the solution and/or the surpassing of the deadlock. We'll try to model and to theoretically ground this second model too, by pleading for the specific plus value this one brings to the parties under dispute, but also to formulate and to fundament its practical use.

THE SCIENCE OF COMMUNICATION AND NEGOTIATION IN MEDIATION

ELENA NEDELCU[*]

Abstract
The present study proposes to contribute in clarifying a subject of great actuality and social importance: why does the contemporary society need such mediation and mediators and what are the psycho-social premises of making the process of mediaton more efficient.
In the first part, this study keeps the track of identifying the connections and the distinctions between communication-negotiation and mediation. The intercession carries forward with the analysis of the communicational and negotiative abilities of the mediator – premises of efficient mediation. The final part consists in an argument towards the imperative need of mediation felt by the contemporary society at all its levels.

Keywords: *communication, negotiation, mediation*

1. Introduction

I communicate, so I exist. We exist as long as we communicate We are constantly facing various problems and in order to solve them we must communicate.

Social life and its existence depend upon human interactions, which is negotiated through communication.

People live amidst multiple communication forms that cover more than 11 hours of the total 24 hours that make up a day. We could state – as Lucien Sfez points out – that everything communicates in nowadays society, which is also known as the *communication society*.

Nowadays we can't imagine the democratic society withought interactions, communications, negotiations and recently mediations.

2. Communication-negotiation-mediation

In *Social organization*, Charles Cooley defines communication as the mechanism through which human relations exist and are developed and which includes all the symbols of spirit and the necessary means to transmit them into the space and to preserve them in time. It is a process that includes facial expression, attitudes, gestures, the tone of voice, words, writing, printing a.s.o.

Etimologically, the term communication comes from the Latin *communis*, which in the XIVth century used to mean "to put together, to share" (Ioan Dragan). Later, in the XVIth century, as the post office services and the roads became more numerous, the term gained a new connotation, i.e. "to transmit".

During the XXth century, the term *communication* gains a new connotation, i.e. "to broadcast" (to transmit through the radio, TV, cinema etc.). J.J. van Cuilenburg, O. Scholten and G.W. Noomen mention three overlapping meanings of the term: "notification, information", "verbal contact within a group or collectivity" and "presentation or occasion that favours exchange of ideas or spiritual relations."[1]

[*] Associated Professor, Ph.D., Faculty of Administrative Social Sciences, "Nicolae Titulescu" University, Bucharest, (e-mail: doina nedelcu@yahoo.com).

[1] J.J. van Cuilenburg, O. Scholten and G.W. Noomen, *Stiinta comunicarii*, Bucuresti, Humanitas, 1998, p.25;

Like communication, negotiation is ever-present in human life and in society. It is a "universal activity performed in international businesses, commercial transactions, diplomacy, in internal and international legislation, in the attempt to build social peace within a country/between countries, and it has an interpersonal, inter-group and inter-institutional content."[2]

Negotiation is closely linked to communication, negotiation without communication cannot exist. That is why specialists in negotiation are also specialists in communication. Goodall Jr. considers that negotitation is actually a communication style recommended for mitigating the negative effects of a conflict.[3]

Negotiation must be understood as "a process in which two or more parties, which have common and conflicting objectives, debate the possibilities of coming to a potential agreement."[4]

In other words, negotiation – as Douglas Kennedy remarked – is the process through which we succeed in obtaining what we want from those who want something from us.

Negotiation is the process by which the conflicting parties try to reach a consensus that is advantageous for all the parties involved in this process, discussing about each party's pretention and respecting these pretentions as much as possible; this process should not be finalized by deciding who the winner or loser is.

In conclusion, **negotitation** is a nonconfrontational process by which two or more parties, having contrary but complementary interests and positions, attempt to reach an advantageous agreement, whose terms are known from the very beginning.[5]

M. Hiltrop and S. Udall identify three categories of objectives which negotiation must consider:

- a major objective – the best result ever recorded;
- a secondary objective – the least efficient, but acceptable as a result;
- a target-objective – which is expected to be accomplished in an effective way[6].

When the involved parties cannot jointly negotiate in an efficient way, they can address a mediator to facilitate the negotiation process. Mediation is closely linked to the negotiation and communication processes.

Mediation is often defined as "interference in the negotiation standards and between the conflicting parties, as well as the acceptance of a third party – which has limited powers and cannot adopt any decision authoritatively, but which is meant to assist the involved parties so as to find a mutually advantageous solution in the disputed issues."[7]

The two parties negotiate in the presence of the negotiatior and come to a final agreement. In other words, mediation is an intermediary position, a type of assisted negotiation that is made by a neutral party, known as the mediator.

Mediation is a form of long-term social education that aims to develop communication and conflict mediation skills so that people would directly come to have a good relationship with each other and to solve their problems alone, without having to go to court.[8]

"Mediation is a process of creation and a social life management process, which allows people either to reconnect to social life or to prevent and solve conflicts thanks to an impartial, authoritativeless third party's interposal that guarantees communication between partners."[9]

Kenneth A. Sprang appreciates that mediation offers many important advantages for the parties involved. A more trustful atmosphere, more confidentiality, less emotional traumas, less transactional costs, a more flexible calendar, more application domains, more creative ways of attack, more opportunities for responsibility and recognition, concentration upon the parties' interests – all are a few of the **advantages** offered by mediation.

Mediation – in Solomon Marcus' view – is a paradigm and it represents, as many other paradigms do, - a convergence point for several disciplines which results in "a richer and more diverse understanding of human behaviour."[10]

For civil society, mediation is an instrument that leads to the creation of social links and it imposes fundamental values such as: autonomy, responsibility, the ability to adapt to new situations, solidarity and agreement. Today we can notice that, in the Western world, mediation has become more and more successful and it is preferred to other ways of settling conflicts. In my opinion, the appearance of mediation, as well as its popularity is linked to the change of mentality regarding social justice (a new understanding of human rights as a form of world justice), the social actor (accepting the role of subject in social and political life), the notion of guilt and conflict (adding value to the psychological and sociological perspective) etc. These modifications lead to preferring/chosing to develop and use alternative methods (ADR) to going to court, i.e. mediation, negotation, legal action. The limits and shortcomings of legal action - that is meant to settle conflicts - are more and more mentioned. Such an action is expensive, adversarial and incapable of wholly solving complex cases!

3. Comprehension and non-violence – basic principles in the science of communication and negotiation

After graduating school many of us have discovered that there are different ways of learning and listening. Research workers have identified 4 styles of learning.

- the Auditory Learner: the learner is concerned about and interested in the moods/feelings of the other person. Auditory learners try to find common interests with the others and react to the other's emotions/moods. Listening is common for couples, families and friends.

- the Active Listening style: the listener requires accuracy, correct presentations, no errors and, if possible, an organized presentation. A boss, for example, could ask the representative of a department to make a report about the general situation of the company. He would expect the report to be concentrated and straightforward.

- The Content Style: the listener prefers the information to be complex and provoking. Since this information is, in general, abstract, people might listen to it without being emotionally affected and then assess the information without making value judgements. A physician might, e.g., ask for information from his colleagues as to how a certain patient should be treated. Thanks to his/her training and his/her experience he/she will not find it difficult to understand a complex medical explanation.

- The Time Style: the listener who adopts this style prefers fast and concise interraction with others and he often gives his interlocutor the possibility to know the amount of time the latter has for finishing his argument. Reporters, when working for a TV broadcast programme, must collect information quickly and effectively because they have tight deadlines and, in fact, this is the reason why they belong to the time style category.

The best listeners are able to adapt their listening style to the given circumstances. If they have not learned how to do that, they will encounter problems when interracting with the others. E.g., when a person complains of a work colleague, he/she probably prefers the auditory learner. However, his/her superior has little time at disposal and, consequently, he/she will want this person

[9] Monique Sassier, 2001, Construire la médiation familiale, ed. Dunod, Paris, 2001, pag. 10.
[10] Solomon Marcus, Paradigme universale, Ed. Paralela 45, Piteşti, 2005.

to quickly state the existing problem and then to leave the office – a reaction that will not satisfy the employee, anyway.

When working with people, it is important to take into account their styles as listeners. E.g., if you want some critical decisive reactions as to a document that you have already written, a listener that identifies himself/herself in the style contained by the text will be more useful than the listener that adapts to the listener's style because the latter will not want to hurt your feelings by pointing out the identified mistakes.

Some research works indicate that culture leaves its mark upon the listening style of a person. A study that has compared American, German and Israeli listeners has revealed that Israeli people concentrate more on the accuracy of the sent messages; Germans are the most active listeners, they often ask questions alongside the listening process. [11]

The ideal communication situation implies observing the non-evaluation, non-interpretation and non-systematic questioning principles.

The first basic condition for avoiding a communication blockage is actively listening to the interlocutor. The active listening attitude is defined according to the above mentioned principles to which one can add the comprehension and rephrasing principle.

The comprehension attitude consists in manifesting interest for what the other says and listening to him in order to try to understand him, not in order to judge or evaluate this person. This attitude is manifested as a request for rephrasing the interlocutor's viewpoints and feelings. Comprehension is the only attitude that favours the interlocutor, which creates a relational climate that is ideal for his/her expressing properly in the absence of any imposed direction or form of manipulation. It is not simple to understand the other person's words. We often take understanding for interpreting. However, understanding does not mean interpreting, but deciphering, decoding the other's words, trying to identify the reasons that guide him. Let us learn how to listen, then! "God has given us two ears and a mouth to listen twice and speak once!"

In order to facilitate authentic communication, one has to be more inclined towards the other, to try to understand his/her inner universe, to see the existing situation through his perspective, to discover the significance he/she gives to a particular event. In other words, to be sympathetic. Sympathy implies "determination and the capacity to control your own social and affective reactions, reaction to the other's feelings, and the verbal capacity to communicate this comprehension." (J.Cl. Abric, 2002).

Active listening is linked to sympathy. It involves surpassing the self, forgetting about ourselves and concentrating upon ourselves, which is not a simple task. Quite often, when our interlocutor speaks, we concentrate upon ourselves, we do not think of what he/she says but of what we intend to tell him/her, of the strategies we are going to use in order to impress, convince or seduce him/her. If we happen to listen to him/her, we shall do this in strict connection with our values, feelings and principles.

Understanding is the only factor that places the interlocutor in a privileged position and that creates a relational climate that is proper for expressing deeply. Understanding the other's words is not easy, however. In other words, paraphrasing Marshall B. Rosenberg, the founder of non-violent communication – let us give up "the jackal's years for the giraffe's ones". The giraffe's ears are big, attentive, open, they know how to decipher the need hidden behind words, while the jackal cannot but hear criticism and answer to them accordingly, provoking violence. The jackal's language is the expression of a biased relationship – as the author states – a relationship based upon waiting, control and guilt. Let us adopt, then, the giraffe's language, a language of amiability, non-judgement/

[11] Kievitz, Christian, *et al*., *Cultural differences in listening style preferences: a comparison of young adults in Germany, Israel, and the United States*, in *International Journal of Public Opinion Research*, 9(3), (Fall 1997), 233(15), online: Infotrac, Expanded Academic ASAP).

labelling, of sympathy, through which the interlocutor's deep needs are heard[12]. To achieve this, we must be more inclined towards the other, try to understand his/her inner universe, discover the significance he/she gives to facts, words, events. This implies an effort of surpassing the self, self-forgetfulness – at least for a while, and concentration upon the other person. This is the only way to acquire comprehensive communication.[13]

"Despite of the urging human need to communicate comprehensively, in most of the so-called civilized countries there is an implied non-communication and human relations culture. It does not favour, either within family and school education or in social life, the development of a high relatedness quotient for most individuals."[14]

In such a society the individual's chance to have a high relatedness quotient (RQ) is low because neither school nor society trains the individual for having lively and healthy relationships. Under these circumstances, as the above mentioned author argues, the relatedness quotient (RQ) could be, however, developed by becoming aware of ourselves and by developing the dynamics of our relationships.

Maryse Legrand – French clinical psychologist – states that one can distinguish between relatedness quotient (RQ) - intelligence quotient (IQ) and emotional quotient (EQ); in her opinion, RQ can be evaluated in two ways: in relationship to the self and in relationship to the others. A good relationship, which has a high RQ, implies the existence of kindness and amiability between its members and it makes possible for the other's particular characteristics to be respected, no matter who the person may be.

RQ is linked to the more or less developed capacity of a person to create for her/him and the others relationships that actively contribute to the increase and flourishing thereof. We could state that an individual has a high RQ when he/she encourages and developes energetic, creative and stimulative relationships for himself/herself and the other one. We shall state the RQ is low when it generates infantile, tiring, alienating relationships for the other one and for himself/herself. (Salome, 2004)

RQ is the art of establishing mutually rewarding relationships. A good relationship implies the following needs: the human need to be accepted, to express oneself, to be recognized as a unique human being and the need to be appreciated. This type of relationship ensures the development, openness and accomplishment of the human being.

As the French writer, Olivier Clerc, points out, RQ also refers to a person's capacity to deal with disagreements and conflicting situations without making use of violence. In such a relationship, our physical, affective and relatedness needs can be heard and recognized – however, this does not mean that they are fulfilled. The need to relate refers to the need to express yourself, to be listened to, to enjoy the others' attention, to be appreciated (to feel yourself appreciated and useful), to be intimate to someone (to be able to share personal secrets), to have a sense of belongingness (to feel that you are accepted in a group), to exercise influence (to contribute to the accomplishment/creation of something new). The RQ is developed within those positive meetings that tend to consolidate personal security, the feeling that you are respected and that you have a certain personal value. At the same time, such a relationship will stimulate openness, interest, curiosity ("taste") to the others. RQ will favour aspiration towards being yourself when meeting the other one, trying to offer him/her the best that you can.[15]

Listening is an ability that can be improved by learning the way it functions. In a survey accomplished by over 500 most successful companies, 59% of those questioned answered that they

[15] J. Salome, *Relation d'aide et formation l'entretien*, p. 27, Septentrion.

paid for their employees to be taught listening courses. This interest for improving listening abilities is important because studies reveal that big company's employees spend about 60% of their time listening, while their managers spend about 57% doing this activity. Research workers have found that good listening skills are directly linked to their work results. When employees attended listening courses before going to the IT training class, they were more efficient they those who were not trained for listening. Fig. 3-1 indicates as a percentage the approximate length of time people dedicate to the 4 communication skills: listening (53%), reading (17%), speaking (16%) and writing (14%). Although we spend most of the time listening, this is the least learned skill.[16]

Listening, like any other skill, must be learned and practiced. When research workers questioned 450 economic graduates as to what communication skills are necessary at the workplace, they answered that listening is the most important quality for acquiring success. When they were asked what communication skills they were taught in high-school, they mentioned listening in the first place.[17]

The negotiator's qualities

Bill Scott considers that important negotiations require not only a negotiator but the whole team. He tries to identify the ideal leader's qualities within the negotiators' team. The team leader's professional level is very important. He/she must have the same professional level as the (rival) team's leader. If this condition is not met, i.e. if his/her negotiation abilities are not as good as his rival's abilities, then his/her team will be dominated and induced towards adopting a defensive, counter-aggressive attitude and, moreover, it is likely for such a team not to be able to cope with a situation of this kind.

Besides the professional level issue, the team leader's work style is also important. As to this, one can not mention a work style that is preferred to another one. It is important for the team to work together effectively and this depends upon its members' capacity to act according to the style they adopted.

In a company in which all information is controlled by a single superior, who assumes all managerial decisions, the negotiators' team will have an identical type of leader. During negotiations this will be able to give answers but he will address his colleagues only when asking for advice regarding the encountered situations and the possibilities that exist for solving these problems – possibilities which he will negotitate later on.

In a company in which management tasks are assigned, the leader will be a person who will control the progress of negotiations in a more free way encouraging the team members to have major contributions during the negotiation process.

The team leader's style has to reflect the organization style, which he represents, and there is no style that could be defined as "perfect".

Bill Scott considers that the leader's educational background is not relevant in negotiation. This role can be played by persons who have a degree in finance or trading or by persons who come from the field of production. It would be preferable, though, for this role to be played by those who, during their trainee years, worked in the commercial field and not the academic one.

First of all, the negotiator must have good communication skills, make proof of the art and science that this skill involves and master communication techniques. The negotiator must be a sympathetic and comprehensive listener. Without these inborn qualities that are developed by studying, it is difficult to be successful when negotiating. A clear communication, which is generally understood, leads to a dicrease in number of unwise decisions and of the costs that the conflicting parties must bear. The wrong perception of the message leads to a wrong interpretation and evaluation of the partner, because one is not fully aware of what they do not know about each other.

---

[16] Sperry Corporation, Your Personal Listening Profile(Sperry Falls Church, VA:1980), p.4.

[17] Vicent DiSalvo, David C. Larsen, William J. Seiler, *Communication Skills Needed by People in Business, Communication Monographs*, 25, (1976): 274.

In our opinion, surpassing these perception limits is possible if all negotiation components have a clear identity and content and if the relationship is based upon precise language and clear rules.[18]

In "One Minute Portrait", Stefan Prutianu considers that the successful negotiator's main qualities are: honesty, industry, love for the others, inner freedom, persuasion, sense of humor, initiative, diplomacy, inspiration and will.

Even if many people think that artfulness is the key of all successful negotiations, the above mentioned writer argues that the most important quality of a good negotiator is honesty and not artfulness. Only an honest and loyal attitude makes human relationships and relationships between organizations last.

As to the mediator, honesty is the manifestation of neutrality and impartiality, the symbol of remaining confidential in order to avoid conflicts of interest and to obtain the parties' consent. These are qualities provided in the codes of ethics belonging to mediation societies.

Hard work, readiness to make effort on a long term, the patience to accomplish a task are undoubtfully a guarantee for success in negotitation and mediation. Like the negotiator, the mediator has to be ready to come to the mediation process in order to work hard, to survey and check "reality". Common sense, good intuition and introspection are important qualities when one deals with a situation of power unbalance and for ensuring an efficient mediation. The mediator must be ready to be creative and flexible when he deals with mediation.[19]

Humanism, love for people, trust in values and the huge potential of the human being are the most important qualities of the person who wants to be a mediator. "Including humanism among the peremptory moral values is no longer negotiable at the beginning of the IIIrd millenium. Animated with humanist ideals, he/she [the negotiator] respects himself/herself and the negotiation partners. He/she can be generous, but, anyway, he/she is fair. He/she can militate for the free development of the human personality, but, however, not anyhow."[20]

The above mentioned author points out the importance of inner freedom in the negotiation process. The ideal negotiator is an independent and autonomous person who negotiates freely and in an unbiased way. These are the basic conditions upon which one's capacity to be natural and free depends. Inner freedom gives man naturalness, ease, dignity and moral steadiness.

Persuasion is the negotiator's capacity to convince and argue and it is transmitted through the rhetoric of the discourse and the orator's passion. The intelligent, logical but cold discourse does not convince. *Passion* warms up spirit and it makes people enthusiastic. We refer to passion here and not ardour ("as a form of slavery caused by ardour").

Diligence, perseverence, not stuborness, represent another dimension of persuasion. Repetitive messages are recorded by passive memory and become more convincing.

"Optimism is the golden hand of the negotiator. It is to a great extent a matter of self trust, attitude and will. It comes from the inner universe, the trust in one's own force and generosity. Good is above evil even if we do not live in the best of all the possible worlds. Optimism is a miraculous plant that can be grown. An optimistic negotiator is generous and cautious. A part of him strongly believes that partners can benefit of the negotiated solution, while the other part remains vigilent."[21]

Smile and humour are important qualities in the negotiation process. A smile can sometimes be more convincing than the whole argumentation. "The serene and smiling face represents 51% of personal charm." Happy, joyous persons are more pleasant and are offered a concession by their partners more easily. Humour is also tonic, it weakens tensions, it warms up atmosphere and it facilitates the offering of concessions.

---

[19] Robert A. Baruch Bush, Joseph Folger, Promisiunea de mediere, Elveția, Jossey Bass ,1994.
[20] Stefan Prutianu, Manual de comunicare si negociere in afaceri, Ed.Polirom, 2000.
[21] Idem.

Initiative is an ally for the one who proposes, begins and initiates an action. Initiative is an ally of the strong, active ones who make decisions alone and never wait for the others to make a decision. A passive, always expecting person cannot have initiative. The strong negotiator depends upon initiative.

Diplomacy allows for a correct and convenient attitude to be adopted in almost any situation. It requires patience, calm and lucidity. The diplomatic negotiator knows how to address his/her interlocutor - the negotiation partner: he/she is balanced and respectful to the others.

Will is also an important quality for obtaining success in negotiations, it is a characteristic of the strong ones and the winners. For them, the exercise of will is so simple that it requires almost no effort. Will is the psychological function that, consciously, directs the individual towards accomplishing his/her objectives. It focuses energies towards attaining goals. Will often differentiates success from failure. Successful persons are those who adopt strong inner decision and do not give up when obstacles are encountered.

Besides the above mentioned qualities of the good negotiator, Stefan Prutianu also adds competitive spirit, dignity, honour, health, experience and age (30 and 50 years).

Conclusions

Communication, negotiation and mediation are creative and managing social life processes, which allow and facilitate human communication, rebuilding broken communication bridgges, preventing or peacefully settling social conflicts. They are processes meant to reinforce the sensibility of human action, cooperation and solidarity, as well as the sustainable development of societies.

Negotiation and mediation are the most convenient and the cheapest ways to settle disputes. That is why, lately they have been more and more used for solving micro and macro social conflicts.

The frequency of using negotiation and mediation in social relationships reveals the level of democracy and political culture in a society.

THE ROLE OF INFORMATION TECHNOLOGY IN BUSINESS GROWTH PERFORMANCE IN KOSOVA

AFËRDITA BERISHA-SHAQIRI[1]

Abstract
As a result of rapid development of information technology and its fast application in the economy and business processes, it has come to the transformation of industrial society to information society while the information society is the new feature of human civilization, where services have become universal and increased the role and importance of information and knowledge.
Today the economy is transformed from the classical model in a new model known as the "knowledge economy" or "global economy". In terms of the knowledge economy in order to create competitive advantage, businesses must be innovative in information technology since information technology has become an integral part of organizational strategy and planning processes and the way to create and enhance competitiveness.
Given current trends in the computerization of enterprises worldwide scale is imperative that Kosovo enterprises to transform into computerized enterprise.

Keywords: *information technology, business processes, enterprise, knowledge, competitive advantage.*

1. INTRODUCTION

As a result of the rapid development of information technology and its very fast application in the economy and business processes became the transformation of industrial society to information society and society of information is a new feature of human civilization, where services have become universal and increased the role and importance of information and knowledge.

Today the economy is transformed from the classical model of economics to a new model known as the "knowledge economy" or "global economy". In terms of the knowledge economy has to created a competitive difference between companies, they must be innovative in information technology because information technology has become an integral part of organizational strategy and planning processes and the way to create and enhance competitiveness.

In the XXI century enterprises operating in a competitive business environs, in terms of computerization and information technology application.

Therefore, those should be able to react fast to changes that may occur in the vicinity which could threaten their existence. Companies today are constantly under pressure of competition and are forced to walk in step with the competition to secure existence in the global markets. Even in Kosovo, under the new economy[2] and present process of globalization the link between different companies and observed trends are increasing use of information technology, computerization of enterprises and the growth business in collaboration between business partners with the customer.

Given current trends of information of enterprises in global scale are imperative of the Kosovo's enterprises to transform into computerized enterprise and focus on achieving their economic sustainability. Actual processes of business development in global scale clearly show that sustainable economic development in time which we live comes from their ability to be innovative in

[1] Afërdita Berisha-Shaqiri, Assistant Professor, Ph.D. Department of Management & Informatics, Faculty of Economics, University of Pristina, Kosova (e-mail: aferdita44@hotmail.com)

[2] According to Don Tapscott new economy or the global economy is nothing more than trade in goods, services, working capital and information. For more see: Group of Authors (1998): Selected topics from informatics. Prishtina, 1998.

business processes to gain competitive edge, which is included in terms of better management and achieve success and prosperity in longer period of time.

This is a challenge for many businesses, even for businesses in Kosovo, they need new information technology whose their data processing must be based on the computer, SMEs and their computer systems must be able to respond quickly and timely with market requirements and necessary changes in the organizational structure of business in order to increase their competitiveness. Business in world has changes every day for that needs growth and development information. At the same time computing systems needs to support growth and development.

2. THEORETICAL ASPECTS OF THE COMPUTERIZATION OF ECONOMIES

Computerization of the economy indicates the level of using computers to perform business activities. Computerization of the economies of most developed countries is the result of a very high rate of growth of manufacturing in electronics and huge investment in these devices. In global proportions almost all countries have the features of information societies.[3] More significant are: the U.S., Japan and Germany which invest many times more per capita on computer equipment than other developed countries. Increasing productivity and reducing costs in developed countries comes from computerized production and investment in robotics and in computerization of administrative tasks. Selection technology today helps companies to provide competitive advantage in all stages of business life cycle.

Today, businesses are using information systems and information technology[4] to improve efficiency and effectiveness of business processes to support the decisions and cooperation in the group. In global proportions there be found some examples of successful companies that use this technology. On this occasion we can mention two of them: American Airlines, which create an entirely new business from the previous one by introducing elements of information technology in their services and Baxter Company from using information technology also they were able to create competitive advantage in global markets in the area in which they operate with their activities.

Using information systems as a factor of efficiency and success of a business has contributed for enterprise to have better position in global market. Computerization system is organized as combination of people, hardware, software, network communications, databases and procedures. These components are organized as a whole unique concept which have to help supporting businesses to create competitive advantage and to support the decision making process to provide support business in operational processes.

Most of today's products derive from the SME and the greatest number of opportunities for employment is also created by SMEs. Taking this into account during the last fifteen years in Kosovo was established a significant sector of SMEs which shows a large dynamic registration of new businesses especially in the first three years of the early nineties and after the war. Distribution of SMEs in Kosovo can be viewed in three stages:

- The first phase from 1991 until 1993
- The second phase from 1994 to 2000
- The third phase from 2001 -.

As a result of all this is necessary these enterprises to create an enabling environment to conduct their business.

---

[3] Information Society is a new feature of human civilization, where universal service and equality of access to information along with the developed infrastructure systems and electronic communications contribute to sustainable socio-economic development, alleviating poverty and providing the best life standard.

[4] We learn and use IT because it is the vital component of business success and it helps to businesses expand and to compete with competitors.

3. EFFECTS OF COMPUTERIZATION OF THE BUSINESS OF SMES IN KOSOVO

Small and medium enterprises in Kosovo have started their development in the early 1990's. However due to the constant pressure on them by the regime they did not mark a significant development. Their rapid development started only after 1999 when it also began to become the main generator of employment and overall economic development of the country.

86.000 enterprises was the number of SMEs registered on March 31, 2008[5] this is one of the best evidence of the importance of this sector. The trend of establishing new SMEs in the economic development of our country according to the statistics shows a high degree of 7% from year to year and continue and into 2008. In the first quarter of 2009 is viewed a increasing interest in establishing new SMEs. The importance of these enterprises is even greater when it is known that over 98% are micro enterprises that employ from 1 to 9 workers.[6]

Despite positive achievements in recent years, the business environment and their surroundings the business in Kosovo still needs to improve, creating more favorable conditions for development and increase their competitiveness by eliminating barriers that private sector is facing the last decade. Computerization of the enterprises is the main way to increase their ability to compete in the global market. The world economy has changed radically, especially due to the rapid development and rapid application also information technology. To survive in global market conditions where there is high competition where the product life cycle is short and where there is a huge diversity of products and services companies it is necessary to apply this technology. It is encouraging fact that the development of information technology in Kosovo's SMEs every day is increasing. This is the best view because the Kosovar business has already realized that the exploitation and the use as soon as possible of this technology creates competitive advantage compared to the competition. They have realized that information technology and its use is the key to success which opens the door towards the future. The globalization of the economy and open competition will be the push for better organization of the production process and increasing demand for relevant software SMEs in Kosovo. Computerization of enterprises create lot of opportunities to contact quickly and directly with business of different countries and regions it has created new business performance and opened a better opportunity for development of various application of software which helps SME to communication wider and easier.

In general, SMEs in Kosovo, mostly uses the Internet to do business transactions, to introduce price lists and types of goods and services on their web-sites, to make orders for goods on-line, to collect information from all areas of different socio-economic activities, to exchange electronic mail with all those who are connected to the Internet, here we think especially for associates and external consultants who are in different universities of the world, to discuss various topics that are developed on the Internet right now that are related to their business activity to pick up various programs and documents relevant to their activities, etc.. Also, personnel working staff respectively to attend different schools on-line, to read and follow the news from around the world etc..

Given the rapid dynamics of development and application of information technology and communications, Kosovo's enterprises tend to adapt to global business environment that presents a real challenge especially if we consider that the Kosova market is limited size. Thus, restructuring can be done only through development that aims to replace imports with local products and export

[5] 51,258 nga këto biznese janë të vogla dhe të mesme, të tjerët janë biznese individuale (dyqane, kafene, restorante, etj) që nuk kanë karakter të ndërmarrjes.

[6] The ownership structure also confirms their importance in terms of employment where near 92% is individual businesses, while 4.1% are limited liability companies. However, concern remains watching business structure in terms of their economic activity, given that only 17% of them are engaged in productive activities, most of them in the food industry (9.4%) and construction ((5.4) and in agriculture only 1.8%. On the other hand almost half of businesses (47.4%) engaged in wholesale and retail trade, 13.4% with transport services, 9% in catering and tourism, etc.. a direct consequence of this is the unfavorable structure of trade exchanges the country where the degree of coverage of imports by exports is only 6.4% according to data for 2007.

promotion. The importance of SME informatization in Kosovo, illustrated by the fact that the average export in 2008 is significantly higher in computerized enterprises compare with those that are not computerized.

It is important to note that enterprises in Kosovo are the initial stage of development of electronic business transactions via the Internet. Over 46% of SMEs conduct business transactions with each other (Business to Business-B2B), while over 35% of them conduct business transactions with the customer (B2C business-to costumers).

According to research on the development of SMEs in Kosovo since (2008), shows that over 70% of SMEs are equipped with computers that makes us realize that Kosovar business understand the importance of using computer technology and information in business processes and changes which bring the use of this powerful tool of our time. Research has also shown that in addition to increasing the number of SMEs that possess computer, from year to year has increased the average availability of computers for an enterprise. In 2008 (6.7 computers) in comparison with 2003 (4.8 PCs) increase is about 40%. While, as to which sector is more computerized research data show that the trade marks the highest percentage (40%), followed by services sector (34.5%) and manufacturing (25.5%).

Tab. 1. Show using Computer by SMEs in Kosovo

	2005 (%)	**2008 (%)**
Financial Evidence	41.6	33.8
Planning	13.7	14.2
Word processing	14.5	16.0
Market research	14.2	14.2
Leadership production	6.8	10.4
Quality control	5.0	6.6
For something else	4.3	4.6
Total	100.0	100.0

Initially small and medium enterprises have used computer for financial records and as a text processor. Today, the use of computers by SMEs is a qualitative change. In particular, there is a positive dynamic of using computers in the past three years in market research and planning (14.2%). Also, the positive trends recorded using computers for production management (10.4%) and for quality control (6.6%)

4. Conclusion

SMEs are an important factor of economic development because it easily withstands shocks from the market, have close relationship with the customer, are flexible to changes, commit resources and capital at the local level, have great affinities to transition from one program to another, create rapid employment. Effects may be organized according to different shapes and create effects in the implementation of rapid technological innovation, the importance of private economy can best be illustrated by its participation in the social product.

Therefore Kosova enterprises should know that in an economy which is undergoing changes every day, adapting to this new environment and in global markets presents a challenge for them to have to be able to afford. Industry should be restructured and internationalize as soon as possible. Given that the Kosova market is of limited size, restructuring can be done only through development

that aims to export, taking into account the challenges and opportunities offered by the digital economy. This is a scenario that Kosovo as a small state and its enterprises have to face and overcome.

Kosovo SMEs are obviously well equipped with computerization of offices, but they should do more to try to modernize the way of communication, with a view to increasing competition outside national borders. The computerized SMEs are considered as a main driver for innovation, employment and social and regional integration.

ICT INDUSTRY R&D IN HUNGARY

ADRIENN FEKÓ[1]

Abstract
In this article, the Hungarian ICT Industry related research and development is analysed. The developments and characteristics of the sector are described on one hand on the available statistics and on the other hand on interviews taken with the representatives of leading ICT companies in Hungary. In this short paper in order to have a larger database, we use a more aggregated definition of ICT sector according to European Commission DG JRC, IPTS (NACE rev.1.1). The main objectives of the paper are: to present the main characteristics of the sector and to explore the main causes of relatively low R&D activity of the ICT sector.

Keywords: *research and development, information and communication technologies, ICT-manufacturing, ICT R&D, Hungary,*

Introduction

The ICT sector is one of Hungary's most dynamic sectors but the related R&D activity is relatively low compare to the EU-27 average, however it increased in the last few years. This short paper focuses on ICT R&D activity of the ICT Manufacturing sector of Hungary and presents the main characteristics and the related R&D activity of the sector. We explore the causes of the low R&D activity of Hungary's ICT Manufacturing sector.

The literature distinguishes two categories in the field of internationalisation of R&D[2]: the 'asset-exploiting' and the 'asset-augmenting' strategies. In case of the 'asset-exploiting' strategy, the main aim of the affiliate is to create localised, market-oriented knowledge which helps firms to adapt existing technologies and products to foreign markets and to boost the overall revenue they generate from these assets[3]. The definition of the 'asset augmenting' strategy covers that situation when the R&D and innovation activities of MNEs abroad focus on creating the kind of technological and scientific knowledge that may find application in the whole enterprise group. However asset-exploiting strategies still prevail, asset-augmenting strategies are gaining importance[4] and we can find examples for asset-augmenting strategies in Hungary as well.

In Hungary in the early 90s a number of multinational companies have begun setting up research and development centres.

The typology of foreign R&D units according to Archibugi&Pietrobelli are the following:

- Centre-for-global: a single 'brain' located within the company headquarters concentrates the strategic resources and distributes impulses to the 'tentacles' (that is, the subsidiaries) scattered across host countries. Even when some overseas R&D is undertaken, this basically focuses on adapting products to the needs of the local users.

- Local-for-local: Each subsidiary develops its own technological know-how to serve local needs.

- Local-for-global: This is the case of TNCs (transnational companies) that, rather than concentrating their technological activities in the home country, distribute R&D and expertise in a variety of host locations.

[1] ICEG European Center, (e-mail: afeko@icegec hu)
[2] see also Cantwell and Mudambi 2005; Narula and Zanfei 2005
[3] EC, 2010a
[4] le Bas and Sierra, 2002

The R&D data of the Hungarian ICT companies is not available in many cases, thus we prepared personal interviews with the representatives of the leading ICT Industry companies in Hungary. It was separate research on ICT R&D in manufacturing and in software, however intertwined to a large extent.

THE MAIN CHARACTERISTICS OF ICT INDUSTRY R&D IN HUNGARY

Methodology of the research

The methodology of the paper involves on one hand the available statistics and on the other hand company interviews taken with the representatives of leading ICT companies in Hungary.

The ICT Sector definition is based on OECD ICT sector definition (ISIC Rev. 3.1.), but due to the lack of detailed data for those categories we used an aggregated definition of the ICT sector[5] according to DG JRC-IPTS, European Commission. We used the following NACE codes (NACE rev 1.1):

Manufacturing:

30: Manufacture of office, accounting and computing machinery

32: Manufacture of radio, television and communication equipment and apparatus

33: Manufacture of medical, precision and optical instruments, watches and clocks

Services:

64: Post and telecommunications

72: Computer and related activities

The paper concentrates only on the NACE 30, 32, 33 of Manufacturing and NACE 64 of Services, without NACE 72 (because the Software sector is another separated part of the research)

Information is limited regarding studies on the ICT R&D in Hungary and also the statistical data are not complete. Due to this, we used statistical data to describe the general trends, but the main characteristics of the activity in the field of ICT Industry R&D in Hungary are underpinned by company interviews. We prepared a list of the largest ICT Industry firms in Hungary based on various sources such as the list of the largest ICT companies, consulted membership lists of relevant associations, articles of economic newspapers, balance sheets, etc. We selected the most important actors and interviewed them.Two categories of the companies were: (1) biggest ICT manufacturing and telecommunication companies with R&D activity, and (2) smaller corporate players, owned by Hungarian private persons. The information gained from the interviews is supplemented by data from other, publicly available sources, such as the balance sheets, the data of the Budapest City Council' Registry Court, websites of the given companies and newspaper articles.

The main limitations of our methodology

- Lack of statistical data on R&D in most of the cases.
- Statistical data are not detailed enough (we used a more aggregated definition of ICT Industry sector).
- Regarding the interviews, we had problems of capturing middle sized companies, who are not mentioned among the top players, but on the other hand, they are also not belonging to the group of the most dynamic, fastest growing smaller sized companies to which the media pays special attention. Thus we might have missed some of the medium sized firms in Hungarian ICT Industry R&D.
- The "ininterestedness" of certain companies to register R&D, in spite of the fact that their activities belonged in essence to that group of economic activities. We tried to capture them, but our means were limited.

The main aim of this paper is to analyse the main characteristics of ICT Industry R&D in Hungary and to explore the most important reasons of the low R&D activity in this field.

[5] EC, 2010b: p 129

The main features of the Hungarian ICT sector

However ICT sector is one of Hungary's most dynamic and innovative sectors, the related R&D activity is relatively low.We explore the main reasons of this paradox.

Table 1. ICT R&D expenditure/GDP indicator

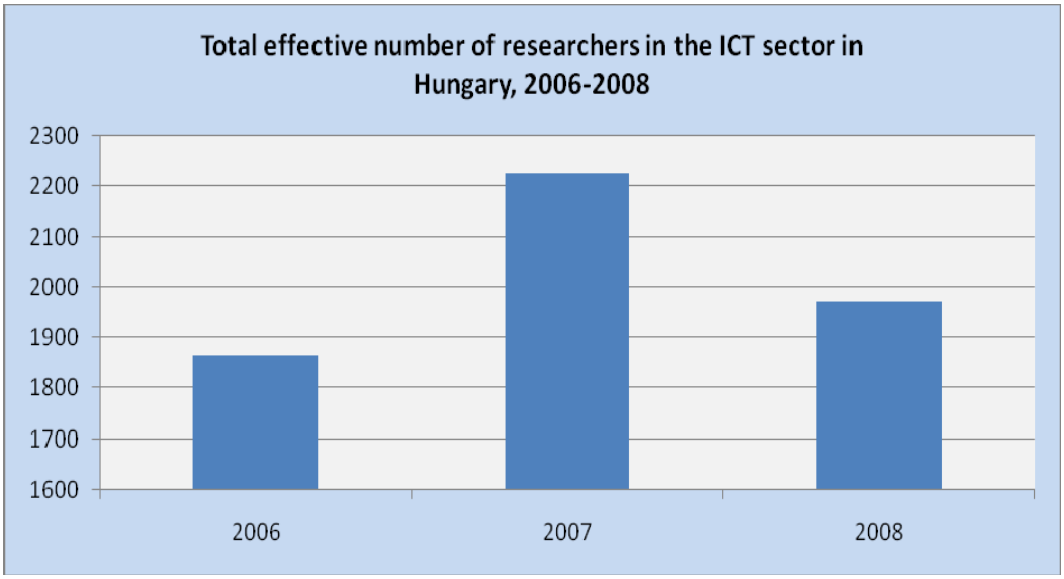
ICT R&D expenditure/GDP (%)	2006	2007	2008
Hungary	0,059	0,067	0,053

Source: CSO, Hungary, DG INFSO

The ICT R&D expenditure proportion in GDP is very low in Hungary, it is approximately 0,05%, in contrary in the EU-27 it is approximately 5% beween 2006-2008.

The effective number of researchers in the ICT sector was 1865 persons in 2006, it increased in 2007 up to 2225 persons, but in 1998 it decreased in Hungary. In the EU-27 ICT sector represents only 3% of total employment[6].

Figure 1. Total effective number of researchers in the ICT sector in Hungary, 2006-2008



Source: CSO, Hungary

The R&D expenditure of the ICT sector increased between 2006 and 2007 and decreased between 2007 and 2008. The R&D cost also increased in 2006 and stagnated in 2007 and in 2008. The ICT R&D expenditure amounted to EUR 56,56 million in 2008 and the ICT R&D cost amounted to EUR 60,07 million in 2008.

[6] EC, 2010b:31

Figure 2. Total effective number of researchers in the ICT sector in Hungary, 2006-2008

ICT Industry BERD, production, export and import in Hungary

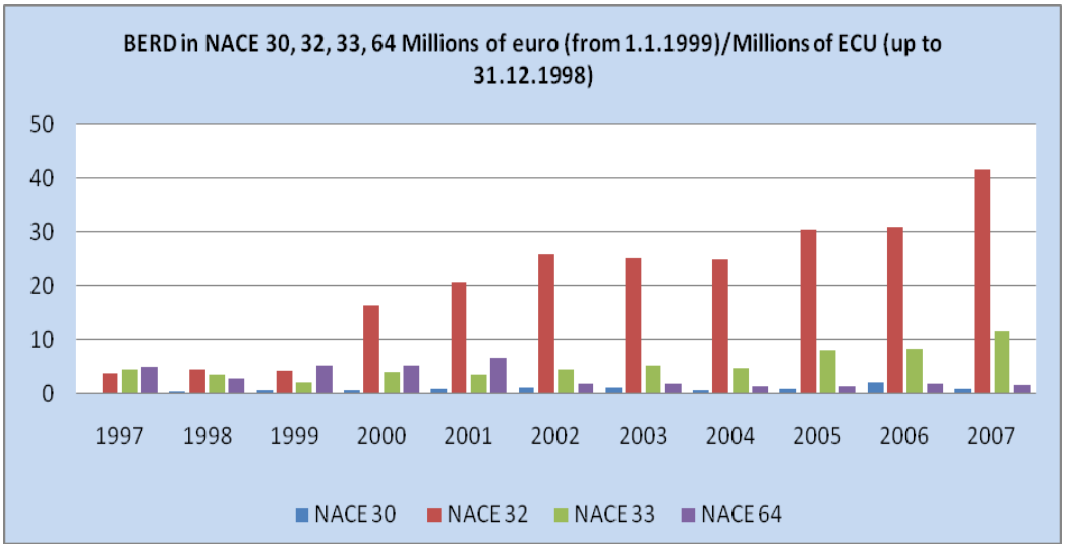
The internationalisation of R&D can be observed in Hungary as well. In the past few years numerous leading ICT industry multinational companies decided to transfer their R&D operations to Hungary. The main reasons of this process are the relatively cheap and relevantly skilled workforce of the country.

In Hungary in 2008 the business sector financed almost the half (48,3%) of the R&D activities[7].

R&D expenditures in NACE 30, 32, 33, 64, have increased significantly between 1997 and 2007; mainly the BERD grew dynamically in these sectors.

[7] CSO, 2009

Figure 3. Business enterprise R&D expenditure in NACE 30, 32, 33, 64 from 1997-2007

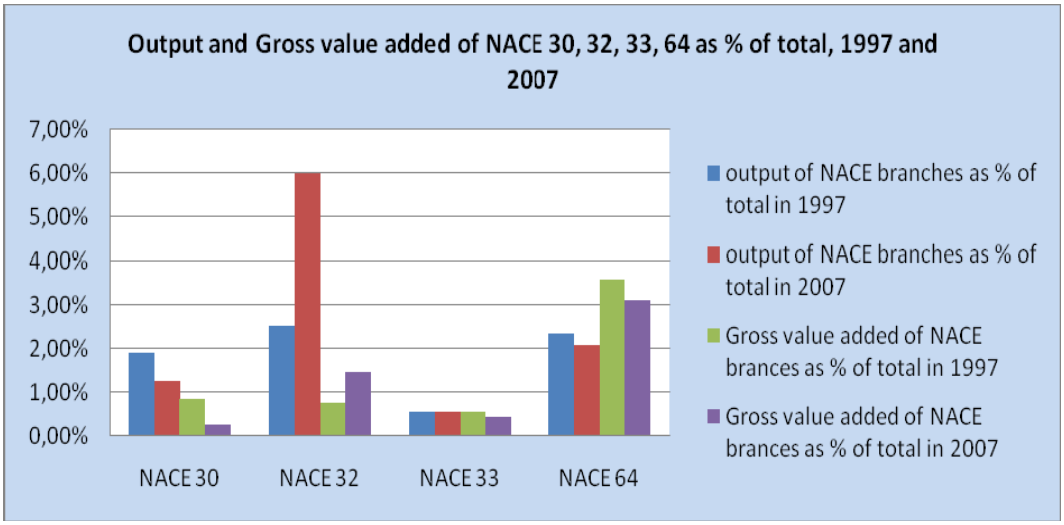


Source: Eurostat

ICT BERD gained importance between 1997 and 2007. ICT BERD (in NACE 30, 32, 33 and 64) was amounted to 11.27% of the business enterprise R&D expenditure of all branches and 5.67% of total R&D expenditures in 2007 in Hungary.

Regarding the production only the NACE 32 sector could increase its share in output and value added. All the other analysed NACE sectors (30, 33, 64) lost some percentage point shares between 1997 and 2007. In 1997 the share of all the analysed NACE categories (30, 32, 33, 64) was 7.28% in total output, in 2007 this grew up to 9.81%. Their share in gross value added decreased between 1997 and 2007, from 5.67% up to 5.22%.

Figure 4. Output and Gross value added of NACE 30, 32, 33 and 64 as %of total



Source: CSO 2008

Figure 5 represents the Hungarian ICT Industry export and import to and from EU 27 in the 75, 773, 776, 76, 874 SITC categories according to SITC classification. Between 1999 and 2007 the high technology product export and import increased dynamically, in 2008 and 2009 the high-tech export and import started to decrease, due to the economic crises. The balance is also increased, stagnation can be observed in 2009.

ICT Industry R&D in Hungary, main characteristics and list of biggest spenders

Table 2 shows our ICT Industry R&D company ranking based on the interviews and available data. Besides the actors of the ICT Manufacturing sector (IT hardware companies, system integrators, automotive companies), we have taken interviews with the representatives of ICT R&D service sectors, e.g. telecommunication (NACE 64). We had a longer list of several companies out of which we have taken interviews with 11 companies of the 13 presented in our estimated raking. Our estimated ranking includes besides the foreign owned affiliates of the biggest ICT industry R&D spenders some smaller actors, companies with Hungarian private owners. In order to provide a real picture, we involved these companies as well.

Table 2. Ranking of ICT Industry companies in Hungary based on their R&D spending

Ranking	Name of the company	Ownership structure	Sales (2008) in HUF thousand (thousand EUR[2])	R&D spending in 2008 in thousand HUF (thousand EUR[2])	Location of Headquarters in Hungary	Location of R&D centres, labs
1.	Audi Hungary Motor Ltd.	AUDI AG, Ingolstadt (Germany)	1 408 650 210 (5 606 568)	74 118 750 (295 000)	Győr	Győr
2.	Robert Bosch Electronics Ltd.	Robert Bosch Investment Nederland B.V. (Netherlands)	24 459 899 (97 353)	10 101 600 (36 000[1])	Hatvan	Budapest
3.	Nokia Siemens Networks Ltd	Nokia Siemens Network BV (Netherlands) (100 %)	12 324 650 (49 053)	6 606 506 (2009) (26 295[1])	Budapest	Budapest
4.	Knorr Bremse Ltd.	Knorr Bremse Systeme für Nutzfarhzeuge GmbH (Germany)	31 012 000 (123 431)	3 268 141 (13 007)	Kecske-mét	Budapest Kecske-mét
5.	GE Hungary Ltd.	GE Holdings Hungary Ltd. (USA) (100%)	667 443 000 (2 656 490)	1 264 000 (5 031)	Budapest	Budapest, Budaörs, Oroszlány
6.	AVL Autókut Ltd.	AVL Holding Gmbh (Austria)	1 356 251 (5 398)	1 085 000 (4 318)	Budapest	Budapest
7.	Magyar Telecom Telecommuni-cations Plc.	MagyarCom (the 100% owner of MagyarCom is Deutsche Telekom A.G.)	500 804 000 (1 993 250)	721 000[1] (2 870)	Budapest	Budapest
8.	NI Hungary Ltd.	Enterprise International Holding B.V. (Netherlands)	56 691 708 (225 639)	566 917 (2 256)	Debrecen	Debrecen

9.	Meditech Ltd	Hungarian private owners	445 089 (1 772)	280 931 (1 118)	Budapest	Budapest
10.	ThyssenKrupp Presta Hungary Ltd	ThyssenKrupp Presta München/ Esslingen GmbH (100%) (Germany)	2 187 077 (8 705)	200 000 (796)	Budapest	Kecske-mét
11.	ThalesNano INC	Hungarian private owners predominant-ly	1 410 136 (5 613)	86 229 (3432)	Budapest	Budapest
12.	BULL Hungary Information System Ltd.	BULL International SA France (France) (100%)	4 058 954 (16 155)	46 044 (183)	Budapest	Budapest
13.	Externet Plc.	Birdcom Consulting Ltd. (Hungary)	2 198 535 (8 750)	10 000 (40)	Szolnok	Budapest

[1] in 2009

[2] Average exchange rate in 2008: 251.25, in 2009: 280.6.

The ownership structure, sales, headquarters and R&D centres

The dominance of the subsidiaries of multinational companies is significant in the estimated ranking; ten of the estimated first thirteen are foreign owned companies, and only three of them are Hungarian owned. Regarding the ownership structure the proportion of companies with Hungarian private owners in the list is only 23,08%, the remaining proportion involves company owners from Germany (30,77%), from Netherlands (23,08%), from USA (7,69%), from Austria (7,69%) and from France (7,69%).

Regarding the amount of companies's sales: Audi Hungary Motor Ltd is the first, GE Hungary Ltd is the second, and Magyar Telecom is the third in the ranking.

The location of headquarters of the biggest R&D spenders is predominantly Budapest, but we can find important ICT Industry companies' locations also in other Hungarian cities such as: Győr, Hatvan, Kecskemét, Debrecen and Szolnok.

The R&D centres and labs are usually at the same place where the headquarters are located.

R&D spending

Many companies (predominantly in the software sector, but some of them also in the ICT Industry sector) declared that they do not have R&D, but further investigation revealed that their task involves R&D activities. We tried to deal with that problem, but understandably, our means were limited.

Among the biggest R&D spenders we can find Audi Hungary Motor Ltd, Robert Bosch Electronic Ltd and Nokia Siemens Networks Ltd.

Main characteristics of the Hungarian ICT Industry R&D

The selected companies are from various ICT fields, but the dominance of telecommunication operators and automotive industry is typical. It can be explained by their rapidly growing R&D activity.

Among the foreign owned companies there are formerly state-owned, privatised companies, for example Matáv, AVL Autokut or GE. The Magyar Telekom Telecommunications PLC was established in 1990 after the split into three firms of the Hungarian Post by the Hungarian Ministry of Transportation, Communication, Information and Architecture, under the name of Matáv Hungarian Telecommunication Company and it remained state owned until 1993. In 1993 the Hungarian Telecommunication Act entered into force and the privatization of Matáv has been launched. Today the majority owner of the company is MagyarCom, and Deutsche Telekom is 100% owner of MagyarCom. Similarly, AVL AUTOKUT is a result of privatisation, and part of the GE affiliate in Hungary was also established through the acquisition of a formerly state-owned company (Tungsram).

Based on the interviews the main motives of foreign companies to establish Hungarian affiliates in R&D are mainly the high quality expertise of Hungarian employees.

The main destinations where ICT R&D results in the case of the interviewed companies were exported are the following:

- Mother company and other affiliates of it (Knorr Bremse, Audi, AVL Autókut, NI Hungary);
- Domestic market (Magyar Telecom Plc, Bull Hungary Ltd, Externet,);
- Clients from all over the world (GE).

In the first group R&D results are mainly exported; export/sales ratio is between 70 to 100%. This underlines the vertical nature of these projects and the fact that R&D activities in Hungary are highly embedded into the "R&D-network" of the parent company.

R&D units of the second group are more of horizontal nature and carry out R&D mainly with the aim of adaptation of the products of the given company to the local market.

In the case of GE (third group), the Hungarian R&D unit can be considered as a globally oriented plant where certain R&D activities of the multinational company are concentrated.

The ICT R&D activities of the companies can be related to the production. Usually it can be observed that production centres could attract R&D (NI, Knorr Bremse, Audi). Based on the interviews in the case of Knorr Bremse the Budapest R&D centre became a stronghold for Knorr Bremse through allocating certain core R&D tasks here. In case of NI, manufacturing activity of the company takes place in Austin and in Debrecen, but the bigger proportion of the production (90%) is carried out in Hungary. At the time of establishment, the main profile of NI Hungary was hardware production, because Hungary offered cheap environment (cheap labour) to this activity. After the initial period of gaining experience, the Hungarian subsidiary could take over high value added activity from the parent company and from other European companies, because of the high quality of human resources. In 2001 manufacturing of loaded electronic boards has started in Debrecen and at the end of 2004 the production of the site represented 70% of NI total. Today 90% of production takes place in Hungary. This concentration of production to one site understandably brought over some related R&D as well.

We also examined some small firms which have Hungarian private owners, such as Externet Plc, ThalesNano Inc., Meditech Ltd. These companies are also important actors of the ICT R&D market. Their relative share in ICT R&D is low but they have outstanding results which are worth to mention.

As far as the geographical location is concerned, headquarters of the affiliates are mainly located in Budapest but certain R&D units or other units are hosted by cities near Budapest, or by bigger cities in the countryside.

Conclusions

The main aim of this paper is to analyse the main characteristics of ICT Industry R&D in Hungary. Based on the company interviews it is most probable that R&D expenditures and the number of R&D employees in the sector are underestimated. Due to the fact that some companies have no interest in registering these neither at the Central Statistical Office nor in their balance sheets.

The most important actors in the field of ICT Industry R&D are the Hungarian subsidiaries of multinational companies (mainly from Germany, but there are actors also outside Europe), in the internationalisation of R&D process the high quality expertise of Hungarian employees is dominant. In the ICT Industry sector among the leader R&D spenders we can find only foreign companies, because it is difficult to Hungarian companies to appear among leaders. Strong concentration and structural duality can be seen: some foreign owned bigger companies (Audi, Robert Bosch, NSN, Knorr Bremse) provide the significant proportion of ICT Industry R&D spending in Hungary, Hungarian companies are only smaller players.

The increasing amount of ICT R&D in Hungary is related to the outsourcing/relocation of R&D activities of multinational companies, which is an international tendency.

Regarding the geographical location, the R&D centres are mainly located in Budapest, but in case of ICT Industry R&D there are centres also in other biggest cities, because the R&D is attracted by the production.

EXTRACTING KNOWLEDGE FROM DATA - DATA MINING

DIANA ELENA CODREANU [1]
DENISA ELENA PARPANDEL [2]
IONELA POPA [3]

Abstract
Managers of economic organizations have at their disposal a large volume of information and practically facing an avalanche of information, but they can not operate studying reports containing detailed data volumes without a correlation because of the good an organization may be decided in fractions of time. Thus, to take the best and effective decisions in real time, managers need to have the correct information is presented quickly, in a synthetic way, but relevant to allow for predictions and analysis.
This paper wants to highlight the solutions to extract knowledge from data, namely data mining. With this technology not only has to verify some hypotheses, but aims at discovering new knowledge, so that economic organization to cope with fierce competition in the market.

Keywords: *data mining, date warehouse, database, analysis, decisions, information*

Introduction

Because the present policy makers in an organization is facing an avalanche of data, data systematic data yet unexplored, but also because computing, informatics, information technology has been developed in to an alert, the skyrocketed and the need to use new methods for information discovery, knowledge that is "hidden" in the data, information that can not be "discovered" by traditional means or by using just the human factor.

Data mining (data mining) sometimes called knowledge discovery in databases (Knowledge Discovery in its Bases - KDD) is a new technology, a young technology, technology "growing" but that seems to be on the verge of reaching a "key technology.

As with other technologies there are many understandings of information technology on the definition of this technology but also in terms of the roots, interdisciplinary nature of this technology. This paper wants to emphasize to point out these two issues, to highlight what "borrow" the process of data mining in other disciplines that cross over, but intense relationship between Data Mining and Business Intelligence. This paper aims to discuss this topic because there are now a number of companies that have field activity data mining applications and this is due to increasingly larger data mining services for example, the economic and financial market (we can give examples of areas like Business Intelligence, Business Performance Management - BPM, Customer Relationship Management - CRM and others).

Data mining has been defined as the automatic analysis of large and complex data sets as its main objective the development of new significant patterns or trends without using this technique could remain "unidentified." Because of recent research in data mining have developed more efficient methods FST for finding these new patterns, as well as huge volumes of data into knowledge based on effective methods of classification to clustering, analysis of frequent patterns, sequential or structural.

Basically data mining is one of the most recent technologies for data analysis with OLAP, data warehouse concept, text mining or web mining.

[3] Lecturer, Ph. D., „Constantin Brancoveanu" University, Piteşti (e-mail: popaionela80@yahoo.com).

The interdisciplinary character of Data Mining Technology

The concept of data mining has emerged in the 80s and in that time and represented the process by which only applied to algorithms for extracting knowledge from large data collections. Year 1994 is another year of reference in terms of data mining technique, so in 1994 the company launched the SPSS data mining program called "Clementine," which proved later to be widely used and widely spread at that time. Another reference date is the data mining industry in 1996 with funds allocated by the Commission shall draw European design methodology CRISP-DM (Cross Industry Standard Process for Data Mining).

Over the years, the concept of data mining has evolved, so has been interpreted in a broader process that is taking place extracting knowledge from databases based on some information requirements and to validate the information obtained. This is the approach that has been accepted more and more lately.

Because now we are facing an avalanche of information in electronic text, data mining has seen a new specialization, namely to help *text mining* automatic extraction of knowledge from text.

Date mining became known in the '90s, when speaking of data mining *or mining the data "in* many environments, whether it is academic whether the business.

In 1997 Pregibon - Research Scientist Google Inc.., Says *that "Data mining is a mixture of Statistics, IA (Intelligence Artificial) and database research"* (D. Pregibon, Data Mining, Statistical Computing and Graphics Newsletter, 7, p.8, 1997).

We say that data mining is an interdisciplinary, as in disciplines such as statistics, database technology and artificial intelligence, has borrowed techniques and terminology work. It is very difficult to define each of these disciplines, but it is equally difficult to delimit the boundaries between data mining and each [one] of them. (Figure)

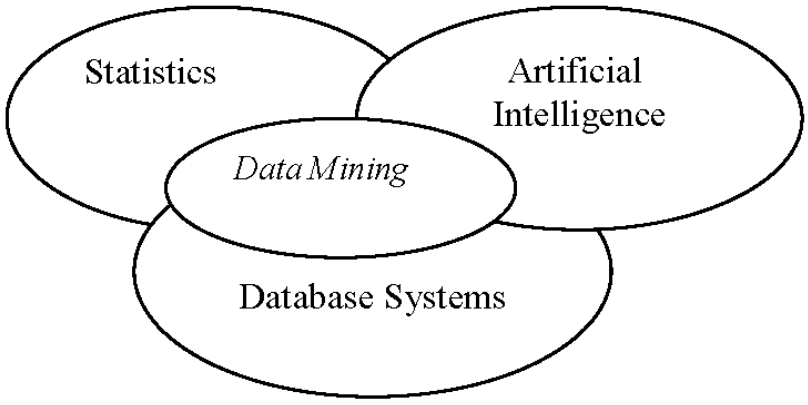

Figure: Data mining interdisciplinary nature of art

Statistics - Data Mining (DM) used in defining statistical techniques that are found in the literature as the *exploratory data analysis (EDA - Exploratory Data Analysis).* EDA is used to establish the systematic relationship between different variables in a situation where we have sufficient information on their nature. Among the best known and EDA techniques can be used to name [two:]

- *Computational methods:* descriptive statistical (repairs, CALS statistical parameters (mean, median, the lead standard), correlations), multivariate statistical methods (clustering, factor analysis, discriminate function analysis, classifications and regression trees, linear and nonlinear regression models;

- Because *data visualization* allows you to view information in visual form, is one of the best and used data mining methods. Among the most commonly used techniques can include: histograms, graphs rectangular, scatter graphs, contour graphs, charts, graphics array.

Artificial Intelligence *(AI - Intelligence Artificial)* Data Mining is its contribution in providing information processing techniques based on human reasoning.

Database Systems *(DBS - Database Systems),* is that the third discipline that provides material that must be operated using the methods mentioned above.

Like *statistics*, data *mining* is a business solution, it is just a technology[4] . In contrast to statistical analysis, *data mining* analyzes all relevant data from the database and extract models (patterns) hidden.

The term "data mining" is used in particular by organizations concerned with information processing companies, financial analysts, in marketing, fraud detection, but lately it has become increasingly used in scientific research scientific, extract information from large volumes of data.

Data mining is a complex process, taking roots in the learning process, a process that can achieve the following levels:

- Facts - definition of reality;
- Concepts - a concept represents a set of objects having certain common symbols SPECIFICATIONS;
- Procedures - a procedure consists of a series of actions performed to achieve an objective;
- Principles - Principles are underlying truths to other truths.

Practical data mining analysis are focused on the discovery of new knowledge from data.

Information obtained by using data mining techniques to be valid. The accuracy and completeness are the two characteristics of the underlying validity of the data. This information should not only be valid and the data mining process itself.

Looking for Data mining definition

In the literature there are many definitions for data mining / knowledge discovery in data base because it is a relatively new technology.

Gray and Watson believe that "data mining allows analysts and store managers to find the answers to company data, which they have not even put"[5]. Data mining has been described as *"the science of extracting useful information from large volumes of data and database"*[6].

Data mining in relation to economic resources planning is the statistical analysis and logical data volumes of transactions, looking for patterns that can help decision-making process.

The data mining process of extracting means knowledge bases or data warehouses, knowledge previously unknown, valid and operational at the same time[7].

Data mining seeks not only verify the hypotheses, but aims at discovering new knowledge, information totally unknown until then. Thus, the results are very valuable.

Extracting knowledge from data performed correctly, the following benefits:

- Helps reduce costs for decision-making processes;
- assist managers in making business decisions faster and better quality;
- Services to business customers an improved knowledge signified;

---

[4] Tudor Irina, Cărbuneanu Mădălina, *Utilizarea tehnicilor de data mining în comunitățile de învățământ virtual,* Conferința Națională de Învățământ Virtual, ediția a V-a, 2007;

[6] Gray P. H.J. Watson (1996) The new DSS: Data Warehouses, OLAP, MDD and KDD;

[7] Ellen Mank, Bret Wagner, *Concepts in Enterprise Resource Planning,* Second Edition, Thomson Cours, Tehnology, Boston, MA, ISBN – 0-619-21663-8, 2006;

We can say that the whole company management knows an improved significantly.

The main features presented by data mining systems are as follows[8]:

- Findings generated by the system have a very high probability; can be considered "safe";
- compared with information held by the user or system, the resulting information is not trivial;
- discovered user models are represented in a comprehensible form.

Data mining process can be used, in principle, any type of database. It is used in particular in data warehouses because to be accurate and reliable results, the data mining process is applied to data of high quality that is to be cleansed, integrated, selected and processed. Such data are found to meet these conditions within the data warehouse.

Data mining and Business Intelligence

Smooth running of an organization is provided by the decisions be taken in time, decisions that are correct as long as they are based on data and information on which to base those decisions. Thus, it is necessary that managers take into account all available information sources, both within the firm, the information system and beyond.

The main purpose of business intelligence is to obtain information from available data, data that may come from scattered sources or stored in a warehouse date. A correct decision based on accurate information.

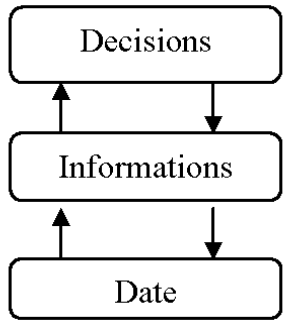

Figure data, information and decisions

Stages of processing data into information and information into decisions then form part of a cyclical process. Substantiation decisions require information and information resulting from the data. Apart from a context, no data are valuable information. To make the information, data should be in particular business contexts.

Using data mining analysis will identify new knowledge without being required human intervention. Basically, data mining analysis is aimed at discovering new knowledge.

Using applications of Business Intelligence (BI) offers users a number of significant advantages especially for those who have to make decisions about the good of the organization[9]

- Because the design and to develop business intelligence applications based on economic progress and requirements processes in organizations, the company will benefit because these applications;

[8] Bodea, C., Inteligența artificială și sisteme expert, București, Editura Inforec, 1998;

[9] Kimball R. Și colectiv, *The Microsoft Data WarehouseToolkit with SQL Server 2005 and Microsoft Business Intelligence Toolset*, John Wiley & Sons, 2006;

- Business Intelligence applications using large volumes of processed data and information from the process are made available to a large number of users;
- Mechanisms for calculating the indicators of business performance analysis and are easily integrated business intelligence applications;
- In the design and development of Business Intelligence applications can be trained, usually decision makers within the firm.

And processed data from various sources are loaded into the data warehouse and then using OLAP and Data Mining technology data are converted into information, information that is presented to the beneficiaries in the form of report. A Model of Business Intelligence in the firm's decision making is presented in the following figure[10] :

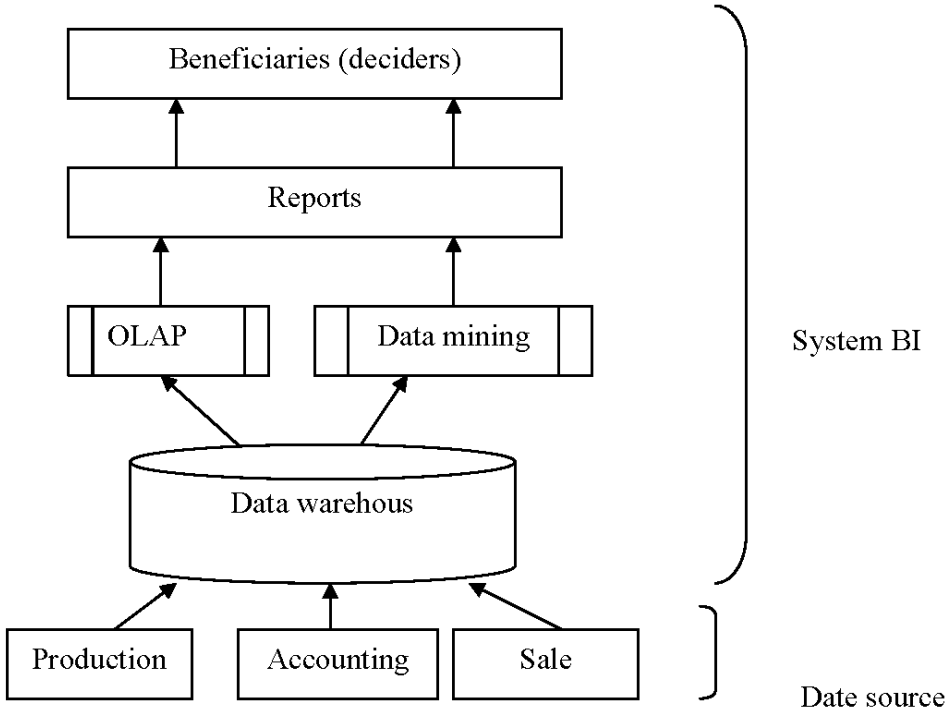

Figure: Business Intelligence in decision-making firm.

With data mining tools are analyzed all links between data characteristics. Also, data mining tools to solve problems of data inconsistency. Although systems containing integrated data source, cleaned and valid, they may contain data about the real world that is not true. These data are called noise and may as a result of human error in the input of data and information systems.

Also, the data may contain patterns (patterns) or trends that would be true only for a small subset of data. This can be examined from two points of view, which, in statistical terms but unattractive business point of view this is perhaps the most interesting customers serum due to their behavior. These types of sets are called local effects.

Using data mining techniques, data are analyzed from several angles simultaneously, which can help eliminate attributes that are considered singular and thus does not seem relevant.

[10] Giovinazzo, W. 2002 , Internet – Enabled Business Intelligence, Prentice Hall.;

Interdependencies between attributes are those that allow the extraction of data to information that is relevant.

Data mining is the process through which one or more machine learning techniques can extract hidden knowledge from data. The process of data mining is to identify trends and patterns in data sets.

The steps of extracting knowledge from data

Typically, when referring to the process of extracting knowledge from data refer only to the application stage, the different methods and data mining techniques, but do not pay attention to the steps needed for the process.

Main stages of extracting knowledge from data are:

1. Defining the problem - at this stage of acquisition of knowledge about the initial state, but also about setting goals and purpose of the application;
2. Building the database - making a single database where data are cleaned and stored to provide the necessary support for building (making) an appropriate model, also reduce the size of the data store, eliminating noise and finding how to replace the data missing;
3. Use of data - is the phase in which the data understanding, viewing them, but also the development of pivot tables to provide a clear view of the database consistency
4. Preparation is the stage when there is data to identify those variables that will constitute the components of the predictive model, you might like to consider all variables to ensure the best predictions. It is still quite difficult to achieve this because a large number of variables increases the time needed to build the model prediction and the decreased ability of the model results;
5. Building the model - is a process interactive as to Jung CAE better option, certain steps in the development process will be repeated, and it will also modify the data. The model can be considered final when there is completion of the training and testing.
6. Assessment model - considering the accuracy of results. Model is given by increasing the efficiency of certain indicators.
7. Interpretation of model results and improvement. This is the stage when the decision to the user based on the results it can decide to replay one or more phases of the project.

All the knowledge extraction process is centralized around an object on the problems encountered in the economic field, problems involving the identification, discovery of knowledge to help solve them.

We can say that the whole process of knowledge extraction is an iterative process, because during the course of this process, shows steps are executed repeatedly, sometimes by taking back some of them.

Although methods and techniques for extracting knowledge from data are applied in automatic mode, the data mining process requires considerable human effort, especially in the stages of analysis, but also in what the validation results.

Conclusions

Data mining is the process of discovering some models of knowledge or information of the user data stored in data warehouses usually type database or data warehouse, as well as advanced data analysis techniques used to discover these patterns.

Data mining has occurred because of developments in information technology, the avalanche of data produced by human society from its their activities and because of the need to transform data into information and knowledge for wide applications in analysis and production control, market analysis, detection fraud but also for medicine.

Data mining involves an integration of techniques from many fields. We can say that it is an interdisciplinary field that intersects the main subjects is technology database, data warehouse technology, statistics, business intelligence, digital technology.

We say that data mining is an advanced analytical processing of data is superior to limited analytical process of database systems and data warehouse analysis because data specific techniques more advanced.

Information that is discovered data mining process are used to substantiate decisions is made by the directors of a company.

A RELATION BETWEEN WEB PAGES

DORU ANASTASIU POPESCU[*]

Abstract
In this paper we define a relation on the set of web pages from a web application. With the help of this relation, we obtain a partition of this set into subsets. Verifying and testing the web application will be accomplished by testing only one representative in each subset. We present two algorithms, one for verifying the relation between two web pages and one for determining which pages to test.

1. Introduction

Web applications are made up of a large variety of files. Among these, the ones built from tags (e.g. htm or html files) are very numerous and of great importance. We now want to group these files based on similarity. For illustration purpose we will use a practical example (built using [12]). Grouping the set of web pages in a web application into subsets leads to a reduced number of files needed for testing.

Testing the files can be done using various validators (e.g. [8], [9], [10]) and test applications presented in paper like [6] and [11].

In section 3 we present an equivalence relation between the web pages of a web application.

In section 4 we describe an algorithm for verifying if two web pages are in the relation described in section 3. In section 5 we present a way of partitioning the web pages of a web application using this relation. In section 6 we present an algorithm which produces the partition and determines a representative for each subset (used for testing and verification).

2. Introducing a web application

In order to understand the notions that are to be introduced in the next sections, we need a concrete web application. For this, we chose an application which contains a photo album. In most cases, such an application is formed from two categories of web pages:

- Index page (1)
- Zoomed in picture page (2)

Moreover, the index pages can be divided in three categories:

- Beginning index page
- Ending index page
- Interior index page

[*] Lecturer, Ph.D., Faculty of Mathematics and Computer Sciences, University of Pitești (e-mail: dopopan@ yahoo.com).

Figure 1

Similarly, the zoomed in pictures pages can be divided in three categories:
- Beginning zoomed in picture page
- Ending zoomed in picture page
- Interior zoomed in picture page

Figure 2

From an object oriented point of view, the web application contains two types of objects, corresponding to the pages (1) and (2). We will note pi_0 the beginning index page, pi_1, pi_2, ..., pi_k the interior index pages and pi_{k+1} the ending index page. Next, the beginning zoomed-in picture page will be noted with pm_0, then pm_1, pm_2, ... , pm_h the interior zoomed in picture pages and with pm_{h+1} the ending zoomed-in index page. We will consider that an index page contains n pictures (in the example in figure 3, n=4, k=2, h=13).

The relations among the objects are relations of navigating between:
index page - index page
index page - zoomed in picture page
zoomed in picture page - zoomed in picture page
The ORD (Object Relational Diagram) of the web application is a directed graph
where the set of vertices is $V=\{pi_0, pi_1, pi_2, ..., pi_k, pi_{k+1}, pm_0, pm_1, pm_2, ..., pm_h, pm_{h+1}\}$. The edges of the ORD are given by the navigation relations:
(pi_j, pi_{j+1}), j=0,1, ..., k
(pm_j, pm_{j+1}), j=0,1, ..., h
(pi_{j+1}, pi_j), j=0,1, ..., k
(pm_{j+1}, pm_j), j=0,1, ..., h
(pi_j, pm_{jn+a}), j=0,1, ...,k, a=0,1,...,n-1
(pi_{k+1}, pm_j), j=(k+1)·n+a, ...,h.

The ORD for the application, with n=4, k=2, h=13 is represented in figure 3.

3. The equivalence relation for the components of a web application

For an application formed of n web pages: $p_1, p_2, ..., p_n$ we can define a relation ~ like this:
$p_i \sim p_j$ if and only if p_i and p_j have the same structure, [1], [3]. (3)
We can state that two web pages have the same structure if they are composed of the same scripts and tags, in the same order and with the same attributes. It can be easily shown that the relation ~ is an equivalence relation. We can define for a page p_i its equivalence class: $C(p_i)=\{p_j \mid p_i \sim p_j, j=1,2, ...,n\}$.
This way, using the equivalence classes, we can obtain a partition of the set $\{p_1, p_2, ..., p_n\}$.
For the example in section 2, the partition is composed of 6 equivalence classes:
$C_1=\{pi_0\}$
$C_2=\{pi_3\}$
$C_3=\{pi_1, pi_2\}$ (4)
$C_4=\{pm_0\}$
$C_5=\{pm_{14}\}$
$C_6=\{pm_1, pm_2, ...,pm_{13}\}$.

A similar way of establishing an equivalence relation can be obtained for other components as well.

4. Algorithm of verifying the ~ relation

We will now consider two web pages p and q of a web application. The following algorithm goes through the source codes of p and q only once, sequentially and simultaneously and determines if the pages are similar. More precisely, we have:
Algorithm - Testing if two web pages are in the ~ relation
found ← true
WHILE (not end of file p) and (not end of file q) and (found)}
  Tp ← current tag in file p
  Tq ← current tag in file q
  IF Tp ≠ Tq THEN
        found ← false
  ENDIF
ENDWHILE
IF there is a tag in p or q's source code that has not been verified THEN

```
  found ← false
ENDIF
IF found THEN
  WRITE p and q are in the ~ relation
ELSE
  WRITE p and q are not in the ~ relation
ENDIF
```

Observation

The complexity of the algorithm is O(u+v), where u is the number of characters in file p and v the number of characters in file q, respectively.

5. Reducing the number of components that have to be verified and tested in a web application

Using the partition of the components of a web application defined in section 3, we can reduce the verification and testing only to one representative of each component. The functionality and correctness of a component from an equivalence class determines the functionality and correctness of all its components.

Proposition 5.1

Let us consider the set M of the components of a web application and an equivalence relation, denoted as ~, defined on M. If C_1, C_2, …, C_k are the equivalence classes of the relation ~ on M, then:

1) $C_1 \cup C_2 \cup ...C_n = M$

2) $C_i \neq \varnothing, \quad i \in \{1,2,...,n\}$.

Proof

The demonstration is immediate, using the properties of the relation ~ and the way of defining the sets C_i.

Proposition 5.2

Let us consider the application formed of n web pages: p_1, p_2, …, p_n and a relation ~, defined by (3). If C is an equivalence relation of p_i, p_i being correct and functional, then every web page p_j in C is correct and functional.

Proof

Find p_j from C. Due to the way of defining C, results that $p_j \sim p_i$, meaning that p_j contains the same scripts and tags, in the same order. Since p_i is correct and functional, it results that all its scripts and tags are correct and functional. Thus, p_j is also correct and functional.

Proposition 5.3

Let us consider an application formed of n web pages: p_1, p_2, …, p_n and a relation ~, defined by (3). If C_1, C_2, ..., C_k are the equivalence classes obtained from the relation ~ and $q_1 \in C_1$, $q_2 \in C_2$, …, $q_k \in C_k$ are correct and functional, then the application is correct and functional.

From $q_i \in C_i$, i=1,2, …, k and proposition proposition 5.2, it results that any web page from C_i is correct and functional. Now, using proposition proposition 5.1, it follows that p_i is correct and functional, for i=1, 2, …, n. This way, it results that the entire web application is correct and functional.

Remark

For our example, using proposition 5.3 and the equalities (4), we may deduce that in order to verify the correctness and functionality of the web application it is necessary and sufficient to test the functionality of the web pages: pi_0, pi_3, pi_1, pm_0, pm_{14}, pm_1.

6. Algorithm for determining the components that have to be verified and tested in a web application

Let $P = \{p_1, p_2, \ldots, p_n\}$ be the set of web pages in a web application. Using the algorithm from the section 4, we can construct a boolean method, named RELATION, which takes as parameters two web pages p_i and p_j (in practice, we can only take the indexes i and j as parameters) and returns true or false, depending on the result of the verification of the $\sim$ relation.

Algorithm - Determining the web pages that have to be verified and tested

```
FOR i=1 to n DO
  class[i] ← i
ENDFOR
FOR i=1 to n-1 DO
  IF class[i] = i THEN
        FOR j=i+1 to n DO
              IF RELATION(i,j) THEN
                    class[j] ← i
              ENDIF
        ENDFOR
  ENDIF
ENDFOR
FOR i=1 to n DO
  IF class[i] = i THEN
        WRITE i
  ENDIF
ENDFOR
```

Remark

The complexity of the algorithm is $O(u \cdot n^2)$, where u is the maximum number of characters of a web page from web application.

The algorithm outputs the index of one page in each equivalence class. These pages can be used for testing.

6. Conclusions

Generally, web applications contain many web pages. Their verification and testing is usually realized by using different verifications. As many components of a web application have the same structure, it results that the time of verifying and testing can be substantially reduced if we verify only one representative from each set of web pages having the same structure. In the future, we intent to realize a complex application that determines the web pages needed to be verified. We will concentrate on finding new selection criteria of the web pages that will considerably reduce the number of pages to be verified (using ideas like the ones in [2], [4], [5] and [6]).

COLLABORATION SYSTEM IN VIRTUAL ORGANIZATION

ADINA CRETAN [*]
EMIL FLOREA [**]

Abstract
The purpose of this work is to provide a collaboration support for small and medium enterprises which cannot or do not want to fulfill a major contract alone. In that case, in order to better meet a higher external demand, the managers are willing to subcontract parts of their contracts even to competitors.
This approach is illustrated by a business-to-business interaction, being proposed a sample scenario where partners are autonomous gas stations grouped in a virtual organization.

Keywords: *SME, B2B interaction, subcontracting, cooperation, collaboration.*

Introduction

Recent advances in the information technology have made possible the development of a new type of organization, the virtual organization. Taking into account the connection between the new communication technologies and the relationships between the industrial organizations, two main directions are distinguished. The first direction considers the Internet and the Informatics as being the main technologies that facilitate the communication between persons. The second direction, more visionary, is focused not only on the communication but mainly on the modalities that allow the information technologies to coordinate in an efficient fashion and with minimal effort requirements the activities of individuals.

Related to the second direction, the concept of "virtual enterprise" or "network of enterprises" has emerged to identify the situation when several independent companies decided to collaborate and establish a virtual organization with the goal of increasing their profits.

Given this general context, the objective of the present paper is to develop a conceptual framework and the associated informational infrastructure that are necessary to facilitate the collaboration activities and, in particular, the negotiations between independent organizations that participate in a virtual alliance.

The starting point in the development of this work was the goal to support small and medium enterprises that are not able or are not willing to perform alone a large contract since in this situation the association in a virtual alliance provides the opportunity to subcontract the tasks of the contract to other partners within the alliance. To achieve this goal, research was dedicated to the development of a model to coordinate the negotiations that take place within an inter-organizational alliance. Our research was focused on the topics of virtual alliances, automation of the negotiations and of coordination aimed to provide the mechanisms for coordinating the negotiations that take place among autonomous enterprises that are grouped in a virtual alliance.

Assuming that the nature of the roles that may be played in a negotiation are similar in multiple approaches, the number of participants involved at the same time in the same negotiation is considerably different.

Depending on the number of participants involved in a negotiation, we may distinguish various negotiation types: *bilateral negotiation (one-to-one)*; *one-to-many negotiation; many-to-many negotiation*.

[**] "Nicolae Titulescu" University, Computer Science Department (e-mail: eflorea@univnt ro)

Taking into account the complexity of the negotiations modeled by multi-agent system, we can state that to conduct in an efficient fashion one or many negotiations that involve a large number of participants and to properly account for all negotiation dimensions, it is necessary to develop a coordination process that is defined outside of the specific constraints of a given decision mechanism or communication protocol.

The negotiation process was exemplified by scenarios tight together by a virtual alliance of the autonomous gas stations. Typically, these are competing companies. However, to satisfy the demands that go beyond the vicinity of a single gas station and to better accommodate the market requirements, they must enter in an alliance and must cooperate to achieve common tasks. The type of alliance that we use to define their association emphasizes that each participant to this alliance is completely autonomous i.e., it is responsible of its own amount of work and the management of its resources. The manager of a gas station wants to have a complete decision-making power over the administration of his contracts, resources, budget and clients. At the same time, the manager attempts to cooperate with other gas stations to accomplish the global task at hand only through a minimal exchange of information. This exchange is minimal in the sense that the manager is in charge and has the ability to select the information exchanged. Taking into account the constraints imposed by the autonomy of the participants and also the fact that the participants are initially competing, the only means to distribute the information or the resources are provided by the negotiation process.

When a purchasing request reaches a gas station, the manager analyses it to understand if it can be accepted, taking into account job schedules and resources availability. If the manager accepts the purchasing request, he may decide to perform the job locally or to partially subcontract it, given the gas station resource availability and technical capabilities. If the manager decides to subcontract a job, he starts a negotiation within the collaborative infrastructure with selected participants. In case that the negotiation results in an agreement, a contract is settled between the subcontractor and the contractor gas station, which defines the business process outsourcing jobs and a set of obligation relations among participants [1].

The gas station alliance scenario shows a typical example of the SME virtual alliances where partner organizations may be in competition with each other, but may want to cooperate in order to be globally more responsive to market demand.

The collaborative infrastructure, that we describe, should flexibly support negotiation processes respecting the autonomy of the partners. We are briefly describing in section 2 the architecture of the collaboration system in which the interactions take place [2].

The main objective of this paper is to propose a collaboration framework in a dynamical system with autonomous organizations. In Section 3 we define the Coordination Components that manage different negotiations which may take place simultaneously. In Section 4 we present how the structure of the negotiation process can be used by describing a particular case of negotiation. Finally, Section 5 concludes this paper.

The Collaborative Infrastructure

The collaborative infrastructure offers generic mechanisms to support different activities, especially negotiation activities, in a distributed environment. This infrastructure is structured in four main layers: Manager, Collaborative Agent, Coordination Components and Middleware. A first layer is dedicated to the Manager of each organization of the alliance. A second layer is dedicated to the Collaborative Agent who assists its gas station manager at a global level (negotiations with different participants on different jobs) and at a specific level (negotiation on the same job with different participants) by coordinating itself with the Collaborative Agents of the other partners through the fourth layer, Middleware [3]. The third layer, Coordination Components, manages the coordination constraints among different negotiations which take place simultaneously.

Figure 1 shows the architecture of the collaborative system:

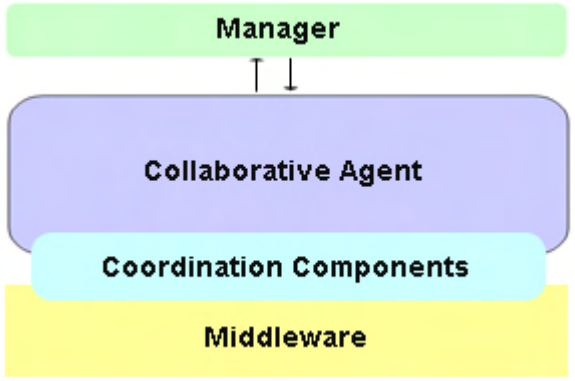

Figure 1. The architecture of the collaborative system

A Collaborative Agent aims at managing the negotiations in which its own gas station is involved (e.g. as initiator or participant) with different partners of the alliance.

Each negotiation is organized in three main steps: initialization; refinement of the job under negotiation and closing [4]. The initialization step allows to define what has to be negotiated (Negotiation Object) and how (Negotiation Framework) [5]. A selection of negotiation participants can be made using history on passed negotiation, available locally or provided by the negotiation infrastructure [6]. In the refinement step, participants exchange proposals on the negotiation object trying to satisfy their constraints [7]. The manager may participate in the definition and evolution of negotiation frameworks and objects [8]. Decisions are taken by the manager, assisted by his Collaborative Agent [9]. For each negotiation, a Collaborative Agent manages one or more negotiation objects, one framework and the negotiation status. A manager can specify some global parameters: duration; maximum number of messages to be exchanged; maximum number of candidates to be considered in the negotiation and involved in the contract; tactics; protocols for the Collaborative Agent interactions with the manager and with the other Collaborative Agents [10] [11].

Coordination Components

In order to handle the complex types of negotiation scenarios, we propose five different components:

- *Subcontracting* (resp. *Contracting*) for subcontracting jobs by exchanging proposals among participants known from the beginning;
- *Block* component for assuring that a task is entirely subcontracted by the single partner;
- *Divide* component manages the propagation of constraints among several slots, negotiated in parallel and issued from the split of a single job;
- *Broker*: a component automating the process of selection of possible partners to start the negotiation;
- *Transport* component implements a coordination mechanism between two ongoing negotiations in order to find and synchronize on the common transport of both tasks.

These components are able to evaluate the received proposals and, further, if these are valid, the components will be able to reply with new proposals constructed based on their particular coordination constraints [12].

From our point of view the coordination problems managing the constraints between several negotiations can be divided into two distinct classes of components:

Coordination components in closed environment**:** components that build their images on the negotiation in progress and manage the coordination constraints according to information extracted only from their current negotiation graph (*Subcontracting, Contracting, Block, Divide)*;

Coordination components in opened environment: components that also build their images on the negotiation in progress but they manage the coordination constraints according to available information in data structures representing certain characteristics of other negotiations currently ongoing into the system (*Broker, Transport).*

Following the descriptions of these components we can state that unlike the components in closed environment (*Subcontracting, Contracting, Block, Divide)* that manage the coordination constraints of a single negotiation at a time, the components in opened environment (*Broker, Transport)* allow the coordination of constraints among several different negotiations in parallel [13].

The novelty degree of this software architecture resides in the fact that it is structured on four levels, each level approaching a particular aspect of the negotiation process. Thus, as opposed to classical architectures which achieve only a limited coordination of proposal exchanges which take place during the same negotiation, the proposed architecture allows approaching complex cases of negotiation coordination. This aspect has been accomplished through the introduction of coordination components level, which allows administrating all simultaneous negotiations in which an alliance partner can be involved.

The coordination components have two main functions such as: i) they mediate the transition between the negotiation image at the Collaboration Agent level and the image at the Middleware level; ii) they allow implementing various types of appropriate behavior in particular cases of negotiation. Thus we can say that each component corresponding to a particular negotiation type.

Following the descriptions of this infrastructure we can state that we developed a framework to describe a negotiation among the participants to a virtual alliance. To achieve a generic coordination framework, nonselective and flexible, we found necessary to first develop the structure of the negotiation process that helps us to describe the negotiation in order to establish the general environment where the participants may negotiate. To develop this structure, we proposed a succession of phases that are specific to different stages of negotiation (initialization, negotiation, contract adoption) that provided a formal description of the negotiation process. The advantage of this structure of the negotiation process consists on the fact that it allows a proper identification of the elements that constitute the object of coordination, of the dependencies that are possible among the existing negotiations within the alliance, as well as the modality to manage these negotiations at the level of the coordination components.

The structure of the negotiation process

The various coordination components in open or closed environment, which we just defined, highlight the main features implemented in this negotiation process: distributive and parallelism.

Coordination schemes, which are implemented in coordination distribution through the components, can be executed in parallel by the proposed infrastructure.

According to our approach regarding the negotiation, the participants to a negotiation may propose offers and each participant may decide in an autonomous manner to stop a negotiation either by accepting or by rejecting the offer received. Also, depending on its role in a negotiation, a participant may invite new participants to the negotiation.

In order to illustrate this approach, we present a schematic example of a negotiation process using negotiation and coordination mechanisms that we proposed in this paper.

Negotiation process that we present in Fig.2 is divided into five parts (initialization, choice of tactics, choice of partners, negotiation and adoption). Judicial proceedings aimed at defining the steps to be followed and the establishment of the necessary components to coordinate implementation of the negotiation process involving multiple concurrent negotiations.

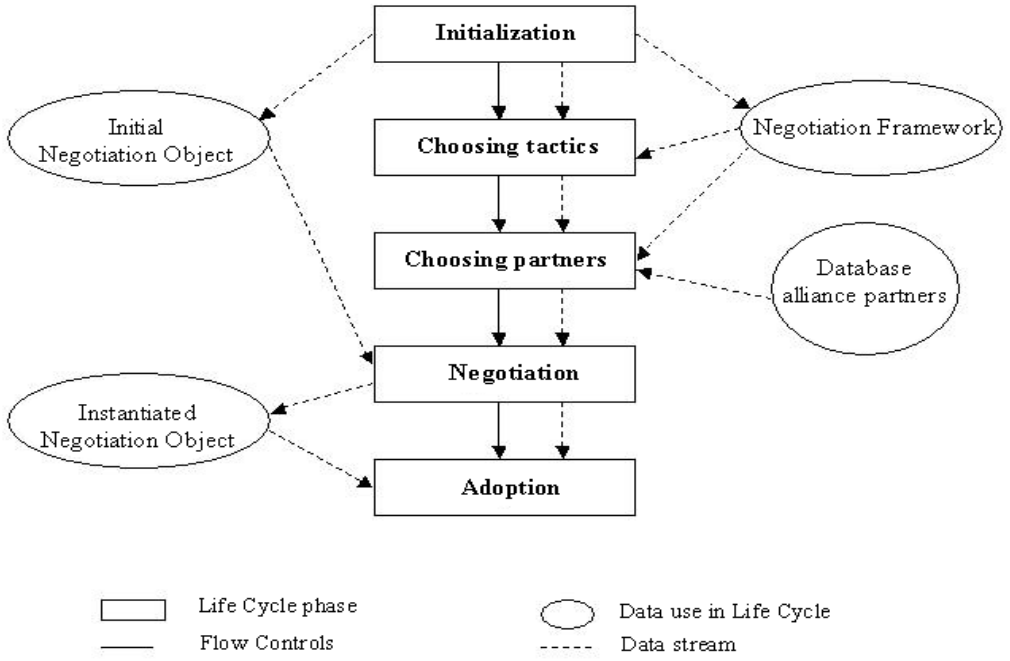

Figure 2 – The structure of the negotiation process

Initialization. The Manager initiates a subcontracting of a task, defining and communicating to the Collaborative Agent the properties and the constraints of the negotiation object and the negotiation framework. The negotiation process begins by creating an instance of the component Subcontracting. This instance will initiate other stages of negotiation, based on constraints provided by the Manager: the invitation of the coordination components (*Contracting*, *Broker*, etc.). Moreover, this instance will conduct negotiations in terms of construction and evaluation of proposals for subcontracting proposed task.

Choosing tactics. Using the tactics of negotiation specified in the negotiation framework, the coordination is decomposed into several coordination schemes. We considered three tactics that correspond to three coordination schemes: Block, Divide and Transport.

Choosing partners. We have two choices of partners:

i) among known partners – The Manager who initiating the outsourcing can specify any constraints on the set of possible alliance contractors. To do this, the manager uses the description of the job that follow to be subcontracted and also the database alliance partners and/or the different adhesion contracts which they signed [14];

ii) among unknown partners - in this case, the entire research activity of the potential partners is managed by the infrastructure through Broker component.

Negotiation. At this stage, during exchanges of proposals, the negotiation object evolves according to the constraints imposed by the manager on negotiated attributes of the subcontracting task. The final objective of the negotiation process is to build an Instantiated Negotiation Object[1]

[1] An Instantiated Negotiation Object is a negotiation object whose attributes have been accepted by the all partners.

from initial specification of negotiation object [15]. After that, this object will be used to establish a contract.

Adoption. In the final negotiation phase, the negotiation properties are fixed values. In this case, the Collaborative Agent asks Manager to validate the result of negotiation and makes contact with other partners' agents. Depending on the answers obtained, the Manager may decide to: i) to restart or to suspend negotiations; ii) to enable the contracting phase, which allows reaching an agreement [16].

The negotiation process involves several parties (for several bilateral negotiations), each having different criteria, constraints and preferences that determine their individual areas of interest [17]. Criteria, constraints and preferences of a participant are partially or totally unknown to the other participants. The job under negotiation is described as a multi-attribute object. Each attribute is related to local constraints and evaluation criteria, but also to global constraints drawing dependencies with other attributes [18].

In conclusion, the proposed architecture provides the following features:

- to define the negotiation process structure: participants, interaction protocol, negotiation protocol, tactics and coordination components, the negotiation object and the negotiation strategies;
- the modeling all negotiations for a gas station in the form of a set of bilateral negotiations, which the agent can operate independently;
- the modeling of the coordination among the negotiations based on a set of coordination components and the synchronization mechanisms at the middleware level.

Thus, we can say, that we have proposed an infrastructure that manages, in a decentralized manner, the coordination of multi-phase negotiations on a multi-attribute object and among a lot of participants.

Conclusions

The functioning of this kind of alliance suppose task achievement, which cannot be individual treated, by a single participant for better adjustment of the clients requirements.

The proposed infrastructure aims to help the different SMEs to fulfill their entire objectives by mediating the collaboration among the several organizations gathered into a virtual alliance.

A specific feature that distinguishes the negotiation structure proposed in this work from the negotiations with imposed options (acceptance or denial) is that it allows the modification of the proposals through the addition of new information (new attributes) or through the modification of the initial values of certain attributes (for example, in the case of gas stations the gasoline price may be changed).

The business-to-business interaction context in which our activities take place forces us to model the unexpected and the dynamic aspects of this environment. An organization may participate in several parallel negotiations. Each negotiation may end with the acceptance of a contract that will automatically reduce the available resources and it will modify the context for the remaining negotiations.

In the current work we've described in our collaboration framework only the interactions with the goal to subcontract or contract a task. A negotiation process may end with a contract and in that case the supply schedule management and the well going of the contracted task are both parts of the outsourcing process.

In order to illustrate our approach we have used a sample scenario where distributed gas stations have been united into alliance. Take into consideration this scenario, one of the principal objectives was related to the generic case and means that this proposed infrastructure can be used in other activity domains.

Regarding research perspective continuation, one first direction which can be mentioned is the negotiation process and the coordination process taking into consideration the contracts

management process. In this way the coordination can administrate not only the dependence between the negotiations and the contracts which are formed and with execution dependences of those contracts.

Another perspective is to deliver to the user one instrument which allows him negotiation protocol definition according with the restrained negotiation interactions possibilities. Consequent, this will be a problem of coordination on which the infrastructure must solve on negotiation protocol administration and protocol build perspective.
