[27] Copyright Amendment (Online Infringement) Bill 2018 –

and the targeting of sites that have a 'primary effect' of facilitating access to infringing content (along with more-explicit and central piracy sites). Dynamic orders are only possible when ISPs don't file an objection.

Denmark is a pioneer in terms of website blocking for copyright enforcement. In 2006[28], Denmark was the first country in the world to allow website blocking for copyright enforcement. During 2019, the Danish Rights Alliance[29] had 141 'pirate' sites blocked by local ISPs[30], which contributed to visits to pirate sites dropping by 40 percent in 2019 as compared to 2018[31].

In the latest development, in April 2019, the Court of Frederiksberg issued Denmark's first dynamic blocking injunction in allowing LaLiga (the Spanish football league) to get local ISPs to block access to 10 sites that infringe its copyrights by showing live matches[32]. Nine of the ten piracy sites listed in the complaint were ultimately deemed to be infringing the rights of the owners and generating revenue via advertising, and the tenth, Spain-based RojaDirecta (also targeted in Mexico), requested more time to respond to LaLiga's complaint, so the site will be dealt with at a later date. The Danish Rights Alliance would follow procedures set by the court in identifying and advising what new sites to add to the junction.

On September 29, 2020, Ireland's High Court granted a dynamic blocking injunction to UEFA's EURO 2020[33] (taking place in 2021 due to the COVID-19 pandemic)[34] and other matches taking place during the 2020/2021 football season. It's the first injunction UEFA has sought and received in Ireland, but it follows a similar 2019 injunction for the English Premier League[35] (which was extended in June 2020[36]). These follow similar injunctions UEFA received in courts in England and Wales[37]. As stated in UEFA's case in Ireland, dynamic injunctions for sporting events are critical as 'the real time nature of live sport means that the primary value of UEFA live match broadcasts is at the point in time when it is being broadcast'[38]. Furthermore, that 'by the end of the match, the streams will have served their purpose, so removal post-match would carry no or, at best, very limited benefit'[39].

The judgment in Ireland reiterates central facts about the use of website blocking for copyright enforcement: the ISP services are being used to infringe copyright, but the ISPs themselves are simply conduits, not infringers; dynamic orders prevent infringement in that they at least make it more difficult or discourage it; they do not impose unreasonable costs on ISPs; and they don't unnecessarily deprive Internet users of lawful access to content online. The judge noted that his decision is consistent with the case law of the Court of Justice of the European Union (CJEU) and, in particular, with the judgment of that court in Spiegel Online v. Beck (2019)[40], in that it strikes a fair balance between the respective rights and interests of rightsholders and of Internet users.

Beyond football, in 2018, Matchroom[41] - one of the world's leading boxing promoters - received a similar dynamic injunction in the United Kingdom[42]. Matchroom wanted to protect upcoming major boxing matches involving British professional boxer Anthony Joshua, which were broadcast by Sky on a standard subscription or pay-per-view basis. Matchroom provided evidence that it lost a significant amount of revenue as a high number of illegal streams were made

available for his prior fights. Matchroom's dynamic injunction differs[43] from those given to UEFA. Given that boxing matches are irregular, the judge allowed blocking orders to be used in the seven days prior to a match and for a period/schedule of two years, thus the rightsholder needs to notify the ISPs at least four weeks in advance of a scheduled match.

Ever since its first dynamic injunction in April 2019[44], the Delhi High Court has become the focal point for rightsholders in India trying to better protect copyright online in India. In 2016 the Bombay High Court[45] took a more cautious approach in only allowing rightsholders to seek blocking injunctions against specific URLs and not entire websites unless they can demonstrate that the entire website contains infringing works. However, the Delhi High Court's detailed, well-reasoned, and comprehensive approach accounts for these and many other concerns in creating a legal and administrative framework for dynamic injunctions. As part of this, the court expressly endorsed the proportionality principle enunciated by courts in the EU and the UK.

On July 27, 2020, the Delhi High Court granted Disney a dynamic injunction against 118 piracy sites[46]. Also, in July 2020, the court granted a dynamic injunction for Snapdeal[47] in fighting trademark infringement, which is in itself an evolution in India in using dynamic injunctions for IP enforcement beyond copyright. As with prior cases, the court allowed the rightsholders to update the list of blocked websites by adding the names of mirror/redirect/alphanumeric websites which piracy operator's setup after they realized their primary sites are blocked. This is the most important part of the judgement as it substantially reduces the resources required for blocking every mirror infringing website. Similar to courts in Ireland, England, Wales, and the EU, the court consciously accounted for the rights of copyright holders in this way.

While India and the Delhi High Court have not yet allowed live blocking orders, they do allow the use of website blocking for sporting events, including pre-emptive "John Doe"[48] cases targeting known infringers. This is important as online viewing of sports content, especially cricket, has grown rapidly in India[49] due to increasing smartphone penetration and the falling cost of cell phone plans. The Indian Premier League (IPL)[50] - the massively popular cricket series - in 2017 saw a 62 percent growth rate of digital viewers. While a substantial number[51] of these viewers watched the IPL on legitimate online services such as Star India's Hotstar mobile streaming app and Time Internet's platform. Crickbuzz, many people resorted to unauthorized online streaming of live matches. For instance, at the end of the 2017 IPL season, it was discovered that more than 1,700 unique URLs were illegally broadcasting the IPL via 211 unique servers, 122 pirate streams, 51 hosting sites, and 23 infrastructure providers[52].

On September 23, 2020 the Delhi High Court granted Star India[53] - the broadcasters of the IPL - a blocking injunction against the operators of a known piracy service. The services are based outside of India and only became active during cricket matches. This follows rulings in 2014 and 2016 whereby the court ordered the complete blocking of websites involved in illegal streams of cricket matches and football tournaments (such as the World Cup)[54].

[46] https://smenews.org/2020/07/29/disney-obtains-new-dynamic-court-order-to-block-118-pirate-domains/ - site accessed on 20 March 2021. The action, filed by Disney Enterprises "and others", was heard via video-conferencing due to the coronavirus pandemic. Defendants include dozens of pirate sites, Internet service providers, the Department of Communications (DoT) and the Ministry of Electronics and Information Technology (MEITY). The list includes 37 'pirate' site defendants, none of whom were present to mount any kind of opposition. The sites were specialized in anime and cartoons, including the massively popular Nyaa.si, Horriblesubs, Kisscartoon/Kimcartoon, Wcostream/watchcartoononline, kissanime, gogoanime, and 9anime. Also, the plaintiffs were demanding that 11 domains/sub-domains to be blocked by ISPs (TorrentDownload and YourBitTorrent2), and finally, the application demanded that named proxy sites are also blocked by ISPs, including Unblockit.red and Proxyof.com.

[54] https://economictimes.indiatimes.com/internet/delhi-hc-orders-blocking-of-73-rogue-websites-with-pirated-videos/articleshow/

In February 2019, the Mexican Institute of Industrial Property implemented the country's first dynamic preliminary injunction to the rightsholders of the Spanish football league "La Liga" to block the pirate website Rojadirecta[55]. The order was only for the duration of the season and only on the days when matches were broadcast.

In February 2020, the Madrid Commercial Court granted Spanish broadcaster Telefónica Audiovisual Digital[56] (which holds the rights to the national "La Liga" football competition) a dynamic blocking[57] injunction to block a list of 44 known piracy sites, which can be updated to add new entries. The injunction is valid until May 25, 2022, so will cover a total of three seasons.

In July 2020, Singaporean courts granted[58] a dynamic injunction to cover 15 flagrantly infringing online locations that included copyright protected content from the English Premier League, Discovery, BBC, La Liga, and TVB.

International jurisprudence has influenced Singapore in different ways. In the initial case, the Singapore High Court largely relied on the approach of English courts (in Twentieth Century Fox v. British Telecommunication and Cartier International v. British Sky Broadcasting). However, the Court expressly rejected the approach of the Federal Court of Australia (in Roadshow Films v. Telstra Corporation)[59] where it refused to allow dynamic blocking with judicial scrutiny. Also, contrary to the 'right balancing analysis' adopted by the Delhi High Court, the Singapore High Court in Disney Enterprises adopted a 'means/ends analysis'.

In December 2019, Sweden's Patent and Market Court issued the first ever dynamic injunction[60] in Sweden. ISPs are required to 'take reasonable steps to block customers' access to identified illegal file-sharing services, not only on the listed domain names and web addresses (subject to a separate traditional blocking injunction with immediate effect) but, for a period of three years, on domain names and websites 'whose sole purpose is to provide access to said illegal file-sharing services'. On June 29, 2020, the court confirmed and elaborated upon this precedent-setting case in establishing the use of dynamic injunctions for copyright enforcement in Sweden[61].

This follows a long-running appeals process that concerns a 2018 case where rightsholders (Disney, Universal Studios, Warner Bros, and several others) asked for an injunction to block infamous piracy sites such as The Pirate Bay, Dreamfilm, Nyafilmer, Fmovies, and several other related proxies and mirror sites. Similar to the High Court of England and Wales, the court made rightsholders responsible for informing the ISP about which domain names and URLs to block (the prerequisite being that these have the main purpose of providing unlawful access to any of the services in question). The court gave the ISPs three weeks to enact new blocking lists. ISPs bear the cost for enacting the blocking orders. However, the fact that it took 16 years for Sweden to block the Pirate Bay - which was founded in Sweden in 2003 - is indicative of how much more work is needed to reduce global digital piracy and how long it has taken website blocking to become accepted antipiracy tool[62].

3. Conclusions

The copyright and related rights injunctions are equitable remedies in a form of a Court order/decision that requires a party to do or refrain from doing specific acts that are infringing copyright and related rights. In the case that the party fails to comply to an injunction faces criminal, administrative or civil sanctions as presented for the Romanian copyright and related rights law.

The main reason of injunctions is to establish the *ante status quo*, which refers essentially to fairness and equity.

In the view of EU regulatory texts, in order to protect copyright and related rights the Courts could take provisional and precautionary measures, measures for preserving evidence, measures for claims, blocking and dynamic injunctions.

As presented in the mentioned case-law and international developments, blocking injunctions are an example of policy best practice in supporting creativity, copyright and related rights in the digital content[63].

Also, more countries are recognising that websites blocking can be well suited to protect live events[64].

Blocking injunctions are imposing as normal forms in order to fight against online piracy, since the websites and the proxies are blocked.

The injunctions forms are evolving for properly adapt to the chancing forms of online piracy and modern digital piracy.

PROTECTION OF NEW VARIETIES OF PLANTS

Andreea LIVĂDARIU[**]

Abstract

Joining Nature and Divinity, man has been working for tens of thousands of years not only to invent new plants, but also to improve plants, to discover develop and create new varieties of plants with high productivity, high energy value, resistant to disease, pests, low temperatures and drought. With results protected by a special law, a sui-generis law that deviates even from the golden rule of intellectual property, that of not protecting ideas and discoveries as they must belong to everyone and to no one at the same time.

Keywords: *plant, plant variety, new plant variety, variety patent, novelty, distinct character, uniformity, stability, name.*

1. Protection system for new plant varieties (conventional, Community, national)

In Part I of this article, entitled "Plants and human food" we showed that in regulating the protection of new plant varieties, the Church has a priority worth mentioning because it demonstrates a remarkable openness (of an institution always considered, but also wrong, in our opinion, hostile to science) towards this field[1]. Proof is an Edict of Papal States dated 1833 which proposed for the first time in the history of intellectual property law the recognition of an exclusive right upon achievements regarding the progress of agriculture under the reasoning that those who put their minds and industry in the service of natural products or of inventions for breeding or for the introduction to agricultural crops of new plant varieties or new cultivation techniques ***"it deserves that the fruits of their research and discovery to be guaranteed to the extent that the results reveal science".***

However, nothing significant was to happen in the 19th century in this field, despite the valuable research and important results obtained by researchers and breeders before and after 1833. However, the doctrine considers that the French Patent Law from 1844 made no difference between manufacturing industry and agriculture, the latter being seen, moreover as a branch of industry in its broadest sense. But in the absence of an explicit provision in French law of a possibility of patenting new varieties, French jurisprudence generally open to novelties, has been reluctant to recognize the validity of such patents, many applications being filed to protect new varieties of roses.[2]

2. Plant varieties in the Paris Convention for the Protection of Industrial Property

However, the issue of protection of new varieties[3] was also of concern to the international community, but not to a sufficient extent, as long as in art. 1 (3) of the Paris Convention of March 20th 1883 on the Protection of Industrial Property, provided that industrial property is to be understood in the broadest sense and ***'applies not only to the actual industry and trade, but also in the field of agricultural and extractive industries and all manufactured or natural products, such as: wines, grains, tobacco leaves, fruit, cattle, ores, mineral waters, beer, flowers, flour".***

Although insufficiently clear, the quoted text of the Convention does not exclude in our view "natural products" from the patent, and the enumeration in the text, which is exemplifying, not limiting, reinforces this conclusion. In fact, when in France in 1922, after the famous carnation process "Aline Bonard"[4] and which was followed by persistent demands of the French breeders to be granted exclusive rights over the varieties created by them, the issue of protection of new varieties of plants (of plant varieties), the solution adopted was that of protection as a right of industrial

property, true, hybrid, because it was similar to the law of trademarks and the law of inventions. However, the proposed system proved to be unattractive, because in 8 years of activity of the special register created for it, only 22 plant varieties were registered. In the face of this (semi) failure, in 1928 a law was submitted and adopted in France which conferred to the author not a trademark right, but a right similar to that of inventor, as a "right of agricultural and horticultural property" the title of protection being a patent issued by the National Office of Agricultural and Horticultural Property.

3. Conventional law of protection of new plant varieties. UPOV Convention

On December 2, 1961, the International Convention for the Protection of New Varieties of Plants[5] was adopted in Paris, which created for those who joined it the International Union for the Protection of New Varieties of Plants – UPOV[6], an intergovernmental organization that currently have 77 members[7], including the European Union (but EU member states are individually members of UPOV) and the African Intellectual Property Organization - OAPI.

UPOV is headquartered in Geneva and without a relationship of subordination of UPOV to OMPI, based on a cooperation agreement, the latter actually exercises guardianship over UPOV, the Director General of OMPI being also Secretary General of UPOV[8]. The International Convention for the Protection of New Varieties of Plants is administered by UPOV and is often referred to as the UPOV Convention.

The purpose of the UPOV Convention is to ensure that the Member States of the Union recognize the rights of breeders (plant breeders), respectively an exclusive right of use on the basis of a set of defined rules to be introduced into the laws of Member States. In this regard, the UPOV Convention regulates a system of protection via intellectual property rights of plant varieties intended to encourage plant breeders to develop new plant varieties for the benefit of society and to increase investment in this field. The Convention is designed to promote industrially kind of agriculture and genetically uniform, an objective in line with the growth of international trade supported by the World Trade Organization.

Following the model already established in the founding conventions of international intellectual property law, the UPOV Convention establishes the rules of minimum protection (leaving Member States the opportunity to take into account national circumstances when regulating protection), conditions of protection, duration of rights and rights conferred / recognized to breeders, however without establishing a title of protection (patent or certificate of registration) although the rights recognized in favor of breeders (plant breeders) are similar to those conferred by patents. At the end of the term of protection, the varieties that have been protected pass into the public domain. To prevent abuse in the public interest protected varieties are subject to controls. It is not necessary to authorize the breeder to use the protected variety for research purposes, including its use to obtain other varieties.

Unsafe and unsatisfactory step in its original form, but important for regulating the protection of new plant varieties, the UPOV Convention was revised in 1972, 1978 and 1991, with changes aimed at a clearer delimitation of the object of protection (plant variety was defined), establishing the conditions of protection (four in number: novelty, distinctiveness, homogeneity, stability), consolidating the rights of breeders as well as eliminating the possible cumulation of protections.

Compared to other intellectual property conventions, the UPOV Convention does not seem very attractive since the number of states that have acceded to it is still low (USA, a pioneer in agricultural research but also in the protection of new varieties has joined the UPOV Convention with reservations), and criticism of it is not lacking, one of the most vehement opponents being India, a large country producing and consuming agricultural products and extremely attached to its agricultural traditions that are not in line with those of industrial and uniform agriculture.

Among the criticisms of the UPOV Convention are: affecting agriculture due to the fact that farmers are forbidden to use protected seeds or varieties, the impossibility of farmers complying with the rules of the Convention, the dependence of poor farmers on increasingly expensive factors of production, neglecting the interests of small farmers in favor of large agro-industrial complexes, the incompatibility of the Convention with other legal instruments such as the International Treaty on Plant Genetic Resources for Food and Agriculture (Plant Treaty), the Convention on Biological Diversity or its Nagoya Protocol and the Declaration adopted by the UN General Assembly in

[5] The Convention entered into force in 1968 and has been revised three times, but Member States which have previously acceded are not obliged to accede to the latest version. Romania acceded to this convention by Law no. 186 of October 27, 2000. Romania's contribution to the International Union for the Protection of New Varieties of Plants created by the Convention is paid by the Ministry of Agriculture.

[6] UPOV is the acronym for the French name: Union internationale pour la protection des obtentions végétales".

[8] Daren Tang, Director General of the World Intellectual Property Organization is the Secretary General of UPOV and his predecessor, Mr. Francis Gurry was the Secretary General of UPOV.

2018 on the rights of peasants and other persons working in rural areas.

As the Convention establishing the World Trade Organization, which has as its Annex C, the Agreement on Intellectual Property Rights in Trade in 1994 has 164 members and 25 government observers, on the one hand it conditions the granting of the most-favored-nation clause to observing the intellectual property rights and on the other hand aims to integrate the UPOV Convention, which has only 77 members into the WTO system and that can only cause dissatisfaction and difficulties for non-members of the UPOV Convention who are members of the WTO.

The shortcomings of the UPOV Convention were also propagated into the national regulations, including those in Romania, which regulated for the first time the protection of new plant varieties by Decree no. 884/1967 on inventions, innovations and rationalizations and subsequently by Law no. 62/1974. The latter provided (in art. 14) that patents should also be granted for *"new varieties of plants, strains of bacteria and fungi, new breeds of animals and silkworms* ***regardless of the conditions under which they were made"***. The conditions of protection were not different from those of technological inventions, but they were unsuitable for inventions involving new plant varieties. Moreover, considering their specificity, the research, experimentation, testing and capitalization of inventions in this field was regulated by special law. The regulations adopted were in line with the 1961 Convention in its original form.

In accordance with the rules of the UPOV Convention in its revised form in 1991, Romania formulated for the first time in our law, special rules for the protection of "new plant varieties, hybrids and animal breeds" by Law no. 64/1991 on patents, introducing for patenting of new plant varieties conditions of novelty, distinctiveness, homogeneity and stability.

The Agreement on Trade-Related Intellectual Property Rights (TRIPs) is limited (in Article 27.3 (b)) to provide that are excluded from the patent under common law of inventions *"plants and animals other than micro-organisms as well as essentially biological processes for obtaining plants or animals other than non-biological and microbiological processes"* and that ***"Members shall provide for the protection of plant varieties by patents, by an efficient sui generis system or by a combination of these two means".***[9]

4. Protection of new plant varieties in the European Union

Extremely active in UPOV and concerned with the protection of new plant varieties to the highest degree, the European Union has created its own system of Community protection through Regulation (EC) no. 2100 of 27th of July 1994 establishing a Community plant variety right system (amended by Regulation No 15/2008 / EC), pursuant to which Regulation (EC) No 874/2009 of the Commission of 17th of September 2009 for establishing normative rules for the application of (EC) Regulation No 2100/94 of the Council on the procedure before the Community Plant Variety Office (recast) was adopted.

Regulation (EC) no. 2100/94 established a system for the protection of new plant varieties **as the sole and exclusive form of Community protection of industrial property of plant varieties**, this protection is granted in the proceedings before the body specially set up for that purpose. Protection shall be granted following the verification of compliance with the conditions of novelty, distinctiveness, homogeneity and stability, by a decision of the Office which shall also contain an official description of the variety.

This protection is uniform across the EU. The Office shall keep a register of applications submitted in order to receive protection which are open to public inspection and shall publish a bulletin with the information described in the register.

According to art. 92 of the Regulation, the variety which has been the subject of a Community protection can no longer be subject to national plant variety protection or a patent, any other right granted in an EU Member State being ineffective. In the event that the breeder obtained protection of his variety in a Member State of the Union before obtaining Community protection, the breeder may not invoke national protection as long as Community protection lasts.

We emphasize that according to art. 92 of the Regulation, the variety which has been the subject of Community protection can no longer be subject to national plant variety protection or a patent, any other right granted in an EU Member State being ineffective. In the event that the breeder obtained protection of his variety in a Member State of the Union before obtaining Community protection, the breeder may not invoke national protection as long as Community protection lasts. In other words, the Regulation prohibits concomitant Community and national protection and gives priority to Community protection.

[9] See also comments on the interpretation of art. 23 para. 3 lit. b) of TRIPS: "*In this sense, the Appellate Body* (n.n. - Appellate Body within the World Trade Organization) *showed that art. 23 para. 3 lit. b of TRIPS refers to the option of WTO members to protect new plant varieties either by patent or by sui generis rights, or, as these rights are not included in the title of any section, such an exception would not, according to the Commission interpretation and the provision of the Agreement be unnecessary.* " in "Disputes over intellectual property rights before the World Trade Organization (Part I)", *Romanian Journal of Intellectual Property Law* (RRDPI) no. 1/2019, pp. 69-96.

The Regulation established the Community Plant Variety Office - OCSP or CPVO, the English acronym for "The Community Plant Variety Office") or OCVV, the French acronym for L'Office communautaire des variétés végétales. This Office, which became operational on the 27th of April 1995 and is self-financing is based in Angers, France and has the status of an EU agency. It has 45 employees divided into three units: administrative, technical and legal, to which are added support services[10].

5. Lack of an international registration / patenting system for new plant varieties

Despite the importance to the world economy and the huge human interest in quality agricultural products at this time there is no international system for the protection of new plant varieties with states being able to resort to national protection and Member States of the European Union to Community protection provided for in Regulation (EC) No 2100/94.

The UPOV Convention and the UPOV itself do not enjoy the success that the great developed and agricultural powers would undoubtedly want. However, UPOV's work is notable. UPOV's main activities are to promote the protection of new plant varieties, to harmonize the laws of the Member States, to strengthen cooperation between States and to respect the rights of breeders and to provide legal and administrative assistance to the States and bodies concerned.

UPOV has adopted a set of general rules for the examination of new plant varieties in terms of novelty, distinctiveness, homogeneity and stability and specific guidelines for approximately 160 plant genera and species that are constantly updated.

Cooperation between states within UPOV is also important for the examination of plant varieties. It is based on conventions between states under which a Member State carries out tests on behalf of another or other States or by which a State accepts the results of tests carried out in other States as a basis for decisions to grant protection respectively rights of the breeder. Through this type of cooperation, states reduce the costs of protection procedures (which are also long-lasting), and breeders can obtain protection for new varieties in several countries at lower costs.

6. Regulation of the protection of new plant varieties in Romanian law

When Romania, following the model of the UPOV Convention of 1961, regulated for the first time the protection of new plant varieties (first, by Decree no. 884/1967 on inventions, innovations and rationalizations, then by Law no. 62/1974), the law provides that patents are also granted *for "new plant varieties, bacterial and fungal strains, new animal breeds and silkworms, **regardless of the conditions under which they were made"***, and the conditions of protection for true inventions and varieties of plants were identical (novelty, inventive step, industrial applicability), which obviously did not make sense because novelty and inventive step as defined in the common law of inventions are not applicable to new plant varieties.

After the April 1991 revision of the UPOV Convention, by Law no. 64/1991, on patents, Romania rethought its protection system in accordance with the UPOV Convention and took over the protection conditions for new plant varieties, respectively, novelty, distinctiveness, homogeneity and stability (which were included in the Regulation for the application of the Law of Inventions) and gave to a specialized body the task of verifying the fulfillment of the conditions for granting the variety patent, the actual granting of the patent remain under the attributions of OSIM.

By virtue of the obligations assumed by the Association Agreements with the European Communities and the Member States of Communities in 1994, Romania has adopted the European Union model for the protection of new plant varieties, adopted by Regulation (EC) no. No 2100 of 27 July 1994 establishing a Community plant variety system of protection (as amended by Regulation No 15/2008 / EC), which also established a separate Office for the processing of applications for protection and also complied with the Agreement on Trade-Related Intellectual Property since 1994 (TRIPs) adopting a sui generis protection system by means of a patent.

In this sense, by Law no. 255/1998 on the protection of new plant varieties, law which abrogated the provisions on the protection of new plant varieties in Law no. 64/1991 and by which (following its amendment by Law no. 204/2011), the competence to register and settle patent applications for new plant varieties was transferred from OSIM to the State Institute for Variety Testing and Registration (ISTIS), an institute established by Law no. 75/1995 on the production, quality control, marketing and use of seeds and propagating material, as well as the registration of agricultural plant varieties and which, previously performed the necessary technical examinations for patenting, OSIM having a more formal role for the issuance of patents.

[10] https://europa.eu/european-union/about-eu/agencies/cpvo_ro.

By Order no. 150 of July 17, 2012 of the Minister of Agriculture and Rural Development the Regulation for the application of Law no. 255/1998 on the protection of new plant varieties and by Order no. 2 of January 5, 2012 the costs for the examination procedures for granting the legal protection of the varieties, the issuance of the variety patent and the registration of the varieties names' were approved.

The regulation for the application of Law no. 255/1998, approved by Order no. 150/2012, in the bad tradition of the Romanian executive, adds copiously to the law defining "candidate variety", "derived essential variety", "similar variety", the requirements for the eligibility of the name, adds (in art. 17 letter e) to the revocation cases of the patent a reason for which the law (in art. 34 letter c) provides that the patent is annulled, reduces the "farmer's privilege" provided by art. 21 of the law, to the "small farmers" whom he does not even define, etc. However, if the law is deficient, it cannot be supplemented by the "implementing regulation", and the regulation cannot, in any case, contradict the law.

It is noted that at this date, in Romanian law, the **inventions in the field of biotechnology which** refer to ***"plants or animals (...) which are not limited to a certain variety of plants or a certain breed of animals",*** as well as to a *"microbiological process or another technical process or a product,* ***other than a plant variety or a breed of animals****, obtained by this process"* are patentable according to the common law of inventions (Law no. 64/1991) and obviously if the conditions of novelty, inventive step and industrial applicability (the latter understood in its broadest sense and which also includes agriculture) are met.

However, regarding the **new plant varieties**, they are protectable by a sui generis intellectual / industrial property law, the title of protection in our law being the patent for the variety and the protection conditions provided in the UPOV Convention and in Regulation no. 2100/94, respectively: novelty (but defined differently from the common law of inventions), distinctiveness, homogeneity and stability.

The difference between inventions in the field of plant-related biotechnologies and achievements in new varieties is given by the **level of creativity, which is higher in the case of inventions in the field of plant-related biotechnologies**, compared to that required and / or submitted for the creation of new plant varieties. The invention represents an important technical progress and of considerably greater economic interest in relation to the protected plant variety. An "invented" plant is an absolute novelty and results from an inventive step. A new variety of plant is an amelioration, an improvement of the qualities of an existing plant.

Examples: researchers at the Massachusetts Institute of Technology (MIT) are working to create a plant that produces light through its energy metabolism, the plants that shine will take the place of traditional lamps. This plant if made would be patentable by a patent[11]. A potato variety that has been improved and acquired increased qualities (higher productivity, resistance to frost and drought, taste, etc.) is a new variety of potato (plant) for which protection is provided by granting a patent for the variety.

In their current wording, Law no. 255/1998 and Law no. 64/1991 distinguish between plant varieties and animal breeds which are not patentable as inventions but are susceptible of protection by a sui-generis intellectual right conferred by the patent for varieties and plants and animals which are patentable under the common law of inventions. The differentiated legal treatment and the specific conditions under which the two categories of achievements can be protected lie in the means of obtaining them. Plant varieties and animal breeds (unprotected as inventions) are usually obtained by biological processes, based on human-directed sexual reproduction and observable in nature, while patentable plants or animals are obtained by genetic techniques and processes.

7. What are the similarities and differences between the patent and the variety patent?

The patent can be an effective mean of protection for certain technical achievements in the field of vineyards (vegetables), but does not offer a complete and satisfactory system of protection in the case of new varieties, plant varieties. In the absence of a specific protection system, adapted to their particularities, many achievements consisting of new varieties of plants, plant varieties, if not all, would remain unprotected. However, the activity and the material and human efforts made, the useful results obtained, the personal merit of the breeder and of the one who ensured the conditions for this justify the protection by an industrial property right, even if it does not fall within the conventional or traditionally accepted patterns. Moreover, we believe that the protection of new varieties, of plant varieties by intellectual property right is justified more than the protection within it of distinctive signs and especially of indicative ones and domain names.

There are similarities, but also differences, between patents for inventions for plants, protected as

[11] http://www.cunoastelumea.ro/plante-stralucitoare-care-ar-putea-inlocui-iluminatul-public-inventate-de-cei-de-la-mit/.

such by inventor's rights and patents for varieties, the first are given by the nature of the activity and the results obtained, the following by own characteristics of the two types of achievements. Thus,

(i) We note first that both the plant or animal patent and the variety patent confer intellectual property rights and the classification of the latter as a "sui-generis right" is not affecting the nature of the right. Moreover, this is the qualification given both by the UPOV Convention and by Regulation no. 2100/94, but also by Directive 2004/48 on the enforcement of intellectual property rights, by Regulation (EU) no. 608/2013 of the European Parliament and of the Council of 12 June 2013 on the enforcement of intellectual property rights by customs authorities and revoking Regulation (EC) No 1383/2003 of the Council, respectively, art. 2 para. (1) lit. h) and i), according to which ***"intellectual property right"*** means: *"a **Community protection upon a plant variety**, as provided for in Regulation (EC) No 2100/94 of the Council from 27th of July 1994 on establishing a system of Community plant variety protection" and, at the same time, "a **right of ownership over a plant variety** as provided for in national law'*. The fact that the conditions of protection differ or the authority designated to settle the applications and issuance of the title of protection or the duration and content of the rights does not change the nature of the right that rewards an intellectual activity with useful results for industry.

(ii) The conditions of protection differ significantly and this is due to the specificity of the two types of achievements and the level of creativity involved. In the case of plants and animals - inventions that can be protected under Law no. 64/1991, the conditions are novelty, inventive step, industrial applicability. In the case of new varieties, they are protected if they are new, distinct, homogeneous and stable. But the novelty of the common law of inventions and the novelty of plant varieties are not identical criteria. In common law, the novelty of the plant or animal invention is inferred from the comparison between the claimed invention and the state of the art on the date of filing or, as the case may be, on the date of the priority invoked. In the case of the plant variety, the novelty is of a commercial nature, because the commercialization of the variety before the filing of the patent application for the variety is destructive of the novelty.

(iii) The inventive step is a condition of protection only for the inventions of plants and / or animals patented under Law no. 64/1991 and this has in view the establishment of the non-evidence of the solution for the specialized person. The condition of the distinctive character of the variety that can be protected under Law no. 255/1998 is not equivalent to the condition of the inventive step, even if a certain resemblance can be made. The distinctive character presupposes that the new variety is different from other varieties known by at least one characteristic.

(iv) uniformity / homogeneity and stability are conditions of protection only for new plant varieties, not for plant or animal inventions.

(v) The issuance of the variety patent does not imply, as required in the case of plant or animal inventions (but also for other inventions in the field of technology) the disclosure of the process for obtaining it. The repeatability of the (culture) process is a condition of protection only for plant or animal inventions, not for plant varieties.

(vi) the scope of protection is different: while for plant or animal inventions the protection covers the production and placing on the market of processed and consumer products, in the case of plant varieties the protection is limited to the act of placing the propagating material on the market.

The conclusion that needs to be drawn from the comparison of plant and animal patents and variety patents is that our legislator has opted for a sui-generis protection of new varieties, and this is a solution in line with TRIPs that requires States to protect new varieties, but does not impose a method of protection, which can be achieved either by patent or by an efficient sui generis system or by a combination of these two means.

We remind you that the Community Office for Plant Varieties does not issue patents for varieties being limited pursuant to art. 62 of Regulation 2100/94 to render a decision containing an official description of the variety. But the name of the title of protection has no relevance to the protection granted and its scope.

8. Holder of the patent right for the variety: its breeder and / or successor in title

In our law, the one who creates a new plant variety is called a breeder, a name that is in accordance with the UPOV Convention and Regulation no. 2100/94. But in other legal systems it is called "obtainer"(obtenteur) in French law (art. L613-15-1 et seq. of CPI) or plant breeder in Canada, or simply inventor in the US.

The name of breeder given to the person who makes a new variety of plant seems to us more suggestive, more in line with what it actually does: it improves something (a species of plant, a breed of animal) that exists in a less advanced form than that obtained as a result of breeding.

The right to issue the patent for the variety belongs to the breeder, this being defined in the law (art. 2) as: (1) the person who **created or discovered and developed a new variety**; (2) the person who is the **employer** of the person who created or discovered and

developed the variety or who ordered the activity of creating new varieties, in accordance with the law or on the basis of a contract specifying that the right belongs to the limited partner; and (3) the successor in rights of the first two.

We note that in French law the right is recognized only in favor of the one who creates and **not the one who discovers and develops a plant variety** (art. L623-2 of the CPI), and the doctrine considers unfortunate the elimination from protection of discovered and developed varieties[12]. We believe, however, that the term "to create" also includes varieties that have been "discovered and developed." However, the doctrine does not rule out the possibility that a horticulturist may observe a natural variation of a known plant and that it may be of interest to be fixed and consequently protected.

In turn, "variety patent holder" is defined as the person holding the variety patent or his successor in title. The law admits and, consequently, regulates the co-authorship in the creation, discovery and development of the new variety (art. 10), the discovery of the variety by two or more persons and its development by another person, the breeder's right to associate third parties without any contribution to obtaining the variety as a patent applicant and holder, the rights of the employed breeder when these are not established by contract, respectively the right to a fair remuneration.

The conclusions to be drawn from these definitions are as follows:

a) The status of breeder does not necessarily involve inventive step in the classical sense of the concept and this may also be enjoyed by persons who have no contribution to the production of the variety. There is an important difference between the breeder and the inventor: the new variety (variety) is not a real invention, the variety is not created from scratch, from something that did not exist before.

b) In the common law of inventions, discoveries are excluded from protection, but in the case of plant varieties protection of the discovered variety is permitted. Provided, however, that it is also developed, a conclusion that emerges from the use of the copulative conjunction "and". In other words, the simple discovery if not followed by the development of the variety does not give the discoverer the quality of breeder, respectively does not entitle him to obtain protection on the discovered variety. We note that UPOV Convention too (art. 1) defines the breeder as the person who "created or discovered and developed a variety", similarly being designated also in art. 11 of Regulation 2100/94

c) Co-authorship is possible in the production of the variety in two forms: (i) creation together and (ii) discovery and development, but the breeder may also associate with persons without any contribution to the production of the variety in and on the occasion of capitalization. However, we believe that this right of association of non-contributing third parties to the production of the variety it applies solely to the independent breeder, the employed breeder not being able to do so since the right belongs to the employer or the limited partner;

d) In the case of varieties obtained from the position of employee (service breeder), the right belongs to the employer, but there is no prohibition by law that the contract provides otherwise.

e) If the right to the variety patent belongs to the employer, the breeder has the monetary rights provided for in the contract, or in the absence of provisions it is entitled to a fair remuneration. However, neither the law nor the implementing regulation do not contain criteria for determining this remuneration.

9. The object of patent protection for varieties

In order to be protected by a variety patent the achievement must: **(i)** represent such an achievement, i.e. **to be a new variety and (ii) to meet the conditions of protection established by law.**

The object of patent protection for varieties under Law no. 255/1998 is a new plant variety as defined by law. It seems to us suggestive of the object of protection and the notion of 'plant variety' (used in French law) because it is consistent with what is done by the breeder: a variety of a species that exists and continues to exist alongside the newly created one, the latter being nothing more than something (a group) that differs within a species by some morphological features or a category within the species. But both the UPOV Convention and Regulation (EC) no. 2100/94 and according to their model and our law also use to designate the object of protection the name "new plant variety" and we will comply with the above. However, we also comply considering that we admit that the name of "plant variety" could create issues when assessing the distinctive character of the variety, respectively that characteristic of the new variety that makes it different from the existing ones and which is a condition in order to obtain protection. Or the vegetal variety is an inferior

[12] Carine Bernault, Jean Pierre Clavier, *Dictionnaire de droit de la propriété intellectuelle*, 2e édition, Ellipses, 2015, p. 340. But other authors believe that the findings are also protectable. Frederic Pollaud-Dulian, *Propriété intellectuelle, La propriété industrielle*, Economica, 2011, p. 468.

category to the species[13], which also means that it is less important than the differentiation of variety.

The variety and the plant are different notions and we remind, for the purpose of this study, that the plant is a generic name given to autotrophic plant organisms, living organisms with a simpler organization than animals, which extract their food through roots and are characterized by the presence of chlorophyll and by the fact that the membrane of their cells consists of cellulose and in the case of higher plant species by the composition of root, stem and leaves. They grow naturally or cultivated and are useful to humans. The phases that a plant goes through from a seed to the formation of new seeds represents a developmental cycle. However, plants do not include bacteria, so the protection of new varieties does not include it, their protection can be obtained, where appropriate, by patent. **The variety** is a homogeneous group of plants that have certain common properties and characteristics (morphological, physiological, economic and ecological) that are genetically transmitted.

The law defines **the object of patent protection for varieties** as being ***"new plant varieties belonging to all plant genera and species***, including, inter alia, ***hybrids between genera and species"***. The object thus defined must not create any confusion: the protection concerns new varieties of plants regardless of the type to which they belong. According to the rules of classification of plant organisms (plant taxonomy[14]), **the genus** is a higher category to which the sub-genera and species[15] are subordinated. The species is a category subordinate to the genus that includes animals and plants with common features. The species is a subdivision in the biological classification made up of related organisms that have common characteristics and can interbreed with each other. Their grouping into species is based on physical similarities, but the most important criterion for association in case of a species is the ability to cross successfully, to mate with each other and give birth to viable offspring. Genetic changes occur in individuals that transmit such changes only within the species, therefore evolution is a process that can only take place within the species.

With reference to hybrids (popularly called mongrel in the case of animals, such as the mule and the hinny), we note that they are the result of crossing specimens (plant or animal) with different genetic traits of different species, genera or even families. Due to fundamental biological incompatibilities, hybrids can be sterile (the mule, the hinny), however hybrids that have the ability to multiply are valuable and can be the basis for the creation of new species of plants and animals with superior qualities to their predecessors. Hybridization can take place naturally or artificially.

We also note that over time, many varieties lose their valuable qualities, but also that for various interests (economic, to meet aesthetic needs, etc.) they must be adapted to different conditions than those in which they were created, so the process of their improvement is continuous.

The Romanian law for the protection of new varieties defines the variety by adopting a "hybrid" solution, taking from the corresponding definitions of the UPOV Convention and Regulation (EC) no. 2100/1994. The definitions sound purely technical and there are few comments on them. Thus, the variety is defined as the group of plants belonging to a botanical taxon of the lowest known rank, which may be: (1) defined by the expression of characters resulting from a particular genotype or a combination of genotypes; (2) distinct from any other group of plants by the expression of at least one of the aforementioned characters; and (3) considered as a unit with respect to its ability to reproduce as such.

We note, however, that our law, in accordance with the UPOV Convention, is more demanding, more restrictive in terms of the object of protection (since it expressly refers to plants) than the Regulation which refers to "vegetable assembly" and not strictly to plants. Or mushrooms, belonging to the fungal kingdom (the other two kingdoms being the Kingdom of Animalia and the Kingdom of Plantae), are considered more closely related to animals than to plants, so in our law is debatable the possibility of protection by law via variety patent.

10. The conditions for the grant of protection of new plant varieties

A plant variety may be patent protected for the new variety if the variety: is: (1) new, (2) distinct, (3) uniform) and (4) stable. The conditions currently established by the UPOV Convention and Regulation (EC) no. 2100/94 comply with the characteristics of this type of achievement, but they are not safe from criticism.

10.1. The condition for variety novelty

Novelty, an objective criterion in the common law of inventions is in the case of new plant varieties, a legal fiction. And this is because novelty is appreciated

[13] Frederic Pollaud-Dulian, *Propriété intellectuelle, La propriété industrielle*, Economica, 2011, p. 469.

[14] Word created by the combination of taxis = arrangement and nomos = rule used to describe the science that deals with the principles and rules of classification of organisms belonging to the plant kingdom.

[15] The classification system of living organisms comprises the following major systematic units: kingdom, branch, class, order, family, genus, species, variety.

not in relation to what exists as a precedent that could have a destructive effect of novelty (in the traditional sense for it on intellectual property), but in relation to commercial events that may have as an outcome its acknowledgement by the public.

The explanation of the solution lies in the variety characteristics and of the real object of protection: the propagating material and not the process of obtaining. The establishment of this condition is also justified by security reasons of legal relations: failure to submit a variety patent application in a timely manner is natural to result in the breeder being deprived of the possibility of acquiring an exclusive right when third parties cultivate and market reproductive material of the same variety without its consent.

Thus, according to our law, the variety is considered new if at the date of filing the patent application for the variety, the propagating material or vegetative multiplication or a crop product **has not been sold or handed over by the breeder or with his consent to third parties in purpose of exploitation of the variety** on the territory of Romania with more than 1 year or on the territory of other states with more than 4 years from the date of filing the patent application for the variety. In the case of trees, arbors, ornamental shrubs the term is 6 years counted since the submission of application.

The person who has to provide the relevant information on the previous exploitation of the variety is the applicant for the variety patent and such information must be mentioned in the patent application (art. 12), however ISTIS may also request the submission such information. If the variety was not new at the time of filing the patent application or the issuance of the patent was essentially based on information inconsistent with the reality that was provided by the applicant, the patent is revocable.

In the common law of inventions, disclosures made against the will of the inventor in circumstances which are characterized as an abuse are not destructive of novelty, but in the case of patents for varieties such an exemption is not formulated by law, so it could be, we believe, invoked only by taking into account the general principles of law.

a) However, there are non-destructive events and circumstances of novelty

b) Assignment of variety rights, where the variety has not been used prior to the assignment;

c) Production of propagating material by a third party under the control of the breeder by agreement between them.

d) Authorization of third-parties by the breeder to carry out a field or laboratory study, experiment or experimentations on a small sample of plants in order to evaluate the new variety;

e) Making available to a third party the propagating material or as material harvested as a result of its use for the purposes for which the law regulates the exhaustion of rights.

f) Making available as a result of the breeder's exposure of the variety to an officially recognized exhibition. We note here that the exhibition can be made without destructive effect in any official exhibition and not only in international exhibitions.

g) Making available to official bodies for the fulfillment of legal or contractual obligations:

h) Making available to a unit when between the two there are relations of subordination or common belonging to another unit.

We have mentioned earlier that the law allows the appropriation of the right by variety patent and variety discoveries. However, this solution conflicts with the Rio Convention on Biological Diversity of 1992, which by art. 8 states that "subject to the provisions of its national law, the (State Party) shall observe, preserve and maintain the knowledge, innovations and practices of indigenous and local communities which embody traditional ways of life which is of interest for the sustainable preservation and use of biological diversity and promoting their application on a larger scale with the agreement and participation of the depositaries of such knowledge, innovation and practice and encourages the equitable sharing of benefits arising from the use of such knowledge, innovation and practice".

10.2. The condition of the distinctive character of the variety

Distinctiveness is a condition for registering signs as trademarks for which it is their meaning to be. The trademark must serve to distinguish products and / or services of the same kind from competitors in a market and for this the sign must be distinctive likely to create in the consumer's perception the arbitrary relationship between sign and product. A similar function in the case of industrial designs fulfills novelty together with individual character. However, the distinctiveness in trademark law is different from the distinctive character of new plant varieties.

In the case of new plant varieties, the distinctive character is complementary to novelty just as the inventive step in the inventions law or the individual character in the case of industrial designs are complementary to the novelty of those types of creations. The connection between novelty and distinctiveness is made in the case of varieties through their notoriety.

The distinctive character of the variety presupposes that it is not enough that the variety has not become known to the public, it must also be different from the notoriously known varieties and its own

characteristics must make it differentiable. The difference is therefore given by the ability of the new variety to differentiate itself by one or more relevant characters (which can be accurately recognized, described and identified) resulting from a genotype or a combination of genotypes compared to any other notorious variety known at the time of filing the application for variety patent.

The condition of distinction is fulfilled if the variety for which protection is sought differs from the previous varieties already known (notoriously known) by an important, precise and slightly fluctuating character or by several characteristics whose combination is likely to confer the quality of new variety. Protection is granted only if the new variety shows a **clear** or **significant** difference from the notoriously known varieties.

The well-known varieties are: (i) the varieties protected in Romania, in the European Union and / or in other member states of the UPOV Convention; (ii) registered in the official catalog of varieties of cultivated plants in Romania intended for marketing or in similar registers and catalogs from other States, Contracting Parties to the Convention; (iii) for which there is a registered application for the protection of the variety or for its registration in a variety register in Romania, provided that the application leads to granting the protection or to the registration of variety; (iv) for which there is an application registered abroad for the granting of protection or for the registration of the variety, provided that the application leads to granting the protection or registration; (v) offered for sale or sold on the territory of Romania or of other states.

The condition thus formulated presumes that differentiation by one or more characters must be important and that only varieties which make a significant contribution to what exists can be protected. The character or characters which differentiate the variety from those notoriously known must be recognizable and identifiable and not fluctuating.

Varieties that are distinguished / differentiated from others by an insignificant aspect or by vague or unstable characteristics or by insignificant differences cannot be protected. But despite its importance this qualitative criterion is vague, inconsistent, relative, subjective and consequently susceptible to various interpretations. It is no coincidence that this criterion is a frequent source of rights disputes in the case of variety patents.

The notoriety of the variety in relation to which it is examined and its distinctive character may result from references, culture, marketing, submissions in official registers, presence in important collections or precise description in publications.

10.3. Condition of uniformity or homogeneity of the variety

Formulated either as a 'condition of uniformity' (in Law No 255/1998) or as a 'condition of homogeneity' (in the UPOV Convention and Regulation No 2100/94), it presupposes that there is uniformity or homogeneity where the most of the vegetable assembly (of the variety) has the common characteristics that define the species. Uniformity or homogeneity must ensure that all plants belonging to the same new species have a global identity.

The law requires that plants of the new variety to be uniform in all their characteristics. Homogeneity is appreciated only in terms of the essential characters and not all the characters of the variety. Some variations may occur, without compromising homogeneity, if these variations are simply the effect of the natural reproduction of the plants concerned. In other words, variations which may result from the particularities of propagation are allowed if the plants (vegetable assembly) remain sufficiently uniform in their relevant characteristics, including those used to examine distinctiveness and those used to describe the variety (by application for patent variety). According to Regulation 2100/94, homogeneity is assessed in the light of the characteristics used to describe the variety.

The control of homogeneity is carried out in practice on the basis of twenty plants, according to the UPOV directives, according to which a tolerance of 5% of individuals who do not have all the characteristics required to describe the variety is allowed. The characteristics of the controlled variety are the same as those taken into account for distinctiveness and stability.

Absolute uniformity / homogeneity cannot be claimed, which means that a margin of tolerance inherent in the case of Nature's intervention, must be accepted. But without sufficient uniformity / homogeneity, the variety would not be exploitable with satisfactory results and does not deserve to be protected.

10.4. Variety stability condition

Stability makes it possible to verify and determine whether the plants derived from the reproduction of the variety for which a variety patent is sought have the same characteristics as the original plants. The stability criterion is considered to be met when a plant is identical to its initial description at the end of each propagation cycle, respectively when the essential characteristics of the variety remain identical after its successive reproductions or multiplications or at the end of each propagation cycle.

In other words, the characteristics of the variety are perpetuated on the occasion of successive

multiplications, generation after generation. But here too, the impact of Nature justifies a dose of tolerance.

In practice, it is found that if the condition of homogeneity is met, the variety is generally considered stable. The UPOV Convention acknowledges that the latter criterion can be measured with less certainty than distinctiveness and novelty.

10.5. What is the sanction for non-compliance with the protection conditions?

According to art. 34 of Law no. 255/1998, ISTIS declares the annulment of the patent when it finds that at the date of the application for patent or, as the case may be, the a priori invoked, (i) the variety was not new, (ii) the variety was not distinct; (iii) the variety was not uniform and (iv) the variety was not stable.

Also, according to the same text, the variety patent may be declared null and void: (a) the person to whom the variety patent was granted was not entitled, unless there was a transfer of rights to the entitled person; and (b) The variety patent was based essentially on information and documents provided by the breeder. In particular, the latest case of patent annulment seems debatable to us.

10.6. Name of the variety for which protection is sought by variety patent

The name may or may not be a condition on the merits for the protection of new plant varieties.

It is not because it is not provided as one of the four conditions provided as such by art. 5 para. (1) of Law no. 255/1998. It is, because according to art. 5 para. (2) of the same law and which has the marginal name of "conditions for granting protection" stipulates that "the variety must bear a name, according to the provisions of art. 15 of the law", a similar resolution is provided in Regulation no. 2100/94 in art. 6. But the UPOV Convention (by art. 5) does not stipulate the name as a condition in order to receive protection, although it regulates it (distinctively).

We consider that the name of the variety, although necessary and important for the adopted protection system, does not represent, however, a condition on the merits because it is not provided in art. 34 of Law no. 255/1998, among the reasons for which the annulment of the variety patent may be ordered. If the name does not comply with the requirements of art. 15 of the law, ISTIS cancels the name, not the patent for the variety and will grant a hearing date to the holder of the patent for the variety in order to change the name.

The name must be a generic designation, enabling the new protected variety to be identified. In order to be registered, the name must make it possible to identify the variety in relation to any other variety and to avoid any risk of confusion with any other variety of the same botanical or neighboring species in all UPOV Member States. It must not be likely to mislead or confuse the origin, provenance, characters or value of the variety or the breeder as a person. It must not be contrary to morals and public order. It cannot be composed only of figures, unless this is an established practice for the designation of varieties. It must be really different from other names designating on the territory of any of the parts of the UPOV a pre-existing variety of the same plant species or of a neighboring species.

The name of the variety is submitted to ISTIS by the applicant together with the patent application, but the applicant can have ISTIS conduct a documentary search on the proposed name, provided the legal fee is paid and we believe, that if the name does not meet the requirements of the law ISTIS may ask the applicant to change it. We believe that the refusal to change it may be grounds for rejecting the application for protection, which would partially justify the classification of the name as a condition on the merits. However, we do not believe that such a solution can be reached by interpreting the law and that a proper amendment of the law would be necessary.

The compliant name is registered by ISTIS at the same time as granting the breeder title. UPOV Member States must verify that no rights relating to the designation registered as the variety name prevents the free use of the name in relation to the protected variety even after the expiry of the breeder's right. The name should be without prejudice to the earlier rights of third parties. If, by virtue of an earlier right, the use of a variety name is prohibited to a person who is obliged to use it, ISTIS must ask the breeder for another name for that variety.

Once the name of the variety is allowed, a variety may not be the subject of an application for a right of ownership in another State unless is the same name. Each national office is required to register the proposed name, unless it finds an inconvenience in connection with that name on its territory. In this case, the breeder may be required to propose another name. In order to ensure this compliance, the Offices should ensure that information on variety names is communicated to each other, mainly proposing, registering and deleting the names. Any Office may submit any comments on the registration of a name to the Office which communicated that name.

The variety patent designates the variety by a name which allows, without confusion and ambiguity, its identification in all States parties to UPOV. The name referred to in the patent shall become binding upon its publication for any commercial transaction even after the expiry of the term for the variety patent.

11. Instead of conclusions. Selection of relevant case law on the protection of new plant varieties

11.1. T-135/08 - Schniga v CPVO (Gala Schnitzer). The decision of the General Court dated 13 September 2010

On 18 January 1999, the Konsortium Südtiroler Baumschuler ('KSB'), the predecessor in title of the applicant, Schniga GmbH, filed an application for a Community plant variety right at the Community Plant Variety Office (CPVO), pursuant to Council Regulation (EC) No 2100/94 of 27 July 1994 on Community plant variety rights (OJ 1994 L 227, p. 1), as amended.

The Community plant variety right was sought for the apple variety (Malus Mill) Gala Schnitzer.

On 5 May 2006, the interveners, Elaris SNC and Brookfield New Zealand Ltd, the licensee and holder respectively of the plant variety right relating to the Baigent reference variety, lodged with the CPVO, pursuant to Article 59 of Regulation No 2100/94, objections to the grant of a right for the Gala Schnitzer variety.

By decisions EU 18759, OBJ 06-021 and OBJ 06-022 of 26 February 2007, the committee responsible for deciding on objections to the grant of Community plant variety rights ('the committee') granted a Community plant variety right for the Gala Schnitzer variety and dismissed the objections.

By decision of 21 November 2007 ('the contested decision'), the Board of Appeal annulled the decision granting a Community plant variety right for the Gala Schnitzer variety and also the decisions dismissing the objections, and the Board of Appeal itself refused the application concerning the Gala Schnitzer variety. In particular, it found that Article 61(1)(b) of Regulation No 2100/94 did not allow the CPVO to authorise KSB to submit new material, since KSB had not complied with the request in an individual case, within the meaning of Article 55(4) of Regulation No 2100/94, by which the CPVO had requested it to provide a phytosanitary certificate confirming that the material submitted was virus-free.

By the Decision dated the 13th of September 2010, the General Court allowed the appeal and annulled the contested decision, stating the reasons set out below.

Article 55(4) of Regulation No 2100/94 provides that the CPVO is to determine, through general rules or through requests in individual cases, when, where and in what quantities and qualities the material for the technical examination and reference samples are to be submitted.

It is apparent from the contested decision that the Board of Appeal took the view that the discretion conferred on the CPVO by that provision did not allow it to authorise KSB to submit new material, in so far as the preconditions for refusing the application filed by KSB had been met. The Board of Appeal held that, due to the viral infection of the material submitted, of which KSB had informed the CPVO, KSB could never have submitted the phytosanitary certificate requested. It then noted that KSB had not provided the phytosanitary certificate requested and inferred that, by not providing that document, KSB had failed to comply with the requests in an individual case contained in the CPVO's letters of 26 January 1999 and 25 March 1999. In accordance with Article 61(1)(b) of Regulation No 2100/94, however, the CPVO was required to refuse the application concerning the Gala Schnitzer variety as soon as that failure to comply had been established.

That reasoning must be rejected, since it misconstrues the scope of the discretion conferred on the CPVO by Article 55(4) of Regulation No 2100/94.

That discretion includes the right for the CPVO to define, should it deem it necessary, the requirements which it applies to the examination of an application for a Community plant variety right, on condition that the period within which the applicant for such a right must respond to the request in the individual case made to him has not expired.

In that connection, it is consistent with the principle of sound administration and with the need to ensure the proper conduct and effectiveness of proceedings that, when it finds that the lack of precision which it has noted may be corrected, the CPVO has the power to continue with the examination of the application filed with it and is not required, in that situation, to refuse that application. Thus envisaged, that discretion makes it possible to avoid any pointless increase in the period between the filing of an application for a Community plant variety right and the decision on that application which would arise if the applicant were required to file a new application.

In addition, that discretion enables, first, the CPVO to satisfy itself that its requests in individual cases are clear and that the applicant alone is responsible for the fact that its actions fail to comply with those requests and, second, applicants to know their rights and obligations without ambiguity and to take steps accordingly, which is a requirement inherent in the principle of legal certainty (see, to that effect, Case 169/80 *Gondrand and Garancini* [1981] ECR 1931, paragraph 17).

11.2. T-133/08, T-134/08, T-177/08 și T-242/09. Schräder v OCVV - Hansson (LEMON SYMPHONY). The decision of the General Court dated 18 September 2012

On 5 September 1996, the intervener, Mr Jørn Hansson, applied to the Community Plant Variety Office (CPVO) for a Community plant variety right

pursuant to the regulation. That application was registered under number 1996/0984. The plant variety for which protection was thereby sought is the variety LEMON SYMPHONY, belonging to the species *Osteospermum ecklonis*.

By a decision of the CPVO of 6 April 1999, a Community plant variety right was granted for LEMON SYMPHONY and the official description of that variety was compiled by the Bundessortenamt in 1997 and reproduced in the Register of Community Plant Variety Rights.

On 26 November 2001, the applicant, Mr Ralf Schräder, applied to the CPVO for a Community plant variety right pursuant to the regulation. That application was registered under number 2001/1758. The plant variety for which the right was thereby sought was the variety SUMOST 01, belonging to the species *Osteospermum ecklonis*. That variety is grown and marketed by Jungpflanzen Grünewald GmbH ('Grünewald'), a company in which the applicant has a 5% shareholding.

On 26 October 2004, the applicant filed an application for cancellation of the Community plant variety right granted to LEMON SYMPHONY, pursuant to Article 21 of the regulation read in conjunction with Article 9 thereof, entitled 'Stability', on the ground that, since 2002 at least, that variety no longer corresponded to its official description entered in 1997 in the Register of Community Plant Variety Rights. In support of his application he submitted, essentially, that, in the examination of LEMON SYMPHONY carried out in 2001 on the basis of the TG/176/3 test guidelines, applicable since 2001, various characteristics of that variety had received different scores in comparison with the official description of that same variety dating from 1997. That demonstrated, he submitted, that the variety at issue lacked stability.

By decision of 19 February 2007 ('the refusal decision'), the CPVO upheld the objections raised by the intervener against the grant of a Community plant variety right to SUMOST 01 and refused the application for a Community plant variety right for that variety, essentially on the ground that that variety was not clearly distinguishable from LEMON SYMPHONY and that the conditions set out in Article 7 of the regulation had therefore not been met. The CPVO observed, inter alia, that it was apparent from the technical examination that SUMOST 01 differed from LEMON SYMPHONY only in one characteristic, namely the start of the flowering period, and in this by only one mark, and that that difference was too slight, in the case of the *Osteospermum* species varieties, to render it clearly distinct. Furthermore, the CPVO considered LEMON SYMPHONY to be stable.

On 11 April 2007, the applicant filed an application for annulment, pursuant to Article 20 of the regulation, of the Community plant variety right granted to LEMON SYMPHONY, essentially on the ground that that variety had never existed in the form reproduced in the official description entered in the Register of Community Plant Variety Rights in 1997.

The decisions issued by the OCSP were appealed to the Boards of Appeal, which dismissed the appeals.

Invested in applications for annulment of the decisions of the Boards of Appeal, the General Court allowed the actions in part. Here are some of the arguments put forward by the Court of First Instance.

Under Article 76 of the regulation, entitled 'Examination of the facts by the [CPVO] of its own motion', the infringement of which is claimed in the present case, the CPVO is to make investigations on the facts of its own motion in proceedings before it, 'to the extent that they come under the examination pursuant to Articles 54 and 55' of that regulation.

Under Article 54 of the regulation, the CPVO is to conduct a substantive examination of the application for a Community plant variety right. In that context, it is to examine, inter alia, whether the variety may be the object of a Community plant variety right pursuant to Article 5 and whether the variety is new pursuant to Article 10 of that regulation.

Under Article 55 of the regulation, where the CVPO has not discovered any impediment to the grant of a Community plant variety right on the basis of a preliminary examination, it is to arrange for the technical examination relating to compliance with the conditions laid down in Articles 7 to 9 (DUS criteria) to be carried out by the competent office or offices in at least one of the Member States (Examination Office or Offices).

It must also be noted at the outset that Article 76 of the regulation, relating to the examination of the facts by the CPVO of its own motion, is, in the strict sense, inapplicable to the proceedings before the Board of Appeal when adjudicating on an appeal against a decision of the CPVO which has refused to declare, on the application of a party, the nullity of a Community plant variety right, because such proceedings do not come within the scope of Articles 54 and 55 of the regulation.

In the course of such proceedings, it is not for the Board of Appeal to carry out the substantive examination provided for in Article 54 or the technical examination provided for in Article 55 of the regulation, or even to rule on the lawfulness of such an examination carried out by the CPVO in the context of an application for a Community plant variety right.

The task of the Board of Appeal is solely to rule, on the application of an interested party, on the lawfulness of a decision of the CPVO adopted under

Article 20(1)(a) of the regulation refusing to declare the Community plant variety right null and void on the ground that it has not been 'established' by that party that the conditions set out in Article 7 or in Article 10 of that regulation were not satisfied at the time when the right was granted.

Since annulment proceedings were initiated not by the CPVO of its own motion, but on the application of an interested party, Articles 76 and 81 of the regulation, read in conjunction with Article 20 thereof, thereby place the onus on that party to prove that the conditions for that declaration of nullity have been met.

As regards the applicant's other arguments, by which he criticises the Board of Appeal for not having responded to his criticisms as to the unreliability of the technical examination of LEMON SYMPHONY carried out in 1997, expressed in the light of the development of the technical description of that variety since 2001, these must be rejected as irrelevant since, first, it has already been accepted that that technical examination had in any event been carried out on appropriate plant material, namely the cuttings originally taken from the plants sent to the Bundessortenamt by the intervener, and that, secondly, the applicant has not identified any other plant variety from which LEMON SYMPHONY, even described with a 'semi-erect to horizontal' attitude of shoots, was not clearly distinguishable in 1997. That assessment is consistent with the principal arguments set out by the CPVO and the intervener in response to the second plea.

Accordingly, even if, as the applicant claims, the 1997 technical examination culminated in an incorrect finding as to the level of expression attributed in respect of the characteristic 'Attitude of shoots', and a level of expression different to that attributed in the Bundessortenamt's examination report of that year should have been attributed to LEMON SYMPHONY in respect of that characteristic from 1997 onwards, that would not have had any effect on the assessment of the distinctive character of that variety for the purpose of Article 7 of the regulation, since that assessment was not determined exclusively, if at all, by reference to that characteristic.

First, the General Court observes in this connection that the adapted 2006 description of LEMON SYMPONY differs from the original 1997 description only in respect of the single characteristic 'Attitude of shoots', the level of expression attributed to which was changed from 'erect' (see paragraph 12 above) to 'semi-erect to horizontal' (see paragraph 25 above).

Second, the General Court observes that the applicant has not yet proved that the effect of that amendment was that the DUS criteria had not been satisfied in 1997. It follows that, even if LEMON SYMPHONY had been described from the outset as having a level of expression 'semi-erect to horizontal' in respect of the characteristic 'Attitude of shoots', it would have obtained a Community plant variety right.

Admittedly, the applicant claimed, during the proceedings before the Board of Appeal, that, had the examination of SUMOST 01 been carried out using for the purposes of the comparative examination the initial description of LEMON SYMPHONY, those two varieties would have been considered to be clearly distinct (see contested decision A 007/2007, p. 2). However, that submission was expressly rejected by the Board of Appeal, which observed in the contested decision that '[t]he test procedure would not have taken a different course if the Office had not immediately adapted and registered the variety description…'. Moreover, the applicant did not specifically challenge that assessment in the present action.

In the course of the exercise of that review, it must nevertheless be stated that, contrary to what the applicant claims, the characteristic 'Attitude of shoots', the levels of expression of which run, according to the test guidelines, from 'erect' to 'drooping', through 'semi-erect' and 'horizontal' and the nuances between those terms, is not, except in extreme cases, an 'absolute' characteristic which can be determined in a thoroughly objective manner using only the measurement of the angle of inclination of the shoots, but a characteristic which, by reason of the specific nature of its expression, can, depending on the case, be the subject of a relative and comparative assessment between varieties of the same species, as the Bundessortenamt's document of 18 May 2005, attached as annex A 27 to the application in Case T-177/08, clearly shows.

According to the Bundessortenamt, the attribution to LEMON SYMPHONY in 1997 of the level of expression 'erect' in respect of the description of the characteristic 'Attitude of shoots' follows from the comparison of that variety with the reference varieties used in the growing trials and the finding that LEMON SYMPHONY was 'the most erect' of the varieties on which trials were performed that year. Subsequently, the increase in the number of varieties of the *Osteospermum ecklonis* species and the amendment of the test guidelines led the Bundessortenamt to propose an adaptation of that description to state the level of expression as 'semi-erect to horizontal'. However, LEMON SYMPHONY remained exactly the same between 1997 and 2005. There was no material amendment of the description affecting the identity of the variety, but merely an amendment of the terms originally chosen, which does not change the identity of the variety but merely enables it to be described more accurately, in particular by delimiting it in relation to other varieties of the species.

The General Court takes the view that those explanations are sufficiently detailed and persuasive to resist firmly the attempted challenge to them made by the applicant in his arguments.

Moreover, the photographs used both before the German civil courts and in the proceedings before the CPVO confirm, at least in the eyes of a lay observer, that the attitude of the shoots of LEMON SYMPHONY did not change appreciably between 1997 and 2005.

11.3. T-140/15 - Aurora v OCVV - SESVanderhave (M 02205). The Decision of the General Court dated 23 November 2017

On 29 November 2002, the intervener, SESVanderhave NV, applied to the Community Plant Variety Office (CPVO) for a Community plant variety right pursuant to Council Regulation (EC) No 2100/94 of 27 July 1994 on Community plant variety rights (OJ 1994 L 227, p. 1). The Community plant variety right was sought for variety M 02205, a sugar beet variety of the species *Beta vulgaris L. ssp. Vulgaris var. altissima Döll*.

The CPVO entrusted the Statens utsädeskontroll (Swedish Seed Testing and Certification Institute, Sweden) ('the Examination Office') with the responsibility of carrying out the technical examination of the candidate variety, in accordance with Article 55(1) of Regulation No 2100/94. The Examination Office was in charge, in particular, of examining whether the candidate variety was distinct from the most similar varieties whose existence was a matter of common knowledge on the date of application for a Community plant variety right ('the reference varieties') within the meaning of Article 7(1) of Regulation No 2100/94. In that respect, sugar beet varieties Dieck 3903 and KW 043 were considered to be most similar to the candidate variety.

On the basis of that report, on 18 April 2005, the CPVO granted the intervener the Community plant variety right applied for, under Registration No EU 15118, for variety M 02205. Annexed to that decision were the documents supplied by the Examination Office, including the variety description and the comparative distinctness report.

On 28 August 2012, the applicant lodged a request for nullity of the Community plant variety right granted to the intervener, pursuant to Article 20 of Regulation No 2100/94, on the ground that the successive corrections to the comparative distinctness report showed that variety M 02205 did not satisfy the 'distinctness' requirement for the purposes of Article 7(1) of the regulation. More particularly, in the statement of grounds of appeal before the CPVO, the applicant disputed the fact that, following the abovementioned corrections, the only distinguishing factor between variety M 02205 and variety KW 043 was the percentage variation relating to the state of expression of the 'germity' characteristic, namely 29% for M 02205 as against 94% for KW 043. According to the applicant, that meant that it was inappropriate to choose that characteristic for the purpose of a finding of distinctness of the candidate variety, given that, in accordance with the explanations in Annex 1 to the protocol adopted by the CPVO on 15 November 2001 in respect of the species *Beta vulgaris L. ssp. Vulgaris var. altissima Döll* ('the Protocol of 15 November 2001'), applicable in the present case, the distinctness of a candidate variety can be justified under the 'germity' characteristic only with two notes difference between the note of the candidate variety and that of the reference variety — which was unquestionably not the case here.

By Decision NN 010 of 23 September 2013, the CPVO dismissed the applicant's request for nullity under Article 20(1)(a) of Regulation No 2100/94, on the ground that variety M 02205 was clearly distinct from the reference varieties, including KW 043. The CPVO explained that, at the time the final report was issued, the Examination Office was aware of the correct notes of expression for all the characteristics of the candidate variety and, therefore, the transcription errors in the comparative distinctness report were immaterial with regard to the finding of distinctness of that variety; furthermore, that fact had been confirmed by the Examination Office.

By Decision A 010/2013 of 26 November 2014 ('the contested decision'), the Board of Appeal dismissed the applicant's appeal as unfounded, holding, in particular, that the latter had overestimated the importance of the comparative distinctness report, whereas, in fact, that document merely contained additional information derived from the results of the comparative growing trials. Accordingly, the fact that the document was corrected three times did not result in the nullity of the Community plant variety right at issue.

By its Decision of 23 November 2017, the General Court upheld the appeal, essentially retaining the following arguments.

Under Article 20(1)(a) of Regulation No 2100/94, the CPVO must declare a Community plant variety right null and void if it is established that the conditions laid down in Articles 7 or 10 were not complied with at the time of the Community plant variety right. Moreover, under Article 7(1) of the regulation, 'a variety shall be deemed to be distinct if it is clearly distinguishable, by reference to the expression of the characteristics that results from a particular genotype or combination of genotypes, from any other variety whose existence is a matter of common knowledge on the date of application determined pursuant to Article 51.'

Furthermore, it must be pointed out that the Court has stated, in that regard, that the conditions relating, in particular, to distinctness are, under Article 6 of the regulation, a prerequisite for the grant of a Community plant variety right. Therefore, in the absence of those conditions, the right granted is unlawful, and it is in the public interest that it be declared null and void (judgment of 21 May 2015, *Schräder* v *CPVO*, C-546/12 P, EU:C:2015:332, paragraph 52).

The Court has also ruled that the CPVO has a broad discretion concerning the declaration of nullity of a plant variety right for the purposes of Article 20 of Regulation No 2100/94. Therefore, only where there are serious doubts that the conditions laid down in Articles 7 or 10 of that regulation had been met on the date of the examination provided for under Articles 54 and 55 of that regulation can a re-examination of the protected variety by way of nullity proceedings under Article 20 of Regulation No 2100/94 be justified (see, to that effect, judgment of 21 May 2015, *Schräder* v *CPVO* (C-546/12 P, EU:C:2015:332, paragraph 56).

In that context, a third party seeking a declaration of nullity of a plant variety right must adduce evidence and facts of sufficient substance to raise serious doubts as to the legality of the plant variety right following the examination provided for in Articles 54 and 55 of that regulation (see, to that effect, judgment of 21 May 2015, *Schräder* v *CPVO* (C-546/12 P, EU:C:2015:332, paragraph 57).

It was thus for the applicant to adduce, in support of its request for nullity, evidence or facts of sufficient substance to raise serious doubts in the mind of the Board of Appeal as to the legality of the plant variety right granted in the present case.

Consequently, the Court must examine whether the elements adduced by the applicant before the Board of Appeal, in that regard, were sufficient to raise serious doubts in the mind of the Board of Appeal and if, accordingly, they could justify a re-examination of variety M 02205 by means of nullity proceedings based on Article 20(1)(a) of Regulation No 2100/94.

In order to answer that question, first of all, it is necessary to ascertain the requirements imposed by the legislation at issue concerning the drafting of the notes of expression on which the findings as to whether or not a plant variety is distinct must be based. Next, it is necessary to examine whether the arguments put forward by the applicant in that regard could raise serious doubts in the mind of the Board of Appeal. Lastly, the Court must consider whether the Board of Appeal duly fulfilled its obligations in the face of such serious doubts.

First, with regard to the requirements imposed by the legislation at issue, it must be noted that, under Article 56(2) of Regulation No 2100/94, the conduct of any technical examination is to be performed in accordance with test guidelines issued by the Administrative Council and any instructions given by the CPVO. In that regard, it must be pointed out that the broad discretion enjoyed by the CPVO in the exercise of its functions cannot allow it to avoid the technical rules that regulate the conduct of the technical examinations without breaching the duty of good administration and its obligations of care and impartiality. In addition, the binding nature of those rules, including for the CPVO, is confirmed by Article 56(2) of Regulation No 2100/94, which requires that the technical examinations are carried out in accordance with those roles (judgment of 8 June 2017, *Schniga* v *CPVO*, C-625/15 P, EU:C:2017:435, paragraph 79).

In that context, it must be observed that, in accordance with the abovementioned Article 56(2), the CPVO adopted the Protocol of 15 November 2001 with a view to establishing test guidelines governing the technical analysis and the conditions for registration of varieties coming within the sugar beet species *Beta vulgaris L. ssp. Vulgaris var. altissima Döll.* Under point III.2., headed ‘Material to be examined’, and point III.5., headed ‘Trial designs and growing conditions’, of the protocol, candidate varieties must be directly compared with reference varieties in growing trials to be carried out normally in at least two independent growing cycles. Moreover, in the contested decision, the Board of Appeal itself stressed the importance of compliance with that requirement, which, in its own words, is a condition precedent for the grant of a Community plant variety right (see paragraph 28 above).

It follows that the notes of expression in the comparative distinctness report, on the basis of which the distinctness of a candidate variety is established, have to correspond to the notes collected from comparative growing trials carried out in two independent growing cycles following the application for a Community plant variety right for the candidate variety.

Secondly, with regard to the arguments put forward by the applicant, the documents in the case file show that the applicant claimed, before the Board of Appeal, that the fact that the notes of expression given to variety KW 043 in the comparative distinctness report were identical to those in its official variety description supports the assumption that the notes were sourced from the official description and not from comparative growing trials carried out in 2003 and 2004, for the purpose of a Community plant variety right being granted for variety M 02205. Furthermore, by relying on concrete examples from other official variety descriptions, the applicant sought to show that the probability of recording the same notes for a sugar beet variety from year to year was very low.

In that regard, it must be observed that, as has been noted in paragraphs 18 and 19 above, although the applicant had requested, several times, access to the file concerning variety M 02205, including the results of the comparative growing trials of 2003 and 2004, the CPVO did not communicate those results to the applicant until 2 March 2015, that is to say, after the date of the Board of Appeal's decision. Therefore, the applicant was clearly not in a position to rely on evidence other than that produced by it before the CPVO bodies, namely the comparison between the data in the comparative distinctness report and that recorded in the official variety descriptions for M 02205 and KW 043 respectively as well as, by way of illustration, data taken from other official variety descriptions.

In addition, the applicant was fully entitled to rely before the Board of Appeal on the series of errors in the comparative distinctness report, mentioned in paragraphs 5 to 15 above, which gave rise to a succession of corrections of that report and could also raise serious doubts in the mind of the Board of Appeal, at the very least, as to the reliability of the notes of expression corresponding to the characteristics included in the comparative distinctness report. Moreover, as pointed out, in essence, by the applicant before the Board of Appeal, the fact that the corrections were late was liable to reinforce those doubts.

In the light of the foregoing, the Court must find that the applicant adduced, before the Board of Appeal, factual elements of sufficient substance to raise serious doubts as to whether the data used for reference variety KW 043 was sourced from its official variety description. The Board of Appeal was thus required to verify whether that contention was well founded and draw the appropriate conclusions for the applicant's action.

Moreover, it should be added that, in its replies to the written questions put by the Court, the CPVO recognised that the notes of expression relating to variety KW 043, as included in the last and penultimate versions of the comparative distinctness report, did not correspond to the data collected from the comparative growing trials of 2003 and 2004 but were sourced from the official variety description for KW 043.

Thirdly, with regard to whether the Board of Appeal duly fulfilled its obligations in the face of such serious doubts, in the first place, it is important to recall that the CPVO's task is characterised by the scientific and technical complexity of the conditions governing the examination of applications for Community plant variety rights and, accordingly, the CPVO must be accorded a margin of discretion in carrying out its functions (see judgment of 19 December 2012, *Brookfield New Zealand and Elaris* v *CPVOandSchniga*, C-534/10 P, EU:C:2012:813, paragraph 50 and the case-law cited). That discretion extends, inter alia, to verifying whether that variety has distinctive character for the purpose of Article 7(1) of Regulation No 2100/94 (see judgment of 8 June 2017, *Schniga* v *CPVO*, C-625/15 P, EU:C:2017:435, paragraph 46 and the case-law cited).

In the second place, the CPVO, as a body of the European Union, is subject to the principle of sound administration, in accordance with which it must examine carefully and impartially all the relevant particulars of an application for a Community plant variety right and gather all the factual and legal information necessary to exercise its discretion. It must furthermore ensure the proper conduct and effectiveness of proceedings which it sets in motion (see judgment of 8 June 2017, *Brookfield New Zealand and Elaris* v *CPVO and Schniga*, C-625/15 P, EU:C:2017:435, paragraph 47 and the case-law cited).

In the third place, it should be recalled that Article 76 of Regulation No 2100/94 provides that 'in proceedings before it [the CPVO] shall make investigations on the facts of its own motion, to the extent that they come under the examination pursuant to Articles 54 and 55.'

Lastly, the Court has held that, under Article 51 of Commission Regulation (EC) No 874/2009 of 17 September 2009 establishing implementing rules for the application of Council Regulation (EC) No 2100/94 as regards proceedings before the CPVO (OJ 2009 L 251, p. 3), the provisions relating to proceedings before the CPVO apply *mutatis mutandis* to appeal proceedings (judgment of 21 May 2015, *Schräder* v *CPVO*, C-546/12 P, EU:C:2015:332, paragraph 46).

Thus, on the one hand, the principle of examination of the facts by the CPVO of its own motion also applies in proceedings before the Board of Appeal (judgment of 21 May 2015, *Schräder* v *CPVO*, C-546/12 P, EU:C:2015:332, paragraph 46). On the other hand, the Board of Appeal is also bound by the principle of sound administration, pursuant to which it is required to examine carefully and impartially all the relevant factual and legal information in the case before it.

11.4. TUE. T-112/18 - Pink Lady America v. OCVV - WAAA (Cripps Pink)[16]. The decision of the General Court dated 24 September 2019

On 29 August 1995, the predecessor in title of the Western Australian Agriculture Authority ('the

[16] For a comment on this General Court of the European Union case: Ciprian Raul Romițan, "Plant varieties. Procedure for declaring nullity. Cripps Pink apple variety. News. Derogatory grace period. The notion of exploitation of the variety. Commercial evaluation. Evidence submitted late to the Board of Appeal. Evidence presented for the first time before the Tribunal", in the *Romanian Journal of Intellectual Property Law (RRDPI)* no. 2/2020, pp. 127-149.

WAAA' or 'the intervener'), the Department of Agriculture and Food Western Australia ('the Department'), filed an application for a Community plant variety right at the Community Plant Variety Office (CPVO) pursuant to Council Regulation (EC) No 2100/94 of 27 July 1994 on Community plant variety rights.

The plant variety in respect of which the right was sought is 'Cripps Pink', a variety of apple belonging to the species *Malus Domestica Borkh*, developed by Mr John Cripps ('the breeder'), a researcher in the Plant Industries division of the Department, by crossing the Golden Delicious and Lady Williams varieties.

The application form for a Community plant variety right stated that the Cripps Pink apple trees were first marketed within the European Union in 1994 in France and first marketed outside the European Union, more specifically in Australia, in 1988. On 12 March 1996, the CPVO informed the representative of the Department that the Cripps Pink variety did not fulfil the novelty requirement under Article 10 of the Basic Regulation. In July 1996, the Department explained that 1988 should have been considered to be the date of the 'first plantings in Australia for experimental purposes'. The Department went on to state that the relevant date for the purposes of Article 10 of the Basic Regulation was July 1992, being the date when Cripps Pink apple trees were marketed in the United Kingdom under the trade name 'Pink Lady'. On 15 January 1997, the CPVO granted Community plant variety right No 1640 to the Cripps Pink variety.

On 26 June 2014, the applicant, Pink Lady America LLC ('the applicant' or 'PLA'), lodged an application for nullity in relation to the Cripps Pink Community plant variety right under Article 20 of the Basic Regulation, arguing that the Community plant variety right at issue did not fulfil the novelty conditions laid down in Article 10 of that regulation. On 19 September 2016, by Decision No NN 17, the CPVO dismissed the applicant's nullity application. The Decision was upheld by the Board of Appeal of the CPVO.

By the Decision dated the 24th of September 2019, the General Court dismissed the action against the decision of the Board of Appeal of the CPVO, citing, in essence, the following grounds.

The relevant date for the purposes of the combined application of Articles 10 and 116 of the Basic Regulation is therefore 1 September 1994, the date of publication of the Basic Regulation in the *Official Journal.*

The effect of Article 116 of the Basic Regulation is to extend the grace period laid down in Article 10(1)(a) of the regulation from 1 year before the application for protection to four, or 6 years in the case of trees, before the date of entry into force of the Basic Regulation. The relevant date in this case was therefore 1 September 1988 for sales and disposals within the European Union.

As regards the grace period for sales and disposals outside the territory of the European Union, as set out in Article 10(1)(b) of the Basic Regulation, that provision is not affected by Article 116 of the regulation.

In the present case, the documents in the case establish that the application for Community plant variety rights was made by the intervener's predecessor in law on 29 August 1995. Therefore, it was filed within 1 year of the entry into force of the Basic Regulation.

Concerning the burden of proof in nullity proceedings, The General Court recalled that an applicant seeking a declaration of nullity in respect of a Community plant variety right must adduce evidence and facts of sufficient substance to give rise to serious doubts as to the legality of the plant variety right granted following the examination provided for in Articles 54 and 55 of that regulation (judgment of 21 May 2015, *Schräder* v *CPVO*, C-546/12 P, EU:C:2015:332, paragraph 57 and judgment of 23 November 2017, *Aurora* v *CPVO — SESVanderhave (M 02205)*, T-140/15, EU:T:2017:830, paragraph 58). It was thus for the applicant to put forward, in support of its nullity application, evidence or facts of sufficient substance to raise serious doubts on the part of the CPVO regarding the legality of the plant variety right granted in the present case.

Regarding the assessment of the novelty requirement in the light of sales or disposals made outside the European Union, The General Court specified that a disposal for the purposes of testing of the variety which does not amount to sale or disposal to third parties for purposes of exploitation of the variety does not negate novelty for the purposes of Article 10 of the Basic Regulation (judgment of 11 April 2019, *Kiku* v *CPVO — Sächsisches Landesamt für Umwelt, Landwirtschaft und Geologie (Pinova)*, T-765/17, not published, under appeal, EU:T:2019:244, paragraph 74).

It follows from this case-law that the concept of 'exploitation' of the variety within the meaning of Article 10(1) of the Basic Regulation relates to exploitation for profit, as further demonstrated by the provisions of the Basic Regulation relating to contractual exploitation rights, but this concept excludes commercial trials aimed at assessing varieties under commercial conditions across a range of soil types and different farming systems to determine their value to customers.

Further, as the intervener explained during the hearing before the Board of Appeal, the purpose of the 'commercial trials' in this case was to assess varieties under commercial conditions across a range of soil

types and different farming systems to determine their value for customers. The trials thus enabled the performance of the variety in question to be monitored under much more representative field conditions, the full crop cycle to be assessed, and, finally, producers to receive more performance data.

These statements by the intervener are corroborated by the breeder's statutory declaration of 6 August 2015 and also by the rebuttal statutory declaration of Mr Geoffrey Godley, Agricultural Advisor to the Department, of 13 January 2015. It is apparent from the breeder's statement of 6 August 2015 that the purpose of distributing the Cripps Pink variety to nurseries and orchardists 'was to see how the trees performed in a non-research station environment'. Mr Godley's statement also indicates that he acknowledges having participated, at the material time, in the 'commercial evaluation' activities, which consisted of collecting information from growers 'on yield, harvest, storage, packing, shipping and consumer reaction to the variety apples.'

Finally, it should be noted that according to the explanations provided during the hearing before the Board of Appeal by the CPVO Technical Expert on Apples, commercial evaluation is a common practice in apple selection. The expert explained that apple selection takes place in two stages: a first stage which consists of carrying out research to test and select varieties, and a second stage which consists of assessing the commercial use of apple trees.

In those circumstances, the Board of Appeal correctly concluded that commercial evaluation did not amount to commercial exploitation and that, accordingly, sales or disposals made for testing purposes before the grace period were circumstances that did not negate novelty.

A FUZZY MULTI-CRITERIA DECISION-MAKING MODEL FOR PROJECT SELECTION

Felicia Alina CHIVULESCU[*]
Sandra TEODORESCU[**]

Abstract

In the contemporary world any activity is involuntarily and often decisively influenced by two phenomena: globalization and sustainable development. Each of them gives a special complexity and uncertainty to the business environment. While globalization requires an organization to adapt to new markets and new cultures, sustainable development outlines the need to respect and support the sustainability of these cultures, by attaching particular importance to socio-economic and ecological issues.

Our paper presents the analysis of the main theoretical and empirical approaches outlined in relevant literature and by practitioners, highlights the methods used in project evaluation and selection, and proposes a hybrid model based on interdependent elements specific to project management, mathematical optimization and sustainability. The approach presented in the paper is based on a Fuzzy Multiple Criteria Group Decision Making model that allows the inclusion of complexity and uncertainty in the evaluation and selection of projects, in order to obtain a high level of performance, during the contemporary economic and social conditions. The model proposed for the optimal project portfolio selection involves a methodology composed of two decision-making methods: fuzzy AHP for determining the relative importance of the criteria considered within the evaluation model and fuzzy TOPSIS for objective, structured and analytical prioritization of the portfolio projects.

Keywords: *decision-making, project management, selection methods, multicriteria, fuzzy sets*.

1. Introduction

With a recent history, of only a few decades, project management has quickly become one of the most used concepts in the development of more and more activities. Their proper implementation within contemporary organizations supports their successful development. The complexity and the high degree of uncertainty that characterizes today the activity of any company, can represent sources of important opportunities, associating the business with project orientation. The attempt to achieve the objectives without adequate planning, organization and monitoring, is certainly materialized in a result that emphasizes failure, unsustainable consumption of resources and diminished chances for a successful future. The simple application of routine project management techniques determines the change of the entire vision and culture of an organization, of the staff involved, the organization, the quality, efficiency and effectiveness of the activity carried out.

Impressive or small projects, complex or low-complexity projects, educational, business or social projects, all involve investment. Investments have their source in the achievements (or failures) of the past, they are built in the present, but they always aim at the future (Românu 2005). Financial resources, personnel, material resources, time, are invested to fulfill the purpose of the project and obtain the desired results. Projects represent a unique set of interrelated objectives, activities and resources in order to achieve a predetermined goal. Project Management Institute proposes the following definition of the project: "A temporary effort made to create a unique product or service" (PMI 2008).

The rapid change of the global environment, technological development and competitive intensity are elements that influence project management in order to constantly redefine how budgets are set or how resources are allocated, response time, quality and characteristics of designed products.

In this sense, one of the great importance decision categories for the performance of an organization involves identifying the optimal portfolio of implemented projects, through the evaluation and selection of the variants that are expected to meet the objectives set in the most efficient way known and analyzed.

The selection of the optimal portfolio implies the evaluation of the projects and the choice of the variants implementation that contribute in the most adequate way to the fulfillment of the organizational objectives (Mantel et al. 2011). Before financing a project, the level of performance that can be supported by the implementation of that variant must be evaluated. Whether it is proposed by a person within the organization, or it is the wish of a client, or it requires

more or less formal approvals, the committee appointed to select the optimal option for a project must ensure that it meets certain conditions.

Thus, special attention must be paid to the issue of subjectivity and decision-making freedom (Damodaran et al. 2005). People think differently, they have different education, culture and principles. That is why the evaluation process must lead to a decision that is as objective as possible. In this regard, in order to support the work of management, in order to optimize the investment decision in a project or a portfolio of projects, I consider it to be necessary the use of appropriate mathematical tools to manage the uncertainty and subjectivity in evaluation.

2. Project selection methods

Planning and developing activities, designing the structure and culture of an organization, providing early responses to environmental events, choosing a technology for products and services, defining a strategy to maximize the value of knowledge and skills of staff to achieve performance, are elements which involve making decisions. Any activity carried out in the organization involves decisions, even if they differ in complexity and importance. The organization can be considered a real decision-making machine. At all levels and in any department, people make decisions constantly, and their degree of optimality significantly determines the level of value created by the organization.

Through the decision-making process, problems are answered, searching and selecting a solution and the mode of action that creates value for the organization and implicitly for its stakeholders. Whether it's choosing the best resources, finding the best way to interact with customers, or adopting the best position in front of a competitor, management must decide.

Strategy, objectives, and why not, the entire contemporary organizational activity, are elements increasingly fulfilled through project management. The multitude and diversity of projects carried out in a society have even determined the development of a new type of organization, the project-oriented organization.

Given the large number of projects and implementation options available, taking into account the simultaneity of development and the interdependencies between them within the organization, a high-performance evaluation is required in order to determine the optimal portfolio.

Project evaluation and selection is a decision-making issue of strategic importance, which forms the basis for studies conducted by many researchers for over 50 years.

The key challenges of project portfolio management include a sensitivity analysis of its interdependencies, traceability, simplicity, supporting quantitative and qualitative data, project quantity, trade-offs, group decision making and the mutual links between portfolio levels (Danesh et al. 2018).

Characterized by multiple criteria, contradictory and often difficult to measure (Liesio et al. 2007), the process requires to pay special attention from the decision maker in order to establishing the most effective alternative in terms of the various aspects considered (Mavrotas et al. 2008). The permanent interest for this subject is also reflected in the variety of methods existing in literature (Heidenberger and Stummer 1999). Hundreds of models and methodologies for project evaluation and selection are grouped into: scoring, classification, mathematical programming, fuzzy logic and AHP (Badri et al. 2001); non-numerical (the sacred cow, operational / competitive need, potential benefits) and numerical (financial evaluation, financial options, opportunity cost, scoring) (Meredith and Mantel, 2010); scoring, ad-hoc, comparative, economic, portfolio, mathematical optimization and simulation (Tavana et al. 2013). One of the most comprehensive classifications is the one made by Iamratanakul (2008), which summarizes the entire relevant literature of project selection methods in: ad-hoc, options, cognitive analysis, mathematical programming, benefit measurement.

2.1. Ad-hoc methods

Ad-hoc methods are the simplest and involve a minimum of effort in decision making.

"The Sacred Cow". Sometimes shareholders or business owners suggest a potential product or service that the organization could offer to customers. In most cases, practice demonstrates that regardless of the selection process and results, the proposed project is approved, becoming a "holy cow", whose technical, economic or any other feasibility must be demonstrated. Even if it seems irrational, such practices are often encountered in practice. Total ignorance of employees, their knowledge and experience in favor of supporting their own idea is often the source of failure in business. This type of "evaluation" of an investment idea disregards the need and special value given by the management and employees support in the successful development of the project (Green 1995). The method highlights that type of "not so" in the evaluation. It is desirable to try the correct approach to the business idea and the proper evaluation of the projects carried out, in order to eliminate waste and adopt a sustainable management.

Operational/competitive necessity. Most times, within organizations, projects are selected due to the need to support the continuity of the business processes or to keep the business within the limits of competitiveness. This category of "mandated" projects must be selected for further use of facilities. In an environment characterized by uncertainty and change, both opportunities and threats are becoming more common. The argument regarding the need for operation, involves the selection of projects in order to avoid or counter threats, which emphasizes the fact that it is not the management that dictated the

implementation but the external environment, the competitiveness imprinted by it. However, a project that supports the performance of a contemporary organization aims, mainly, to capitalize on opportunities or create them by implementing projects that involve new technologies, innovation and sustainability.

Compared to the first selection model, this one, although it also involves the implementation of an imposed idea (this time by maintaining the level of competitiveness or avoiding the risk of business failure and not by the owner's desire), can still be subject to an objective evaluation, regarding the selection of the most efficient realization variation model available.

2.2. Financial options

Opportunity cost. A more recent approach to project selection, includes within the evaluation process a type of financial analysis, which recognizes the value of the organization's positioning in order to capitalize on future opportunities. The financial options specific principles are used as working grounds, in order to capitalize on future investment opportunities. The concept of financial option (Xie 2009) expresses the acquisition by an organization or person of the right to act in a certain direction, without requiring the mandatory exercise of that right. For example, when purchasing a stock option, the holder is given the right to buy a number of shares at a certain price within a specified period of time. Thus, if the market price of those shares becomes higher than the specific price of the option within the specified time frame, the entity holding the option may exercise its right, thus gaining from the price difference. However, at an inverse relationship between the market price and the option price, the holder may choose not to exercise his right to buy the share. Thus, if the market price of those shares becomes higher than the specific price of the option within the specified time frame, the entity holding the option may exercise its right, thus gaining from the price difference. However, at an inverse relationship between the market price and the option price, the holder may choose not to exercise his right to buy the share.

In the field of projects, options represent the response modalities planification to various likely future states that may be transmitted by the environment. If the event occurs, then one of the options provided will be used, if not, they will be waived.

In an environment of uncertainty and rapid change, identifying the right options is of high importance. If none of the options appear, the cost of determining them is useless. The time, money and resources spent in order to substantiate the options can only be quantified in terms of waste. We believe that options are one of the main methods of responding to potential risks, but their success depends to a large extent on quantifying the elements that can determine the triggering events for implementing the option. The main weakness of this method derives from considerations related to uncertainty. However, uncertainty is taken into account in methods that use fuzzy variables. In order to fulfill the purpose of optimizing the investment decision and implicitly the process of evaluation and selection of projects, forecasts and plans can be made in order to determine the evolution of influencing factors and to establish their ranges of variation and response strategies.

In addition to taking into account the value of future opportunities and threats, in relevant literature (ACCA 2011) the analysis of the cost of giving up the project is also presented, method based on elements characteristic to the concept called "opportunity cost". For example, if a decision has to be made in order to choose an investment with two competing projects at its disposal (choosing one of them involves giving up the other) and the rate of return for the first project is 15%, the choice to invest in -the second will have an opportunity cost of 15%, represented by the lost opportunity cost. If the profitability of the number two project is higher than 15%, it will be selected against the choice of the first project. The decision is based on a basic economic principle, which aims to minimize costs. Choosing the right time to make an investment can also be supported by similar principles. Given a project to implement a new technology in an organization, the value of the investment made differs considerably over time. Mantel et al. (2011) argue that the passage of time reduces the level of uncertainty involved in a project, whether we refer to technological or commercial elements. "The value of making the investment now may be higher than the value of making it later." From a mathematical and economic point of view, an investment made today is more expensive than if we make it in a future period. That is why some specialists recommend placing large sums in the last years of implementation for the investment staggering. But delaying the adoption of new technologies can cost more than an increase in inflation or the discount rate. However, there are situations when the simple maximization or minimization of the values of some indicators does not reflect the real performance of the project. Projects that predict negative cash flows are sometimes approved, these decisions not necessarily reflecting mistakes, but the existence of elements considered by evaluators much more important than profit positivity: acquiring knowledge about a new technology, implementing innovative elements that can support the organization's competitiveness, obtaining the necessary parts to continue the business, the possibility to bring in the future new contracts or profitable investments, improving the competitiveness of the organization, expanding a range of products or a business field.

2.3. Measuring benefits

Benefit-based methods involve an additional dose of effort on the part of decision-makers to establish the selection criteria and evaluate the portfolio accordingly.

In cost-benefit analyzes, the classification of projects involves comparing the expected effects with the efforts required to achieve them.

Potential benefits. Another situation an organization may face, in terms of establishing the optimal portfolio, is the situation characterized by the existence of a whole list of potential projects, each of which involves different ideas, objectives, benefits and costs. Under such conditions, the evaluation and selection process is much more complex and difficult than in the case of the models presented above. For selection, commissions are often set up, with each of its members responsible for ordering a number of potential projects and providing the resulting ranking in support of the selection decision. The element that implies a substantial dose of uncertainty is the freedom to choose the criteria used, each evaluator judging based to his own beliefs; thus, while some of them focus on technical specifications, others consider the relationship with the organization's strategy or the degree of compliance with environmental standards to be particularly important.

In order to be able to quantify the results, the proposal of certain criteria by each member of the commission must be followed by the establishment of a common list, based on which to continue the individual evaluation and the desired classification. According to the Q-sort method (Helin and Souder 1974), first of all the projects must be divided into three categories (good, medium and poor) according to the established criteria. If there are more than 7-8 projects in a category, the group must be divided into two subgroups, for example good plus and good minus. Subdivision continues until no class consists of more than 7-8 elements. The next stage is the one in which each subcategory must be presented in the form of a ranking, and to complete the individual evaluation, the subcategories are ordered according to the rank already established. The global ranking is established by calculating the composite rank of each project, depending on the serial number assigned by each evaluator.

2.4. Mathematical programming

Mathematical programming optimizes the fulfillment of an objective function of maximizing or minimizing some effects, under the conditions imposed by the identified constraints (Romero and Rehman 1989). The options/scenarios and the simulation allow to estimate the relationship between efforts and effects and the analysis of the evolution of some categories of benefits when the influencing factors change; presumed change, expected by the decision maker or randomly generated. Among the linear programming methods found in the selection of projects we can identify the linear programming, purpose programming, dynamic programming, stochastic programming, but also the use of fuzzy sets.

3. The proposed FMCGDM model

Organizational performance is conditioned by permanent investments in consecutive and simultaneous projects, which are often also competing (Ghasemzadeh et al. 1999). Thus, managers must solve a complex decision-making situation, in order to allocate limited resources to the multitude of projects with a superior contribution to meeting the organization's objectives (Cheng and Li 2005, Medaglia et al. 2007). Making wrong decisions when selecting projects involves two negative consequences: on the one hand resources are consumed for the implementation of inappropriate projects, and on the other hand the organization loses the potential benefits of allocating resources to appropriate projects (Martino 1995). Thus, the optimization of the investment decision and choosing the correct project portfolio guarantees efficiency considering the level of the developing organization, effectiveness and therefore performance, profitability and capitalization of the efforts of the stakeholders involved.

The analysis of the specialty literature shows that most evaluations are based on cost-benefit analysis, mathematical programming or simulation that is limited exclusively to economic and financial indicators, monetary, thus neglecting the difficult to capitalize effects in monetary terms. Moreover, many of them are strictly based on the opinion of the evaluator, not allowing the participation of other stakeholders or groups of specialists (Sieber and Braunschweig 2005). Many topics in the practice of project portfolio management have been studied in qualitative settings, with selected case companies and portfolios as the source of data. However, also questionnaire-based hypothetic-deductive studies have been carried out (Martinsuo 2013). Project portfolio management is a process for and between people, and for and between organizations, besides its service to strategy and products within one organization. Despite the quite obvious linkages between, e.g., project selection and managers' interaction, or project portfolios and project offices, the behavioral and organizational viewpoints have received far too little attention and may well explain some of the problems in achieving PPM success (e.g. Elonen and Artto 2003, Engwall and Jerbrant 2003, Zika-Viktorsson et al. 2006). If previous frameworks have portrayed project portfolio management as a systemic solution to goals and environments that are assumed as static, future research could explore the behavioral and organizational viewpoints that embrace the dynamic and complex nature of practice and context (Geraldi 2008).

Organizing a personal event, writing a book, reorganizing a company or building a bridge over the Danube, are significantly different projects, which still have common characteristics in terms of uniqueness, specificity and necessity. Another element common to many projects is multidisciplinarity (Mantel et al. 2011), reflected in the need to involve the knowledge

and experience of people with different specializations. Multidisciplinarity implies a high degree of complexity of the projects, through the existing correlations between the component elements, but especially through the success dependence on the performance of the relationship between the know-how possessors necessary for obtaining the expected results. These explanations emphasize once again the importance of the staff, more precisely of the ways to capitalizing their knowledge in the relationships developed between the team members and between them and the other categories of the social environment of a project. For this reason, we consider it particularly important to take into account, for a successful evaluation, the elements related to the complexity of teamwork, team management, conflicts and resistance to change.

In terms of this paper, the decision regarding the selection of projects must not include strictly financial elements, but also indicators based on the interdependence of dimensions and principles of sustainable development. Project multicriteria management thus involves the use of advanced scoring methods (DePiante and Jensen 1999, Coldrick et al. 2005), multi-attribute (Duarte and Reis 2006), which quantifies the opinion of several decision makers (Carazo et al. 2010, Khalili -Damghani and Sadi-Nezhad 2013).

Scoring based methods. In order to overcome the main disadvantage of financial evaluation methods (one-dimensional focus) and to improve the methodology used by adding more criteria in the analysis, scoring-based methods have been developed. The simplest form of evaluation based on grading, the unweighted factorial method 0-1, uses in the evaluation a list of criteria of significant interest to management, criteria that reflect the purpose and objectives of the organization. The analyzed projects receive from the selection committee 1 if the criterion is met or 0 if it cannot be met by the evaluated project variant. The selection depends on maximizing the number of points accumulated.

Although it seems easy to adopt, due to its characteristic simplicity, the method has many disadvantages: it does not take into account the importance of each criterion and the level of compatibility of a project with the intended objective. However, these deficiencies are corrected by the weighted average mean, based on a number n of evaluation criteria and on estimates of the weight of the relative importance of each of them w_j, the sum of the weights of the j criteria being usually 1. Some specialists recommend limiting the computations only the criteria that reflect important factors and not including those marginal criteria of the investment decision (considered to have an importance of 2-3%), resulting thus in n <8 factors with weights greater than 10-15%, which involves reducing the significance of low-weight criteria.

The level of importance and the weighted mean of each factor reflect the difficulty of implementing weighted scoring in project evaluation. For their selection, it is possible to use the direct transformation into criteria of some organizational objectives and indicators or to determine the importance of specific factors of the projects evaluated through individual methods (which involve substantiating the necessary elements based on a particular subjective opinion), and/or methods group. One of the most sophisticated versions of scoring methods is the AHP (Analytic Hierarchy Process) method.

Within the pages of this paper, the notion of group and the multidisciplinarity involvement in all phases of a project are considered of particular importance. In a world dominated by specialists, managers can not only rely on their own beliefs in the decision-making process, but must take into account, in order to optimize the decisions taken, the knowledge and experience of the staff they work with, their work "summing up" to create environment conducive to group performance. Mission, strategy, purpose, objectives and activities, all these elements are based on and for employees, but important is the value printed by them to the organization.

The second element included in the calculation of the score of the evaluated projects is the score s_{ij} (usually a scale from 1 to 5 is used), which reflects the degree of fulfillment of each criterion j by project i. For each project, it is weighted the score sij with the level of importance w_j, resulting by summing its final grade. The projects with the highest score are selected, or, under the conditions of setting a constraint, the projects with the highest score from those that exceed the required factor.

The calculation formula used is:

$$S_i = \sum_{j=1}^{n} s_{ij} \cdot w_j$$

where:

S_i = project i total score

s_{ij} = the grade received by project i for criterion j

w_j = weight, importance of criterion j

A disadvantage identified in the use of this method concerns the subjectivity of notation; for different evaluators, the excellent grade can have various meanings. Criteria such as correlation with organizational objectives, compliance with ethical principles or ease of implementation and acceptance by employees, are subject to a high degree of subjectivity in the evaluation. It is therefore desirable to include quantifiable elements among the criteria, but also the concrete way of quantification.

However, we consider that modeling and mathematization are the most suitable elements to combat subjectivity, and therefore the proposed model uses fuzzy variables both for modeling multicriteria and

for modeling the process of optimal projects evaluation and selection.

Projects' selection process includes complex decision variables. Thus, there is a need to solve selection problems by an integrated approach, considering that a single technique is not adequate to address this issue (Vinodh, Prasanna, and Hari Prakash 2014). Therefore, based on the literature review, fuzzy AHP and fuzzy TOPSIS have been used by several researchers for various applications. However, the use of fuzzy AHP-TOPSIS portfolio management of projects is found to be scant (Mohammed 2021).

Optimizing the project portfolio selection decision in the current context involves correlating the society complexity and uncertainty, the environment, the organization, the project, decision makers and specialists. It implies thus a multicriteria, multidimensional approach, and the involvement of groups of specialists to validate the model and give special importance to the projects business environment.

Under these conditions, the approach proposed in this paper for the evaluation and selection of projects is based on a group decision model, multicriteria, with fuzzy variables (eng. FMCGDM - Fuzzy Multiple Criteria Group Decision Making), whose development required modeling the decision multicriteria, within the current context, by applying the fuzzy AHP method and modeling the evaluation process and optimal projects selection considering the uncertainty of the environment, through the TOPSIS method with vague variables. The detailed presentation of each applied method shall be included in future works.

4. Conclusions

The permanent change of the economic environment and the complexity of the business world are reflected, but it is also the effect of the emergence of managerial ideas and values (Clarke and Clegg 2000). The emergence of new paradigms in management and their evolution is increasing in speed; by paradigm understanding a model of thinking, a "constellation of concepts, values, perceptions and practices that form the vision of the reality of a community and dictates the way it is organized" (Kuhn 1970).

In terms of project management, their selection has evolved from static evaluation methods that use cost analysis or linear programming with real or integer numbers, to much more flexible methods such as fuzzy multi-attribute. The classical, quantitative decision criteria based on discounted cash flows and purely financial indicators such as net present value (NPV) or internal rate of return (Brigham 1975, Boer 1999, Copeland et al., 2000) are no longer sufficient to correctly reflect the image imposed by the current economic environment. Qualitative and difficult-to-measure indicators, which quantify the impact of the project on the environment and society, give the investment decision an additional degree of difficulty. The recognition of the need to use models composed of subjective, qualitative indicators is highlighted by the methods adopted by many authors in their work. By introducing the theory of multi-attribute utility (Moselhi and Deb 1993, Dozzi et al. 1996, Fayek 1998), the Gray method (Chua and Li 2000), TOPSIS (Chua et al. 2000), ELECTREII (Wong et al. 2000) they include in the evaluation and selection of projects criteria such as profit, cost, social benefits, risk, but also other factors considered relevant by the decision maker.

The analytical hierarchy process (AHP) suggested by Thomas Saaty and used for the first time in selecting the Cascio projects (1995), is also a mathematical method of substantiation of the decision, which covers both quantitative and qualitative aspects from the decision-making process. The method reduces complex decisions to a series of pairwise comparisons and then synthesizes the results, giving the author the opportunity to measure the influence of a multi-criteria system of indicators. In order to properly manage the interdependencies between the indicators included in the decision model, some authors (Cheng and Li 2005) work with a variant of the method that consists of a process of analytical network process (ANP).

However, the use of multi-attribute analysis (Molenaar and Songer 1998), although they report the project evaluation to a large number of indicators, does not capture the appearance of multiple constraints (limited resources, strategic, political constraints) (Mavrotas et al. 2006). Therefore, in order to establish the project portfolio, the list of selection methods shall be filled up with the methods specific to multi-objective programming. To this end, some authors apply the goal programming method (Lee and Kim 2001, Wainwright et al. 2003), undertaking the responsibility to establish in collaboration with decision makers the levels of aspiration for the objectives considered, based on their preferences, experience accumulated, or linear programming. The construction of a useful synthesis function that allows all objectives integration, weighted according to the importance given to them by the decision maker, is the choice of other authors (Ghasemzadeh et al. 1999, Medaglia et al. 2008). And other authors choose to minimize the distance to the ideal point (Klapka and Pinos 2002), or to implement metaheuristic algorithms such as Scatter Search Procedure for Multiobjective Optimization (SSPMO) (Carazo et al. 2010) to solve the problem of multiple objectives involved in determining the most efficient project portfolios.

In order to have a complete picture of the investment project selection methodology, we must also consider the proposals for managing an element present in all activities of the contemporary world, difficult to quantify, but extremely important: uncertainty. Shakhsi-Niaei et al. (2011) considers the constraints of the environment and the uncertainty of the inputs of the selection problems through a model composed of three methods (PROMETHEE -

Preference Ranking Organization Method for Enrichment Evaluations, Monte Carlo simulation and mathematical programming).

In another approach, Machacha and Bhattacharya (2000) emphasizes that most classical methods of project selection ignore the behavior of the people involved and the differences in managers culture and experience, and support the use of fuzzy logic in managing uncertain data. Expressions by fuzzy units are not as rigid and complicated as mathematical algorithms and allow the selection of projects in an uncertain environment reducing the risk of projects. Moon and Kang (1999), Hsueh and Yan (2011), Khalili-Damghani and Sadi-Nezhad (2013) apply multicriteria fuzzy evaluation models to choose the most suitable projects. Studies such as those of Liu (2008), Guo and Tanaka (2001), Leon et al. (2003), Lertworasirikul et al. (2003), Kao and Liu (2000) introduce fuzzy logic into the relatively new DEA methodology, in order to quantify the inaccuracy of its specific inputs and outputs.

Concluding on the existing methodology mentioned in the specialty literature and in practice, specific to the evaluation and selection of projects/project portfolios, we can emphasize the outline of a mature theoretical and methodological tools, based on numerous researches and proposals.

Multicriteria decision models, such as AHP or TOPSIS, are among the most appreciated and used in various fields of activity, but for their successful implementation there will always be questions in terms of establishing the criteria and their corresponding weights within the created interdependencies system of (Saghaei and Didehkhani 2011).

Thus, the support model of the decision to select the optimal portfolio of projects proposed by this paper is based on a methodology composed of two methods: fuzzy AHP to determine the relative importance of the criteria considered in the evaluation model and fuzzy TOPSIS for objective, structured and analytical prioritization of the portfolio projects.

Nonetheless, it remains a permanent challenge to identify the optimal set of techniques and methods for project evaluation and selection, and it is amplified by the need for permanent adaptation to the context imposed by the current business environment.

AGENT-BASED COLLABORATIVE PLATFORM FOR COORDINATING CONCURRENT NEGOTIATION ACTIVITIES

Adina-Georgeta CREȚAN*

Abstract

Maintaining the sustainability of an organization on the market and their performance in a competitive market is very difficult to achieve. In this dynamic environment, organizations decide to cooperate, becoming partners in a virtual enterprise. In order to work efficiently, the partners must collaborate and coordinate their negotiation activities.

This paper proposes an agent-based collaborative platform for coordinating concurrent negotiations among organizations acting in the same industrial market. The underlying complexity is to model the dynamic environment where multi-attribute and multi-participant negotiations are racing over a set of heterogeneous resources.

Keywords: *Automated negotiation, Collaborative activities, Multi-agent system, Dynamic environment, Collaborative platform.*

1. Introduction

To be able to perform, enterprises need to exchange information, whether this exchange is internal (among departments of the enterprise), external (between the enterprise or part of it and an external party), or both. Enterprise Interoperability (EI) is thus defined as the ability of an enterprise to seamlessly exchange information in all the above cases, ensuring the understanding of the exchanged information in the same way by all the involved parties[1]. Large enterprises accomplish this by setting market standards and leading their supply chain to comply with these standards. Small and Medium Enterprises (SMEs) usually don't have the empowerment to do so, and are therefore more sensible to the oscillations of the environment that involves them, which leads them to the need to constantly change to interoperate with their surrounding ecosystem. Sustainable EI (SEI) is thus defined as the ability of maintaining and enduring interoperability along the enterprise systems and applications' life cycle. Achieving a SEI in this context requires a continuous maintenance and iterative effort to adapt to new conditions and partners, and a constant check of the status and maintaining existing interoperability[2].

Given this general context, the objective of the present paper is to develop a conceptual framework and the associated informational infrastructure that are necessary to facilitate the collaboration activities and, in particular, the negotiations among independent organizations that participate in a Network Enterprises.

The concept of "Virtual Enterprise (VE)" or "Network of Enterprises" has emerged to identify the situation when several independent companies decided to collaborate and establish a virtual organization with the goal of increasing their profits. Camarinha-Matos[3] defines the concept of VE as follows: "A *Virtual Enterprise (VE)* is a temporary alliance of enterprises that come together to share skills and resources in order to better respond to business opportunities and whose cooperation is supported by computer networks".

In this paper the negotiation we want to model involves several participants negotiating for a negotiation object described by several interdependent attributes and each agent manages its own information regarding the strategy used, in order to achieve the proposed objective. Thus, in order to conduct one or more negotiations, in an effective manner, taking into account all dimensions of negotiations, coordination mechanisms with well-defined functionalities are needed.

The negotiation process was exemplified by scenarios tight together by a virtual alliance of the autonomous gas stations. Typically, these are competing companies. However, to satisfy the demands that go beyond the vicinity of a single gas station and to better accommodate the market requirements, they must enter in an alliance and must cooperate to achieve common tasks. The manager of a gas station wants to have a complete decision-making power over the administration of his contracts, resources, budget and clients. At the same time, the manager attempts to cooperate with other gas stations to accomplish the global task at hand only through a minimal exchange of information. This exchange is minimal in the sense that

the manager is in charge and has the ability to select the information exchanged.

Section 2 presents the theoretical background. In Section 3 we are describing the collaborative platform for coordinating concurrent negotiation activities[4]. In Section 4 we define the Coordination Components that manage different negotiations that may take place simultaneously. In Sections 5 we present the collaborative approach and the proposed solution, and, finally, Section 6 concludes this paper.

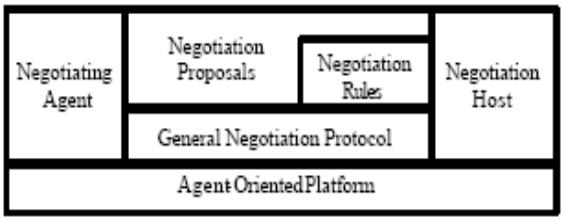

Fig. 1. The architecture of a negotiation framework

2. Theoretical Background

2.1. Generic coordination of negotiations

HP Laboratories (Hewlett-Packard) has found that the automation of the negotiation mechanism between multiple agents is not enough. The negotiation protocol, which indicates the transmission of messages, may set the coordination constraints on the possible actions of each party and on the completion of the negotiation. But, the protocols do not specify the constraints related to the content of the messages or the time of negotiation. So, starting from the finding that the negotiation protocol is insufficient for coordinating interactions in a negotiation, a generic framework dedicated to automatic negotiation in a centralized environment was proposed[5]. This framework is generic insofar as it does not take into account the structure of the object of negotiation, the characteristics of the participants involved or their negotiation strategies. The system coordinates messages by abstracting content or the specific characteristics of the sender or receiver. Another feature of this negotiation framework is that it proposes a separation between the decision process, implemented by the negotiation strategies established locally and autonomously by each participant, and the coordination process, implemented by public rules shared by all participants in the negotiation. This separation allows a flexible description of the protocol and coordination rules used for the implementation of a negotiation.

The architecture of a framework is structured on several layers (see Fig.1). The Agent Oriented Platform (AOP) bottom layer offers basic services such as: communication between agents or negotiation lifecycle management. Above the PDO layer are:

(i) General Negotiation Protocol (GNP);
(ii) taxonomy of negotiating rules;
(iii) language for defining negotiating rules;
(iv) language for expressing negotiating offers.

The general negotiation protocol is composed of coordination rules that indicate when an agent can send a message and what message it can send.

In this type of negotiation process, agents can have two roles which, according to our approach, are the following: participating agent (negotiating agent) and mediating agent (negotiation host). To negotiate, participants send their offers to a common space (local negotiation), which is controlled by a mediator. This negotiation space is a blackboard on which each agent - participant or mediator - can write. However, only the mediator has full visibility into the information. Its role is to create and enforce the rules of coordination that may impose constraints on the execution of the negotiation protocol, on the validation of offers, on the completion of the negotiation and, of course, on the communication between the participants. So, the negotiation process is modeled as a centralized market in which the mediating agent has the role of coordinating all ongoing negotiations. Depending on the types of rules, the role of the mediating agent is broken down into several sub-roles attached to a taxonomy of declarative rules that can be used to capture a wide variety of negotiation mechanisms. These sub-roles and the types of rules attached are as follows:

- Gatekeeper: establishes the rules for the admission of participants in the negotiation;
- Proposal validator: manages the validity rules that stipulate that each offer must be in accordance with a negotiation format and sets the constraints on the attributes of the negotiated objects and their values;
- Enforcer protocol: establishes several types of rules for fulfilling the negotiation protocol: signaling rules - specifies when a participant can send an offer; improvement rules - specifies which new offers can be sent; withdrawal rules - specifies when the offers can be withdrawn and what is the policy on the expiration period of the offers;
- Agreement maker: establishes several types of rules, especially for updating the status of participants and the information to which each participant has access. These rules are: update rules - specify how the

[5] Bartolini, C., Preist, C., and Jennings, N., "A generic software framework for automated negotiation", Technical Report HPL-2002-2, HP Laboratories Bristol.

negotiation parameters change under the influence of certain events; visibility rules - specify which participants can access a certain offer; display rules - specifies whether certain information (a new offer or a new agreement) is visible to a participant and how this information will be shared between participants;

- Information updater: establishes the rules for accepting an agreement; this set of rules determines which agreements should be concluded given a set of offers of which at least two are compatible;
- Negotiation terminator: sets the rules for the life cycle of the negotiation process, indicating when the negotiation should stop.

The mediating agent, with his role and sub-roles, behaves like a system of cooperative agents that communicates with the help of a blackboard. From the participants' point of view, these agents are seen as a single mediating agent coordinating the negotiation. This centralization of the coordination process leads to the non-existence of a distribution of control over the interactions between the participating agents and the mediating agent. Each agent participating in a negotiation sends offers to the mediating agent and it is the one who, using the set of coordination rules as filters, decides if the offer is valid and who can access this offer. Thus, in the proposed system, the coordination process not only manages the dependencies between the initial and final state of negotiation, but also the dependencies between the intermediate states of negotiation. In other words, the mediating agent is able to check the constraints for each offer sent. These constraints aim to synchronize communication in negotiations. Although all the submitted offers are available at the level of the mediating agent, he cannot fix the dependencies on the values of these offers without having any information about the purpose and strategies of the different participating agents. In conclusion, the system allows modeling and coordination of n-type negotiations to n participants as a lot of one-to-one type negotiations, but always having the mediating agent as one of the participants. This approach has advantages in terms of optimizing the coordination of interactions, but limits the autonomy and power of the participating agents through the various rules imposed and managed by the mediating agent.

2.2. Interaction Oriented Programming

In order to implement a multi-agent system, with autonomous agents that can interact with each other, not only the application-specific aspects must be coordinated, but also the aspects related to the agents' behavior and the possible interactions between them. The IOP (Interaction Oriented Programming) approach achieves this type of coordination based on the communication protocol or on the organizational characteristics of the system. These means are rigid and can sometimes limit the autonomy of the agent. In order for the agents to maintain their autonomy, Singh proposed separating the coordination of a multi-agent system into a separate service[6]. Singh's approach to coordinating agent autonomy is structured on two levels. First, at the programming level, where agents may be implemented differently and their internal details may be unavailable. And, secondly, at the level of the agent's behavior, where the agents act autonomously and can perform certain specific actions.

Coordination refers to the actions that the agent performs externally and which are considered as potentially significant for the coordination service. These actions are called events and can be of four types:

- flexible: events that show that the agent is willing to delay the action or withdraw it;
- inevitable: events that show that the agent is only willing to delay the action;
- immediate: events that show that the agent does not want to delay or withdraw the action;
- triggerable: events that show that the agent can execute the action but only at the request of the system.

An agent's events are then organized into a framework (skeleton) to provide a simple model of agent-level coordination. Each event was associated with a "guard" that expresses the conditions in the system for which the exemption must be executed. The expressed conditions fix the constraints on the eventual execution of the event and of other events on which it depends in order to be executed. Figure 2 shows how the coordination service interacts with the agencies. Agents inform the coordination service about immediate events and request permission for unavoidable and flexible events. The coordination service grants or does not grant permissions on flexible events, delays unavoidable events or triggers triggerable events depending on the "guards" associated with them.

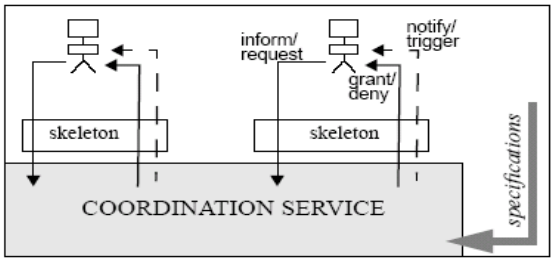

Fig. 2. I.O.P. - Interaction between the coordination service and agents

For effective coordination between events performed by multiple agents, the approach proposed by Singh requires that the following characteristics be met:

a) the dependencies between actions (events) are known from the beginning of the system implementation;

[6] Singh., M. P., "Interaction-Oriented Programming: Concepts, Theories, and Results on Commitment Protocols". In AI 2006: Advances in Artificial Intelligence, LNAI 4304, pp. 5–6, 2006.

b) the agents communicate with each other, exchanging relevant information on the execution of their actions.

So, the approach proposes a generic coordination service that is implemented in a distributed way between the component agents of the system, as well as the execution of a single workflow that describes the actions necessary to fulfill a single task. Each agent can be seen as an entity that encompasses part of the coordination service and makes decisions about the execution of events based on local information.

In conclusion, we chose to present this system in the end because Singh demonstrates a clear separation between agent-modeled decision-making processes and coordination processes modeled by an outside service. This feature is similar to one of our goals. In Singh's approach, the coordination service is interested in synchronizing interactions between agents without taking into account any information about the content of messages or the purpose of the conversation between agents. Assuming the particular case where conversations between agents refer to negotiation, the only dependencies that the service can manage are the dependencies between the execution of different actions (i.e., sending offers) that make up a negotiation to ensure a coherent flow of conversation.

Depending on the different dimensions of the negotiation process, we can see that the type of strategic coordination is directly influenced by several factors such as: participants and their role, time, object of negotiation and negotiation protocol. Also, given that this type of coordination is implemented in the decision-making process, strategic coordination is therefore strongly influenced by the negotiation strategy. Strategic coordination fixes the dependencies between the initial and final states of negotiation, between the objects of negotiation or between the attributes that describe these objects. Regarding the generic coordination, it does not take into account, at the level of the negotiation process, only the events related to the management of the interactions between activities, actions or messages. Neither the objects of the negotiations nor the participants in the negotiations are taken into account. So, in general, generic coordination is not influenced by any of the dimensions of the negotiation process.

In the different coordination systems presented, we can observe that no coordination is proposed between the intermediate phases of negotiation in order to dynamically correct the proposals made during the negotiations. This limitation may result from the fact that, in a generic coordination, the necessary data are unavailable. In the case of a strategic coordination, although the necessary data are available, the coordination through a decision process is not the optimal solution for the implementation of the management of the types of dependencies. In other words, strategic approaches that try to take into account dynamic data are hit by the fact that every change that occurs on the data, involves a restart of the decision process, because the decision process is based on history. Certain features of the presented systems meet our objectives, but our problem is much more complex due to the fact that we want to coordinate actions (negotiations) that are performed by competing agents to perform not only a certain task, but several different tasks. An additional aspect is given by the fact that the dependencies to be managed refer to the values of the attributes of the proposals changed during the negotiations. Thus, in addition to coordinating the initial and final states of the negotiations, we will also coordinate the intermediate states, verifying and modifying the content of the messages exchanged during the negotiations.

3. Collaborative Platform

Our approach in terms of coordination of negotiations is structured on two models:

- strategic coordination managed at the agent level;
- generic coordination managed at the middleware level.

This approach (multi-agent and middleware) allows the development of a multi-agent system based on a distributed and competing architecture. Aspects related to the synchronization of the negotiation process are left to the middleware.

In the context of this approach, we break down the negotiation process into three distinct processes:

i) coordination process;
ii) decision process;
iii) communication process.

This structuring of the negotiation process is justified by its complexity, involving multiple dimensions and different mechanisms.

The implementation of a negotiation presupposes the existence of a well-structured coordination mechanism or process. In this sense, we call the *coordination process*, the process that has a global vision on the negotiation, in order to manage the parallelism and dependence between the actions executed in a complex negotiation. Thus, we will approach the negotiation as a process that preserves the autonomy of the participants - each of them manages their own negotiations and their own information (description of tasks, contracts, partners, etc.). In addition, two important aspects of the negotiation process need to be highlighted:

i) for a single task, one participant is involved in several bilateral negotiations - one for each participant interested in contracting the task;

ii) at the same time, the same participant is engaged in other bilateral negotiations on other different tasks. So, the coordination process is the process that manages, for each participant, three important aspects: 1) coordinating the different proposals received in a bilateral negotiation (one to one) for modeling a multi-phase negotiation on a multi-attribute negotiation object;

2) coordinating several bilateral negotiations to model a multi-participant negotiation;

3) coordination of several negotiations in which the participant is engaged.

The aim of this paper is to propose basic mechanisms for coordinating negotiations. These represent mechanisms for interfacing between the generic communication process and the decision process in order to implement negotiation schemes that manage the simultaneous evolution of several negotiations. These coordination mechanisms must maintain the coherence of the agent's decisions in terms of actions that can be executed (initiating or finalizing a negotiation) and proposals that can be sent. This coherence must also be guaranteed both locally (for a single negotiation) and globally (for all negotiations in which a participant is involved).

The main objective of this software infrastructure is to support collaborating activities in virtual enterprises. In VE partners are autonomous companies with the same object of activity, geographically distributed.

Taking into consideration, the constraints imposed by the autonomy of participants within VE, the only way to share information and resources is the negotiation process.

Figure 3 shows the architecture of the collaborative system:

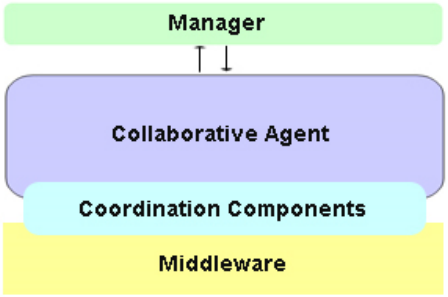

Fig. 3 The architecture of the collaborative system

This infrastructure is structured in four main layers: Manager, Collaborative Agent, Coordination Components and Middleware. A first layer is dedicated to the Manager of each organization of the alliance. A second layer is dedicated to the Collaborative Agent who assists its gas station manager at a global level (negotiations with different participants on different jobs) and at a specific level (negotiation on the same job with different participants) by coordinating itself with the Collaborative Agents of the other partners through the fourth layer, Middleware[7]. The third layer, Coordination Components, manages the coordination constraints among different negotiations which take place simultaneously.

- The initialization step allows to define what has to be negotiated (Negotiation Object) and how (Negotiation Framework)[8]. A selection of negotiation participants can be made using history on passed negotiation, available locally or provided by the negotiation infrastructure (Zhang and Lesser, 2002). A Collaborative Agent aims at managing the negotiations in which its own gas station is involved (e.g., as initiator or participant) with different partners of the alliance.
- Each negotiation is organized in three main steps: initialization; refinement of the job under negotiation and closing[9].
- In the refinement step, participants exchange proposals on the negotiation object trying to satisfy their constraints (Barbuceanu and Wai-Kau, 2003). The manager may participate in the definition and evolution of negotiation frameworks and objects (Keeny and Raiffa, 1976). Decisions are taken by the manager, assisted by his Collaborative Agent (Bui and Kowalczyk, 2003). For each negotiation, a Collaborative Agent manages one or more negotiation objects, one framework and the negotiation status. A manager can specify some global parameters: duration; maximum number of messages to be exchanged; maximum number of candidates to be considered in the negotiation and involved in the contract; tactics; protocols for the Collaborative Agent interactions with the manager and with the other Collaborative Agents (Faratin, 2000).

4. Coordination Components

In order to handle the complex types of negotiation scenarios, we propose the negotiation components[10]: *Subcontracting* (resp. *Contracting*) for subcontracting jobs by exchanging proposals among participants known from the beginning.

These components are able to evaluate the received proposals and, further, if these are valid, the components will be able to reply with new proposals constructed based on their particular coordination constraints[11].

The novelty degree of this software architecture resides in the fact that it is structured on four levels, each level approaching a particular aspect of the negotiation process. Thus, as opposed to classical architectures which achieve only a limited coordination

[11] Vercouter, L., A distributed approach to design open multi-agent system. In 2nd Int. Workshop Engineering Societies in the Agents' World (ESAW), 2000.

of proposal exchanges which take place during the same negotiation, the proposed architecture allows approaching complex cases of negotiation coordination. This aspect has been accomplished through the introduction of coordination components level, which allows administrating all simultaneous negotiations in which an alliance partner can be involved.

The coordination components have two main functions such as: i) they mediate the transition between the negotiation image at the Collaboration Agent level and the image at the Middleware level; ii) they allow implementing various types of appropriate behavior in particular cases of negotiation. Thus, we can say that each component corresponding to a particular negotiation type.

Following the descriptions of this infrastructure we can state that we developed a framework to describe a negotiation among the participants to a virtual enterprise. To achieve a generic coordination framework, nonselective and flexible, we found necessary to first develop the structure of the negotiation process that helps us to describe the negotiation in order to establish the general environment where the participants may negotiate. In the next sub-sections we will describe the *Subcontracting* and *Contracting* components.

4.1. Subcontracting Component

The *Subcontracting* component is the main component of a negotiation. The automatic negotiation process is initiated by creating an instance of this component starting from the initial negotiation object. Further, this component must build the negotiation graph by following the negotiation requirements (i.e., assessment and creation of proposals and coordination rules). The component meets these requirements by manipulating the Xplore primitives [14].

Besides these functionalities, the *Subcontracting* component has to interpret and check the negotiation constraints, which are set up in the following two data structures: *Negotiation Object* and *Negotiation Framework.*

The information provided by the structure of the Negotiation Object on the possible values of the attributes to be negotiated allow easily the *Subcontracting* component to check whether the proposals received concern the attributes negotiated in the current negotiation and if they are associated to the values of the intervals specified.

For example, assuming that the Negotiation Object requires that the price should be (*cost <= 10k)*, the *Subcontracting* component can stop the continuation of the negotiation in the phases associated to the white nodes where the proposals are outside the interval.

Also, by using the *partner* coordination attribute, the *Subcontracting* component can make known to the other components the participants imposed by the Negotiation Object or whether other components instantiate this attribute. In this regard, the *Subcontracting* component can easily check if the associated value confirms the constraints imposed by the Manager.

At middleware level, the *Subcontracting* component has also the function of administrating the transactional aspect of the negotiation. This component is seen like a *coordinator* and has the role to conclude an agreement among the component instances participating in the same negotiation.

Another *Subcontracting* component functionality is to interpret and execute the tactics specified in the Negotiation Framework structure by connecting a combination of different instances of the other components.

Thus, the *Subcontracting* component as well as the *Contracting* component described below are those connecting the aspects specified at the Negotiation Agent level and their implementation at the coordination components level.

4.2. Contracting Component

The *Contracting* component manages the negotiation from the organization side deciding to accept a task proposed in the collaborative networked environment, with some functionalities similar to those of the *Subcontracting* component.

The differences come from the fact that this component does not have a complete picture on the negotiation and that, at the beginning of the negotiation, it has no information about what is negotiated or about the constraints of its Manager.

Therefore, looking to the differences, we can say at first that the image of the *Contracting* component on the negotiation graph is limited to the data referring only to its direct negotiation with the *Subcontracting* component or with another component negotiating for the organization having initiated the negotiation.

Secondly, unlike the *Subcontracting* component, which, from the beginning, has constraints specified by the Manager within the data structures of the *Negotiation Object* and the *Negotiation Framework*, the *Contracting* component has a close interaction with its own Manager on the new aspects required in the negotiation.

Thus, depending on attributes required by the negotiation initiator the *Contracting* component is able to progressively build the data structures describing the Manager's preferences on the negotiation object and on the negotiation process.

5. Collaborative Approach

In the proposed scenario, a conflict occurs in a network of enterprises, threatening to jeopardize the interoperability of the entire system. The first step consists in identifying the Enterprise Interoperability issue. The following steps refer to analyse the problem, evaluate possible solutions and select the optimal solution. The proposed solution for conflict resolution

is reaching a mutual agreement through negotiation. The benefit of this approach is the possibility to reach a much more stable solution, unanimously accepted, in a shorter period of time.

The design and coordination of the negotiation process must take into consideration:

- Timing (the time for the negotiation process will be pre-set);
- The set of participants to the negotiation process (which can be involved simultaneous in one or more bilateral negotiations);
- The set of simultaneous negotiations on the same negotiation object, which must follow a set of coordination policies/ rules;
- The set of coordination policies established by a certain participant and focused on a series of bilateral negotiations[12];
- Strategy/decision algorithm responsible for proposals creation;
- The common ontology, consisting of a set of definitions of the attributes used in negotiation.

The negotiation process begins when one of the enterprises initiate a negotiation proposal towards another enterprise, on a chosen negotiation object. We name this enterprise the Initiating Enterprise (E1). This enterprise also selects the negotiation partners and sets the negotiation conditions (for example sets the timing for the negotiation) (Schumacher, 2001). The negotiation partners are represented by all enterprises on which the proposed change has an impact. We assume this information is available to E1 (if not, the first step would consist in a simple negotiation in which all enterprises are invited to participate at the negotiation of the identified solution. The enterprises which are impacted will accept the negotiation) (Kraus, 2001).

After the selection of invited enterprises (E2 … En), E1 starts bilateral negotiations with each guest enterprise by sending of a first proposal. For all these bilateral negotiations, E1 sets a series of coordination policies/rules (setting the conditions for the mechanism of creation and acceptance of proposals) and a negotiation object/framework (NO/NF), setting the limits of solutions acceptable for E1. Similarly, invited enterprises set their own series of coordination policies and a negotiation object/framework for the ongoing negotiation.

After the first offer sent by E1, each invited enterprise has the possibility to accept, reject or send a counter offer. On each offer sent, participating enterprises, from E1 to E2 ... En follow the same algorithm.

The algorithm is shown below: Pseudocode representation of the negotiation process

Inputs: Enterprises *E1...En; NO(Negotiation Object); NF(Negotiation Framework)*

Outputs: The possible state of a negotiation: *success, failure*

```
BEGIN
on receive start from E1{
    send initial offer to partner;
}
on receive offer from partner{
    evaluate offer;
    if(conditions set by the NO/NF are not met){
            offer is rejected;
            if(time allows it){
                    send new offer to partner;
            }else{
                    failure;
            }end if;
    }else{
            send offer to another partner;
    }end if;
    if(receive an accepted offer){
            if(offer is accepted in all bilateral negotiations){
                    success;
            }else{
                    if(time allows it){
                            send new offer to partner;
                    }else{
                            failure;
                    }end if;

6. Conclusions

This paper proposes a collaborative e-platform for sustainable interoperability by modeling and managing of parallel and concurrent negotiations, which aims to open the market to broader discovery of opportunities and partnerships, to allow formalization and negotiation knowledge to be passed to future negotiations and to properly document negotiation decisions and responsibilities. The negotiation activities typically fail because they are often based on tacit knowledge and these activities are poorly described and modeled. Also, as negotiations occur in a dynamic environment, many external potential interested parties are not aware of them and do not subscribe them. This makes negotiations reach poorer results or fail by disagreement or exhaustion. The integration of formal procedures for modeling, storing and documenting the negotiation activities allows an optimized analysis of the alternative solutions and by

[12] Ossowski S., Coordination in Artificial Agent Societies. Social Structure and its Implications for Autonomus Problem-Solving Agents, No. 1202, LNAI, Springer Verlag, 1999.

adding the analysis of lessons-learned on past activities leads to maximized negotiation results, stronger negotiation capabilities and relationships.

Currently, interoperability among the involved parties in a negotiation is often not reached or maintained due to failure in adapting to new requirements, parties or conditions. The use of an adaptive platform as proposed will result in a seamless, sustainable interoperability which favours its maintenance across time; the ability to reach and interoperate with more parties leads to more business opportunities and to stronger and healthier interactions.

The sequence of this research will comprise the completion of this negotiation framework with the contract management process and a possible renegotiation mechanism.

With respect to the framework middleware, future research shall include handling issues regarding the security and resilience of the stored negotiation data in the cloud, and managing privacy aspects as the negotiating parties should be able to seamlessly interoperate but still to maintain their data free from prying eyes; also, several issues need to be solved from non-disclosure of participating parties to secure access to the negotiation process.

EARNINGS AND FAIR VALUE ACCOUNTING

Valentin Gabriel CRISTEA*

Abstract

Fair value measurements are on the Romanian Commercial Bank earnings at June 30, 2019. We focus on the relationship between fair value measurements and predictability as a measure of earnings quality. The data collected are from the Romanian Commercial Bank annual reports at June 30, 2019. The persistence, predictability, accruals quality, earnings smoothing and value relevance are the most important measures of earnings quality. Earnings quality and the quality of accounting information are in direct relation. The usefulness of fair value information is explored directly by inspecting its predictive power with respect to future cash flows and future earnings.

Keywords: *earnings quality, earnings predictability, commercial bank, fair value accounting, financial statements, historical cost.*

1. Introduction

Johnson et al.[1] stated in 1995 that financial failure was not reported and thus was ignored on the condition that these securities were still being held, yet according to Johnson profits could be reported for securities rising values. Then, the controversial use of FVM, he establishes a direct connection between Enron's collapse, the GFC, and improper FVM practices. Secondly, the current pricing strategy for audit as an industry response to the abuse of external audit arrangements. Based on the comprehensive literature review, Johnson arrives at two earlier main findings. For this reason, FVA in the early 1990s was put forward as a remedy, so that losses as well as profits could be accounted for in a timely and honest way.

There was no noticeable change in these requirements when they began in 1993 until after the GFC in 2008-2009. Other fair value standards, also comprising mixed forms of measurement, soon followed FAS 115, for example FAS 123: Accounting for Stock-Based Compensation (FASB, 1993), and FAS 133: Accounting for Derivative Instruments and Hedging Activities (FASB, 1998). The standards represented efforts to prepare fair values through the profit statement in specific scenarios. In 1998, IAS 39 was established by the IASB. At that time, IASB standards were referred to as International Accounting Standards (IAS). Subsequently, FAS 115 was equivalent to IAS 39: Financial Instruments: Recognition and Measurement, (IAS Plus 2019). In fact, IAS 39 and FAS 115 were similar in adopting a mixed approach (both fair value and historical cost models).

Heaton et al.[2] established in 2010 that regulators noted the rise of financial instruments and wanted a method with which to measure those financial assets that were being rapidly traded fairly. Then we noted the FAS 115: Accounting for Certain Investments in Debt and Equity Securities (FASB, 1993).

Schultz and Hollister remarked in 2003 that following pressure by conservative banks, the standard only needed some investments, in other words, those proposed to be sold in the short-term and those prepared using fair value through the profit statement.

Chen, Lo, Tsang & Zhang, in 2013, established that earnings quality is used as an indicator of dividends, as these dividends are important things that are taken into account when making investment decisions.

Sodan said in 2015 that the fair value approach is also one of the approaches that was born to cover the shortcomings of applying the historical cost approach. This approach shows users of financial statements the right information to make the right decisions, because that information becomes more relevant when we apply fair value.

1.1. Earnings and fair value

After Sodan (2015), his concept of valuation was adopted, as he mentioned that exposure to fair value accounting is measured using global or net income approaches. In other words, changes in fair values are reported as gains and losses on net or other global income.

Thus, we deduced that the effect of gains (losses) on fair value through other comprehensive income and net income on predictability as a measure of the quality of gains. Muller, Riedl & Sellhorn, in 2008, analysed the historical cost principle, which led them to look for a new accounting alternative to keep up with the economic conditions characterized by Asian Economic and Financial Review, 2020, 10 (12): 1466-1479 1468,

which cause strong fluctuations, changes in purchasing power, create instability and lead to inflation or depression. It is undeniable that the concept of fair value has projected traditional accounting theory to new horizons and brought a comprehensive innovation in the structure of financial statements and their implications. This has been an effect of the evolution of accounting theory in recent years, which have matured and been implemented in international fair value accounting standards and was introduced at the beginning of the third millennium, in 2001 (Sodan, 2015). When a company uses the fair value method, it generates higher income due to the difference between the fair value and the carrying amount, which is recognized as part of the gain and loss on the application of fair value. Thus, using the cost model, the value of net income or loss is distorted only by depreciation expenses (Wahyuni, Soepriyanto, Avianti and Naulibasa, 2019).

2. The fair value of financial assets and liabilities at Romanian Commercial Bank

Romanian Commercial Bank was established in 1990, when it took over the commercial operations of the National Bank of Romania.

Fair value is the price that would have been collected for the sale of an asset or paid for the transfer of a debt in a regulated transaction between market participants at the valuation date. The fair value is best highlighted by a price dictated by the market, if it exists. The value adjustments due to changes in credit risk is included in the fair value of derivatives and is intangible both on December 31, 2018 and on December 31, 2019.

Level 1 in the fair value hierarchy

The fair value of financial instruments allocated on level 1 of the fair value hierarchy is determined on the basis of the prices quoted on the active markets related to identical financial assets and liabilities. In particular, the measured fair value can be classified as entry level 1 if the transactions take place with a high frequency, volume and consistency of pricing continuously. This will be used as a fair value and in this case no valuation model is needed.

These include derivative financial instruments traded on the stock exchange (futures contracts, options), shares, government securities, as well as other bonds and funds, which are traded on highly liquid and active markets.

Level 2 in the fair value hierarchy

If a market quotation is used for valuation, but due to limited liquidity, the market does not qualify as active (information derived from available market liquidity indicators), the instrument is classified as level 2. If there are no market prices available, fair value is measured using valuation models based on observable market data. If all input data significant in the valuation model are observable, the instrument is classified as level 2 in the fair value hierarchy. For valuations for level 2, yield curves, credit margins and implicit volatilities are usually used as market parameters.

Level 2 includes financial instruments on the OTC market, less liquid shares, bonds and funds, as well as own issues. If the "spread" is not observable, it must be tested if the unobservable input parameter is significant. An unobservable input parameter for securities with theoretical prices is considered significant if the effect of unobservable inflows on the fair value of that guarantee is greater than 2%.

Level 3 in the fair value hierarchy

In some cases, fair value cannot be determined either on the basis of quoted market prices with sufficient frequency or on the basis of valuation models that take into account only observable market data. In these cases the individual evaluation parameters, unobservable on the market, are estimated based on reasonable assumptions. If significant strength data are not observable or the price quotation used is not frequently updated, the instrument is ranked level 3 in the fair value hierarchy. For level 3, the assessments take into account, in addition to observable parameters, credit margins derived from internal historical estimates for the probability of default (PD) and loss in case of default (LGD) which are used as unobservable parameters.

Financial instruments measured at amortized cost in the statement of financial position whose fair value is presented in the following notes.

The following table shows the fair value and the fair value hierarchy for financial assets whose fair value is presented in the notes to the financial statements at June 30th, 2019:

Figure 2. Statement of financial position (continued)

The fair values of loans and advances granted to customers and credit institutions have been calculated by discounting future cash flows taking into account the effect of interest and credit margin. The impact of the interest rate is based on movements in market interest rates, while credit margins are determined by the probability of default (PD) used for the internal risk calculation. For the calculation of fair value, loans and advances were grouped into homogeneous portfolios, based on rating methods, rating class, maturity and client's country of residence.

The fair value of amortized cost financial assets is either taken directly from the market or determined by directly observable input parameters (i.e. yield curves).

The fair value of the securities issued and of the financial debts valued at amortized cost, is based on prices quoted in the active market of some similar tools. If these are not available and other observable input parameters are used (e.g. quoted prices in inactive markets) the classification will be Level 2.

The fair value of deposits and other financial liabilities measured at amortized cost is estimated taking into account the market interest rate and credit margins; they qualify on Level 3.

Figure 3. Financial instruments measured at fair value in the statement of financial position

Source: https://cdn0.erstegroup.com/content/dam/ro/bcr/www_bcr_ro/EN/Investors/Financial-reports/2019/Financial_statements_June_30th_2019.pdf.

Financial assets held for trading increased during 2019, largely due to investments in bonds representing 91% of the total position.

Financial assets that are not held for trading and that are measured at fair value through profit or loss include:

Loans and advances granted to customers classified at fair value through profit or loss in accordance with IFRS 9 due failure to meet the conditions necessary to pass the SPPI test (excluding payment of principal and interest). Fair value calculation methodology of these assets correspond to the current base value technique in which the cash flows of the assets are discounted at full rate, including credit risk, market risk and cost components.

Credit risk is incorporated in the assessment of cash flows to reaches the expected cash flows, accounting for the customer's probability of default. These cash flows are then adjusted with discount rate.

Equity instruments, especially minority investments classified as level 3 instruments for which the fair value is determined on the basis of internal evaluation. Among the most common methods of valuing minority interests are:

- Quoted price on active markets,
- Expert opinion or recent trading value, Discounted cash flow method / dividend discount model,
- Adjusted net asset value,
- Simplified income approach.

Investments in VISA INC preference shares for which the fair value is calculated based on internal valuations and are classified by level 3.

Financial assets measured at fair value through other comprehensive income include:

Debt securities issued by the Ministry of Public Finance that are actively traded being classified as level 1 and 2.

A corporate bond having the theoretically established price, classified as level 3.

Valuation of level 3 financial assets

The volume of level 3 financial assets can be allocated in the following two categories:

The market values of derivative financial instruments when the credit rating adjustment (CVA) has a significant impact and is calculate based on unobservable parameters (internal estimates of PD and LGD);

Less liquid bonds, shares and funds that are not listed on an active market in which valuation models with parameters were used unobservable (e.g. credit margins) or broker quotes cannot be allocated to level 1 or 2.

The unobservable parameters in the CVA calculation are: the probability of default (PD ñ Probability of Default) and the loss in case of non-refund (LGD ñ Loss Given Default). Non-repayment probabilities are the result of internal estimates in the context of the development of rating models and are used in the assessment of credit risk, including CVA.

Each counterparty, depending on the rating received, is associated with a probability of default. The LGD parameter for the CVA calculation has the value of 60%.

As of December 31, 2019, the fair value of the preferred shares in VISA Inc. was based on reasonable assumptions and estimates and were classified on level 3.

The sale of shares is limited to certain conditions that may restrict the conversion of preferred shares into shares of VISA Inc. tradable.

Due to these restrictive conditions and to reflect the potential price volatility of VISA Inc. Class A common shares and the limited liquidity of the preferred shares, the fair value of the preferred shares was capped compared to the VISA common shares Class A Inc. based on assumptions.

The price of the Class C preferred shares was determined on the basis of the conversion ratio of 1: 13,952 and on the basis of two additional adjustment margins: a margin of 12.65% to take into account the uncertainty related to the market price taking into account low liquidity of class C shares; and a margin of 17.5% to reflect the risk of the conversion factor.

Real estate investments are systematically valued at fair value. Assets held for sale are valued at fair value when their carrying amount is depreciated below fair value less costs to sell.

The fair value of non-financial assets is determined by experts with relevant and recognized professional qualifications.

For non-financial assets held by the BCR Group, the valuation is made mainly using the comparative method and the investment method.

The assessment is made on the basis of the comparison and analysis of comparable investments and rental transactions, including information on demand in the area, in which the respective property is located. The characteristics of similar transactions are then applied to the asset to be valued, taking into account the size, location, contractual terms and other relevant factors. These valuations are presented in Level 3 of the fair value hierarchy.

For each reviewed stream of research, the paper establishes the theoretical underpinning and discusses its application supported by the context. The content analysis using NVivo software was employed to analyze existing research and available published information.

Earnings quality and the quality of accounting information are in direct relation. The usefulness of fair value information is explored directly by inspecting its predictive power with respect to future cash flows and future earnings..

They seek to anticipate the continuity of corporate earnings in the coming periods, while financial analysts point to financial statements as the primary source on which to analyze information and make rational decisions (Schipper and Vincent, 2003). For example, Barth., Beaver & Landsman, pointed out in 2001 that earnings are, of course, valued as indirect indicators for assessing the quality of accounting standards, as there is a direct relationship between the quality of earnings and the quality of accounting information.

There are different measures of income quality, the most well-known measures are persistence, predictability, quality of accumulations, income smoothing and relevance of value.

Predictability refers to the well-known fact that income is of higher quality and is more beneficial for predicting future income. It is noted that the predictive power of profits is affected by the time series of earnings and the fluctuation of business operations, the economic environment and the accounting system used by companies.

Sodan, in 2015, stated that the initial assumption of the value relevance of research at fair value is that fair value information predicts future cash flows. Therefore, instead of measuring the correlation between fair value estimates and market prices or returns, the usefulness of fair value information is, of course, examined directly by analyzing its predictive power in terms of future cash flows and future revenues. Thus, fair value estimates are given by the present value of expected future cash flows, so if fair values are reliable measures of asset values, changes in fair values (i.e. unrealized gains and losses on fair value) should be reflected in future performance changes. (Barth, 1994).

Otherwise, if the fair value estimates are not reliable, then the correlation with future performance measures will not be taken into account. Among the most important accounting tasks is to choose the correct valuation method for valuing assets and liabilities.

This task has been shown by many scientists, such as McDonough & Shakespeare, 2015, who are determined that the financial position and results of economic activities represented in balance sheets and profit and loss statements depend not only on current reality but also on estimation methods. and calculation of reported indicators.

The concept of fair value emerged in the nineteenth and early twentieth centuries, but recently there has been much research and controversy among researchers calling for its cessation due to misuse and manipulation of accounting numbers at preparation of financial reports.

Abuse of fair value reached a peak during the twenties of the last century in many industrialized countries where prosperity and inflation have encouraged the development of optimistic repercussions of values, and many of them have returned to a significant decline due to the global recession (Thomason, 2017). Between 2006 and 2007, new accounting statements were issued that expanded the scope of fair value accounting, which led to a discussion that extended beyond the accounting profession to the rest of the business community.

Although fair value accounting is not a new concept or a new accounting practice, new data requirements coupled with the recent credit crunch that started in 2007 have caused many companies and users of financial data to question whether current fair value accounting practices should continue. Therefore, it is important to make a decision to resolve this difference because many companies that use fair value accounting have to record their assets and liabilities in difficult circumstances, such as the market crash, which makes the financial statements of these companies appear much worse than they really are. Since the purpose of financial statements is to clarify the financial condition of the company and its activities during the financial year and allow users of financial data to forecast future cash flows of the company, when the market collapses and the values of assets and liabilities appear below their actual value, this leads to distortion of the financial position of the company and it appears unable to achieve its intended goals (McDonough & Shakespeare, 2015).

In the retail banking activity, BCR granted new loans in local currency for individuals and micro-enterprises of over 7.8 billion lei (1.7 billion euros) in

2019, mainly due to mortgages, personal loans and those intended microenterprises. New loans for micro-enterprises increased by 31.5% in 2019 compared to the previous year, due to higher financing granted within the Start-Up Nation program. Unsecured loans increased by 3.4% compared to the previous year, due to the activity of personal loans and increasing the number of credit cards and overdrafts.

Regarding the corporate banking activity, BCR (bank only) approved new corporate loans amounting to 7.4 billion lei (1.6 billion) in 2019. The stock of financing granted to the SME sector (incl. BCR Leasing subsidiary) increased by 12.3% compared to past, reaching the value of 6.1 billion lei (1.3 billion euros) as of December 31, 2019, as a result of a higher concentration on new business and on the development of the leasing sector. The real estate segment increased significantly by 34.3% compared to
last year, as a result of new office and commercial space construction projects funded in the last year.

The total number of customers increased to 3.3 million at the end of last year, compared to 3.1 million in 2018.

If the fair values of financial assets and financial liabilities recorded in the balance sheet cannot be obtained from the active markets, they are determined using a wide range of assessment techniques that include the use of mathematical models. The values entered in these models are taken from existing markets when possible, but when this is not possible, a certain type of reasoning is needed to set fair values. Presentations on valuation models, fair value hierarchy, fair value of financial instruments and analysis sensitivity for Level 3 financial instruments are described in Note 43 “Fair value of financial assets and liabilities”.

The impairment loss model is a reasoning model because it requires the assessment of a significant increase in risk credit and measurement of expected credit losses without detailed instructions. Regarding the significant increase in credit risk, the group established specific evaluation rules consisting of qualitative information and quantitative thresholds.

Another area of complexity concerns establishing groups of similar assets when credit risk impairment must be assessed collectively before specific information is available individually.

Assessing expected credit losses involves complex models based on statistical data non-reimbursement probabilities and loss rates in case of non-payment, on extrapolation of information in case of insufficient observations, on estimates individuals of future cash flows and probabilities of different scenarios, including prospective information. In addition, the lifespan of instruments must be modeled in terms of the possibilities of early repayment and the behavior of credit facilities revolving.

Debt securities are measured at fair value through other comprehensive income (FVOCI) if their cash flows are compliant with the SPPI and are held within a business model whose objective is achieved both by collecting contractual cash flows, as well as by selling assets. In the balance sheet, they are included as "Debt securities" under the line "Financial assets valued at fair value through other comprehensive income ".

Interest income from these assets is calculated using the effective interest rate method and is included in the line "Net interest income" in the statement of profit or loss account. Impairment gains or losses are recognized in the income statement "Net impairment loss on financial instruments".

As a result, the impact of the recognized valuation in profit or loss is the same as for financial assets valued at amortized cost.

The difference between the fair value at which the assets are recognized in the balance sheet and the amortized cost component is recognized as accumulated OCI in equity, in the line "Fair value reserve" in the event of changes in equity. The change for that period is recorded as OCI in the statement of comprehensive income in the line "Debt instruments measured at fair value through other comprehensive income global ".

Financial assets whose contractual cash flows are not considered SPPIs are automatically measured at fair value through profit or loss ("FVPL"). In the Group's activity, it refers to certain loans granted to clients, equity instruments and securities debt.

Another way of valuing the FVPL refers to the financial assets that are part of the residual business models, i.e. they are not even kept for the collection of contractual cash flows or not kept for the collection of flows or for their sale. In general, it is expected that these financial assets be sold before maturity or are valued from the perspective of business performance at fair value.

In the balance sheet, the debt instruments valued at FVPL are presented as "Financial assets held for trading", under the line "Other assets held for trading. "Financial assets are measured at fair value through profit or loss either because their cash flows contractual funds are not SPPIs, either because they are held as part of residual business models that are other than those held for trading.

In the situation of the profit or loss account, the effects produced by the financial assets valued at FVPL are divided into interest income or income from dividends and gains or losses on fair value. Dividend income related to equity instruments is presented in the line "Dividend income".

Fair value gains or losses are calculated excluding interest or dividend income and also include trading costs and issue fees. These are reported in the line "Net trading income" for assets financial assets held for trading and in the line "Gains / losses on financial instruments not intended for the measured trading mandatory at fair value through profit or loss "in the case of financial assets not intended for trading and are valued at FVPL.

Derivative financial instruments are used by the Group to manage exposures to interest rates, foreign currencies and other risks related to the market price. The derivative instruments used by the Group mainly include interest rate swaps, futures contracts, contracts forward, interest rate options, currency swaps and currency options, as well as credit risk swaps.

Derivative financial instruments are recorded at fair value (the price including the interest component) in the statement of financial position.

Derivatives are recorded as assets if their fair value is positive and as liabilities if their fair value is negative.

Derivatives held for trading are those that are not designated as hedging instruments against risks for hedge accounting. These are presented in the line "Derivative financial instruments" under the category "Financial assets / Financial liabilities held for trading ". This item presents all types of derivative instruments that do not cover risks, regardless of their internal classification, both the derivatives held in the trading book and those held in the "banking book" portfolio.

Changes in the fair value (interest-free price) of derivative financial instruments held for trading are recorded in the profit or loss account in the position "Net trading income". Interest income / expenses related to both held for trading used for economic hedging, as well as hedging derivatives against risk are presented in the account profit or loss in the item "Other similar income" or "Other similar expenses" as "Net interest income".

The BCR Group continued to improve the ICAAP framework. It includes as its main pillar the ICAAP process (The internal evaluation process of capital adequacy to risks) required under Pillar 2 of the Basel Accord.

The ICAAP framework is a holistic risk management tool, designed to support the management of the BCR Group in the management of portfolios at risk as well as the potential for capital hedging, in order to ensure at all times the appropriate capital, able to reflect the nature and size of the Banks' risk portfolio and to support the business strategies and risk of these.

A key component of the ICAAP framework is the proper valuation of the Group's capital using economic capital measures. Within ICAAP,

The group identifies and measures risks and ensures that there is sufficient capital in relation to the risk profile. The process also ensures that they are use and develop appropriate risk management systems.

3. Conclusions

First, the paper concludes that the persistence, predictability, accruals quality, earnings smoothing and value relevance are the most important measures of earnings quality. Earnings quality and relation. The usefulness of fair value information is explored directly by inspecting its predictive power with respect to future cash flows and future earnings.

EARNINGS QUALITY BASED ON FAIR VALUE ACCOUNTING

Valentin Gabriel CRISTEA*

Abstract

Fair value measurements are on the Transilvania Bank Group earnings from December 31, 2017 to December 31, 2018. We search on the correlation between fair value measurements and earnings quality. As the fair value is an independent variable, the earnings quality is a dependent variable. The data collected are from the Transilvania Bank Group annual reports between December 31, 2017 and December 31, 2018. The predictability, accruals quality, earnings smoothing and value relevance are the most important measures of earnings quality. Earnings quality and the quality of accounting information are in direct relation. The impact of fair value accounting on earnings quality is significant. With the adoption of fair values, earnings predictability at Transilvania Bank Group became quite high due to the variability of income. This thing alters the quality of the earnings and thus affects the choices that stakeholders can make.

Keywords: *earnings quality, earnings predictability, bank, fair value accounting, financial statements.*

1. Introduction

Barth, Beaver and Landsman[1] considered, in 2001, that revenue is, of course, considered an indirect indicator for assessing the quality of accounting standards, as it shows a direct relationship between the quality of revenue and the quality of accounting information.

Sodan, in 2015, showed that fair value information predicts future cash flows and is the current assumption of the value relevance of research at fair value. Therefore, the usefulness of fair value information is, of course, studied directly by analyzing its predictive power in terms of future cash flows and future earnings. So Barth, in 1994, said that fair value measurements are given by the present value of expected future cash flows, so if fair values are reliable measures of asset values, changes in fair values (i.e. unrealized gains and losses at fair value) would it must be reflected in future performance changes.

Thus, if the fair value estimates are not reliable, then the correlation with future performance measures will not be taken into account. Among the most important accounting tasks is the choice of the correct valuation method for valuing assets and liabilities.

Then, it is not necessary to measure the correlation between fair value estimates and market prices or yields.

Many scientists such as McDonough and Shakespeare, in 2015, confirmed that the financial position and results of economic activities represented in the balance sheets and profit and loss statements depend on the current reality and the methods of estimating and calculating the reported indicators.

The concept of fair value emerged in the nineteenth and early twentieth centuries, but recently there has been much research and controversy among researchers calling for its cessation due to misuse and manipulation. accounting numbers when preparing financial statements.

Thomason, in 2017, showed that fair value abuse peaked in the 1920s in many developed countries where prosperity and inflation fueled the development of over-optimism of values, and many of them declined steadily due to the global recession. Between 2006 and 2007, new accounting situations were developed that broadened the scope of fair value accounting, leading to a discussion that extended beyond the accounting profession to the rest of the business community.

The predictability, accruals quality, earnings smoothing and value relevance are the most important measures of earnings quality. Earnings quality and the quality of accounting information are in direct relation. The impact of fair value accounting on earnings quality is significant.

1.1. Earnings quality based on fair value accounting

Although IAS 39 and FAS 115 were similar in adopting a mixed approach (both fair value and historical cost models), Sodan[2] thought, in 2015, that information becomes more relevant with the application of fair value, this approach providing users financial statements with appropriate information to make the right decisions. Then, the fair value approach has emerged to cover the shortcomings resulting from the application of the

[2] Sodan, S. (2015). The impact of fair value accounting on earnings quality in eastern European countries. Procedia Economics and Finance, 32, 1769-1786. Available at: https://doi.org/10.1016/s2212-5671(15)01481-1.

historical cost approach. Schipper and Vincent, in 2003, predicted the continuity of corporate earnings in the coming periods, as long as financial analysts believe that financial statements as the main source on which they rely for information analysis and rational decision making. Chen, Lo, Tsang and Zhang, in 2013, noted that the quality of earnings is an indicator of dividends, because these dividends were important things indispensable in making investment decisions. Barth, Beaver and Landsman, in 2001, considered that earnings are valued, of course, as indirect indicators for assessing the quality of accounting standards, because there is a direct relationship between the quality of earnings and the quality of accounting information. Persistence, predictability, accruals quality, earnings smoothing and value relevance are various measures of earnings quality. Predictability tells us the idea that earnings are of higher quality and are more beneficial for predicting future earnings. Then it noted that the predictive power of profits is affected by the time series of earnings and the fluctuation of business operations, the economic environment and the accounting system used by companies. Sodan, in 2015, observed that the initial assumption of the value relevance of the research at fair value was that fair value information may predict future cash flows. We estimate the correlation between fair value estimates and market prices or returns, then the usefulness of fair value information is, of course, directly observed by analyzing its predictive power in terms of future cash flows and future earnings. Barth stated in 1994 that fair value estimates mean the present value of expected future cash flows, so if fair values are reliable measures of asset values, changes in fair values (i.e. unrealized gains and losses in fair value) must be reflected in changes in fair value future performance.

2. Earnings at Transilvania S.A. Bank

Transilvania S.A. Bank ("Parent Company", "BT") is a joint stock company registered in Romania. The Bank started its activity as a banking company in 1993, being authorized by the National Bank of Romania (“BNR”, “Central Bank”) to carry out activities in the banking field. The bank started in 1994 and its services relate to banking for legal entities and individuals.

The individual and consolidated financial statements have been prepared on the basis of the historical cost convention, except for financial assets recognized at fair value through profit or loss, financial assets at fair value through other comprehensive income and revaluation property, plant and equipment and real estate investments, except those for which the fair value cannot be credibly established.

(i) Foreign currency transactions

Transactions denominated in foreign currency are recorded in lei at the official exchange rate of the settlement date of the transaction. Exchange differences resulting from the conclusion of these transactions expressed in foreign currency are highlighted in the statement of profit or loss at the date of transactions using exchange rate from this date.

Monetary assets and liabilities recorded in foreign currencies at the date of preparation of the consolidated statement and the individual financial position items are expressed in the functional currency at the exchange rate on that day.

The conversion differences are presented in the result of the exercise.

Non-monetary assets and liabilities that are measured at historical cost in foreign currency are recorded in the functional currency at the exchange rate on the date of the transaction. Non-monetary assets and liabilities denominated in foreign currency that are measured at fair value are translated into the currency at the exchange rate on the date on which the fair value was determined.

The conversion differences are presented in the result of the exercise.

(ii) Conversion of operations into foreign currency

Results and financial position of operations conducted in a currency other than the currency and the Group's presentation currency are converted into this functional currency as follows:

- the assets and liabilities, both monetary and non-monetary, of this entity have been converted to the closing rate at the date of the consolidated and individual statement of financial position;
- the income and expenditure items of these operations were transformed at the average exchange rate, as an estimate for exchange rates related to transaction data;
- all the resulting differences were classified as other elements of the overall result up to when the investment is transferred.

In accordance with IAS 29 and IAS 21, the financial statements of an enterprise whose functional currency is the currency of a hyperinflationary economy should be presented in terms of purchasing power currency of the currency at the date of preparation of the consolidated and individual statement of financial position, I.e. non-monetary items are restated by applying the general price index from the date acquisition or contribution.

IAS 29 stipulates that an economy is considered hyperinflationary if, among other factors, the cumulative inflation index exceeds 100% over a period of three years. The continuous decrease of the inflation rate and other factors related to the characteristics of the economic environment in Romania indicates that the economy whose functional currency has been adopted by the Group

of ceased to be hyperinflationary, with effect on financial periods starting January 1, 2004.

Therefore, the provisions of IAS 29 have not been adopted in the preparation of the financial statements consolidated and individual. Thus, the values expressed in the current unit of measurement on December 31, 2003 are treated as the basis for the carrying amounts reported in these consolidated financial statements and individual and do not represent valued values, replacement cost, or any other measure of value current assets or prices at which the transactions would take place at this time.

2.1. The fair value of financial assets and liabilities

Fair value is the price that would have been collected for the sale of an asset or paid for the transfer of a debt in a regulated transaction between market participants at the valuation date. The fair value is best highlighted by a price dictated by the market, if it exists.

The Group and the Bank measure the fair value of financial instruments using one of the following ranking methods:

- Level 1 in the fair value hierarchy

The fair value of financial assets and liabilities allocated to Level 1 of the fair value hierarchy is determined on the basis of quoted prices on active markets related to financial assets and liabilities identical. The price quotations used are regularly and immediately available on active markets / indices exchange and prices that represent current and regular market transactions according to the principle of market price.

- Level 2 in the fair value hierarchy

The fair value of the financial assets and liabilities allocated to level 2 is determined using valuation models based on observable market data when there are no market prices available.

For level 2 valuations, they are usually used as observable market parameters interest rates and yield curves observable at commonly quoted intervals, default credit and volatility.

- Level 3 in the fair value hierarchy

The fair value of the financial assets and liabilities allocated to level 3 is determined using data which are not based on observable market information (unobservable input data which must reflect the assumptions that market participants would use in setting the price an asset or a liability, including risk assumptions).

The objective of valuation techniques is to determine the fair value, which should reflect the price that would be obtained following a transaction under normal market conditions for the financial instrument, on preparation of consolidated financial statements.

The availability of observable data and models in the market reduces the need for estimates and management judgments and the uncertainty associated with determining fair value.

Data availability and observable patterns in the market depends on the products in the market and is inclined to change on the basis of specific events and general conditions in the financial market.

The fair value of financial instruments that are not traded in an active market are determined using evaluation techniques with market observable data.

Leadership uses judgment to select the valuation method and issue assumptions based mainly on existing market conditions at the date of preparation of the consolidated statement of financial position.

i) Hierarchical analysis of the fair value of financial instruments held at fair value at level 1 of the fair value hierarchy, the Group and the Bank classified in the asset category: instruments of equity and debt instruments held at fair value through profit or loss and loss, liabilities classified as assets measured at fair value through other comprehensive income globally (before January 1, 2018 classified as available-for-sale assets), except bonds issued by City Halls.

At level 2 of the fair value hierarchy, the Group and the Bank classified in the asset category: instruments derivatives held at fair value through profit or loss, bonds classified as assets measured at fair value through other comprehensive (income before January 1, 2018 classified as available-for-sale assets) issued by City Halls and in the debt category: derivatives classified as financial liabilities held for trading at level 3 of the fair value hierarchy, the Bank and the Group classified in the asset category: instruments equity, property, plant and equipment and real estate investments.

As of January 1, 2018, the Group and the Bank have classified financial assets and liabilities in the following categories:

- Financial assets at fair value through profit or loss (FVPL);
- Financial assets at fair value through other comprehensive income (FVOCI);
- Financial assets at amortized cost.

The Group and the Bank recognize all financial assets and liabilities at the date of trading. Date

trading date is the date on which the Group and the Bank commit to buy or sell an asset.

After initial recognition, a financial asset is classified as measured at amortized cost, only if two conditions are met simultaneously:

- the asset is held within a business model whose objective is to keep the assets to collect contractual cash flows;
- the contractual terms of the financial asset give rise, at specified dates, to cash flows representing only principal and interest payments.

Financial assets classified as measured at fair value through other comprehensive income are those

financial assets that are held both for the collection of cash flows and for their sale.

Financial assets that do not meet the cash flow criteria (SPPI test) must be valued at fair value (e.g. derivatives or units background). The embedded derivatives are no longer separated from the host financial assets, but will be valued as a whole with the non-derivative financial instrument in terms of compliance with the conditions cash flow collection.

Investments in equity instruments are always measured at fair value. However, management may make an irrevocable choice to present changes in fair value other elements of the overall result, provided that the instrument is not held for trading.

Therefore, if one chooses to measure equity instruments at fair value through other comprehensive income, then these financial instruments will not represent monetary items, and the cumulative gain or loss, including the related foreign exchange component, will be transferred to the equity of the entity at the time of derecognition instrument.

If the equity instrument is held for trading, changes in fair value are presented in profit or loss.

Financial liabilities are classified after initial measurement at amortized cost, except when they are measured at fair value through profit or loss (financial liabilities derivative instruments). The embedded derivatives are separated from the host contract in the case of financial liabilities.

As of January 1, 2018, the Group and the Bank measure the equity instruments obligatorily measured at fair value through profit or loss. They were included in this category shares held in VISA Inc.

Gains and losses on investments in equity instruments measured at fair value through profit or loss are included in the line “Gains on financial instruments at fair value through profit or loss” in the statement of profit or loss.

Investments in equity instruments, for which the Group and the Bank do not express an intention to maximize cash flows through sale or these financial assets are not included in the trading book, have been classified as financial assets valued at fair value through profit or loss. and loss. In this case, the Group and the Bank have made an irrevocable choice to present changes in fair values in the comprehensive income, and the gains or losses on these instruments will be transferred directly to the Group's equity, without recycling these items in profit or loss.

Government bonds, bonds issued by town halls and other financial and non-financial companies were classified at fair value through other elements of the overall result, taking into account the criteria of the SPPI test and the inclusion in the business model of collecting contractual cash flows and selling of assets. As of January 1, 2018, the Group and the Bank recognized a provision for expected credit losses related to these assets measured at fair value through other comprehensive income. This provision is recognized in other comprehensive income and will not reduce the carrying amount of the financial asset.

The obligations issued by credit institutions and other financial institutions that meet the criteria of the SPPI test and the inclusion in the business model of collecting contractual cash flows were classified at amortized cost.

As of January 1, 2018, the Group and the Bank recognized adjustments of depreciation related to the class of financial assets valued at amortized cost.

Mutual funds held in mutual funds are measured at fair value through profit or loss.

They are treated as debt instruments, do not meet the criteria for collecting cash flows and do not fall within the trading portfolio of the Group and the Bank. Therefore, they were included in the category of financial assets valued at fair value.

In the individual statement of financial position, equity instruments representing investments in associates and subsidiaries continue to be measured at cost in accordance with IAS 27 "Individual financial statements".

Derivative financial instruments are measured at fair value through profit or loss.

Impairment under IFRS 9 is based on anticipated losses and requires early recognition of expected future losses. IFRS 9 eliminates profit or loss volatility caused by changes in credit risk related to liabilities designated at fair value. Specifically, gains due to credit risk impairment will no longer be recognized in the income statement.

The calculation of expected losses shall use, at the reporting date, the effective interest rate established at the initial recognition or an approximation thereof. If a financial asset has a variable interest rate, the expected loss on credit must be determined using the current effective interest rate. For financial assets acquired or issued impaired as a result of credit risk, the expected credit losses must be determined using the credit-adjusted effective interest rate set at the initial recognition.

In some circumstances, renegotiating or changing the contractual cash flows of financial assets leads recognition of existing financial assets. If it significantly changes the contractual conditions on the background of commercial renegotiations, both at the client's request and at the Bank's initiative, the derecognition of the existing financial asset and the subsequent recognition of the modified financial asset takes place, the modified financial asset being considered "new" financial asset.

In 2018, the average annual inflation stood at 4.6% (4.1% on the EU harmonized index of consumer prices), the highest in 2011.

However, inflation slowed in the last quarter of 2018, re-entering the Central Bank's target range (1.5% - 3.5%).

The acceleration of inflationary pressures coupled with the accumulation of challenges in the sphere of domestic macroeconomic balance determined the National Bank of Romania (BNR) to increase the reference interest rate from 1.75% to 2.50% in the first half of 2018.

In April 2015, the Bank took control of Volksbank Romania S.A. ("VBRO"), recognizing in the individual and consolidated financial statements the acquisition gain in the amount of 1,650,600 thousand lei as following the business combination in accordance with IFRS 3.

At level 2 of the fair value hierarchy, the Bank and the Group classified in the category of assets that are not held at fair value: investments in banks less securities classified in the category loans and receivables (which do not have an active market), loans, advances and receivables from financial leasing contracts granted to customers, and in the category of debts: deposits from banks and customers.

At level 3 of the fair value hierarchy, the Bank and the Group classified in the category of assets: financial assets valued at amortized cost - debt instruments and other financial assets, and in the category of debt: loans from banks and other financial institutions, subordinated debt and other liabilities financial.

Schultz and Hollister observed in 2003 that, under pressure from conservative banks, the standard required only certain investments, then some of them proposed to be sold in the short term and others prepared using fair value through profit or loss. The standards represented efforts to determine fair values through the profit statement in specific scenarios. In 1998, IASB got IAS 39. At that time, IASB standards were referred to as International Accounting Standards (IAS). Then, FAS 115 was equivalent to IAS 39: Financial Instruments: Recognition and Measurement, (IAS Plus 2019). If fair value measurements are not reliable, then the correlation with future performance measures will not be significant. In 2015, Sodan adopted the concept of measurement, according to which exposure to fair value accounting is measured using global or net income approaches. Then, changes in fair values are reported as gains and losses on net or other global income. In other words, we studied the effect of fair value gains (losses) on other global income and net income on predictability as a measure of the quality of gains. Muller, Riedl and Sellhorn, in 2008, referred to ongoing variations, which cause changes in purchasing power, create instability and can lead to inflation or depression. The concept of fair value has moved traditional accounting theory to new horizons and made a comprehensive change in the structure of financial statements and their implications. Sodan noted in 2015 that this was a result of the evolution of accounting theory in the years that developed and were implemented in international fair value accounting standards and was practiced at the beginning of the third millennium, in 2001. Using the model fair value, the company can obtain a higher income depending on the difference between the fair value and the book value, which is recognized as part of the gain and loss on the application of fair value. Wahyuni, Soepriyanto, Avianti and Naulibasa concluded in 2019 that using the cost model, the value of net income or loss is affected only by depreciation expenses. Among the accounting tasks is the choice of the appropriate valuation method for valuing assets and liabilities. Scientists have confirmed this. Scientists, such as McDonough and Shakespeare, in 2015, admitted that the financial position and results of economic activities represented in the balance sheets and profit and loss statements depend on the current reality and the methods of estimating and calculating the reported indicators. Forecast the company's future cash flows when the market collapses and assets and liabilities appear below. Their real value, this leads to a distortion of the company's financial position and seems unable to achieve the proposed objectives.

3. Conclusions

The predictability, accruals quality, earnings smoothing and value relevance are the most important measures of earnings quality. Earnings quality and the quality of accounting information are in direct relation. The impact of fair value accounting on earnings quality is significant. With the adoption of fair values, earnings predictability at Transilvania Bank Group became quite high due to the variability of income. This thing alters the quality of the earnings and thus affects the choices that stakeholders can make. Consolidated and individual statement of profit or loss and others elements of the overall result is represented in Table 1 below.

Table 1. Transilvania Bank S.A.

CHALLENGES WITHIN THE FINANCIAL-ACCOUNTING ACTIVITY IN THE CONTEXT OF COVID-19

Mariana GURĂU[*]
Maria Zenovia GRIGORE[**]
Mihaela Ioana GURĂU[***]

Abstract

The period of the COVID-19 pandemic brought many economic, social and environmental challenges. In the financial-accounting sector, the situation of uncertainty, including remote work, has generated and continues to generate various problems for companies and their employees. One of these is the temporary inability of employees to carry out their activity even within the financial-accounting activity. Another challenge that many companies have faced has been the adoption of online commerce as a method of maintaining the business during the pandemic. This form of trade also meant different work for the financial-accounting departments, which had to adapt to the new style of trade, which also involves new financial-accounting rules and regulations.

In this paper we analyze the challenges to which the financial-accounting activity have been subjected as a result of the numerous measures of fiscal and commercial nature, but also some long-term benefits of these measures.

Keywords: *COVID – 19, financial-accounting activity, essential services, big winners in pandemic, losers and survivors in pandemic.*

1. Introduction

The COVID-19 pandemic took all economic sectors by surprise. No one was prepared for such big changes in the way and pace of daily activities. As a result of the lock-down measures, the companies had to reorganize their activity, and because the authorities took a series of financial protection measures, the financial-accounting departments had additional obligations.

Regardless of the reasons for local or global problems, within the financial-accounting department, the economic entity is obliged to ensure the registration (recognition) of transactions in up-to-date accounting with the appropriate internal control of the company to allow the correct collection of information and, more chosen, they should be timely. It is essential to consider compliance with internal audit requirements, but also the obligation to prepare financial and fiscal statements on time. Daily financial-accounting activities, which must ensure continuity in the collection and processing of information, put additional pressure on the economic entity that, in the context of the current crisis, must dedicate itself to preparing the necessary reports for information users in the decision-making process.

In the presence of such a context, any economic entity must analyse its internal economic resources in order to be able to consider the appropriate solution, adapted to the particularities of the current situation. Accelerating digitalization within the finance department by adopting existing tools on the market, can be one of the ideal solutions for companies that not only want to solve a problem related to the impossibility of employees to carry out their activity, but also aim at streamlining existing processes .

In analysing the situation of the team in the financial-accounting department, in the context of the digital economy, companies can use modern solutions such as outsourcing their own processes to the financial-accounting department, the department responsible for preparing reports necessary for decision making. Another solution would be to outsource operational reporting, using business intelligence tools - Power BI, Tableau, QlickSense.

2. Economic challenges during the pandemic

Since the beginning of the COVID-19 pandemic, the National Institute of Statistics has conducted several statistical surveys on economic activity trends, the impact of SARS-COV2 on the volume of exports and imports of goods and the assessment of the environmental impact of COVID-19 to quantify the impact of the crisis on economic activity and the volume of foreign trade, the results of which were of real interest to decision-makers, the media and users in

general. The implications of the pandemic on economic activity and the natural movement of the population underlie new national and European statistical data requirements on the impact of prevention measures on sectors of national economies.

In order to control the pandemic with the new coronavirus, unprecedented measures were taken, measures that left traces on many areas of activity. Many sectors of activity are currently in a situation where they need to rethink their strategy, protect their employees and ensure business continuity. The latter is a central element that companies must ensure, including for financial-accounting activities. In the context of the Covid - 19 pandemic, the Romanian state came to the aid of companies but also of citizens with a series of fiscal measures in order to help the business environment to overcome the financial difficulties it is currently facing, as well as to prevent the accumulation of new debts to the state by supporting taxpayers' compliance with payments. Taxpayers are therefore in a rare situation of currently having a very diverse range of tax facilities at their disposal, and the choice of the optimal route requires an analysis of these options.

We can group the fiscal measures into three categories:

- Immediate fiscal measures: funds to strengthen the health system; risk incentive for employees in medical units; subsidizing technical unemployment - 75% of gross salary; allowances for reducing working time; allowances for parents (suspension of courses).
- Fiscal deferral measures, the most important of which are:

- the total cancellation of interest, penalties and all accessories related to outstanding budget obligations on March 31, 2020. The tax amnesty allows taxpayers to request the cancellation of all accessories related to tax obligations due on March 31, 2020. This it applies not only to unpaid accessories, but also allows the return of accessories already paid, but only if they have been paid after the date of entry into force of the ordinance (14 May 2020). Although the scope of the amnesty is quite wide, taxpayers wishing to benefit from this facility must meet certain conditions specific to each of the situations presented above. Of these, the most important is that, at the time of registration of the cancellation request, the taxpayers have submitted all the declarations and have paid up to date (or have extinguished by any method) all the main or ancillary tax obligations due to the state budget, with except for ancillary obligations whose cancellation is sought.
- restructuring of outstanding tax liabilities on 31 July 2020 under certain express conditions. The restructuring procedure, as regulated by this ordinance, with subsequent amendments and completions, is a solution that can benefit any legal entity, except public institutions and administrative-territorial units, which are in financial difficulty, are obliged outstanding on 31 July 2020 and presents a restructuring plan. Legal entities that meet the legal conditions must notify the tax authorities of their intention to benefit from this facility by March 31, 2021, the deadline for submitting the actual application being June 30, 2021.
- a simplified procedure for granting payment rescheduling in accordance with the rules of the Fiscal Procedure Code and, in the alternative, postponing certain deadlines in the context of the COVID-19 epidemic. More specifically, it offers taxpayers the possibility to pay in several instalments the main and ancillary tax obligations whose maturity / payment deadline has been met after the date of declaration of the state of emergency, based on a request subject to conditions of grant, which can be formulated until 15 December 2020. The main and ancillary tax obligations are staggered for a maximum period of 12 months, the beneficiary being any natural or legal person. In addition to the new provisions on payment rescheduling, another welcome measure is the extension of deadlines, namely the extension of the period of non-application of accessories for outstanding debts until 25 December 2020 and the extension of the deadline for VAT refund with subsequent control until 25 January 2021.

- Monetary measures NBR - liquidity requirements

- reduction of the reference interest rate (from 2.5% to 1.5%)
- acquisitions of government securities on the secondary market (5 billion lei)
- framework arrangement with the ECB through which they can borrow up to EUR 4.5 billion (valid until July 2021).

Therefore, taxpayers facing financial difficulties have these modalities at their disposal for the restructuring, cancellation or staggering of outstanding tax obligations, which partially overlap. The decision to choose one of these should be preceded by a careful analysis of the current situation and business forecasts for the next period.

3. The impact of the pandemic on the Romanian economy

The year 2020 had a good economic start, according to data published by the National Institute of Statistics, in the first quarter of 2020 compared to the first quarter of 2019 the economy registered an advance of 2.4% (gross series, provisional data). In terms of economic growth, Romania recorded the second highest growth in the EU (Ireland, 4.6%). Across the EU as a whole, economic growth contracted by 2.4%. On a seasonally adjusted series, the quarterly gross domestic product in Romania increased by 2.7% in the first quarter of 2020 compared to the corresponding quarter of the previous year.

The volume1 "of industrial production decreased in the first 6 months of 2020 compared to the same period in 2019, by 16.4%, the most vulnerable branches, in the context of the pandemic, being those of light industry and capital goods industry (manufacture of motor vehicles, cars and machinery and electrical equipment manufacturing)."

"In the case of the light industry branches, there was a continuation of the decline in recent years, caused by a gradual loss of competitiveness, but also a narrowing of external demand during the pandemic crisis. The minimum activity registered in April resulted in reductions of about 50% in the case of the textile industry and the manufacture of clothing and of 70% for the leather industry. May marked the beginning of the process of recovering from this contraction, as in the vast majority of industries."2

Starting with March 2020, the health crisis is also found in the economic one, aiming at the reaction of the economy both in the short term and in the long term, the Romanian economy being impacted differently from one branch to another, from one sector economically to another. The performance of the construction sector is notable in the context of the pandemic, the volume of construction works increasing in the first half by 18.9%. However, in the last two months, the momentum in the first part of the year has moderated, especially in the new construction component, which recorded an annual increase of only 0.4% in June, as noted by the National Strategy and Forecast Commission.3

The specialists of the Faculty of Economic Sciences within the Babeș-Bolyai University of Cluj-Napoca monitor in real time the impact of the COVID-19 pandemic on the Romanian economy. UBB has launched an online platform in which economics researchers publish interactive infographics with the evolution of COVID-19 cases in Romania and in the world, government social and economic measures, stock market reactions, reactions of top 50 companies in Romania to the coronavirus pandemic4. The analyses of UBB experts show that the areas most affected by the COVID-19 pandemic, after the decrease in the contribution to GDP, are:

- 1. Tourism - 75%
- 2. Culture - 60.4%
- 3. Administrative services - 47.2%.

Having as subject the impact of the pandemic on tourism, the National Institute of Statistics published, on April 2, 2021, a report according to which[5]:

- In February 2021, compared to the corresponding month of the previous year, arrivals in tourist accommodation structures with accommodation functions decreased by 31.2%, and overnight stays by 32.9%.
- Compared to February 2020, in February 2021, at the border points, the arrivals of foreign visitors decreased by 61.0%, and the departures abroad of Romanian visitors by 59.0%.

The National Strategy and Forecast Commission[6] states that the impact of the pandemic on HORECA activity (this being one of the most affected areas) at the territorial level cannot yet be assessed based on data from official sources, but the indicator of overnight stays in tourist accommodation structures (Romanian tourists plus foreigners) is a satisfactory proxy for the real evolutions of the sector.

It is also specified that in 2020 measures were taken to reduce the risk of job loss and provide sources of income for employees and other categories of economically active persons, granting technical unemployment during the suspension of the individual employment contract for about 1,200 thousand employees, being made payments of 4,280 million lei, part of the amount was subsidized by the project #SPER, and the rest from the European Instrument for Temporary Support for Emergency Risk Mitigation (SURE).

"The COVID-19 pandemic also caused a negative evolution in the export activity of goods, both due to the deterioration of world trade flows and as an effect of the measures for distancing. Thus, in the first 10 months of 2020 compared to the similar period of 2019, the largest decreases in exports were registered in the regions: South - East (-19.89%), South Muntenia (-19.79%) , North - East (-18.13%) and West (-15.0%), given that at national level the reduction was 12.21%. At the same time, moderate decreases compared to the national level of exports were in the regions: Bucharest - Ilfov (-9.8%), Center (-9.7%) and North - West (-7.9%) "[7].

On 11 February 2021, the European Commission[8] published its 2021 winter economic forecast. According to them, the Romanian economy suffered a depreciation of 12.2% in the second quarter of last year, returned by 5.8% in the third quarter of 2020, mainly due to the recovery of private consumption, and supported by the strong performance of the construction sector sustained increase in gross fixed capital formation throughout the year. Industrial production offset some of its previous losses in the second and third quarters of 2020, but this

positive performance appears to have stopped at the beginning of the last quarter.

In the 4th quarter, economic activity weakened somewhat as isolation restrictions caused by the pandemic were reintroduced in response to a new wave of infections. Fiscal support measures, some of which have been extended until mid-2021, have mitigated the impact of the crisis on the economy in 2020. Real GDP is projected to grow by 3.8% in 2021 and 4% in 2022.

By 2022, consumption is expected to remain robust in 2022. Investments will remain strong above the forecast horizon, supported by the construction sector.

Romania - Real GDP growth and contributions

One of the sectors severely affected by the COVID - 19 pandemic, restaurants have shifted to online orders. Since the outbreak of the COVID-19 pandemic, "orders for bundled and delivered food have increased by 14% among consumers who order at least once a month, prompting restaurants to reconfigure their networks, according to the Deloitte study" The Restaurant of the Future Arrives Ahead of Schedule - Time to Get on Board ", conducted among US restaurant customers and managers. Almost two thirds (68%) of consumers say they order food with delivery, 52% order in bulk, and almost half (46%) of respondents expect to maintain these habits after the end of the pandemic.

"Millennials exponents[9], aged between 23 and 39, place the most delivery orders (65%), up 13% from the pre-pandemic period, and 77% of Generation X exponents, aged between 40 and 55 years old, order packaged food, 20% more than in the pre-COVID period[10] "shows the Delloite study.

In addition to the negative effects of the COVID - 19 pandemic, we can say that there are some benefits. Among the important changes with a positive effect on the economy caused by the influence of the pandemic is the way we use digital activity. Thus, a Delloite[11] study shows that "During the COVID-19 pandemic, more than eight in ten consumers (82%) tried at least one digital activity for the first time, such as ordering groceries online, using an educational or an exercise app, according to Deloitte Global Marketing Trends 2021, and more than half of them (53%) believe that their new digital experiences are an adequate substitute for activities they used to conduct prior to the pandemic. The study highlights the importance of expanding brands' digital ecosystem, as almost a third of respondents say that digitally native activities were a superior alternative to their in-person experiences… The current context is rapidly changing consumers' behaviour, who seem to favour the adoption of digital channels, with 66% agreeing that the pandemic has increased their appreciation for well-designed technologies. The health crisis has not only contributed to this change towards digital technologies, but it has also set a pattern for the years to come, according to the findings of the study, as 63% of respondents agreed that they would continue to use digital technologies more often well after the pandemic subsides."

The report concludes that purpose, agility, human experience, trust, consumers' participation, fusion and talent are the main seven global marketing trends on which brands need to focus in 2021 in order to build better connections with their customers, workforces and society.

The conclusion of this study should serve as a model for companies to focus on the use of online activity both for sale (those that have the field of trade) and for the development of financial-accounting activity. Since companies operate in unprecedented times, they need to adapt and embrace change as quickly as possible and adapt to new economic trends, seek partnerships outside their traditional fields, and use digital solutions to meet the needs of their customers.

The category of benefits also includes a series of improvements regarding the relationship of citizens, individuals or legal entities, with state institutions, by implementing online communication systems on most levels of social and economic-financial interest, action that brought important benefits in the financial-accounting activity. During the pandemic, online platforms were developed through which taxpayers can communicate with state institutions, submit statements, makes online payments and appointments for those operations that require their physical presence.

4. Conclusions

In order to control the pandemic with the new coronavirus, unprecedented measures were taken, measures that left traces on many areas of activity.

[9] Millennials (Generation Y) are people born between January 1983 and December 1994.
[10] Idem: Deloitte study.
[11] Half of consumers consider new digital experiences are an adequate substitute for activities they used to conduct prior to the COVID-19 pandemic, 25 November 2020. The study was conducted globally with the help of more than 2,400 consumers from China, the Kingdom of Saudi Arabia, Mexico, Qatar, Sout.

Many sectors of activity are currently in a situation where they have to rethink their strategy, protect your employees and ensure business continuity. The latter is a central element that companies must ensure, including for financial-accounting activities.

We can say without fear of error that the economic effects generated by the COVID - 19 pandemic at the sectoral level had an asymmetric social, economic and financial impact and divided the business into four categories. Thus, depending on the vulnerability, the 4 categories are: essential services, big winners, losers and survivors.

"The pharmaceutical services, food, health, telecommunications and utilities sectors are part of the essential services category. The big winners, those for whom the current crisis has represented an increase in market demand, are, for example, companies operating in e-commerce, video communications, cloud or telemedicine platforms, courier services. The obvious losers of the shock are the economic entities in the field of tourism, entertainment, traditional retail or restaurants. The survivors, i.e. those sectors that could "escape" less affected by the crisis, could be companies in the field of financial services, real estate, online retail, fashion or media.[12]"

Regardless of the area in which they operate, companies have felt and will feel the economic effects of COVID-19. The World Bank has forecast that global GDP will decline by 5.2% in 2020, with recessions in both advanced and emerging market economies. This seems to outline the worst recession since the Great Depression and much worse than the Global Financial Crisis of 2008. Some countries in the world have come to the aid of companies and we have seen that they have been and will continue to be given generous to support companies in difficulty.

STUDY ABOUT SUSTAINABILITY AND THE FOURTH PILLAR ADDED AS A RESULT OF THE CORONAVIRUS PANDEMIC

Mihaela Ioana GURĂU[*]

Abstract

In a century in which everything is directed towards consumerism, implicitly pollution, deforestation, neglect of the environment and not only, the concept of sustainability or sustainable development comes as a helping hand for everything around us: for us, for nature, for the future of the Earth. This concept arises from the need to protect ourselves from ourselves, from all the dangers to which we submit for the simple reason that we are not used to looking carefully to the future. The phrase "carpe diem" (live the moment) is not an exhortation that it is good to rely on in today's economic, social and environmental context. We have to look to the future and to protect it.

In this paper, after a brief history of global, European and national sustainability programs, we make an analysis of the influence of the pandemic period on sustainability programs. We also want to influence as many people as possible towards a behavior that fits in with the sustainability needs of the planet and of humanity, of our descendants.

What do each of us know when it comes to sustainability? Caring for the environment. Nothing less true. In addition to the environment, sustainability strategies have three other pillars in mind, one of which has been added to care for the future as a result of the COVID - 19 pandemic. I invite you to discover them together.

I intend to continue my research on topics related to the influence that content creators have through social media in the field of sustainability so i invite you to follow my future work.

Keywords: *sustainability, sustainable development, sustainability pillars, sustainability goals, COVID-19.*

1. Introduction

The great economic crisis of 1929-1933, started from overproduction was the starting point of the concept of sustainable development, coming in response to the ecological crisis caused by the major exploitation of resources, as well as the increased degradation of the environment.

The modern definition, in 2021, of the term sustainability is much broader than that offered in 1987. In a short time, we will see that the need to protect and preserve the environment dates back to the mid-seventeenth century in Germany, and aimed at forestry. According to the literature, sustainability encompasses three pillars that intersect in a common denominator the vector of sustainability, as follows: social, environmental and economic.

Appearance Commission report Brundtland entitled "Our Common Future" led in 1987 to the idea that "sustainability is provided to meet human needs while avoiding environmental problems, it said a growing movement expanded to economic development and sustainable and new techniques have been developed to enable the measurement and implementation of sustainability. " (Zaman & Goschin, 2010)

Sustainability can be approached, as stated by Professor Zaman "at different reference levels, in time, space and from an ecological, social or economic point of view. Sustainability science connects to several different disciplines and fields of research and, being too complex to be fully understood using a single research method, considers specific ways of combining different disciplines. "(Zaman & Goschin, 2010)

As mentioned above, the term "sustainable" has its origins in Latin - *sustenere*. The terminology is much older than we think. The appearance of the German term "nachhaltende nutzung " (sustainable use) by Hannss Carl von Carlowitz in his publication on sustainable forestry is well documented in 1713. Many researchers have sought to find out the origins of this concept, and according to him (Caradonna, 2014), it considers "that the history of sustainability follows the ecological systems dominated by people from the first civilizations to the present."

In the article " Sustainable Development : A Bird's Eye View ", experts point out that there are three terms commonly used even interchangeably, namely "sustainable development", "sustainability" and "sustainable", which are used in several ways, often with different connotations. (Wass, Huge, Verbruggen, & Wright, 2011)

According to "Our Common Future", "sustainable development is defined as a development that" meets the needs of the present without compromising the ability of future generations to meet their own needs. „Sustainable development can be the organizing principle of sustainability, however others may consider the two terms to be paradoxical (i.e. development is inherently unsustainable)." (United Nations General Assembly, UN. Secretary-General, 1987).

[*] PhD Candidate at Romanian Academy, School of Advanced Studies of the Romanian Academy, Student at Accounting and Management Information Systems, Faculty of Economics and Business Administration, „Nicolae Titulescu" University (e-mail: mihaelagi@yahoo.com).

Some researchers argue that "sustainability is the "goal", while sustainable development refers to the "process" of achieving it" (Zaccaï, 2002)[1], but this conception is not consensual either.

However, in this paper we will use the two terms mentioned above interchangeably

2. Study about sustainable development

When we talk about sustainable development, we normally think of a concept that comes as a solution to current problems, problems that we face because of the rapid expansion and carelessness with which we treat the environment. If we were to summarize and address the colloquial issue, I believe that we can say that environmental sustainability is geared towards issues such as global warming, heavy pollution, major and negligent exploitation of resources. Therefore, we could put forward the idea that sustainability is considered a new model of development, which took shape towards the end of the twentieth century. However, the concept of sustainable development is much older.

2.1. History of the concept of sustainable development / sustainability

The problems and ideas we classify today under the concept of sustainability have their origins thousands of years ago. The search for a balance between the demand for raw materials for food, clothing, shelter, energy and other goods, but also awareness of the environmental limits of ecosystems has been a constant concern throughout human history.

Although the first records of the need to protect the environment appear as early as 8,000 -10,000 years ago, the period in which "agrarian communities emerged that depended largely on their environment and the creation of *permanent structures* " (Gasper, 1977), we will focus research on modern economic, environmental and social crises, which have led to the development and application of concepts and solutions globally.

It is important to remember the period of the Industrial Revolution, from the 18th and 19th centuries, in which the vast potential for increasing the energy based on fossil fuels was exploited. Coal was the basic source for powering more and more efficient engines, and later for generating electricity. Started in Western Europe, at the end of the twentieth century, the environmental problems caused by the Industrial Revolution became global. However, the development of the industry has also led to advances in medicine and the improvement of sanitation systems, which have protected large populations from disease.

Between 1950 and 1960, development continued to focus on economic growth and economic production. The early 1970s bring to mind the huge differences between underdeveloped and developing countries. Part of the population faces great poverty, and all in all it brings to our attention the failure to share the benefits of economic growth with these countries, probably here being the roots of the need for socially sustainable development.

The energy crises of 1973 and 1979 call attention to the extent to which the entire population has become dependent on non-renewable energy resources. The 1970s severely put the planet to the test, which (Lin, et al., 2018) states that "In the 1970s, humanity's ecological footprint exceeded the earth's carrying capacity, so humanity's way of life became unsustainable ."

In the 1980s, environmental protection became the third major goal of development. In fact, we can even say that sustainable development is a combination of different ideas about progress, environmental protection, growth and development.

The famous Brundtland Report "Our Common Future", which I mentioned at the beginning of this paper, was published in 1987 by the World Commission on Environment and Development (WCED), established in 1983 by the UN General Assembly and chaired by Gro Harlem. Brundtland, former Prime Minister of Norway, also gave the name of this report. WCED has been tasked with formulating a "global agenda for change" (United Nations General Assembly, UN Secretary-General, 1987) and, compared to the previous report, has now managed to incorporate development and environmental protection measures.

The report serves as a vital step in the current thinking of development for at least four reasons: First, it launched a famous definition of sustainable development. The second important reason is to establish sustainable development as a substantial component of international development thinking and practice. Third, it initiated what we might call an explosion of work on sustainability. And last but not least, we mention the fact that it represents the discovery at a global level and the popularization of the concept of sustainability.

2.2. Modern landmarks in the process of sustainability

In recent decades, sustainable development has grown from what we can consider to be a simple alternative perspective on development to a recognized and politically supported development model. I want to mention three letters from the scientific community about the danger of increasingly at sea obey lack of concern for the environment and sustainability ways the backing them which can remove these threats.

In 1997, the Union of Concerned Scientists published the first warning to humanity that "Human beings and the natural world are on a collision course" (Scientists, 1997) , a letter signed by 1,700 of the most

[1] The paper quotes from Reid, D. Sustainable Development — An Introductory Guide; Earthscan: London, UK, 2005; Lozano, R. Envisioning sustainability three-dimensionally. J. Clean. Prod.2008, 16, 1838–1846.

important scientists. , many of them being Nobel laureates in science. The letter mentions “serious damage to the atmosphere, oceans, ecosystems, soil productivity and more. It warns mankind that life on earth, as we know it, can become impossible, and if humanity wants to prevent damage, some measures must be taken: better use of resources, abandonment of fossil fuels, stabilization of the human population, eradication of poverty " (Scientists , 1997) .

Ten years later, scientists wrote the second warning to humanity. This letter mentions positive trends, such as slowing down deforestation, but despite this, scientists say that, "except for ozone depletion, none of the problems mentioned in the first warning have been adequately addressed." Scientists “have called for reduced consumption of fossil fuels, meat and other resources and stabilization of the population” (Ripple, et al., 2017) . This letter has more co - signers and supporters than any other article ever published in the magazine. The article is signed by over 15,000 scientists from one hundred and eighty-four countries.

In 2019, a new warning letter was published. It is signed by over 11,000 scientists. Serious threats due to climate change are being reported and major and urgent changes are being called for. The scientists called it a "climate emergency" and called for "stopping excessive consumption, replacing fossil fuels, consuming less meat, stabilizing the population and more." (J Ripple, Wolf, M Newsome, Barnard, & R Moomaw, 2019)

2.3. Global, European, national strategies for sustainable development

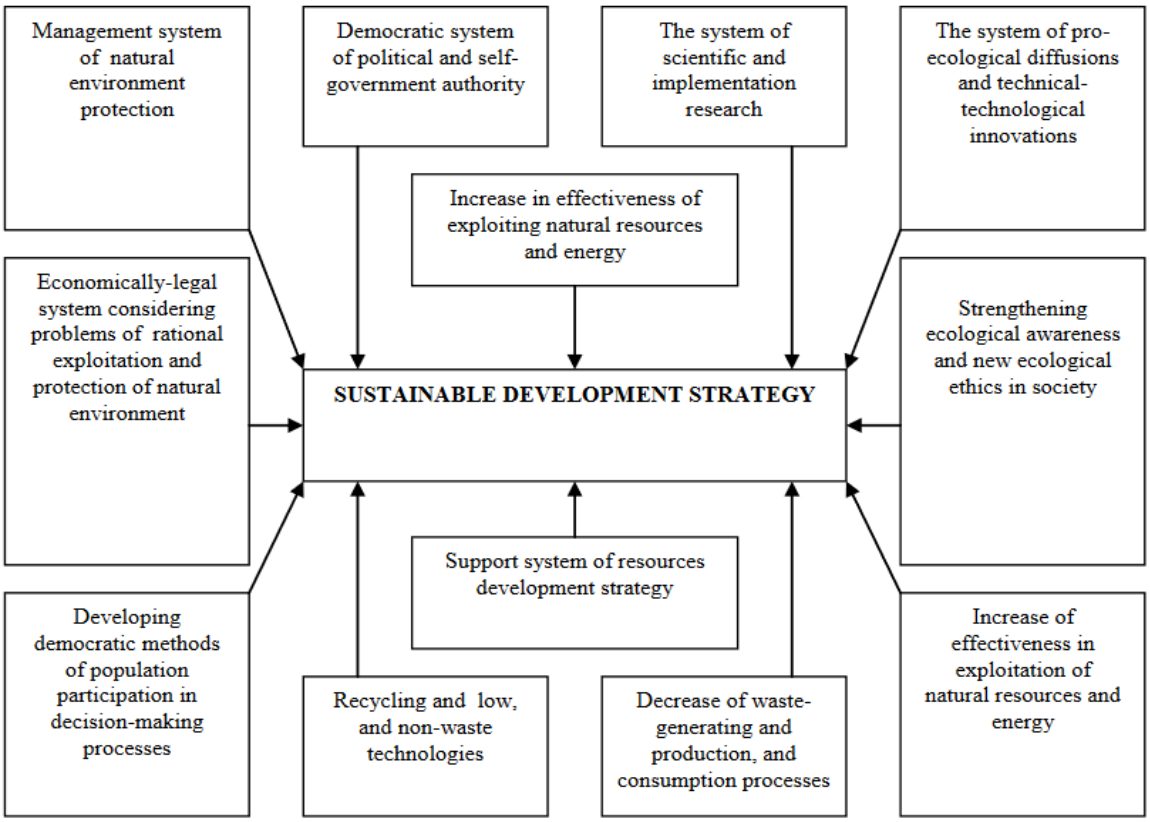
Pillars of sustainable development

Modern sustainability strategies are developed considering three pillars that definitely influence the future of humanity: economic, social and environmental or, informally, we can call them pillars of profits, planet and people.

Another perspective of the sustainable development strategy is presented by Annetta Zielinska in the paper “*Principles of sustainability versus sustainable development, eco- development with reference to the forms of natural areas of value*, as follows:

Figure 1

Source: Elements for achieving the sustainable development strategy, adaptation after (Zielińska, 2012) https://www.economics-sociology.eu/files/14_Anetta_3_3.pdf



The environmental pillar

In the era of the development of the concept of Industry 4.0 and implicitly the transition to digitalization, the strategic interest of the UN Agenda and the EU objectives focused on the environmental pillar. Recent research has shown that companies focus more on reducing their carbon footprint, packaging waste, water use and overall environmental impact. (Beattie, 2015) states about companies that "they have discovered that a beneficial impact on the planet can also have a positive financial impact." And today's consumer is much more selective in terms of the company from which they purchase products or services, the inclination towards the social and environmental environment being a criterion that prevails when making a purchase decision.

For example, "reducing the amount of material used in packaging usually reduces the total cost of these materials." Walmart has launched a campaign to achieve zero waste and has introduced packaging in line with the project, pushing for fewer packaging in their supply chain, and packaging to be made from recycled or reused materials[2].

The social pillar

Although it is the second pillar addressed in the paper, social sustainability is often "the most disadvantaged branch, receiving considerably less attention than economic and environmental sustainability." (Kandachar, 2014) Also, its definition is slightly uncertain and the area it covers is not as well defined as in the case of environmental and economic pillars. The social pillar is of particular importance in view of the fact that in the last decade, it has gained momentum through the attention paid by the business environment to the concept of social responsibility, especially in developed and highly developed countries. During the paper will be presented the implications, importance and role of social media, channels and popular tools used in promoting the social pillar that in recent years, has gained new value through various campaigns launched worldwide.

Social sustainability in the literature (Vallance, Perkins, & Dixon, 2011) has three components: "*social sustainability of development*, which is concerned with basic needs, equity inter- and intra-generational equity, *sustainability of bridge* is based on behavior change to achieve bio- physical environmental goals, *Sustainability of maintenance* refers to social acceptance or what can be sustained in social terms".

Social development aims to treat employees fairly, as well as ensure their responsible, ethical and sustainable treatment. A sustainable business should have the support and approval of its employees, stakeholders and the community in which it operates. The social pillar can be reduced to equal treatment of employees, but also to being a good neighbor and member of the community, both locally and globally.

Returning to the work environment, when we talk about social sustainability we also mean that companies should focus on strategies for retention and involvement, including benefits for employees, such as better benefits for maternity and paternity, flexible schedule, as well as and learning and development opportunities. Companies have also come up with many ways to help the community, such as sponsorships, scholarships and investments in local public projects.

According to the Western Australian Council for Social Services, social sustainability occurs when "formal and informal processes actively support the ability of current and future generations to create healthy and viable communities. Socially sustainable communities are fair, diverse, connected and democratic and offer a good quality of life. " (Western Australian Council of Social Service Inc., 2002).

Amartya Sen, the Nobel Laureate for her work on the well-being of the economy, offers the following dimensions for social sustainability:

"Equity - the community offers equitable opportunities and results for all its members, especially the poorest and most vulnerable.

Diversity - the community promotes and encourages diversity.

Social / interconnected cohesion - the community provides processes, systems and structures that promote connectivity inside and outside the community at a formal, informal and institutional level.

Quality of life - the community ensures that basic needs are met and promotes a good quality of life for all members at the individual, group and community level (e.g. health, housing, education, employment, safety).

Democracy and governance - the community provides open and accountable democratic processes and governance structures.

Maturity - the individual accepts the responsibility for consistent growth and improvement through broader social attributes (e.g., communication styles, behavioral patterns, indirect education, and philosophical explorations)" (Sen, 1999)

Social sustainability is not just the working environment, the rights and benefits offered to employees by employers, but also social inclusion, i.e. respect for the status and rights of all people equally, equality between the sexes, between races and acceptance of any social orientation. This goal is strongly transmitted in the online environment, there are hashtags used in huge numbers (#blm has over 26.2 million references)[3], and the subject is a topical one,

[2] Walmart, "Reducing Waste" https://corporate.walmart.com/global-responsibility/sustainability/sustainability-in-our-operations/reducing-waste, accessed at 18 January 2021, 4:18 PM.

[3] https://www.instagram.com/explore/tags/blacklivesmatter/ accessed at 22January 2021, 2:34 AM.

approached and promoted by the greatest influencers of the moment.

The economic pillar

The economic pillar of sustainability is the easiest to monitor. To be economically sustainable, a business must be profitable, so it must generate enough revenue to continue its business in the future.

This pillar is sometimes called the governance pillar, referring to good corporate governance. This means that "the board of directors and management align with the interests of shareholders, as well as the interests of the company community, value chains and end customers. In terms of governance, investors may want to know that a company uses accurate and transparent accounting methods and that shareholders are given the opportunity to vote on important issues. They may also want to ensure that firms avoid conflicts of interest in electing board members, do not use political contributions to obtain unjustified favorable treatment and, of course, do not engage in illegal practices " (Beattie, 2015) .

(United Nations, 2014) has issued the Sustainable Development Goals, which are its main goals to give humanity and planet Earth a better and more sustainable future. The 17 sustainable development objectives materialized in 69 targets aim to solve economic, social and environmental problems that ensure respect for human rights and equality between all categories of individuals. All these objectives are projected until 2030, when it is hoped to eradicate poverty, eradicate hunger, ensure access to clean water and sanitation, clean energy at affordable prices and responsible consumption and production.

2.4. United Nations strategy on sustainable development

The title of the 15-year Agenda for Sustainable Development, starting in 2015, developed by the United Nations that aims to free humanity from poverty and protect the planet, is called "Transforming our Moon: 2030 Agenda for Sustainable Development" and is the basis of the strategies adopted at continental or country level.

Transforming our world: The 2030 Agenda for Sustainable Development

Signatory's agenda advocating for sustainability aim 17 sustainable development objectives (SDO) is very bold and says "We are determined to realize the three dimensions of sustainable development - economic, social and environmental - in a balanced and integrated manner." (United Nations, 2014). The goals that the UN aims to achieve by 2030 are: no poverty, no hunger, health and well-being for all, quality education, gender equality, clean water and sanitation, renewable and affordable energy, good jobs and good economy, and Novara infrastructure, reducing inequality, cities and communities sustainable, responsible use of resources, climate change, oceans and seas clean, sustainable use of land, peace, justice and strong institutions, partnerships for sustainable goals.

The goals are very great and I could say impossible to achieve in such a short time. Next we will discuss the first objectives and we will notice not only that no progress has been made to achieve them, but even, due to factors such as the COVID-19 crisis, we can even talk about regressions.

The goals of the UN Sustainable Development Agenda are interdependent, so resolving one has a favorable echo in achieving another goal. Thus, if we refer to two of these, namely the eradication of poverty and the eradication of hunger, we will see that those measures that lead to poverty reduction will have a positive resonance in eradicating hunger or, conversely, conditions that increase poverty will increase the degree of poverty. starvation of the population.

Poverty eradication by the end of 2030 is the first goal of sustainable development on the UN agenda because poverty is in stark contrast to the progress that humanity is experiencing today. "Despite ongoing progress, 10% of the world lives in poverty and struggles to meet basic needs such as health, education and access to water and sanitation" (World Bank, 2018). The report presented by the World Bank is a painful and difficult to overcome truth. I believe that this plan cannot, however, be completed so quickly. There are huge communities that still live in precarious conditions, and in many countries it seems an impossible goal for decades to come. In the case of the European Union, the plan is easier to achieve, here we are referring only to a few countries with a GDP that places them in the ranking of countries that are still facing poverty.

As a brake on achieving these goals, humanity faced the COVID-19 pandemic in 2020, which was a huge impediment to fighting poverty. A study published in September 2020 found that "poverty has increased by 7% in just a few months due to the COVID-19 pandemic, even though there have been steady declines over the past 20 years." (BMGF, 2020)

If the goal of eradicating poverty has been hampered by the unfavorable conditions of 2020, this is also reflected in the goal of sustainable development of ending hunger, ensuring food security and improved nutrition, which promotes sustainable agriculture. Globally, 1 in 9 children are malnourished and causes the death of more than three million children annually. At European level, the situation is not so dramatic, there are only eight countries facing famine: Ukraine, Bulgaria, Serbia, Cyprus, Slovakia, Macedonia, Albania and Estonia[4].

[4] https://ourworldindata.org/hunger-and-undernourishment, accessed at 4 February 2021, 10:41PM.

The level of malnutrition has increased from 2015 to the present, after declining in recent decades. The increase in malnutrition, similar to the increase in poverty, is also caused by, among other things, force majeure situations such as the locust crisis and the COVID-19 pandemic.

2.5. European Union Sustainable Development Agenda

The European Union aims to work with the UN to achieve the same 17 goals by the end of 2030. In addition to the 17 goals by which world leaders aim to eradicate poverty and protect the planet, the European Union has reached *the Paris Agreement* on change climate. Both goals represent "the path to a better world and the global framework for international cooperation in the field of sustainable development and its economic, social, environmental and governance dimensions." (European Commission, Paris)

It takes us less than 10 years to achieve the 2030 Agenda, and "the world is not on the right track, the COVID-19 pandemic has further aggravated existing inequalities, sometimes reversing progress on certain goals. Climate change, gender inequality and poverty are the most pressing issues and political will and ambition will be needed to recover better. " (European Commission, 2020)[5]

In 2020, following the first wave of COVID-19, the European Union and its Member States state that "they are fully committed to accelerating the implementation of the 2030 Agenda for Sustainable Development and its 17 Sustainable Development Goals (SDGs) to ensure its timely implementation. „(European Union and its Member States, 2020)

In addition to the goals proposed by the UN, the European Union has set itself the goal of making Europe the first climate-neutral continent through *the European Green Pact.* It is "the EU's new growth strategy, with people and the planet at its center." (European Union and its Member States, 2020)

The European Green Pact is an initiative started in 2019, which aims to present developments to all pillars of sustainability by 2050. "The European Green Pact is the EU's roadmap for achieving a sustainable economy." (European Commission, 2019)

From the point of view of environmental sustainability, Europe aims to reduce greenhouse gas emissions, on the economic front we want an increase that is decoupled from the use of resources, and social sustainability is supported by the fact that all people be integrated into society and included in the development plan.

2.6. Sustainable development program in Romania

The national strategy for the sustainable development of Romania 2030 was adopted by the Government of Romania by Government Decision no. 877 of November 2018, this being elaborated under the direct coordination of the Department for sustainable development. Through this normative act, Romania adheres to the 17 sustainable development objectives proposed by the UN and adopted by the entire European Union.

In 2016, Romania registered a high share of materially deprived persons, compared to the EU average, being 23.8% following a report by INS[6]. Numerous measures have been taken to reduce this percentage, such as the Social Assistance Law no. 292/2011, Law no. 219/2015 on the social economy, the National strategy in the field of youth policy 2015-2020 was addressed.

Through sustained efforts, remarkable progress has been made on escalating poverty and in 2021, Romania was promoted by the World Bank at the level of the developed country, which means that we are on the right track to achieving economic, social and environmental sustainability goals. until 2030. The strategy that Romania approaches is oriented towards satisfying the needs of the citizens and focuses on resilience.

The strategy approached by Romania "starts from the premise that sustainable development presents a framework of thinking that, once mastered by the citizen, will help create a more equitable society, defined by balance and solidarity and that can cope with the changes brought by problems global, regional and national levels, including demographic decline." (Celac, Vădineanu, & others, 2018)

From the point of view of economic sustainability, Romania aims to record long-term economic growth. Even if in 2021 it received the status of a developed country, it can be claimed in case of economic setbacks. But, at present, Romania is on the right track and can reach the UN economic objectives.

The proposed targets for 2030 are "eradicating extreme poverty for all citizens, reducing the number of citizens living in relative poverty by at least half and strengthening the unitary national system of emergency response services, further rehabilitation and compensation for losses in the event of natural disasters, industrial accidents or extreme weather events. " (Celac, Vădineanu, & others, 2018)

From a social point of view, it is necessary for Romania to offer its citizens a cohesive society, with a well-developed education and health system. One of the 17 objectives is to reduce inequalities between men and women, and Romania is the country with the lowest discrimination in this regard, especially in terms of wages.

We want society to be more open and citizens to feel supported. "It is necessary to cultivate the resilience of the population, so that the citizen, in a fair institutional framework, can realize his dreams at

[5] https://ec.europa.eu/info/strategy/international-strategies/sustainable-development-goals/eu-and-united-nations-common-goals-sustainable-future.ro, accessed at 8 February, 1:43AM.

[6] http://statistici.insse.ro/shop/index.jsp?page=tempo2&lang=ro&context=20, accessed at 15 Feb, 11:23 PM.

home. At the same time, the state must help increase the potential of the citizen by addressing issues related to health, education and the limits of the free market, problems that can be addressed through public policies, resulting in a high standard of living for all citizens." (Celac, Vădineanu, & others, 2018)

Romania aims to increase the social capital that leads to increasing the potential of the country's citizens, in order to achieve by its own forces, thus ensuring the sustainable development of the community.

Environmental sustainability is receiving more and more attention in our country, targeting both natural and anthropogenic environments. It is important to protect nature, based on human-environmental impact and put it in the forefront in achieving goals.

Some of the goals that Romania aims to meet by 2030 are: "expanding the transmission and distribution networks for electricity and natural gas in order to ensure access for domestic, industrial and commercial consumers to safe energy sources at acceptable prices, ensuring security of the monitoring platforms for the production, transmission and distribution networks of electricity and natural gas, decoupling economic growth from the process of resource depletion and environmental degradation by considerably increasing energy efficiency (by at least 27% compared to the status –quo scenario) and the widespread use of the EU ETS scheme under predictable and stable market conditions, increasing the share of renewable energy sources and low-carbon fuels in the transport sector (electric vehicles), including alternative fuels, improving air quality, recycling in 55% proportion of municipal waste by 2025 and 60% by 2030." (Celac, Vădineanu, & others, 2018)

2.7. Sustainability during the pandemic

The year 2020 gave us another perspective on life. The pandemic, as well as other events that have taken place worldwide, lead us to the conclusion that sustainability is fast becoming the new reality of the world. In just a few months, COVID-19 has managed to transform the world, all at an economic, environmental and social price.

Crisis COVID-19 impacted strong corporate activity and generated a large number of changes on their communication strategy, supply chain, safety and health of employees, unemployment in large numbers and many other powerful transformation. However, the current downturn in economic activity is not expected to generate long-term environmental benefits.

Covid-19 made us aware of our vulnerability. The magnitude of the disturbance caused by this virus is comparable, in many ways, to a world where climate change is left uncontrolled. The pandemic allowed us to experience the real global disruption caused by a scientific- fantasy scenario event, which affected our entire social and economic system, although as a personal note, I would like to add an environmental issue. As a result, political and business leaders are taking sustainability more seriously now, given the conditions caused by the pandemic.

In 2020, in the context of the coronavirus pandemic, the fourth pillar of sustainable development will be developed, namely the health pillar, which is interrelated with the environmental pillar, the economic pillar and the social pillar. A sustainable health and care system is achieved by providing high quality care and improving public health without depleting natural resources or causing severe environmental damage.

According to the World Bank Group "short-term considerations - over a period of six to eighteen months - for governments should be the impact of the pandemic on employment and economic activity, and how long it will take until the full implementation of the creation employment and tax incentives." The article also states that in the long run, governments must "consider the effect of COVID-19 on: (i) human and social capital; (ii) technologies; (iii) natural and cultural capital; (iv) physical capital; and (v) fundamental market failures. " (World Bank Group, 2020)

In the new reality affected by COVID-19, it is essential for companies to integrate sustainability into a long-term recovery and growth plan. At the same time, significant barriers need to be overcome to reuse assets and capacity for post-pandemic markets.

From previous experience of the global financial crisis, it is suggested that any decrease in greenhouse gas (GHG) emissions is likely to be short-lived and followed by a return to emissions, increased due to stimulus packages and low greenhouse gas prices. Following the 2008 recession, "the subsequent increase in CO2 emissions exceeded the observed transient decline and about 40% of the recovery effect was due to a small number of emerging economies, especially China and India. But the effect has also been substantial in the European Union (EU)." (Tienhaara, 2010)

It is important to place health and sustainability at the heart of the economy, implementing post-COVID-19 policies that achieve multiple goals: health, environmental sustainability, employment and equitable socio-economic recovery.

The economic policy response to the COVID-19 shock should pursue integrated actions to improve health and reduce greenhouse gas emissions. (Haines, Pagano, & Guerriero, 2020) I argue that the means that will help in this regard are "eliminating harmful subsidies for health and climate and helping renewable energy sources to remain economically competitive, especially when oil prices are low, but also by recapitalizing companies not only according to economic criteria, but also based on environmental and health criteria."

The need for a post-COVID economic stimulus is an opportunity to redirect harmful subsidies for fossil fuels and other harmful products and services to more productive and necessary goods, as well as sustainable energy. "Currently, subsidies for fossil fuels remain high in some countries and exceed subsidies for

renewable sources" (International Renewable Energy Agency, 2019).

According to the International Monetary Fund, "in 2015 global post-tax subsidies for fossil fuels were estimated at $ 4.7 trillion, reflecting in particular the failure to take into account air pollution and the impact of climate change." (Coady, Parry, Le, & Shang, 2019)

The pandemic also greatly affects the social pillar. Inter-human relations are strongly impacted by the crisis caused by COVID-19. As we saw above, social sustainability includes both interactions for work, relationships with the employer, benefits offered at work, but also social inclusion and human adaptation. We can also talk about the fact that "sustainable human development can be seen as a development that promotes the capabilities of present people, without compromising the capabilities of future generations." (Sen AK, 2000) Societies have been isolated, borders have been closed due to the pandemic, and the unemployment rate is severely affected, rising. Companies are also in trouble.

Over the past year, pervasive challenges have undermined poverty reduction and inclusive growth. A study by the World Bank says that "recently, due to COVID-19 and the economic crisis associated with the pandemic, progress towards social inclusion has slowed down and long-term systemic inequalities and exclusions have been revealed. Extreme poverty is expected to increase due to the crisis, affecting between 73 and 117 million people. Recent protests against racism and persistent discrimination also underscore the structural barriers to opportunity and prosperity for so many human beings. "(Sivaraman, 2020)

Sustainability and social inclusion also work between work teams to build tools to engage citizens in investment projects. It is very important that citizens are involved during the COVID-19 pandemic, as this can provide insight into how the crisis is affecting communities. In Afghanistan, citizen involvement means "working with communities to share COVID-19 prevention messages via WhatsApp and Telegraph, reaching out to people affected by the crisis, including refugees, people with disabilities, poor women and nomads. These channels of communication are two-way, enabling citizens to receive support and share information about changing situations in their communities. " (Sivaraman, 2020)

3. Conclusions

Sustainable development normally leads us to think of a concept that comes as a solution to current problems, problems that we face due to the rapid expansion and carelessness with which we treat the environment. We could put forward the idea that sustainability is considered a new model of development, which took shape towards the end of the twentieth century. However, the concept of sustainable development is much older.

Modern sustainability strategies are developed considering three pillars that definitely influence the future of humanity: economic, social and environmental or, informally, we can call them pillars of profits, planet and people.

The three dimensions of sustainable development are inter-conditioned, the effects of any action whether positive or negative in one area, reflecting like "*boule of neige*" on the other two.

In the era of developing the concept of Industry 4.0 and implicitly the transition to digitalization, the strategic interest in global sustainability has focused on the environmental pillar. Recent research has shown that companies focus more on reducing their carbon footprint, packaging waste, water use and overall environmental impact. And today's consumer is much more selective in terms of the company from which they purchase products or services, the inclination towards the social environment is a criterion that prevails when making a purchase decision.

The social pillar is of particular importance in view of the fact that in the last decade, it has gained momentum through the attention paid by the business environment to the concept of social responsibility, especially in developed and highly developed countries. During the paper will be presented the implications, importance and role of social media, channels and popular tools used in promoting the social pillar that in recent years, has gained new value through various campaigns launched worldwide.

Returning to the work environment, when we talk about social sustainability we also mean that companies should focus on strategies for retention and involvement, including benefits for employees, such as better benefits for maternity and paternity, flexible schedule, as well as and learning and development opportunities. Companies have also come up with many ways to help the community, such as sponsorships, scholarships and investments in local public projects.

The economic pillar of sustainability is the easiest to monitor. In order to be economically sustainable, a business must be profitable, so it must generate enough income to be able to continue its activity in the future. This pillar is sometimes called the governance pillar, referring to good corporate governance.

The signatories of the Agenda for Sustainability set out 17 Sustainable Development Goals which they aim to achieve by 2030: no poverty, no hunger, health and well-being for all, quality education, gender equality, clean water and sanitation, renewable and affordable energy, good jobs and a good economy, innovation and infrastructure, reducing inequality, sustainable cities and communities, responsible use of resources, combating climate change, clean oceans and seas, sustainable land use, peace, justice and strong institutions, partnerships for sustainable goals.

Covid-19 made us aware of our vulnerability. The magnitude of the disturbance caused by this virus is comparable, in many ways, to a world where climate

change is left uncontrolled. The pandemic allowed us to experience the real global disruption caused by a science-fiction scenario event, which affected our entire social and economic system, although as a personal note, I would like to add an environmental issue. As a result, political and business leaders are taking sustainability more seriously now, given the conditions caused by the pandemic.

In the context of the coronavirus pandemic, in 2020 the fourth pillar of sustainable development will be developed, namely the health pillar, which is interrelated with the environmental pillar, the economic pillar and the social pillar. A sustainable health and care system is achieved by providing high quality care and improving public health without depleting natural resources or causing severe environmental damage.

THE INTEGRATION OF ESG FACTORS IN BUSINESS STRATEGIES – COMPETITIVE ADVANTAGE

Elena Mihaela ILIESCU [*]
Mirela-Cristina VOICU[**]

Abstract

Uncertainty, increasingly higher and diverse risks but also the opportunities generated by the environmental, social and corporate governance factors' actions, have led to a change of approach in the business environment - these factors are no longer treated randomly and punctually in business strategies but, in an integrated approach, in the form of ESG factors. Consequently, starting with 2005, responsible investments (ESG investments) gradually increased, becoming a decisive criterion in investment decisions, both at individual and institutional level, especially on the financial markets. It was also facilitated by their regulation and the introduction of general principles and criteria for analysis and degree of implementation measurement at the organizations' level.

Given the positive externalities generated, the purpose of the paper is to popularize and promote this type of investment and, implicitly, the sustainable behavior in business, based on the principles of sustainable growth. In this sense, we used open documentation sources of international specialized institutions, the research method having both theoretical character by presenting the conceptual evolution of ESG investments and empirical character by revealing the dynamics, advantages and limits of integrating ESG criteria in business strategies.

Keywords: *competitiveness, investment analysis, ESG factors, responsible investments, sustainability*.

1. Introduction

Awareness of the climate change impact, growing demonstrations to promote and support equity and social justice, the effects of the COVID pandemic have led to a change in perspective in society, including in business. In this context, there is an increase in the interest of investors, both institutional and individual[1], in order to obtain sustainable results and, consequently, a reconsideration of business strategies.

Thus, if initially, the responsible investments were considered niche investments, recently there has been an acceleration of the implementation rate and the degree of spread of this investment paradigm, the impact of non-financial factors such as environment, social and corporate governance (ESG factors) being integrated more often, along with the financial impact, in the analysis and decision-making in business. But while the use of this perspective is on the rise, it still remains a competitive advantage of organizations that implement and advocate for ESG investments, increasing their financial value and long-term resilience.

Therefore, the boundaries of business performance analysis have been extended by including, alongside traditional economic and financial indicators, of ESG criteria.

Table no.1 Examples of ESG factors

ENVIRONMENTAL	SOCIAL	GOVERNANCE
Resource use rationality	Modern slavery	Board of directors and employees diversity
Climate change	Supply chain	Elimination of corruption
Recycling	Exploitation of minors	Lobby policy
Pollution	Labor conditions	Donation policy
Deforestation	Inclusion	The relationship between employees - manager - shareholders (fair remuneration, support for innovative ideas)
Natural resources depletion (water)	Human capital management	Transparency
Circular economy	Health and safety (including data	Organizational culture
Gas emissions and the greenhouse effect	Social conflicts	Fiscal strategy

2. ESG investments – dashboard

2.1. Short history

The history of ESG indicators is relatively recent and has emerged at the initiative of the UN in order to accelerate the inclusion of the financial sector, business in general, on the path of the principles of sustainable development. Thus, it began in 2004 when, at the initiative of the UN Global Compact and supported by the International Finance Corporation (IFC) and the Swiss Government, international discussions were started with representatives of the largest financial institutions in order to identify means to include ESG indicators in the capital markets[2]. The conclusions of these debates were included in 2005 in a reference paper in the field of sustainable investments, the report "Who Cares Wins", on which occasion it was used for the first time officially, in a specialized paper, the concept of factors ESG and the idea that the integration of environmental, social and governance factors in investment processes produces positive effects on their financial performance was promoted. The idea of the relevance of ESG factors in the financial evaluation of a business was reiterated in the "Freshfield" report, also prepared under the auspices of the UN, by the United Nations Environment Program Finance Initiative (UNEP FI)[3].

These two reports can be considered the cornerstone in the direction of integration and interconnection of the three categories of factors for the development and implementation of sustainable investments, consolidated on ESG factors.

The next step in promoting this approach in business strategies was the launch of the Principles for Responsible Investment (PRI) in 2006. Evidence of the growing interest in this type of investment is the continuous annual increase in the number of those who have adhered to these principles. Thus, from 100 signatories at the time of launch[4], on March 31, 2020, the total number of signatories was 3,222, which means an increase of 29% over the previous year in the number of investor signatories (from 2092 to 2701), and of 21% of the number of signatories owning the assets, meaning 521[5].

The rise of responsible investment was favored by three conditions[6]:

- the growing recognition and popularization, both in the business and in the academic environment, of the positive contribution that the integration of ESG factors has on the financial results;

- the emergence of national and international regulatory institutions (reference United Nations Environment Program Finance Initiative - UNEP FI, Principles for Responsible Investing in the New York Stock Exchange -PRI, SSEI Sustainable Stock Market Initiative) which through involvement and creation of instruments and guidance promoted the idea of ESG factors as part of the fiduciary obligation of investors;

- manifesting the clients' interest for the transparency of the information regarding the placed investments.

For example, in the US at the beginning of 2020, $ 17.1 trillion was actively invested in ESG investments, an increase of 42% over 2018[7].

We should not lose sight of the fact that specific concerns for the three problems analyzed by ESG factors have existed before. Thus, topics such as socially responsible investment, corporate governance, environmental protection and reducing the effects of climate change, human rights, gender diversity, labor exploitation of minors, sustainable development have gradually become, since the 1970s, issues of interest for the academic environment, for investors but also for institutional decision makers at national and international level. Notable in this regard are a number of positions on current economic issues, such as: The establishment in 1971 in the USA of the first socially responsible mutual fund, the massive withdrawal in the 80s of South African investments in protest against apartheid, the publication of the first corporate governance code in the United Kingdom, the issuance of green bonds by the World Bank, the involvement of over 570 large investors in reducing greenhouse gas emissions (Climate Action 100+), the UN concern for promoting sustainable development among member countries (the 2030 Agenda for Sustainable Development is the ongoing initiative), the spread of social enterprises at international level since 1978 (although in different forms and names). Under these conditions, the added value generated by the

implementation of the principles of responsible investments is the integrated approach of the three dimensions, their merging and their inclusion in a clear and organized manner within business strategies, thus increasing the premises for more efficient risk management and increasing long-term financial returns.

2.2. Opportunities and limitations in adopting ESG criteria

Although the integration of environmental, social and governance indicators in the analysis and implementation of business is still mitigated by the primary desire of investors, namely profit maximization, along with awareness and popularization of positive effects in the business environment that has adhered to sustainable investment values (a short selection is presented in table No. 2), we can gradually note, an acceptance of them as part of the fiduciary debt[8].

Table no. 2 Benefits of implementing ESG factors versus ignoring costs

ESG factors	Superior implementation	Low implementation
Employees (factor G)	involvement, superior training, diversity, innovation => positive impact on labor productivity	poorly trained and uninvolved staff, high staff turnover, inadequate working conditions => negative impact on labor productivity
Clients (factor S)	dissatisfaction mediation, flexibility, accessibility => customer loyalty	lack of a mediation policy in case of disputes (e.g. return conditions), non-compliance with the rules on labeling, over-invoicing => dissatisfied customers and thus reduced sales
Suppliers (factor S)	optimal supply chain logistics, payment on time => optimization of the supply process	supply problems, poor control quality => selected reputational risk industry
Environment (factor E)	control of carbon emissions, use of renewable energy => supply, production distribution on sustainable principles =>long-term economic benefits	pollution, irrational consumption of natural resources => short-term economic benefits
Social projects (factor S)	promotes and implements the principles of social justice => visibility and direct contribution	lack of social involvement => they do not contribute to the creation of economic, political
	to the improvement of the factors belonging to the macro-environment (factors included in any business plan through the analysis of FISH)	and social opportunities, they only pursue short-term profitability

Source: personal adaptation based on information from RBC Global Asset Management (2019), What ESG is, and isn't. Breaking down responsible investing, Canada, p. 2, article available at https://www.rbcgam.com/documents/en/articles/what-esg-is-and-isnt.pdf, accessed online on 1.03.2021

As a result, the sphere of ESG indicators is gaining ground on the financial markets, evolving and developing as a complementary segment of the classic financial information.

Thus, all the more so, the analysis of empirical data revealed a positive financial impact, reflected by increased profitability, reduced risks, reduced capital costs, improved operational performance and, implicitly, a better return on stock prices over the medium term and long in the case of companies where the ESG criteria have been implemented.

Reference in this direction is the study conducted in 2012 "The impact of corporate sustainability on organizational processes and performance" for which the authors George Serafeim, Bob Eccles and Ioannis Ioannou compared the results recorded in 1993-2009 by 180 American companies, divided into two categories: companies that have adopted and implemented sustainable development policies (High Sustainability companies) and companies not interested in their sustainable development (Low Sustainability companies).

Similar results have been reflected in numerous subsequent scientific studies, such as "Industrial changes in corporate sustainability performance - an empirical overview using data envelopement analysis[9]" or "Foundations of ESG Investing: How ESG Affects Equity Valuation, Risk, and Performance[10]", but also within studies and recommendations of some globally prestigious companies activating in the investments evaluations and consulting field - MSCI, Morgan Stanley Institute for Sustainable Investing, Moody's, BlackRock, etc.

For example, BlackRock, Inc., an American multinational investment management corporation, one of the world's largest asset managers, states that between January 1 and April 30, 2020, 88% of the sustainable funds in their analysis exceeded unsustainable counterparts.

Also, for 2020, the Morgan Stanley Institute for Sustainable Investing reported a higher performance of sustainable investments compared to traditional ones

[8] Georg Kell (11 July 2018), *The Remarkable Rise Of ESG Investing*, available article at http://www.georgkell.com/opinions/https/wwwforbescom/sites/georgkell/2018/07/11/the-remarkable-rise-of-esg/3dd3f3501695, accessed online on 18.04.2021.

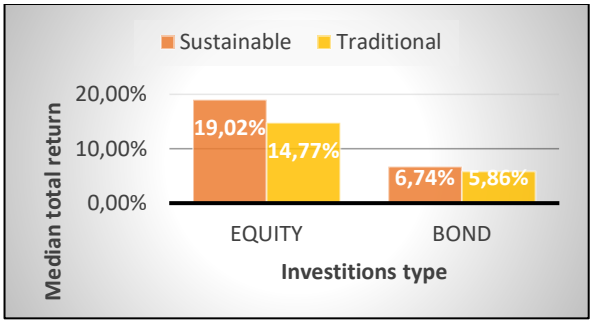
[9] Chang Dong-Shang, Kuo Li-Chin Regina, Chen Yi-Tui (2013), *Industrial changes in corporate sustainability performance – an empirical overview using data envelopment analysis*, Journal of Cleaner Production, Volume 56, pp.147-155.

[10] Guido Giese, Linda-Eling Lee, Dimitris Melas, Zoltán Nagy, Laura Nishikawa (2019), *Foundations of ESG Investing: How ESG Affects Equity Valuation, Risk, and Performance*, The Journal of Portfolio Management, volume 45, number 5, pp 1-14.

from a median total return perspective (chart no. 1), and Moody's stated in February 2021 that "2020 marked a year for the performance of ESG investments" and that "Thematic investments in environment, social and governance (ESG) have become one of the best performing categories of investment in recent years, paving the way for the continued growth of this strategy.".[11]

Therefore, the evolution of the financial results in the context of the COVID pandemic brought an additional proof of the superior resilience of the investments built on the principles of sustainable development.

Chart no.1. Sustainable vs traditional investments - median total return in 2020



Source: personal adaptation based on information available at https://www.morganstanley.com/ideas/esg-funds-outperform-peers-coronavirus, accessed online on 12.03.2021

All these results support the importance of integrating the ESG criteria together with the financial evaluations, within the reference criteria for designing the business strategies and to analyze businesses, respectively investment opportunities, regardless of the activity sector.

2.3. Reporting the degree of implementation of ESG indicators

Given that ESG factors play an important role in a company's ability to create value by identifying and correcting non-financial issues that may impact the organization's financial results, there has been a growing interest in gaining access to such information by default, the ESG reporting request. The diversity of reporting models and tools, the difficult access to the information presented subjectively and fragmented revealed the need to develop and apply standardized ESG reports.

Several evaluation systems are currently used: GRI standards, Stakeholder Capitalism Metrics of the World Economic Forum, Moody's Sustanalytics which calculates ESG ratings for both companies and countries, MSCI ESG Indexes, Standard & Poor's ESG Evaluation.

The first steps towards building a business sustainability reporting guide were taken by GRI in 2000, but limited to environmental factors. Gradually, the GRI guide was extended, completed and improved, being included together with environmental factors and economic, social and governance factors, so that in 2016 the first global standards for sustainability reporting will be formulated. Today, over 80% of the world's major corporations use GRI standards.[12]

Given that investors' interest in ESG information is growing, the ESG information market has evolved, matured continuously, but currently, the diversity of evaluation methods and the selective and optional nature of the reported information generate disputes and difficulties in comparing scores.

As a result, companies and international institutions such as the World Economic Forum, the Global Reporting Initiative (GRI), the US Council on Sustainable Accounting Standards (SASB), the International Federation of Accountants (IFAC) aim to develop standardized sustainability reporting standards. but with ESG factors adapted to each sector of activity.

In this context, the political environment is also emerging as an important actor, with a decisive role in creating a favorable framework, built on global rules and principles that regulate, stimulate and harmonize the practices of monitoring and reporting the sustainability of organizations' activities. sustainability to go beyond formalities and become, along with financial reporting, a relevant source of information, generally accepted and a decision-making criterion for investors.

For example, the rules of the 2014/9 /EU Non-Financial Reporting Directive - NFRD (a supplement to Directive 2013/34 / EU) currently apply at EU level, and the European Commission announced in April 2021 its intention to it imposes additional reporting requirements compared to the rules in force and to extend the scope (by different standards for large companies and SMEs) so that, in the long run, sustainability reporting becomes comparable to financial reporting[13].

Today, thousands of professionals around the world hold the position of ESG analyst, and the sustainability teams of large companies and evaluation institutions also include professionals in accounting and finance[14]. Consequently, ESG reporting is gradually affecting the accounting profession as well.

2.4. Romania from the perspective of implementing ESG factors

Romania, as a member state of the European Union, took the first steps for harmonization with the European regulations by enforcing the Order no. 1938/2016, amended and supplemented by Order no. 3456/2018. If in the initial version only the institutions of public interest with over 500 employees were targeted, Order 3456 extends the area of applicability, eliminating the condition regarding the public interest institutions. Thus, according to Article 7, starting with the financial year 2019 "Entities which, at the balance sheet date, exceed the criterion of having an average number of 500 employees during the financial year shall include in the administrators' report a non-financial statement containing, as far as they are necessary to understand development, performance and position of the entity and the impact of its work, information on at least environmental, social and personnel issues, respect for human rights, the fight against corruption and bribery, including".

Thus, if approximately 180 entities were initially targeted, after the addition, more than 1000 entities are targeted, especially since, although not directly, the regulation on sustainability reporting also indirectly targets collaborating companies (suppliers, subcontractors) because, the wording a non-financial statement also involves non-financial data provided by them. As a result, these companies will also have to implement a process of tracking and reporting non-financial performance[15] but, although at first glance it may be perceived as an additional burden for taxpayers, previous experiences have shown a positive impact on the long-term financial results of organizations, but also on society, the environment and the national economy.

3. Conclusions

Sustainability must be the core of successful[16] investment since sustainable and responsible investment brings together traditional financial values and environmental, social and governance factors, allowing their promoters to express their own values and preferences from an ethical and moral business perspective, without negatively affecting the profitability of their investments.

Although ESG investments are currently analyzed and measured mainly from the perspective of capital markets, their expansion as a generalized business practice, regardless of the field of activity and scope, must become a desideratum for all actors of national economies. This is because the holistic tracing of ESG criteria in business strategies, through their multistakeholder approach, has proved useful and effective not only for the entities that have implemented them, but also for the evolution of financial markets, of host economies in general.

ESG investments therefore aim to optimize financial results, but also the current impact and the legacy left to future generations.

AUDITORS' AND MANAGERS' RESPONSIBILITIES REGARDING GOING CONCERN ASSUMPTION IN THE COVID -19 PANDEMIC CONTEXT

Nicoleta Cristina MATEI[*]
Maria Zenovia GRIGORE[**]

Abstract

The social protection measures imposed or recommended by the authorities during 2020, as a result of the COVID-19 pandemic, had a negative impact on the activity carried out by several economic entities in Romania, calling into question the presumption of going concern. Such situations require a closer analysis by auditors and members of the management of economic entities in terms of the risk of business continuity and the implications for the annual financial statements. The annual financial statements are the main source of information for a large category of users, including owners, on the assets, liabilities, financial position and financial performance of economic entities. If the management of an economic entity is aware of events that may lead to a significant restriction of the entity's activity or inability to continue its activity, it must be presented in the financial statements, as well as in the accompanying reports, the director's report and the of the independent auditor, as appropriate.

The purpose of this paper is to present the responsibilities of financial auditors and those of the management of economic entities regarding the presumption of going concern, in the context of the pandemic COVID - 19. To achieve this goal there were analyzed studies, conducted so far by various authors, regarding the economic fields affected by the COVID -19 pandemic, the recommendations of the professional bodies active in the field of auditing the financial statements regarding the analysis of the business continuity risk and how they were applied by the auditors, the provisions of national accounting regulations regarding the going concern principle and the responsibilities of economic entities management to prepare the annual financial statements, in the current context.

Keywords: *going concern, annual financial statements, independent auditor's report, significant subsequent events, COVID-19.*

1. Introduction

For most economic entities in Romania, the year 2020, in the context of the COVID-19 pandemic, represented a year full of challenges, which called into question the presumption of continuity of activity. The effects of this year on economic activity will be felt even in 2021 and maybe even in the future depending on the evolution of the pandemic and the restrictive measures that could be imposed by the authorities.

Although it is the first situation of this kind, situations of economic crisis have existed in the past, respectively in the period 2008-2012, the period of the last economic crisis and its effects. During this period, the international and national professional bodies made a series of recommendations that signaled the necessary changes in the approach of the audit mission, and among the identified risk areas was the continuity of activity.[1]

As expected in the context of the COVID -19 pandemic, the Chamber of Financial Auditors (CAFR), the national professional body, made recommendations to the financial auditors to give importance to the analysis of exposure to business risk and implications for annual financial statements.[2]

The International Auditing and Assurance Standards Board (IAASB) also produced, in 2020, a publication for audit firm employees highlighting the potential implications of the current context on audit reports, including significant uncertainty about business continuity.

In Romania, indications regarding the development of the activity of economic entities based on the principle of continuity can be obtained from the financial statements and from the accompanying audit report.

The financial statements are the main source of information on the financial position of the economic entity, financial performance, as well as other information detailing aspects of the activity carried out, presented in the explanatory notes. In most cases, the annual financial statements are prepared on a going concern basis. This principle states that the entity is considered to have a continuation of its business in the foreseeable future with neither the need nor the

[2] https://www.cafr.ro/wp-content/uploads/2020/03/Recomandari-pentru-AF-COVID_25_3_20.pdf accessed on February 1, 2021.

intention to be liquidated, to suspend[3] or to significantly restrict its activity [4].

According to a study conducted by the National Institute of Statistics, in April 2020, approximately 34% of economic agents that participated in the research could not estimate the evolution of economic activity, 45% estimated a reduction in the volume of activity by more than 25%, while about 14% of economic agents expected the closure of the activity.[5] The statistical research was addressed to the managers of economic entities with activity in the manufacturing industry, constructions, retail trade and services.

The purpose of this paper is to present the responsibilities of financial auditors regarding the presumption of continuity of the activity of an economic entity and those of the entity's management, in the context of the COVID-19 pandemic, from the perspective of companies that apply the provisions of the Order of the Ministry of Public Finance no. 1802/2014 for the approval of the Accounting Regulations on individual annual financial statements and consolidated annual financial statements and chose as the reporting period the calendar year. In order to carry out the work, a study was carried out on the economic fields affected by the COVID-19 pandemic, a documentation on the provisions of the International Standards on Auditing regarding the responsibilities of financial auditors to assess business continuity, as well as on recommendations issued by the International Auditing and Assurance Standards Board (IAASB) for audit firm employees in terms of reporting in the current context. Also, a documentation was made on the provisions of the accounting regulations regarding the responsibilities of the management of an economic entity to analyze whether the assumption regarding the continuity of the activity is still adequate or not.

In order to highlight the impact of the economic context caused by the COVID-19 pandemic on the independent auditor's report and on the financial statements, the financial statements for 2019 were analyzed, accompanied by the auditor's report, of several economic entities that apply the provisions of the Order of the Ministry of Public Finance no. 1802/2014, with activity in the affected fields.

2. Effects of the Covid -19 pandemic and implications on the going concern

To fight the pandemic, EU Member States have taken a wide variety of measures, including restrictions on travel into the EU and between EU Member States, cancellation of public events, restrictions on private gatherings, closing of schools, bars, restaurants, hotels and many retail shops with the exception of supermarkets, pharmacies and banks.[6]. Most of the measures to prevent the spread of COVID -19 were taken in mid-March 2020, kept during April, and since May, many of them have been abandoned or reduced in severity. During the summer, prevention measures were more relaxed, which led to an increase in the number of new cases of COVID-19, and this situation led the authorities in many EU Member States to reintroduce in September and October 2020 some isolation measures of the population.

In Romania, between March and May 2020, the activity of many companies, regardless of their size, was blocked and they faced major problems related to sales, the impossibility of paying due debts due to non-collection of receivables, as well as the situation of choose between keeping employees, sending them into technical unemployment or firing them[7].

The vast majority of companies in Romania whose activity has been affected by the restrictions imposed by the authorities to prevent the spread of COVID -19 operate in tourism; road, sea, air transport; production and sale of cars; constructions; production of non-vital goods during the pandemic (clothing, footwear).[8]

In view of the information presented above, we conclude that the main economic areas affected are construction, production, services and trade. Thus, in figure 1 we present the dynamics of the volume of constructions, industrial production and trade in the period January - December 2020.

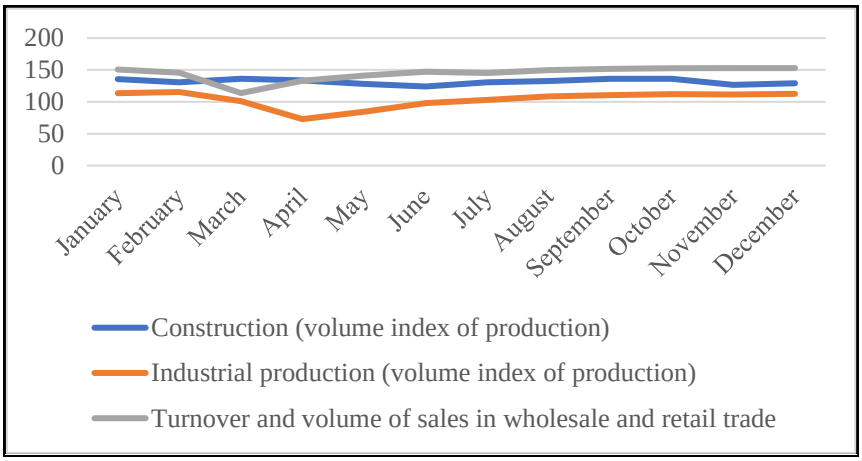
Fig. 1. Development of construction, production activities & sales, between January and December 2020



Source: https://ec.europa.eu/eurostat and author's processing

The table below shows the change in the volume of construction production, industrial production and sales in December compared to January 2020 and in December compared to April 2020:

Table 1

	December/ January 2020	**December/ April 2020**
Construction	-4.79%	-3.44%
Industrial production	-0.88%	54.73%
Sales	1.39%	14.70%

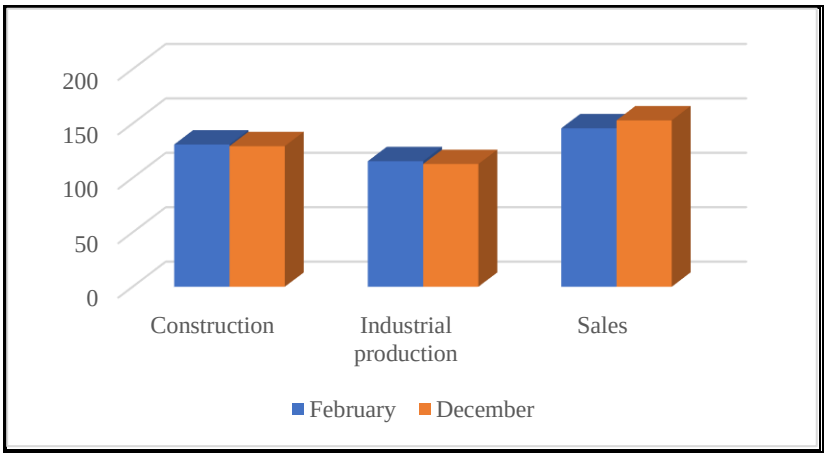
Source: https://ec.europa.eu/eurostat and author's processing

In order to perform the analysis, the first month of 2020, the month in which the COVID -19 pandemic had not yet been declared, was taken as benchmarks, as well as April, which was the first full month in which severe restrictive measures were applied that led to limiting the activity of certain economic entities or to the temporary or permanent closure of others.

Thus, the volume of construction production decreased by 4.79% in December 2020 compared to January of the same year, and compared to April by 3.44%. Meanwhile, the volume of industrial production decreased by 0.88% in December 2020 compared to January 2020 and an increase of 54.73% compared to April 2020. The volume of sales, although in March 2020 recorded the lowest value (Fig. 1), increased both in December compared to January 2020, by 1.39%, and compared to April 2020, by 14.7%.

An analysis of the recovery of the volume of activity in December compared to February 2020 was also performed, the last month before the declaration of the COVID -19 pandemic, which is shown graphically in figure 2. Thus, the volume of construction production was recovered in proportion of 98.85%, that of industrial production in proportion of 97.75%, and in terms of sales volume, it exceeded in December the value recorded in February 2020 by 5%.

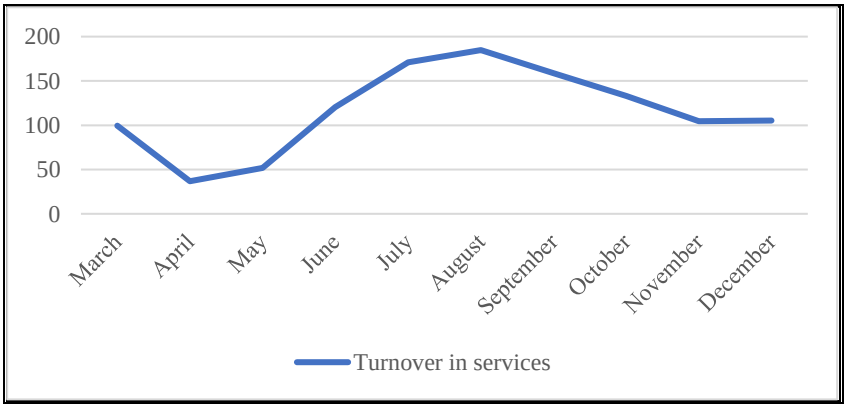
Fig. 2. The degree of recovery of the activity volume in December compared to February 2020



Source: https://ec.europa.eu/eurostat and author's processing

Regarding the economic entities in Romania with activity in the provision of services, they registered a turnover in the period March - December 2020 according to Figure 3:

Fig. 3 The evolution of the turnover of the companies with service provision activity in the period March - December 2020



Source: https://ec.europa.eu/eurostat and author's processing

We present in table 2 services turnover growth rates in first, second and third quarter 2020, depending on the category of services provided:

Table 2

Activities	**Services turnover growth rates (%)**		
	Trim I 2020	**Trim II 2020**	**Trim III 2020**
Transportation and storage	5.7	-14.8	9.4
Accommodation and food service activities	-15.7	-58.3	110.7
Information and communication	5.9	-3.1	3.7
Professional services	7.5	-15.6	14
Administration support	2.3	-17	8.2
Total	**4.5**	**-17.6**	**13.8**

Source: https://ec.europa.eu/eurostat

Economic entities with service activity experienced a decrease of approximately 18% in turnover in the second quarter of 2020 compared to the first quarter of the same year. The largest decrease in

turnover was registered by companies with activity in accommodation and food service of 58.3%.

In conclusion, the Romanian economic entities with activity in the field of constructions registered a decrease of the production volume in February 2020, those with activity in the field of industrial production faced a decrease of the production volume in the period February - April 2020, meanwhile sales volume of trading companies had the lowest level in March 2020. Regarding the turnover of companies with service activities, it decreased in the second quarter of 2020 compared to the previous period. Therefore, economic entities from Romania that apply the provisions of the Order of the Ministry of Public Finance no. 1802/2014 and that have chosen the calendar year as the reporting period, had indications about the reduction of the volume of activity or turnover before the submission, at the territorial units of the Ministry of Public Finance, of the annual financial statements for 2019 , respectively before 31 July 2020[9].

A significant reduction in the volume of activity, production volume or turnover could negatively affect the operating result of an economic entity, as well as the financial position. According to the accounting regulations, the administrators of the companies that became aware of some elements of insecurity generated by the COVID-19 pandemic and that could have led to their inability to continue their activity, should have presented these elements in the explanatory notes of the financial statements for 2019.

Specialists of the Body of Expert Accountants and Certified Accountants recommended that large economic entities, with complex activity, in the context of the COVID-19 pandemic, perform a more detailed analysis of business continuity, taking into account the company's net situation, operating cash flows, generation significant operating losses due to production delays, supply shortages, labor difficulties due to illness or restrictions imposed by the authorities, inability to pay debts at maturity[10].

3. Responsibilities of the management of economic entities regarding the presumption of going concern

Economic entities from Romania that apply the provisions of the Order of the Ministry of Public Finance no. 1802/2014 prepare annual financial statements through which they provide information to a wide range of users regarding financial position, financial performance, cash flows generated by the activity carried out during the financial year, which, in most cases, coincides with the calendar year.

The management of the economic entities is responsible for preparing the annual financial statements[11]. The items presented in the financial statements are recognized and measured in accordance with the principles described in the above-mentioned accounting regulations. One of the fundamental accounting principles is the going concern principle which assumes that the entity will continue to operate normally, without entering into a state of liquidation or significant reduction in business.[12] However, the financial statements will not be prepared on the basis of the going concern principle if the members of the management of the economic entity establish after the balance sheet date that they liquidate the entity or cease the activity.

If the managers of an economic entity are aware of certain elements that could affect the continuity of the activity, these must be presented in the explanatory notes[13], annexed to the balance sheet.

Business continuity requires careful analysis by the management of the economic entity when operating profit and financial position deteriorate.

On January 30, 2020, the World Health Organization declared a state of emergency following the epidemic caused by the new coronavirus, and as of March 11, 2020, it was considered a pandemic. At national level, various measures have been taken by the authorities to prevent the spread of the virus, measures which have included, inter alia, the temporary suspension of the activity of some economic entities.

Given that the date on which the Covid-19 pandemic was declared is later than the balance sheet date of the economic entities that have chosen the calendar year as their financial year, the events generated by the social protection measures imposed or recommended by the authorities are subsequent events that do not adjust the indicators presented in the financial statements for 2019. However, their impact on the activity of economic entities is significant and an estimate of the financial effect must be provided or the reason why such an estimate cannot be made [14] in the explanatory notes annexed to the financial statements for 2019.

[9] The usual deadline for submitting the annual financial statements is 150 days from the end of the previous financial year, but in 2020 was adopted an Emergency Ordinance no. 48/2020 on some financial - fiscal measures, by which the deadline for submitting the annual financial statements for the financial year 2019 has been extended to 31 July 2020.

[10] Corina Grazziela Dumitru, Alina Mihaela Irimescu, *Guide to Financial Reporting According to National Accounting Regulations, in the Context of the Crisis Generated by Coronavirus*, CECCAR, Bucharest, 2020, pp. 17.

[11] Handbook of International Quality Control, Auditing, Review, Other Assurance, and Related Services Pronouncements, 2018 Edition, Vol. I, IFAC, pp. 84.

[12] Order of the Minister of Public Finance no. 1802/2014 for the approval of the Accounting Regulations on individual annual financial statements and consolidated annual financial statements, article 49, paragraph 1.

[13] Order of the Minister of Public Finance no. 1802/2014 for the approval of the Accounting Regulations on individual annual financial statements and consolidated annual financial statements, article 49, paragraph 3.

[14] Order of the Minister of Public Finance no. 1802/2014 for the approval of the Accounting Regulations on individual annual financial statements and consolidated annual financial statements, article 74, paragraph 4.

The specialists of the Body of Expert Accountants and Certified Accountants from Romania recommended that the information that can be presented in the notes to the financial statements as subsequent events, the following: interruptions in the supply chains; decrease in sales revenues and, implicitly, in revenues; decrease in liquidity, caused by non-collection of customers; cessation / reduction of production for certain periods for certain categories of goods; restructuring plans determined by the closure of some work points or shops; losses caused by the cancellation of certain contracts; dismissing employees or resorting to measures of technical unemployment; renegotiating the maturity of debts resulting from contracts with suppliers.[15]

The administrators' report accompanying the annual financial statements must also contain an analysis of the uncertainties and risks to which the economic entity is subject in the coming period.[16] In this regard, companies are advised to consider potential issues, such as the loss of customers or the decrease in their traffic in sales units, the impact on the distribution chain and supply delays or interruptions and production delays or limitations. At the same time, the impact on human capital, the additional security measures required and their impact on production must be taken into account. Neither the risk of losing significant contracts, which may lead to the closure of production units, shops or installations, nor the risk of penalties for non-performance of contractual obligations should be neglected.[17]

In the table below we have made a selection of the information presented in the Administrators' Report and the explanatory notes regarding the continuity of activity in the context of the COVID pandemic - 19. Economic entities from Romania with activity in the economic fields affected by the health crisis were selected, which apply the provisions of the Order of the Ministry of Public Finance no. 1802/2014 and chose as reporting period the calendar year:

Table 3

Activities	**Date of signing the financial statements for 2019**	**Mentions in the Administrators' Report / explanatory notes**
Clothing Manufacturing; Retail Clothing, Footwear, Watches, Jewelry	April 1, 2020	The Administrators' Report mentions that the financial statements for 2019 are prepared based on the principle of business continuity. There are no risks that could affect the activity due to the COVID -19 pandemic. The explanatory notes related to the financial statements of 2019 state that they were prepared based on the going concern principle and the entity's management is not aware of other events subsequent to December 31, 2019 that could have a significant impact on them. Also, reference is made to the situation of the entity in the context of COVID - 19, namely the activity is partially affected, on the retail side, the work points being temporarily closed.
Retail	April 22, 2020	The Administrators' Report does not present any risks that may affect the activity as a result of the COVID -19 pandemic. The explanatory notes related to the financial statements of 2019 state that they are prepared based on the going concern principle. The note on subsequent events describes the context in which the company operates and states that management cannot assess, at the date of preparation of the financial statements, the financial impact or the duration of the effects of the pandemic. However, this event does not adjust the figures in the financial statements as of 31.12.2019. It is also stated that managers expect this crisis to affect the company's activity in 2020, without a major impact on the financial position.
Automotive and non-automotive production; services - logistics, transport, construction, electrical works.	March 18, 2020	The Administrators' Report does not present any risks that may affect the activity as a result of the COVID -19 pandemic. The financial statements for 2019 have been prepared based on the going concern principle. The explanatory note on subsequent events states that the long-term impact of COVID-19 may affect the volume of products traded, cash flows and profitability. However, in the context of the COVID -19 pandemic, at the date of preparation of the financial statements for 2019, the company fulfills its obligations at maturity and applies the principle of business continuity.

Source: Financial statements for 2019 prepared by listed economic entities with activity in the areas affected by the COVID pandemic -19

[15] Corina Grazziela Dumitru, Alina Mihaela Irimescu, Guide to Financial Reporting According to National Accounting Regulations, in the Context of the Crisis Generated by Coronavirus, CECCAR, Bucharest, 2020, pp. 7.

[16] Corina Grazziela Dumitru, Alina Mihaela Irimescu, Guide to Financial Reporting According to National Accounting Regulations, in the Context of the Crisis Generated by Coronavirus, CECCAR, Bucharest, 2020, pp. 8.

[17] https://www2.deloitte.com/ro/en/pages/business-continuity/articles/cum-reflectam-COVID-19-in-situatiile-financiare.html accessed on February 20, 2021.

In conclusion, the COVID -19 pandemic began to have effects on the activity of economic entities in March 2020, but at the date of preparation of the financial statements for 2019, they were subsequent events that did not adjust the amount of indicators for the financial year ended 31.12.2019.

Regarding the going concern principle, the economic entities that did not intend to liquidate or significantly restrict the activity in 2020, mentioned, according to the provisions of the accounting regulations, in the explanatory notes, that this principle is the basis for preparing the financial statements at 31.12.2019. If the managers of the entities were able to assess the impact of COVID - 19 on the activity in 2020 or on the financial position, profitability, cash flows, they mentioned these aspects in the explanatory notes related to the financial statements of 2019.

4. Responsibilities of financial auditors regarding the going concern principle

Economic entities from Romania that apply the provisions of the Order of the Ministry of Public Finance no. 1802/2014, have the obligation to audit the annual financial statements if they fall into the category of medium and large entities or if they are public entities.

The economic entities that are part of the category of medium and large entities are those that, at the balance sheet date, exceed the limits of at least two of the following three criteria: total assets 17, 5 million lei, net turnover 35 million lei and average number of employees during the financial year 50.[18]

Also, economic entities that in two consecutive financial years exceed the limits of at least two of the following criteria: total assets 16 million lei, net turnover 32 million lei and average number of employees 50, have the obligation to audit the annual financial statements.

Auditors plan and perform the audit to obtain reasonable assurance about whether the financial statements as a whole, including disclosures, are free from material misstatement[19]. Following the audit mission, the auditors obtain evidence on the basis of which they draw up a report in order to express their opinion on the financial statements.

The restrictive measures taken by the authorities, starting with the first quarter of 2020, in order to protect the health of the population as a result of the COVID-19 pandemic, have affected and continue to affect the economic environment. In this context, the Romanian Chamber of Financial Auditors recommended to the auditors that, starting with January 2020, they should be extremely alert to audit risk in terms of direct implications on compliance with the going concern principle of audited companies.[20].

The IAASB also recommends that audit firm employees obtain sufficient appropriate audit evidence regarding disclosures of the significant effects of the COVID-19 pandemic on business continuity reasoning.[21] However, the auditor is not responsible for issuing a final conclusion on business continuity[22], but to obtain sufficient adequate audit evidence, and to conclude on the degree of adequacy with which the entity's management uses the going concern principle in preparing the financial statements and if any significant uncertainty about events or conditions may raise significant doubts about the entity's ability to continue to operate.[23]

The auditor's conclusions regarding the adequacy with which the entity's management uses the going concern principle in preparing the financial statements will have implications for the audit report, which are summarized in the table below:

Table 4

The use of the going concern bases of accounting is		**Implications for the report**
inappropriate		the auditor shall express an adverse opinion
		the auditor may consider it appropriate, in extremely rare cases, to declare that it is impossible to express an opinion
appropriate, but a material uncertainty exists	an adequate presentation of significant uncertainty is made in the financial statements	the auditor shall express an unmodified opinion and the auditor's report shall include a separate section entitled "Material uncertainty regarding on Going Concern"
	an adequate presentation of significant uncertainty is **not** made in the financial statements	the auditor shall express a qualified or adverse opinion, as appropriate, and in the Base for qualified (adverse) opinion section of the report, state that there is material uncertainty that could raise significant doubts about the entity's ability to proceed activity and that the financial statements do not adequately present this aspect

[18] Order of the Minister of Public Finance no. 1802/2014 for the approval of the Accounting Regulations on individual annual financial statements and consolidated annual financial statements, article 9, paragraph 4.

In the table below we have made a selection of the information presented in the Independent Auditor's Report on on going concern basis of accounting. The economic entities from Romania with activity in the economic fields affected by the COVID - 19 pandemic, which apply the provisions of the Order of the Ministry of Public Finance (OMPF) no. 1802/2014 and chose as reporting period the calendar year, were targeted:

Table 5

Activities	**Date of signing the Audit Report on the financial statements for 2019**	**Mentions in the independent auditor's report**
Clothing Manufacturing; Retail Clothing, Footwear, Watches, Jewelry	April 1, 2020	Qualified opinion: Except for the possible effects of those presented on the basis of the qualified opinion section, the financial statements present faithfully, in all material respects, the company's financial position at 31.12.2019, financial performance and cash flows for the year ended . The basis of the qualified opinion section mentions the issues that led the auditors to this opinion, which are related to the inability to determine whether value adjustments are required for property, plant and equipment in the absence of their revaluation by the entity and the inability to obtain sufficient and adequate information on the net realizable value of inventories. Revaluation is the accounting treatment chosen by the entity in order to establish the value of tangible assets. No details were provided regarding the uncertainties generated by the effects of the COVID-19 pandemic on business continuity.
Retail	April 22, 2020	Opinion: the financial statements present faithfully, in all material respects, the company's financial position at 31.12.2019, financial performance and cash flows for the year ended on the same date. The paragraph on key issues states that the financial statements have been prepared on a going concern basis, but the auditors have identified an element of uncertainty, namely negative equity, which may significantly call into question the company's ability to continue to operate. No details were provided regarding the uncertainties generated by the effects of the COVID-19 pandemic on business continuity.
Automotive and non-automotive production; services - logistics, transport, construction, electrical works.	March 18, 2020	Opinion: the financial statements present faithfully, in all material respects, the company's financial position at 31.12.2019, financial performance and cash flows for the year ended on the same date. The section on management responsibilities states that managers are responsible for assessing the company's ability to continue its business. No details were provided regarding the uncertainties generated by the effects of the COVID-19 pandemic on business continuity.

Source: Report of the independent auditor accompanying the Financial Statements for 2019 prepared by listed economic entities with activity in the fields affected by the COVID -19 pandemic

If auditors find significant uncertainties that may affect business continuity, they must be reported in accordance with ISA 570 Going Concern, expressing an unmodified opinion, a qualified opinion or an adverse one, as appropriate.

5. Conclusions

In the first quarter of 2020, the World Health Organization declared the COVID-19 pandemic, which prompted state authorities to take action to prevent the spread of the virus. The measures taken, in March 2020, by the Romanian authorities led to the restriction or temporary suspension of the activity of certain economic entities. In this context, in April 2020, one third of the managers of economic entities, subject to a study conducted by INS, could not estimate the evolution of economic activity, more than 40% estimated a reduction in the volume of activity by more than 25%, meanwhile about 14% of them predicted the closure of the activity. Thus, the presumption of going concern for economic entities active in the manufacturing, construction, retail and services industries was called into question.

Indications about the continuity of the activity of the companies that apply the provisions of OMPF no. 1802/2014 and are obliged to audit the annual financial statements, can be obtained from the explanatory notes attached to the balance sheet and from the report of the independent auditor.

The annual financial statements for the financial year 2019 had as deadline for submission to the territorial units of the Ministry of Public Finance July 31, 2020, at that time it was known that the COVID-19 pandemic will have repercussions on future activity, but the indicators presented in the balance sheet 2019 were not adjusted because the events generated by the social protection measures, imposed or recommended by the authorities, were events subsequent to the balance sheet date. However, their impact on the activity of economic entities is significant, it was mentioned in the explanatory note regarding subsequent events, and in the case of entities that could assess the impact of COVID - 19 on the activity in 2020 or on financial position, profitability, cash flows , also

made references to them. Therefore, the provisions of the accounting regulations according to which if the administrators of an economic entity have knowledge about events that would prevent the continuous activity or determine the significant restriction of the activity, they must be presented in the explanatory notes, otherwise it will be mentioned that the financial statements are prepared on the going concern basis of accounting and the events subsequent to the balance sheet with significant impact will be presented in the specific explanatory note.

With regard to the auditors' responsibilities for the financial statements for 2019, they have planned and conducted their work in such a way as to obtain sufficient evidence and adequacy to conclude whether the financial statements as a whole, including disclosures, are free from material misstatement.

Auditors are not responsible for issuing a final conclusion on business continuity, but for concluding on the adequacy with which the entity's management uses the going concern basis of accounting in preparing the financial statements and whether there is significant uncertainty about events or conditions that may give rise to material doubt on the entity's ability to continue its business. If auditors find significant uncertainties that may affect business continuity, they should be presented in the report.

In the audit reports that accompanied the annual financial statements of the financial year 2019, prepared by the studied entities, no mentions were made regarding the uncertainties generated by the effects of the COVID-19 pandemic on the continuity of activity. Instead, clarifications were made that the financial statements were prepared on the basis of the business continuity principle, and in cases where auditors identified elements of uncertainty, they were presented in the paragraph related to key issues.

The COVID -19 pandemic, for the financial statements of 2020, which will be submitted to the tax authorities by economic entities until May 31, 2021, is no longer a subsequent event, its effects on the activity carried out by the entities will be reflected in the amount reported indicators. In this context, the management of economic entities must pay greater attention to the assessment of the business continuity hypothesis, the dynamics of operating results and the financial position, and if it finds the inability to continue the activity it must be presented in the explanatory notes to the financial statements of the year 2020.

TRADITIONAL CRYPTOCURRENCIES AND FIAT-BACKED DIGITAL CURRENCIES

Serghei MĂRGULESCU[*]
Elena MĂRGULESCU[**]

Abstract

The digital payments space saw vigorous investment activity during 2020 and there have been a plethora of announcements about account based Central Bank Digital Currencies. The cryptocurrency market can be roughly divided into two segments: traditional cryptocurrencies and fiat-backed digital currencies, including stablecoins and central bank digital currencies. 2021 may be the year we see the world's first sovereign digital currency. China's digital yuan or DCEP (short for Digital Currency/Electronic Payments) looks to be nearing completion. DCEP allows China to push forward into the digital era, while still retaining control over its financial instruments. The European Commission and European Central Bank are working together to investigate the policy, legal and technical questions emerging from a possible introduction of a digital euro. But creating a digital currency is actually the easy part. What is more important is how it is linked into the wider ecosystem to ensure the circulation of money and cash flows. Digital currencies are likely to have big implications for the role of central banks and retail lenders and could change the face of the entire financial system.

Key words: *Central Bank Digital Currencies, cryptocurrencies, stablecoins, digital payments, digital euro.*

1. Introduction

Market dynamics and infrastructure vary greatly per country and region but the direction of innovation and change is converging on the same outcome: digitisation and cashlessness. As the world adopts digitalisation in all sectors and societies, there is greater demand for unbanked communities to be banked and for digital banking to enable better choice and control for consumers, greater opportunities for merchants and business, increased cross-border trade and benefits for governments.

As the White paper from Finextra in association with HPS (january 2021) puts it, the reasons for the transition away from cash and towards digital include enabling connection between unbanked consumers, merchants and services through mobile money; greater visibility and view on liquidity for merchants, including real time confirmation and settlement; reduction in fraud and crime by implementing a digital trace and, hence, audit system; financial inclusion; for banks, greater volumes and transactions are welcomed also.

Cashless society initiatives bring greater transparency to governments, including better regulated tax systems and stronger control on fraud.

On the other hand, there are many who argue that this must be resisted with every fiber of our being because traditional currencies replaced with number on a computer screen will be another step towards total Government control over every aspect of your life. Every purchase you make will be recorded. If you have any outstanding debts e.g., fines the money will be removed from any savings you may without consent. Governments will have the power to Confiscate/Suspend/Freeze your account with a few key strokes.

One of the big challenges with digital currencies is the amount of data that comes with them, said recently Raghuram Rajan, former Reserve Bank of India governor. "We need some sort of broader global rules of the game. What are countries going to do with data collected from abroad on who uses their currency? How do you make sure that the usual safeguards on that use are there? If somebody uses a foreign digital currency to buy certain services which could compromise them, can they be liable to espionage and blackmail, et cetera? And those are concerns that are not farfetched in today's world," Rajan told CNBC.

Digital currencies are likely to have big implications for the role central banks and retail lenders play in the world and could change the face of the entire financial system.

While the idea is still being debated, central banks would likely issue digital versions of fiat currencies. The People's Bank of China is already doing pilots while other central banks are considering whether to issue their own.

The cryptocurrency market can be roughly divided into two segments:

- the first segment includes **traditional cryptocurrencies,** which, in essence, are assets and are used as an investment tool.
- the second segment includes **fiat-backed digital currencies**, including stablecoins, and central bank digital currencies.

2. Traditional cryptocurrencies

Cryptocurrency market

The total value of all the digital currencies exceeded $1 trillion for the first time ever after the leading crypto asset, bitcoin, continued its bull run to the next all-time peak.

Bitcoin, which accounts for around 70 percent of the value of the entire cryptocurrency market, has been deemed *"digital gold,"* attracting more and more large and institutional investors who consider it as a hedge against inflation and the weakness of the dollar. With some critics insisting that the cryptocurrency is a massive bubble, others still bet on its rising value.

Bitcoin could more than double in price by the end of the year as more firms allow customers to use it to make purchases, says Michael Novogratz, the founder of cryptocurrency investment firm Galaxy Digital. The price of the crypto coin blew past an all-time high driven by Tesla's announcement that it had bought $1.5 billion worth of bitcoin. The company also said it will allow customers to buy its electric cars with the coins.

A long-time crypto enthusiast and investor, Novogratz said that other companies would consider moving excess reserves into bitcoin, perhaps as a hedge against inflation or against a falling US dollar. In a world where central banks issue digital currencies, bitcoin and Libra may find a place

Cryptocurrency bitcoin and Facebook-backed Libra could play a role in a world where central banks globally begin to issue their own digital currencies, Raghuram Rajan, former Reserve Bank of India governor, told CNBC.

Rajan called bitcoin a "speculative asset" while Libra has been designed for transacting. Both could have different roles to play when central banks begin to issue digital currencies.

Bitcoin is a "decentralized" cryptocurrency meaning it has no central authority governing its issuance, unlike fiat currencies. It is built on so-called blockchain technology, which at its simplest level, is an immutable public ledger of bitcoin transactions. Bitcoin has often been criticized as being a speculative asset. Legendary investor Warren Buffett said earlier this year that it has "no value."

Libra takes a more centralized approach. It is a project that was proposed by a Facebook-led consortium of companies last year. But Libra drew heavy criticism from regulators, particularly because of its ties to Facebook and its murky track record of data privacy.

The idea is for Libra to be a so-called "stable coin" which would be backed by a basket of global currencies. That would keep its value stable in contrast with the volatility that has been seen in bitcoin. Libra has scaled down some of its ambitions. Earlier this year, the Libra Association applied to obtain approval from regulators to issue a digital currency backed by one currency. That would mean the consortium's digital coin may be equivalent to a euro or a U.S. dollar, for example.

Rajan said that bitcoin is a "speculative asset" rather than one that is used for transactions on a large scale. He said investors have often flocked to bitcoin when traditional assets such as bonds are less attractive. "In that sense, bitcoin is a little bit like gold, in fact, gold has some value because we value it for jewelry, but bitcoin you can't even do that. Nevertheless it has value because others think it has value," Rajan said.

"On the other hand, Libra is an attempt to create a currency which is used for transacting. And that, the whole idea is not to hold it as a speculative asset which increases in value … but use it for transactions. So the ultimate underlying value is going to be from the central banks, they're going to preserve the value, not of Libra but of what Libra can be exchanged into," he added.

But ultimately there will be competing private digital currencies with different roles. "So the bottom line I think is different private currencies will do different things and it may be bitcoin has value going forward just as a store of value, or as a speculative asset. While Libra may be the kind of currency which is used more for transacting," Rajan said.

Cryptocurrencies, particularly bitcoin and ethereum, started gaining more institutional support last year, triggering another massive rally. Payments companies Square and PayPal have recently backed cryptocurrencies, along with influential hedge fund heads such as Paul Tudor Jones and Stan Druckenmiller. International payment system Visa is moving towards allowing its cardholders to buy and sell cryptocurrencies in countries where it does not contradict the local legislation According to the company, it has partnered with the First Boulevard neobank in the United States, which would allow Visa clients to buy, store and sell digital assets via the Anchorage cryptocurrency bank.

Visa's announcement follows rival credit card major Mastercard, which announced last week it will begin allowing clients to make payments in certain cryptocurrencies on its network this year.

The key change is that Mastercard's current crypto partners, which include Wirex and BitPay, have to convert the digital asset into traditional currencies before making a transaction. The credit card major now wants to support digital assets directly instead. "This change will also cut out inefficiencies, letting both consumers and merchants avoid having to convert back and forth between crypto and traditional to make purchases," Mastercard said.

3. Fiat-backed digital currencies

China

The cashless, digital revolution is on its way, and while the West has so far failed to come up with any comparable scheme of its own, China's is almost at the finish line already.

China's central bank is nearly ready to issue its own sovereign digital currency, according to Mu Changchun, deputy director of the People's Bank of China's payments department. Researchers at the bank have been working on the currency for five years. According to reports, China's central bank would launch its digital token through a two-tier system, under which both the PBOC and commercial banks are legitimate issuers.

But according to crypto-expert Simon Dixon's theory, if your account is full of digital currencies that are backed by the government then, if the bank fails, the deposits are guaranteed because they are in the wallet. "So, this could be a major contentious moment between banks and governments" and "the governments are getting ready to allow banks to fail," Max Keiser says.

The PBOC said it wouldn't rely on blockchain exclusively, and would instead maintain a more neutral stance on which technology it decides to use. Blockchain, otherwise known as distributed ledger technology, is the framework that underpins cryptocurrencies like bitcoin. The digital yuan will be linked to the holder's smartphone number, with transactions taking place through an app. Users will be able to transfer money between accounts by tapping phones, much like having physical cash change hands. The currency will be legal tender, so it could be exchanged without needing a bank as an intermediary. The size of transactions would be limited based on identity verification. A phone number alone would permit only small transactions, while providing proof of identity or a photo of a debit card would raise the limit. Speaking with a bank representative in person could allow for the cap to be removed entirely. Suspected criminal activity will be uncovered via transaction histories.

China is expanding trials of its sovereign digital currency in the capital Beijing, the nation's most populous city of Shanghai and leading tech hub Shenzhen this year. The digital currency was projected to replace cash in circulation. But China's new sovereign digital currency could also transform cross-border trade due to its ability to process payments and handle foreign exchange transactions simultaneously. That's according to the former head of the People's Bank of China, Zhou Xiaochuan, who told the Shanghai Financial Forum that one of the major benefits of using a digital system is that it allows both payments and currency conversions to happen in real time.

"If you are willing to use it, the yuan can be used for trade and investment," he said. "But we are not like Libra and we don't have an ambition to replace existing currencies." The Digital Currency Electronic Payment (as it is formally known) was not intended as a replacement for globally accepted fiat currencies like the US dollar and the euro. According to Zhou, rather than challenging foreign exchange regulatory frameworks and monetary systems, Beijing wanted to persuade consumers and overseas merchants to gradually accept digital yuan payments.

The digital yuan will be the first national currency which will not exist in physical form, but entirely online. While currencies of old were traditionally based on something tangible – such as the gold standard – the digital yuan is built on computer engineering. This means the way it is utilized and regulated differs from a normal currency. A digital currency is more easily managed by its parent government, and more traceable and observable. With a government-controlled digital currency, financial crimes such as money laundering and tax evasion become more difficult. It provides increased security for users, even if it reduces privacy. But even more striking to international observers than the implications for personal use is the potential geopolitical impact it could have.

Many are speculating that this new currency will have global ramifications, with Facebook's Libra executive David Marcus noting that China will create a digital currency system that can be entirely out of reach for US authorities, meaning America's financial sanctions would have little effect. He added that if the digital yuan gets widely adopted across the world, many countries could opt for renminbi as an alternative to the dollar for international clearing and settlement services.

While launching studies on its own digital unit as far back as 2014, Beijing has cracked down on the use of all cryptocurrencies, such as bitcoin. Cryptocurrency trading has been halted on some 100 exchanges in the country since 2017, in compliance with regulation on fraud and money laundering. But elsewhere, the Chinese currency is not a threat to bitcoin because it's a highly-centralized digital currency.

The emergence of a digital yuan, as opposed to the standard yuan, is an international gamechanger. As the first currency of its kind, China has the potential to pioneer it as a new global standard in its own transactions and, by using the country's economic muscle, persuade other countries and financial institutions to use it, too. The potential outcome is clear; it may have a serious impact on the US dollar.

At present, the dollar is the hegemonic currency of the world. It is the preferred medium of transaction for many sectors and commodities alike, not least in the realm of finance. Due to its widespread use and the dominance of American financial institutions, the US government has the power to weaponize the dollar as a form of 'extraterritorial jurisdiction' against countries that it doesn't like. If the US sanctions a company or individual, it effectively cuts them off from the global financial system. The banks who serve these individuals rely on the dollar, and thus face penalties if they violate the sanctions.

This demonstrates the global strength of the dollar, but also shows how the digital yuan may change the current landscape. The creation of a new international medium of transaction means that financial institutions, companies and governments now

have a new avenue to do business without having to use dollar transactions. This will reduce its global reach. For countries like Iran and Venezuela, heavily targeted by US sanctions, it is an obvious way out. Of course, such a system will be met with a mixed response throughout the world. While beneficial to some countries, it is inevitable that others will not accept their financial systems being re-written and dominated by China.

The digital yuan is set to face political resistance from the US, which is likely to respond by eventually creating a digital currency of its own (even though it's well behind at present). The European Union is also likely to move towards a 'digital euro' to safeguard its own interests.

On the other hand, the digital yuan should be expected to gain traction in countries strongly integrated with China, particularly in Asia, Africa and Latin America. There are many nations who will see the opportunity to diversify from the US dollar as a positive development.

And so arguably, the rise of the digital yuan will prove to be an innovation which will truly hasten a multipolar world. It has the potential to effectively break the monopoly of the dollar as a unilateral, extraterritorial weapon and rewrite the rules of the global financial system in a way which will be shaped by China. It could set off a digital currency race with many other major powers too, fragmenting the existing order whereby the US dollar serves as the underbelly of all things.

The People's Bank of China has agreed a **partnership with the global interbank settlement organization SWIFT,** as part of an effort to internationalize the yuan and develop a digital Chinese currency. The new entity, Finance Gateway Information Service, was registered in Beijing on January 16, 2021 with €10 million ($12 million) as incorporation capital, according to the National Enterprise Credit Information Publicity System, the Chinese government's enterprise credit information agency. SWIFT is the largest shareholder, with 55 percent of the capital owned via a Hong Kong subsidiary, while the China National Clearing Centre, a wholly-owned domestic settlement subsidiary of the PBOC, owns 34 percent. The joint venture emerged after concerns were raised that the US might cut off China or Hong Kong from the SWIFT financial payment network as a result of the Trump administration's sanctions over the Hong Kong autonomy issue. Calls have also been growing from within China for Beijing to reduce its reliance on the US dollar by increasing the global use of the yuan amid worsening relations with Washington.

Also, the central banks of China and the United Arab Emirates are joining their counterparts in Thailand and Hong Kong on a CBDC project investigating cross-border foreign currency payments. **The Multiple CBDC (m-CBDC) project** will see a proof-of-concept prototype developed designed to support real-time cross-border foreign exchange payment-versus-payment transactions in multiple jurisdictions, operating 24/7. It will analyse business use cases in a cross-border context with both domestic and foreign currencies. The project was first developed by the Hong Kong Monetary Authority and the Bank of Thailand and is being run with the BIS Innovation Hub in Hong Kong.

Experts say China's plans have triggered concerns about a new threat to US financial dominance. According to Aditi Kumar and Eric Rosenbach of the Harvard Kennedy School, the digital version of the Chinese renminbi could eventually allow Iran and other countries to more easily evade US sanctions or move money without it being spotted by Washington. They explained in an article for Foreign Affairs that one day it might be possible to transfer the digital currency across borders without going through dollar-based international payment systems.

Former US Treasury Secretary Henry Paulson has argued that the threat to the dollar's status as the world's preferred currency is "not a serious concern." He claimed that even if a digital yuan proves to be highly mobile around the world, the US dollar is widely trusted, and oil and other key commodities are still priced in it. However, according to the CEO of Sino Global Capital Matthew Graham, digital yuan could encourage other countries and people overseas to get on board with China's technology and currency.

With Beijing pushing for greater use of the yuan internationally, the Chinese currency could rise to the status of the world's third-largest reserve currency in 10 years, according to a forecast by Morgan Stanley. The share of the yuan in global foreign exchange reserve assets could more than double from its current level of two percent and surpass the share of the Japanese yen and the British pound, the bank's analysts said in a report released on Friday, cited by CNBC. According to their estimates, the Chinese currency, officially known as the renminbi or RMB, could reach five to 10 percent of reserve assets by 2030.

"This target is not unrealistic in light of the financial market opening in China, the growing cross border capital market integration we see across equities and fixed income and an increasing proportion of China's cross-border transactions being denominated in RMB," Morgan Stanley international strategist James Lord said. More and more central banks worldwide have been gradually stockpiling yuan in their coffers. According to Morgan Stanley, at least 10 regulators added the currency to their forex reserves last year, with the total number of holders reaching 70.

International Monetary Fund (IMF) data shows that the renminbi share in global reserves has doubled since it was included in the IMF's basket of major reserve currencies in October 2016. Back then, the share of the yuan amounted to one percent, and now it stands at 2.02 percent. Its main rivals – the yen and the British pound – have a 5.7 percent and 4.43 percent share respectively. The US dollar accounts for almost

62 percent of global forex holdings and the euro for over 20 percent.

Russia

After discussing the launch of the digital ruble with local banks, the country's financial watchdog says it will present a more detailed concept for the national digital currency by summer.

Russia's central bank initially revealed that it was assessing the possibility of creating a digital form of the Russian national currency in its report published in October 2020. The digital ruble is meant to exist along with cash and non-cash rubles and will allow private and corporate users to freely transfer digital rubles to their electronic wallets and use them on mobile devices.

The head of the Central Bank of Russia, Elvira Nabiullina, said on the 18th of February, that the regulator received detailed feedback from the banking community in its October report, in which the regulator introduced the digital ruble as a possible new form of national currency. According to the official, most lenders support a two-level model of the digital ruble, which allows banks to open wallets for their clients on the central bank's platform and conduct operations.

"We will develop a more detailed concept and start discussing it with the public, market participants, and banks at the beginning of summer," Nabiullina said. She added that the next step will be launching and testing a special platform. The adoption of the new form of the currency will also require amending legislation. The new form of the Russian currency is to be test-launched as soon as 2021 in the Crimea. Earlier this year, Russia's central bank said that the digital ruble may be used for international money transfers, but only after its global peers establish their sovereign digital currencies.

More than 30 financial regulators are currently working on their national digital currencies, according to First Deputy Governor of the CBR, Olga Skorobogatova. Given the pace of the development, several countries may launch the new form of currencies over the next 5-7 years, the official added.

The development of digital currencies may challenge the SWIFT international banking payment system and could eventually make it redundant, the Central Bank of Russia (CBR) has said. "Then we can deal with direct integration issues. In this case SWIFT it may not be necessary, because it will be a different kind of technological interaction," Skorobogatova said at an online meeting earlier this week. However, the global banking network may become one of the platforms for the new form of national currencies, she added.

Meanwhile, Russia's largest lender, Sberbank, has applied to the national financial regulator to set up a blockchain platform for its own digital token called Sbercoin. The project may be launched as early as this spring. Sberbank sent the application for the platform to the Central Bank of Russia at the beginning of the year, Director of the Transaction Business Division Sergey Popov revealed earlier this week. He said that the registration was required by the law on digital financial assets, which came into force in Russia on January 1,2021.

However, Sberbak still has to resolve some issues linked to the digital currency, such as the taxation of digital financial assets as well as how the token can be used. According to the bank's top manager, Sbercoin can be used as a "digital promissory note," as this form can open "new opportunities" if it replaces the paper one. **Sbercoin could actually be a stablecoin**. Unlike bitcoin and other cryptocurrencies, stablecoins are pegged to fiat currencies, and Sberbank's token will be pegged to the Russian ruble.

The most commonly used stablecoin is issued by Tether. By March 2020, Tether's market capitalisation was more than USD 4.6 billion, but its use is almost entirely limited to the crypto-asset market. Other examples include Fnality and JPM Coin. Facebook recently announced that it was launching a new stablecoin named Libra in cooperation with a group of multinational corporations, with the currency being operated by an umbrella organisation called the Libra Association.

India

The Indian government plans to introduce a bill to prohibit "private cryptocurrencies," paving the way to outlaw the likes of bitcoin. The law is set to facilitate the creation of the nation's own official digital currency. The legislation moves to prohibit what it calls "all private cryptocurrencies in India," but allows "certain exceptions" to promote blockchain, the underlying technology of cryptocurrency and its uses. It also aims to provide a framework to set up an official digital coin, issued by the Reserve Bank of India.

India has previously tried to ban virtual currencies, including bitcoin. In 2018, its monetary policy regulator alerted banks that they must stop dealing with them, citing "various risks associated in dealing with such virtual currencies." However, the move was subsequently overturned by India's Supreme Court, bearing in mind that there are millions of crypto investors in India and, as Rahul Pagidipati, the head of a leading exchange, ZebPay, said "Crypto assets and digital government currency can co-exist and together, they can bring tremendous benefits to the Indian economy"

European Union

The European Commission and European Central Bank are working together to investigate the policy, legal and technical questions emerging from a possible introduction of a digital euro.

Having just closed a public consultation on the subject, the ECB says it will now consider whether to start a digital euro project towards the middle of the year as it looks to answer design and technical questions ahead of any decision to actually issue the CBDC. Now, the ECB and the EC have created a joint

technical group to look at the policy, legal and technical aspects of the possible introduction of a digital euro. The EC says that one of the reasons a digital euro is appealing is that it could help promote global use of the currency. However, the Commission has also stressed that there are significant issues to address relating to financial stability, financial inclusion, and anti-money laundering and counter-terrorism financing. The public consultation was launched on 12 October 2020, following the publication of the Eurosystem report on a digital euro. Among respondents to the ECB's public consultation, privacy of payments ranked highest among the requested features of a potential digital euro (41% of replies), followed by security (17%) and pan-European reach (10%).“A digital euro solution should not crowd out solutions that come from the private sector. In the ECB report, it is highlighted that such a solution would be complementary to private sector opportunities. There should not be rivalry or competition.” ECB president Christine Lagarde said “A digital euro will never be a substitute for cash. It is a very good supplement and a very good partial substitute for what was being done physically.” “Technology and innovation are changing the way we consume, work and relate to each other,” says Fabio Panetta, member of the ECB’s executive board and chair of the task force. “A digital euro would support Europe’s drive towards continued innovation. It would also contribute to its financial sovereignty and strengthen the international role of the euro.

The Italian Banking Association is to kick of a technicial feasibility study on the use of distributed ledger technology for a future digital euro. The initiative comes at the urging of the European Central bank for EU nations to contribute to the public policy debate around the creation of a central bank digital currency (CBDC) covering the Euro-zone. The experimentation project is divided into two work areas: one involving the infrastructure and distribution model to analyse technical feasibility, and the second focusing on programmability to experiment with use cases that can differentiate the central bank’s digital euro from the electronic payments already available.

The European Central Bank is stepping up its analytical investigations into the potential for creating a central-bank backed digital currency for retail customers, a move which would be "a game changer" for the banking industry, says ECB exec Yves Mersch. "A **wholesale CBDC**, restricted to a limited group of financial counterparties, would be largely business as usual," says Mersch. "However, a **retail CBDC**, accessible to all, would be a game changer. So a retail CBDC is now our main focus." The creation of a retail CBDC would need to address the currency's legal tender status and the relationship between a CBDC and euro banknotes and coins, along with the process by which one could be exchanged for the other. Mersch describes two different ways to design a CBDC - operating either as a decentralised digital token, or based on deposit accounts lodged with the central bank. Of the former, he says: "We are currently looking into the legal questions raised by the potential use of intermediaries to facilitate the circulation of a CBDC and also the processing of transactions in a CBDC. To what extent are we permitted to outsource public law tasks to private entities? And what would be the appropriate extent of supervision over such entities?" The latter approach raises serious policy questions relating to the potential disintermediation of commercial banks and the possibility of digital bank runs, as consumers cash out their accounts in favour of a central bank-issued currency. What, then, could be done to mitigate the impact of a CBDC on the financial system? asks Mersch. "One option could be to remunerate CBDC at below-market rates in order to create incentives for non-banks to rely more on market-based alternatives rather than on central bank deposits. The drawback would be that, in times of crisis, it may become necessary to apply highly negative rates, which could generate criticism from the public and substantially undermine public confidence in the central bank as well as in the basic values of saving which underlie our societies. "Another option is a tiered remuneration system. In line with the functions of money, the first tier could serve as a **means of payment**. The central bank would have to refrain from setting a lower or a negative interest rate in order to keep a CBDC attractive to the public as a means of payment. While the second tier could serve as a **store of value**, the central banks could discourage people from using it as such by setting unattractive interest rates. However, such schemes should draw from the experience of multiple exchange rate regimes. And the repercussions of the intentional use of such schemes need to be subjected to an additional comprehensive investigation." For the moment, the ECB's investigation is purely analytical.

Bank for International Settlements (BIS)

In its annual economic report (June 2020), BIS says that while central banks play a pivotal role in safeguarding the payments system, they also need to foster innovation. One significant way in which they are looking to innovate is through the investigation of Central bank digital currencies (CBDCs) which "deserve consideration" as an additional means of payment.

Last year, BIS surveyed 63 central banks, finding that 70% are currently, or soon will be, engaged in CBDC work. Since then, Canada, Italy and Thailand, among others, have taken significant steps on the issue. The central bankers' bank has previously urged caution on the subject but it now says such digital currencies "could offer a new, safe, trusted and widely accessible means of payment". Benoît Cœuré, head, BIS Innovation Hub, says: "Central banks around the world are stepping up their efforts to study CBDCs and, whether wholesale or retail, the goal is to create safe and reliable settlement instruments for transacting in the digital economy." A group of seven central banks

together with the Bank for International Settlements (BIS) have published a report laying out the key requirements for creation of a central bank digital currency.

The report, **'Central bank digital currencies: foundational principles and core features'**, was compiled by the Bank of Canada, the Bank of England, the Bank of Japan, the European Central Bank, the Federal Reserve, Sveriges Riksbank, the Swiss National Bank and the BIS. It highlights the key principles and core features of a CBDC, but does not give an opinion on whether to issue, although the race is clearly on to catch up with China's trailblazing exploits and beat off private initiatives such as facebook's Libra. The document stresses that any introduction should support wider policy objectives and do no harm to monetary and financial stability. Coexistence with cash and other types of money is considered essential, as well as core features that promote innovation and efficiency. "This report is a real step forward...in agreeing the common principles and identifying the key features we believe would be needed for a workable CBDC system," says Jon Cunliffe, deputy governor of the Bank of England. "This group of central banks has built a strong international consensus which will help light the way as we each explore the case and design for CBDCs in our own jurisdictions." While there will be no 'one size fits all' framework due to national priorities and circumstances, a workable CBDC should at a minimum, be:

- Resilient and secure to maintain operational integrity;
- Convenient and available "at very low or no cost" to end users;
- Underpinned by appropriate standards and a clear legal framework;
- Have an appropriate role for the private sector, as well as promoting competition and innovation.

Benoît Cœuré, working group co-chair and Head of the BIS Innovation Hub, says: "A design that delivers these features can promote more resilient, efficient, inclusive and innovative payments.

4. Conclusions

The digital payments space saw vigorous investment activity during 2020 and there have been a plethora of announcements about account based Central Bank Digital Currency (CBDC). Whilst some emerging markets have announced that they have either launched or are launching a CBDC, what many do not realise is that creating a digital currency is actually the easy part.

What is more important is how it is linked into the wider ecosystem to ensure the circulation of money and cash flows. Without it, it is a cart without a horse. It looks like the likes of China are making good progress having understood this construct and other major nations will not stand by watching and as such here will be some interesting developments with numerous pilots in 2021 starting to develop.

DIGITAL TRANSFORMATION IN RETAIL BUSINESS

Sandra Mrvica MAĐARAC*
Marko ELJUGA**
Zvonimir FILIPOVIĆ***

Abstract

The way of doing retail business and its form has changed substantially during the course of the last 20 years or so. Under the influence of technology, new retail forms have emerged, as well as the new ways of doing business. Modern retail uses advanced tools in sales processes, all for the purpose to make it easier for customers and to speed up the sales process. The objectives of the digital retail transformation are: the increase of efficiency of sales, time savings when purchasing, costs reductions and higher level of organization and productivity.

As a complex marketing strategy, instore technology is changing retail business, and it has become an integral part of modern retail logistics. By providing digitalised services to customers through their integration, digital retail tools contribute to major changes in the trading business. Trading companies are forced to keep up with the social habits and modern technological tools. By implementation of new technological solutions in retail, to customers are offered simpler and more modern ways of selling. However, it is the customers who decide on the use of these tools in retail, so it is necessary for trade companies to listen to the habits of customers.

In the paper are explored and analysed some of the examples of a retail digital transformation, such as: using of QR codes, buying when using the augmented reality (A-commerce), trade without cash desks and sellers, purchase by means of use of virtual googles, purchase when using virtual assistants, or by omnichannel. There are also some of the examples of trading companies that successfully use these sales tools.

Keywords: *retail business, the efficiency of sales, advanced tools, digitalised services to customers, the examples of a retail digital transformation.*

1. Introduction

We are witnessing a time of great technological advances that are reflected in all spheres of our life. Every day, we witness an improvement of new technologies that affect our lives, and thus the way we make purchases. Newer technologies lead to a progress and relieves the very process of buying. In addition to the traditional ways of shopping (visiting the point of sale) customers can also use alternative and new ways of shopping. Under the influence of technology, during the last decade the trade has also changed. Due to customer preferences, their way of life, lack of time, and wide range of goods on the market, retailers want to meet the customer's needs to facilitate the purchase process and make it as simple as possible, but also more pleasant. It is for this reason that retail has been digitized. With the smart solutions, new solutions are constantly being found for upgrading of the old forms of retail and developing the ways of selling, for the purpose of the improvement and acceleration of business processes within the company. The implementation of new trends in the trade business complements the offer and gives to the customers a proposition of a new and unconventional forms of sales. The aim of this paper is to define new trends in digital retail business, the way they work and their application in practice. In this paper are analysed some of the examples of digitizing retail (using of the QR codes, purchasing with the help of the augmented reality (A - commerce), purchasing without need for the cashiers, use of goggles when doing virtual purchasing, and purchasing with the usage of omnichannel).

2. Digital retail

Retail acts as an intermediary subject in the exchange between the wholesaler and the end consumers, i.e., between producers and final consumers[1]. Retail is an important factor in the development of each country's economy. The most important feature for assessing the quality of the retail structure is the sales method, which includes organizational and technical-technological factors. The great influence on the retail has the size of the company, location, variety of assortment, retail prices and diversity of demand[2]. The core functions of retailers are: location accessibility, proper timing, appropriateness in retail size, information and lifestyle support[3]. The digital transformation of a company is a change in a way a company uses digital technologies to develop a new digital business model that helps create

and deliver greater value to the enterprise[4]. The process of digital transformation of the company includes the development of an innovative business model, the creation and efficient use of the organization's innovation system when creating new services and products, and the complete reorganization of the system[5].

Research on the future of in-store technology[6] proves that retailers face limited resources, and as a result must prioritize investing in technology in their stores. In accordance to the aforementioned study, in order to achieve the largest sales growth, the investment is needed in the quadrant of high practicality and high social presence, in order to improve product vividness, increase in customers experience and increase in sales. The actual potential of information technology in a company's business is realistic, but creating of the business success involves much more than buying software, hardware, and network infrastructure. The use of digital technology in business requires solving problems that, if overlooked, can turn an investment into a cost. Modern business and technology are connected to such an extent that business would be impossible without information technology[7]. Following an e-commerce and its evolution into mobile commerce, the Internet of Things (IoT) will radically transform retail commerce from recognizing the need to engagement after the buying process[8]. For many years, the term IoT has been used only in theory, and only recently we can see materialized examples of IoT in the context of retail. In this form, trade refers to the activity of buying and selling and to the exchange of tangible and intangible products on a large scale[9].

There is a small volume of literature available on IoT and on how companies can improve the user value of IoT devices through energy savings, asset protection, proactivity, or the personalized experience[10]. During recent years, shopping and commerce via mobile devices have been increasingly used. Mobile devices in the context of commerce are devices with a wireless Internet access network that is designed for the mobility of its users[11]. Mobile devices provide location-based services, and advertising is personalised to the local context. For instance, Uber allows taxis to be called to the customer's current GPS location and therefore estimates the time of their arrival[12]. The operational characteristics of an information-enabled trading company include external business activities of the supply chain and internal business activities. External business activities include: steady partnerships with the suppliers, global markets and production, fast delivery, tightly integrated production and accelerated product development for the market segments. Internal business activities include: shared databases, available information's, a wide range of employee's involvement, decentralization of authority, computer expertise, centralized monitoring, and less hierarchical levels between employees[13].

3. Some examples of digital retail transformation

We have lately witnessed that we have been seeing black rectangles, i.e., QR codes[14] featured in various places such as catalogues, tickets for social events, they are visible at the shop's front doors, various products and the like. The QR (Quick Response) code is a two-dimensional code created by the Japanese company Denso Wawe in 1994, which is a subsidiary of Toyota[15]. The initial application of the QR code was in the automotive industry, however, due to its characteristics it as well quickly became popular in other spheres. Unlike with the form of barcode that can store only up to 30 numbers, QR codes can store up to 7.089 characters, so in addition to the numbers of QR codes can store such as Text, Active links, Phone numbers with the activation calls, SMS / MMS messages, Active E-mail, Contact (vCard or meCard) and Calendar Commitment (vCalendar)[16]. In order to be able to use QR codes, it is enough to have a smartphone with a camera that has an application for reading installed QR codes; of course the phone must have an Internet connection. One of the most common uses of QR codes is for reading the URL, or scanning the code that will takes us to the specific Website. Quite frequent use of the QR code is also present in prize games, because it can be found really anywhere, ranging from

newspapers, product packaging and the like. QR codes appear as a link between the online world and the real world. They represent a strong marketing tool by which it can tell a story to the end users and cause them to additionally attach with the brand. QR codes owe their planetary popularity primarily to the development and mass application of smartphones in people's daily lives. It can be said that QR codes are an unavoidable marketing and sales tool[17]. A fashion brand Polo Ralph Lauren is one of the major exponents of QR codes. Polo Ralph Lauren uses QR code technology as an extension of his brand. With the help of QR codes, the company continuously works on building of its image and thus establishes an interactive relationship between its brand and its customers, the most common on the point of sale. The Canadian coffee company Ethical Bean, uses QR codes to connect with its customers before and after the sale. After a successful campaign in which they promoted the use of QR codes associated with their products, they confirmed that their business has doubled. In addition to diverting the QR code on the Websites of individual companies, nowadays more and more often, QR codes are used to redirect users to the appropriate profile on social networks (Facebook, Twitter, Instagram, Pinterest etc.). QR codes are possible to develop with the help of the QR generator or service to create QR codes that can be found on the Internet. After creating the code, it can be downloaded from the Internet or saved to your computer and use further when and where necessary. In addition, there are many services on the Internet for the free making of QR codes: which service will be used depends on the preferences and complexity of the task to be solved. QR codes have brought a new dimension in the creation of primarily marketing content, so with their help and through the new media we are able to tell a story to our customers that will connect them even more strongly with the brand and encourage them to opt for company products in the future.

Augmented reality (or abbreviated, AR) is a modified and upgraded image of an already existing reality and makes a part between the real and the virtual word. Augmented reality is a practical method that can create links between social content and physical products, because in this way customers get information's about the products[18]. Because of its all-embracing nature and hedonistic values, the experience of augmented reality could help individuals to change consumer attitudes[19]. We can say that the time for more serious application of augmented reality in shopping is yet to come. According to some estimates, it is considered that by 2020, 100 million consumers purchased products online and with the help of classical trade and augmented reality[20]. If we consider the fact and that the global consumption of smartphones in 2018 amounted to 101 billion dollars (wearesocial.com), augmented reality represents great potential for the food and the retail sector. Augmented reality is one of the latest technologies, which has become increasingly popular during recent years. It can be described as an augmented version of reality, that is, as a combination of virtual and real environment. With the help of computer-generated images of the real world we can change to the enhanced version of a reality for that we reinforce the perception of the physical environment. Augmented reality can manifest in a variety of ways from monitors, to handheld devices and glasses (goggles), becoming one of the essential links between retailers and brands that makes the shopping experience simpler, but at the same time more personal for the customer. There are several different types of augmented reality, each of which aims to address different issues and has a slightly different application. Not all of the kinds are appropriate to manufacturing or retail applications, but their capabilities are developing. Marker-based augmented reality is also called the image recognition. An example of this is when cameras are built into an augmented reality device that read QR codes or the two-dimensional codes, and consequently provide information to the user. This use of augmented reality is very common, but it is not flexible due to the necessity of the existence of markers. Augmented reality that doesn't use markers is location-based. It uses a combination of sensors to accurately detect and map the real-world environment with the camera system. With the cameras on their smartphones, users can access information about their environment. This type of augmented reality is currently most widely used and implemented in various technologies; it's often used to access retail discounts. Projected augmented reality works by projecting artificial light onto real physical surfaces. The most well-known application of this type of augmented reality is in the laser projection of 3D interactive holograms in the air. Outline-based augmented reality recognizes different objects. This method has found its application in architecture for outlining buildings. Augmented reality based on superposition or overlap, recognizes objects and can replace the whole object or part of it with a larger display. This type of augmented reality is mostly often used in mobile applications, social networks and real sales facilities. The greatest advantage of augmented reality is the possibility of interactive three-dimensional display of the real objects or products in a demonstrative way, on this way creating a strong impression on the consumer. Augmented reality causes

consumers to react emotionally to the product, which has an impact on increased awareness and a positive impression of the brand itself. Also, the augmented reality enables a very simple presentation of products through experiential marketing provided by augmented reality technology. The basic components of augmented reality that contribute to marketing achievements are the ability to connect to almost anything, with obtainable high level of interactivity, technology portability, business intelligence, and a measurable rate of return on investment[21]. Augmented reality is well accepted by users because its focus is not only on the product or service being promoted, but the user experience and his overall experience is put in the foreground. According to the Forbes Council, significant annual growth is expected at a rate of 75.72% by 2022, which will reach $ 117.4 million by 2022. Insufficient research into augmented reality and a lack of literature for the purpose of education and informing the users about how to use and apply augmented reality could be considered as the biggest drawback of this technology. Also, there are none of the measuring instruments and the criteria in existence by which it should be demonstrated concrete benefits for the consumers of augmented reality and the companies. It is possible that some of the side effects, such as dizziness or nausea, may occur on the first prolonged encounter with augmented reality. However, according to previous user experiences these are transient and short-term effects that result from the human body's habituation and adaptation to novelties from the environment[22]. For the purpose of the long-term impact analysis, it requires a longer period of application and use of augmented reality technology. All those who follow sports especially football have had the opportunity to see one of the applications of augmented reality in everyday life. The offside line in the broadcasts of football matches on real images of football fields is an actual example of the application of augmented reality in everyday life. Augmented reality has globally shown a full range of its capabilities through Pokemon Go play, and thus clearly confirmed that it is a bigger hit than virtual reality, which may be due to the fact that it does not create a complete world around us but simply implements particular details within what is actually around us. And that is why this technology is revolutionary for retail[23]. It is actually the smaller stores that have the chance to compete with the biggest „players" in their industry, with the help of augmented reality. With the help of AR, retailers can allow their customers to try on shoes or clothes and see how they fit without actually doing so in the wardrobe. In this way, the sales process itself can be significantly simplified and accelerated; and with the warmth of customer's home one can enjoy online shopping having the same shopping experience as if we were in a real sale place.

Globally speaking, the trend of introducing automatic cash registers has been present for the last fifteen years, and in the past few years it has also appeared among retailers present in the Republic of Croatia. The German retail chain Real has introduced automatic cash registers to about forty of its stores in 2004[24]. The first retail chain in Croatia to introduce automatic cash registers was the Slovenian „Mercator", followed immediately by the domestic retail chain „Konzum". The primary goal of introducing automatic cash registers in retail facilities was to speed up the process of payment of selected products, without the subjective influence of employees at the cash register on the payment process itself. The process of introducing cash registers itself has encountered with many difficulties, primarily the resistance from employees who saw them as a threat to their jobs, as well as distrust of older customers in such technological solutions. The disadvantage of automatic cash registers is that they offer only the possibility of paying by card. During the period of application, significant benefits of automatic cash registers have been shown for those customers who buy only a few items and pay by a credit / debit card, thus significantly saving time they spend at the cash register. Automatic cash registers show their benefits at the largest sales formats and with the younger customer population, while in smaller sales formats, classic cash registers with sales staff still have an advantage. In the Republic of Croatia, today it is very rare to come across to the point of sale that have implemented automatic cash registers. The continuation of the development of automatic cash registers is moving in the direction of RFID technology, which is becoming a leader for stores[25]. Radio Frequency Identification (RFID) technology could very quickly replace bar codes on products, and product identification will be done wirelessly[26]. In the storage business and application in animals, RFID technology has largely come to life in practice. There are already a number of large stores in America that have become cash-free zones. Amazon has introduced the Amazon

Go concept in its stores where there is no scanning and billing at the checkout but the store itself charges what you choose. Walmart in its store in Dallas allows customers to scan the products they have decided to buy via their smartphones and, when leaving the store, they only show the e-invoice they received via the payment application. By reducing the number of cashiers, traders will significantly reduce their labour costs. It opens their opportunities to invest such saved funds in an additional business improvement or to realize investments in new business. To get an idea of what sizes are involved, we will cite the example of America where about 3.5 million people work at the cash registers. For the Republic of Croatia, there is no exact data on how many people work exclusively at the cash registers, but it is known that about 100.000 people work in wholesale and retail trade in Croatia. In time, cashiers will not disappear from stores, but it is certain that their number will decrease[27]. The fact is that on the four automatic cash registers comes one cashier speaks enough for itself about the savings that this technology brings.

Shopping is no longer a problem and is becoming something that could be very simple in the near future and something that we could do from our households with the help of virtual goggles. We will be shopping in virtual stores very soon. Since shopping using virtual goggles is something new, opinions on it are still divided. Some individuals considered it as a progress, but some are resisting to it just like everything else that comes as a novelty. The younger generation is looking forward to virtual shopping and perfecting it very quickly, while the older generations still see it as something that causes big changes that they are not ready to implement. Virtual goggles preferably have been applied in the gaming industry, and later their application has been implied on a large scale. Their application is versatile, and among other things they are applied in medicine, education, tourism, military industry, etc. The very idea of using virtual glasses began long ago in the 30's of the last century (SF writer Stanly G. Weinbaum wrote Pygmalion's Spectacles, the story of glasses that allows the virtual reality). Shortly after it, virtual goggles developed and are improving day by day and their application is gaining ever more share. As already mentioned, their development began in the early 1990s in the gaming industry where several manufacturers made prototypes (SEGA, NINTENDO, etc.), but failed to encourage widespread production and application due to the fact that the production itself was extremely expensive. In the course of the last twenty years, we have witnessed a huge development of this technology and virtual goggles have become something that is affordable and possible to obtain very easily. Of course, as with everything else, there are different classes and pricing and therefore, different types of goggles with different possibilities of application. What has not yet been sufficiently researched and what is still much talked about is that the use of virtual goggles has harmful consequences and that their frequent use leads to nausea, headaches and some other adverse health effects. This segment of safe use and possible harmful effects are still being researched and scientists are making judgments about whether their use is harmful to users. Virtual product testing is also not something new, but the application has not yet taken on a large scale. Many retailers have to make adjustments so that customers can make purchases in their stores with the help of virtual goggles. In addition to preparing their products, retailers must either develop or implement one of the developed applications to enable customers to try out their products or to make a purchase. Currently, the most developed segment of sales where the virtual goggles make their use is the segment of cosmetics and sales of the goggles, where product development is present day by day and where marketing investments are the highest. The financial results of these companies have enabled the biggest step forward in the development of purchasing through virtual goggles. Sales of cars, white goods, clothing and footwear and other products using virtual goggles are still not so developed, but there are also positive examples. Currently, most major brands are working on the development of applications to enable the smooth sale of their products and to ensure secure shopping for customers. Selling through virtual glasses allows for an additional increase in sales, especially in the time we are living (COVID 19 pandemic). Unlike the online way of shopping, this way of shopping causes a reduction of dissatisfied customers, and thus keep savings, because returns are reduced to a minimum. Virtual shopping in retail is still not sufficiently developed, but day by day offers some new opportunities. With it, to the customers products can be better presented and also customers can more easily meet their wishes and their needs. In a way, shopping using the virtual goggles does not have to be dull experience and can bring a certain fun for the customer when using it. It allows its customers to make purchases outside the stores, and to try certain products before the purchase. The use of virtual goggles can also be within the store itself, where they are used to ensure the testing of certain products, without the need to leave the sales premises. Some of the car showrooms offer virtual goggles for the customers to try and experience driving of a new vehicle models without having to leave the showroom. Using VR is extremely interesting when you want to show some goods that are expecting to arrive to the store in the near future. The buying of travel packages is an interesting experience, because before the packet purchasing, by using VR goggles you can experience the destination where you want to go. Even on the Internet, you can see different places and

[27] Jutarnji list (2020) Cashiers are an endangered species, Accessed January 20, 2021: https://novac.jutarnji.hr/novac/novcanik/blagajnice-su-ugrozena-vrsta-zbog-razvoja-tehnologija-uskor.

destinations that you want to visit. In the course of 2017, virtual reality has becoming accessible to the consumers and it is no longer focused solely on entertainment but also on something that is taking an increase share in our daily lives. The definition of virtual reality derives from the merging of the two worlds: virtuality and reality. Reality represents the world we live in, that is, everything we can experience and feel as human beings, and virtuality represents an area that is close to reality, but the individual is not positioned in the real but in an artificially created environment[28].

A virtual assistant is a person who does work for someone else and for such a work receives compensation. The question is what is the difference between an employee and a virtual assistant. The answer to this question gives us a better picture of who the virtual assistant really is and only when we get to know such thing, we can evoke the meaning of such person. The difference between a virtual assistant and an employee is, first of all that the virtual assistant is not a company's employee, he does not have to work in the company milieu, so we are obliged to pay him only for the part of the work we've agreed on, therefore he works with his equipment and in times when it suits him. Unlike the virtual assistant, the employee is obliged to come to work in a given time, so the duty of an employer is to provide him or her with everything necessary to do the job. Employer shall pay the employee pay when he isn't working, i.e., when the employee has taken a vacation, sick leave, etc. For the Virtual Assistants are presumed to be the persons who are top experts in what they offer for their support. In the Republic of Croatia, there are still a relatively small number of virtual assistants and very few of the employers have heard of them, as well as the opportunities that a virtual assistant can contribute to a company. For the time being, the largest number of virtual assistants is focused on the provision of services such as preparing annual (final) accounts and general activities related to accounting, preparation of presentations and other documents necessary for business companies (such as reports and various business analysis), market research, creation and maintenance of Websites, recruitment services for the new employees, buying and selling services and other types of services. When it comes to shopping with the help of a virtual assistant, we have still not come to the favourable solution, and there are very few examples of this type, but it is to be assumed that in the future we will see examples where companies will hire virtual assistants to make certain purchases for them. For now, what it can be assumed is that some of the companies hire virtual assistants to make a purchase of cars, machinery and equipment, office paper, products and services on their behalf, because they either do not have enough of their own time or knowledge and what is the most important, they do not have enough information's to make the right decision for their company. Those companies that recognize and find quality virtual assistants will surely achieve better results in their business.

Omnichannel is a multiple sales approach that is integrated into one whole and aims to offer a unique user experience. Omnichannel uses multi-channel approaches, while multi-channel approaches do not have to make an omnichannel experience. The multiple-channel approach to sales allows the customer to solely choose through the which channel they will examine the product they are interested in. The customer goes through the purchasing segments and realizes the final purchase when the customer can realize certain benefits for future purchases, but the greatest acquired privilege is the shopping experience[29]. Omnichannel is a way for retailers to combine the online and offline user experience, with the hint of a Web shop and a physical store where customers communicate and interact with the brand. Factors of a good omnichannel system are[30]:

- Convenience; today's customers have little time at their disposal, and therefore it is necessary to organize the ways of interaction with the customers, so that customers will get the requested information as soon as possible.
- Consistency; trust is one of the most important elements of today's buying process, and consistency is one of the most important parts in the process for the trust establishment.
- Relevance**;** today's customer expects that all the information's at his disposal are up-to-date, accurate at all times, that the interaction with the brand is personalized and adapted to customer's shopping habits.
- Empowerment; retailers who act on their customers through all stages from inducing an interest to decision making, for the customer to make a purchase, and also the subsequent customer care by which we actually educate the customers on how to make the best purchase decision.
- Agility; The development of technology is extremely fast and retailers who want to constantly provide their customers with an optimal user experience and to keep them, they need to constantly work on improving their processes. Analytical tools provide an extremely large amount of useful data that can provide information's in which direction to introduce changes and adaptations. Through omnichannel we want to achieve a unique experience of communication and shopping through all the channels (offline, online and mobile), to maximally

[28] Virtual Reality Society (2016) What is Virtual Reality?, Accessed January 10, 2021: http://www.vrs.org.uk/virtual-reality/concepts.html.

simplify processes for customers, digitize offline trading and to improve customer satisfaction and to increase their loyalty.

3. Conclusions

The current situation that is caused by the Covid - 19 pandemic has led purchase on which the majority of customers have used to have developed in some another direction. This is where the development of online shopping has mostly taken place, but at the same time the development of virtual shopping has increased. Although we are still most satisfied when we can try certain products before the decision to actually buy them, we are currently somewhat limited and the shopping on which we are used to has become difficult around the world. The growing popularity of virtual product testing is attempt to make up for the actual departure and shopping we are used to. Every company wants to have better business results and that is sometimes difficult to achieve with the existing employees. There are many examples where companies are forced to look for employees outside the system in order to be able to bring about changes in the business that will enable them an achievement of better results. For the case of the virtual assistant, the agreement on the payment of their service is related to the work the virtual assistant is obliged to do through the period that was agreed in advance. Thus, companies can achieve savings in their business and hire experts for the part of the work that needs to be done during the particular time. With this in mind, some savings can be realised and such resources can be deployed elsewhere in the business. In the future, investing in the development of virtual purchasing is a vehicle that will make it easier to make the purchase itself, but also this investment poses certain risks. For this reason, preparations need to be properly done in order to succeed and realize this way of selling. The analysed examples of forms of digital trade indicate a modern approach to trade that has a tendency of development. Given the fact that the consumers quickly adapt to the use of new technologies and sales methods, trade companies should certainly consider to introduce digital sales methods in their business practice.

QUALITATIVE RESEARCH IN THE DEVELOPMENT AND IMPLEMENTATION OF ARTIFICIAL INTELLIGENCE IN ECONOMY

Ana-Maria NEDELCU[*]

Abstract

We are currently feeling the effects of the Fourth Industrial Revolution (4IR) which has undergone considerable improvements as a result of the advancement of artificial intelligence and its related technologies, as well as other disruptive technologies components of Industry 4.0. The impact that artificial intelligence has had on humanity is spectacular, given that it is a much more present element in our lives than we would have thought. From translation software to virtual assistants (Siri, Cortana, etc.) artificial intelligence makes its presence felt and improves the way we live, communicate and work. Robotics is the most extensive field related to artificial intelligence and deals with the study and development of robots. They have great potential in improving the quality of our lives both at home and at work, and robots that work with human colleagues will help create new jobs and improve existing ones, giving people more time to focus on other activities. Collaboration in the process of work between man and robot will lead to the mutual completion of skills on both sides.

In this paper I will address topics such as artificial intelligence, automation, robotics, the impact of robots on jobs and as a practical part of the paper I will conduct a qualitative research on companies' perceptions of the adoption of artificial intelligence technologies.

Keywords: *Industry 4.0, artificial intelligence, robotics, automation, qualitative research*.

1. Introduction

The concepts of digital economy and technology have been called into question by the movement towards cutting-edge technologies in information, telecommunication and innovation that takes place in the 21st century (Tsyganov, 2016).

The concept of digital economy represents a digital technologies-based economy that mainly utilizes hardware, software, applications and telecommunications in the information technology in all of the economy's domains, as well as the organizations' internal and externa; activities (Domazet, 2017); (Sutherland, 2018). Also, digital economy makes reference to an economy that is based on creativity, market knowledge and a society based on innovation. Digital economy embodies a global level paradigm of the information society that is focused on technological platforms like the Internet, mobile devices being used for the production, distribution and goods or services exchange and consumption in global markets (Tsyganov, 2016); (Balcerzak, 2017).

The European Union Member States are in a conversion to a digital economy. There is a substantial difference between different countries in terms of development, denoted by the deficiency of harmonious relationship between the digital technology advancement level and the time required for their introduction in the business and industry spheres (Galichkina, 2014).

Artificial intelligence (AI) is a field of computer science that designates the development of intelligent machines. Artificial intelligence is specific to both machines (robots) and computers. Some of the activities for which artificial intelligence computers are dedicated include: learning, voice recognition, planning and problem solving.

It is well known that there is no widely accepted definition of artificial intelligence (AI) (Kirsh, 1991); (Allen, 1998); (Hearst, 2000); (Brachman, 2006); (Nilsson, 2009); (Bhatnagar, et al., 2008); (Monett, 2018), consequently, the term "artificial intelligence" being used with many different connotations, in the disruptive technologies field as well as apart from it.

Machine learning represents a fundamental part of artificial intelligence which requires the capacity of recognizing patterns in the appearance of entries concerning unassisted learning (unsupervised), while assisted learning involves numerical regression and classification.

Knowledge engineering is another cornerstone of artificial intelligence research. In order for machines to act in a similar way to humans, they must have pantagruelic information about the surrounding world.

Artificial intelligence can be grouped into four categories, as follows: reactive machines, limited memory, theory of mind and self-awareness.

The first type of artificial intelligence is a limited program of action that has no memory and cannot use its past experiences to change future ones. For example, Deep Blue, IBM's chess program that has limited objectives, analyzes the movements of its competitor and chooses the most advantageous movement.

The second type of artificial intelligence, limited memory can use past experiences to influence future selections. For example, self-driving cars have a section of functions that make decisions based on previous experience. Knowledge changes the actions that will

[*] PhD Candidate, Institute of National Economy, Romanian Academy (e-mail: ana_maria_ned@yahoo.com).

take place in the near future, for example an unforeseen event such as a car bypassing an obstacle on the road.

The third type of artificial intelligence, theory of mind refers to other machines that have personal assumptions, aspirations and goals that influence their decisions. This type of artificial intelligence has not yet been developed.

The fourth type of artificial intelligence, self-awareness embodies artificial intelligence systems that possess the ability to memorize. Self-awareness machines can discern their current state and use the information to deduce the feelings of others. However, this type of artificial intelligence has not yet been developed.

Artificial intelligence (AI) tools and techniques' role in business and the global economy represent a topic of interest, of no surprise, given the recent advances and innovations in artificial intelligence, as well as the products and services becoming more and more ubiquitous that are already widely used. All this has led to speculation that artificial intelligence could introduce radical changes in human life and employment in particular.

2. The impact of artificial intelligence on economy

There is no generally accepted, precise and unambiguous definition of artificial intelligence. This is a generic notion for a large number of subfields, such as: cognitive computing (algorithms capable of reasoning and understanding at a higher level, similar to the human mind), machine learning (algorithms that learn to perform tasks), enhanced intelligence (cooperation between man and machine), AI robotics (artificial intelligence integrated in robots). However, the main objective of artificial intelligence research and development is to automate intelligent behavior such as reasoning, information gathering, planning, learning, communication, and manipulation.

Artificial intelligence is divided into two categories: restricted and general, the first being able to perform specific tasks, and the other any task that would require human thinking.

Recently, there has been an impressive progress in the restricted field of artificial intelligence, mainly due to the large amount of data available, the increase in computer processing power and the progress of machine learning (ML). Machine learning incorporates self-teaching algorithms that learn to perform specific tasks. The basis of this method is the processing of "data training", with which the algorithm learns to recognize patterns.

Deep learning (DL) is an embodiment of machine learning that uses neural networks based to some extent on the human brain and that learns through practice and feedback.

Artificial intelligence will have an enlarging impact on the global economy as the adoption of new technologies increases.

Research and development of artificial intelligence has concentrated for an extended period of time on the elements of reasoning, information gathering, communication and perception (visual, auditory and sensory). This has resulted in a large number of uses of artificial intelligence: virtual assistants, speech recognition, translation programs, text-to-speech programs, and so on.

Artificial intelligence is seen as an engine for economic growth and productivity, as it can increase production efficiency and analyze large amounts of data, thus greatly enhancing the decision-making process.

Artificial intelligence can also lead to the emergence of new services and products, as well as industries and markets, thus stimulating consumer demand and generating new revenue streams.

However, artificial intelligence can also have an extremely disruptive effect on the society and economy. Some speculate that AI could lead to the genesis of super-firms - resource and knowledge centers that could have detrimental effects on the expansive economy.

Artificial intelligence could also expand the gap between developed and developing countries and increase the demand for workers with certain skills, while making other workers redundant. This trend could have significant results for the labor market.

Despite the important advances that have arisen in the artificial intelligence (AI) and robotics' field, artificial agents still do not have the autonomy and versatility to interact properly with realistic environments. This requires agents to face unknown situations at the time of design, to discover multiple goals / tasks autonomously and to be endowed with learning processes capable of solving several tasks incrementally and online.

2.1. Ethics of artificial intelligence

Although artificial intelligence tools present a new range of functionality for companies, the implementation of artificial intelligence casts doubt on ethical issues. Because of the deep learning algorithms that underlie many of the most advanced artificial intelligence tools, they cannot be smarter than the data they receive in training. Since a person decides what data should be used to train an AI-based program, the potential for human prejudice is intrinsic and needs to be meticulously monitored.

The most important human skills that an AI system (a computer or a robot controlled by a computer) must manifest are: reasoning, understanding a given situation, generalization starting from a particular case and learning from previous experiences.

A vital objective in the ethical artificial intelligence development is consisted by the encouraging of general acceptance and trust in AI tools. Concerns regarding the business drivers for capitalizing AI have been expressed in the academic literature (Baldini G, 2018); (Bauer WA, 2019), predominantly

from the most opportune strategies for the development of artificial intelligence (bottom-up approaches and to a considerable degree, hybrid approaches). Apart from that, the media has a notable impact on the process in which issues of interest, regardless of the field, are presented to the public (Racine E, 2005); (Society, 2018); (Chuan C-H, 2019). Consequently, the public opinion in what concerns the artificial intelligence acceptance will most probably be affected by media. Market economy consumers as well as liberal democracy members are the key stakeholders of the technology endorsement, as well as to a great extent, for public policy and legal framework. The public opinion could affect the further development of artificial intelligence and the way the government deals with its regulation. When referring to a considerably stigmatized subject, in some cases there is a discrepancy between the media representation and the public opinion (Ding, 2009). However, this shouldn't be the case of artificial intelligence.

3. Robotization

Artificial intelligence is also the major component of robotics, an integrative scientific and engineering subdivision that deals with the planning, assembly and use of mechanical robots. Robots need artificial intelligence to handle tasks such as manipulating objects and navigating, along with location problems, motion planning, and mapping.

Robotics is an interdisciplinary division of science and engineering, including mechanical and electrical engineering, computer science as well as others that deal with the design, construction, operation and use of robots, as well as computer systems for their handle, sensorial feedback and processing of information. Robots represent physical machines that possess sensors, controllers and motors that have the capacity of being programmed to execute tasks in an autonomous way.

Robots have great potential in improving the quality of our lives both at work and at home. Robots that cooperate with human colleagues will help create new jobs and improve existing ones, giving people more time to focus on other activities.

Robots are also better than humans at repetitive tasks because they do not get tired and have a higher work precision in the matter of numbers or typing certain information at which people often tend to make mistakes.

Humans surpass robots in abstraction, generalization, creative thinking given by their ability to reason and act based on their previous experiences.

However, the goal of robotics is not to replace human labor by automating tasks, but to find cost-effective ways of cooperation in the human-robot association.

Collaboration in the process of work between man and robot will lead to the mutual complement of skills on both sides.

However, there are significant gaps between where robots are today and the promise of a future era of "ubiquitous robotics", when robots will be integrated into the fabric of everyday life, becoming as common as computers and today's smartphones, performing many specializations, tasks and, often, operating side by side with people." (Rus, 2015)

The aim of current research is to improve robots in terms of manufacturing, the ability to handle objects, the way they reason, cooperate with humans and other robots and their perception of the environment.

"Creating a world of ubiquitous and customized robots is a major challenge, but its scope is no different than the problem computer scientists faced almost three decades ago when they dreamed of a world where computers would become integral parts of human societies. " (Rus, 2015)

The range of functionalities was made possible by innovations that came in the design of the robot and the development of algorithms that guide the perception, reasoning, control and coordination of robots.

Robotics has benefited greatly from advances in various fields, such as: data storage, computing, wireless communications, electronics, Internet performance, instrument design and manufacturing.

However, such a confined definition of robots ignores many of the important developments underway. "Robots are the latest expression of the growth and diffusion of ICT and can have a huge impact on the labor market" (van der Berge, 2015)

The term "robots" is referring not only to physical robots, but also to technologies like "softbots", artificial intelligence, sensor networks and data analysis. This is the Internet of Robotic Things, where the internet is extended by the senses (sensors), hands and feet (actuators) and, thanks to machine learning (ML) and artificial intelligence they can also be "smart" machines (Kool, 2015)

"Today's robots can recognize objects, map new environments, perform 'selection and placement' operations on the assembly line, imitate simple human movements, acquire simple skills, and even act in coordination with other robots and human partners. (Rus, 2015)

Robots as well as other machines bear different shapes and sizes (Hueck, 2014) and range from industrial and service robots to artificial intelligence-based robots. Industrial robotics is not yet a considerably developed field. According to the latest figures collected by the International Federation of Robotics (IFR) in 2020, there are 2.7 million industrial robots working worldwide and their number has increased for many years and will continue to do so, but not exponentially (IFR, 2020).

Many of the recent robotic applications do not immediately stand out as such. A car navigation system via satellite and the subway access gates represent examples of robotics.

NASA described the human as being "the smallest, nonlinear, universal 150kg computing system

that can serve all purposes that can be mass-produced by unskilled labor" (Brynjolfsson, 2015). Unlike machines, humans are able to originate useful ideas and new alternatives for problems and have the power of empathy (Colvin, 2015); (Toyama, 2015).

Robots can considerably improve our lives as well as our work, but they cannot fully execute human tasks, or at least not yet. For instance, judges are aided by computer algorithms that seek jurisprudence and help organize material, but judges and not robots, will continue to issue judgments for the time being, because what matters is "the social need for individuals to be responsible for making important decisions." (Colvin, 2015).

Starting with developmental robotics (Lungarella, 2003); (Cangelosi, 2015) and gradually expanding into other areas, intrinsically motivated learning (sometimes called "curiosity-based learning") has been studied by many researchers as an approach to lifelong learning in machines (Oudeyer, 2007); (Schmidhuber, 2010); (Barto, 2013); (Mirolli, 2013). Inspired by the ability of humans and other mammals to discover how to produce "interesting" effects in the environment caused by self-generated motivational signals that are not related to specific tasks or instructions (White, 1959); (Berlyne, 1960); (Deci, 1985), intrinsically motivated open learning research aims to develop agents that autonomously generate motivational signals (Merrick, 2010) in order to acquire repertoires of various skills that are likely to become useful later when specific "extrinsic" tasks need to be performed. (Barto AG, 2004); (Baldassarre, 2011); (Baranes, 2013); (Kulkarni, 2016); (Santucci, 2016).

However, in 4IR we do not operate only with robots - they are the most visible component of this new industrial ecosystem. Basically, in a factory where the principles of Industry 4.0 function, the machines will operate independently or cooperate with people in a production process controlled through digital interfaces by the user and not by workers and whose maintenance, supply and logistics could be managed automatically. Thus, the factory becomes an independent and interconnected entity, which has the ability to collect data, analyze it and make automated decisions. The operation of such a factory depends to a lesser extent on traditional production engineers and more on IT specialists.

Table 1 Layers that form the structure of the sampling base

4. Qualitative research

Due to the unprecedented pandemic situation, the selection of respondents and interviews had to be conducted online via e-mail and specialized platforms for virtual conferences, respectively Zoom. The companies selected for the qualitative research were informed by e-mail and were asked to participate through one or more representatives that are relevant to the purpose of the research.

Participants in the semistructured (interviu semi-dirijat) individual interview were recruited via e-mail in which the recruitment criteria were verified and the attendance at the interview was confirmed.

The recruitment criteria discussed both by phone and in the online interview allowed the selection of those individuals who meet the criteria set out in the sampling process.

- Identification questions regarding some personal data of the interview participants: sex, age, education and income were used.
- At the same time, by the specific question "Are you familiar with collaborative robots, RPA and automation of production processes?", All respondents who answered "no" were eliminated.

The recruited participants were informed of the possible duration of the interview for participation. It was also decided on the date and time.

The interviews took place between February 1 and February 7, 2021 based on the interview guide (conversation guide). The interview guide contains five topics that were covered during the discussion:

- The purposes of using collaborative robots and RPA at the workplace (respectively within companies)
- Workers' motivation to collaborate with robots within the companies where they carry out their activity
- The risk associated with collaborative robots or RPA
- Workers' confidence in robots
- Workers' satisfaction toward the collaboration with robots or RPAs within the companies where they work

4.1. Conclusions and remarks of the qualitative research

The need for exploratory research appears against the background of an atypical reality regarding the adoption of collaborative robots within companies.

Thus, the technique of the semistructured interview conducted on the basis of an interview guide was used, among 26 workers familiar with the robots. The interview followed five main topics on which conclusions were drawn.

All selected respondents are familiar with collaborative robots and RPA and also work with them in the field in which they operate.

Asked about their perception of collaborative robots at work, most respondents agreed that they make their work a lot easier and can also focus on other activities while the robot performs the task for which it has been programmed to execute.

Apparently, the number of repetitive and monotonous tasks is really quite high, and the fact that robots can take over some of these tasks makes labour easier for workers and at the same time considerably reduces the risk of making mistakes even by 99%. Human workers tend to make mistakes when performing repetitive tasks such as entering numbers into a computer.

Along with the benefits, there is also a risk associated with collaborative robots and RPA. Many respondents fear that they will lose their jobs due to the massive automation of certain work sectors in which robots have proven to be much more profitable and efficient than human workers. A robot can take over the work of more than 10 people depending on the tasks for which it is programmed to execute.

Fears also arise regarding the human-robot "symbiosis", as some respondents stated that in some cases they feel compelled to compete with cars instead of collaborating with them. As most respondents have recently started collaborating with robots, they said that this adaptation is difficult and requires a lot of time and patience to reach a mutual completion of the tasks on the part of both human and robot.

Given that they perceive a high level of risk in terms of collaborating with robots, respondents said that they had to improve themselves in the field in which they operate. Precisely to reduce the risk of being replaced by workers who are more familiar with robotics and who know how to collaborate with it. The risk of being replaced by robots is not as high as that of being replaced by more competent people when it comes to highly skilled workers. However, for unskilled or low-skilled workers the forecasts are gloomy in the sense that they may lose their job much easier due to automation (introduction of a robot to take over their tasks).

There is a good level of satisfaction with collaborative robots, in the sense that most respondents consider them useful and even indispensable in the workplace given that they help them by taking over some of the monotonous, heavy, repetitive or dangerous tasks at the same time requiring a human partner (operator) to guide them in performing the tasks.

Of course, there are also reluctant people in the sample used who are afraid of the extent of automation, as it has undergone a rapid evolution in a relatively short time, and what is now present in factories and companies is far from the full potential of automation and robotization.

Most importantly, no respondents stated that they intend to change jobs due to automation, on the contrary, some of them responded that they are willing to specialize in robot-assisted work and unskilled and

low-skilled workers who are the most exposed to the risk of automation of the industry responded that they are willing to undergo training if required or even specialized studies to continue their work in that field.

The use of robots to take on repetitive, monotonous and dangerous activities thus becomes a necessity and comes to the aid of human workers, relieving them of difficult, unpleasant or even life-threatening tasks.

5. Theoretical-Methodological and Practical-Applicative Conclusions

The world is in an era of fundamental transformation which is regarded as the Fourth Industrial Revolution, also called the cognitive era. Artificial intelligence is at the heart of this development, as full-fledged AI has the potential to disrupt every industry in the economy and virtually every aspect of human life in the next 20-50 years.

Today, artificial intelligence is in a period of constant innovation in which new technologies and ideas are emerging. It is transitioning from the advancement of the underlying theoretical concepts (e.g., machine and deep learning, neural networks) to a real impact in a multitude of industries and products. These include areas such as health, retail and e-commerce, transport, finance, national security, energy smart cities and more.

Predictions regarding the impact of artificial intelligence (worth US dollars) may differ, but a common fact is that artificial intelligence will be a disruptive force - not only in every industry and sector, but for society as a whole. Projections show that by 2030 artificial intelligence will have the potential to increase gross domestic product by 10% or more. This is mainly due to product improvements and increased productivity.

The countries which will benefit most from the continued progress of artificial intelligence and its associated technologies are China and the United States.

The current perspective on artificial intelligence now shows that smart cars will become a reality. Today's AI systems respond to voice commands, distinguish images and drive vehicles.

The main limitation of AI is its learning from data and the lack of other ways in which knowledge can be embodied. This means that any data errors will be displayed in the results and any subsequent analysis predictions must be added individually.

In conclusion, the objective of artificial intelligence is to provide software capable of reasoning at the input and explaining at the output. Artificial intelligence will provide human-type interactions with software and support specific tasks, but will not be able to replace the human element.

THE DEGREE OF DIGITALIZATION OF PUBLIC SERVICES IN ROMANIA

Nicoleta PANAIT[*]
Mădălina RĂDOI[**]

Abstract

From the appearance of the pandemic until now, we can conclude that this uncertain and completely atypical period still had a positive impact for Romania, namely the accelerated digitalization both in private companies and in the state administration. The main objective of digitalisation is to contribute to the profound transformation of the economy, public administration and society, increasing performance and efficiency in the public sector, by creating new types of value based on digitalisation, innovation and digital technologies.

The study aims to present and become aware of the reality in Romania regarding the lack of interoperability of IT systems in public administration, the low level of integration of digital technology by the business environment, the level of digitalization skills of the population, etc. According to reports and statistics, Romania ranks last in most of the analysis indicators on the degree of digitization in the European Union. Small and medium-sized companies that have been cross the barrier of technology have had the best chance of identifying new business opportunities during the pandemic.

In this context, it is necessary for public administrations to adapt to new realities and to develop not only services that lead to simplification of processes and increase the speed of execution of works, but especially to improve interaction with citizens, by reducing bureaucracy and providing digital solutions. That they can solve most of their problems without having to make unnecessary trips to state institutions.

Keywords: *digitalization, public services, integration of digital technology, economic growth, public administrations, Romanian Digitization Authority.*

1. Content

The Digital Economy and Society Index (DESI) for 2020, ranked Romania at the beginning of the Covid-19 pandemic on the 26th place in Europe. This is due to the lack of interest of decision makers in the state, the lack of precise planning of the digitization process, the instability at the level of responsible institutions, but also the lack of governmental assumption of this priority.

Table 1. The structure of DESI

No.	SERIES	CATEGORY
1	Connectivity	Fixed broadband take-up, fixed broadband coverage, mobile broadband and broadband prices
2	Human capital	Internet user skills and advanced skills
3	Use of internet	Citizens' use of internet services and online transactions
4	Integration of digital technology	Business digitalisation and e-commerce
5	Digital public services	E-Gouvernment

Source: DESI

Starting with the end of 2019, the digitization process has become one of Romania's main priorities, laying the foundations of a central authority, the Romanian Digitization Authority (ADR), with the main objective of coordinating the process of digital transformation of the Romanian economy and society. This objective represents a fundamental element in order to implement the new development model of Romania and to achieve convergence with the more advanced European states.

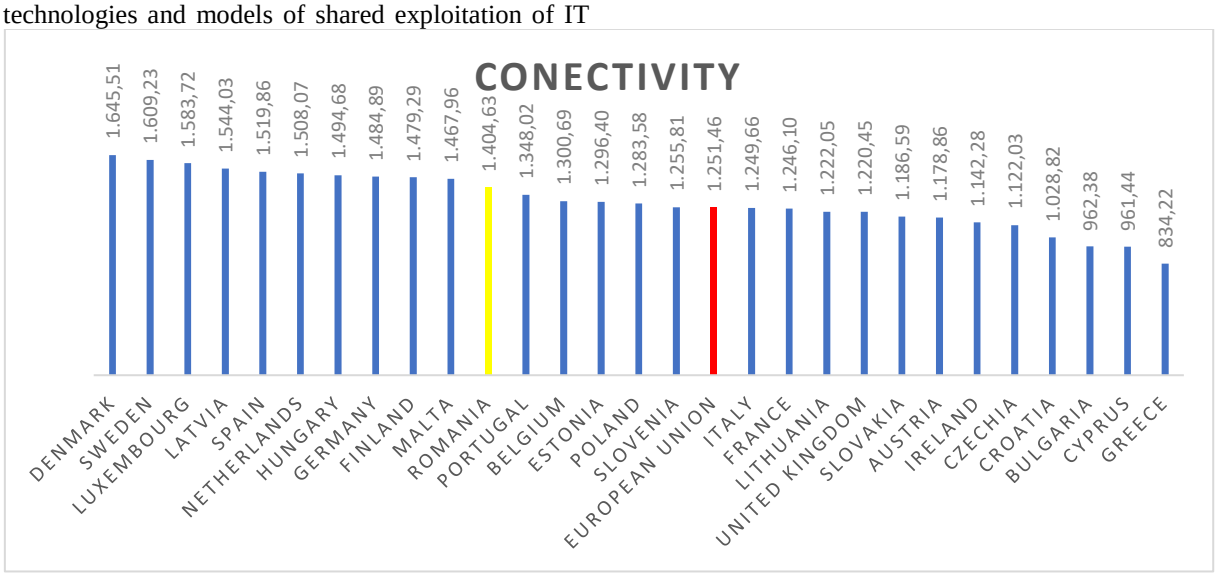
The Authority for the Digitization of Romania (ADR) was established in 2020. It functions as a structure with legal personality subordinated to the Government and aims at: the digitization of the public sector; developing and ensuring interoperability between public authorities and institutions; development of computer authentication systems and interconnection of public computer systems; development of electronic public services; implementation at national level of information systems that provide eGovernment services; operation

[*] Lecturer, PhD, Faculty of Economics and Business Administration, "Nicolae Titulescu" University, Bucharest (e-mail: npanait@univnt.ro).

[**] Associate Professor, PhD, Faculty of Economics and Business Administration, "Nicolae Titulescu" University, Bucharest, (e-mail: radoimadalina@univnt.ro).

of information systems providing eGovernment services; elaboration and implementation of regulations on specific activities of government by electronic means in accordance with European and national strategies in the field of digitization; the operation of interfaces between the computer systems of public institutions and citizens or the business environment, being a gateway to their electronic public services provided by the public administration; implementation of digital services that capitalize on technical mechanisms for certifying authenticity and ensuring data protection; implementation of specific technologies and models of shared exploitation of IT resources, to support the implementation and provision of digital services including on the basis of cloud platforms; implementation and operation of access mechanisms to digital services in a regime of mobility and independence from access technology, in order to maximize their addressability; ensuring cyber security for the public sector; implementation of artificial intelligence in the public sector.

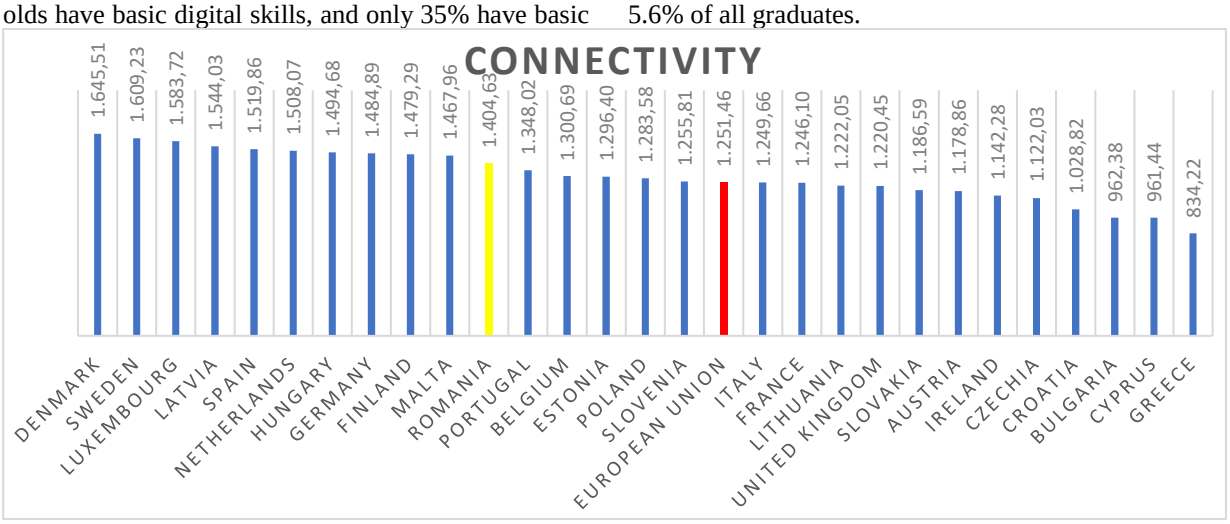
According to DESI indicators, Romania ranks 11th in terms of connectivity. In 2019, Romania improved its results in terms of coverage, but stagnated in terms of use.



Source: DESI

Table 2. DESI values for Connectivity in European countries

In terms of digital skills, Romania ranks 27th out of 28 EU countries. Less than a third of 16- to 74-year-olds have basic digital skills, and only 35% have basic software skills. Romania has good results in terms of ICT graduates, ranking 5th among Member States, with 5.6% of all graduates.

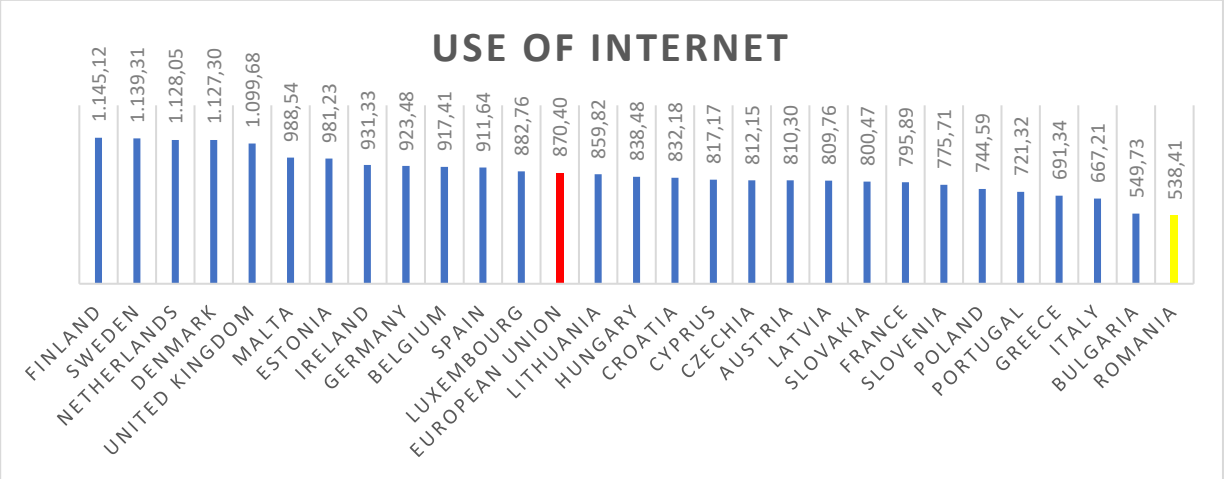


Source: DESI

Table 3. DESI values for Human Capital in Europe country

Regarding the use of internet services, Romania has the lowest level of use compared to EU member states. However, there are two online activities in which Romania ranks first in the use of social networks (82%, compared to an EU average of 65%) and video calls (67%; EU average: 60%). In contrast, the use of online

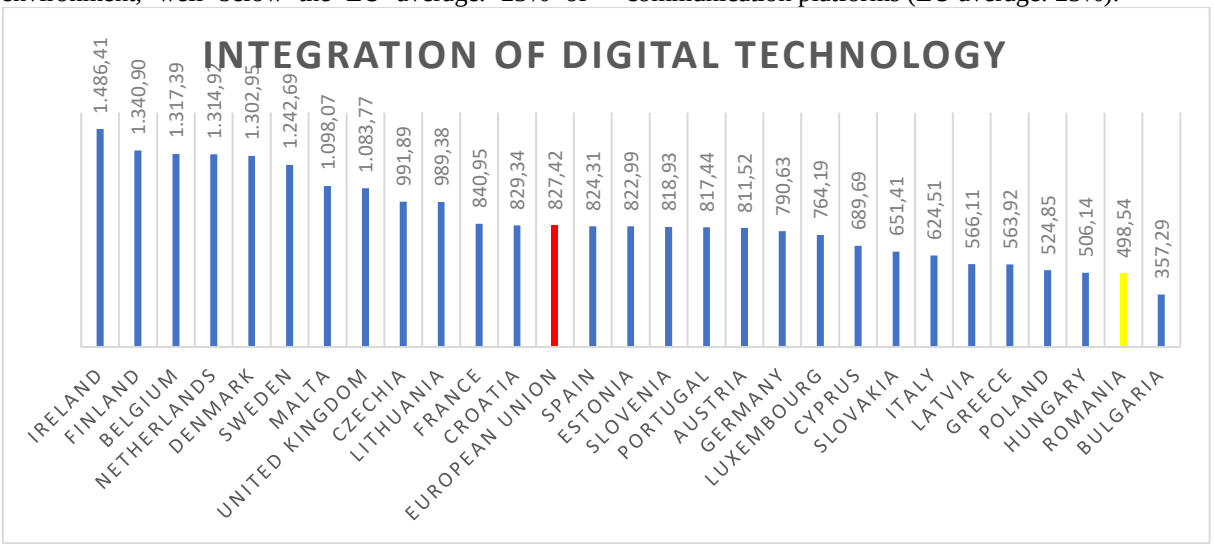
banking (11%), shopping (29%), reading news (55%), as well as the consumption of music, videos and online games (63%) are the lowest among EU Member States, mainly due to a lack of confidence in digital technology. The low level of use of online banking services is also due to the fact that more than two out of five Romanian adults (42%) (16) do not have a bank account



Source: DESI

Table 4. Connectivity value on Europe country - DESI values for Use of Internet in European countries

Romania ranks 28th among EU countries in terms of the integration of digital technology by the business environment, well below the EU average. 23% of Romanian companies exchange information electronically, while only 8% use social communication platforms (EU average: 25%).

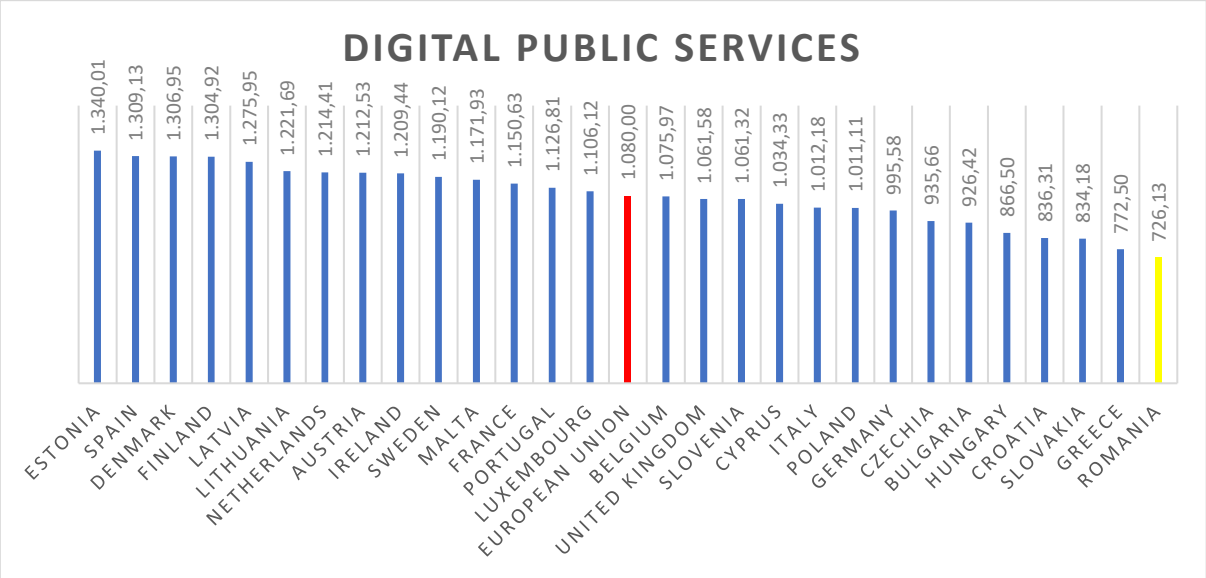


Source: DESI

Table 5. DESI values for Integration of Digital Technology in European countries

Romania has the lowest performance in terms of digital public services, it is at the bottom of the ranking in the EU. In fact, the only online interaction between public authorities and the population is the submission of forms, according to the latest DESI report.

In contrast, Romania ranks 8th in terms of users of e-government services, with 82% of Internet users, compared to the EU average of 67%. However, this high level of online interaction between public authorities and the population only targets internet users who have to submit forms. The low scores obtained on pre-filled forms and services performed entirely online, in which the country ranks 28th, indicate a systemic problem in terms of the quality and usability of the services provided. There was no improvement of digital public services for enterprises, Romania being on the last place in this respect as well.



Source: DESI

Table 6. DESI values for Digital Public Services Technology in European countries

The causes that led to a weak development of electronic public services in Romania were: the lack of an efficient and effective IT architecture, the lack of information systems necessary for central public institutions for the operationalization of electronic public services; the inadequacy of e-government and human resources specialists in the IT departments of public institutions and authorities and, consequently, the skills needed to develop and maintain electronic public services and the lack of a uniform and effective legislative and procedural framework to support electronic public services.

In Romania, a series of IT platforms available to citizens are currently active:

- Online Trade Register (ONRC portal);
- The court portal (portal.just.ro);
- The system of the National Agency for Cadastre and Real Estate Advertising for issuing land book extracts (ancpi.ro);
- The national electronic system for online payment of taxes (ghiseul.ro).

Starting with 2020, the listed IT platforms have been streamlined and expanded, as well as other relevant platforms at national level, to strengthen e-government (PCUe), web platforms and applications have been created to provide correct support and information for citizens. and Covid-19 pandemic management companies. Among the IT systems implemented by ADR, in the event of the COVID 19 pandemic, are:

- https://stirioficiale.ro/informatii - the official page of the government regarding the real information in the fight against Covid 19;
- https://cetrebuiesafac.ro/ - the official website of the government with information on how citizens should act if they have symptoms or are sick;
- https://www.datelazi.ro/ - the official page of the government with official data about the official situation about the disease situation, centralized by regions;
- https://aici.gov.ro/ - the official page of the government for uploading online the documents intended for registration, addressed to public institutions that do not have their own online registration system;
- https://diasporahub.ro/ - the official page of the government for Romanian citizens and support groups from abroad in emergency situations;
- https://rohelp.ro/ro/ - the official page of the government for non-profit organizations actively involved in limiting the effects of the Covid-19 pandemic.

2. Streamlining the institutions of the public system

In the public administrations in the last year the process of implementation of some digitization projects of the institutions providing public services has been accelerated and administrative processes have been streamlined, in relation to the citizens, the business environment and inter-institutional.

Implement the “once only” principle and the interoperability architecture based on an API management provided by all public institutions that have national data registers. The aim is to identify all the basic registers and create a mechanism for amending this list, ensuring the technical infrastructure so that access to the basic registers can be achieved quickly, securely and flexibly, ensuring the confidentiality of data;

In parallel, the electronic signature of public administration officials will be generalized and used by all population, so that they can communicate digitally with companies, reducing reaction time and early correction of possible mistakes.

Introduction of an electronic identity system that will allow full remote interaction with the public administration, with the clear effect of reducing costs, using a unique identity and an SSO (single Sign On) authentication mechanism, including enrolment on this online identification platform being able to be done remotely. The result will be a system that allows zero interaction at the counter for citizens from the moment of enrolment, achieving a reduction in the costs of implementing new platforms and a high level of security for all public services offered online. This e-identity scheme will be notified at EU level and integrated with the European cross-border communication node eIDAS. The national electronic identity system will be open, ready to integrate new types of identities and including to ensure the transition to systems that involve the use of SSI (Self-sovereign identity) mechanisms;

Effective operationalization of a single electronic contact point for citizens and companies by restoring the PCUe and integrating it with the national payment system, ghiseul.ro, in a single platform for citizens. By including all available electronic services and making it accessible through the national e-identity scheme, according to the European regulatory framework, public electronic services will be available and accessible and cross-border based on the eIDAS node. In addition, this approach will generate an increase in the visibility of public services, having as main effect the decrease of the time for the search for information by the companies and the resolution of the different cases.

3. Economic digitalization

For Romania, the potential economic benefits of digitalization would bring a contribution of 42 billion Euros to GDP by 2025. The Romanian economy is dominated by 99% of small and medium enterprises, the speed with which they can be digitized and the digitization that they can achieve, being two elements with far-reaching effects on Romania's competitiveness on the European and global market. Due to the rapid growth of the technology industry at EU level (five times faster than the rest of the European economy in terms of gross value added), digital technologies are disruptively impacting the market dynamics at an increasing speed, creating unprecedented opportunities for European and implicitly Romanian SMEs, enabling companies to innovate, grow and compete using new models and solutions in previous generations of technologies.

Industry can benefit from an indirect effect of digitalization, but with a major impact on the ability of companies to converge on the principles of the digital economy through new business models, business models and a new managerial vision in a new paradigm based on digital innovations and technologies.

The poor level of economic digitalization is also caused by the fact that the process of digital transformation of SMEs has often been misunderstood and reduced to numerous financing programs, assimilated only to simple purchases of IT systems and equipment.

The digital transformation process involves fundamental changes on different levels of a business:

- at process level (use of an increased percentage of automation in production and integration of data in processes and supply chains, leading to increased productivity and resource efficiency),
- at product level (incorporation of ICT in as many product categories as possible) and last but not least
- at the level of business models (smart and connected products lead and adapt to changes in customer behaviour).

The digital economy has the potential to generate major changes and opportunities in a wide variety of fields, such as administrative, social, educational, medical, but also in emerging fields. Increasing Romania's potential to create and innovate digital technologies and, on the other hand, to adopt and use them will generate strategic value on several levels.

The Romanian economy must make a transition as fast as possible to the new economy (Digital Economy) capitalizing on all the advantages of the new industrial revolution. Most SMEs in Romania (1/3 of European SMEs) invest mainly in digital products that allow business optimization, operations, such as Customer Relationship Management (CRM) or Enterprise Resource Planning (ERP), focusing -is on optimizing existing models and processes, without a substantiated business analysis, a simplification of processes, data collection or the use of emerging technologies such as Artificial Intelligence, Cloud Computing, IoT, Blockchain, etc. The fields with the greatest potential for automation in Romania and where we can get the greatest impact are: agriculture, manufacturing, trade and transport.

The European Investment Bank shows that approximately 70% of European SMEs that have implemented a digitization project have used the infrastructure of the regional innovation hub in the region in which they operate, whether or not the SME has a digital profile. Thus, the European Digital Innovation Hubs are the main trans-European tool and vector that the European Commission together with the Member States envisages to drive both innovation and the digitalisation of the economy and the digitalisation of European public administration. Designed as public-private partnerships for digital development, these hubs will be funded mainly through the Digital Europe Program and European Regional Development Fund allocations at the level of each European region and will network to achieve the above-mentioned objectives. up. The Digital Innovation Hubs will highlight the

technological and regional innovation potential to develop digital technologies and tools for fields with a high degree of adoption: industry, public administration, agriculture, healthcare, etc.

The strategic role of the Digital Innovation Hubs is also to define from a geostrategic point of view the role of Romania on a European map, but also a global one of digitalization and technological innovation. Digital Innovation Hubs will become strategic vectors, connected in the European network of Digital Innovation Hubs capable of generating and transferring know-how and generating value in the economy and society.

4. The level of digital education of the population

An important aspect for government action is the development of digital skills in all segments of the population and the workforce. According to the Society and Digital Economy Index published by the European Commission (DESI), here too Romania is at the end of the European ranking, with less than 30% of the population having basic digital skills.

In 2020, the COVID-19 crisis has led education and training institutions around the world to move to distance / online teaching. In a few weeks, the educational landscape in Europe and around the world has changed fundamentally. Teachers, students and parents were forced to adapt quickly to the situation.

For Romania, the COVID-19 pandemic highlighted significant gaps and deficiencies in terms of digital skills, connectivity and the use of technologies in education. In addition, according to the latest Index of the Digital Economy and Society, 42% of Europeans do not have basic digital skills, and the European labor market faces a significant shortage of digital experts. Moreover, the COVID-19 crisis has drawn attention both to the opportunities and risks of online life and to the need for a better and safer digital environment for all, especially for young people under 18.

At EU level, the European Commission, according to the European Competence Agenda for Sustainable Competitiveness, Social Equity and Resilience), has the following objectives: strengthening sustainable competitiveness; ensuring social equity; increasing social resilience; promoting lifelong learning; job skills training; resilience of the economy at EU level.

In the case of Romania, the issues followed by government measures to improve digital skills in education will be the following: investments will be made in the basic digital skills of teachers in regular training programs and in the transfer of IT resources to problem areas and evaluation and modifying the school curriculum to include both age and school-specific digitization hours and the implementation of a digitized teaching mode for all subjects.

5. Conclusions

Through specific mechanisms and activities, it will be necessary to ensure the increase of Romania's capacity to develop and integrate digital innovations and technologies in order to digitize for several fields and sectors of activity, to increase the global visibility, but also to capitalize on the strategic potential that Romania he has it in the IT&C field. These actions will contribute to increasing the quality of life of citizens and reducing costs for companies, by simplifying the interaction with state institutions.

The changes that took place, such as the obligation imposed on public institutions by GEO 38/2020 to accept documents in electronic form and digitally signed, the possibility to send documents and make payments online through the ghiseul.ro or here.gov.ro platforms - represents only the digitization of some services, and not of the administration, which implies a rethinking of processes, interaction, services, etc.

BRANDING IN TIMES OF CRISIS: BUILDING BRAND ATTACHMENT AND TRUST DURING COVID-19

Otilia-Elena PLATON*

Abstract

When a crisis strikes, it is important for brands to react and respond with adapted messages in order to remain relevant during the crisis and beyond. The way brands respond during and after a crisis will have a significant impact on consumer perceptions and also on the sales. During the crisis caused by the COVID-19 pandemic, the world has been faced with an unprecedented situation, quite unlike any other modern crisis regarding its breadth and consequences. The COVID-19 pandemic has had an effect including on brands' performance. Brands had to rethink their strategies in order to cope with this situation and to limit the impact of the crisis. Companies have started to create marketing campaigns and activities that show how they are helping during the crisis. One of the early responses to the pandemic was a rush by brands to educate consumers about the need for social distancing and about the need to comply with the protective measures to prevent COVID-19 transmission. As the situation evolved, brands aimed to create a solid position from which to respond in a meaningful way to world events and to consumer needs. The aim of this paper was to identify the ways brands responded during this crisis. Also, this paper aimed to investigate, through a secondary data exploratory research, the aspects that matter more for consumers during this time of crisis and confusion, and to identify what type of marketing messages have an impact on consumers' trust in a brand.

Keywords: *COVID-19, brand trust, brand attachment, branding, crisis.*

1. Introduction

An essential element of a company's success is the relationship that a brand has managed to build with its customers. Loyal, satisfied consumers, who maintain a long-term relationship with the brand, ensure the stability of a company. In this sense, companies must give great importance to brand management and to the process of building a solid consumer-brand connection.

In a normal, stable market context, in which the evolution of processes is predictable, a company must develop brand management strategies taking into account two categories of elements[1]:

- *Tangible elements* - the product itself, its packaging, price, etc.
- *Intangible elements* - the experiences offered, the customers' relationship with the brand, the brand values and the value offered to the customers, the level of trust in the brand, etc.

By combining these elements, a brand manages to create a certain image in the minds of consumers, it manages to be associated with a certain user experience and to gain the attachment and trust of consumers.

When the situation on a market becomes unstable or unpredictable, companies can face more easily unforeseen situations or even crises, caused by various factors, and the relationship between consumers and brands can be easily affected. In such situations, companies should focus primarily on intangible brand elements because crises generally lead to a dramatic decline of consumers' trust in brands[2].

According to a Deloitte study conducted on 1000 respondents, emotional factors inspire brand loyalty and "83% of customers believe that trust is the first emotional metric that influences brand loyalty"[3], while rational factors play a key role at the beginning and in the end of the customers-brand relationship.

"Brands, like people, form relationships with consumers and other stakeholders built off trust, reputation and recommendation."[4] In general, "the trust that consumers place on a brand is a mix of empathy (based on positive experiences offered by the brand) and pragmatism (the usefulness of the products, in relation to their needs)"[5]. During a crisis, however, consumers often re-evaluate their priorities, and the emotional factor is minimized, so that pragmatism comes to dominate purchasing decisions[6].

The crisis caused by the COVID-19 pandemic is no exception. During the last year, the world has been faced with an unprecedented situation, quite unlike any other modern crisis regarding its breadth and consequences. The COVID-19 pandemic has had an effect including on brands' performance. In the last year, a series of important changes in consumer behaviour have been observed. Relationships with brands have been under greater pressure and companies have had to rethink their brand strategies to meet new

challenges. Brands had to adapt their strategies in order to cope with this situation and to limit the impact of the crisis because the way brands respond during and after a crisis will have a significant impact on consumer perceptions and also on the sales.

The aim of this paper was to identify the ways brands responded during this crisis. Also, this paper aimed to investigate, through a secondary data exploratory research, the aspects that matter more for consumers during this time of crisis and confusion, and to identify what type of marketing messages have an impact on consumers' trust in a brand.

2. Brand management in times of crisis

In general, "a crisis is an unexpected situation that calls into question the organisation's responsibility to its public and threatens its ability to continue its activities normally"[7]. A crisis implies the existence of negative effects at both the material level (sales, production, etc.), and the symbolic level (deterioration of the image of the organization, decreased consumer trust, etc.).

Since 2020, the entire world is experiencing a great challenge, the society and the economy have largely been brought to a standstill and the COVID-19 crisis is affecting every aspect of our lives. It is already obvious that the COVID-19 crisis has substantial consequences for our way of living, working and shopping, and more specifically for consumer behaviour. All these changes affected many businesses. Furthermore the COVID-19 crisis is continuing to have a transforming impact on the lives of consumers and on the activity of businesses. In this context "it would probably be a mistake to assume things will simply return to 'normal' post COVID-19. It would be equally wrong to suggest that the world has been changed forever, but one can reasonably expect a change in multiple areas of consumption going forward, at least in some categories."[8]

In 2020, Edelman, a global communications firm, conducted a study on 12,000 people from Brazil, Canada, China, France, Germany, India, Italy, Japan, South Africa, South Korea, the UK and U.S regarding the critical role brands are expected to play during the coronavirus pandemic. According to this study, 65% of the respondents have affirmed that "the way a brand acts during the pandemic will have a significant impact on their likelihood to buy that brand in the future"[9] and 62% of respondents said that brands are "playing a critical role in addressing the challenges"[10] of this pandemic. Also, 60% said that they are turning to brands that they absolutely can trust. The study revealed that brands that are perceived to be acting unsympathetically are exposed to a greater risk since "one-third of respondents have already convinced other people to stop using a brand that was not acting appropriately."[11] This study shows that there are negative consumer reactions to the misconduct of brands or companies. This demonstrates that during this period "brands can build a new level of connection with consumers or lose the relationship forever."[12]

In these times of crisis, companies need to adapt their marketing strategies because the COVID-19 crisis is affecting consumer behaviour and thus the way in which marketing can be used. Companies have realized that it is important to react and respond with adapted messages in order to remain relevant during the crisis and beyond. Companies have started to create marketing campaigns and activities that show how they are helping during the crisis. One of the early responses to the pandemic was a rush by brands to educate consumers about the need for social distancing and about the need to comply with the protective measures to prevent COVID-19 transmission. "First of all, we observe that companies are adapting their goals and are launching initiatives designed to contribute to tackling COVID-19. Such activities are referred to as 'purpose marketing' or 'cause-related marketing' and demonstrate corporate social responsibility."[13] As the situation evolved, brands aimed to create a solid position from which to respond in a meaningful way to world events and to consumer needs. "In the face of the COVID-19 crisis, brands must figure out how they can help and what actions can be taken that are consistent with their values and abilities."[14] During this period "in terms of messaging, consumers are asking for brands to focus on value, authenticity, social awareness. Brands that clearly communicate a sense of purpose, tap nostalgia and are proactive about social issues will generate greater loyalty and minimize the negative impact of the pandemic."[15]

Thus, brands have now an opportunity to strengthen their relationship with consumers and their bonds of trust by "using data to help determine which actions will have the greatest impact on their employees, customers, and communities."[16] According to a Euromonitor International report, consumers are looking for reliable information about COVID-19 and its consequences, and are also looking for stability and emotional connection with reliable companies. During this period, consumers have the tendency to show a

stronger emotional connections mostly with important and well-known brands and to become more engaged with businesses that are characterised by moral and ethical values.

Numerous researches have been carried out and have highlighted the fact that during the pandemic there are a series of communication strategies that will ensure the strengthening of the relationship between the brand and consumers. In this regard, companies need to focus on issues such as[17]:

- *Safety and health* - companies need to assure consumers that all the activities they carry out are responsible and are meant to protect people's health.
- *Responsibility* - companies must transform the business and adapt it to the new context in order to help the business recover as soon as possible after this difficult period.
- *Connecting with the audience* - the audience must be fully understood during this period when people's needs change in real time and emotions become stronger than in normal times.
- *Transparent, positive communication* - companies must rely on correct information during this period and send positive messages of hope and confirmation that things will evolve well.
- *Concrete, authentic actions* - consumers will appreciate actions that demonstrate a real involvement of a company in today's problems. However, it is important that these actions are in synergy with the brand identity and are authentic.

In communication campaigns, companies must have a clear vision, set a mission, and identify the values they want to rely on. In their relationship with consumers, it is advisable to communicate naturally, sincerely, transparently and to show that behind the brand are people with common needs and aspirations as consumers, meaning that the brand has to be humanized. It is also necessary to strengthen the presence on social networks. In this respect, digitalization is more important than ever. This will satisfy the need for connection that people feel stronger during this period.[18]

3. Building brand trust during COVID-19

Brand management strategies must be supported by a constant and effective communication process that will help build, strengthen and develop consumer trust in the brand in times of crisis. Trust plays a central role in this process because "it gives consumers confidence when choosing to engage with a brand. A fundamental component in building trust in today's environment is keeping a pulse on consumer behaviours, drivers of brand preference, and how brand actions influence perception. Ultimately, it's knowing how your consumers want to be engaged - and then delivering against their expectations."[19]

A brand strategy designed to ensure its resilience in the market during this period must take into consideration five attributes, namely[20]:

- *A brand must be risk tolerant*: this means that a company must assess risk from the combined perspectives of protection, management and opportunity. Brand management involves identifying the risks that "the brand needs to prepare for, which it needs to mitigate, and which can help the brand grow and thrive through uncertain and prosperous times alike."[21]
- *A brand must be built to serve*: this means that a brand must provide value to its customers, but also it needs to receive value in the form of trust or attachment.
- *A brand must be values led*: this means that a brand's identity must be built on a solid set of core values, aligned with the company's goals and the brand's broader purpose.
- *A brand must be connected*: this means that a brand should cultivate meaningful relationships with its consumers across multiple media, using appropriate communications and engagement.
- *A brand must be adaptable*: this means that a brand should be "able to respond, pivot, evolve and transform based on changing conditions caused by severe disruption. Being adaptable requires flexibility in how the brand responds, acts and anticipates the needs of its audiences."[22]

In order to better understand the impact of COVID-19 on consumers' trust in brands, Qualtrics, an experience management company, conducted a study on more than 1000 U.S. consumers to test what actions can be taken to build and keep trust among customers. As shown in Table 1, consumers will trust brands that don't take advantage of a crisis to maximize their own profits, that take care of their employees and customers, and that act in a way that demonstrates a real involvement in today's problems. On the other hand, consumers find less impactful the messages of hope, optimism, nostalgia or even statements about strong moral principles. The study showed that 65% of consumers indicated that "during this crisis a brands' actions have a significant or major impact on their trust in that brand."[23]

Table 1. Factors that make consumers trust brands more in the midst of COVID-19

They don't take advantage of a crisis to maximize their own profits	33%
They take care of their employees	24%
They take care of their customers	24%
Maintain reasonable pricing	22%
Go above and beyond the safety standards and recommendations	21%
Don't overreact or underestimate the circumstances	19%
Help keep me and my loved ones safe	18%
They give back to the community, particularly in times of need	18%
They communicate in a transparent and timely manner	16%
They are among the first to respond in a time of crisis	14%
They represent strong moral principles such as integrity	13%
They demonstrate expertise in their industry	13%
They have established track record of responding well in times of crisis	12%
They deliver a message of hope and optimism	12%
They empathize by showing compassion	11%
They provide a sense of hope	4%

Source: Qualtrics, "How your brand".

The current COVID-19 pandemic has resulted in a series of brand messages that are based on concepts such as human connection, care and community. Companies understood that building brand trust in a time of crisis can make or break a brand and this will ultimately have lasting effects on their brands. Ultimately, brands that fail to take action during this period put their reputations and trustworthiness at risk[24].

The study conducted by Edelman[25] highlighted a number of important issues regarding consumers' expectations during this period. The study showed that most of the consumers (84%) would like brands to offer solutions and focus on how they can help people to cope with pandemic-related life challenges. Consumers (77%) think that companies should communicate in ways that show they are aware of the crisis and the impact on people's lives. Consumers (84%) consider brands as a reliable source of information during the crisis and they are willing to receive brand messages in order to remain informed. Consumers (85%) would like brands to use their power to educate and to offer instructional information about how to protect yourself during this pandemic. Brands should also use their power in order to bring people together at this difficult time. Consumers (84%) think that brands should use social channels in order to facilitate a sense of community, to show empathy and offer support to those in need. A large part of consumers (65%) find it comforting and reassuring to receive from the brands they use messages about what they are doing in response to the pandemic. "In short, respondents believe that brands can and should make a difference throughout the Coronavirus crisis"[26].

4. Conclusions

This global COVID-19 crisis has fundamentally changed a series of aspects regarding how consumers think, behave, and buy products and services. Since this crisis shows no signs of a rapid return to normal, many companies adapted or changed their brand strategies and took into consideration the fact that the way a brand responds to this crisis will have a huge impact on consumers' likelihood to buy that brand in the future. Given the fact that creating trusted relationships is an important objective for every brand, companies have adapted their messages in order to grow an emotional connection and to maintain a long-term relationship with consumers during this period. Many brands position trust at the center of their marketing efforts, since emotional connection is vital to customer loyalty, and customer-brand relationship needs to be built on more than rational factors. During the last year, consumers didn't judge brands based only on their functionality, but also on their wider contributions to society. This period became an opportunity for brands to prove that they put people, not profits, first. So, the COVID-19 pandemic can be a transformational opportunity for brand management.

Companies should adopt a holistic approach, regarding how they treat their employees and how they protect their customers. The main message that a brand should communicate is one of real interest to people' needs and desires. Companies must act in the interest of their employees, stakeholders, consumers and society. They should try to solve problems, offers a sense of protection, compassion and care for consumers, and act in the public interest. At this moment of global crisis, consumers want brands to step up, keep us safe, guide us and help us. Brands that act in this manner will manage to reinforce their trust and to strengthen the bond they have with consumers.

To conclude, this crisis is undoubtedly a threat, but offers many opportunities for companies and brands to demonstrate their value for consumers and to facilitate how they deal with the pandemic.

KEY CONSIDERATIONS WHEN DEVELOPING A COUNTRY'S TOURISM BRANDING STRATEGY

Otilia-Elena PLATON[*]
Irina CIOTEANU (IOSUB)[**]
Monica Nicoleta NEACȘU[***]

Abstract

Brand identity, brand positioning and brand image are three of the most important concepts that need to be considered when developing a successful tourism branding strategy. A credible positioning is based on a distinctive and coherent identity, therefore the relationship between these two elements needs to be carefully managed. Also, the brand image is formed following the positioning process, it aligns with the brand identity and it symbolizes the perception of consumers. Thus, the successful development of the national tourism brand of Romania is dependent on the ability to create a coherent identity of the country and a distinctive positioning as a unique tourism destination among the competitors in the region that offer similar travel experiences and benefits. In this context, the paper presents the methodology, main results and conclusions of a quantitative research, that was conducted among 246 respondents in order to validate a conceptual model regarding the relationship between brand identity, brand positioning and brand image in case of Romania's tourism brand. The model was designed considering the most important determinants of the national tourism brand identity, namely the brand attributes, the brand iconography and the brand personality, and also of the brand positioning, namely the differentiation elements and the target group. The brand image took into consideration the benefits and associations made with the national tourism brand. The analysis and validation of the proposed conceptual model was accomplished using structural equations modelling.

Keywords: *national tourism brand, tourism marketing, brand identity, brand positioning, brand image.*

1. Introduction

In the context of globalization, which has led to the accelerated development of countries under competitive pressure and, at the same time, of international market positioning, country branding and building a national tourism brand is a matter of great importance and complexity. Although it is based on principles very similar to product or service branding[1], country branding presents a special complexity and it represents a long-lasting process consisting of a set of programs that help a country differentiate itself from other countries[2] or, in other words, a process through which the destination develops and promotes a different identity from other destinations with which it competes[3].

Taking into account the importance of this topic, this paper aims to focus on three of the most significant elements that contribute to developing a successful national tourism brand, namely brand identity, brand positioning and brand image. Analysing the relationship between these elements has the role of pointing out how those three key branding elements support and influence each other. The paper presents, besides a number of theoretical aspects, the results of a marketing research whose purpose was to define, test and validate a conceptual model that aims to analyse how the attributes, the iconography and the personality of the national tourism brand influence the identity of the national tourism brand of Romania and then in what way the identity of the national tourism brand influences its positioning and its image.

2. The relationship between brand identity, brand positioning and brand image in case of a national tourism brand

In a narrow sense, a destination brand is "a name, a symbol, a logo, a keyword or any graphic sign that identifies and differentiates the destination"[4]. In a wider sense, a destination brand expresses the promise of a memorable travel experience that is uniquely associated with the destination, thus serving to strengthen the link between the visitor and the

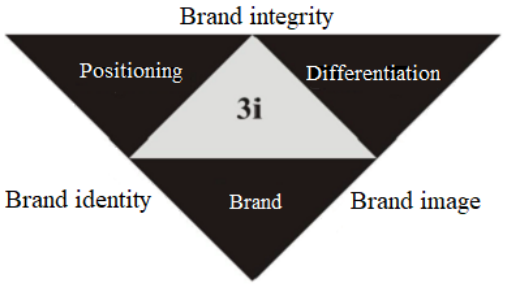
destination[5]. Viewed from the visitor's perspective, the destination brand refers to the personality of the place and the emotional relationship that is established between the destination and the visitors[6]. Therefore, the destination branding is a powerful marketing tool[7], which establishes the link between individuals and places or countries and ensures the visitors of the quality of the experience, while providing a way for destinations to establish a unique proposal in the minds of individuals[8].

At the base of building a country's tourism brand there are two key concepts: the identity and the image of the country, "brand identity and brand image being the ingredients needed for a successful destination branding"[9]. Brand identity must be understood as being created by the organizations dealing with the destination marketing, while brand image exists primarily in the minds of consumers. The identity of a tourism destination can be defined as "the main mean of identification, but also the source of the associations made by the consumer"[10], the identity being the one "creating a relationship between the brand and consumers, proposing a value that consists of functional and emotional benefits"[11]. The ultimate goal of any marketing program designed to develop a national tourism brand is to interweave the identity and the image so that the brand image to be a reflection of brand identity. Thus, destination marketing must reduce the gap between what an area truly is (identity), what visitors think about it (the image) and how it wishes to be perceived by outsiders (the brand or desired reputation)[12].

In the context of marketing 3.0, characterized by value orientation and people viewed as a whole, not only as potential/actual consumers, Kotler, Kartajaya, and Setiawan (2010) define a new brand model focused on three dimensions (Figure 1), represented in the form of a triangle, in which besides the brand, the positioning and the differentiation process, are also included three more elements (3i): brand identity, brand integrity and brand image.

According to this model, it is very important for any brand how it is positioned and differentiated on a market. Through the positioning process, the brand identity is made known and the way the brand is positioned should be unique and relevant to the consumers. At the same time, positioning is in close relationship with differentiation, which gives the consumer the opportunity to check the extent to which the brand promises are respected. Differentiation is generated by the total, functional and emotional, experience which the consumer has with the brand[13]. Regarding the brand integrity, this is in fact the brand credibility, the extent to which it retains its promises, while the brand image represents "acquiring a substantial part of the consumer's affection"[14].

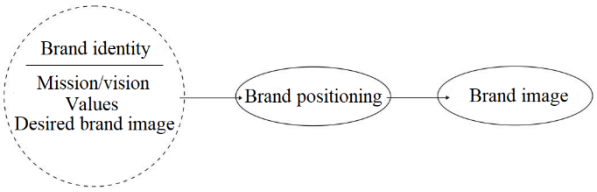
Figure 1. Components of the 3i model



Source: Kotler, Kartajaya, and Setiawan, "Marketing 3.0", 59.

Analysing another model (Figure 2), proposed by Damnjanovic et al., (2009), it can be more clearly and linearly observed the relationship between the identity, positioning and image of the destination brand.

Figure 2. The relationship between brand identity, brand positioning and brand image



Source: Damnjanovic, Kravic, and Razek, "Tourism Branding", 107.

This model proposes a framework for building a branding strategy for a destination. According to this model, the brand identity is composed of the mission/vision, values and desired brand image, leading to a desired positioning, while the brand image is formed following the positioning process and represents "the current image of the brand on the market"[15]. Positioning involves "identifying the brand elements that are important for a better positioning of the destination brand on the market, as well as an

effective communication to target groups"[16]. Therefore, the positioning strategy "represents the act of designing the offer and the image of a company so that it occupies a distinct and appreciable place in the attention of the target buyers"[17] starting from what already exists in the mind of the consumer.

3. Romania's tourism brand

In 2010, the new tourism brand of Romania was launched, under the slogan "explore the Carpathian garden". The campaign for promoting the new tourism brand was part of a large project, financed by European funds, whose objective was to create a positive image of Romania by realizing and promoting the country's tourism brand and by increasing the attractiveness of our country internationally. The Romanian Ministry of Regional Development and Tourism developed a Model of the National Brand and created a strategy regarding the positioning of the national tourism brand on the international market. Through the National Brand Model the Ministry designed a brand iconography, established and defined the target group, established the frame of reference (namely what Romania can offer to visitors and the benefits that the traveller gets), identified the key differentiators and the arguments that support and determine the credibility of the differentiation elements, and determined the attributes, benefits and brand personality[18].

4. Research methodology

The research presented in this paper aimed to study the influence of brand identity on brand positioning and brand image, in case of Romania`s national tourism brand. In order to achieve this purpose, it was developed a quantitative research based on a survey. Data were collected using an online self-administered questionnaire, on a sample of 246 respondents. Then, data were analysed using structural equation modelling (SEM) through variance method and partial least squares technique. Taking into consideration all the theoretical aspects presented above, the conceptual model regarding the influence of brand identity on brand positioning and brand image in the case of Romania's tourism brand was developed based on the following hypotheses:

H1: There is a direct and positive effect between national tourism brand identity and national tourism brand positioning.

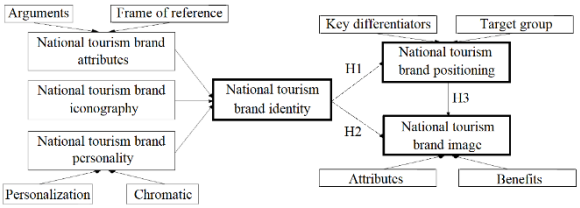
H2: There is a direct and positive effect between national tourism brand identity and national tourism brand image.

H3: There is a direct and positive effect between national tourism brand positioning and national tourism brand image.

Figure 3 presents the three hypotheses, as well as how each variable was formed and measured.

All the variables were measured using a 5-point semantic differential (from 1-to a very small extent to 5-to a very large extent) aiming to determine the extent to which the respondents associated each of the research items with the national tourism brand of Romania. The items used to measure the variables of the conceptual model were adapted from the variables used in Romania's National Tourism Brand Model developed by the Ministry of Regional Development and Tourism, as shown in Annex 1. The relationships between these variables have been proposed taking into account the model of Damnajovic, Kravic, and Razek (2009).

Figure 3. The conceptual model regarding the relationship between brand identity, brand positioning and brand image in the case of Romania's tourism brand



The variable *National tourism brand attributes* is based on the variables *Arguments* and *Frame of reference*. The attributes of the national tourism brand represent the totality of the descriptive elements that characterize the brand[19].

The variable *Arguments* represents "the factors that determine the credibility of the elements of differentiation of Romania"[20] respectively, what Risitano (2009, 7) calls "the culture of the destination brand". This variable is measured based on three items, selected from the structure of the Romanian national tourism brand model, namely: unique Latin-Byzantine heritage; high share of protected nature; one of Europe's most rural countries.

The variable *Frame of Reference* represents the benefits that visitors will gain from their travel in Romania. It is measured on the basis of three items: itineraries for exploration; destinations offering rewarding travel experiences; unpolluted historically loaded areas. The first two items were selected from the structure of the Romanian national tourism brand model and the last item was proposed as a new element

[16] Damnjanovic, V.; Kravic, M.; Razek, T.A. "Tourism Branding Strategy of the Mediterranean Region." *International Journal of Euro-Mediterranean Studies*, vol. 2, no. 1 (2009): 107.
[17] Kotler, Kartajaya, and Setiawan, "*Marketing 3.0*".

[20] MDRT.

that would reflect the attributes of the national tourism brand.

The variable *National tourism brand iconography* is made up of all the representations and graphic symbols that represent the country tourism brand. This variable was measured by two items: logo and slogan, chosen based on the model described by Risitano (2009).

The variable *National tourism brand personality* is composed based on the variables *Personalization* and *Chromatic*. Brand personality has been defined as the sum of human characteristics that are associated with the destination brand.

The variable *Personalization* translates into those human qualities that characterize the brand.

The variable *Chromatic* refers to the totality of the chromatic elements included in the graphic representations (logo) of the brand.

The variable *National tourism brand identity* is composed on the basis of the national tourism brand attributes, iconography and personality. The identity of the national tourism brand is supported by the natural and anthropogenic resources of the destination, but also by the iconography of the brand and its personality[21].

The variable *National tourism brand positioning* is composed of the variable *Key differentiators* and the variable *Target group*. Brand positioning implies "identifying the brand elements that are important for a better position of the target brand, as well as effective communication to target groups"[22].

The variable *Key differentiators* represents the sum of the factors that give uniqueness to a country in relation to other destinations that offer similar travel benefits[23].

The variable *Target group* is made up of those categories of tourists that meet certain characteristics pursued by the national tourism brand model.

The variable *National tourism brand image* represents "brand perceptions reflected by brand associations preserved in the memory of consumers"[24] and is composed based on the attributes and benefits of the tourist destination.

The variable *Attributes* represents the totality of the elements that the respondents associate with the national tourism brand. The variable *Benefits* is represented by the personal advantages that consumers give to the attributes of the brand[25].

5. Research findings

The sample used in this research was composed of 78% women and 22% men, 36.6% were aged between 25-34 years old, 39% were aged between 35-44 years old, 22% were aged between 45-54 years old and 2.4% were aged over 55 years old. Regarding their level of studies, 4.9% were high school graduates, 36.6% were bachelor studies graduates and 58.5% were postgraduates. As to the residence, 97.6% of respondents lived in urban areas, while 2.4% in rural areas.

In order to develop the SEM analysis, it was necessary to evaluate the accuracy of the measurements and therefore it was conducted a reliability analysis based on the internal consistency of measurements for all the variables, using Cronbach Alpha and composite reliability coefficients. As shown in Table 1, all the values of Cronbach Alpha and composite reliability coefficients are above the recommended threshold of 0.7. The Cronbach Alpha coefficients are ranging from 0.727 to 0.929 and the composite reliability coefficients are ranging from 0.802 to 0.966, proving a very good reliability.

Table 1. Reliability coefficients

Variable	Cronbach's alpha	Composite reliability
Arguments	0.727	0.846
Frame of reference	0.792	0.878
Iconography	0.929	0.966
Personalization	0.853	0.896
Chromatic	0.793	0.906
Key differentiators	0.735	0.842
Target group	0.781	0.802
Attributes	0.834	0.884
Benefits	0.919	0.935

The validity of the measurements was tested using predictive, convergent and discriminant validity. Predictive validity was measured through Q-squared coefficients. As shown in Table 2, the values of Q-squared coefficients are ranging from 0.784 to 0.991 and are all above the threshold of 0.1, proving that the scales used for measuring the variables have a good predictive capacity.

Table 2. Q-squared and R-squared coefficients

	Brand identity	Brand positioning	Brand image
Q-squared	0.991	0.784	0,908
R-squared	-	0,808	0,910

The convergent and discriminant validity were determined based on the exploratory and confirmatory factor analysis. Before running the factor analysis, were conducted the Kaiser-Meyer-Olkin and Bartlett tests. The KMO test has a good value (0.530), above the threshold of 0.5. Also, the significance value of Bartlett's test is under the threshold of 0.05, proving that the data are suitable for factor analysis.

The next step in performing the SEM analysis consisted in determining the path coefficients and the p values for all the relationships included in the conceptual model. In this manner it is possible to validate the research hypotheses. The validation of the

[21] Risitano, Marcello. *"The role of destination branding in the tourism stakeholders system: The CampiFlegrei case"*, 7.
[22] Damnjanovic, Kravic, and Razek, "Tourism Branding", 107.
[23] MDRT.
[24] Keller, "Conceptualizing", 3.
[25] Keller, "Conceptualizing", 4.

research hypotheses is possible if the values of the path coefficients are above the threshold of 0.1 and the p values are under the threshold of 0.05. The path coefficients and the p values are shown in Table 3. As it can be seen, all the path coefficients have values above 0.1, ranging from 0.19 to 0.38 and all the p values are under 0.01. Therefore, all the research hypotheses were validated.

Table 3. Path coefficients and p values

Hypothesis	β	p
H1	0,38	<0,01
H2	0,19	<0,01
H3	0,32	<0,01

Also, in order to validate the model, fit and quality indices of the model must be analysed. In this case, the values of APC and ARS associated probabilities must be $p<0.05$ and the value of AVIF is considered acceptable if $AVIF\leq5$ and ideally if $AVIF\leq3.3$. As shown in Table 4, the model is validated.

Table 4. Model fit and quality indices

Indicator	Value	Validation
Average path coefficient	APC=0.400, p<0.001	Yes
Average R-squared	ARS=0.843, p<0.001	Yes
Average block VIF	AVIF=1.945	Yes

6. Conclusions

This article aimed to analyse how Romanian tourists perceive the constituent elements of the national brand and what is the relationship between brand identity, brand positioning and brand image. The conceptual model used in this research was developed starting from the directions outlined in the model of the Romanian national tourism brand, launched by the Ministry of Regional Development and Tourism in 2010.

The most important conclusion that can be drawn is that the proposed conceptual model was validated. The research demonstrated that brand identity has the capacity to influence brand positioning and brand image. Thus, all hypotheses were validated. The model shows that there is a direct and positive link between national tourism brand identity and national tourism brand positioning, the value of the associated beta coefficient being 0.38. There is also a direct and positive effect between national tourism brand identity and national tourism brand image, the value of the associated beta coefficient being 0.19. The national tourism brand positioning has a direct and positive effect on the national tourism brand image, the value of the associated beta coefficient being 0.32.

Another important conclusion is that all the measurement scales that were used in this research are valid and the measurements have a good explanatory and predictive capacity. The R-squared coefficients reflect the percentages of explained variance associated with each latent variable. For the national tourism brand positioning, the calculated value of the determination coefficient R^2 indicates that the variable national tourism brand identity explains the variation of this variable in a proportion of 80.8%. The variable national tourism brand image has a calculated value of the determination coefficient R^2 of 0.910, which indicates that the identity and positioning explain the variance of this variable in a proportion of 91%.

Tourists choose a certain destination according to several criteria, and the image intertwines with the identity during this selection process. A tourist's cognitive and emotional evaluations are comprised of all the tangible and intangible components of that destination. Basically, the choice is based on the particularities of that place, such as certain tourist attractions, natural monuments, etc. (which represent the identity of the tourism destination), as well as certain intangible characteristics, such as the feeling of freedom or relaxation or other benefits (which represent the image associated with that destination)[26].

The process of creating a national tourism brand image is a complex process during which "a country actively seeks to create a unique and competitive identity in order to position itself both internally and externally as an attractive destination"[27]. The research results showed that respondents associate Romania as a tourist destination with attributes such as: rural character, authenticity / originality, welcoming character, spirituality, pure character and honesty, and the main benefits they associate with our country are: the connection to nature, health and relaxation and contact with an intact nature. In fact, the main argument that defines Romania from a tourist's point of view, was the fact that it is one of the most rural countries in Europe, followed by the fact that it has a large area of protected nature. Another important conclusion has to do with the visual identity of the national tourism brand and consists in the fact that the respondents consider that the slogan reflects to a greater extent the tourism brand of our country than the logo used.

The research limits derive from the chosen sampling method and from the size of the proposed sample. Therefore, the sample of Romanian tourists was not representative either in terms of its size nor its structure, the chosen sampling method being a non-probability method, namely the oriented method. For this reason, the research results cannot be generalized at the level of the entire target population analysed. Therefore, the research could be improved by analysing a representative sample of respondents.

Annex 1. Measurement scales of the variables

Variable			Items
National tourism brand identity	National tourism brand attributes	Arguments	Unique Latin-Byzantine heritage; High share of protected nature; One of Europe`s most rural countries
		Frame of reference	Itineraries for exploration; Destinations offering rewarding travel experiences; Unpolluted historically loaded areas
	National tourism brand iconography	Logo	
		Slogan	"explore the Carpathian garden"
	National tourism brand personality	Personalization	Kindness; Elegance; Purity; Maturity; Innocence
		Chromatic	Green; Blue
National tourism brand positioning		Key differentiators	Intact nature/wild landscapes; Hospitable people; Unique cultural heritage; The authentic lifestyle of people living in rural areas
		Target group	I like destinations with intact nature and wild landscapes; I like to travel to destinations with authentic culture features; I like destinations where I can experience the lifestyle of people who live in rural areas
National tourism brand image		Attributes	Authentic / Original; Rural; Spiritual; Welcoming; Pure; Honest
		Benefits	Connection with nature; Health and relaxation; Contact with an intact nature; Discovery and exploration; Simple and good life; Experience of living culture; Contact with people; Escape and slowdown of life; Feeling of courage / adventure; Positive surprises; Respect for people; Safety

MEASURES TAKEN BY STATES IN THE CONTEXT OF THE COVID PANDEMIC AND THEIR EFFECT ON ECONOMIES

Mădălina RĂDOI[*]
Nicoleta PANAIT[**]

Abstract

In the context of the evolution of the epidemiological situation in Romania, like other countries, determined by the spread of COVID-19 and the massive increase in the number of people infected with SARS-CoV-2 coronavirus, starting with March 16, 2020, the state of emergency was established by presidential decree. subsequently extended. The law on establishing the state of alert on the territory of Romania for 30 days was adopted on May 15, 2020 and even at the beginning of 2021 this state of alert is maintained.

By spring 2020, more than half of the world's population had experienced a lockdown with strong containment measures.

Measures taken by states to reduce the effects of the health crisis have been severe, the most important being stopping non-essential activities, restricting travel and banning travel to and from certain countries and causing shocks in production and distribution chains, but also a sharp contraction in demand for a wide range of goods and services.

Beyond the health and human tragedy of the coronavirus, it is now widely recognized that the pandemic triggered the most serious economic crisis since World War II. Many economies will not recover their 2019 output levels until 2022 at the earliest[***]

This paper highlights the strong territorial dimension of the COVID-19 crisis. National government was at the frontline of the crisis management and recovery plan. It reacted quickly, applying a place-based approach to policy responses, and implementing national measures for in response to the COVID-19 crisis. Also, this paper provides examples on policy responses to help mitigate the impact of the crisis on our country.

Keywords: *COVID-19 pandemic, economic crisis, economic growth, evolution of GDP, fiscal impact*.

1. Content

Given the difficult economic context created by the COVID-19 pandemic, the main fiscal response in Romania came from the national budget. EU state aid rules allow Member States to take swift and effective action to support citizens and companies, especially SMEs, who are facing economic difficulties.

Under existing EU rules, any Member State can devise comprehensive support measures. First, an EU Member State, as in the case of Romania, may decide to take measures, such as wage subsidies, the suspension of the payment of income tax, value added tax or social contributions. In addition, it may provide direct financial support to consumers, such as canceled services or tickets not reimbursed by the operators concerned. EU state aid rules also allow Member States to help companies cope with liquidity shortages and need help quickly. Article 107 (2) (b) TFEU allows Member States to compensate companies for damage directly caused by exceptional events, including measures in sectors such as aviation and tourism.

Analyzes of adverse natural shocks over time have shown that the rate of growth in the medium-term post-shock is generally higher than in the absence of shock. The main explanation is the implementation of measures at national, regional and global levels to counteract and avoid the incidence of shocks in the future. In this respect, according to European Council1, a recovery plan for Europe was presented by the European Commission on 27 May 2020. EU leaders agreed on a recovery package which is going to be ready this year. Together with the €540 billion of funds already in place for the three safety nets (for workers, for businesses and for member states), the overall EU's recovery package amounts to €2 364.3 billion. Alongside the recovery package, EU leaders agreed on a €1 074.3 billion long-term EU budget for 2021-2027. Among others, the budget will support investment in the digital and green transitions and resilience.

In Romania, based on the Emergency Ordinance no. 29/2020 and published in the Official Gazette no. 230/21.03.2020, a series of economic and fiscal-budgetary measures were adopted to support the economy and companies, especially SMEs, which may face a lack of liquidity in response to the crisis created by the COVID pandemic, of which the most important are:

[1] EU recovery plan and long-term EU budget 2021-2027 - Consilium (europa.eu).

a. guaranteeing up to 80% of the value of financing granted to SMEs; The maximum value of loans or lines of credit for financing the working capital granted to a beneficiary may not exceed the average of the working capital expenditures of the last two fiscal years, up to 5 million lei, and for investment loans, the maximum value of financing is 10 million lei. At the same time, the maximum cumulated value of the state-guaranteed financing that can be granted to a beneficiary within this facility is 10 million lei.

b. guaranteeing up to a maximum of 90% of the amount of financing granted to micro, small and medium-sized enterprises, and subsidizing 100% of the interest on loans to be guaranteed until 31 March 2021 for both micro and small and medium-sized enterprises; The maximum value of financing is 500,000 lei for micro-enterprises and 1 million lei for small enterprises.

c. during the state of emergency, small and medium-sized enterprises that held the emergency certificate issued by the Ministry of Economy, Energy and Business Environment, benefited from the deferral of payment for utility services - electricity, natural gas, water, telephone services and internet, as well as the deferral of payment of rent for the building intended for registered offices and secondary offices;

d. suspension or non-initiation of enforcement measures by seizure of natural persons, with the exception of enforcement which applies to the recovery of budget claims established by court decisions in criminal matters. Measures to suspend enforcement by seizure of traceable amounts representing income and cash are applied, by the effect of the law, by credit institutions or seized third parties, without other formalities from the tax authorities;

e. suspension of the payment of installments due by persons whose income was directly or indirectly affected by the health crisis to credit institutions until March 31 2021. Debtors wishing to benefit from the suspension of the payment of installments to banks must declare, on their own responsibility, that their income has decreased by at least 25% in the last 3 months prior to the request, by reference to the similar period of 2019/2020. Limiting the indebtedness of the population starting with January 1, 2019 allows the population to adapt more easily to unfavorable developments such as those generated by the current crisis.

f. sending into technical unemployment more than 1 million employees in the economy during the state of emergency due to the partial or complete interruption of activity.

Other European countries have also adopted a number of measures, namely:

1. Poland has introduced the option to deduct the 2020 revenue loss from the 2019 revenue provided that the revenue is at least 50% lower than in the previous year. Research and development (R&D) corporate tax exemption is granted to companies conducting research and development for products aimed at preventing the spread of the COVID-19 pandemic.

2. Italy has adopted a number of measures that are good for the business environment, such as: providing tax incentives for donations made to support measures to combat epidemiological emergencies; suspension of deadlines for civil, criminal, fiscal and administrative hearings; extending the deadlines for submitting the financial statements and balance sheets for the financial year 2019, as well as postponing the submission of fiscal statements. Many regions[2] have adopted specific measures to support their SMEs, which be divided into six policy macro-areas: facilitating access to bank credit and reducing related cost; public financing; simplified procedures; labor and welfare; tax relief and planning and budgeting.

3. Belgium has adopted measures on taxpayers facing difficulties as a result of the Covid-19 pandemic, regardless of the object of activity, which may require various tax facilities: payment in installments of payroll tax, VAT, corporate tax; elimination of late interest, elimination of fines.

4. France has adopted the postponement of the payment deadline for direct tax returns (income tax, payroll tax, local taxes). In addition, if the deferral of payments is not sufficient, given the financial difficulties of the company, it is possible to request a tax reduction, provided that adequate documentation is provided. More[3],[4], regional governments unlocked EUR 250 million (in addition to EUR 750 million allocated by the State) to participate in the National Solidarity Fund for artisans, retailers and small businesses. This National Fund has two components: i) monthly aid to very small enterprises, self-employed people, micro-entrepreneurs and liberal professions experiencing turnover losses of more than 50%; ii) a one-time additional payment for the most fragile small businesses. Almost all French regions have developed support programs for SMES and the self-employed.

5. Bulgaria has given new powers to the Customs Agency to donate confiscated goods, if they can be useful in preserving public health to hospitals. It was also adopted to extend the deadlines for profit / income tax payments for 2019, as well as to extend the deadlines for publishing the annual financial statements for 2019 until September 30, 2020.

6. Hungary has adopted a package of measures for companies in certain sectors of activity (tourism, hospitality, entertainment, gambling, cinema, arts,

[2] OECD Trento Centre for Local development (2020), Coronavirus (COVID-19): SME policy responses - A case study: Italian regions (as of 25 March 2020), https://www.oecd.org/cfe/leed/COVID-19-Italian-regions-SME-policy-responses.pdf.

[3] BPI France (2020), Covid-19: les aides regionales, https://bpifrance-creation.fr/encyclopedie/covid-19-mesures-exceptionnelles/autres-mesures/covid-19-aides-regionales.

[4] Organisation for Economic Co-operation and Development (OECD) "The territorial impact of COVID-19: Managing the crisis across levels of government"; https://www.oecd.org/coronavirus/policy-responses/the-territorial-impact-of-COVID-19-managing-the-crisis-across-levels-of-government-d3e314e1/.

event organization, sports activities, such as: (i) leases cannot be concluded before (ii) the rental price cannot be increased during the emergency period, (iii) for March, April, May and June 2020, employers have been exempted from paying all taxes on income and contributions. granted an exemption from the payment of tax obligations for companies performing passenger services for five months of 2020.

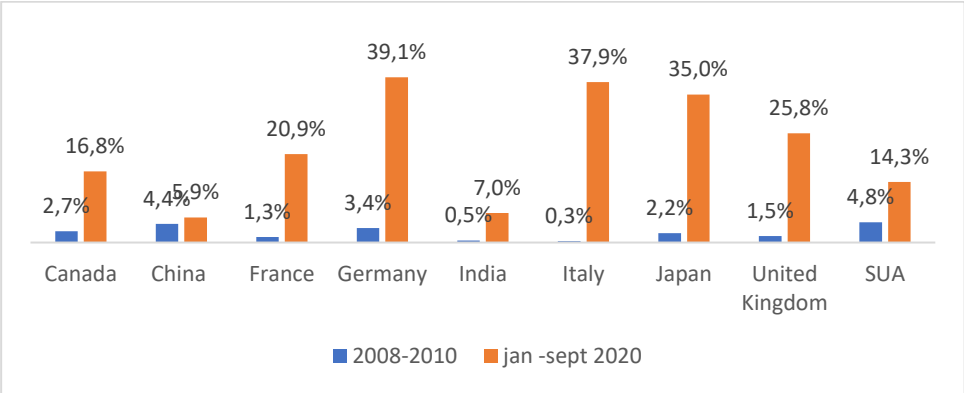
7. Finland has agreed on a package to protect jobs and living standards, as well as to ease economic pressure on companies. The total value of the measures is around EUR 15 billion. The aim is to ensure the liquidity of companies during the crisis and to prevent bankruptcies, these measures being applicable in all sectors of activity.

8. Spain has suspended or suspended until 1 June 2020 the time limits applicable to administrative proceedings as well as to administrative litigation courts. The customs authorities were also able to take any measures necessary to ensure the customs transit of essential goods at all checkpoints and at the border from ports and airports. The regional government of Madrid[5] has passed a financial support plan of EUR 220 million for SMEs and self-employed, to help them cope with the economic impact of the crisis (economic aid and financing schemes). The Basque Country launched a set of measures including an extraordinary fund for SMEs and the self-employed, an emergency credit line at zero cost through the Basque Institute of Finance (IVF), a line of working capital guaranteed by the region at zero cost, refinancing and adaptation of the conditions on repayable advances, technical advice on the implementation of teleworking to freelancers and SMEs.

9. Austria has adopted a reduction in advance payments for income tax or corporate tax for 2020, as far as the expected reduction of the tax base is concerned (possibly up to EUR 0.00, if there is a liquidity problem). No late payment interest will be applied in the event of an additional payment amount occurring during 2020, due to the reduction of advance payments. Late interest and penalties may be reduced or eliminated upon request, as a result of demonstrating the impact of Covid-19 on the taxpayer. All nine Bundesländer[6] set up aid packages for SMEs that complement and expand the measures taken by the federal government. Austria has developed a start-ups support package consisting of a special consulting service by the regional start-up consulting and support council "tech2b Inkubator" and a deferral of active start-up loans from "tech2b Inkubator".

It is well known that fiscal measures can lead to an increase in public debt and budget deficits. National government faces strong pressure on expenditure and reduced revenue, thus increasing deficits and debt. While the crisis has already put short-term pressure on health and social expenditures and on different categories of revenue, the strongest impact is expected in the medium term.

If we analyze comparatively the financial crisis of 2008 with the one caused by the COVID-19 pandemic, we can notice at the Romanian level that the fiscal stimulus rose to values, in general, of over 10% of GDP, in some cases reaching even almost 40% of GDP unlike the whole period of 2008 when the fiscal stimulus was a few percent of GDP to which were added the monetary easing measures.



Fiscal stimulus during the crisis from 2008 to 2010 compared to the COVID-19 crisis (% of GDP)[7]

According to the article elaborated by OCDE[8], there are some examples of COVID-19's fiscal impact on subnational government:

a. in Canada, over the first three quarters of 2020, municipalities may have lost between CAD 10 billion and CAD 15 billion in revenue and unanticipated costs

[5] EU Committee of the Regions (2020), COVID-19 Exchange Platform, https://cor.europa.eu/en/engage/Pages/COVID19-exchangeplatform.aspx.

[6] OECD (2020), Covid-19: SME Policy Responses (as of 15 July 2020), https://www.oecd.org/coronavirus/policy-responses/coronavirus-covid-19-sme-policy-responses-04440101/.

[7] https://www.piatafinanciara.ro/ asf-a-lansat-raportul-de-stabilitate-financiara/.

[8] Organisation for Economic Co-operation and Development (OECD) "The territorial impact of COVID-19: Managing the crisis across levels of government"; https://www.oecd.org/coronavirus/policy-responses/the-territorial-impact-of-COVID-19-managing-the-crisis-across-levels-of-government-d3e314e1/.

including public safety measures and support for vulnerable populations According to estimates provincial governments may have a revenue shortfall of CAD 35 billion in 2020/21 compared to 2019/20 which is representing CAD 1 000 per person.

b. in Germany, in 2020, many state governments saw a sharp deterioration in their budgetary performance given falling revenues and rising expenditure. Behind this are packages adopted by the regions to support local economies and the wish to maintain, and even increase, public investment. It is expected that most states will revert to debt financing to cover their budget deficits, increasing their borrowing needs. According to the Association of German municipalities, the municipal share of income tax fell by 7.4% but transfers from the state governments have increased by 20%. Overall, the funding gap between income and expenditure of municipalities is estimated at EUR 10 billion in 2021, depending on the measures that are taken to mitigate the decrease of municipal revenue in 2021 and 2022.

c. in Italy, the Association of Italian Municipalities (ANCI) developed three scenarios for the loss of municipal revenues due to COVID-19. The first one is a low-risk scenario with a loss of revenue among municipalities of about EUR 3.7 billion (down 9% compared to 2019). This is based on a relatively rapid exit from the emergency beginning in May 2020, where the largest losses would be concentrated on the sectors directly exposed to the crisis, with other sectors recovering relatively quickly in 2020 or by 2021. The second one is a medium risk scenario, with an estimated municipal revenue loss of about EUR 5.6 billion (a decrease of 14% from 2019). Finally, the third one is a high-risk scenario which estimates a loss of EUR 8 billion (a drop of almost 21% over 2019). In this last scenario, COVID-19 triggers a major and long running national and international economic crisis that causes recovery difficulties for all economic sectors.

In Romania, the effect of fiscal measures taken during emergencies and alert on the public budget for the budget is almost 1.5% of GDP which is added over the budget deficit of 4.6% in 2019 as a result of poor revenue collection budget, the high share of rigid expenditures in tax revenues, but also a lower collection of dividends from state-owned companies and the payment of state debts to private companies. The widening of the deficit from 2.8% of GDP in 2018 to 4.6% was determined by a decrease in total revenues of 0.1 percentage points and an increase in total expenditures by 1.7 percentage points.

The increase of the budget deficit has been one of the main drivers of the deepening of the current account deficit in recent years, fiscal easing leading to an increase in household income over domestic supply capacity. In order to provide the liquidity needed to cover government spending, the central bank has reduced its monetary policy interest rate to 1.25% and carried out repo operations as well as purchases of government securities on the secondary market. The reduction of the monetary policy interest rate, in three stages, confirmed the decrease of inflation in the medium and long term, at the end of 2020, the annual inflation rate being 2.1%, the lowest in the last three years.

The state also issued bonds worth 3.3 billion euros at the end of May, the highest amount obtained through an external bond issue, but the interest rate was about 1.6 percentage points higher than the issue of January bonds, indicating an increase in risk aversion by investors. Although the rating agencies kept the evaluation of the Romanian public debt in the investment category, the outlook was changed to negative.

Regarding the evolution of GDP, except for the economic performance in the first two months of 2020, the impact of the pandemic and the state of emergency established by the Romanian authorities since March was felt, thus canceling that strong start. The first quarter of the year brought an economic stagnation (-0.04%, revised data) compared to the level of GDP in the last quarter of 2019.

According to the National Institute of Statistics, the second quarter of 2020 was the worst affected by the pandemic, bringing a record economic decline of 12.2 compared to the first quarter. This figure represents the largest decrease in the quarterly GDP of the Romanian economy, also exceeding the negative quarterly records of the economic-financial crisis of 2008-2009.

After this record decrease, the Romanian economy grew by + 5.6% in the third quarter compared to the previous quarter. Thus, in annual terms, Romania's GDP accumulated a decrease of 5.7%, both on the gross series and on the seasonally adjusted series, compared to the third quarter of 2019, which is at the same time a decrease below the national average. EU (-4.3%).

Regarding the longer-term economic outlook, BBU[9] researchers forecast that the full recovery of the economy in terms of performance in the run-up to this crisis will take about 2.5 years. The most likely scenario at the moment shows that Romania's GDP will return to the level before the pandemic during 2022, this return being conditioned by the production and efficient delivery of the vaccine against Covid-19 throughout the country, respectively the wise use of substantial EU economic support funds. So far, the vaccination strategy adopted at the country level has proved effective, given that Romania is in the top five countries in terms of population vaccinated by early February 2021. In terms of EU funding, Romania is a country with a low rate of contracting these funds, due to lack of submission of projects.

As a whole, the financial system has faced, in the context of the COVID-19 pandemic, a significant

[9] https://news.ubbcluj.ro/perspectivele-economiei-romanesti-in-contextul-pandemiei-pe-baza-analizelor-efectuate-de-cercetatorii-ubb/

increase in uncertainty and a rapid adjustment of risk premiums in the financial markets.

In the context of limiting the spread of the virus, the measures taken have generated supply chain bottlenecks and strong contraction in demand, while financial markets have experienced significant increases in volatility and significant adjustments in financial asset prices. After this virus spread globally and was declared a pandemic, the next day European stock markets reported declines of more than 10 percent, the maximum cumulative losses being over 35% in the first four months of 2020.

These were similar corrections. those recorded during the financial crisis of 2007-2008. By the end of April, more than a third of these losses had already been recovered. Stock price volatility indices reached or even exceeded historical highs recorded during the 2007-2008 crisis. The oil segment was most affected by the decrease in consumption generated by the cessation or substantial slowdown of large economic activities consuming petroleum products and the introduction of social distance measures.

Regarding the Bucharest Stock Exchange, the BET[10] index decreased by about 30% by the end of March, following the evolutions of the main international index, such as S&P 500, DJIA, FTSE 100 and DAX, which experienced decreases of around 35%, recovery of losses in a percentage of approximately 80% - 85% taking place in the next 2 months. During this period, the Bucharest Stock Exchange was in the same trend of high volatility, in correlation both with the number of new cases of illness and as an effect of reducing the activity of enterprises in most fields of activity.

The same strongly negative correlation, of - 0.81, was also found in the case of the evolution of the BET index compared to the evolution of the number of new cases of diseases in China. On the other hand, the analysis of the correlation between the BET index and the number of new cases in the USA resulted in a moderate negative correlation of -0.46, which decreased as the number of new cases of diseases decreased. Thus, the reaction of the local stock market is in the general context of the evolution of international stock exchanges that reacted to the first signs of the pandemic in China, the effects of pandemic transmission later in the US being already absorbed by capital markets.

Overall, the evolution of capital markets was in V, respectively in broad reductions in stock market indices, followed by a fairly rapid recovery, which does not take into account the long-term economic fundamentals, highlighting the decoupling of stock markets from the real economy.

According to the World Economic Outlook Update of June 2020 developed by the International Monetary Fund[11], the following were identified as the main vulnerabilities to global financial stability:

(a) the indebtedness of the non-financial corporations sector to a level above the 2008-2009 values for certain countries,

(b) the sustainability of public debt; and

(c) the indebtedness and maturity and liquidity gaps of investment funds, their portfolios reflecting low-risk environmental risk assessments (especially in the US and China).

Therefore, the IMF and the World Bank have provided substantial resources for liquidity needs and for maintaining the financial stability of states.

2. Conclusions

The balance sheet of the world economy in 2020, the first year of the COVID-19 pandemic in the history of capitalism, is far from being analyzed and understood in depth. The changes it has generated represent long-term trends in the emergence of a new paradigm of the functioning and development of the global economy model, which, at this time, we can only notice without being able to predict in order to achieve a higher degree of predictability.

China was the only major economy in the world to see GDP growth of 2.3% in 2020, although it was the weakest since 1976. Strict measures to stop the spread of the virus have largely allowed part of the Chinese authorities to control the pandemic faster than most states, while massive incentives for local producers have accelerated the production of goods that have been exported to many countries affected by the effects of the crisis.

While the United States has been and is mired in a pandemic and has had a difficult presidential transition, China has continued to promote an extremely active economic policy. An example of this, from mid-November 2020, was the signing of a trade agreement involving the 15 largest countries in the world. respectively from Asia and the Pacific. Certainly, China and the emerging countries from Asia will fare better in the near term.

According to the October 2020[12] IMF report on the outlook for the world economy, even if the global economy is coming back, the ascent will likely be long, uneven, and uncertain. Emerging market and developing economies, excluding China, are projected to incur a greater loss of output over 2020-21 relative to the pre-pandemic projected path when compared to advanced economies.

Global growth is projected at 5.2 percent in 2021 reflecting the more moderate downturn projected for 2020 and consistent with expectations of persistent social distancing. Following the contraction in 2020

[10] https://www.economistul.ro/stiri-si-analize-business/prof-univ-dr-dan-armeanu-ase-impactul-covid-19-asupra-pietelor-de-capital-18037.

and recovery in 2021, the level of global GDP in 2021 is expected to be a modest 0.6 percent above that of 2019. The growth projections imply wide negative output gaps and elevated unemployment rates this year and in 2021 across both advanced and emerging market economies.

Latest world economic outlook growth projection[13]

		projection	
Real GDP, annual percent change	2019	2020	2021
World output	2,8	-4,4	5,2
Advanced economies	1,7	-5,8	3,9
United States	2,2	-4,3	3,1
Euro area	1,3	-8,3	5,2
Germany	0,6	-6,0	4,2
France	1,5	-9,8	6,0
Italy	0,3	-10,6	5,2
Spain	2,0	-12,8	7,2
Japan	0,7	-5,3	2,3
United Kingdom	1,5	-9,8	5,9
Canada	1,7	-7,1	5,2
Other Advanced Economies	1,7	-3,8	3,6
Emerging markets and developing economies	3,7	-3,3	6,0
Emerging and developing Asia	5,5	-1,7	8,0
China	6,1	1,9	8,2
India	4,2	-10,3	8,8
ASEAN - 5	4,9	-3,4	6,2
Emerging and developing Europe	2,1	-4,6	3,9
Russia	1,3	-4,1	2,8
Latin America and Caribbean	0,0	-8,1	3,6
Brazil	1,1	-5,8	2,8
Mexico	-0,3	-9,0	3,5
Middle East and Central Asia	1,4	-4,1	3,5

Nigeria	2,2	-4,3	1,7
South Africa	0,2	-8,0	3,0
Low income developing countries	5,3	-1,2	4,9

In the case of Romania, the recovery of the economy after the medical crisis[14] will also depend on the way in which the existing structural vulnerabilities will be solved. The lax financial discipline of Romanian companies represents a significant structural vulnerability and is characterized, on the one hand, by a relatively high value of arrears in the economy and, on the other hand, by a significant share of companies with a high level of capital below the minimum value provided by the legal framework, their recapitalization need being in a significant amount of almost 34 billion euros.

Another structural challenge refers to the need to avoid the middle-income trap, by looking for solutions to increase the added value produced in the economy, including by stimulating innovation. In order to realize the potential for economic growth, solutions are needed in terms of the demographic problem and inequalities in society. In this sense, we also mention the need for the role of banks in financing the economy to increase, but prudently, the financial intermediation in Romania being on the last place in the EU.

QUALITATIVE STUDY REGARDING THE EVOLUTION OF PUBLIC INVESTMENTS AND PRIVATE INVESTMENTS

Daniela STANCU (ZAMFIR)[*]

Abstract

In this written paper I will conduct a qualitative research on the evolution of public investments and the evolution of private investments.

Qualitative research in the field of public investment and in the field of private investment is introductory and I must say it necessary to go through a few steps: a short introduction; it is important to show the types of qualitative research methods designed in this way and those that have led to the perception of the target audience and the disclosure of the behavior of the target audience; then the research objectives and qualitative research procedures in the field of investments and their applications are established, the outline of the research methodology and the analysis of the details and results, as well as the highlighting of the conclusions.

Keywords: *the public investments, the private investments, qualitative research, the evolution of public investment, the evolution of private investment.*

JEL: A10, O16, H54, P45, P40

1. Introduction

From an economic point of view, the effect of the COVID-19 pandemic on the global economy is negative, as economic activity is reduced by direct government action and decisions to suspend business activity to limit the spread of the virus among many states, including our country.

Every effort must be made to increase the resilience of businesses, to increase the resilience of economic activities and to increase the resilience of public services to the crisis caused by COVID-19. All these efforts must be made in order to return to the activities carried out before the COVID-19 pandemic.

Qualitative research in the domain of public investments and in the domain of private investments has an exploratory character, and in this sense I consider that it is necessary to go through the following stages:

» it is important to highlight the types of qualitative research methods designed in such a way as to lead to the disclosure of the behavior and perception of the target audience;

» the objectives of qualitative investment research must be set;

» qualitative investment research procedures need to be established;

» the methodology of the research must be highlighted;

» analysis of data and results such as;

» highlighting the conclusions.

2. Highlighting the types of qualitative research methods

The results of the qualitative methods are very suggestive, and the conclusions can be obtained quite easily from the data obtained.

The qualitative research methods are the following:

2.1. The interview

Conducting in-depth interviews is one of the most common methods of qualitative research. It is a conversation method that helps to obtain as detailed details as possible from the respondent (from the interviewee).

The advantage of this method is that it offers a very good opportunity to gather accurate data about what people think and what are the motivations behind it. If the researcher asks relevant questions, they can help him collect meaningful data. Interviews can be conducted face-to-face, over the phone or online.

In-depth interview: this type of method is rarely used because interpretation is difficult due to the variety of answers received.

Informal interview: is based on free discussions conducted through a mini-questionnaire, which reveals their own opinions, satisfactions or dissatisfactions. This method provides inconclusive data, has a high degree of subjectivism.

2.2. Focus group

A focus group is one of the qualitative research methods that used in data collection, based on a broad discussion with a limited number of persons, a limited number of participants, selected according to defined

[*] PhD Candidate, The Romanian Academy (e-mail: zamfirdaniela51@gmail.com).

criteria, being active participants in the discussion, the moderator must have relevant skills to facilitate interactions between participants, with the possibility of mutual clarification on the topic, and members subsequently have the option to return to positions as a result of the interaction. At the same time, the moderator allows the respondents to build a conversation, making real-time data, ensuring the correct course of the conversation and the necessary depth.

Focus-group is an expensive method compared to other qualitative research methods, such as online. They are used to explain complex processes. This method is very useful when it comes to market research of new products and testing new concepts, testing new products.

The focus-group interview is an interview focused on a specific topic in a planned discussion, conducted under the attention of the moderator whose goal is to obtain relevant information, respectively feelings, needs, motivations and opinions, being an integral part of the category of quality techniques. data collection for perception analysis.

With the help of this method, qualitative data are obtained that highlight the respondents from a behavioral point of view, their opinions and perceptions regarding the proposed topic.

2.3. Focus group online

An online focus group is one of the newest online research methods used. The most important thing is to conduct business research, consumer research and other research that requires qualitative research online. The COVID-19 crisis has accelerated the adoption and use of this information as much as possible, being an effective technique in managing qualitative information, including using tools such as online communities.

2.3.1. The practices for managing an online focus group are as follows

• *Proper training* - online focus groups are a method of qualitative research considered remote, and detailed, strict planning is needed in relation to the tools used, in relation to the selected participants, in relation to the questions to be asked, so as to achieve the objectives of the research.

• *Appropriate sampling* - Sampling and placing the right people in an online focus group is very important and uses appropriate sampling techniques with appropriate respondents to achieve the highest possible quality of data collection.

• *Sample size* - online focus groups should be between 7-10 participants to get the best information.

• *Rigorous moderation* - The role of the moderator is to lead the conversations in a way that provides the best results in relation to the topic.

• *Online focus group platform* - is one of the most critical aspects of online focus groups is the tool used to provide data analysis and reporting as flexible as possible to meet the proposed objectives.

2.3.2. The advantages of online focus group research

Among the benefits offered by qualitative online focus-group research we list:

• New perspectives due to online discussion groups that can take place at any time, with the ability to monitor information from members.

• It offers another dimension of qualitative research, while traditional focus groups have specific advantages, the ease of managing the information obtained in the case of online focus groups offers fast tangible benefits.

• The absence of restrictions on the time or place of development from a geographical point of view and the low costs compared to those of the traditional focus group.

• Ease of analyzing the data obtained using the tools specific to the online focus group.

• Paid online focus groups, more and more companies are resorting to such ways to recruit and obtain information from people with whom they are most likely to co-operate, with respondents more likely to join and provide opinions, thoughts and to add value to the research process.

2.3.3. Types of online focus groups

Synchronous online focus group (real time): Takes place in real time at a set time, lasts between 30-90 minutes and consists of 6-10 participants who can interact with the moderator and each other in real time.

Asynchronous online focus group: It does not take place in real time, it can take days, weeks, months, years. Users can interact with other users and moderators, respond to surveys and questionnaires, post images, provide video feedback, and more.

3. Case study

It is one of the simplest ways to conduct qualitative research, it is used in collecting the widest possible answers and involves reaching a deeper understanding of the subject.

Ethnographic interviews. It is long-lasting and time-consuming, as it involves in-depth observation to be able to analyze, observe and correlate data. It is the most in-depth observation method that studies people in their natural environment, the goal being to understand respondents, their lifestyle and daily routine, geographical constraints, etc.

The observation. It is a qualitative research method carried out in the environment of the participant, his behavior being very carefully analyzed with the aim of collecting information, collecting systematic data.

Objectives of qualitative research: how investment is perceived, how public investment is perceived, how private investment is perceived, identifying effects, identifying economic and societal changes caused by the COVID 19 pandemic,

identifying ways for economic recovery of companies in the context pandemic.

4. Understanding the investment idea

The investment, from an economic point of view, represents a long-term capital investment in industry, agriculture, trade, etc. It is the current financial effort made for a better future, created through development and modernization, having as source of financing the renunciation of current safe but small and non-performing consumptions, in favor of higher future consumptions and in a modern structure.

Investments are: tangible / tangible investments - represent expenses for the acquisition of machinery and equipment, constructions and others similar, with certain exceptions / limitations regarding the acquisition of land; intangible / intangible investments - represent expenses for research - development, purchase of patents and patents; financial investments - means any investment of capital (money resources) made by a natural or legal person investor, in one of the investment systems offered in the economy: government securities, shares, bonds, real estate investments, mutual fund investments, currency etc.

5. A better understanding of investors with the help of qualitative research

Qualitative research helps us understand how consumers behave when they are interested in a product or service; how consumers behave in different situations; how consumers differ from each other.

Every consumer is influenced by his environment. Social networks are a good example of this phenomenon. Consumers are often willing to share where they are and what they would be interested in. Research is conducted to correctly identify opportunities for future products, services, serves to collect as much data as possible about current or future investors, in order to better address the target audience.

Customer feedback is used to identify customers, identify wishes, etc.

6. Implications of COVID 19

The pandemic COVID 19 made very big changes, both economic and societal, triggered new economic inequalities, geopolitical tensions, negatively affected the entire global economy.

Private equity companies are adapting to ways to save the adversely affected parts of their companies, as well as new directions they could support in their business.

From an economic point of view, the effect of the COVID-19 pandemic on the global economy is negative, as economic activity is reduced by government action and decisions to suspend business activity to limit the spread of the virus among many states, including our country.

All countries that are affected by COVID-19 must show commitment, interdependence and effectiveness in the face of this state of emergency, protecting all affected employees and all affected businesses. Every effort must be made to grow up the durability of the businesses, of the economic activities and of the public services to this crisis, and to be able to do our normal activities as before the COVID-19 pandemic.

In order to be able to specify the ways to reduce the negative effects of the COVID-19 crisis, it is very important the collaboration between the government and the employers' organizations so that the socio-economic crisis caused by COVID-19 can be overcome. The government must be called upon to set up a national committee of private sector representatives, together with trade unions, academia, scientists, and related ministries, to address the negative economic and social effects of the pandemic. COVID-19.

7. Measures to support employees

»Businesses must ensure that all required social distancing measures are complied with in such a way as to avoid meetings that are not urgent (unnecessary), but at the same time maintain the provision of information relating to business safety and security procedures. employees such as: implementing sanitation procedures, disinfecting common areas, increasing the number of hand sanitizers, reducing the number of seats in common areas.

»The government must provide adequate support, especially to households and workers with family responsibilities, during the closure of schools, so that the economic difficulties of the crisis are mitigated until it is eradicated.

»The government must provide financial provisions so that employers can afford the payment of sick leave and unemployment benefits.

»The government must explore the possibility of providing subsidies to enterprises for the immediate stimulation of cash movement and support urgent payments.

»In order to provide a basic monthly income for all workers affected by the COVID-19 crisis, the government should provide wage subsidies and provide social assistance measures.

»During the COVID-19 pandemic, national funds could be accessed at low interest rates.

8. Business support measures

In order to keep businesses running, to avoid job losses for employees, and to ensure that financial support reaches companies during the COVID-19

pandemic, the government is introducing business support measures such as:

»The government needs to expand its support for liquidity and tolerance measures through the tax authorities.

»The government could offer companies affected by COVID-19 a zero-interest loan program.

»The government could provide direct subsidies to enterprises to cover part of the expenses with staff salaries or loss of income.

»A delay of a few months in the payment of taxes and fees must be taken into account, in the context of the crisis caused by the COVID-19 pandemic.

9. Research methodology. Study of young investors' attitudes towards investments

The organization of qualitative research involves the composition of the sample "with the help of theoretical sampling methods" (Catoiu et al., 2009, p. 211).

In the case of qualitative research, we work with small samples.

The sampling base included persons domiciled in Bucharest, both female and male persons, persons aged between 18 and 35 years, persons with low, medium and above average income.

Criteria underlying sampling:

a) Sex:

» The layer of females

» The layer of males

b) Age

» The layer of people aged between 18 and 25 years

» The layer of people aged between 26 and 35 years

c) Income

» persons with net monthly income below 2230 RON

» persons with net monthly income between 2231 - 2500 RON

» persons with net monthly income between 2501 - 3000 RON

» persons with net monthly income between 3001 - 5000 RON

» persons with a net monthly income of over 5000 RON

d) Education

» the layer of people with primary or secondary education

» the layer of people with graduated higher education

The structure of the sample and its specific size (30 interviewees), has the following form:

Figure.1. The structure of the sample and its specific size

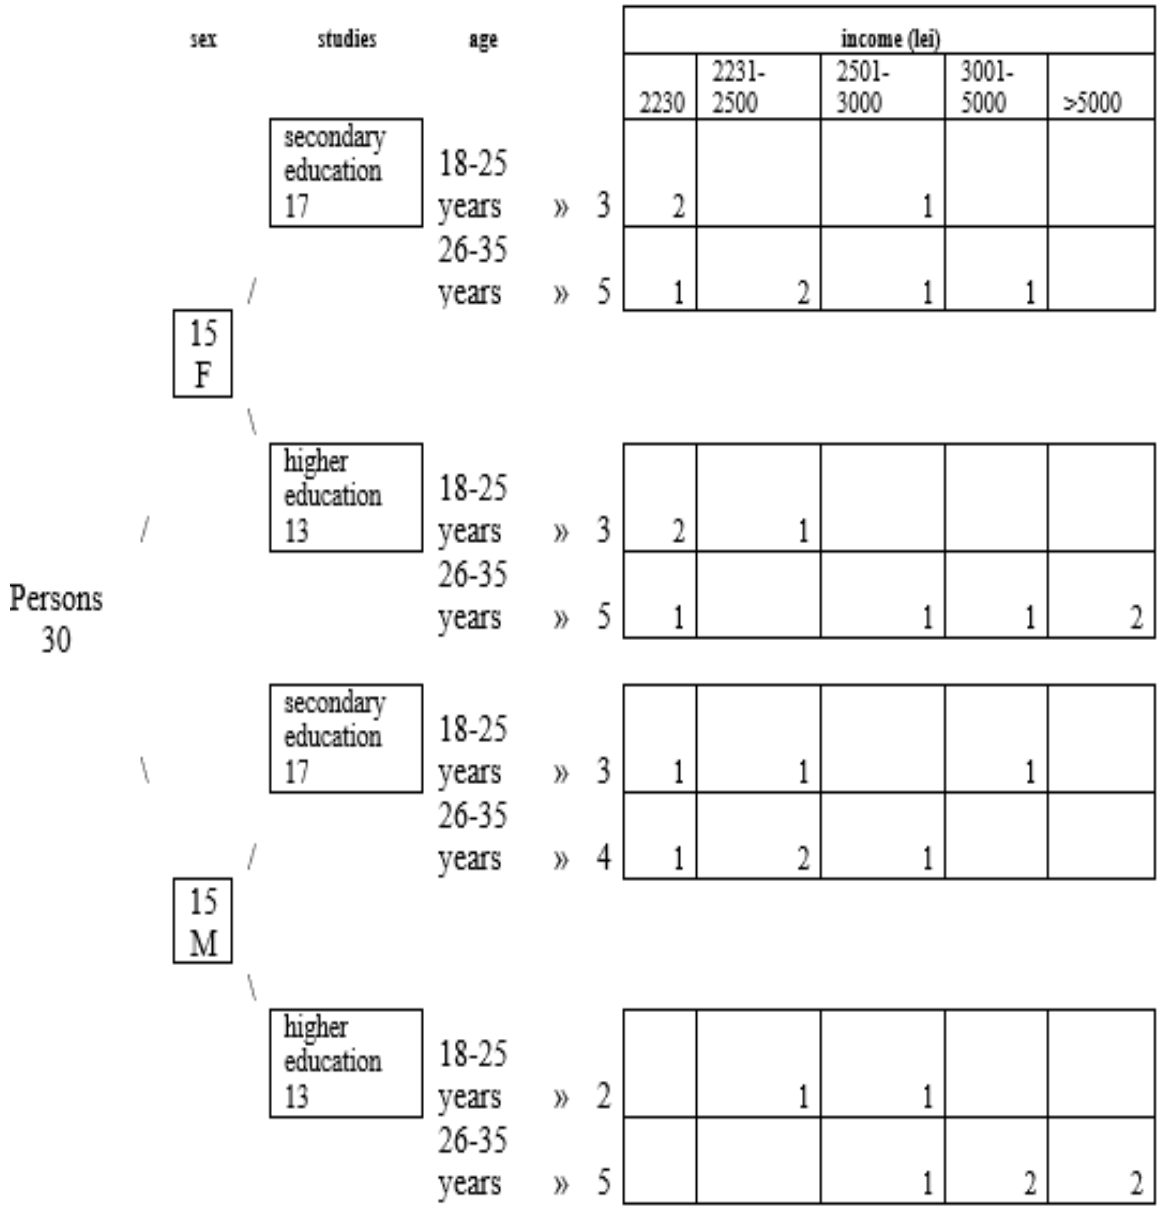

Figure 1. Source: own study

Figure.2. Sample structure

Bucharest City	18-25 years	26-35 years	Total
M (male)	3	6	9
F(female)	5	16	21
Total	8	22	30

Source: own study

Research population: people aged between 18 and 35, from Bucharest.

10. Recruitment of interview participants

Participants in the semi-structured individual interview were recruited through telephone interviews in which the recruitment criteria were verified and attendance at the interview was confirmed.

The recruitment criteria discussed both by telephone and face to face, allowed the selection of those persons who meet the criteria established in the sampling process.

Identification questions were used regarding some personal data of the interview participants: sex, age, education and income.

The recruited participants were informed of the possible duration of the interview. It was also decided on the date, time and place.

11. Modal, spatial and temporal coordinates of the research

Method used: the method used is the survey, the investigate method.

Technique used: the technique used is the half-conducted interview (conducted online).

Research tools: the research tools are the selection questionnaire as well as the conversation guide

Spatial coordinates: given the context of the COVID 19 pandemic, the selection and interview were conducted online through digital platforms.

Temporal coordinates: the questionnaire was applied on 08.02.2021, and the conversation guide was applied on 10.02.2021.

12. Content analysis

The analysis of the information obtained from the interview to draw conclusions was based on the review of the interviews. It was necessary that the data obtained from the interviews be reviewed through domain recordings and notes.

Each topic brought up is treated separately.

Most respondents said that they were interested in investing in order to be self-employed, to generate labor, and then to make an investment through state aid programs. A smaller percentage replied that they want to make an investment with the possibility to take out life insurance, etc.

In descending order, the respondents answered that they are interested in investing in areas with access to universities and the center, safe areas.

Respondents chose to invest primarily based on the purchase price, the area in which the investment will be located, the quality and revaluation in the medium - long term.

13. Conclusions

Research serves us to understand: how consumers are interested about a product or about a service; how consumers it manifests itself in different situations.

I can say that social networks are a good example: consumers are willing to share where they are and what they would be interested in.

Qualitative research serves to collect as much data as possible about current / potential investors, in order to better address the target audience.

The method used is the survey, and the technique used is the half-conducted interview based on a selection questionnaire as well as a conversation guide (the operator must guide the respondent to give reasoned answers without influencing him, and if it deviates from the topic, to direct the discussion to that topic) among 30 respondents.

The interview followed several topics on which conclusions were formulated to highlight the way Romanian respondents think.

Qualitative research is usually the one that feeds different hypotheses.

Customer feedback is used to: identify customers, identify desires, identify investment issues.

DIVERSIFYING OF INVESTMENTS PORTFOLIOS BY ALTERNATIVE ASSETS

Mihaela SUDACEVSCHI*

Abstract

A well-diversified portfolio means investments în stocks, bonds, cash or alternative assets, such as cryptocurrencies, commodities, real estate, art pieces, wine collections or even collections of cars or diamonds. Alternative investments have been used for long time by investors, but these have been diversified permanently, depending on the interest of investors for new categories of assets, depending on the level of demand, as well as on returns and risks of these assets.

The development of the capital market also had the effect of updating the legislation in the field. At the beginning of 2020, the Romanian legislation, aiming to increase investors' confidence in alternative investments, regulated the operation of alternative investment funds, as well as their obligation to request authorization from the Financial Supervisory Authority.

This article aims to present a number of advantages and specifics of investments on the capital market in diversified portfolios, as well as in investment funds.

Keywords: *financial market, alternative assets, cryptocurrencies, portfolio management, alternative investments.*

1. Introduction

The capital market is the market in which financial instruments are sold and bought. Financial instruments are represented by various forms of holdings that can be easily traded on the capital market: shares, bonds, government securities, futures contracts, options, fund units, etc. But investors can also choose to invest in alternative assets as forms of efficient investment, the advantage of which is the low correlation with traditional assets.

One of the basic laws for the investment portfolios efficient management is diversification. This involves investments in different assets across multiple markets, so that portfolio risk can be minimized. Each type of asset has a certain specific risk, but at the same time is accompanied by a certain systematic risk of the market in which it is traded. Therefore, investors need to invest in the most profitable assets in a given market or looking for the most profitable markets at one moment in time for trading securities, and the best solution is to investing in as many types of profitable assets as possible in different markets. Thus, the potential loss of a particular asset will affect the performance of the portfolio only in proportion to the asset's participation in the portfolio.

2. Investments on the capital market

Regarding to investments on the capital market, each investor, depending on his profile (riskofil person or riskofobic person) will choose to build a more or less risky portfolio. Financial securities are characterized by a certain level of profitability and a specific risk, i.e.:

- shares - are risky securities with a level of risk, which is proportional to the specific return, but also to the systemic risk of the market on which they are listed;
- bonds – are financial securities with a lower level of risk, but which, at the same time, will offer a lower level of profitability;
- government bonds (including municipal bonds) – are low-risk securities that offer a minimum return (in minimum risk conditions)

In these circumstances, if the investor seeks to achieve as much gain as possible in the shortest possible time, he should invest in very risky securities. However, prudent management of the investment portfolio requires that only 15% – 20% of the investment be made in very risky securities.

Financial theory describes two models of investment portfolios strategies:

- passive strategy
- active strategy

Passive and active investment strategies properly impose to check if the results meet the objectives. Thus, investment passive manager has to check if portfolio return rate is at the same level as stock index performance. Instead, the manager who prefer to apply an active strategy of the investments and who has to manage the informational efficiency of the market, too, should check if the excess return level achieved is big enough to offset the risk supplement level.

3. Investment portfolio strategies

The decision of how to manage the portfolio (active or passive strategy) depends on whether the manager has access to superior analysts. A portfolio

*Associate Professor, PhD, Faculty of Economics and Business Administration, "Nicolae Titulescu" University, Bucharest (e-mail: msudacevschi@univnt.ro).

manager with superior analysts or an investor who believes that he has the time and expertise to be a superior investor can manage a portfolio actively by looking for undervalued or overvalued securities and trading accordingly. In contrast, without access to superior investor, the manager should manage passively and assume that all securities are properly priced based on their levels of risk.

A portfolio manager with access to superior analysts, who have unique and analytical ability, should fellow their recommendations. The superior analysts should make investment recommendations for a certain proportion of the portfolio, and the portfolio manager should ensure that the risk preferences of the client are maintained[1].

3.1. Passive investment portfolio strategy

(or indexing strategy) starts from the premise that the investor has no information that would make him giving of his portfolio a different structure of the market portfolio, in which case, the portfolio risk is only the systematic risk. Passive investment management involves minimal trading, based on the belief that is impossible to beat averages on a risk – adjusted basis consistently.

The equations underlying this theory are:

$$E(\overline{R}_{pf}) = E(\overline{R}_M) \quad and \quad \sigma_{pf} = \sigma_M$$

Where: $E(\overline{R}_{pf})$ is the expected return for the portfolio, which depends on the expected return of all the assets returns in the portfolio

σ_M is the Variance of the portfolio's return, which depends on the variance of all the assets in the portfolio and the covariance of returns between al pairs of assets in the portfolio

$E(\overline{R}_M)$ is the market return, expressed by the official market index

σ_M variance of the market return

Indexing is a sensible strategy because the security market appears to be remarkably efficient in adjusting the new information. When information arises about individual stocks or about the market as a whole, that information is generally reflected in market prices without delay. But passive management would still be a winning strategy even if markets very inefficient. This is so because winning performance must be a zero – sum. Clearly all stocks have to be held by some of certain investors achieve above – average returns, then it must be the case the other investors are achieving below – average performance. It is clear that all investors cannot be above average.[2]

If the market where portfolio securities are quoted is an efficient market, the only criterion considered for buying them is their relative capitalization. But it is not possible to know if the share's decreasing price is the effect of constitutive factors of securities. Investment passive strategy is considered the most appropriate method for managing a portfolio, in the stock exchange efficiency conditions. The result of choosing this strategy is the elimination of portfolio's specific risk.

Another great advantage of buy and hold strategy is also, the low cost, because broker's commission fees, spreads and other dealing costs become occasional rather than frequent. Passive strategy or buy- and-hold investment strategy means that rather than trading regularly securities are purchased and held for a long time (many years).

3.2. Active investment portfolio strategy

Another portfolio management strategy, opposite of the one, previously presented, is the active portfolio management. In an active portfolio strategy, a manager uses financial and economic indicators along with various other tools to forecast the market and achieve higher gains than a buy- and-hold (passive) portfolio.

Active portfolio management strategy is based on the selection of securities included in the portfolio. Manager will select securities according to their own performance and not according to their affiliation to an index or sector. Active management objective is to achieve higher performance as the benchmark (the stock market's official index).

Accordingly, the return rate obtained by the investment's active management, which involves investing in securities with high return rate and risk is random, being the result of a normal distribution around the average return. (Gaussian function). Managers who adopt this strategy relies on a certain degree of market's inefficiency. They noticed that it could be achieved a higher return rate for very short term, as long as financial asset's price is not steady. Portfolio active management can be applied both on the individual securities, in which case we are talking about "stock selection" (picking) and on various financial assets (from the stock exchange market and from the banking sector), in which case active management is called "active asset allocation". The third form of active management is "market timing", the strategy which is based on expectations of market's return development.

Portfolio managed by an active strategy has fewer titles than the one which is managed by the passive strategy, because requires individual analysis of each title of the portfolio. The active strategy also involves higher costs than the passive one.

4. Alternative investments

Structuring of efficient portfolios implies the existence of a correlation coefficient as lower as it

[1] Reilly, Frank, Brown, C, Keith - Investments Analysis and Portfolio Management (10th Edition), South – Western Cengage Learning, Mason, Ohio, USA, 2012.

[2] Burton G. Malkiel – "Passive Investment Strategies and Efficient Markets" - European Financial Management, Vol. 9. No. 1, 2003, Blackwell Publishing Ltd., 2003.

could be, between the portfolio component assets, so that the fluctuation in profitability or risk of one of them does not influence the financial performance of the other securities in the portfolio. That's why investors are choosing more and more the alternative assets for investing their economies in, aiming to conserve the value or increase the value of their economies. Such alternative assets could be: investments in gold, investments in art objects, investments in various collections (jewelry, machines, wines and stamps), investments in the forex market or, more recently, investments in cryptocurrencies.

One of the methods used for trading alternative assets is represented by contracts for difference (or CFD). Contracts for Difference (CFD) = are complex, derivative financial instruments that operate on the basis of leverage, which does not imply the effective holding of the underlying asset. The underlying asset could be: a commodity, a currency, a stock index, for which a certain fluctuation in the market is anticipated. The investor's aim is to obtain as much gain as possible from the change of the underlying asset price.

Initiating a CFD transaction involves acquiring a long/short position, based on estimates of the price evolution of the underlying asset:

- the anticipation of the increase in the price of the underlying asset leads to the opening of a long position. This financial position means that, in the following period, the investor will could buy the underlying asset at the price fixed in the contract, if on the market the asset's price increases;
- anticipating the decrease in the price of the underlying asset implies the opening of a short position, which will permit to the person who initiated the transaction to sell the underlying asset in the following period at the price stipulated in the contract, given that its market price is falling.

But, the risks of such transactions are high, when the evolution of the market price of the underlying asset is contrary to expectations.

The development of the financial market, as well as the desire of investors to make the greatest and most secure profit, have led to the emergence of a wide range of investments. Alternative investments, in recent times, are showing a growing trend, in terms of quantity and quality, and they are becoming more diversified and at the same time increasingly risky[3].

In 2016 – alternative assets accounted 23% of sovereign funds assets (up 4pp. from 2010[4]) as a result of lower interest rates on banking markets and yields on traditional assets (shares, bonds). Each category of alternative investments has its own advantages and disadvantages, such as the reduced correlation between the profitability of alternative assets and the profitability of financial markets, under the conditions of high financial performance of these investments. But, at the same time, the specific risks of these alternative assets may make them less attractive (the difficulty to determine their real price, their low liquidity or even the high price of alternative assets on the market).

Many types of alternative investments have existed for a long time and are known to investors. Others are relatively new, the alternative investment opportunities continuing to expand in the same time with rising demand. This is how alternative investments such as cryptocurrencies, real estate, art, wine collections, cars, diamonds and jewelry, as well as peer-to-peer loans, have emerged over time.

1. The cryptocurrencies. Investing in cryptocurrencies is based on the same principles as any other type of investment – diversifying the investments for the risks minimizing. This investment diversification can be achieved as time as more and more national entities will enter on the cryptocurrency market, which situation will create a favorable and safe environment for cryptocurrencies in the global economy. The cryptocurrencies provide a high degree of security in terms of how they were created, with Blockchain technology, which enabling users to have the image of all transactions and avoid fraudulent losses. Actually, any intervention by a hacker can be observed in the network of connected computers, which have a copy of the operations performed. The greatest risk of the cryptocurrencies investments remains the strong variation of their price on the market.

2. Art objects. In Romania, the art market has developed very strongly over the last 10 years, which has led to the appearance of the Art Market Index (developed by the Artmark Institute of Art Management, together with Price Waterhouse Coopers) and the TudorArt Index. Internationally, there is the ArtPrice portal, which monitoring public transactions with works of art and publishes the annual returns for the authors with high sales on the specific market.

Made it with inspiration, the investment in artwork can be more cost-effective than other alternative investments. The contemporary art market is more active from an investment point of view, both internationally and in Romania. The "old" art market is the most stable, but positioned far above contemporary art in terms of prices.

The risk factors of the art objects market are:

- the authenticity of the art object
- the real value of the art object (hard to evaluate)
- the emotional involvement of the investor

The specific elements of the art market are: belonging to an important art collection, the provenance of the art object, the mention in the art catalogues or showing in collections and exhibitions. All these specific elements are reflected in the value and the price of the art object.

[3] Conf. dr. Ivan Luchian, conf. dr. Angela Filip – "Abordările conceptuale modern ale investiţiilor alternative", *Paradigme moderne ale economiei şi antreprenoriatului inovativ*. Ediţia a XII-a, 3-4 noiembrie 2017, Chișinău. Chișinău, Republica Moldova: Centrul Editorial-Poligrafic al USM, 2017, pag. 164-170.

[4] According to consulting firm Price Waterhouse Cooper.

Volatility of an art object translates into the intensity of its trading on the market, and from this point of view, such investments are characterized by a low volatility, but which is offset by the fact that, over the time, the investment value will be kept or even will increase.

The trading of art objects is done on the primary market (of art galleries) and the trading through auction houses is increasing. This situation means a benefit from the visibility point of view, greater than the visibility offered by the art galleries and, also, offer the possibility of important gains.

3. Wine collections – are a safe investment, as the price of wine has never experienced sudden collapses on the market, unlike the other traditional assets. At the beginning of the financial crisis, in 2018, all the main sectors of the economy and the capital market suffered considerable losses, but the investments in the wine generated for the investors a profit of 7%, which over time reached even +16% in 12 months.

Accordingly with a study from Mediobanca, investment in wine generated a profit of 160% to 190% in 10 years, surpassing almost all investments in traditional assets, including gold investments and oil investments. In addition, the wine being an absolutely natural product and subject of a large number of factors, (which influence its ageing over time) and being considered a perishable good, the result of these reasons, is that wine isn't subject of any capital gains taxation.

4. Diamonds and the jewels. The investment in jewelry is an opportunity that carries just a few risks and will be a very profitable investment for long term.

The advantages of the investment in jewelry are: a steady increase in long-term value; the jewelry are easy to sell and the demand of jewelry is growing.

a) The steady increase in long-term value

While currencies, cryptocurrencies or shares on the stock exchanges have a volatile value and any increase or decrease of their value is almost impossible to predict, the precious metals from which the jewels are made are stable on the market and aren't devalued. The price of precious metals, too, may decrease for short term, but their value increases in for long term.

b) The jewelry are easy to sell

Even if investments in art objects or in art collections could be profitable for long term, selling them for profit is complicated. Finding a buyer interested in that object and willing to pay the correct price for it can be difficult and may take a long time.

By contrast, gold jewelry and gemstone jewelry are much easier to resell, as the number of people interested in such accessories is high. Also, in situations when it is necessary to sell a jewel and there is no buyer on the market at that time, one of the possible options is to sell the jewel at a pawnshop. The risk of not being able to sell a jewel immediately and with profit may be the result of a declining popularity of a jewelry collection. However, this situation can also be an advantage, because a not very popular jewel can be purchased at a low price and could be sold in the future at a much higher price than the purchase price, as the market trend may change.

c) The demand of jewelry is bigger and bigger

In recent years, the popularity of jewelry, especially gold jewelry, has reached new heights and more and more people are interested in getting jewelry or adding a new model to their collection. As all the signs show that this upward trend of interest for jewelry will continue in the next years, the price of these accessories is possible to increase more and more, like the price of any good for which demand is increasing. In these circumstances, the investment in jewelry is very profitable, both in terms of resale price and in terms of resale opportunity. But, an owner of a gemstone jewelry will never be able to resale the jewelry at the exact market price, because in most cases the person who redeems the jewel will want either its resale or separating gold from the gem and then selling them separately. So that in the price offered for the purchase of the jewelry must also include the future gain of the buyer. But, generally, at least 75 to 80% of the market value at the time of redemption can be obtained, or even less, but if the investment was made at least 1 year before the resale date, it could be obtain a gain over the price registered at the time of the first purchase.

Modern investors prefer alternative investments. In this way, the Rally platform of New York was created for alternative investment. Founded in 2017, Rally platform buys collectibles such as rare cars, sporting items that evoke important moments, old books and so on, and divides these assets into shares which are sells to investors for just $5, making these collectible objects much more affordable. The value of the shares is subject of market fluctuations, the investors being able to sell or buy that shares after a 90-day lockdown period.

The Rally platform facilitates peer-to-peer transactions in a secondary market, where prices can fluctuate over time. But, collectibles are considered risky investments, because the value of some of them can increase greatly over time, and the value of others can quickly depreciate. This situation is generated by the fact that investors lose their desire to own the luxury asset, which they have bought it and will sell it, which will cause the falling of its price. The advantage of such a trading platform, like Rally platform, is that investors can purchase and hold practically a small part of a very valuable asset.

5. Conclusions

Investments in alternative assets offer investors the chance to earn high profits, if they are open to taking high risks. Although traditional financial markets offer a wide range of financial assets, investors' goals of earning as much and as securely as possible make the alternative investment market very attractive. In the latest period, the alternative sources of funding and the

removal of barriers to cross-border investment are intensive promoted. They will stimulate the cross-border market for investing funds, promote the EU market for secured bonds as a source of long-term financing and will provide investors with greater certainty in cross-border securities and receivables transactions.

TYPES OF JUDGMENT WITHIN THE ACCOUNTING THEORIES

Viorica Mirela ȘTEFAN-DUICU*

Abstract

In the content of this article, we will briefly expose the explanation of the accounting theories classified on a general level, namely the positive and normative theories of accounting. The purpose of the present article is to provide the type of judgments that lay foundation to each type of accounting theory.

Also, we will highlight the documentation from the specialty literature regarding these demarches and we will build a pertinent research speech. The professional judgment represents an important concept in carrying the existing processes in the organizational environment and is dictated by a plethora of factors that are fitted and guided by these theories.

Keywords: *normative theory of accounting, positive theory of accounting, inductive judgments, deductive judgment, research.*

1. Introduction

Most of the times, the academic environment focuses on the present reality of the economic and social processes and not limited to but losing out of sight the fact that a real help is the recognition of the importance of the starting point of each phenomena. This starting point is represented by the laws that provide the development and trigger of phenomena and certain theories.

Below we will present the accounting theories focusing our attention on the positive and normative theories of accounting. An important role within our study is represented by the professional judgment that is shaped by these types of accounting theories.

2. General fitting of the professional judgment within the context of the positive accounting theory

An important aspect is represented by the fact that „the positive accounting theory occupies a central piece in the contemporary process of founding the accounting research" [1] therefore the „researcher must remember the interest into the rigorous formalization of sentences, relationships, results of his scientific demarche starting from the agreed type of judgment and from the corresponding scientific methods of the investigated domain"[2].

The type of the judgments on which the positive accounting theory relies is *inductive*. The inductive judgment demarches are focused on getting new information and on issuing a new theory having as starting point the empirical posture. The direction of forming the knowledge starts from particular to general, from effects to cause leading to the extension of conclusive signification of the observed phenomena at a universal level.

„Studying asymmetries of information with the help of *game theory* allows examining numerous problems neglected by traditional microeconomics, such as: advantages which can be obtained by more informed agents, the manner of markets' functioning in the conditions of information asymmetry, loss of resources involved by the functioning of these markets etc."[3]

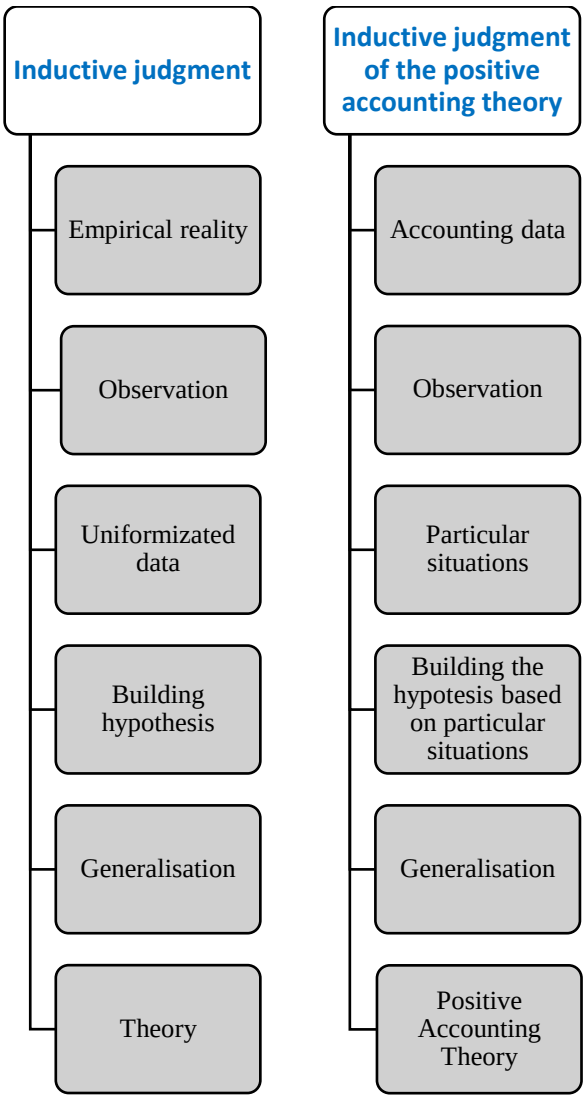
Figure 1 The representation of the inductive judgment



Source: issued by the author

The professional judgment in the context of the positive theory of accounting imposes specificity both in the theoretical and practical framework.

Through the prism of the imposed principles of the positive theory of accounting, the employee uses his professional judgment under the aegis of an informational guidance that determines the actions carried at an organizational level.

A professional judgment seen through the positive accounting vision requires the application of the observation techniques of the accounting phenomena and also involves an ascertainment empirical side of the use of the professional judgment in practices and financial statements useful in the domain, generating a systemic evidence of particular situations that delimit the hypothesis meant to lead to the formalization of the initially established problematic, meaning a generalization of the use of the professional judgment.

„ In the case of accountants, the marketing must provide a description of the services offered by professional accountant, and the description must concords to reality".[4]

After the generalization of the principles that dictates the professional judgment through the filter of the positive theory of accounting, a standing rule is issued. This rule folds on the framework of the hypothesis validated at the beginning of the inductive demarche.

The result of this demarche takes the shape of a theory such as „a form of rational knowledge, an assembly of judgments systemically coming from each other or more general principles that offer together a

[4] Sudacevschi, M., The promotion of the accounting services within the limits of professional ethics. Challenges of the Knowledge Society, 2016 718-722, pg. 718.

descriptions and an explanation"[5] of using the professional judgments within the context of the accounting reality.

3. The normative theory of accounting and the professional judgment

3.1. Developments regarding the normative theory of accounting

„The normative theory of accounting consists into a general reference framework due to which it's possible to evaluate the accounting practices, framework that serves as guidance for the development of new practices and new procedures (improvement)"[6] and consists into „a logical production that takes the shape of a high principle assembly"[7].

The normative theory draws the directions to be followed in order to solve issues and represents within its corpus pertinent expressions of practices. The utility of this theory derives from the standardization process of practices and from providing an improvement following the use of the principles on which relies on. These kinds of improvements can lead to the creation of a standard that, from compelling pragmatic reasons, departs from a principle stated within an applicable conceptual framework[8] empowering the fact that the normative approach sustains the prescription of facts at a practical level.

Out of the normative theories we highlight *The theory of bureaucracy*[9], *The theory of efficient markets*[1011], *The theory of business revenue estimates*[12], etc.

The normative theory of accounting „relies on standards and principles that are applied in the accounting process and also implies a specific environment in which measurements are carried and the issued norms are verified"[13] .

„The normative theory of accounting is objective through the prism of base values and judgments of value which it incorporates and through the empirical testing of the accounting instruments recommended for reaching the pre-established mechanisms"[14] .

The normative theory of accounting was most used in the '70s and has supported the accounting research domain in the area of financial statements, representing a precursory element for the positive theory of accounting.

Jensen stated that „the answers regarding the normative questions always depend on the choosing of the criteria or objective functions that highlight self-values"[15] .

Professor Joel S. Demski states that „no normative theory of accounting can be build using a single set of standards in particular because this fact will lead to an incomplete or incorrect demarche in the accounting domain"[16] .

„The objective of the normative theory of accounting is to maximize the accuracy in the prediction related to the accounting reports trough concentrating over the crucial attributes of the accounting mechanism prescribed in the normative"[17].

„The normative approaches are concentrated on highlighting the modality of decision taking and represents a basis for the examination of information carried by the investors and employees"[18].

„The economic reality is, in fact, the cumulus of operations within an economy, and its normative representation involves the write down in accordance with the accounting regulations at the „economic reality" precisely to represent what it needs to and mainly what it supposes to"[19].

From the predecessors of the normative theory of accounting we name: W.A. Paton, J. B. Canning, H. W. Sweeney, K. MacNeal, P. Gensse, E. O. Edwards, P. W. Bell, etc.

Table 1. Structure of the normative theory as seen by K. MacNeal (1939)

Postulates of environment	• Numerous uninformed title owners • The existence of a free and competitive market • The continuity of the operational activities of entities
Objectives	The objective of accounting is to supply information regarding an entity and useful information for shareholders and creditors in taking decisions regarding investments and credits.
Information needs	Managers, creditors and shareholders are interested in knowing the net value of the business and in having information regarding all the profits and losses.
Recognition and accounting evaluation	• The balance sheet must be reported at the economic value of its assets and liabilities. • Profit and loss account must report losses, current and capital profits realized and unrealized. • The principle of realization is abandoned. (The principle of realization is the concept that refers tot the fact that revenues can be recognised just at the moment in which the goods or services on which it relies have been delivered or respectively rendered.)

Source: issued after Md. Humayun Kabir[20]

Table 2 – the structure as in accordance with the vision of Paton and Littleton (1940)

Postulates of environment	• Existence of numerous passive investors. • Existence of various groups of shareholders within the company.
Purposes of accounting	The purpose of accounting is to provide reliable information (relevant) regarding the economic entity.
Base concepts	• The entity as a business environment. • Continuation of activity. • Cost attachments. • Efforts and realization. • Objective, verifiable evidence.
Accounting evaluation	• Transactions are recorded at fair value of the attributed importance. • Accounting records should not be adjusted with the modification of prices.

Table 3. The structure of the normative theory as seen by Chambers (1966)

Postulates of environment	The enterprise wished to adapt to the market conditions.
Relevant information in taking decisions	The relevant decision relies on knowing multiple possibilities for an entity, possibilities expressed in current monetary units.
Accounting function	The accounting function is to supply contemporary financial information as a guide for future actions.
Evaluation and accounting recognition	• Assets and liabilities should be recognized at the current cash equivalents. • The principle of realization is abandoned. (The principle of realization is the concept that refers to the fact that revenues can be recognised just at the moment in which the goods or services on which it relies have been delivered or respectively rendered.)

Source: issued after Md. Humayun Kabir[22]

Over time, theoreticians have divided in two major categories: the ones that support the concept of „historical cost" out of which we name Paton and Littleton and the ones that support the concept of „market value", represented by MacNeal and Chambers. „Historical cost is the assessment base most commonly adopted by companies to prepare their financial statements"[23].

In MacNeal's opinion, the role of accounting is to highlight the economic reality by stating that the economic statements do not represent a specific truth, having the possibility to misguide the creditors and investors. MacNeal states that the principle of historical cost prevents the real presentation of the financial status and the operational results in the company's financial statements. This links the development of the accounting principles to the economic and business conditions found in medieval Europe and through reconstruction, he points that the accounting principles have followed the natural development of those conditions, conditions that have stopped from existence. Therefore, the accounting principles did not keep up with the changed conditions.

Paton and Littleton aimed at developing a presentation regarding the accounting standards that will provide guidance for the accounting practice.

At a methodological level, Paton and Littleton carried within their research deductive demarche, supporting their theories on more basis structures: the entity in the business environment, the continuity of the activity, attached costs, efforts and achievements and the evidence of achieving the proposed goals. The matters presented did not led to a complete verification of the forwarded proposals but the work they put in was characterized as coherent, objective and with a high contribution.

The proposals forwarded by Paton and Littleton are different from MacNeal's because the difference in grading the importance of the relevance and trust in the accounting information. MacNeal stated that the accounting practice doesn't always have a common point with the investors and creditors' need of information while the proposals of Paton and Littleton were highlighted by the need of providing reliable information at corporation's level especially for investors.

Following the normative demarches, Chamber's proposal is based on the idea of the entity's adaptation to the dominant market through engaging it to the changes imposed by the environment. In his opinion, the role of accounting consists in providing contemporary financial information (prices/current values) that will direct the actions carried by the entity.

„Accounting axiomatization products produce change because are based on the arrangement of users of financial information and on their information evolutionary needs".[24]

Theoreticians have different opinions when discussing the construction of the normative theory. Differences mainly appear due to debated concepts and

[22] Ibidem pg. 16.

[23] Cristea, V. G., The necessity to introduce the accounting rules and fair value in the conceptual framework. Procedia economics and finance, 26, 2015, pg. 515-521, pg. 517.

[24] Cristea, V. G., Accounting Paradigms which Favor Historical Cost. Challenges of the Knowledge Society, 2014, 488-493.pg. 489.

mainly from the notions given to the role of accounting. For example, Chambers states that the central problem of an entity is whether it can adapt or not to the environment the market involves, having as base the information provided by accounting at current level, contemporary, while Littleton considers that the entity has as purpose to provide goods and economic service, the performance of the entity being measured as it reaches the proposed objectives.

The development of the normative theory consists in assimilation the contributions provided by the theoreticians through the revision of accounting practices and through debating the ways of improving the accounting system. These lead to supplying an accounting framework that supports the regulating authorities in establishing a measuring accounting basis.

3.2. The normative theory – deductive judgment – professional judgment relationship

The normative theories have as starting point an assembly of standards and principles out of which we name IFRS/IAS, an assembly that delimits, in the named context, the development of a guide that contains accounting practices and procedures. Within these theories the deductive judgment is being used, having as purpose the gain of improvements of the described environment.

„Judgment is a diluted and hierarchical informational structure in which thinking starts from certain data (judgments) and reaches the gain of new ideas (conclusions)"[25].

„The hypothetical-deductive demarche for research starts by studying the theory (theories), followed by the selection of hypothesis, test and validity check through observations, experiences and measurements"[26].

Fig. 2. The representation of the deductive judgment

[26] M. Niculescu, N. Vasile, „Epistemologie. Perspectivă interdisciplinară", Ed. Bibliotheca, Târgoviște, 2011, pg. 111.

4. Conclusions

„A normative theoretical system needs a judgment of value in order to be validated. This inclusion of judgment of value differentiates the notion of „normative" from "positive"[27]. „Theories are essentially normative and formative, meaning that it assumes the judgments of value and shape future actions. In Steve Smiths' words, „theories not only explain or predict, it tells us what human action and intervention are possible: it defines not only our explicative possibilities but also our practical and ethical horizons"[28].

In Milton Friedman's opinion, the positive vision „is independent from the situations that imply ethics of normative judgments"[29]. Explaining this statement, professor D. Wade Hands highlights the identification of the normative judgment with the ethics represented as documentary basis at an economical level in the economy[30].

The professional judgment in the context of the normative theory of accounting represents a set of linked logical judgments that serve to obtain conclusive results for the carried activities taking into account certain circumstances, knowledge, evidences, methods, criteria and proper regulations.

Accounting practices, in the normative vision, impose the compliance of standards and regulations in order to achieve the major goal and namely gain and prescription of solutions or improvements of the accounting treatments.

The professional judgment, guided by existing norms, is strictly directed by the regulatory framework which leads to shaping the idea that the professional judgment tents to overlap from a utility point of view with the normative theory of accounting.

GRADUATES AND THE LABOR MARKET DEFICIT IN THE ROMANIAN HEALTH SECTOR

Valentina VASILE[*]
Elena BUNDUCHI[**]
Cristina BOBOC[***]
Răzvan VASILE[****]

Abstract

The main directions of the migratory flow of health specialists are towards more developed countries. Around 1/3 of Romanian health professions graduates are working abroad while the national health system faced with a chronic shortage of staff. The paper highlighted the fact that the increase in the number of graduates in recent decades did not ensure coverage of the deficit, because only a small part of them remain on the Romanian labor market, the motivation of migration being much higher income, lack of equipment and low level of transfer technological as well as working conditions. The lack of an integrated and realistic national plan for health care reform runs counter to developed countries' measures to attract and hire migrant physicians, and rapid integration facilities for new jobs promoted during the pandemic have kept the migration alternative as a solid alternative for graduates to pursue and progress in their careers abroad.

Keywords: *Medical staff, health graduates, health workforce migration, Romania, linear model regression.*

1. Introduction

The challenges of the external labour migration of health professionals are not a new problem, being specific to most developing countries. The demand for human resources in health care sector is growing rapidly worldwide due to a) last demographic transition and medical care for all principle implementation, b) shortage of graduates in health professions in developed countries and c) epidemiological conditions, especially in the context of the COVID-19 pandemic. The expansion of the migration phenomenon both at European and national level in the context of globalization attracts the interest of experts from different fields of activity, who turn their attention to the analysis of the consequences of this phenomenon on health services (Teodorescu, 2012).

The main directions of the migratory flow of health specialists are towards more developed countries from developing ones, known as "brain drain" (Mullan, 2005). There is an established link between an adequate level of staff and the positive outcomes of healthcare (Chen et al., 2004).

International recruitment and migration of medical staff has become a common practice for many economically prosperous countries to fill vacancies, but with negative externalities for developing countries of origin, which remain in (even more) employment deficit. The migration of medical staff unbalances national health systems, which are already threatened by financial shortage and the lack of medical staff in relation to the needs of the population. The increased deficit of medical staff, including highly qualified staff, is a matter of particular importance for the performance of health systems and undermines the ability of these countries to achieve sustainable development and to provide quality health services for all, both for preventive care and for treatments.

Romania is among less developed countries of EU that is facing an acute shortage of employment in health care sector, and the migration of both experienced specialists and health graduates is a high challenge having complex impact of the whole society. The crisis of the health system in the current pandemic conditions has highlighted the profound negative effects of the migration of medical graduates in the last two decades as its have spread within health systems across all disciplines.

The purpose of this research is to identify the impact of the mobility of health graduates on the shortage of medical staff in Romania and on the size of the stock of Romanian medical staff working abroad.

2. Literature review

The process of globalization and the growing demand for medical services worldwide have determined both the development of trade in services, equipment, and technologies in the medical field, and

[****] Economist, CASID Research Center from Romania, (e-mail: vasile.razvan89@gmail.com).

have encouraged the mobility of medical staff in this sector.

The cost and duration of training for the health professions are substantial and, therefore, the most effective option for developed countries is to cover staff shortages by recruiting them from the international labor market, both recent graduates and young staff with several years of experience / practice, offering comparative advantages. So, among the determinants of the decision to migrate of the medical staff we can identify: salary differential and opportunities for career development and promotion, better working conditions, the desire to acquire new skills and knowledge, for family reasons (Apostu et al., 2020; Apostu et al., 2020; Vasile et al., 2018; Buchan et al., 2014; Humphries et al., 2015; Boboc et al., 2011). Also, a number of other factors shape the geographical distribution and intensity of mobility flows of medical staff, including doctors, nurses or other categories of health workers. De Vries (et al., 2016) studied the typology of migrants in the field of health, and their results highlight the fact that a large part of medical staff are motivated by higher salaries compared to the country of origin and a more flexible work schedule. While for other categories of doctors included in the study, the language spoken in the destination country is important, in consequence they migrate to countries in the same language basin.

At European Union level, some Member States are paying more attention to the phenomenon of medical staff mobility and building databases on these categories of migrants, and a wide range of studies have been carried out (Buchan, 2006; Cehan, 2013; Humphries et al., 2008; Humphries et al., 2012; OECD, 2008; WHO, 2008). These studies give a realistic analysis of the medical staff mobility, but also highlight variations in terms of detailing the topics to be studied, and analytical depth or of statistical research that do not allow comparisons. An analysis of the data provided by the Romanian College of Physicians on Current Professional Certificates issued to work abroad (Apostu et al, 2020) only partially highlighted the size of the phenomenon, namely the intention to mobilize for a job abroad, without measuring statistically and the proportion in which this intention was materialized, So, at the national level, there is a lack of data on Romanian doctors who emigrated abroad, and studies on the size and structure of migrant flows in the field of health care are limited. Thus, in the research conducted by Suciu (et al., 2017) on a sample of 975 graduates from medicine faculties for the period 2013-2015, are analyzed their intentions to work abroad. The study's results indicate that 84.7% of these graduates plan to look for jobs abroad, and of these, 44.5% have already taken language courses that can help them to integrate in the destination country, while 26.5% have already looked for jobs abroad using online medical platforms. The migration determinants for Romanian graduates are higher salaries, better living and working conditions, professional opportunities, "lack of internships" in the chosen specialty and disappointment regarding the medical system in Romania.

The migration process of Romanian medical staff is also studied by Dornescu & Manea (2013). They support the development of control levers for the migration of physicians, such as codes of ethics for medical staff that should be used by all developing countries facing this phenomenon. Similar policy measures in order to restrict migration are supported by Cehan and Teodorescu (2012). Medical staff is involved not only in permanent migration, but in temporary too, most often for carrier opportunities. When the medical staff migrates temporarily, they return with a much wider experience in the field and with examples of good practices that they can implement in the Romanian medical system and can lead to an increase in the quality of services offered to the common public.

But, unfortunately, examples and situations of temporary migration among medical staff are very rare, and the effects of permanent migration are overwhelming for the country of origin.

3. Research methodology

Current research uses linear model regression in order to analyze the impact of the mobility of health graduates on the shortage of medical staff in Romania and on the stock of Romanian doctors practicing abroad. Therefore, the dependent variables used in the research are:

a) the number of medical staff in Romania;
b) the number of Romanian medical staff abroad.

In order to investigate the impact between the listed variables included in the present research, we formulated the resulting economic hypotheses:

• H_1 - the increase in the number of health graduates contributes to the growth in the number of employed medical staff in Romania;

• H_2 - the increase in the number of health graduates contributes to the increase in the number of Romanian medical staff working abroad.

Using linear model regression, we will observe if exists a statistically significant and direct relationship between the variables by elaborating several equations.

The general linear model regression has the following form:

$$Y_i = \beta_0 + \beta_1 X_i + e_i \quad (1)$$

where:

Y_i represents the dependent variable,

X_i is the independent variable,

β_0 is a parameter and shows the mean value of the dependent variable when X is equal to 0,

β_1 represents the slope and indicates the mean variation of Y when X variable vary with a unit,

e_i is the residual variable.

Parameter estimation of the linear model regression will be performed using the statistical software R.

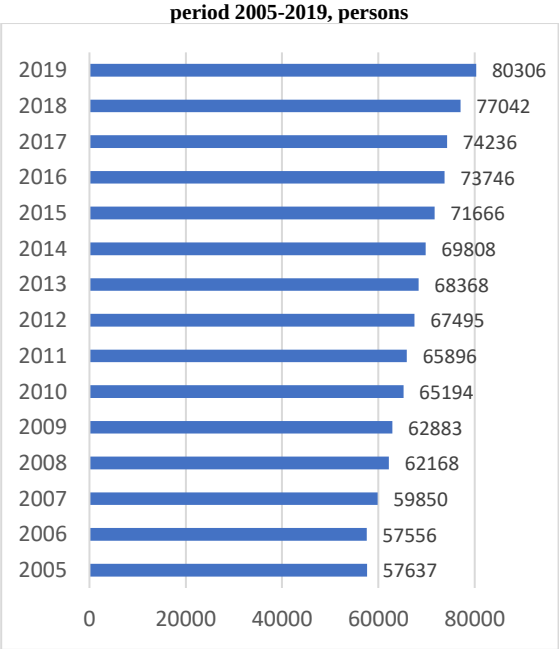
4. Data description

The data used in the research are provided by the National Institute of Statistics of Romania and the OECD for the period 2005-2019.

The importance of the phenomenon of migration of Romanian doctors derives from the shortage of doctors registered by Romania.

As we can see in Figure 1 the number of Romanian doctors working in Romania is increasing, reaching the value of 80306 in 2019.

Figure 1. The evolution of medical staff in Romania in the period 2005-2019, persons



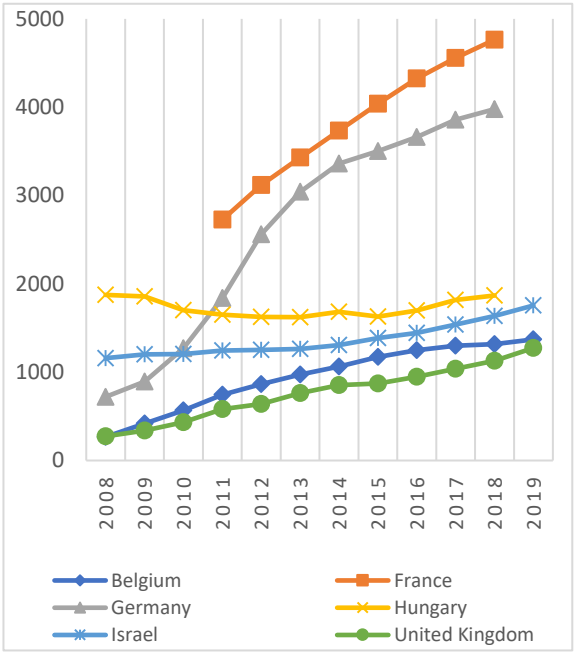
Source: Author's calculation based on Romanian National Institute of Statistics, 2021

However, according to the latest report of the European Commission „State of Health in the EU" the country profiles of the Member States (European Commission, 2019) the Romanian health system still suffers from a lack of sufficient medical staff (doctors and nurses) compared to 1,000 inhabitants. In 2017, there were 2.9 practicing physicians per 1,000 inhabitants, the third lowest value in the EU (EU average 3.6) and 6.7 nurses per 1,000 population (EU average 8.5). And in the context of the COVID-19 pandemic, when the importance of doctors increased even more, 231 medical staff from Romania and Bulgaria decided to go to practice in Austria (Romania Insider, 2020), although in Romania the epidemiological situation was not under control, with many areas of the country where there were cases of infection and death among doctors.

According to the data presented by the OECD, (2021) we notice that the Romanian medical staff is increasing in different destination countries (Annex 1), and among the preferred destination we can mention France, Germany, Hungary or Israel with 4764, 3978, 1870 and 1755 Romanian medical staff, respectively (Figure 2).

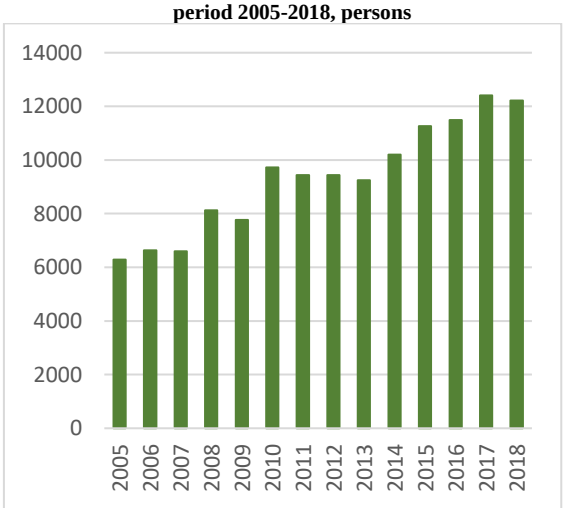
Figure 2. Top countries of destination for Romanian medical staff in 2008-2019, persons

Source: Author's calculation based on OECD data (2021)



As we can see from the existing research on medical staff in Romania and especially young graduates in the field of health, the migration trend has existed since the student years. Thus, it is important to analyze the trend of the number of graduates of medical specializations at the national level (Figure 3). Thus, we find an increase in the number of medical graduates throughout the analyzed period, which means that this specialization is in high demand by young high school students.

Figure 3. The evolution of health graduates in Romania in the period 2005-2018, persons



Source: Author's calculation based on Romanian National Institute of Statistics, 2021

Comparing with the data from figure 1 it is found that: a) the dynamics of the number of graduates is more accentuated than of the employment in the health sector, the field of professional specialization being of interest for young people.

a) the annual contingents of graduates, which represent about 10-15% of the annual staff of medical staff are found in the staff increases only in very small proportion, respectively less than 1/3 of the number of graduates, which cannot be justified only by replacement rate by age (at retirement), but especially by migrating for a job abroad;

b) if we associate the available data on the applications for Current Professional Certificates issued to work abroad with the aspects mentioned above, although we cannot make an accurately statistical determination, we can still conclude that we have much enough cases of graduates who, after completing their studies, do not works in the medical sector, migrating to other activities in the business environment, capitalizing on the specialization acquired through school or even giving it up.

5. Results and discussion

In order to determine the impact generated by health graduates on the shortage of medical personnel in Romania and on the Romanian medical staff abroad, we decided to apply a linear regression model on the research data.

Table 1. Impact of health graduates on medical staff in Romania using linear model regression

	Coefficient	Standard error	t test
Intercept	39143,58	1812,38	21,59
Health graduates	2,94	0,18	15,53
p-value 2,6057e-09			

Source: Author's calculation

According to Table 1, we find that the independent variable - medical graduates of higher education institutions in Romania - shows a statistically significant influence. Thus, the regression equation has the following form:

$$Med\ staff\ Ro_i = 39143{,}58 + 2{,}94 * health\ grad_i + e_i$$

Therefore, we notice that with the increase of the number of graduates in the medical field, on average the number of employed medical staff in Romania increases. The obtained results allow us to ascertain the fact that some of the medical graduates stay at home and practice in the hospital units in Romania, thus contributing to the reduction of the shortage of doctors.

Table 2. Impact of health graduates on Romanian medical staff abroad using linear model regression

	Coefficient	Standard error	t test
Intercept	-9560,00	2296,93	-4,16
Health graduates	2,01	0,24	8,36
p-value 2,37955e-06			

Source: Author's calculation

Applying the same method of quantitative analysis, we observe a similar result in the case of the relationship between the impact of health graduates and the number of Romanian medical staff abroad, with the following mathematical representation:

$$Med\ staff\ abroad_i = -9560 + 2{,}01 * health\ grad_i + e_i$$

Even if the influence is statistically significant, the overall generated impact is negative. Thus, the increase in the number of health graduates determines on average an increase in the Romanian medical staff who practice in hospitals abroad.

The results allow us to conclude that young graduates are not only assimilated by the domestic labor market, but also, many of them tend to migrate to other countries of destination for various economic, social, family etc., reasons, results also supported by other research in the field.

6. Conclusions

Most Romanian medical graduates consider migration an alternative for continuing their professional activities and an opportunity for future career advancement. The results of this study are important in terms of supporting the shaping future migration of Romanian doctors and have implications for both policy development and future research.

During the first year of pandemic crisis the health system in Romania faced with the challenge of retaining the graduates for decreasing staff deficit. According to last OECD report on doctors migration Romania has the highest number of Romanian-graduates who have emigrated and carry out their professional activity abroad (about 1/3 according to OECD, 2021[1]), and in countries like Germany the highest number of migrants doctors are Romanians. Although salaries in Romania for doctors have increased significantly since 2017, "OECD member states have taken decisions that have facilitated the recognition of the professional skills of foreign doctors and their rapid entry into the national health system"[2], making the migration option an important alternative for graduates.

In order to reduce the propensity for migration of graduates from health professions, public authorities must ensure an articulated reform and finance the health

[1] http://www.oecd.org/coronavirus/policy-responses/contribution-of-migrant-doctors-and-nurses-to-tackling-covid-19-crisis-in-oecd-countries-2f7bace2/.

[2] https://www.g4media.ro/raport-ocde-o-treime-din-medicii-romani-au-emigrat-record-absolut-in-lume.html.

system (health financing in Romania is about half of the EU average). Romanian authorities must develop a comprehensive national health workforce employment plan to mitigate the migration of medical staff. The recovery of the health system through technology / endowments and working conditions will attract graduates and probably some of the migrants who have left their families in the country. However, the shortage of doctors on Romania's labour market still cannot be covered, health sector being confronted with a critically short of nurses and doctors in general and in particular for the specialisations related to pandemic crisis. This issue remains equally important as investments in health sector for equipments, technology in order to shift the working condition and significally improve the efficiency of health services, both from the client (patients) and health staff perspectives. Retaining graduates to work in Romanian health sector is the mail challenges of the public authorities in the context of commitments undertaken by Romania to implement the Millennium Development Goals.

LEAN TOOLS TO ELIMINATE LOSSES. TRANSPOSING AUTOMOTIVE APPROACH IN OTHER AREAS

Cristina VERES[*]
Sebastian CANDEA[**]
Manuela Rozalia GABOR[***]
Valentina VASILE[****]

Abstract

In a competitive environment each company strives to bring higher added value to the customers, while improving the quality of its products and services, diversifying its offer in anticipating demand and streamlining its activity. To achieve market sustainability, companies aim to both map out the progress and use the resources efficiently and economically. During time several methods and tools were developed and used to this end. Lean Management tools implementation has proven to have effects not only in manufacturing sector, but also in healthcare, IT, government, construction, retail and others.

This study presents the steps of implementing the 5S method, highlighting the real impact of Lean tools and the potential to be extended in other activities with at least similar success. Based on case study developed in automotive activity we underlined how these externalities can be economically measured. Moreover, having the automotive example of good practice, we outlined the general framework for adapting the method to other fields of interest, i.e. in companies that provide goods and services for personal healthcare. Designing this framework for improving activity of such essential companies during COVID-19 crisis, we are providing arguments for a market-based approach to social value / social profit creation.

Keywords: *Lean Management, Tools and Methods, Automotive, Medical, Healthcare, Sustainability, 5S tool.*

1. Introduction

As an improvement tool of modern enterprise, the Lean methodology brings advanced management ideas and business processes to companies[1,2].

Lean Management (LM) was developed on the foundation of Toyota Production system and has become a need in the automotive industry and not only. Since it generated a wide range of advantages, the LM has rapidly grown in popularity and it started to be implemented in other sectors than manufacturing, too: information technology, government, retail, construction, procurement etc.

Lately Lean methodology evolved, being linked to „innovation" and „sustainability" approaches. Not by chance, in order to maintain a sustainable business, organizations need to apply solutions in order to reduce the potential risks posed by industry, the economic and political environment and the business environment in its complexity. As the external environment is hardly to be significantly influenced by firm's activity, a flexible internal approach is managers' and entrepreneurs' solution.

Sustainability[3] and Lean methodology are two interdependent components: on the one hand, through Lean actions and solutions, the sustainability of the organization is ensured, and on the other hand, sustainability provides the needed background for new Lean actions and improvements. There is thus a positive relationship between the two. Recent analyzes have determined multiple determinations between LM, industry 4.0[4] and the circular economy[5].

Because Lean is based on identifying and eliminating waste as a continuous process, the business remains efficient and able to adapt to the changing external environment on a long-term basis. Manufacturers have experienced increases in

profitability and customer satisfaction as a result of reducing their lead times, improving product quality and eliminating waste[6].

In the last decades, Lean tools application has proven an increased impact and has contributed to achieve consistent results in several fields. When focusing on Lean concept, it's important to be aware of the losses which the organization is accumulating and thus eliminate them. Still, applying lean tools is not an easy process. In order to achieve results the management should show perseverance and commitment.

There are several instruments which harness the potential of a company and its people. Lean tools are used to solve specific problems the company faces. Visual management instruments are used to increase productivity and cleanliness at the workplace, Just in Time concept helps decreasing stocks, waste and costs, Andon facilitates communication and problem-solving, and the list may continue.

This paper focuses more on the 5S Method, as a way to increase productivity, save costs and streamline the activity, knowing that, in the current conditions of the ever faster technology transfer in the business environment, the significant comparative advantages are based on the increase of the productivity of the resources;

5S is a basic Lean tool which includes 5 phases:

1. Sort – sort out needed items and remove items which are not needed at the workplace;
2. Set – put in order the items, objects, furniture which are needed, establish a place for each item, designate labels;
3. Shine – clean everything regularly at the workplace to identify possible irregularities;
4. Standardize – establish standard procedures to maintain the achieved results;
5. Sustain – keep following the established procedures, making 5S part of the organizational culture.

5S tool helps to reduce non-value adding time, increase productivity and improve quality[7], reduce waste and increase process efficiency. The hardest part of the process is to sustain, because in time places tend to clutter again and get back to the initial situation.

As the method has specific and detailed steps to follow, it can be easily implemented in any field.

2. Case study - Hirschmann Lean tools

Hirschmann Automotive is an Austrian company which produces parts for the auto industry and not only. The group has production units in Austria, Czech Republic, Romania, Marroco, China, Mexico, and Germany.

In Romania Hirschmann has 2 production units, situated in Mures County, Transylvania. The activity was established in 2007 and manufactures wiring for parking and battery sensors, wiring for mirrors, automatic gearboxes and motors. 1.950 company's employees out of 5.900 are working in Romania.

The 5S and other Lean tools use is integrated into the production processes and managerial culture, being present simultaneously in all sectors and departments of the enterprise. Hirschmann School offers the new employees a specialized training on the Lean used tools, organizational culture, company's vision and so on.

Hirschmann focuses on eliminating the 8 types of Muda described in the literature as: overproduction, waiting time, transport, extra-processing, inventory, motion, defective products, unused potential.

For eliminating Muda, Hirschmann Automotive Romania uses 2 types of Lean methods:

- Basic methods:
  - 5S method;
  - Improvement ideas management;
  - 7 Muda elimination;
  - Practical methods for solving problems;
  - Process confirmation;
  - Visual management.
- Complex methods:
  - SMED (single minute exchange of die);
  - VSM (value stream mapping);
  - 6 Sigma;
  - TPM (total productive maintenance);
  - TQM (total quality management);
  - Kanban;
  - OPF (one pieces flow).

3. 5S tool implementation and benefits quantification

3.1. Implementing 5S tool in production

For implementing 5S method in the production environment, Hirschmann Romania follows specific successive actions:

1. Select the pilot area for a 5S site;
2. Establishing the team, the members who will participate in the activity;
3. Providing the necessary resources for the development of the site;
4. Training the selected team;
5. Development of the 5S site in Gemba;
6. Closure of actions on site;
7. Achieving the 5S standard;
8. 5S site documentation;
9. Extension of the standard to similar positions;

[6] Paul Resetarits, "The application of lean management principles to fields other than manufacturing," Proceedings of PICMET '12: Technology Management for Emerging Technologies (IEEE 2012): 1705-1742, https://ieeexplore.ieee.org/document/6304189.

[7] Oleghe Omogbai, and Konstantinos Salonitis, "The Implementation of 5S Lean Tool Using System Dynamics Approach," Procedia CIRP 60 (Elsevier 2017): 380-385, https://doi.org/10.1016/j.procir.2017.01.057.

10. Evaluation of 5S level, degree of implementation.

Step 1.

Based on the company's needs, a pilot area for 5S implementation is selected.

Step 2.

For establishing the team, Hirschmann considers selecting 4 to 10 people to participate to the 5S site:

- CIP (Continuous Improvement Project) coordinator in the area - site coordinator;
- workplace operators;
- internal customer;
- the internal supplier;
- process engineer;
- quality engineer;
- segment leader.

Step 3.

The company ensures the following resources:

- Printing of 40-50 pieces of 5S Red tags;
- adhesive tape for gluing the red tags;
- blue, red and green markers;
- Flip chart;
- red and white strip for marking the area;
- standard information label Site pilot area 5S.

Step 4.

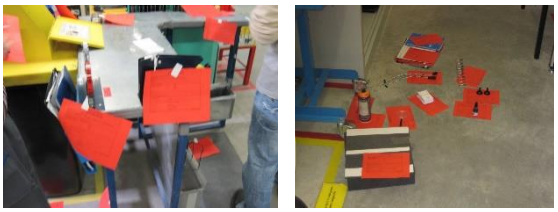
The course material and Best practices in production are presented and trained for 1-1,5 hours.

Step 5.

The implementation of 5S method starts. The Flipchart is filled in with data: Site location, site date, site purpose, participants (team), team expectations.

Sorting implies the identification of unnecessary objects, problem areas, sources of dirt and hard-to-reach areas with red tags. Unnecessary objects are removed from the area and written on the Flip-chart.

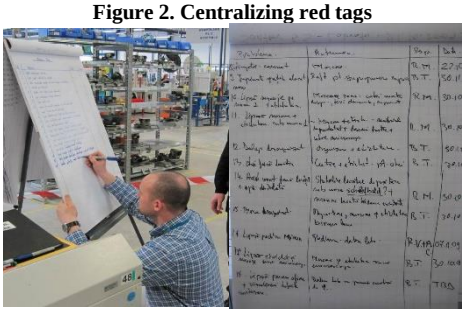
Figure 1. Red tags on unnecessary objects



Source: Hirschmann Automotive Romania

All red tickets are centralized in an Action Plan.

Figure 2. Centralizing red tags



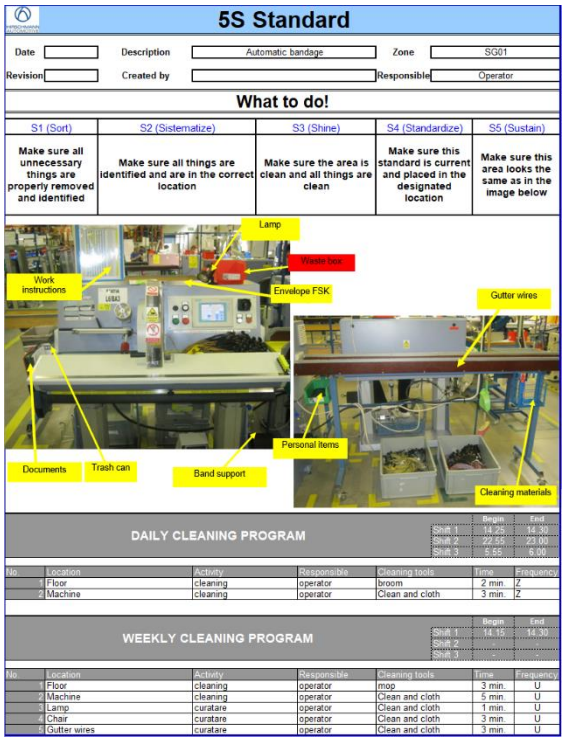
Source: Hirschmann Automotive Romania

The remaining things are put in order, then the space is cleaned to shine. Cleaning is done together with the whole team, so during this time the following necessary things are identified to achieve the standard of cleanliness and 5S:

- Sources of mess;
- Hard to reach areas;
- Required cleaning time;
- Materials needed for cleaning.

To standardize the achieved results, a standard form is used within Hirschmann company, which shows and describes all the objects present at the workplace, but also details the daily and weekly cleaning program in tabular form (see figure 4).

Figure 3. 5S Standard



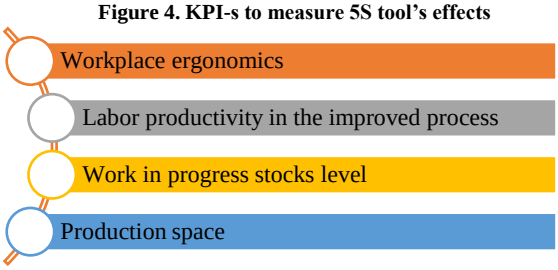
Source: Hirschmann Automotive Romania

3.2. Benefits of 5S tool use

The main effects of continuously using 5S tool are well-known: increased power of concentration, increased labor productivity, improved quality of products and services, clean and productive work environment, improved maintenance and safety, cost reduction, increasing of effectiveness and efficiency in the processes, discipline and better engagement at workplace, improved sense of responsibility and teamwork, better equipment reliability, as well as reduced waste: less space for storage and wasted labor

time, reduced production and set-up times etc[8,9]. But then how do we quantify the benefits in economic terms? It is important to know that the achieved results can be measured also as performance indicators. Four main KPI-s (Key Performance Indicators) will be used to measure the impact 5S implementation had in Automatic Bandage process.

Figure 4. KPI-s to measure 5S tool's effects



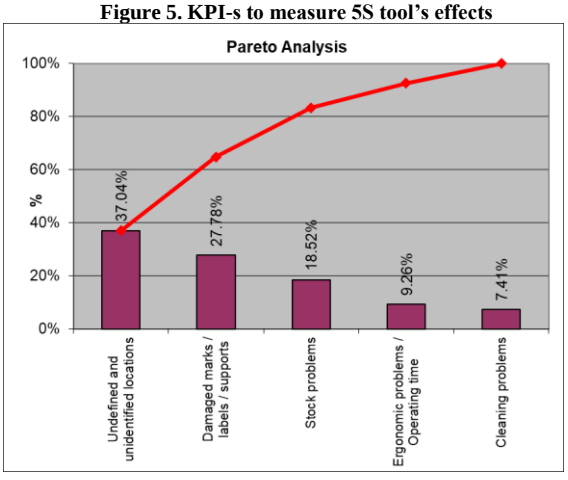
A. Workplace ergonomics KPI

Ergonomics is especially important at the workplace not only for comfort, but also for increasing productivity, minimise risk of injury or accidents.

When measuring the ergonomy KPI, Hirschmann Automotive Romania uses a Motion Economy Chart. The main objective is to ensure to the operators a workspace where the tools are at 2-second distance, can be easily reached at a stretch of hand. Time is measured at a workplace and specific analysis are performed to optimize it.

For example, in Pre-assembly area, at the Automatic Bandaging process a Motion Economy Chart was developed and a 5S site was implemented. 73 issues were identified at the workplace, all of them were classified based on the type of issue. Analysing the occurrences of identified issues, a Pareto analysis was performed (figure 5).

Figure 5. KPI-s to measure 5S tool's effects

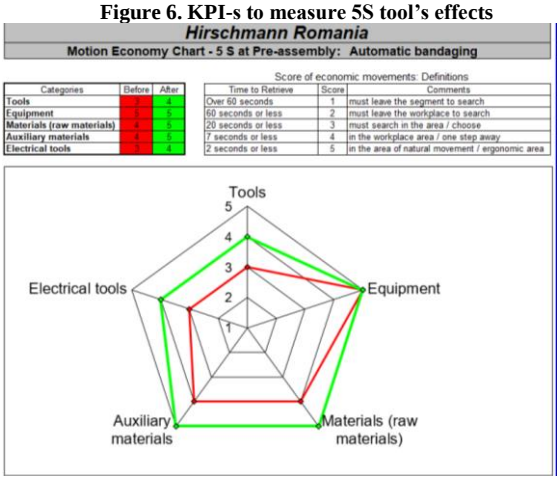


Source: Hirschmann Automotive Romania

The analysis helped to establish 76 actions, 97% of which were implemented at the Automatic Bandaging workplace. Time was measured again and results were introduced in the Motion Economy Chart (please see figure 6).

Improved results in terms of workplace ergonomics can be seen, comparing the green area of the Motion Economy Chart with the red area.

Figure 6. KPI-s to measure 5S tool's effects



Source: Hirschmann Automotive Romania

B. Labor productivity in the improved process KPI

The workplace was optimized as a result of the 5S tool implementation and the analysis performed. By standardizing the objects places (raw materials, tools, etc.) used in the assembly process, it was possible to reduce the Cycle Time from 13 seconds to 10 seconds, i.e. an increase of 23% of productivity. This gain of 3 seconds, transformed into hours, multiplied by the number of products/year and by the cost rate/hour result a gain of 1.856 euro/year. Please consider that this gain is yearly, so the sooner the improvement is introduced, the bigger the cummulated save is.

C. Work in progress stocks level KPI

For the interphase stocks, a minimum and maximum value was introduced. This helped reaching a better control of the material flow and the reduction from 5 boxes to 2 boxes of the stock, i.e. by 60%, meaning 53 euros per year. Several similar actions were introduced in the factory (see examples in the figure 7), which helped to decrease work in progress stocks level.

D. Production space KPI

Due to the optimization of the workstation and the reduction of the interphase stock, it was possible to reduce the space used from 15.6 sqm to 12.3 sqm, i.e. a reduction of 21%, meaning 165 euros per year. Even

[8] Cristina Veres, Liviu Marian, Sorina Moica, and Karam Al-Akel, "Case study concerning 5S method impact in an automotive company," Procedia Manufacturing 22 (Elsevier 2018): 900–905, https://doi.org/10.1016/j.promfg.2018.03.127.

[9] Vipulkumar Patel, Hemant Thakkar, "Review on Implementation of 5S in Various Organization," International Journal of Engineering Research and Applications 4 no.3 vrs. 1 (IJERA 2014): 774-779, https://core.ac.uk/download/pdf/26989504.pdf.

though the amount is not big, several improvements in different areas of the factory increment the saved space.

*Small improvements * Many repeats = Major Impact*

Figure 7. Before and after examples

4. Transposing automotive experience into medical environment

The described 5S approach can be transposed into other fields, such as healthcare, government, IT, retail and others to improve productivity and quality of products and services.

Adapting 5S method in healthcare, for example, should consider the specific medical environment and conditions. As in any other field, health system has several wastes, too.

The 8 Muda in the medical field are different from the 8 Muda in automotive. See table 1 for some specific examples of wastes.

Table 1. Examples of 8 Muda in healthcare

Types of MUDA	Examples in healthcare
Defects	misdiagnosis, incorrect administration of treatment, labels on the wrong tube, mixed analysis
Waiting time	patients waiting for consultation / hospitalization or discharge/ test results / doctor`s stamp; waiting for beds, equipment, information, operating rooms; Blockage of the computer system; time spent searching for a missing scalpel in the surgical kit; any interruptions or blockages
Inventory	inventory for 50 weeks; medications that may expire; too many consumables; pre-printed forms; any medicine, solution, furniture, object in too large quantities
Over-production	discharging all patients at 12 a.m., processing of all blood tests at 10:00 in the laboratory, ordering medications that the patient doesn`t need
Transport	Unnecessary movement of patients, samples, equipment or materials; remote locations
Extra-processing	Extra work, which the patient does not need; requesting and performing unnecessary diagnostic procedures; excessive bureaucracy; forms with information never used; surgery instead of an equally effective medical alternative
Motion	Travel 20 meters to the printer or to take analysis results; accompanying a patient for a NMR; long distance between locations
Unused potential	Loss of ideas, skills, improvements and learning opportunities through lack of involvement, listening and support of employees; putting pressure on people to hide problems

Implementing 5S means following the same 5 steps as in automotive field (follow section 3.1). In hospitals or clinics, Gemba means the place where medical care is offered. The teams are formed of the doctors, nurses, managers and other employees who are involved in creating value for the customers. Patients are the customers in healthcare.

There are several top hospitals and clinics in the world which monitors KPI's.

Applying the described in this paper KPI-s, we should not subestimate the importance of ergonomy in a surgery unit, emergency unit, histopathology laboratory, neonatology, cardiology unit, radioactive laboratory in nuclear medicine, and so on. Seconds matter as we are no longer operating with technical equipment or raw materials, but with human lives. We have seen how the ergonomy of a space can be measured and improved.

Labor productivity is very useful in crowded environment, which cumulate large waiting lists and queues, as well as in the emergency unit, where each minute matters more than elsewhere.

In the actual pandemic situation saving and optimizing space can allow a bigger number of patients to be treated at the same time, a bigger number of drugs to be stored and a more efficient use of equipment to be achieved.

Work in progress stocks level can be also decreased in the medical environment, using the same

approach of streamlining spaces by finding solution to store the same equipment in less space. A medical unit can establish a specific number of drugs to be stored in a particular space, to avoid disorder and time waste.

Figure 8. Before and after examples

Source: www.youtube.com[10]

A simple labelling of boxes helps saving time to search drugs or equipment, making the workplace more "visual".

5. Conclusions

The presented case study highlighted the externalities of using LM, especially the 5S method and the potential to expand the application in other fields of activity. 5S Tool is an appropriate choice to start introducing excellency in health care as the basis for redefining the measurement of quality in health services. In the actual pandemic crisis, when hospitals are facing a very large number of patients, 5S brings simplicity, focus, reduces stress and increases significant KPI-s: Workplace ergonomics, Labor productivity in the improved process, Work in progress and Adding-value space.

Why is it necessary to apply the 5S method in the health system? There are several reasons:

1. Nowadays the medical system is facing an excessive waste. Staff travel significant distances daily, patients wait tens of minutes or even hours in line to be consulted, we face an excessive bureaucracy that forces us to fill in dozens of forms, and so on.

2. Patient satisfaction is strongly influenced by the services provided by medical staff. In addition to patient satisfaction, it is important to increase employee satisfaction. Thus, we must first make sure that we offer our employees optimal working conditions, simplifying and making their work easier.

3. The quality of the health system needs to improve. Only excellence in the medical field is the way to achieve top results.

4. The medical field is constantly evolving and as a result, the staff, the professionals must be continuously adapted to the changes that take place, to improve.

5. The efficiency of routine activities leads to significant improvements, which are imperative in conditions of increasing demand for health care services.

6. Efficient medical management systems are successfully applied and show remarkable results in the top hospitals, being important models and examples of best practice for clinics, hospitals, pharmacies, medical offices, medical departments, etc.

6. Acknowledgement

ASPECTS REGARDING THE USE OF MARKETING FOR REDUCING CONSUMPTION

Mirela-Cristina VOICU*

Abstract

Environmental degradation is a reality that we face more and more often. It's been a while since recycling was proposed as a behavioral solution. Recently, however, the limits of recycling as a solution to environmental problems have begun to emerge. On the other hand, efforts to make products in a sustainable way and to stimulate the consumption of organic products is also not a solution given that we continue to exhibit irresponsible consumption behavior. In addition, despite countless initiatives by various companies and other stakeholders to reduce social and environmental impact, the planet's resources are becoming increasingly poor and the land and water are becoming increasingly polluted due to our unsustainable behavior. Humanity has reached the limits of the planet's sustaining capacity and the waste generated by production is more than the ecosystem can bear. In these circumstances, a new behavioral solution imposes itself, particularly one aimed at encouraging the reduction of resource consumption. It is imperative that consumers take into account the common good, including that of future generations, when exercising their buying and consuming behavior.

Although marketing has played for so long a crucial role in stimulating consumption, in the current context characterized by continuous environmental degradation, marketing is playing an increasingly important role in encouraging sustainable behavior aimed, in particular, at reducing consumption. In this context, the following paper reveals some important aspects regarding the necessity of consumption reduction and the ways in which marketing can add its contribution in this direction.

Keywords: *social marketing, responsible consumer behavior, consumption reduction, sustainable marketing, anti-consumption.*

1. Introduction

Environmental degradation is a reality that we face more and more often. It's been quite a while since recycling was proposed as a behavioral solution, which is not a too technologically sophisticated solution for the waste problem of a nation. Unfortunately, Romania is still flunking in this regard[1]. We are still striving to achieve the targets set by the European Union for recycling without much success. We are still at an early stage when it comes to the existence of a recycling-oriented consumer behavior or the consumption of recycled materials.

Recently, however, the limits of recycling as a solution to the environmental problem have begun to appear. The level of recyclable materials saved from landfills remains constant given that there are still materials that cannot be recycled. The recycling process itself also involves consumption of resources (transport of recyclable materials involves the consumption of fossil fuels, etc.). Also, another reason why we can no longer consider recycling as the best solution to the waste problem is market saturation; with the encouragement of recycling, new buyers of materials should be sought in order to process them. On the other hand, efforts to make products in a sustainable way and to stimulate the consumption of organic products is also not a solution given that we continue to exhibit irresponsible consumption behavior. In addition, despite countless initiatives by various companies and other stakeholders to reduce social and environmental impact, the planet's resources are becoming increasingly poor and the land and water are becoming increasingly polluted due to our unsustainable behavior. Humanity has reached the limits of the planet's sustaining capacity and the waste generated by production is more than the ecosystem can bear.

In these circumstances, a solution regarding the change of people's behavior imposes itself, in particular a solution aimed at encouraging the reduction of resource consumption. Few people are aware that the famous slogan „Reduce. Reuse. Recycle" that promotes environmentally sustainable behavior presents a series of actions in the order of their importance and impact[2]. It is quite clear that consumers need to be increasingly encouraged to consider the consequences of their consumption decisions, as the consumer imposes by his purchase or non-purchase decision. It is also clear that consumer choices have different consequences for the environment. The consequences are different if the consumer chooses to travel by car, compared to those

arising from the situation in which he chooses to ride a bicycle. Thus, it is imperative that consumers take into account the common good, including that of future generations, when exercising their buying and consuming behavior.

R.K. Pachauri, the president of the Intergovernmental Panel on Climate Change (IPCC) at that time, stated in 2014 that although there are many solutions to limit climate change, the first sine qua non element is the will to change ourselves[3]. The common theme of all reports and studies on the environment that is increasingly brought forward is that if human activities are not drastically changed immediately, there is a high probability that life on Earth, including humans, will disappear during the 21st century[4].

It is often stated that marketing activities are, to some extent, responsible for the current environmental degradation, a situation generated by consumption and over-consumption stimulated by these activities given that the success of marketing strategies is measured by indicators such as sales volume, market share, profits, etc. Focusing the attention of specialists only on these types of objectives in the process of formulating marketing strategies has a negative impact on society in terms of sustainability[5].

On the other hand, as marketing also contributes to influencing consumer behavior[6], its activities can be aimed at raising awareness of the consumption impact on the environment and achieving significant progress towards sustainability by promoting concepts such as responsible consumption, consumption reduction, anti-consumption, voluntary minimalism and a sustainable lifestyle. The problem in achieving this goal is to determine how to promote these concepts so that they are assimilated by consumers.

2. Why is it necessary to reduce consumption

Currently, the main sources of concern regarding the environment are:

- **Carbon dioxide emissions** which have already caused significant climate change seeing as these emissions have increased significantly in recent years. According to the International Energy Agency (IEA), carbon dioxide emissions from burning fossil fuels has stabilized at 33 gigatons in 2019, following two years of increases[7]. In 2020, carbon dioxide emissions fell by 7%[8], an unprecedented decline due to quarantine and restrictions to prevent the spread of the coronavirus. These consequences support the idea of the positive effects of reducing consumption.
- **The ecological footprint** is a standardized unit of measurement, which refers to the exploitable land and the sea area needed to produce the resources that human society consumes at a given time but also to absorb the resulting waste, using the available technology. The current ecological footprint both globally and individually, at the level of most countries, is unsustainable, a situation that is deteriorating with each passing day. By 2030, the demand for drinking water could exceed the supply by 40% and the forested areas will be reduced by 13%[9].
- **Consumption growth in emerging economies** (such as China and India) characterized by a rapid population growth rate. The world's population is estimated to reach 9.6 billion by 2050[10] (from 7 billion today), a situation in which the natural resources of three Earth like planets will be needed to support our current lifestyle. Achieving and maintaining sustainability will become an increasingly difficult task, given that demand for food and energy will increase by 40-50% and that for fresh water by 30-40%[11].

On the other hand, the analysis of the environmental impact of the products consumed within households is constantly performed by the European Union. Following these studies, it is always concluded that food and beverage consumption[12], utilities and transport are the categories of products that have the greatest negative impact on the environment. With regard to food consumption, the consumption of meat and meat products as well as milk and dairy products have the greatest negative impact on the environment. We cannot say that significant improvements have been made in these areas in terms of sustainability in recent decades, with global consumption growth exceeding

most of the improvements made in the field of environmental efficiency. Indeed, the consumption of organic food has increased, but to an even greater extent has increased the consumption of imported food or precooked products, which are consuming a lot of energy and additional raw materials (for example, for packaging). In the field of car production, sales growth of SUV vehicles exceeded the improvements obtained in fuel consumption efficiency offered by the new technologies implemented in the manufacture of engines. Households have become much more efficient in using energy for heating, but this improvement is outweighed by the increase in the level of energy used for countless home appliances. On the other hand, the number of households is increasing, and not necessarily pushed by population growth as much as the number of individual households. All this led to a 2.1% increase in energy consumption in 2017, compared to 2016[13]. In the first four months of 2020, however, global energy consumption fell by 3.8% as a result of the quarantine imposed in many countries[14]. Specialists' estimates of year-round energy consumption place this reduction at 5%. Such a reduction in energy consumption exceeds 6 times the record registered in 2009, due to the global economic crisis from that time. However, specialists fear that in the near future we will register an equally spectacular return to the growing trend of this consumption.

In this context, we can conclude that green marketing has failed in its desire to bring about changes or any significant progress towards sustainability.

3. Marketing for consumption reduction

Marketing was created in order to develop tangible products that meet the requirements and desires of customers in order to make a profit. The field has developed over time in various specializations such as service marketing to allow the realization of marketing in the field of intangibles, tourism marketing to promote visiting certain places or events, cultural marketing to promote culture or relational marketing that aims to build and to maintain long-term relationships with consumers. The common feature that permeates almost all the specializations that have emerged is that marketing aims to stimulate the growth of consumption or at least to change the consumer's purchasing decision in the direction of a particular product or service promoted. The exceptions are few and they refer to the so-called demarketing strategies that involve discouraging demand, such as, for example, placing a higher price during the tourist season to discourage the lower-income tourists, or anti-marketing strategies. One of the marketing specializations that has a significant potential aimed at reducing consumption is social marketing that uses the tools, techniques and concepts of commercial marketing to achieve social goals. Most social marketing initiatives focus on changing consumer behavior in order to increase the well-being of consumers and/or society.

The field of marketing has been flirting for some time with the concept of reducing consumption or even anti-consumption, since the early ’70s, with the advent of green marketing and social marketing. However, this marketing activity was focused on several areas (chemical industry, automotive industry, etc.) or on behaviors of interest (recycling, fuel saving, etc.). Unfortunately, promoting the reduction of consumption and non-purchase for certain products has involved, on the other hand, encouraging the consumption of organic products or encouraging the responsible way of disposing of products after consumption. These changes are indeed steps towards responsible behavior, but placing the emphasis on buying substitute products that are not so harmful to the environment is not a long-term solution and will not contribute substantially to the development of a sustainable economy, green marketing being rather used to create competitive advantages and a certain image in the market, as can be seen from the "progress" made towards sustainability. Thus, in the orientation of the green marketing so far, the concerns for stimulating the non-buying behavior of the consumers should be introduced. In order to achieve this goal, the marketing activity must focus on the positive economic aspects that reducing consumption could bring as well as on the level of well-being of the population in terms of happiness and quality of life.

The development of sustainable marketing strategies is not a simple process given that the contradiction between one of the basic principles of sustainability regarding the conservation of resources and low consumption, on the one hand, and one of the principles of marketing, on the other, regarding the increase of sales, which means the increase of production and consequently the increase of resource consumption, must be resolved.

The marketing aimed at reducing consumption should be based, similar to commercial marketing, on the ***research of the target segment, competition and environment*** and on a consumer approach through the ***marketing mix*** tailored to the characteristics of the field so we can talk about a social product and a social price.

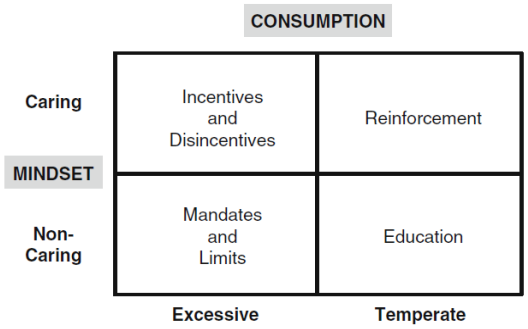
In the concerted effort to limit global material consumption by reducing individual consumption, those who enjoy a high and average level of consumption (compared to a calculated global average), regardless of the country in which they live, play a much more important role than below-average consumption, so efforts should be focused primarily on

[13] *Global Energy & CO_2 Status Report 2017*, March 2018, International Energy Agency, https://www.iea.org/publications/freepublications/publication/GECO2017.pdf.
[14] *Global Energy Review 2020*, April 2020, International Energy Agency, https://www.iea.org/reports/global-energy-review-2020.

this segment[15]. Also, industrialized economies, which represent only 23% of the world's population, consume over 77% of the planet's resources (including 72% of total energy) and generate about 80% of global pollution[16].

Also, a tool that can be used in this context is the one proposed by Sheth et al which is based on the planned social change model and a framework for addressing the discrepancy between attitude and behavior proposed by Sheth and Frazier. Through this tool, four consumer segments are delimited taking into account two criteria (see figure 1): 1. the tendency of the consumption behavior ("excessive" versus "temperate") and 2. the attitude towards consumption or the way of thinking ("caring" versus "non-caring") for each segment being proposed solutions for approaching them in order to reduce consumption.

Figure 1. Solutions for consumer approach taking into account the trend of consumer behavior and the attitude towards consumption



Sursa: Sheth, J.N., Sethia, N.K., Srinivas, S., 2011, *Mindful consumption: a costumer-centric approach to sutainability*, Journal of the Academy of Marketing Science, Vol. 39, Issue 1, pp 21-39, https://doi.org/10.1007/s11747-010-0216-3

Also, an important concept in this context is the one regarding the consumer willingness for change. The model proposed by James O. Prochaska in 1977 to explain how cigarette addicts managed to give them up, a model that was later improved in collaboration with Carlo C. DiClemente[17], can be taken into account in developing strategies aimed at reducing consumption. The mentioned theory holds that changing a behavior is a process that takes place in several stages: pre-contemplation - contemplation - preparation - action - maintenance. During pre-contemplation, individuals either do not want to change their behavior or are unaware of the consequences of their behavior for themselves or others. In the contemplation stage, individuals begin to consider the costs and benefits of changing their behavior. In the preparation stage, individuals are motivated to change so they begin to prepare mentally and practically. During the action stage, the individual is in the process of change, followed by the stage in which the individual maintains the behavior or relapses to a previous state. Considering the mentioned model, we can observe the complexity of the process of changing a behavior taking into account that it takes place in several stages and that the relapse can happen a number of times. In the context of the reducing consumption issue, the model proposed by Prochaska contributes to understanding the availability of the target segment to change and thus to developing marketing strategies appropriate to the needs and desires of consumers. For example, in the pre-contemplation stage, marketers may seek to increase awareness and interest in reducing consumption and may even try to change the system of values and beliefs. In the contemplation stage, the marketer must convince and motivate consumers to perceive an increase in the benefits of the behavior that is to be adopted and a reduction in costs associated with its change (time, physical and money). In the next stages of preparation and action, marketers need to focus on stimulating action and finally, in order to maintain behavior change, specialists should consider reducing cognitive dissonance by consolidation[18].

Another aspect that should be considered in this context was highlighted in a study by Black and Cherrier (2010)[19], namely that consumers' self-interest or concern for the environment is not a sufficient motivation to reduce consumption. Self-interest and the concern for the environment are interrelated and together represent a motivation that determines the reduction of consumption and even the practice of anti-consumption.

Social changes are more likely to occur when communication no longer focuses on the message and the experience of those behind it, but rather on the audience's point of view, including possible barriers it faces to achieve the promoted social changes, given that in the campaigns carried out so far the emphasis has been on guilt, which didn't have not had the expected success[20].

Also, using marketing to reduce consumption can target different segments, beyond the target audience, including groups of media representatives, authorities or related businesses. Reducing consumption must also

be transformed into acceptable behavior for policy makers too, given that such behavior contributes to reducing consumer spending with an impact on gross domestic product and, implicitly, on taxes and duties levied.

In addition, the target audience can be approached in different phases of awareness and reaction to a particular problem or behavior of interest.

According to marketers, the effectiveness in overcoming well-established consumption behaviors of marketing programs for reducing consumption lies in the extent to which consumption reduction will become a much more interesting behavior throughout society and when it will be considered a normal behavior[21].

On the other hand, the ***marketing mix*** aimed at reducing consumption has the following dominant features:

- *The product* to be promoted is represented by the idea of reducing consumption. In this context, the marketing activity will be directed towards promoting statements that emphasize the need to consume less ("happiness cannot be bought in the store", "new does not necessarily mean better", "do not be another fashion victim",“walking makes the foot beautiful and the environment healthy” etc.). The idea of reducing consumption has already been addressed in campaigns to raise awareness of food waste, to promote vegetarianism as a solution to protect the environment (environmental vegetarianism) and to reduce the consumption of plastic packaging.
- *The placement* is, in this context, accessibility in terms of access to alternative solutions that bring satisfaction to the consumer following the reduction of consumption (for example, access to bicycles and bicycle lanes when the reduction of the number of cars on the roads is desired), access to repair services or access to information or expertise. One of the solutions that has gained momentum at the moment is collaborative consumption such as car sharing (for example, Get Pony, Zipcar, toy lending library), redistribution of goods (such as the Freecycle program) or social credit (Zopa) proposing the overcoming of individual property and the sharing of possessions[22].
- In this case, *the price* mainly takes the form of time and effort costs (less financial costs taking into account that the reduction of consumption implies making savings) incurred to change the behavior. In this area, the decisions that can be taken by those interested in achieving a change in behavior towards reducing consumption, can take the form of discounts for access to infrastructure, service and information or reducing the risks associated with changing behavior (secure parking for bicycles, instructors, etc.). It should also be borne in mind that the price paid by consumers who choose to reduce consumption can also take the form of rather unpleasant social labels ("strange", "idealistic", "gullible", etc.).
- *The communication* will be similar to the one practiced in commercial marketing, having a bidirectional character and aiming at interaction and building long-term relationships with the audience. Promoting consumption reduction aims to encourage the acceptance, adoption and maintenance of this behavior.

Communicating to people that they can no longer drive so much, that they should no longer consume as they see fit, or that they should no longer fly by plane are certainly more than unpopular messages. Reducing consumption must be addressed beyond its rational aspects regarding the benefits and necessity of this behavior, investing the concept of sustainability with an emotional charge capable of leading to this change in behavior. We must not lose sight of the fact that the reduction of consumption will be achieved, first of all, due to our own interest (for example, interest in what we leave behind to our children, care for our health, etc.), and not simply because of concern for the environment. The emphasis should be placed on the countless benefits of reducing consumption for the consumer - financial freedom, less stress, personal integrity and a good life - attributes of the so-called "quality of life" indicator.

The perception over reducing consumption, that of a practice due to insufficient financial resources, can be changed through communication campaigns that give a status to the consumer concerned about the environment. An example of this is the successful campaign conducted in 2015 by REI, a retailer of outdoor products, in which customers were asked to "opt outside" on Black Friday[23]. As a result of this campaign, there are currently over 11 million Instagram posts with the hashtag #OptOutside and over 1.4 million people and 170 businesses committed to doing so on the REI website in 2017 (#OptOutside - Will you go out with us?).

One of the trends that could be promoted through the marketing activity aimed at reducing consumption is the phenomenon of "downshifting" or "voluntary simplicity"[24] with the meaning of giving up a well-paid job and a consumption-intensive lifestyle for a simpler lifestyle, less focused on material rewards but no less satisfactory. The trend clearly expresses a latent demand represented by consumers in search of a life with a lower stress level and a lifestyle less focused on

consumption, elements that can be the basis of a campaign to promote the reduction of consumption.

4. Conclusions

Given that the available environmental resources are constantly decreasing and the probability of leading the current lifestyle decreases with each passing day, there is also a need to reduce the level of consumption for a significant number of people. Governments, educational institutions, non-governmental organizations and even companies play an important role in achieving this goal. But actual changes in purchasing behavior, defining part of a long process towards sustainable consumption, should take place primarily at the individual and household level.

Unfortunately, in contemporary society, individuals associate consumption with social welfare as an indicator of success and personal preferences. At the same time, the level of consumption has increased dramatically worldwide and, in particular, in developed countries, which reduces the chances of achieving a sustainable lifestyle. In these circumstances, all efforts must be focused on changing social paradigms and the economic system in order to minimize the impact on the environment and effectively reduce the level of consumption. The imperative and urgency of reducing the level of consumption are recognized only theoretically. Unfortunately, however, in reality the measures taken to achieve this goal are ineffective. The theory of punctuated equilibrium suggests that a radical change, in which the premises underlying previous behavior are called into question, usually occurs only if people perceive a significant crisis. Perhaps a more active promotion of the crisis we are in will contribute to changing current consumer behavior. Higher education teachers, pressure groups and the media, among others, can play a significant role in creating a sense of crisis[25].

Particular emphasis should be placed on developing new strategies to change current high consumerism habits and promote a less materialistic mentality. Even if we resort to solutions such as recycling or consuming organic products, consumers need to be aware of what the appropriate level of consumption is and how to reach that level. Creating a sustainable society involves, among other things, that each of us uses only as much as we need.

Promoting the reduction of consumption in consumer societies is a particularly difficult task, a move against the tide created by the predominant consumer-oriented social paradigm. The consumption of a particular product is much easier to represent in the media and advertising compared to the joys brought by the savings obtained by reducing consumption and a simplified lifestyle. In other words, it is much more difficult to turn reducing consumption into an attractive behavior in the eyes of consumers.

Also, the consumer segment is not the only one that should be targeted by the marketing aimed at reducing consumption. Important in this context is the transformation of consumption reduction into an acceptable behavior for policy makers. A step in this direction is to promote the level of population's happiness as a metric system for measuring the progress of a state in exchange for traditional indicators of economic growth.

THE ROLE OF LEGAL INSTRUMENTS AND MARKETING EFFORTS IN ENSURING A HIGH DEGREE OF SATISFACTION FOR BENEFICIARIES OF MEDICAL SERVICES

Adelin-Mihai ZĂGĂRIN[*]
Alexandru-Bogdan URSOIU[**]

Abstract

The right to health is part of the second generation of rights, outlined after the Second World War, based on its features and socio-economic and cultural nature. Respect for human rights with regard to health care providers is a growing and ongoing concern aimed at increasing the satisfaction of the beneficiaries of the services provided by them. The protection of human rights in the field of health and the prevention of their violation can be done by establishing legal protection mechanisms and marketing actions available to the beneficiaries of health services, in the context of medical care. Legal instruments and marketing efforts for ensuring a high level of satisfaction for the patients is scientifically viable and can be implemented in the health market. The economy of medical services addresses three fundamental questions: what health care services are needed, in which manner must the medical units provide those services and to whom the services must be delivered. In terms of managerial implications, the conclusions support the importance of providing health care by deeply focusing on the patient. The activity of medical units, both public and private owned, can be continuously improved by adapting to the needs and desires of consumers.

Keywords: *fundamental rights, quality standards, patient satisfaction, marketing, adaptation to patient requirements.*

1. Introduction

Referring to the well-known categorization into three generations of human rights, rights presented by the Czech law professor Karel Vasak at the International Institute of Human Rights in Strasbourg in 1977, the right to health is found in the second generation of rights[1]. Outlined after the Second World War, based on their economic, social and cultural nature, it includes: the right to work in fair and favorable conditions, the right to social security and unemployment benefits, the right to housing, care and health care, at school, etc.

Human rights publications in general are numerous, but few study the observance of human rights by health care providers to protect their legitimate interests. The protection of human rights in the field of health[2] and the prevention of their violation can be done by establishing protection mechanisms and legal actions available to the beneficiaries of health services, in the context of medical care.

Participants in the medical act, both health care providers and patients, by knowing the rights and responsibilities, contribute directly to improving the health of the population and medical services, with direct implications on protecting the legitimate interests of patients.

The improvement of health care is truly achieved when the consumers drive it, becoming both better and cheaper[3]. Under the modern conception of providing quality medical services, the allocation of resources and all the efforts are inevitably focused on the patient's best interest, as the ultimate purpose of all the medical enterprises, both public and private. In that context, medical unit's management must routinely evaluate the level of patient's satisfaction because having satisfied consumers demonstrates that the achieved quality of services is higher[4]. The European Union, as some authors[5] point out, has adopted a leading position on the international stage regarding the subject of consumers' rights, health care included.

The convergent approach involving legal instruments and marketing efforts for ensuring a high level of satisfaction for the patients is scientifically

viable and can be implemented in the health market. Based on the findings of another authors[6], the introduction of elements from expert domains like law and marketing is able to determine changes within a practical domain like health care and subsequently its desired framework becomes progressively updated.

2. The rights of Romanian patients to high quality medical services

The protection of human rights with regard to patient care is guaranteed by a series of international treaties[7], to which Romania is a party, ratified, having binding legal force, to which is added the Universal Declaration of Human Rights adopted by the UN General Assembly in 1948 Contrary to the fact that the declaration does not have the character and legal force of a treaty, scholars of international law argue that it has attained the status of customary international law, and its provisions are accepted as obligations by all states, becoming universal standards[8] over time.

Respect for the rights deriving from the relevant international treaties rests with the UN bodies, which issue documents interpreting the content of the treaties for the guidance of states in order to implement their content.

Ensuring the rights of persons who have the quality of patient or benefit from medical services is a continuous concern of both the legislator and the public administration designated with the organization and concrete execution of public health. The economy of medical services addresses three fundamental questions: what health care services are needed, in which manner must the medical units provide those services and to whom must the services be delivered[9].

Individuals, either patients undergoing medical treatment or persons who are about to enter into legal relations with a medical entity, have the right to a series of concrete actions and measures by the state, which ensures a high degree of satisfaction of the beneficiaries of medical services in general, in conjunction with the fulfillment of obligations by providers of this type of public service. As demonstrated in 2008 by international specialists[10], there might occur specific situations when, despite the fact that a medical unit provides an excellent core medical performance, the patients report a low satisfaction because they evaluate the services mainly based on non-medical elements.

The European Charter of Patients' Rights, hereinafter referred to as the Charter, drawn up in 2002 by the European network of consumer and patient civil organizations - Active Citizenship[11], although not a legally binding legal instrument, is the most comprehensive statement of patients' rights. The cornerstone for the realization of the European Charter of Patients' Rights is art. 35 of the Charter of Fundamental Rights of the European Union, called health protection, according to which "*everyone has the right of access to preventive health care and the right to receive medical care under the conditions established by national laws and practices. A high level of human health protection shall be ensured in the definition and implementation of all Union policies and activities*[12]. "

The charter begins in the second part with the definition and explanation of the 14 rights of patients[13], first referring **to the patient's right to preventive measures** entitled, "*every individual has the right to adequate services to prevent the occurrence of diseases*." As referred on art. 1 of the Charter rests with the public and private network health services a number of obligations: firstly to raise the level of information of the public on preventive procedures that are carried out at regular intervals free of charge; secondly, the obligation to carry out those procedures with priority for those high-risk population groups; thirdly, it is the responsibility of the health services to ensure that everyone has access to the results of scientific research and technological innovations in the field of health.

With the inclusion in the constitution of most countries, the right to health has become a fundamental right, in our country **the right to health care** being guaranteed by art. 34 of the 2003 Romanian Constitution. From the corroboration of the provisions of art. 34 and art. 35 which stipulates with the title of fundamental right that citizens have the right to a

[13] The right to preventive measures, the right to access, the right to information, the right to consent, the right to free choice, the right to privacy and confidentiality, the right to respect patients' time, the right to respect the quality standards of medical services, the right to safety , the right to innovation, the right to avoid unnecessary suffering and pain, the right to personalized treatment, the right to file a complaint, the right to compensation, other patients' rights. Generically called other patients' rights and being derived from European legislation, they are divided into: the right to dignity, the right to non-discrimination.

healthy environment, outlines measures to prevent diseases.

National legislation[14], by Law no. 95/2006 on the reform in the field, republished, stipulates that among the main functions of public health, there are also preventive measures: "*epidemiological surveillance, disease prevention and control*" - at art. 5, lit. c; "*Prevention, surveillance and control of communicable and non-communicable diseases*" in art. 48, para. 1, lit. a; „*The provision of preventive medical services is an objective of the ambulatory medical assistance*" regulated by art. 134, etc.

Achieving a high degree of satisfaction of patients and beneficiaries of medical services can be done by informing the public of their fundamental rights under the law and their responsibilities in the legal relationship with the entities responsible for ensuring public health.

The provision of medical services at quality standards is a fundamental right, provided by the Charter but also by art. 2 of Law no. 46 of January 21, 2003 on patient rights. The quality level indicated by the legislator refers to the highest standard available to the company, taking into account the human, financial and material resources available.

Based on the **right of access to high quality standards of medical services**, insured patients have the right to travel to a third country to benefit from medical services covered by CNAS based on the tariffs provided by law. The expenses occasioned by the cross-border medical assistance are made based on the Government Decision no. 304 of 2014.

According to law no. 554/2004 on the Law on Administrative Litigation, the insured may address the court of administrative litigation in the following situations found in art. 913 of Law no. 95 of 2006 on health care reform:

- *The unjustified refusal of the health insurance companies regarding the reimbursement of the expenses occasioned by the cross-border medical assistance;*
- *The level of health care equivalent is not in line with the rates covered by the insured;*
- *Failure to approve the insured's claims regarding the reimbursement of the cross-border healthcare value.*

Individuals are recognized the right to access high quality medical services based on concrete standards and criteria established by public authorities. It is appreciated that the level of technical performance, comfort and interpersonal relationships must be at least satisfactory.

The notion of **quality standard** is not properly defined in Law 95/2006 on health care reform, although it often refers to the quality of medical services in general. Art. 5, lit. g), m) of the mentioned law are detailed that among the main functions of the public health care are targeted: *ensuring the quality of public health services; evaluating the quality, efficiency, effectiveness and access to medical services*. The ambiguity and inaccuracy of establishing a level of appreciation of the quality standards of medical services generate both practical problems and litigious or health situations for cases of malpractice[15], related to the liability of health units.

Malpractice occurs as a result of an individual act that takes place during the process of prevention, diagnosis and treatment or as a result of exceeding the limits of legal and professional competences. The reasons behind medical malpractice, malpractice, are recklessness, negligence, error and insufficient training and preparation, generating harm to the patient. The Code of Medical Deontology of the Romanian College of Physicians provides in art. 9 and art. 53-55 the obligation of the doctor to show maximum diligence "*in establishing the diagnosis, the appropriate treatment and avoiding the foreseeable complications in the patient in his care*." In regard, as demonstrated in a specific research[16], the medical services are certainly generating an essential contribution to the wellbeing of the population, but the risks of errors and complications cannot be completely eliminated. The modern diagnostics and therapies are complex and the treatments might involve delivery by specialists from different medical units, requiring a high degree of collaboration and a quick transfer of the relevant information.

In order to assess the quality of medical services, aspects related to the endowment of medical service providers with the necessary equipment and medicines, the existence of specialist doctors and legal qualifications or accreditations, etc. must be taken into account.

[14] With regard to the right to prevention, the National Legislation includes, together with Law 95/2006 on health care reform and other normative acts intended for certain sectors of activity or socio-professional categories, including: Law 319/2006 on safety and health at work aimed at preventing illness and accidents by introducing measures to eliminate risk factors at work; Law no. 138/2008 for a healthy diet in pre-university education units aiming at the prevention of diseases caused by unhealthy nutrition, with applicability in the communities of children and schoolchildren; Law 104/2011 on ambient air quality; Law no. 487/2002 on mental health and the protection of persons with mental disorders.

[15] Decision 337 / R of 29.09.2016 of the Court of Appeal of Târgu Mureș, Malpractice, Compensation under the conditions of art. 998-999 Civil Code, art. 653 of Law 95/2006. Compensation for non-pecuniary damage. Decision of the Oradea Court of Appeal no. 777 in 29.10.2019, Delinquent civil liability for bodily injury through fault - Medical malpractice. The damage suffered by the patient is often a permanent disability, with consequences for quality of life and a radical change in lifestyle, so the doctor is required to take all necessary steps to ensure a high degree of patient satisfaction.

[16] Luke Slawomirski, Ane Auraaen, Nicolaas Klazinga, *The economics of patient safety: Strengthening a value-based approach to reducing patient harm at national level*. Organisation for Economic Cooperation and Development, Paris, 2017.

3. Patients' requirements for satisfactory medical services

As part of the marketing efforts to provide scientific support for the higher adaptation of health care providers in Romania to the demands and expectations of the patients, a direct study was employed, based on the quantitative approach. The survey sought to provide relevant data about the mechanisms of satisfaction formation among the patients, as well as the factors that influence it and the practical implications. The study was conducted on a number of 385 patients above the age of 18 that had voluntarily used health care services at least once within a timeframe of 12 months, provided by medical units located in Bucharest and the surrounding district of Ilfov, with a sampling error within the margin of ±5%. In terms of sample structure, the gender and age distribution of frequencies were similar to those officially provided by the National Statistics Institute regarding the general population and therefore the collected data did not require additional measures of ponderation for representativity. The collection of data took place in the field using three waves of distribution of self-administered questionnaires to patients and that instrument was built on the funnel-approach paradigm in terms of required effort from the participants, while the sampling technique's nature was proportional.

In line with the fulfilment of the objectives of the present paper, the following results represent a proportion of the content of the mentioned survey, whose scope was broader in terms of marketing implications regarding the creation and the consumption of health care services. In that regard, two relevant objectives of the quantitative research were determining the ranks of some relevant aspects that are having an impact on satisfaction, as conferred by the patients, and also the ranks of the central reasons for trusting that a medical unit can best serve patients' best interest.

The survey results are indicating that the leading factors for satisfaction in terms of importance granted by the patients are the attention that they are receiving from the medical unit (its score averaging at 8.35 out of a maximum of 10), closely followed by the performance of the medical staff (with a score of 8.30). Also, a high position in terms of importance was conferred to the respectfully behaviour of the health care provider (placed at 8.14). The middle group in term of importance could be built from the patients' request to be informed about the benefits as well as the risks of every possible option regarding the treatment (averaging at 7.67 on the scale from 1 to 10), the logistics base (with a level of 7.54) and the waiting time (its score being 7.26). The group of factors with lower relative importance was comprised of the amiability of the staff (placed at the level 6.78), the thorough information regarding the medical procedures (scoring 6.43 points) and finally the price and the auxiliary staff's performance (with average scores of 6.21 and 6.04 respectively). It is also relevant that all the ten proposed criteria for satisfaction received absolute ratings of importance above 6 on a scale from 1 to 10, indicating that the choice of items for researching was relevant for the participants regarding the evaluation of satisfaction for the medical services.

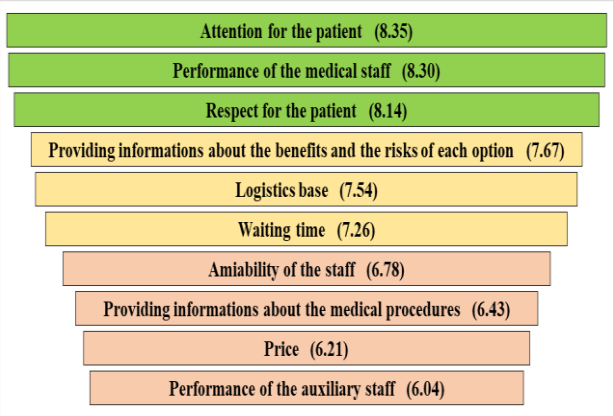

Figure 1: Patients' ratings on the importance of some relevant items for satisfaction

Source: Author statistical survey

Regarding the topic of patients' trust about the best defending of their interest, the most appreciated approach from the health care services providers is to provide the medical practice at the highest level of quality, regardless of costs, with 36.4% of the respondents indicating it as the most important reason for trusting a medical unit. The second option in terms of preference was the one focusing on making the health care as accessible as possible, while fulfilling the promises stated in the offer, with 33.2% of the participants favouring it. A possible middle way, in terms of expecting the medical units to provide a decent quality of service while adapting to the needs, with translates in neither top performance nor highest accessibility but on the overall average, was placed on the third position, gathering 30.4% of the patient's options.

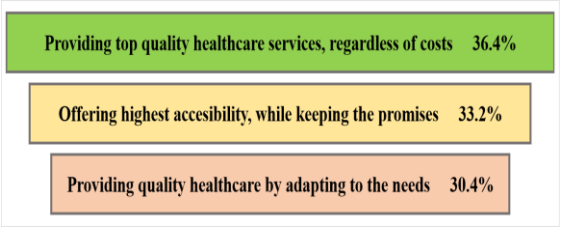

Figure 2: The main reason for patient's trust in a medical unit

Source: Author statistical survey

The patients, as revealed by the study, have manifested a tendency for considering their interest best served by the health care providers that build their management orientation either on providing the top quality of services, or on providing the highest accessibility, while the middle option seemed to have been less favoured.

4. Conclusions

This research paper's aim was to explore the convergence of the roles of legal instruments and marketing efforts to support the achievement of higher patients' satisfaction.

In order to assess the quality of medical services, aspects related to the endowment of medical service providers with the necessary equipment and medicines, the existence of specialist doctors and legal qualifications or accreditations, which are the responsibility of the competent public institutions, must be taken into account.

The most important attributes for the patients regarding the quality of medical services were the attention that they are receiving from the medical unit, the performance of the medical staff and the respectfully behaviour of the health care provider. A high proportion of the study participants also indicated that in order to gain their trust, health care providers must provide at the highest level of quality for the medical practice, even if that would imply higher costs.

Individuals are recognized the right to access high quality medical services based on concrete standards and criteria established by public authorities. It is appreciated that the level of technical performance, comfort and interpersonal relationships must be at least satisfactory. Among the main functions of public health care are: *ensuring the quality of public health services; evaluating the quality, efficiency, effectiveness and access to medical services.*

In terms of managerial implications, the conclusions support the importance of providing health care by deeply focusing on the patient. The activity of medical units, both public and private owned, can be continuously improved by adapting to the needs and desires of consumers. In that regard, the legal instruments are effective and their implementation in convergence with the marketing efforts based on consumer research will also increase the efficiency of the allocation of resources, resulting in a higher and durable level of satisfaction for the patients and further supporting wellbeing of the society.

ONLINE EDUCATION – IMPROVISATION OR INNOVATION

Norica Felicia BUCUR[*]
Oana Rica POPA[**]

Abstract

Online education has been widely available since the internet started to play an important part in everybody's life and its benefits for all stakeholders are unquestionable. Since the pandemic struck, online education has become the watchword for an audience wider than the one envisaged before, as, at all levels, be they primary, secondary or tertiary, teachers, students and parents have pinned all their hopes on it, expecting it to be the appropriate solution, so that educational standards could be kept at least at a minimum/ satisfactory level. But, were they ready to turn to this somewhat new teaching and learning paradigm? Did they have the necessary digital skills? Could they successfully adapt to a whole new approach? Considering that online teaching has been more or less exclusive in most parts in Romania for the last two semesters in primary and secondary education, our paper aims to tentatively answer these questions from the teachers' perspective, by pointing to both the positive and negative aspects entailed by this unforeseen situation which does not seem to end any time too soon. Even if our investigation is limited to a relatively small number of primary and secondary school educators from only one county of Romania, our conclusions might shed some light on the challenges that these specific actors have had to deal with so far, given the circumstances. Moreover, we might also be able to indicate whether the balance was tipped in favour of improvisation or innovation for those willing to participate in our survey.

Keywords: *online education, primary and secondary education in Romania, teachers, digital competences.*

1. Introduction

Approaching education by exclusively using digital devices and an internet connection has become the only way possible to ensure participation in the teaching learning process in Romania, starting with March 2020. The entire student population enrolled in primary, secondary or tertiary education in Romania, as well as the teaching and management staff, not to mention parents, had to quickly internalize the requirements of the new educational paradigm so that satisfactory results could be achieved. This sudden change has made considerable demands on all stakeholders, be they financial, technical or psychological, and the gap between those situated at the high and low ends of the educational continuum has unfortunately deepened.

Continuing to build up the key competences in students, especially those in primary and lower secondary education, was put to a hold or significantly slowed down when the lockdown measures came into force in Romania, in March 2020. No overnight miraculous solutions could be envisaged so that the educational objectives set for the 2019-2020 school year could still be attained. It was the more difficult as nobody could roughly estimate how long the pandemic was going to last/ when the pandemic might possibly come to an end.

Under these circumstances, this paper aims at investigating whether Romanian teachers were able to adapt or change their teaching abilities so that curricular objectives could be partially or totally met. In point of structure, the first part of our paper provides a diachronic perspective on the regulations put forward by the Romanian Ministry of Education regarding online education in the primary and secondary educational system, during March 2020 – January 2021. In part two, we give a brief outline of the recent reports on online education published by Romanian education specialists, giving special attention to the teachers' opinion. Part three covers the methodology employed in our study and in part four we discuss the findings of our small-scale research. The final part deals with the conclusions of our investigation.

2. Online Teaching Regulations in Romania: March 2020 – January 2021

Regular school activities were suspended starting with March 11, 2020, as a result of the Decree no. 195[1] of March 16, 2020 regarding the establishment of the state of emergency on the Romanian territory and the Decision of the National Committee for Special Emergency Situations no. 6[2] of March 9, 2020. Taken by surprise, Romanian education stakeholders expected that the unperformed activity (for 8 working days)

[1] Published in the Official Gazette of Romania no. 212 of 16 March 2020 (Chapter VII - Other measures, Article 49: 'During the state of emergency, activities in all educational units and institutions are suspended.').

[2] Art. 1 specifies the suspension of courses in state and private pre-university education units for the period March 11-March 22, 2020, with the possibility of extending this period, depending on the evolution of the situation.

would be recovered in the near future, when activities were to be resumed, very similar to previous situations that had existed (caused by strikes, unfavorable weather conditions, etc.).

On March 9 and 10, the Romanian Ministry of Education (RME) made their first recommendations, underlying the fact that the guidelines provided were not meant to replace the activities that used to be performed in schools on a regular basis. The official document included the following:

- the necessity to create technology-assisted resources (RME Notice no. 79 / 10.03.2020, to the county school inspectorates);
- teachers were recommended to access the educational applications offered under free licence by Google and Microsoft, being indicated that they would get support from the Teaching Staff Resource Centers[3] and e-learning experts within the CRED project[4];
- teachers were suggested that they could keep in touch with their students through any means of communication;
- the schools' boards of directors were to decide how suspended educational activities could be recovered.
- This endeavour could be interpreted as an attempt to create a framework to regulate educators' activity in the short term. Moreover, the solution envisaged by the Romanian educational authorities, at that point, was the recovery of the classes.

On March 18, RME came back with more clarifications (RME Notice no. 8731 / 18.03.2020), requesting the county school inspectorates to analyze alternative solutions for continuing online education. Thus, the suspension of the regular teaching activities until further notice was anticipated and the RME evinced their concern to support students and teachers in the efficient use of tools and educational applications useful for distance learning, along with their planning of training teachers (made by experts of the CRED project, underway at the onset of the pandemic) between March 19-25.

On March 30, the RME addressed an open letter to teachers, mentioning that:

- the Ministry was aware that there were students and teachers who did not have the necessary technology to continue the teaching-learning process;
- the Ministry encouraged teaching and learning, creating educational context through any means of communication, using any available resources to motivate students to stay connected to education;
- the Ministry announced the identification of digital tools and resources, grouped on the DIGITAL educred.ro platform[5];
- activities (revisions) meant to reinforce already acquired competences are suggested (therefore no teaching and assessment activities are to be performed);
- the Ministry urged teachers to keep a balance in the volume of resources transmitted, so that individual activity and participation in online activities would not be a pressure for students;
- the Ministry stated that they were working on scenarios to compensate for the effects of the crisis.

The following months (until the end of the 2019-2020 school year) were also under the sign of improvisation from the point of view of the actual organization of the educational activities. In this period, the regulations put forth by the RME focused on the administrative part: the management of the student records, the organization of national exams.

As the beginning of the new 2020-2021 school year was approaching, clear specifications were necessary, so new RME orders were issued (RME Order no. 5447 / 31.08.2020 on the *Approval of the Framework Regulation for the Organization and Functioning of Pre-University Education Units*; RME Order no. 5545 / 10.09.2020, on the *Approval of the Framework Methodology regarding the Organisation of Teaching Activities through Technology and the Internet, and the Processing of Personal Data*). Thus, by means of these regulations, it was indicated that various educational activities could be carried out online, by electronic means of communication (videoconferencing), whenever objective circumstances (such as the pandemic) can be identified. The latter RME order produced badly needed clarifications for the first time since online education became the watchword:

- the list of terms associated with online teaching and their definitions (teaching activity through technology and the internet; virtual educational environment; digital educational platforms to be used for the teaching/learning process or necessary to create and share open educational resources, applications for communication through technology and the internet, digital resources; forms of communication through technology and the internet – synchronous, asynchronous, mixed);
- the applicable principles, as well as the aspects regarding security in the virtual educational environment and the management of personal data;
- the stages of implementation of the teaching-learning activities through technology and the internet, at the level of educational units;
- the specific roles of the stakeholders involved in organizing and carrying out teaching activities for learning through technology and the internet (ministry, school inspectorates, management of educational units, teachers, students, parents),
- the methodological aspects on organizing and carrying out teaching activities through technology and the internet in pre-university education units,

[3] Each county in Romania has such an institution.
[4] An Romanian educational project, co-financed by the European Social Fund.
[5] The same CRED project, aforementioned in this paper.

– how to carry out teaching activities in disadvantaged communities where teachers and students have limited access to technology.

Based on the methodology put forth by the RME, the schools developed their own procedures regarding the teaching activities performed through technology and the internet, as well as for the processing of personal data.

Approved just a few days before the start of the 2020-2021 school year, on September 14, the *Framework Methodology for Organizing Teaching Activities through Technology and the Internet, and the Processing of Personal Data* was a first step towards normality, considering the period we were going through: the normality of the online school/ education. It is hard to believe that schools had the necessary respite to carry out the necessary procedures, to make the necessary acquisitions, to instruct the teachers and students, etc. However, the gains this official document brought on were significant, because it created a framework in which online activity could grow. Starting with this moment, the schools proceeded to activate their licence for a free platform within the RME partnership with Google and Microsoft, to create personalized accounts (on the school domain) for all the teachers and for all the students, thus having the possibility to benefit from a free service for online activities.

This *Framework Methodology* also shed some light on the most difficult problem to solve: ensuring the necessary resources for students. Art 11 included, among the competences / obligations of the management of the educational units, the necessity to ask the local authorities to ensure the proper digital devices as well as the internet connection for the preschoolers / students who did not have the necessary means to carry out the activities through technology and the internet; the distribution of devices connected to the internet, to preschoolers / students who did not have these means (art. 11, paras d, f)), by concluding a loan agreement. The obligation of school units to provide resources for students was also included in subsequent regulations (RME Order No. 5972/2020 of 8.11.2020 and RME Order No. 3090 of 8.01.2021, both regarding the suspension of activities that involved the physical presence of preschoolers and students in the units of pre-university education): the county school inspectorates / the school inspectorate of Bucharest and the pre-university education units had the obligation to provide educational resources for students who did not have access to information technology and the internet.

We could not overlook that this obligation did not include teachers as well. Nothing was mentioned about teachers who did not have access to technology / internet. We do not know the exact situation at this point, but there are still students without the necessary technical means and most teachers use their personal resources. The issue of teachers' competences to carry out online activities appropriately also remains open; it is an issue that our investigation is trying to throw some light on.

3. Recent Online Education Reports in Romania: A Brief Overview

Shortly after students and teachers stopped their regular activities, Romanian education specialists grasped this wholly new research opportunity and started investigating it. Two reports were published, one in May 2020 and the other one in August 2020, both of them trying to evaluate the new teaching and learning paradigm, as knowledge of the situation could offer valuable insight to all stakeholders.

Even if they share a common goal, the differences between these research projects are obvious: the May report focuses exclusively on the teachers and their (in)ability to deal with the sudden change which occurred in March (the survey was made available between March, 25-31), whereas the August report considers the multiple stakeholders involved in the educational process for the rest of the second semester (the respondents could participate in this survey between May, 27 – June, 12). Moreover, the research teams are also different: behind the May report there is a team of academics from several Romanian universities (Bucharest, Iași, Cluj, Timișoara), accompanied by two researchers from the Romanian Institute for Education and one online education specialist; the August report was ordered by the RME and is the product of the Romanian Institute for Education. No other information is available to identify the actual researchers involved in this project – we could assume that one of the departments within this research institution initiated and coordinated the project, and, subsequently, drafted the report. In addition to that, the samplings differ as well: only 6436 teachers participated in the March survey vs. 6166 principals, 65309 teachers, 219073 students and 316492 parents, who took part in the other survey. So, in point of representativeness, obviously, the August report supersedes the one from May; due to the resources the Romanian Institute for Education has at its disposal, as the institution coordinating education related research at national level, the access to those participants willing to share their opinion on the topic of online education was easier to get.

As far as the teachers' digital skills are concerned, the May report concludes that most teachers have or should have these skills because the RME and its subordinate institutions have either promoted or set up various programmes that have helped them acquire the necessary skills. Nevertheless, the report also points to the fact that the Romanian educational system was not fully prepared to welcome such a change (despite having digital skills, the teaching staff might lack skills necessary for computer-assisted teaching) and, what is more important, the curriculum was not designed in such a way to allow exclusive online teaching. In addition to that, apart from the pedagogical barriers (no

curriculum planning skills for online education; no skills for developing digital learning resources; the difficulty to motivate students and keep them interested in an online educational environment), there were also technical obstacles (poor internet connection, difficult access to students' personal email addresses / no access to digital platforms, inappropriate digital devices, scarce digital resources) that teachers had to deal with. Therefore, according to the May report, in order to be successful in their new endeavour, teachers had to exhibit specific qualities: availability, interest, pedagogical skillfulness and inventivity.

The May report indirectly identifies the problems that students had (from their teachers' perspective). Thus, students had to overcome technical obstacles (no/ poor internet connection; improper digital devices; multiple platforms/ communication channels used by their teachers), become used to online learning (recalibrate their digital competence, attuning it for learning, not entertaining purposes), reach a higher level of autonomy in learning (at the end of March 2020 regular teaching activities were either missing or scarce, so teacher monitoring was no longer in place and there was no real possibility to cover the educational content in a structured manner) or rely on adult/parent support. Under these circumstances, the report makes an ominous prediction: the gap between good/average students and weak/poor students will be on the rise.

Considering that online education is unlikely to end soon, the May report suggests that 'the Romanian curriculum should be reorganized, as well as the manner in which computer assisted activities are delivered, monitored, promoted and rewarded' (p. 50). From this perspective, the report points to the importance of holding on to the long-term opportunity arisen in this context: internalizing the newly acquired digital tools, fully integrating them in the teaching-learning process, no matter the future educational settings (be they exclusively online, hybrid or face-to-face). Moreover, it is proposed that RME should develop a free access website for teachers, which is to include digital educational products and professional support. Also, it is recommended that the quality and relevance of continuous professional development programs should be centrally stimulated and monitored. Given the unknown variables of the new educational situation, teachers are not only expected to be/become self responsible, inventive and exhibit courage when identifying proper solutions, but they should also trust their pedagogical competences and rely on them in order to successfully cope with the obstacles.

Considering the moment it was launched, the institution coordinating the research project and the impressive number of participants, the August report offers a comprehensive perspective on the online education unfolding in Romania, between March-June 2020. In point of the teachers' digital competence, this report reinforces the findings of the report published in May, 2020: having digital competence is usually understood as being able to use a computer/ digital devices and NOT as being able to identify/ develop open educational resources or use educational platforms/ applications (p.15). Thus, during the period covered by this research, many Romanian teachers needed help to carry out their activities and sometimes an ITC specialist indicated by the school principal provided the necessary guidance or, quite often, their more digitalized colleagues gave the badly needed support. What is more important, the teachers participating in the survey mentioned that some students (especially those in primary school) could not autonomously cope with the requirements specific to online education.

The August Report also pointed to both the obstacles that teachers had to overcome as well as to the positive outcomes of the new educational situation. Thus, among the difficulties encountered by the teachers, the report includes: no/ poor access to equipment (in some cases, no personal digital device or internet connection existed); more time allotted for the organization of online teaching activities (as compared to their usual routine before the pandemic); insufficient experience related to using digital resources/ tools/ applications; professional discomfort in interacting with their students via online platforms. As for the positive aspects related to online education that teachers could identify, the August Report lists the following: advanced/ enhanced digital competence for teachers (first teachers became capable of identifying appropriate learning resources and then they started creating alternative resources that they could further use in the traditional classroom, as well); better skills at adapting the curriculum to the students' needs (in this case, online education); more parents offering support to their children; increased learning autonomy for students; more opportunities for teachers to exchange ideas, resources, experiences.

As for recommendations, the teachers who took part in the May-June survey mentioned that, unless traditional face-to-face education is possible (while fully complying with safety measures in force), then the hybrid scenario should be used (combining the traditional and the online systems of education) starting with the 2020-2021 school year. They also proposed that proper digital equipment as well as free internet connection should be made available for teachers and students, as well as schools; teachers should have free access to online educational platforms and resources (every school should decide on using a specific platform). In addition to that, teachers suggested that there should be more methodological guidelines as to the way in which the curricular content is to be covered (in the online scenario, the activities selected are expected to be more practical and interdisciplinary), as well as to the manner in which the assessment is to take place. As for further enhancing the digital competence, in the teachers' opinion, organizing continuous professional development might prove extremely

valuable, with a special focus on the particular features of online teaching and learning. Moreover, very much in line with the May Report, this report also suggested that students digital abilities need to become more education-oriented, and thus be an effective tool in maintaining/ boosting their knowledge level.

In a nutshell, these reports offered a multifaceted view on the way in which online education unfolded in Romanian primary and secondary schools, from the start of the lockdown measures imposed by the government until almost the end of the school year. The conclusions of these reports helped the RME to consider possible scenarios for the 2020-2021 school year, as well as to start catering for the needs of all the stakeholders, be they material, technical or methodological.

4. Methodology

The hypothesis of our research is that teachers have the necessary skills / are able to adapt to achieve the objectives of education, transposed into the new paradigm – online education. In addition to that, we assume that this new paradigm might help teachers overcome the initial stage of improvisation, providing them with the opportunity to head for a new stage, which could be referred to as didactic innovation.

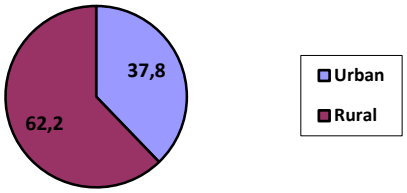
The objectives of our research are:

- to confirm / deny the results of the research reports carried out in Romania during the online school period;
- to identify and emphasize the strengths, but also the shortcomings of online education, from the perspective of teachers.

To conduct our research we used document analysis (research reports, legislation that regulated the period discussed here), as well as a questionnaire-based survey. The questionnaire (created with Google Forms) was distributed online, reaching teachers through social networks (Facebook, WhatsApp) and several (7) principals of schools and high schools in Prahova County, who sent it by e-mail to school teachers . The questionnaire includes 14 items, one of which refers to identification data and categorisation criteria for our participants: the environment in which the school operates, the level of education at which it operates, the discipline taught / teaching specialization, teaching experience / seniority in education. The others items of the questionaire deal with information about the continuous training opportunities related the acquisition of competences compatible with online education (1 item) and 12 multiple choice items that aim at the level of teachers' agreement with: the statements regarding methodological aspects of online teaching and learning (6 items); the existence of technological barriers that teachers and students might encounter in online education (6 items).

The participation was voluntary; the answers we received indicated a group of 166 participating teachers. The group may seem small, but it covers the preschool, primary, lower and upper secondary levels of education, in rural and urban areas, as well as a wide range of specializations, with representatives from all curricular areas. Our subjects work in kindergartens, primary and middle schools, theoretical and technological high schools and have varied teaching experience: from beginners to teachers with over 20 years of experience. We note the high percentage of respondents having over 20 years of work experience (55.3%), to which is added 31.1% with over 11-20 years of work experience in the educational field. As a whole, the vast majority of our group has at least a decade of teaching experience (enough time, for instance, to obtain teaching tenures). It remains to be seen whether the experience is a factor that facilitated teachers' swift attuning to the new approach of the educational process or, on the contrary, as a result of their constant exposure and limitation (in many cases) to classical teaching, it is a factor that blocked innovation.

Figure 1 – The school location of the survey participants



The variety in the group of subjects taking part in the survey gives weight to our conclusions. In addition to that, the area where the research was carried out brings extra validation for the results obtained, as Prahova is one of the counties with a higher standard of living than the Romanian average (which implies better endowment of schools, better preparation of teachers – through continuous training; there are several schools where online education could be carried out in decent conditions), so these respondents could express a well-informed opinion.

Figure 2 – The educational level in which the survey participants teach

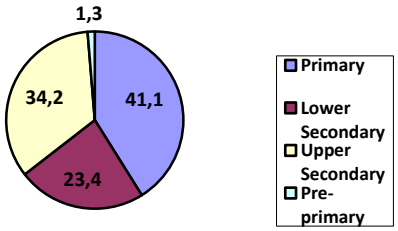


Figure 3 – The teaching experience of the survey participants

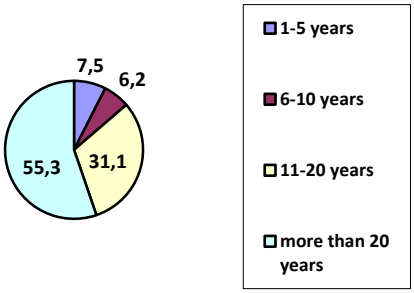
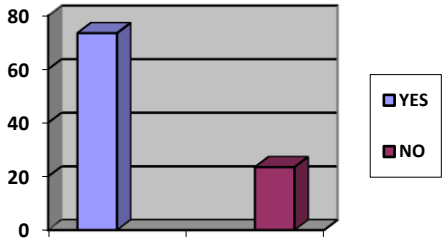


Besides these aspects, we are also aware of the limits of our research: the small group of subjects (the limit compensated by the great variety of their specialisations, as we aforementioned); the impossibility to check whether the subjects really belong to the targeted categories (teaching experience, specialization, level of education, etc.). Moreover, our research exclusively focuses on teachers, which could limit the overview of the problem (for a more comprehensive perspective we should have asked the opinion of the other educational actors – students, parents, managers at the central and local level of education). Nevertheless, we believe that teachers are the most valuable variable: they are the ones who deliver the curriculum (the same for everyone), and the way in which they do it is essential, because it is the way in which it comes to be reflected in their students' acquisitions / competences. Have the teachers in Romania been able to do this in a completely new way as compared to the one in which they had done it before? This is the question our paper seeks to tentatively answer.

5. Findings

Most of the teachers participating in the surveys from the previously analyzed research reports consider that they have the necessary digital skills; by digital skills it is meant the ability to use a computer or electronic device and not the ability to identify / develop open educational resources or use educational platforms / applications. 90% of those surveyed in March and May-June 2020 estimated that their ICT level was *good* and *excellent*, and 40% stated that they used ICT-based activities daily or almost daily. Both reports emphasized that it was difficult to interpret these results, as it was not clear what it meant to have digital skills in teachers' case, from their own perspective. For a possible clarification, the question in our questionnaire regarding this aspect is more specific: *Have you participated in a training course / training program (online or face to face) to acquire the necessary skills to use the necessary applications (such as Microsoft Educator; Google Educator) to carry out the teaching activity in the online environment?* The answers provided by our respondents indicate an important percentage of the teachers who have acquired, through such a course, the necessary competences (73.5%) (Figure 4).

Figure 4 – Teachers' participating in a training course to acquire digital skills

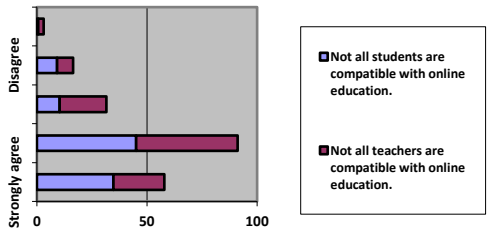


However, it is not easy to identify the teachers' own acceptance of the description of these competences, especially since, given the exceptional situation, most courses took place, mainly through the Teaching-Staff Resource Centres, after the onset of the pandemic, in an attempt to quickly ensure the much needed help, so that teachers could adapt their activities to the new situation. Our subjects seem to be aware of the shortcomings of such training (insufficient time allotted or failure to comply with the demands specific for the new educational context), as this is the inference that results from the answers they gave when asked about the existence of technological barriers (from their own point of view, as well as that of their students). Most teachers received training, but the skills acquired fail to overcome the barriers that (still) exist: 88.5% of subjects express their agreement and total agreement about the existence of technological barriers for students in online learning, and 77.6 % consider that such obstacles characterize their online teaching activity, too.

According to the reports analyzed in the third part of this paper, the obstacles faced by the teachers referred to: difficulties in having access to quality equipment and internet necessary to carry out online activities with their students; more time dedicated to preparing and organizing online activities; insufficient development of the digital skills needed to use various online tools and applications; professional discomfort in interacting with students in online contexts. From the same perspective, that of the teachers participating in the March and May-June surveys, their students had to deal with: technical difficulties; not having the habit of learning/studying by means of new technologies; insufficient level of digital skills; lacking appropriate digital devices; lacking a well-structured program; lacking constant control and monitoring of their activity; limited internet access; lacking support / lacking interest / prohibitions from adults. Even if students have had access to information in digital format, they are not used to learning using digital tools (usually they have used / are using digital devices for fun). The answers of our survey respondents confirm

the difficulties identified in the two reports: they even go further, as most consider that there are students, respectively teachers, incompatible with online education (Figure 5.)

Figure 5 – Students'/teachers' who are not compatible with online education



The opinion expressed by our survey participants raise important questions that cannot be neglected: *What happens to students who are incompatible with online education?*; *How will they catch up with the students who are compatible with online education?; What happens to the students of those teachers who are incompatible with online education?; How will these incompatible teachers make students form the competences targeted by the curriculum?; What results from the meeting between students incompatible with online education and teachers incompatible with online education?* The possible answers cannot be encouraging. It is also necessary to analyze where this incompatibility comes from. In the case of students, is it due to: the particularities of age / level of education? the socio-economic context? In the case of teachers, is it due to: insufficient / inappropriate training? a rigidity of the methods used so far? out of routine, lack of flexibility and adaptation? And, further, we should also investigate what needs to be done for these incompatibilities to diminish / disappear, because, based on the experience gained during the pandemic, we do not know when / if / for how long online education will be an option, maybe the only option. We believe that these questions require definite answers, which could only be obtained through further detailed research.

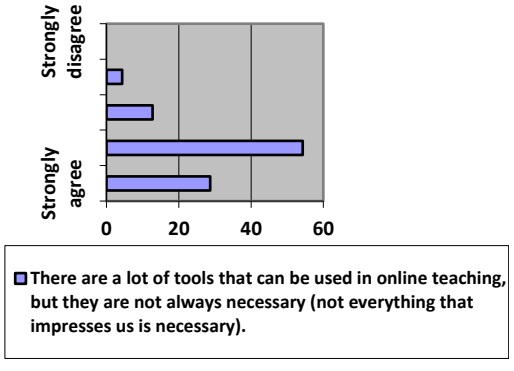
The questions in our survey that targeted the teaching methodology to be used in online education bring into discussion various problematic aspects. The first concerns the time needed to carry out an efficient online activity. Teachers consider that online teaching (such as preparing materials in electronic format, creating new specific activities, learning the characteristics of the application used / using the application, electronic correspondence, assessment) is much more time-consuming than classical teaching; the level of agreement is extremely high: 61.4% of our survey participants express their total agreement with this statement (*Teaching takes more time online*) and along with another 29.5% who express their agreement represent a total that exceeds 90%. It turns out that only a little over 9% of our survey participants did not need more time than before to carry out their teaching activities.

Regarding students and online learning, things are a little different, according to our respondents; their answers are differently distributed: 53.4%, that is a little over half of the group, expresses their total agreement (17.6%) or agreement (35.8%) with the statement *Doing homework and participating in online activities take students more time as compared to the previous situation*. 21.8% of the teachers articipating in the survey adopt a neutral position, and the others, 24.8%, do not consider that students need more time, expressing their disagreement or total disagreement with this statement.

Comparing the opinions about the time needed for teachers to prepare and conduct their teaching activities with the time needed by students to deal with online learning (in their teachers' view), it turns out that teachers' activity is more demanding in terms of the time required – almost unanimous opinion. Therefore, one could infer that our respondents believe that the burden for online teaching and learning lies with them, the teachers.

One of the difficulties that teachers have to deal with refers to the selection of the tools to be used in teaching process. *There are a lot of tools that can be used in online teaching, but they are not always necessary* (*not everything that impresses us is necessary*) is the statement against which the surveyed teachers were invited to express their agreement. The answers are, again, homogeneous. Only 4.35 of the teachers express their disagreement (the percentage of total disagreement is 0) and only 12.8% prefer the neutral option. The rest, 83%, consider that, given the wide variety of available digital tools, the selection of those that are really useful represents the big challenge (Figure 6).

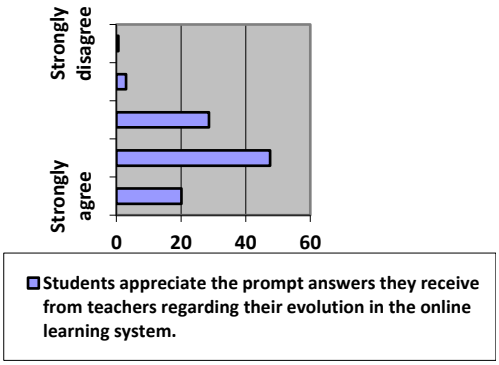
Figure 6 – Teachers'opinion on the usefulness of digital tools available



The difficulty to maintain students' interest is increasing in the case of online education, indicate the two reports sumarised in part three of this paper. This difficulty also emerges from the answers of the teachers participating in our survey, who specify that *students*

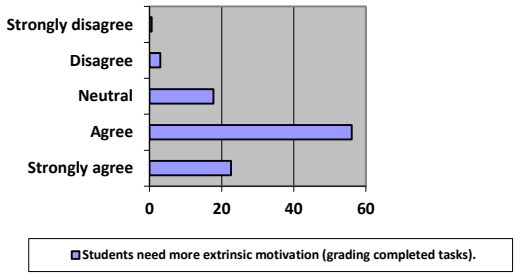
appreciate the prompt answers they receive from teachers regarding their evolution in the online learning system, and that, as compared to the educational paradigm used before the pandemic, students feel more the need for constant feedback (Figure 7) to guide them and help them continue. 67.75% of the respondents agree with this aspect, while only 3.6% do not consider that the constant appreciation of their students' activity is useful for maintaining their interest alive in the online teaching and learning process.

Figure 7 – Students' need for feedback



Developing and maintaining students' motivation for learning is an important and difficult task for teachers, whatever the conditions of the educational process, especially in the new context characterized by so many unknown variables. In proportion of 78.7% (agree and strongly agree), our respondents find that students need more extrinsic motivation (grading the tasks that students accomplish), which shows that online education is still in its infancy. Teachers are expected to identify those strategies that support and increase their students' motivation for learning, so that students could ultimately reach the next level, that of intrinsic motivation, which is an absolutely necessary step for them becoming autonomous in learning.

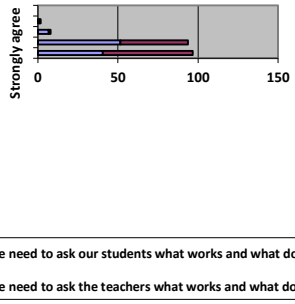
Figure 8 - Students' need for extrinsic motivation



In the same context, related to increasing students' motivation and autonomy for learning, the pace of the proposed activities is also important. In a broad consensus (38.4% strongly agree and 54.3% agree), the teachers participating in our investigation deem that setting clear deadlines for completing tasks / homework assigned to students are useful.

Even if online education has existed for several decades, there is still so much to find out about it, since the targeted audience encompasses the whole school population at this moment. Not only the conclusions of the recent reports mentioned in our paper suggest that investigations should continue, but also the teachers participating in our small scale survey. There is a need for in-depth research to identify what works and what does not in online education. To check this assumption we asked our respondents' opinion. 92% agreed and strongly agreed that *we need to ask our students what works and what doesn't in online education.* To an even greater extent (98.2% agree and strongly agree), the survey participants would highly value the opinion of their fellow teachers on what is to be kept and what is to be disposed of, when it comes to online education, given that personal experience has now become a reality.

Figure 9 – Students' and teachers' need for in/validating the strengths and weaknesses of online education



6. Conclusions

Before the pandemic started, in Romania, innovation in education meant digitalization. It was thought that using digital resources in the teaching-learning process, better, quicker, durable acquisitions could result. Now, as we were forced to undergo this process of digitalization almost overnight and online education has assigned us specific roles that we cannot reject (e.g. digital teacher, digital student, digital parent), because we would otherwise be left behind, we come to realize that digitalization brings along both strengths and weaknesses. As our findings show, even if the teachers may not have been prepared to respond to the challenges of the new educational paradigm, they somehow succeeded in overcoming some of the obstacles, by enhancing their digital competences and adapting their teaching approaches to suit the new circumstances, so that they could make the best of it for the sake of their students. How teachers concretely succeeded in overcoming these obstacles, the exact circumstances and variables which allowed teachers to adapt to the requirements of online education are to be closely investigated in further research, be they ours or other researchers interested in this topic, because there is no doubt that a lot of papers will attempt to dissect the multifaceted 'forced reform' that has characterized

worldwide educational systems during this ongoing pandemic, pinpointing to its positive or negative, long or short-term implications.

Not only the May and August reports, but also our small scale investigation indicated both the drawbacks and the benefits associated with the new educational paradigm that has become dominant since the pandemic started. On the one hand, online education may have a negative impact on young and very young students who lack self-discipline and autonomy in learning. In addition to that, group/pair work is not achievable during online classes on all major applications used and thus one of the good features of face to face education cannot be transferred into the new educational context. Moreover, students' passivity is more difficult to control or question, as they may not want to turn on their camera and mike to fully participate in the activities, or they may not have the proper digital device and/or good quality internet access to do this. Also, the danger of becoming totally dependent on technology for satisfying socializing needs from a very young age has never been more serious and the pressure to resist the temptations that internet-connected devices might entail requires a lot of will and determination that many students might not have. Thus, under these wholly new circumstances, teachers have found themselves in a difficult position, as they are supposed to choose from an almost limitless variety of resources to meet possibly ever-more demanding students.

Our small scale research not only has confirmed the shortcomings associated with online education (evinced by the reports we analysed), which started in March 2020 as an improvisation, as the only possible solution at that time, but it has also pointed to other weaknesses. Our findings have prompted us to ask further questions for which proper answers are urgently needed. We would like to tentatively suggest that these answers might provide the necessary hints to what should be discarded, and, more importantly, to what should be kept and permanently integrated in the teaching learning process from now on; we strongly believe that not being able to make the most of the positive experiences and good practices (that is what proved to be useful and could facilitate teaching and learning in the future) would mean that we have pointlessly gone through an unprecedentedly difficult period and that the efforts made by all stakeholders have been in vain.

Even if further thorough investigations are necessary, at this point, it is important to keep in mind that online education has undoubtedly brought along significant advantages that could definitely boost the quality of the teaching-learning process when schools resume their regular schedule, as teachers and students would be able to turn their digital educational experience to good account. Capitalizing on the strong points of online education (flexibility, possibility to cater for various learning needs, no time dedicated to commuting, direct access to activities organized by the teacher etc.) could represent a long-awaited step forward for the Romanian educational system, which has constantly received criticisms from all stakeholders.

We are very much aware of the limits of our paper and, consequently, our attempt should be viewed as the first step towards analyzing a major problem that education has suddenly and unexpectedly had to cope with. We deliberately confined ourselves to the Romanian experience, considering no other experiences from abroad, so that we could get to the bottom of the problem and subsequently find appropriate ways to approach and deal with it, as this might be a useful endeavour when the time comes to extract the benefits and eliminate the risks evinced by the 'forced reform' that we have been experiencing for a year now.

When it comes to any educational reform, resistance to change is usually one of the major difficulties one has to deal with, which may significantly reduce the chances for success. Given the special features of this 'forced reform', teachers may have exhibited some resistance to change at the beginning, but as online education has continued without any definite indication of its eventual ending, they have embraced the new educational paradigm, turning their teaching methods and strategies around so that curricular objectives could be met. Even though online education started under the bleak auspices of improvisation, the experience gained by teachers is considerable and may prove extremely valuable on the long term. Teachers have definitely acquired new competences and these could represent the onset of innovation, as, at this moment, all premises exist for the traditional approaches to education to harmoniously and inextricably interwine with digitally led ones. From this perspective, we might conclude that there are reasonable chances for Romanian education to somehow leave behind the gloomy past and open the door to a promising future.

THE IMPACT OF THE 2007-2008 CRISIS ON THE EUROPEAN AND ROMANIAN LEGISLATIVE AND INSTITUTIONAL FRAMEWORK IN THE PROTECTION OF CONSUMERS OF FINANCIAL SERVICES

Monica CALU[*]

Abstract

Inadequate consumer protection, especially in the US mortgage market, has not only resulted in considerable consumer harm, but has contributed substantially to the onset of the global financial crisis. In the EU, the miss-selling of financial products has also led to major damages to consumers. Given the potential significant detriment that financial services can cause to individual consumers and to the single market, it has become clear that consumer protection policy needs to be properly regulated in this area. The global trend is to include the responsibilities of information, financial education, consumer protection and transparency among the duties of supervisory and regulatory authorities. In the EU, enhanced consumer protection has resulted in improved transparency of financial products for consumers and better information regarding retail financial transactions. Stricter regulation of the financial products and services market has resulted in better solutions for consumers and an increased efficiency of the retail financial products market. The improved European legislation was gradually transposed into Romanian internal law.

A number of legislative solutions, recommendations and actions to strengthen consumer protection in the area of financial services are put forward in this study with the aim to demonstrate that one of the aftermath of the financial crisis was an irreversible change of paradigm regarding the end users and consumers of financial services reflected in consumer protection legislation.

Keywords: *consumer protection, financial services, financial education, digitalisation, European regulation, Romanian Law.*

1. Introduction

The global financial crisis has highlighted the need for more effective and efficient measures to protect consumers of financial services in the context where they are facing increasingly sophisticated offers and matching risks. One of the lessons of the 2008 mortgage crisis was that it is essential to protect the rights of the consumer, while admitting that these rights also come with responsibilities on both sides of the financial market.

The field of financial services consumer protection, as we understand it today, is relatively new but is developing rapidly and this will probably be the trend for the following period. In this regard, new approaches to the regulation of business codes of conduct are constantly being developed and implemented, and the major challenge is to implement the best practices and to standardize these approaches, benefiting from the accumulated experiences as well as the results of scientific research on consumer behavior.

The global trend is to include the responsibilities of information, financial education, consumer protection and transparency among the duties of supervisory and regulatory authorities.[1]

At present, international policies and regulatory efforts are increasingly taking consumer protection into account, as companies tend to transfer a broad range of risks associated with the new saving and investment opportunities to customers and households. At the same time we are witnessing a constant increase in the complexity of financial products and the rapid development of the related technical tools. All of these overlap with adverse conditions for consumers, where access to basic financial services and financial literacy are unsatisfactory in many countries around the world.

Basically, technology has developed at a faster pace than consumer education and skills and suppliers are developing their products faster than the market can adapt to them safely.

Rapid evolutions of market conditions, the pace of innovation in the financial field, the emergence of alternative financial services and of poorly regulated or completely unregulated suppliers, generate risk factors for possible market abuses, miss selling of financial products and services, non-transparent and non-compliant activities, financial exclusion for those less digitalised, fraud, money laundering. In particular, lower income or less experienced consumers face additional difficulties in accessing or using financial services and products. There may also be cases where compliant financial products are promoted and sold by authorized agents, at the edge or with the breach of the law, to unsuitable categories of consumers, causing them significant losses due to information and transparency flaws.

[*] President of Consumers United Association, mastering at SNSPA, Department of International and European Integration (DRIIE) – Master's programme International Relations and European Integration (RIIE) (e-mail: monica.calu@consumers-united.eu).

From the perspective of supervisory and regulatory authorities, at a strategic level, the duties regarding consumer protection and education of consumers of financial services imply the allocation of a sufficient level of authority and resources to the specialized personnel as well as the elaboration and implementation of clear working procedures integrated into a coherent legislative framework. The rationale of this strategy is the recognition that only an integrated approach can contribute to the stimulation of healthy consumer behaviors into the retail financial market, allowing long-term financial plans of individuals and helping to financial stability. At the same time, to ensure robust post-crisis recovery, the goal of not burdening the market with too much regulation has been weighed.

In light of these aspects, consumer protection measures for financial services have to be integrated with other inclusion and financial education policies, thus contributing to achieving a strengthened financial stability.

2. Consumer protection

Consumer protection is usually one of the main functions of any market regulatory and supervisory authority. By extrapolating, we could say that almost all the measures taken by the authorities are, in essence, taken with the ultimate purpose of protecting consumers. However, the term consumer protection is consecrated among authorities to describe the direct and domain-specific measures related to: complaints management, ensuring the transparency framework in the activity of suppliers, compensation of the injured, business ethics, supervision and control of abusive clauses and modalities of selling financial products to the retail market, issuing public communications such as alerts or recommendations, analyzing the impact of niche financial products.

The complaints analysis and the conclusions drawn from their settlement are the main factors generating regulation and control actions in the field of consumer protection. In this context, at European level, there is a tendency to harmonize policies and regulations in the field as well as measures to collect and analyze data on petitions.

Currently, consumers are at a disadvantage in the financial market equation, the balance being inclined in favor of the suppliers. The latter have better access to information, resources and skills to measure. Financial innovation is most often used to differentiate competition providers by competitive advantage, sometimes disregarding the limited degree of consumer understanding, or the potential harms that may arise from the misuse of financial instruments and services. Thus, the prospect of increasing profits can even lead to systemic risks, without strict regulation and supervision of the activity or without implementing clear and transparent ethical rules at the suppliers' level.

In order to understand the present role of consumer protection in ensuring financial stability, we must first analyze the moments in the recent history of the financial mechanism in which the protection measures were either non-existent or improperly applied.

In the context of a relaxed supervisory and regulatory framework in mature markets, this imbalance has led to the rapid spread of the high-risk (subprime) mortgage crisis in the US, which has since expanded to the level of the global financial mechanism and then to the entire economic system, culminating in the state debt crisis. According to the trigger mechanism of the crisis[2], banks have relaxed the security requirements when granting loans, customers without sufficient incomes or guarantees thus being able to qualify for a mortgage loan. With the new money thus thrown into the real estate market, buying pressure was created and the price of real estate increased artificially. The more expensive houses required higher loans, over time. When the price started to fall, the loan installments became too high compared to the daily value of the purchased properties. Clients stopped paying their mortgages and banks were left with properties that could not cover their debts. Initially, banks secured insurance coverage against the risk of non-payment through complex financial products. But the risk does not simply disappear from the system, it being taken over by other financial entities (usually speculators) and sometimes sold indirectly even to those who were insured in the first place, lured by the attractive yields offered and ignoring the risk for the second time. Thus, everything started from the chase after profit, from underestimation and ignorance from both buyers and sellers, who often failed to fully understand the mechanism of the financial products they were selling to ordinary customers. In this context, where the suppliers carry, perhaps, most of the blame, we cannot ignore the failure of the supervision, control and prevention policies implemented by the authorities, but also of the lack of understanding of the risks by consumers.

Nowadays, financial products and instruments are becoming more and more complex, especially in markets with a high degree of competitiveness. High competition, usually a factor for the benefit of consumers, generator of reasonable prices and high quality services, works to their detriment. Studies conducted on both mature systems and developing markets highlight that complex products have higher hidden costs and lower performance for ordinary consumers[3], especially when these tools are promoted to inappropriate groups of customers.[4]

[4] https://www.thepriceofbadadvice.eu/static-map/.

The information available to the public in the financial field has evolved not only in complexity but also in quantity and the pace of change, regarding the launch of new services and products, as well as the pace of adaptation of financial services to new technologies, has increased dramatically.

From the considerations set out above, consumer protection has become a term usually associated with the regulatory and supervisory authorities, the only ones able to ensure the impartiality of the regulations and the actions taken to improve the financial mechanism.

For instance, into the Report From The European Commission To The European Parliament And Council on the operation of the European Supervisory Authorities (ESAs) and the European System of Financial Supervision (ESFS) COM(2014) 509 final, it is provided: „(ESAs) have been assigned regulatory, supervisory, financial stability and consumer protection roles." At part v. **Consumer protection,** is stated: *Consumer and investor protection is one of the statutory tasks assigned to the ESAs, which so-far is perceived as not being given sufficient priority in the work of the authorities*. [5]

3. Financial education

Some authorities regard financial education as part of the broader field of consumer protection, on the preventive side, others treat it separately and complementarily.

It is certain that the recent economic crisis has highlighted the need for adequate information, education and tools to make the right financial decisions in an increasingly complex financial system. The financial difficulties of consumers and of their families can affect the development of communities and of the market as a whole. The crisis has shown that the financial well-being of individuals is fundamental to the financial stability at national level and that the lack of financial education is one of the reasons that can lead to a decrease in the standard of living.

Financial education has become a complementary element to the policies of prudential regulation and supervision of business conduct in the financial field. In many countries of the world, it is considered a long-term priority policy aimed at improving individual financial behavior.

Thus, at the epilogue of the financial crisis, financial education has begun to be recognized as one of the major individual skills in most economies of the world. As in the case of the consumer protection field, the basic reasons for the increasing importance of this field include the tendency to transfer an increasing range of (financial) risks to the population, the tendency to increase the complexity of financial services, the pace of evolution of financial markets, the increasing number of active consumer-investors as well as the recognition of the limits of the regulatory instrument as the only consumer protection tool. The definition of *financial education* developed by the OECD in 2005 and endorsed by G20 leaders in 2012 is used in a majority of countries to refer to: *"the process by which financial consumers/investors improve their understanding of financial products, concepts and risks and, through information, instruction and/or objective advice, develop the skills and confidence to become more aware of financial risks and opportunities, to make informed choices, to know where to go for help, and to take other effective actions to improve their financial well-being."* (OECD, 2005a). In addition, OECD statuates:"financial education is a process that covers and takes into account the varying needs of individuals in different socio-economic contexts. Financial literacy that is the outcome of this process is defined as a combination of financial awareness, knowledge, skills, attitude and behaviours necessary to make sound financial decisions and ultimately achieve financial well-being (OECD/INFE, 2012)."[6]

Another point of view regarding the goals of the financial education is emphasized into the Communication from the Commission COM (2007) 808 final on Financial Education, from 18.12.2007. As a recognition of the economic and social benefits of providing financial education is mentioned that *"financial education should be seen as a complement to adequate consumer protection and to the responsible behaviour of financial services providers. It can in no way be seen as the only solution to remedy information asymmetries between consumers and providers."* [7]

While financial institutions are obviously familiar with the contractual terms and conditions of their own financial products, they may be non-transparent or difficult to decipher by the clients to whom they are addressed. Thus, financial education must aim at rebalancing information symmetry, on both sides of the balance, so that consumers can ultimately make informed decisions. To do this, in most cases, suppliers must be required by law to provide product information in a wording accessible to their customers.

Currently, it is recommended to implement programs only after the clear identification of the needs of the population, of the target groups and of the most efficient ways of transmitting the messages, following surveys and analyzes that can last, according to the World Bank estimates, up to 3 years[8]. In the meantime, pilot programs can be organized which can then be refined and calibrated on a large scale, following a clear plan, preferably set according to a national strategy in the field. The evaluation stage is deemed to be absolutely necessary, allowing policies and programs

to be calibrated and adjusted in accordance with the field reality.

4. International context

The change of paradigm started in 2010, at G20 summit in Seoul, where participants called for stronger protection of consumer interests in financial markets. As a result, under the 2010 Dodd-Frank Act, the United States established the Federal Deposit Insurance Corporation, FDIC. After three years, in the United Kingdom was created a separate independent supervisory body to protect the interests of consumers of financial services - Financial Conduct Authority, FCA.

In EU, consumer protection and information also fall within the framework of Community legislation in the field of financial services. The Articles 114 and 169 of the Treaty on the Functioning of the European Union[9] are the legal basis for the protection of consumers in European Union, including consumers of financial services, from which is derive the Community's commitment to promoting consumers' right to information, education and to organise themselves in order to safeguard their interests.

The Cannes Summit, held in 2011 seeking measures to counteract the negative effects of the financial crisis has addressed, among others, the need for better regulation of the protection of consumers of financial services, central bank governors in the G20 states and finance ministers and have appealed to the OECD and the Financial Stability Board (FSB) together with any other relevant international organizations to develop a set of common principles of consumer protection in the field of financial services[10]. An international working group was established, focused on the effective implementation of the three priority objectives set out in the Action Plan, regarding transparency and provision of information for consumers, responsible behavior and business ethics for financial service providers and authorized intermediaries and procedures to manage and settle complaints.

At the time of drafting the strategy, the international working group involved in monitoring the implementation of the objectives was in the process of drafting effective methods and guidelines in this regard, meant to stimulate the implementation at national level. The approaches take into account the best practices identified so far in different states and the circumstances of each financial sector and the materials developed include experiences identified in many parts of the world following consultations with stakeholders: national regulatory and supervisory authorities, employers' associations, the academic environment, and consumer associations. Considering the high level of the works elaborated in this context, we can say with certainty that they represent the current concerns and the global trends in the matter of consumer protection. At the same time, taking into account the secondary intention of elaborating these principles, namely their implementation in a form as uniform and comparable as possible by the states, it is advisable to integrate them in any strategic document in the field, respecting the specificity of the local systems and markets.

Important to mention is the joint statement of the G20 leaders, at the Cannes summit, which shows the level of involvement and importance of this aspect, at international level: "We agree that integration of financial consumer protection policies into regulatory and supervisory frameworks contributes to strengthening financial stability, endorse the FSB report on consumer finance protection and the high level principles on financial consumer protection prepared by the OECD together with the FSB. We will pursue the full application of these principles in our jurisdictions and ask the FSB and OECD along with other relevant bodies, to report on progress on their implementation to the upcoming Summits and develop further guidelines if appropriate."

The need to standardize the practices in this field, in the context of globalization, has led to the correlation between the materials elaborated by the OECD and the existing or planned regulations at EU level, in the field of financial services.

The World Bank has also played a pivotal role in the field of consumer protection and financial education, dealing with these areas in an inter-dependent manner. The institution has issued numerous studies and researches in the field as well as specific recommendations applicable both at international level and in particular, to the states under review. For example, the World Bank has prepared the document Good Practices for Consumer Protection and Financial Literacy in Europe and Central Asia: A Diagnostic Tool. The paper reviewed the good practices and made necessary annotations, being elaborated in order to stimulate the debates in the field. The recommendations contained in this analysis are valuable in the light of the fact that they were not limited to incorporating the principles and recommendations contained in EU directives and European Commission recommendations, but went further with the comparative analysis of good practices used worldwide.

5. European post crisis context of consumer protection

The first aspects of increasing EU consumer confidence and strengthening their position were addressed in the Green Paper on Retail Financial

[9] https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:12012E/TXT.
[10] https://www.oecd.org/daf/fin/financial-markets/48892010.pdf.

Services in the single market[11]*, which overlaps with the onset of the 2008 global financial crisis.*

The necessity of better regulation of financial market, including the adequate supervision of the retail financial services market for consumers have been reflected in the new Community institutions created in 2011, the European Supervisory Authorities (ESAS) system, which consist of the European Systemic Risk Board (ESRB), the European Banking Authority (EBA), the European Insurance and Occupational Pensions Authority (EIOPA) and the European Securities and Markets Authority, (ESMA). The European financial supervisory authorities, EBA, EIOPA and ESMA carry out activities in the field of financial education and each of them has in their operating regulations similar provisions regarding consumer protection and financial education. "EIOPA has a key role in promoting consistent supervisory practices on consumer protection issues, working together with national competent authorities on the tools they can use and measures them can take to identify, assess and solve consumer protection problems".[12]

„The role and tasks of the EBA related to consumer protection and financial activities include: collecting, analysing and reporting on consumer trends in the EU; reviewing and coordinating financial literacy and education initiatives; developing training standards for the industry; contributing to the development of common disclosure rules; monitoring existing and new financial activities; issuing warnings if a financial activity poses a serious threat to the EBA's objectives as set out in the its funding Regulation; and temporarily prohibiting or restraining certain financial activities, provided certain conditions are met."[13]

ESMA's activity in the field of consumer protection is not limited to legislative improvements. According to article 9 of the ESMA Regulation no. 1095/2010, in Chapter II Article 8, Tasks and powers of the Authority, is provided "(i) develop common methodologies for assessing the effect of product characteristics and distribution processes on the financial position of financial market participants and on consumer protection".

Also, Article 9, Tasks related to consumer protection and financial activities is stated:

1. The Authority shall take a leading role in promoting transparency, simplicity and fairness in the market for consumer financial products or services across the internal market, including by:

(a) collecting, analysing and reporting on consumer trends;

(b) reviewing and coordinating financial literacy and education initiatives by the competent authorities.

Therefore, according to article 9 of the ESMA Regulation no. 1095/2010, consumer protection and financial activity related tasks are delegated to the European Authority.

In coordination with the European Securities and Markets Authority (ESMA) and in specific and well-defined circumstances, supervisory authorities may prohibit certain products, services or practices in the case of threats to investor protection, financial stability or proper functioning of markets ESMA Regulation no. 1095/2010 (12)[14].

In this respect, at 27th March 2018, ESMA, along with National Competent Authorities (NCAs), concluded that there exists a significant investor protection concern in relation to CFDs and binary options offered to retail investors and prohibited the marketing, distribution or sale of binary options to retail investors. Also, imposed a restriction on the marketing, distribution or sale of CFDs to retail investors.[15]

Another European Authority, EIOPA, more recently, pursuant to Article 18(2) of the PRIIPs Regulation, EIOPA announced that partially supports a planned prohibition of some unit-linked life insurance products by the Polish Financial Supervision Authority and calls for coordinated action across Europe, for identified risks for policyholders buying unit-linked insurance products in Poland.[16]

One more example: making use of its active role in consumer protection, the European Banking Authority (EBA) issued a statement in relation to consumer and payment issues in the context of the COVID-19 pandemic, which acknowledges the need to adopt appropriate measures to protect consumers and the orderly functioning of payment services across the EU.[17]

With regard to the European policy in the field of financial education, in May 2012, the European Commission adopted a new European Consumer Agenda[18] to boost confidence and development by placing consumers at the center of the single market concerns. Built around four main objectives, the European Consumer Agenda aimed to increase consumer confidence by increasing security, improving their knowledge, intensifying law enforcement and ensuring the possibility of obtaining compensation as

[18] https://ec.europa.eu/commission/presscorner/detail/en/IP_12_491.

well as adapting consumers' rights and policies in the field to changes which have occurred in society and the economy.

Consumer expenses, which amounted at the level of 2011 to approx. 56% of the EU's GDP[19], reflects the huge power of consumers (about 500 million consumers at European level) to drive the European economy. And consumers need to enjoy their rights and be confident in order to fully exploit the potential of the single market and stimulate innovation and growth. The agenda replaces the EU Consumer Policy Strategy 2007-2013. According to the Agenda, the Commission aims, among other things, to recognize the importance of the role of national consumer organizations and to support them through capacity building and assistance in the field. European institutions recognize the transformation of the financial crisis into a crisis of consumer confidence.

Nowadays, financial literacy is becoming increasingly vital for individuals, and it should be considered, in the context of the European Pillar of Social Rights, Principle 20 on the right to access to essential services: „Access to essential services: "Everyone has the right to access essential services of good quality, including water, sanitation, energy, transport, **financial services** and digital communications. Support for access to such services shall be available for those in need."[20]

Due to the lack of transparency, the low level of information on risks and the inappropriate treatment of conflicts of interest, consumers across the EU have repeatedly been sold investment and insurance products that were not suited to their needs. Consumer confidence in the financial sector has been shaken here and there. In addition, the existing legislation has not developed fast enough to reflect the increasing complexity of financial services.

The consequences of taking too many risks can be devastating for consumers, since investments are often the essential element of their life-long savings. In the context where the EU retail investment market stands at 10,000 billion euros, buying wrong or inadequate products can quickly become a major problem.

There are three types of financial abuse at European level: (1) the poor performance generated by the incompetence of the providers or the poor quality of the services; (2) misinformation or overselling, i.e. the sale of inadequate financial products in the context of a low financial literacy of consumers, misinformation or abusive sales practices; (3) fraudulent trading, that is, abuse and direct fraud performed by financial service providers. The consequences of taking too many risks can be devastating for consumers, since investments are often the essential element of their life-long savings. In the context where the EU retail investment market stands at 10,000 billion euros, buying wrong or inadequate products can quickly become a major problem.

In order to strengthen consumer confidence and economic growth in the medium and long term, solid, well regulated retail markets that are focused on consumer interests are needed. As part of its reporting activity in 2012, the Commission assessed the need to strengthen current rules on combating unfair practices in the financial services sector and to optimize their application, including for vulnerable consumers.

Thus, in the last decade, the European Commission has focused its attention on taking concrete legislative measures to address deficiencies in consumer protection, while helping to restore the level of trust. That is why, in 2012, the Commission presented a legislative package that tried to raise the standards in the field and eliminate legislative gaps. More specifically, the package was made up of three legislative proposals: a proposal for a regulation on key information documents for packaged retail investment products (PRIPS), a revision of the Insurance Mediation Directive (IMD), and a proposal to increase protection for those who buy investment funds.

With the aims of strengthening the consumer protection and empowering the consumers of financial services, EU Member States have transposed EU directives regarding to the protection of consumers of financial services to their national law, namely, the Markets for Financial Instruments Directive (MIFID), the Consumer Credit Directive, and the Payments Directive. Regarding the protection of investors at European level, the most important ones to mention is the revised Markets in Financial Instruments Directive (MiFID), proposed in October 2011: a revised directive - MiFID II and a new regulation – MiFIR (the Markets in Financial Instruments Regulation).

The new rules contained in MiFID II offer increased protection to consumer which act as investors by imposing requirements for financial institutions and strengthening the rules of professional conduct.

Over the past decades, household debt in Europe increased tremendously: between 1997 and 2017, it increased from 39.3% to 50% of nominal GDP. [21] Main components were mortgage credit and consumer credit. In 2017, the outstanding amount of consumer credit in EU28 was around EUR 1,800 billion, according to EBA Consumer Trends Report 2018/2019.

Regarding consumer credit, the same report found that "the main issues arise from the cost of short-term credit, the misuse of consumer credit, poor creditworthiness assessment and insufficient contractual and precontractual information."[122]

A Commission study[23] estimated that, in 2016, the total financial damage for EU consumers in the market for loans, credit and credit cards was EUR 12.84 billion.

Among the major drivers of irresponsible lending that may cause consumer detriment are inappropriate product design, misaligned sales incentives, even conflict of interest on credit or financial advice, unsolicited credit offers, risks related to online distribution of credit, inadequate creditworthiness assessment by creditors, product cross-selling, financial products bundle, lack of a harmonised EU personal bankruptcy scheme and lack of effective supervision and enforcement by competent authorities. [24]

In the context of the existence of a high degree of indebtedness of the European population even after a decade of the previous recession, the European Commission considers amending the Consumer Credit Directive 2008/48.

6. Romanian post crisis development of consumer protection

The economic crisis has led consumers to look more closely at credit agreements and to become more aware of their rights, thus iscovering the benefits of the existence of EU legislation and the regulation of retail financial services. Many of them discovered not only that they were mislead by the banks, by incorrect practices and terms, even from the pre-contractual stages. Credit institutions hide some fees or commissions or by splitting the real percentage of the loan interest so they can advertise offers with a very low interest, while in contracts was provided clauses which introduced the duty for the consumer to pay a certain percentage sum of money to the ballance as a commission under different terms (credit management fee or risk commission). The legal battle started and thousands of them referred their credit contracts to the National Consumer Protection Authority establishing a dark history of the relationship between consumer and banks and creating a litigation culture[25]. The examination in Romanian courts of the applicable legislation of consumer protection though rised issues related to the transposition in national law and interpretation of the directives on consumer protection, which in several cases was asked to the European Court of Justice[26]. In Romania, the major obstacle to the development of an adequate legal framework for protection of consumer of financial services was generated by the great inertia of the authorities regarding the adoption of modern instruments of safeguarding and prevention in the financial field. The Consumer Credit Directive (CCD) was agreed by the Council and Parliament and published in the Official Journal in May 2008. The CCD was designed to harmonise the regulation of consumer credit across Europe and to increase consumer protection. Member States were asked to transpose the Directive into national law before 12 June 2010. In 2010, the EU Directive 2008/48/EC on credit agreements for consumers was transposed in Romania by Government Emergency Ordinance no. 50/2010 on credit agreements for consumers after months of debates, fortunately with an application to a wider array of contracts - including mortgage credit, which has been shown to be a source of relief for the debtors affected by the recession beginning to be felt in Europe. This ordinance is the main regulation on consumer credit protection and implemented EU requirements on the obligations of creditors. Even this Directive was aimed at unsecured lending such as credit for the purchase of consumer goods or leasing contracts, the Romanian Parliament adopted the law with a higher level of protection than in the Directive, providing stronger information obligations, a prohibition post-contractual changes and extended them to mortgage loans. Government Emergency Ordinance no 50/2010 was amended by Law no. 288/2010, published in the Official Gazette of Romania no. 888 of 30.12.2010.

The provisions of Directive 2014/17/EU on credit agreements for consumers relating to residential immovable property were implemented into national law through Government Emergency Ordinance no. 52/2016 on credit agreements offered to consumers for immovable property and for amending and supplementing the Government Emergency Ordinance no. 50/2010 on credit agreements for consumers („GEO 52/2016") and it was after passed the transposition term of 21 March 2016 established by the Directive. The new legislation entered into force on 30 September 2016.

In Romania, Regulation No. 32/2006 regarding financial investment services transposed MiFID I Directive, Directive implementing Market abuse Directive, Distance marketing of consumer financial services Directive. Regulation No. 15/2004 regarding the authorisation and functioning of investment management firms, collective investment undertaking and depositories, as amended and supplemented, transposed UCITS Directive.

MiFID II has been transposed into Romanian legislation by Law No. 126/2018 on markets of financial instruments, and by several regulations issued by the FSA and the NBR.

Romania was one of just a few European countries without a personal bankruptcy regulation in place. Law no. 151/2015 on insolvency of natural persons was adopted by the Romanian Parliament in June 2015 after numberless postponement entered into force on 1 January 2018. After the 2008 financial crisis, the stable core of the consumer protection sector in Romania is represented by solid regulations mainly due to transposition of the EU directives into internal legislation. Several central government institutions with continuity in the field, together with some NGOs that have proven a sustained and consistent activity in the field of financial services carried out programs and actions of financial education and popularization of consumer rights. As regards financial education, in the first stages the initiatives came mostly from the civil society and private sector, but sometimes their actions were with a strong commercial character, promoting credit cards or investment plans, for instance. Among the public institutions the programs developed by the National Bank of Romania and the financial supervisory authorities of the non-banking sectors stood out. Especially with regard to public information, efforts towards the transparency of financial institutions and dully informing consumers have often been regarded as a burden or a mere obligation to align with European standards without fully understanding the usefulness of these measures for society in the long term. Thus, the divergent views of the leaders of financial institutions and national competent authorities

[25] https://www.digi24.ro/stiri/economie/capcanele-creditelor-bancare-eliminarea-clauzelor-abuzive-destul-de-greu-de-pus-in-practica-124366.
[26] https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2261915.

on the usefulness of financial information, retail market data or regarding competition and sanctions for the breach of legislation on consumer protection has often created lack of trust on behalf of consumers and users of financial services.

7. Conclusions

The financial crisis of 2007 began with a failure to protect consumers of financial services, especially those with mortgage debts. A growing number of member states, like Austria, Belgium, Czech Republic, France, Hungary, Ireland, Lithuania, the Netherlands, Portugal, Romania, Spain and Slovakia have already developed national strategies in order to clarify the roles, competences, mode and level of involvement of each player, in order to identify and prioritize the needs of different social groups and in order to rationalize the available resources. Despite of measures taken both locally and at the highest international level, since 2007 there has been limited progress in most Member States in Europe in ensuring a sufficient level of financial capacity and education and an adequate response to the problem of financial illiteracy in Europe that prevents people from understanding basic financial services and products and making informed and knowledgeable decisions. This somewhat limited progress and effect of the programs so far in the field is widely accepted at international level and officially recognized by the Report of the Directorate-General for Internal Market and Services of the European Commission of March 2011, Review of the Initiatives of the European Commission in the Area of Financial Education. Numerous international surveys have demonstrated consumers' generally low level of understanding of financial matters and of basic economics and shows that even under conditions of full disclosure, many consumers of financial services are unable to make adequate and reasonable decisions. Therefore, these explains somewhat the limited progress and effectivity of the financial education programs so far in this field. Among the first conclusions of the 2007-2008 crisis, the European Commission said[27] that economic and financial education should be complementary to legal and regulatory measures aimed at providing consumers with relevant information and adequate protection.

Another conclusion of the previous recession is that a well-functioning consumer credit market is beneficial to households, not just producers and sellers of goods and services, and stimulates economic growth. But if credit is misused and the debt burden becomes unbearable, it harms not only debtors but also creditors, endangering economic stability. Consumer confidence in a well-functioning financial market creates the premise of financial stability and is a trigger for continuous development and improvement of the efficiency and innovation characteristics for the entire financial system.

Without supervising and effectively enforcing regulations, consumer protection of financial services risks being superfluous. It is essential to ensure that national and EU public authorities in the field are well equipped with clear competences, the ability to monitor, investigate and sanction in order to effectively supervise the business behavior of financial service providers and tackle consumer protection issues.

Consumer protection is generally considered to be a regulatory response to a market failure. (Eisner, Allen, Worsham & Ringquist, 2006). In the context of the new Covid-19 crisis the review of EU consumer protection legislative framework and the transposition into the respective national member states law may address early a foreseeable financial failure of the European housholds by providing alleviating measures to repair or restructure the economic situation of the concerned persons, and allow them to return to a financially sustainable or sociably acceptable situation. Therefore, regulators need to timely understand the consumer perspective in order to establish effective regulation and supervision regimes.

CHANGING MASCULINITIES? DADFLUENCING IN ROMANIA: BETWEEN FEMINISM, CONSERVATISM AND CAPITALISM

Diana Elena NEAGA[*]
Bogdan ȘTEFAN[**]

Abstract

Despite all controversies, men and women are also social concepts that changed over time as well as the power relation between men and women changed over time. Different forces have impacted this change and some cannot be omitted when talking about how masculinities are reshaped nowadays and here we think at the feminist movement and in counterpart - the conservative one, but also the neoliberalism and its principles and values (mainly the pressure of extending markets and selling goods). In this broader context, in this paper we first look closer at the concept of care and how men can be and become over time caregivers, especially as fathers, why this is important, what are the figures regarding sharing care responsibilities between men and women. Second, we discuss the way in which connecting men with care is represented in a broader arena that we call the popular culture, and here we focus especially on a relatively new phenomenon called "dadfluencing" – as men that are fathers, that are communicating about this experience especially on social media and that are trying to have an influence on their audience/public. Last but not least, in this paper we will present the findings of a small qualitative research that we have done on two Romanian "dadfluencers", namely on their Facebook pages, field research that we conducted in order to give a possible answer to the following research questions: What kind of masculinities are promoted by the two influencers? Can the content promoted be connected to any kind of feminist discourse that engages critical changings in traditional gender roles or it remains mainly a conservative one? Or in fact we are facing a new way of selling goods in a neoliberal world of markets and consumers that uses the image of the caring father in order to increase profit?

Keywords: *masculinity, care, influencing, dadfluencing, feminism, Romania*.

1. Introduction

Our aim in this paper is to discuss some aspects regarding the reconstruction of masculinity by including care and caring as defining elements. Therefore, our first intention was to investigate the mainstream-dictionary definitions of care, which have a high degree of social acceptability, and to see if we can find there those elements that reflect what we, as gender studies researchers, recognize from various scientific investigations and statistical data to be gender inequalities, power imbalances, discriminations, stereotypical representations and prejudice[1]. As a result, we found that care implies altruism, solidarity, empathy, loyalty, which are general human attributes, used without any gender bias.

Nevertheless, if we were to associate gender or sex with care, and particularly gender roles, then the result is dramatically different – the researcher is suddenly sent to a different conceptual field, one of starch dichotomies, stereotypes, prejudices and, last but not least, of inequalities. From this standpoint, Otilia Dragomir and Mihaela Miroiu (2002) approach care and caring by exploring the power relations between men and women and the way in which they are shaping women's preeminent role as main carriers of children, seniors, men, sick, homes, streets and so forth, and how this specific state of affairs tends to perpetuate. Laura Grünberg offers a broader perspective, based on the dynamics of gender roles in Romania as it was presented by the last Gender Barometer (2018), compared with the one released in 2000: "71% of the responders considered in 2000, that both parents should take part in childcare (and 28% were pointing out the mothers as the main caretakers), whilst in 2018 the ratio grew significantly, to 80.3%" (Grünberg, 2018, p. 19). Grünberg continues by stating that there can be identified a permanence in regard to the perception of the complementary and unbalanced distribution of the household chores. In the year 2000, at least 80% of the respondents considered that cooking, house cleaning, clothing and dishwashing and so forth are mainly feminine activities, while home repairs are seen to be men's responsibilities. With little fluctuations, these numbers are the same in 2018" (Grünberg, 2018, p. 18). The same 2018 Gender Barometer shows that there is a long way from wishing to practice in regard to gender roles distribution in family care. Thus, the respondents considered that "both parents should be involved in childcare, but also that men are unable to provide equally good care as women – 80.3% (80.7% women

[*] Lecturer, PhD, Faculty of International Relations and Administration, "Nicolae Titulescu" University of Bucharest (e-mail: diananeaga@univnt.ro).

[1] "The provision of what is necessary for the health, welfare, maintenance, and protection of someone or something; Protective custody or guardianship provided by a local authority for children whose parents are dead or unable to look after them properly; Serious attention or consideration applied to doing something correctly or to avoid damage or risk; Feel concern or interest; attach importance to something" Lexico, UK Dictionary, accesat în 08.04.2020, la https://www.lexico.com/definition/care.

and 79.7% men). At the same time, 48.9% of women and 49.2% of men think that men are unable to raise children as well as women can (compared to 31.9% of women and 33.8% of men that said the contrary) (Grünberg, 2018, p. 20).

Therefore, care and caring are essential components in the perpetuation of gender inequalities and therefore we think that is important to have a critical discussion about them. Esplen identifies the main issues that need to be approached:

- Offering care and caring produces a major impact in people's livelihoods, and this impact is more substantial in the case of people living in poverty;
- Many young girl drop out of school in order to be able to help with domestic chores in the household, particularly when their mothers are sick or are employed;
- When they are unable to pay for care work, women are forced to give up their jobs, their careers, and pushed towards low-paying inferior part time jobs, thus being deprived of various empowering instances
- Therefore, their capacity to save money for a later period when they themselves would be needing care and caring, or their ability to have a decent retirement fund drops dramatically, therefore increasing their long-term insecurity;
- The double day-work performed by women brings most women on the brink of burnout;
- The burden of caring and household chores limits dramatically the time and resources that women have for civic and political participation, thus depriving them of access to power and to enter mainstream debates regarding public policy;
- Even when they are paid, their work is usually under-evaluated, jobs in care and caring are feminized and underpaid;
- Most of the time the working conditions are precarious and the work tends to be informal, implying a lack of work protection (Esplen, 2009).

Also in 2019, Promundo released their third *State of the World's Fathers* report, discussing the way in which men getting involved into care work and fatherhood could impact the inequalities resulted from the disproportionate distribution of care work. Several of their findings are worth mentioning:

- In 2018, 606 million women worldwide declared that they are unable to enter the workforce due to their burden represented by care work. Also, in countries where women perform twice as much unpaid care work as men, their medium income is approximately two thirds of their male counterparts (van der Gaag, Heilman, Gupta, Nembhard, Barker, 2019, 8)
- In medium and high-income countries, the difference between unpaid care work performed by women and that of men has dropped only by 7 minutes in the last 15 years (idem);
- Young girls spend 40% more time than boys on doing unpaid work (idem);
- On average, women spend approximately 4 hours per day performing unpaid care work, while men spend only 2.5 hours doing so (idem, p. 14);
- Globally, at least 16.4 billion hours per day are invested in care work, which is the equivalent for 2 billion people working 8 hours per day, producing 95 of the PGB for minimum wage (idem, p. 17);
- Actually, no country in the world has managed to reach an equilibrium between women and men regarding the levels of unpaid care work produced (idem);
- Globally, 18% of men benefitted from various forms of paid leave for childcare work, and it's relevant to stress out that here we also have arrangements involving 1-2 days per week, a week or a month, the tendency in the OECD countries being that men tend to take the minimum amount of paid leave (idem, p. 33-34);
- As a matter of consequence, the idea that women should have the responsibility for rising children still persists in both the ranks of men and women (idem, p. 45);
- At the same time, the Ipsos MORI research reveals that 75% of the respondents think that staying at home dads ale somehow "less manly" compared to those holding a job (idem, p. 47);
- Similarly, the data collected through the Helping Dads Care Research Project shows that almost 85% of dads say that they would be interested in doing anything in order to be more involved in their child's first months after birth (idem);

The authors also offer a list of solutions aimed at reducing inequalities in this area, perhaps the most relevant being the "4RModel" (idem, p. 18):

- Recognition – increased attention towards the social value of care work;
- Reduction – investing in programs and policies that would reduce the difficulty and time spent on care work – water, sewage, transportation infrastructure, public care infrastructure;
- Redistribution – the state, boys and men all together should get involved more in taking over part of the burden of care work currently placed on women;
- Representation – supporting women in participating in decision making processes in trade unions and other relevant instances.

2. Men should care and do care

Veronika Wallroth (2016, pp. 33-56) considers that the involvement of men in care work should be based on the several aspects. 1. Intergenerational/biunivocal solidarity, that involves devotion, affection, intimacy, love, empathy and altruism and which should come from parents to children and the other way around. The intergenerational theories usually underscore the positive aspects of intergenerational links, such as solidarity and consensus, but are criticized for being too normative and for having the tendency to reflect family interactions in a very dichotomous manner, as being

either positive of negative (idem, p. 36). 2. Assuming the caring roles and their relation with various types of power is an element that brings out several aspects involving the way in which roles and statuses generated via identities such as cared/carer are producing and reproducing power structures for women, men, brothers and sisters (idem, p. 41). 3. Societal and cultural motivations, that usually refer to the pragmatic, demographic aspect of population ageing and bring into light religious aspects that involve personal sacrifice and family obligations and accentuate the dominant expectations regarding children that will eventually have to care for their parents (idem, p. 45). 4. The idea of exchange relates to the help and support between family members based on reciprocity and continuity, sustained by generational links. The exchange can be emotional, economical, continuous or intermittent, and implies a transfer of knowledge and wisdom (idem, p. 50). 6. The idea of choice/lack of choice. The role of caregiver can be the result of a multiplicity of factors that can manifest simultaneously or separately:

A. *The personal attachment to the act of caring* – caring is a choice;

B. *"legitimate excuses"* – the situation in which there are justified situational reasons for not offering care (work, distance etc);

C. *"Caring by default"*, when there is no one to do the care work, therefore it is attributed to the person performing the work without the possibility of choice (idem, p. 53).

Are these motivations manifesting themselves more intensely for women (who are, as we had shown above, the main caregivers)? Are these motivations disconnected from men and their experiences? How can we still integrate men in this discussion regarding care and caring? What role plays in this context the construction of masculinity, and also the need for a deconstruction of toxic, patriarchal masculinity that perhaps kept men for far too long away from their own children?

A short review of the main bodies of literature on masculinity presents the benefits of paternity for men, bringing forth several very interesting issues. First, the relationships men develop with their children are making them more mature, responsible and contributes significantly to their development – their thinking, feelings and general behavior can be characterized as long-term qualitative changes (Palkovitz, 2005, p. 59). Second, men that are actively involved in their children rising and care tend to have a better health and a higher life quality. Paternity contributes towards the strengthening men's links with their families and communities (Eggebeen et al, 2013, p. 352). Third, reing a father leads to men attaining their highest psychological development stages, as Erik H Erikson's model of psychosocial development shows – "the attainment of generativity" (Randon, 2015, p. 12). And those are only few of them.

Nevertheless, men continue to have very little involvement in the rising and caring of their children, to this respect Ranson's explanation for men's distancing from care being very interesting – conceptualizing care as being profoundly linked to the body and corporeality (the embodiment of care). Thus, a plausible explanation regarding men's absence from practicing care work relates to "normative assumptions regarding gender, bodies, spatial distribution and regulation, and misery. *Masculine dignity* is much more dependent on phantasies about the body as closed and bounded, therefore men find care work as being mentally challenging and to be feared" (idem, p. 20).

Thus, we are referring to a traditional construction, mostly cultural, of the male body as being linked mostly to violence, physical force, war, sexuality, and this state of affairs is perhaps most visible in the case of male athletes or male bodies featured in various lifestyle magazines. Another very important distinction regards the capital brought by the (male or female) bodies in the relationship with children and particularly with the newly-born. From this perspective, we can identify a sort of biological advantage held by women, due to their specific maternal experiences of gestation and lactation (idem, p. 40), but this does not mean that we cannot identify similar advantages in men's case. Moreover, in patriarchal cultures (or at least in the vast majority of them), this biologic capital was undoubtedly used to constraint and subdue women in their role of caregivers (which implies much more than giving birth and nurturing children).

Investigating how men's bodies add value and benefits in their relationship with children and in care work, Ranson discusses several aspects which we wind to be relevant for the aims and scopes of our paper (idem, p. 40-2):

- *Post-partum fitness* – by not giving birth, men have the distinctive advantage of being able to get involved in the caring relationship with an intact body, fully available. Thus, men have the advantage of not having to go through a complex and major process of recuperation (physical and psychical) when the children are the most vulnerable. In this sense, one of the participants in the study said ironically that "I had a baby five months ago, and I am in perfect physical shape".
- *Size and shape* of the body also matters when it comes to childcare. In this respect, men have bigger bodies, bigger hands and a wider chest. These characteristics matter in care work and are perhaps most evident when it comes to washing the babies and putting them to sleep. The wider male chest is the perfect place to sleep for a toddler. Also, longer hands can prove to be helpful while multitasking, such holding the baby and cooking.
- *Strength* – children spend much of their time hugging their parents, thus they frequently need to be carried and usually not only them but also luggage, toys, food and so on. These things are made even more

difficult in countries with a poor transportation and urban infrastructure such is the case for Romania. In these particular contexts, physical force matters.

3. Masculinity, care, pop culture and dadfluencing

We undeniably live in a world in which patriarchal hegemonic conservative masculinities are being more and more examined and contested by various movements, of which the feminist one is the most vocal. Male parenthood is not spared of this critical scrutiny, their role within the family and in the wider social groups being continuously remodeled. Elizabeth Podnieks asks a very legitimate question: if the dad of today is no longer the income provider, and is also less emotionally involved as the mother, isn't there that he tends to be more disconnected and lightheaded, then who is he? (Podniek, 2016, p. 1). Off course, the authoress does not limit herself to simply asking the question, but she tries, along various other authors, to investigate contemporary representations of male parenthood in 21st century pop culture. In this context, a relatively recent phenomenon deserves our attention, from the standpoint of the construction and projection of masculinity in pop culture – dadfluencing. This phenomenon refers to dads who, using the information technologies available (such as Facebook, twitter, Instagram and so on), bring into the spotlight the much-needed changes in traditional gender roles, presenting themselves as involved dads, partners, dedicated to care and household work, thus challenging the dominant stereotypies and gender prejudices at the same time proposing new ways of masculinity construction, oriented towards care and caring. In an article published by wired.com in 2009, "In Praise of Dadfluencing", we can find some very interesting facts and numbers regarding the magnitude of the dadfluencing phenomenon: for example, on Instagram, there are over 3.700.000 posts with the hashtag #dadlife and over 2 million posts with the hashtag #fatherhood.

Romania is also part of this phenomenon and its analysis is the main objective of our paper. Our aim is to identify if and how men's visible involvement in rising and caring for the children is also considering contesting the traditional gender roles and producing a different discourse, aimed to combat gender inequalities.

4. Case study: the "dadfluencing" phenomenon in Romania

Starting from the theoretical framework presented above, we aim to present the findings of our qualitative research regarding the dadfluencing phenomenon in Romania. Our approach is centered around the need to redefine family gender roles on a more partnerial basis, and the fact that social media instruments have proven to be highly relevant in terms of behavioral change. Dadfluencing is centered around the capacity to influence, trough social media, vast numbers of people in order to change their opinions, attitudes and behavior. The Oxford English Dictionary defines influence as being "the ability to have an effect on someone's character, development or behavior"[2].In relation to social media, influence usually refers to the way in which ordinary people can create content with notable impact on their followers, the basis of influence in this respect is the process of sharing content with a high personal character.

Our main research question is – what kind of content is promoted on two Facebook pages, *Taticool* and *Cel mai bun tata* (The best father), and how this content critically addresses traditional gender roles? Subsequently, we also devised several additional questions:

- Which are the main issues addressed by those two dadfluencers?
- What is the frequency with which specific issues are addressed?
- What are the gender roles promoted?
- What is the generated impact in relation with the addressed issues?

5. Methodology

The method used in our research is qualitative content analysis. This type of analysis, even if it brings up frequencies and absolute numbers (e.g. number of followers, number of likes or shares and so on), these are used only in order to give perspective in relation to the researched items, but not in a *stricto sensu* statistical representativity. We have analyzed the two abovementioned paged in terms of posts during January of 2021, but also the general information presented on them. The content analysis involves on one hand the text, and on the other the visual components. Also, we have used two scales with which we categorized the content:

1. The positive/negative/neutral scale with which we approached the content posts on the two pages;
2. The emotions scale – with which we observed the emotions triggered by the analyzed posts. We used the emotions categories already present on the platform: like, love, haha, wow, sad, angry and share.
3. Thematic analysis – we used a category set aimed to collect the most relevant data in relation to the research question(s):
   - Commercial content;
   - Men's expertise/authority;
   - Women's expertise/authority;
   - Critical content in relation to gender roles/inequalities;
   - Conservative content;
   - Neutral content.

6. Research findings

6.1. The best father (Cel mai bun tata)

The best father is a Facebook page assuming the identity of a personal blog and that, in its description, briefly states that its main focus is "stories about the most beautiful job in the world". One can immediately notice that childcare is associated with a job, as an activity having social value, productive, signifying a masculinized symbolic dimension. The page has approximately 26.500 likes and 28.000 followers. From the description, the page seems to have been initiated in March of 2014, and its personal image is an impersonal design, resembling more a business logo. This is very interesting, because it appears to be in conflict with the classic communication style for influencer, who are putting a big accent on the personal information that could generate emotions and thus enhance the page's impact. Moreover, we also noticed that the logo is shaped like a competition trophy, which again suggest traditional masculine attributes – competition, power, energy, hierarchies.

Our content analysis of the page's covers produced the following data:

- 52 covers used throughout the time;
- 27 of those (approx. 50%) have a social theme: they illustrate the way in which the page's main character got involved in various social causes (funding for a children's hospital etc);
- 13 present various events that had invited Mr. Alexandru Zamfir (aka *The best dad*) to speak: events where he talks with other dads – 6; financial education – 3 events; couple relations – 2; digital children and the access to technology – 1; healthy lifestyles – 1;
- Covers with messages assumed by the author – 7: "Sooner or later we will all fail"; "I know that, if you are judging by the screaming it doesn't seem so, but parents really love their children"; "Dad is like a mother that is unable to differentiate between body oil and hydrating cream. And he doesn't want to, either.";
- Commercial covers, promoting events or products – 3;
- Pictures of his own child – 1;
- And one image with his award received for best blogger.

So, what can we say about the way in which *Cel mai bun tata* manages its content in relation to the communication instrument, the Facebook cover? Firstly, that Alexandru Zamfir **communicates by underpinning his quality as an expert in parenting**, and as being an inspirational source for other dads. Secondly, he underscores his involvement in various social causes regarding children, fact that in our analysis reflects a reproduction of the classical traditional gender roles due to the fact that the accent is always put on the authority and visibility of the page's owner.

The conservative-traditional trend present on this blog is further illustrated by the abovementioned cover stating that "Dad is like a mother that is unable to differentiate between body oil and hydrating cream. And he doesn't want to, either." The covers transmit a lot of information about Alex Zamfir in his role as an expert dad and in couple relations, in a framework that preserve traditional gender roles, and the focus is mainly on authority, expertise, getting involved as a influencing factor and, last but not least, leadership, and not on care, partnerial relations or deconstructing gender roles.

Content analysis of January 2021 posts

During January of 2021the page had 27 posts. Firstly, we investigated them by using the positive/negative/neutral scale and secondly, we also grouped the posts by following the second scale regarding issues. We need to mention here one particular aspect related to the posts we branded as negative – we did so due to a tendency of the main character, that manifested throughout his January postings, to complain about the roles generated by the status of involved father. Thus, the negative category mainly consists of postings that, although Alex Zamfir is trying to be ironical and jovial, he is complaining of being tired, overworked, of lack of intimacy, that his kid had a tantrum, that his kid sees him as an old man overwhelmed by various situations, that the child is giving him orders or is screaming at him and so forth. Overall, there are 9 posts of this sort, reflecting a 30% of the whole content posted during January.

Of these posts, the one that reached the biggest audience for its class (negative/complaining) is the following: "My child asked me who is getting vaccinated in this stage. I said that old people and the sick. He then asked if that means if I can therefore get a vaccine. I changed his wifi password". This post clearly illustrates a conservative stance, based on authority, following the classical way of constructing gender roles and masculinity: the authoritative father deciding to refuse to answer questions because he can.

An analysis of postings placed in the *neutral* category (10 out of 27) brings to light classical themes of parenting, such as nutrition, children and pets, online schooling. The posts are short and present content without a visible emotional involvement of the author. Many of these are actually commercial messages, promoting games for example. The post in this category that received the most reactions (actually having most reactions of all January postings) deals with the discussion regarding the need for acceptance and the pressure that parents are frequently putting on their children to better perform in school. The post got 2400 reactions, of which the majority of them were Likes and Loves, thus confirming clearly the concept of dadfluencing - here we have the well-known recipe of personal stories turned into inspirational postings that aggregate emotional responses from the public. Also we have observed that this posting departs from the usual scheme adopted by the author, which involves irony, humor and short texts. We chose to place this post on the neutral category because the author does not

explicitly assume the need to produce value judgements or setting trends.

On the *Positive* category (8 out of 27) we find postings that reflect an optimistic attitude in relation to the issues discussed – here there are texts regarding couple relations, father qualities, how good it is to be a father, but also several commercial posts promoting products endorsed by the host.

The posting that had the most reaction in this category is one in which the author is praising his own qualities as a father: "quality parenting is when the kid goes outside to play in the snow and you give him a shovel and tell him that you believe no one would be able to clean the snow from the yard in less than 30 minutes". From the gender roles perspective, we tend to put this one also in the conservative-traditional category – the men's expertise in determining children to do as they are told, but also the value as a lesson – how to teach your child to be more competitive.

Thematic analysis

Commercial content	Men's expertise/authority	Women's expertise/authority	Critical to gender roles/inequalities	Conservative	Neutral
10	9	1	0	0	7

But perhaps the most interesting classification in our research is the issue based one, because it's designed to answer the research question "can we identify in the posted content of the two pages relevant a contestation of traditional gender roles and the promotion of more partnerial gender roles?". The issue-based analysis offers a blunt answer to our question – no, *Cel mai bun tata* page is not attempting to be critical towards gender roles and inequalities and is not trying to promote gender equality. Our main conclusions raised after the thematic analysis are the following:

- That, at least in January, most of the postings are commercial, the author promoting various products such as games, vitamins and so forth;
- That the second most important issue present in the postings is the men's expertise /authority, particularly that of the owner, who is The Best Dad. This is fully in accord with the observations made when analyzing the covers, where we noted the same thing happening;
- That there are 7 posts out of 27 that are mostly neutral.
- There is only one post promoting women's expertise and authority, but the author does not use it in order to provoke a discussion regarding gender inequalities. Alex Zamfir limits himself to noting that women have excelled too in several areas.

In conclusion, the analysis of the posts on the "*Cel mai bun tata"* page reveals that the best parent is the father due to his expertise and authority which are most of the time presented in a humorous/ironical manner that "sweetens" a bit the overall discourse. On the other hand, the owner is complaining a lot in relation to his lived experiences as a father and also we find that he is interested in selling his own products through the page.

6.2. Taticool - Dan Cruceru

Taticool is also a Facebook page assuming a personal blog identity, but also as a community. On contradistinction from the *Cel mai bun tata* page, here the influencing towards a less conservative approach to gender roles is more visible starting with the page's description. We have also noted in the description that the focus of the owner appears to be on breaking gender stereotypes and contesting traditional gender roles, bringing a new light to the way in which men should involve themselves in parenthood.

The page has over 50.500 likes and almost 60.000 followers. The first profile image was posted back in October 2015, therefore one can conclude that the page has approximately 5 years of activity. Comparing with *Cel mai bun tata*, where we have just one abstract profile image, *Taticool* chooses a different strategy to communicate with his followers: he appears in the profile pic almost exclusively with his children: out of 19 profile photos, 15 are with his girl, one with the whole family and 3 having no characters in them.

Content analysis of the cover photos

There are a number of 38 covers in total, of which:

- 8 with the *Taticool* logo;
- 11 with the family – 4 of which are with the spouse and the children, most of them illustrating family and household depictions;
- 9 with Taticool in his quality as an expert, invited at various events;
- 7 holyday messages;
- 1 with the hashtag #Colectiv
- One message with Safer Internet Day 2017;
- One with the message World Children's Day Unicef.

Taticool communicates differently than *Cel mai bun tata*, by being more personal and closer to his family, including his life partner. Also, the psotos featuring him on the page are predominantly with his children and not featuring him as an expert, leader, influencer. His cover photos do not appear to be biased towards promoting the traditional gender roles. Moreover, *Taticool* frequently appears in household depictions – playing with his children, thus breaking in a way the classical construction of rational, detached and problem-solving masculinity, again in contrast with the cover photos found on *Cel mai bun tata*.

Content analysis of postings in January of 2021

Taticool has 13 postings in January, of which 3 we placed in the *positive* category. One of these

postings refers to product characteristics, another features him as an avid reader and the last one promotes a vitamin brand, along an expert on parenting. This last post is also the one having most reactions on the *positive* category amassing 314 likes, not far from the second one regarding reading. These, as it's easy to note, are posts without critical content, aimed at keeping the public linked to the page's activity.

In the *negative* category we placed 5 of the 13 postings, these being more variated in content, some of them indicating revolt or others, just as in the case of *Cel mai bun tata*, where the owner complains about his status as a father, in a similar conservative and masculinist stance. Thus, we have postings regarding Disney's decision to remove several cartoons which were deemed racist and sexist, postings where the main character is depicted as a growing girl's father who needs the police to protect his daughter from boys, another post is criticizing the lack of sexual education in schools and, last but not least, the post where he complains about being his children's toy.

The posting who got the most reactions was the one where Dan Cruceru posed as the revolted father of a girl that needs defending. Reactions are divided between likes and haha's, a clear sign that the public is in consonance with the conservative position expressed by the author, him being either understood, either ironized with stereotypical messages regarding fathers of girls: "My 9 years old daughter: Daddy, don't you think that my eyebrows are a bit too thick? I am thinking to trim them a bit. Helloooo! Call the police, the army, Santa Claus, everybody! Stop the time, because I feel that I am going to do some damage soon at my door!"

There are also 5 neutral postings, being similarly variated, from images of children to new year's wishes or discussions regarding school/kindergarten. The post that generated most reactions is a self-ironic one, dealing with the fact that the father has to keep a cure to lose weight. We could consider this posting through the lens of the way in which the author assumes perhaps a less conservative stance – that of a man preoccupied of his own image – but we chose not to put it under the *critical towards gender roles and inequalities* category. Our argument is that a more suited variable to explain this redefining position in regard to men's image relates less to gender and more to class and social status, in the sense in which they are explored by Ietza Bojorquez and Claudia Unikel in *Body image and Social Class* (2012).

Thematic analysis

Commercial content	Men's expertise/authority	Women's expertise/authority	Critical to gender roles/inequalities	Conservative	Neutral
3	1	0	1	2	6

Differently than *Cel mai bun tata*, which had most of his January postings dominated by commercial products, the thematic analysis shows that *Taticool* has mostly neutral posts in January. Commercial posts are fewer than on the other page (only 3 of 13, but in percent the difference is not that high – 23% commercial content for *Taticool* and 37% for *Cel mai bun tata*). The differences continue – we also have two posts we labeled as having conservative content, and one which we labeled into the *critical towards gender roles/inequalities*.

The conservative posts discuss two issues of which one – being a father of a growing girl – was already analyzed above. The second one is particularly relevant for our research question(s), because it addresses the issue of screening policies of several Disney animated movies, which were labeled by the company as having racist and/or sexist content. Here Taticool takes an explicit critical conservative position, not limiting himself to just having a short post, but writing an entire article. After apparently accepting and promoting the anti-racist and anti-sexist discourse, Dan Cruceru switches to conservative critique: "this is already getting to be absurd: for example, movies that depict specific instances of white history suddenly introduce a non-white which, simply put, has no way to be physically, temporally, logically, there". These arguments further illustrate a superficial understanding of these issues and the reproduction of the mainstream discourse which reflects racist and sexist stances which are strongly internalized.

Nevertheless, *Taticool* is the only of the two pages that has a posting which is critical towards gender inequalities, in a text discussing the need for sexual education. This is a long post, that appeal to aspects such as "My body, my rights!", several NGO's active in the field (such as SECS, minor mothers and so forth). The author clearly assumes a position of support for the introduction of sexual education classes in schools, by both analyzing the issues faced by this project but also by trying to provide solutions.

To conclude, *Taticool*'s relative low number of postings and their distribution in a much-varied categories brings up the need to further research this page in order to reach more solid results. This recommendation also comes after noticing that his posts (in the About section, but also in other posts, as shown above) tend to be more personal and focused on family, children, play, which are not at all conservatively biased and focused on male expertise and authority (as is the case for *Cel mai bun tata*). Also, we tend to find in his posts at least the intention to try to promote more gender equitable and partnerial models. Nevertheless, it is hard to affirm that the page is critical of traditional gender roles, due to the fact that we can clearly find conservative clichés and stereotypies. Also, when the author has to prove that he has a reasonable understanding of the way in which

gender and race inequalities are constructed, he proves time and again that he is unable to overcome his own internalized racism and sexism. Also is important to note that the commercial endorsements are usually linked to the *Taticool store* that sells children's products, therefore rising the question of if (like in the *Cel mai bun tata* case) the page is not simply a vehicle using the fatherhood image in order to promote his own business.

7. Instead of conclusion

Care and caring undoubtedly are one of the core concepts of feminist political theories. No human being is completely independent of care and, unfortunately, due to the dominant constructions overtime, care became a gender biased concept – being more associated with women seen both as givers and receivers – and therefore pushed towards the private sphere and consequently depoliticized. The emergence of the new mediums for communication, such as the various social platforms from Twitter to Instagram has engendered the new phenomena of *influencing*. In this sphere, and correlated to the increasingly anti-gender inequality discourse and for a more partnerial family and men's involvement in fatherhood and childcare, *dadfluencing* appeared.

In this context, we tried to see how does this concept functions in the Romanian sphere, how two of the dadfluencers are dealing with the issue of combating gender inequalities and promoting a more partnerial family model. Unfortunately, perhaps as it was to be expected, the answer tends to reflect a negative relationship. Thus, the two protagonists are both focusing in product promotions, and they put forward a conservative worldview that focuses on male expertise and authority but that also complains about the various situations encountered during fatherhood. Postings that address gender issues are scarce and they usually give the impression that the authors are completely disconnected from the power-centered discourse, the construction of inequalities or their causes. At the same time, they are placing themselves easily in conservative stances – the father of a daughter that cries for the police to stop him from hurting the boys at the door when his daughter has grown up (*Taticool*) or the stereotypical stance regarding men that are clearly the only ones able to offer parenting advice and guidance (following the cultural model according to which the best cooks are always men).

CONSUMERISM VERSUS THE CULTURE OF EXISTENTIAL INTELLIGENCE

Elena NEDELCU[*]

Abstract

The present study aims to investigate the possible difficulties that human beings (especially young people) face in finding the existential meaning in consumer society. It tries to outline answers to the following questions: Does consumerism feed the crisis of meaning in contemporary society? Do consumerist ideologies and lifestyles meet the fundamental needs of the human being or do they rather induce false needs? Doesn't it propose false clues in search of meaning, in search of happiness? Maintaining the illusion that by purchasing goods, services, experiences (as many and as expensive as possible) we gain self-esteem and respect for others, consumerism can induce a dangerous sense of self-sufficiency, self-satisfaction. After the job, or even before it, the feverish, compulsive rush for shopping has become the main concern of hyperconsumerists. Under these conditions, do they still have time and energy to search for self, otherness, the purpose of life? Isn't consumerism a real obstacle in cultivating existential (spiritual) intelligence? If consumerism through (pseudo) values, the behaviors it cultivates, supports and maintains the existential crisis, then what is to be done, how can we get out of the impasse? Could the increase of the preoccupation of the society, of the socialization factors, of each individual for the development of his own existential / spiritual intelligence be a solution?

Keywords: *consumerism, existential meaning, crisis of meaning, existential intelligence.*

1. Introduction: What is consumerism?

The Larousse dictionary defines consumerism as lifestyle focused on consumption and characterized by a tendency to systematically buy new goods[1].

Consumerism is the dominant ideology and ethos of a consumer society, or market society, in which the whole of social life is penetrated, even structured by the economy. A culture of consumption is a culture in which the consumption of goods (tangible or intangible) is constitutive of social relations and social meanings[2]. In other words, consumerism is a certain way of thinking and lifestyle based on excessive consumption of goods, services, real or digital life experiences. It has infiltrated everywhere, leaving its mark on our everyday life.

It is a fact reported, more than a decade ago by Jonathon Porritt, in an article published in *The Guardian* ("Stop shopping or Planet go pop"): "Fascism. Communism. Democracy. Religion. But only one has achieved total supremacy. Its compulsive attractions rob its followers of reason and good sense (...). More powerful than any cause or even religion it has reached into every corner of the globe. It is consumerism."[3] In this article, Jonathon Porritt draws our attention to the traps that both the individual and the society might fall into due to consumerism, as well as to the consequences it causes on the environment.

2. The Traps of Consumerism

In this type of (consumerist) society, according to Galbraith (1986, p. 169), production creates the needs it wants to satisfy, and then fills the void it has created. Under these circumstances, the individual begins to believe and feel that his fundamental and primary need is consumption. Lipovetski finds that the influence of consumerism on the individual and on society is remarkable: 'There are very few social phenomena that have managed to change so profoundly the lifestyles and tastes, aspirations and behaviors of adults in such a short period of time, as consumerism has.'[4] He notices that today's consumption has acquired a truly existential dimension, coming to be used even in the pursuit of individual happiness. Lipovetski concludes that in 'the hyperconsumption society, consumption is radically divided, being ordered around two antagonistic axes: on the one hand, the practical purchase of products, the necessary services; on the other hand, the hedonic buying (for pleasure).'

Goods have completely invaded our lives, becoming the accessories of a merry show, this is what Debord (1996) outlines in his paper *La société du spectacle*: 'I would rather call this *show* grotesque. Consumption becomes the new reason to live, a way of life focused on material values, excess, comfort, the satisfaction of pleasure. A (pseudo) nonethical culture of the unnatural is born, promoter of ultramercantilism

[4] Interview with Gilles Lipovetsky, 2013, https://www.millenaire3.com/interview/2013/la-dimension-existentielle-de-la-consommation.

(everything is for sale!), of the quantitative (much, more and more!), of ignoring otherness; a reductionist lifestyle that excludes or ignores everything that does not enter the narrow sphere of one's own interests and pleasures. I would say that this principle of hyperconsumption tends to be extrapolated to the level of experiencing human relationships. We notice an increase – rather among young people – in the preference for as many friends, relationships, life experiences as possible. The preference for this kind of superficial, undigested, thoughtless relationships (they don't have time to reflect on them) does not bring them anything good, on the contrary. In their haste, they do not realize that, in fact, it does not matter how many relationships (experiences) you have, how many conquests you have ticked, it matters what you learned from them, after you reflected on them. Going along the same lines, Lipovetsky (2007, p. 13) suggests that 'we are only at the beginning of the hyper-consumer society, nothing is currently able to stop or even slow down the progress of transforming experience and ways of life into a commodity.'

To be effective, consumerism needs a strong ally: advertising. It could not exist without advertising. Advertising is a faithful and unbeatable instrument of consumerism. It models the needs and aspirations of people, it stimulates greed (more) and grandiosity (more expensive), it forms conditioned reflexes, it acts on the subconscious through subliminal perceptions, it induces false needs etc., its 'disinterested' goal being the perpetual increase of the sales volume. Its purpose is achieved: we buy more and more and not only because we need it but also for pleasure, to feel good, to have fun. We buy more and more expensive goods in the hope that our self-esteem will increase and we will enjoy more respect from the others. We buy because buying gives us the illusion of happiness! (Shopping therapy!) In conclusion, we can say that advertising does not only sell products, but it sells the illusion of living, of having a purpose, of being happy. The private sector, consumerism, advertising 'want to create the individual who seeks compensation for his needs and disappointments not in the quality of his life and his profession, but in consumer goods (...).'[5]

Children and teenagers can become the easiest victims of the commercials and advertising programs to which they are exposed. Under the influence of publicity, before acquiring the necessary discernment for their choices, they move towards values with material connotations, towards displaying a socio-economic status as high as possible; they channel their interests in the direction of purchasing company clothes, the most hi-tech and expensive devices; they select their friends according to the material values to which they have adhered. Those who cannot buy such goods become frustrated, risk developing symptoms of anxiety, depression; they can even become aggressive. If we take into account the effects of excessive use of the smartphone, the Internet (social media in general), a phenomenon very common in this age group, we complete the picture of the possible risks teenagers face. Numerous psychosociological studies have shown that excessive digital consumption generates addiction, depression, isolation, loneliness; live contact with others is diminished, and the creation of an ideal and false image of oneself is encouraged. We cannot ignore Jules Henry's remarks about advertising as an expression of an irrational economy centered on a high standard of living.

In conclusion, I would like to point out that this kind of hyperconsumption pseudoculture, apparently paradoxical, has found a favorable ground in the troubled anomie societies, characterised by multiple transition (economic, political, social) settling quickly and even more successfully than in developed societies. This is also the case of Romania. I would also like to point out that, beyond the negative influences on the individual, society, the environment, consumerism also contains positive elements that are not negligible. We must not fall into the trap of *radical demonization of consumerism*: 'Let's recognize that, among the positive elements of consumerism, the most important is the autonomy of the individual. Consumption is able to bring real satisfaction. Harmful excess consumption is not enough to reduce the phenomenon as a whole. The search for pleasure, comfort, entertainment, escape, is consubstantial with human desire.'[6] Probably intending to show the bright face of consumption, the role it played in reducing poverty and hunger, Noah Harari noted that: '... today, hunger affects fewer people than obesity. In 2017, 124 million people died of starvation, but many more (over a billion) were suffering from obesity.'[7] I wonder if these figures are the expression of the benefits of the consumer society. From my point of view, they are false indicators, irrelevant for measuring prosperity, development and quality of life. They rather reflect the greed, irrationality and injustice that exist in the world.

3. The crisis of meaning in the society of 'hyperconsumption'

Existential crises, also known as existential dreads, are moments when individuals question whether their lives have meaning, purpose, or value, and are negatively impacted by contemplation[8]. It may be commonly, but not necessarily, tied to depression or inevitably negative speculations on purpose in life (e.g.,

[5] Robins, 1999, p. 112, apud. Ar. Gör. Baris KARA, Les valeurs de la société de consommation : une analyse sémiologique des publicités de presse, http://iletisimdergisi.gsu.edu.tr/tr/download/article-file/82747).

[8] Richard K. James, *Crisis intervention strategies*, https://en.wikipedia.org/wiki/Existential_crisis.

'if one day I am to be be forgotten, what is the point of all of my work?'). Lipovetski (1983) was one of the first philosophers to draw attention to the deepening of the crisis of meaning in consumer society. He felt this wind of 'emptiness', the risk of the materialism inherent in today's world that makes existence lose substance and verticality. The existential void takes strange contours for many of the individuals in society. There is 'a diffuse and ubiquitous discomfort, a feeling of inner emptiness and the absurdity of life, an inability to feel things and beings.'[9] Around the same time (1992) and in the same register, Emil Cioran pointed out that: 'today's man is the expression of a deep crisis, of great (soul, moral and spiritual) complexity. Today's man is alone and empty; he lacks landmarks; he is the *object of manipulation* and that of *anti-models* that deepen the crisis of values; he no longer recognizes himself; he is deceived by the illusion of false values; the world no longer offers him authentic values, nor does man have anything to ask of this world; what to build or project ideals for.'[10] Moreover, Adorno pointed out that: 'In modern societies dominated by consumer ideology, excess consumer goods have become harmful and destructive. As the population is surrounded, if not suffocated by goods, the chance of the individual to find his way, his purpose in life, his meaning, becomes more and more difficult and even impossible' (Adorno, 1998, pp. 122-123). In Bauman's opinion (1999, p. 43), the individuals who make up the consumer society are in a constant situation of lack of content, dissatisfaction. Consumers are oriented towards meeting new needs, with constant exaltation and enthusiasm. Trapped, they can (apparently) get rid of their dissatisfaction only through consumption.

Today's society lacks landmarks, it is a society of 'the present moment, of urgency, of the visual, of the individual lost in the crowd', a society in which individuals are 'saturated with information', but for whom the loss of earlier constituted social *fabric* has become apparent' (...), it is a consumer society 'in which consumerism and narcissism intertwine with frustration and a sense of insecurity', 'in which individuals are fascinated by advertising and seduced by the populism of their leaders', a society that 'prepares and orients individuals so that they can function in the realm of the imaginary and the virtual'.[11]

Consumerism seeks to create an individual focused on wealth and comfort, not on the search for 'the reason to live' and on increasing the quality of life. Thus consumerism projects an individual who neither intends nor has time to pose the problem of an intelligent existence, of a meaningful existence. Time is one of the greatest problems of the individuals of this society. Increasing consumption often involves increasing time spent working. We consume more, we work harder. We exhaust ourselves by working and consuming. Fatigue, overwork, stress affect our physical and/or mental health. We no longer have enough time for family, friends, and community, to discover and build the meaning of our own lives. Not only does the lack of time prevent us from discovering our purpose in the world, the reason for living, but the main obstacle is the axiological system itself that underlies consumerism. It is difficult to find the meaning of life in a society whose main stakes are: the excess, the comfort, the pleasure, the tangible, the concrete.

Excessive consumption, whether for pleasure or ostentation, nourishes pride, shakes desires, creates other needs. It does not urge us to existential interrogations, to reflect on inwardness, and otherness. The individual of this world is more concerned with showing that he is above his fellow men than with being in joy and harmony with others. Hyperconsumption expresses the narcissistic pleasure of feeling a distance from the common, enjoying a positive image of oneself (Lipovetski, 2013).

Consciously or not, people are looking for themselves; they are looking for their identity. For many of them, the things, the services purchased represent an 'amplifier of their identity', of their superiority in relation to the others. The psychological effect is even more pronounced in the case of branded goods. Being expensive, they are 'exclusive'. Eckhart Tolle points out that trying to find oneself through things does not work: the satisfaction of the ego is only short-lived, followed by the appearance of other frustrations and dissatisfactions that need to be resolved. Man does not find himself, nor does he see the meaning of his existence. 'Identifying the ego with things gives rise to attachment and obsession with things, which, in turn, ensure the continuity of the consumer society.'[12]

The crisis of meaning finds its explanation in a complex of factors (be them economic, social-political, psychological, etc.) not only in the axiological system promoted by the consumer society. I am thinking, for example, of the effects of accelerating robotization, including the disappearance of a large number of industries and professions; many of the current socio-professional categories will become 'irrelevant' to the economy and not just to it. As already announced – due to robotics – the 21st century could be the 'end of work' in its traditional sense. Under these conditions, the question of man's relationship with his existence will become even more pressing. What will this 'useless, irrelevant mass' (Harari, 2019) do with its life? Given that the key statuses, the fundamental social statuses (profession, family) will be questioned, what will man do with his life? What will give meaning to his life?

[9] Gilles Lipovetski, 1983, p. 108, apud. Jean-Luc Bernaud, *Introduction à la psychologie existentielle*, Dunod, 2019, pp. 15-16.
[10] Emil Cioran, *Tratat de descompunere*. Bucureşti: Editura Humanitas, 1992, p. 224.
[11] Barus-Michel, J. *Criza ca obiect al psihologiei sociale clinice*, in Barus-Michel, J. & Neculau, A. (coord.). *Psihosociologia crizei*. Editura Trei, Bucureşti, 2011, pp. 90-91.
[12] Eckhart Tolle, *Un pământ nou*, Curtea Veche, Bucureşti, 2019, pp. 49, 50.

How will people come to terms with the idea that they are 'useless' and 'irrelevant'? The feeling of uselessness is devastating for the human being: it depresses him, it inhibits his desire to fight and even his desire to exist.

4. The way out of the stalemate: the orientation towards an intelligent existence

Motto:

'Man does not live only on material security, but on the meaning he gives to what he achieves.'

(V. Frankl)

An intelligent existence means, above all, a meaningful existence. Know what you live for! The Japanese believe that every human being has a reason to exist, a reason to live, has an 'ikigai'. 'It is hidden inside us and requires a careful search to reach the depths of our being and find it. (....) Ikigai is the reason we wake up in the morning.'[13] Some have discovered it, they are aware of it, others are still looking for it.

The one who has something to live for can bear almost anything (Frankl, 2009). In Allport's view, for man, the discovery and construction of the meaning of existence, the discovery of a suitable guiding truth represent the foundation for developing resilience, for finding the strength to overcome all obstacles, misfortunes, dramas of life. By discovering the meaning and following it, man can transcend critical situations, can rise even above fate (destiny). 'The search for meaning is the first motivation of man in life' (Frankl, p. 111). 'Meaning differs from person to person, from day to day and from hour to hour. (...) Every man has his own vocation, his own mission in life to carry out a certain task that is required to be fulfilled. The more man forgets himself by giving himself to a cause that he serves or a person he loves, the more human he is and the more he updates himself.'[14] 'When I look for the meaning of life, I want to explain what reality is and what my specific role is in the cosmic drama. This role makes me take part in something above myself and gives meaning to all my experiences and choices (...). To understand the meaning of life means to understand one's unique function, and to lead a good life means to fulfill that function.'[15]

Throughout history, billions of people have believed that for their lives to make sense, it is enough to 'leave something behind' (Harari, 2019, p. 277). It can be a child, a book, a house, etc. The orientation of man towards an intelligent existence presupposes the intensification of his preoccupation for discovering the meaning of his own existence, for rethinking the relationship with the self, with the fellows, with the environment. It also involves reviewing its relationship with goods, with consumption, his orientation towards a 'sober', intelligent consumption. Only in this way will he more easily distinguish between real and false (induced) needs, between values and pseudo-values. He will better withstand the temptation of the superficial, the excess, the useless and the success as life's goals. All these will be perceived as anti-values.

According to psychosociologist Danielle Rapoport, we can only be happy if we choose sobriety, intelligent consumption; only if we become subjects in our consumption, if we lean more towards 'utility, quality, proximity'.[16] Existential intelligence, however, involves more than awareness and fulfillment of meaning and orientation towards intelligent consumption. It represents a new paradigm that we meet in specialized literature, under the name of spiritual intelligence, both names, designating, broadly speaking, one and the same thing. Existential intelligence, as Gardner characterizes it, involves having a heightened capacity to appreciate and attend to the cosmological enigmas that define the human condition, an exceptional awareness of the metaphysical, ontological, and epistemological mysteries that have been a perennial concern for people of all cultures.[17] McMullen noted that 'if cognitive intelligence is about thinking and emotional intelligence is about feeling, then spiritual intelligence is about being' (McMullen, 2003, pp. 43-46).

In the view of Zohar and Marshall, spiritual intelligence (SQ) is the intelligence with which 'we address and solve problems of meaning and value, the intelligence with which we can place our actions and our lives in a wider, richer, meaning-giving context, the intelligence with which we can assess that one course of action or one life-path is more meaningful than another. SQ is the necessary foundation for the effective functioning of both IQ and EQ. It is our ultimate intelligence.'[18]

Spiritual intelligence means 'to be able to discern the real meaning of events and circumstances, and be able to make work meaningful; identify and align personal values with a clear sense of purpose; live those vales without compromise and thereby demonstrate integrity by example; and understand where and how each of the above is sabotaged by the ego, which means being able to understand and influence *true cause*' (Mike, 2006, pp. 3-5). Cindy Wigglesworth identified the spiritual intelligence as the ability to behave with wisdom and compassion, while maintaining inner and outer peace (equanimity), regardless of the circumstances.

[18] Zohar D., Marshall I. *SQ: Connecting With Our Spiritual Intelligence*. Bloomsbury Publishing, New-York, 2000, pp. 3-4.

In *Spiritual Intelligence: A New Paradigm for Collaborative Action*, Danah Zohar considered that Spiritual intelligence can be fostered by applying 12 principles:

1. Spiritual self-awareness. It means to recognize what I care about, what I live for, and what I would die for. It's to live true to myself while respecting others.

2. Spontaneity. To be spontaneous means letting go of all your baggage (your childhood problems, prejudices, assumptions, values, and projections) and be responsive to the moment.

3. Being Vision and Value-Led. Vision is the capacity to see something that inspires us and means something broader than a company vision or a vision for educational development.

4. Holism encourages cooperation, because as you realize you're all part of the same system, you take responsibility for your part in it. A lack of holism encourages competition, which encourages separateness.

5. Compassion. I don't just recognize or accept your feelings, I feel them.

6. Celebration of Diversity. Compassion is strongly linked to the principle of diversity. We celebrate our differences because they teach us what matters. Celebrating diversity means that I appreciate that you rattle my cage, because by doing so, you make me think and grow.

7. Field Independence. It's a willingness to go it alone, but only after I've carefully considered what others have to say.

8. Humility. Humility is the necessary other side of field independence, whereby I realize that I am one actor in a larger play and that I might be wrong. Humility makes us great, not small. It makes us proud to be a voice in a choir.

9. Tendency to Ask Fundamental 'Why?' Questions. 'Why?' is subversive, and people are often frightened by questions without easy answers. Answers are a finite game; they're played within boundaries, rules, and expectations. Questions are an infinite game; they play with the boundaries, they define them.

10. Ability to Reframe. Reframing refers to the ability to stand back from a situation and look for the bigger picture. It brings a variety of approaches to problem-solving tasks and is prepared to let go of previously held ideas when these clearly are not working. It seeks to broaden experience by taking on tasks outside of comfort zone

11. Positive Use of Adversity. This principle is about owning, recognizing, accepting, and acknowledging mistakes. Positive use of adversity is also the ability to recognize that suffering is inevitable in life. There are painful things for human beings to deal with, yet they make us stronger, wiser, and braver.

12. Sense of Vocation. This principle sums up spiritual intelligence and spiritual capital. It's my ideal that business will become a vocation that appeals to people with a larger purpose and a desire to make wealth that benefits not only those who create it but also the community and the world.

The development of existential intelligence presupposes first the knowledge, the awareness of its inherent benefits. It would take an effort of will both individually and socially. The involvement of socialization factors in the education of children and young people in this spirit would be required. At the macrosocial level, the creation of the necessary context for an intelligent existence requires profound changes at political, economic and socio-cultural levels.

5. Conclusions

This paper is a plea for a rational, decent, sober, without excess consumption. The benefits that people enjoy in today's consumer society (the progress of comfort, the multiplication of experiences, 'the satisfaction of having') cannot be denied. On the other hand, it cannot be denied that hyperconsumption does not make it possible to fill the feelings of existential emptiness related to the relationship with others, communication, love, recognition, self-esteem, professional achievement. Moreover, a consumer-centered existence risks favoring the deepening of the crisis of meaning, does not leave time for existential interrogations, overturns the hierarchy of values, in conclusion, is the opposite of an intelligent existence.

VIEWS REGARDING THE CURRENT ADMINISTRATIVE PHENOMENON

Iulian NEDELCU[*]
Paul-Iulian NEDELCU[**]

Abstract

An essential pillar of the rule of law – the principle of legality of the administration, which together with the separation of powers in the state, must guarantee the fundamental rights and freedoms of citizens.

The form of government, as a concept, we appreciate that it specifically designated the use and organisation of state bodies, as well as the characteristics, principles that underlie the relationship between them.

At the same time, the economic and social structure of the state, the principles underlying the organisation and functioning of power, its objectives and forces, the way in which society is reflected in the power and style it imparts to the rulers must be taken into account.

From the point of view of the forms of government, it is spoken in the specialised literature of monarchs and republics.

Within the republic, we find that the position of head of state is performed by an authority that can be either unipersonal or collegial.

We note, depending on the elements considered in the more general concept of state form that a number of notions and derived concepts appear, such as those of form of government, state structure and political regime.

The set of institutions, methods and means by which power is realised represents the political regime, which has much more complex determinations than the relations between the powers and the way they are organised.

The idea of collaboration of powers is used by the parliamentary regime, in which we find the principle of separation of powers – understanding by this, the functional autonomy especially of the legislature and the existence of specific means of mutual pressure.

From the specialised literature of public law, we come to the conclusion that there is no perfect constitutional regime – an opinion that can be criticised – that falls within pre-elaborated theoretical schemes.

Keywords: *separation of powers system, public administration, state of democracy, forms of government, rule of law*.

1. Introduction

1.1. Introductory Notions

Given the rationality of the administrative phenomenon, it is essential to understand the notions in a real, not abstract way of how administrative law is realised in order for the theoretical essence to harmonise with practice.

Thus, from an etymological point of view, the term ”*administration”* has its origin in Latin composed of the preposition *ad* with the noun *ministry*, which could mean in a faithful translation – servant, executor. Next, the first definition of the word administration leads us to the idea of subordinate activity, but in another opinion, ”*administration*” was defined as ”*the act of administering, conducting public or private affairs, managing property*” or ”*administrative power*” or ”*the science and art of governing the state*”.[1]

Therefore, from the presentation of the word “*public administration*”, we will therefore note that it should not be confused with “*state administration*” – the concept of public administration referring not only to government and ministries, but also to the activity and organisational structure respectively through which the application is organised and the law is enforced within territorial and administrative divisions in accordance with the principle of local autonomy and administrative decentralisation, applicable in a state governed by the rule of law.

In administrative law, the notion of public administration is also analysed by referring to other notions: administrative authority, public power, public service, administrative body.

For example, Professor Anibal Teodorescu, a remarkable personality of the interwar period, used the concept of public power, which he defined as ”*the power of the state to command all the individuals who make up its population, united with that of not recognising on its territory any other will coming from outside*”.[2]

Indeed, for the rule of law to exist, the separation of powers in the state is required[3].

[2] Anibal Teodorescu, *Basic treaty of administrative law, Ist volume, IInd Edition*, Bucharest, 1929, p. 113. Anibal Teodorescu (1881-1971) he was a Romanian jurist, corresponding member of the Romanian Academy, https://ro.wikipedia.org/wiki/Anibal_Teodorescu.

[3] John Locke, clearly formulated the issue of the separation of powers, his concern starting from the practical necessity of moderating the strength of state powers. The author considers that in the state there are three powers: the legislative power, the executive power and the confederate power. John Locke (August 29th, 1632 – October 28th, 1704), was an English philosopher and politician of the seventeenth century,

Montesquieu[4] theorised the principle of separation of powers which became a dogma of liberal democracies and the essential guarantee of individual security in relations with power.

Thus, the administration is no longer an exclusively etatist activity as it was previously known.

French Professor Emeritus Bernard Chantebout highlights the three functions that the state must perform: the legislative function, the executive function and the jurisdictional function.

Consequently, the former enacts the general rules, the latter is responsible for their enforcement or execution, and the latter has the role of resolving disputes that arise in the process of legislation.

In other words, if in French doctrine we find most theories and definitions of public administration, German doctrine emphasizes the abstract nature of the notion of public administration and concludes that "*administration can be described and yet, not defined*"[5].

On the other hand, the Anglo-Saxon system is examined together with constitutional law under the generic name of "*law relating to public administration*".

Nor do we omit the American theory that uses the following notions to define the term "*administration*": running and guiding business and institutions; government officials; policy execution; the period during which any chief executive holds a position.[6]

Consequently, we emphasize that all European Community countries refer to the executive power, public authority, state power, executive function, as an expression of the consecration of the principle of separation or balance of the three powers of the state.

Of course, we would like to point out that the separation of powers is not allowed in the form of opposition between them, because such a conception is likely to block the activity of the state.2. Contents

2.1. Cooperation in administrative law

First of all, from the research of the notion of public administration it arises out that this represents an activity of execution and organisation of the specific execution of the law.

Thus, it can be grouped into two broad categories:

- executive activity standing for regulations, through which the organisation of law enforcement is realised, the perceptions of ethics of natural persons and legal entities are established, permuting or prohibiting a certain behaviour, going as far as the application of penalties for non-compliance with legal provisions.

The activity in this category involves the decision-making process from the adoption of legal deeds, to committing material acts by public authorities and their functioning, as the main activity.[7]

Subsidiarily, such activities may also be carried out by other public authorities: law giving or judiciary.

- the activity being a provided service, which is executed on the basis and by enforcement of the law or upon the request of the natural person or legal entities of other public authorities (in fields such as: water, telephony, mailing, transport, etc.).

For example, the service activity is carried out through legal acts, but also through material operations.

The state administration, understood either as an execution activity or as a system of state administration bodies, materialises its entire activity in a socio-political and legal context.

Regarding the legal relations in whom the public administration is manifested and realised, it should be noted that they are executed within a social group and up to the whole society, globally viewed.

The specifics of the tasks of the public administration system, also arises out from the particularities of the administrative fact of being the organiser of the political values realisation, in a given social system.

Also, a definition of the position is as[8] "*administrative activity that someone performs regularly and organized in an institution, in exchange for a salary*" or "*degree that someone holds in an administrative hierarchy*".

In other words, in relation to the public administration, the function represents a set of attributions established by law or by acts issued on the basis and in the execution of the law.

They are performed by a natural person employed in a public administration body and who has the legal ability to perform these duties of public administration.

In the opinion of Professor Erast Diti Tarangul[9], starting from the functions of the state, he classifies the public administration, from a formal and material point of view, examining as basic notions of public administration, the public service and the general interest.

As regards of public administration, functions can be described in relation to the main objective pursued by the administration and the realisation of the interests of the citizens.

---

especially concerned with society and epistemology. Locke is the iconic figure of the three great traditions of thought at the heart of the spirituality of the modern age, https://ro.wikipedia.org/wiki/John_Locke.

[4] Montesquieu, (1689-1755) was a French judge, a man of letter and a political philosopher. He is the main source of the theory of separation of powers, which is implemented in many constitutions around the world, https://en.wikipedia.org/wiki/Montesquieu.

[5] Antonie Iorgovan, *Treaty of administrative law*, Nemira Publishing House, Bucharest, 1996, vol. I, p. 22-30.

[6] Dictionary of American government and politics, 1998, The Darsey Press Chicago, 1988.

[7] The entire activity of organising the execution and specific execution of the law, involves several stages: the documentation activity, which gives rise to the well-known advisory administration (service) and execution; deliberative activity, or prior to issuing decisions; active administration – materialised in legal acts – administrative deeds, jurisdictional and administrative deeds and even material operations.

[8] Explanatory Dictionary of the Romanian Language, Univers Enciclopedic Publishing House, Bucharest, 1998, p. 404.

[9] Erast Diti Tarangul, *Romanian Administrative Law Treaty*, Glasul Bucovinei Publishing House, Cernăuţi, 1944, p. 49-56.

These could be summarised as execution functions[10], both of the political decisions reflected in the law, and of their activity of current administration under the law, information functions not only to the legislative authority (art.110 of the Constitution), but also to of citizen, (art.31, 78 and art.107, paragraph 4 of the Constitution) and functions of realisation of the drafts of normative acts and of some political decisions.

Administrative relations and law enforcement activity involve the state authority of the subject of law that participates in their implementation – practically a legal framework within which to perform the public administration tasks.

Therefore, the tasks of the administration are classified according to several branches: according to the content of the activity (management and organisation tasks; performance tasks), depending on the nature of the device or provider of the activity (tasks of organising the execution and execution of the law), by the scope of the regulation (tasks of national interest and tasks of local interest).

The clarification of some notions such as society, state, executive power or public administration start from the institutional reality of the moment, namely the existence of Romania in the administrative space of the European Union.

Thus, the adoption of *OUG (Government Emergency Ordinance) No.57/2019 of July 3rd, 2019* on the Administrative Code is almost a bias in relation to the concluded European partnerships, maybe not so imperative and necessary given the current legal provisions.

An interesting remark is the fact that the supreme law, the Constitution of Romania, establishes the terms of – *balance* – or – *cooperation of powers in the state* – and not – *separation*. According to the Constitution approved by referendum on December 8th, 1991, in Romania *the only holder of power is the Romanian people*.

Regarding the object of activity of administrative law, the question was asked in the specialised literature, if it is not, somehow, the same as the object of public administration as a form of achieving state power.

Administrative law consists of the social relations that form the object of public administration in the conditions in which the notion of public administration is also defined by the formal criterion of the law.

Administrative law as a branch of law regulates only certain social relations specific to its object of activity. Regarding the object of activity of administrative law, the question was asked in the literature, if it is not the same as the object of public administration as a form of achieving state power.[11]

It is important to specify, however, that although the object of administrative law is similar to that of public administration, it is not to be confused with it. Public administration consists in organizing the concrete execution of laws and other acts of state authorities based on the law.

The content of the administrative law identifies some social relations that could be the object of other forms of activity of the state, such as, for example, the settlement of jurisdictional administrative deeds that through their procedure can also be the object of the activity of justice.

These activities are located at the confluence between public administration and other forms of state power that can be considered as or not part of the administrative activity and therefore may or may not be regulated by the rules of administrative law in relation to how it disposes. the law, a fact already emphasized in comparative law.[12]

Last but not least, there is a complexity of social relations that manifests itself within the groups of people organised in order to perform the duties of public administration, as well as between these groups of people and public institutions or state authorities.

The organisation and activity of those who perform public administration must be subject to legal regulation.

In other words, the social relations that form the object of the administrative law are those relations that forms the object of the public administration carried out according to the legal norms by the public administration authorities.

It follows that the administrative law consists of the social relations that form the object of public administration in the conditions in which the notion of public administration is also defined according to the formal criterion of the law.

2.2. The principle of legitimacy

The principle of legitimacy is the principle that appoints the bounds of the actions of the public authorities, limiting their power, without injuring their undertaking spirit.

Such a hypothesis comes from the ascertainment according to which the law regulation cannot provide absolutely everything, fact that warrants the public authority to implement the regulation when informed.

Distinction between discretionary power and bound power has a crucial interest, since it determines the legality requirements of the administrative act with regard to the relationship between its object and its motives, therefore having direct consequences in the legal field and that of the jurisdictional control.

As unanimously expressed by all doctrinarians, in the current activity of public administration, it is indispensably required to be achieved a balance between the two types of competences.

Thus, the administration action cannot adjust to a generalisation of the bound competence, which would

[10] Ioan Alexandru, *Administrative structures, mechanisms and institutions*, Ministry of Teaching, National School of Political and Administrative Studies, vol. I, 1996, p. 45.

[11] Alexandru Negoiță, *Administrative law and Administration Science*, Atlas Lex Publishing House, Bucharest, 1993.

[12] André de Laubadère, *Traité élèmentaire de droit administratif*, Paris, 1963.

actually be the equivalent of determining a reflex conduct, based on administrative type automatisms, in applying pre-established rules[13] .

For that matter, most of the times, administration has to permanently adjust to specific and changing circumstances that the rule of law cannot provide[14]. On the contrary, an administration which has very wide discretionary powers, does not offer to the administrated people any security, since it would tend to abuse and contingency. For these reasons, the bottom line is the need of a dosage[15] between the two types of competences.

3. Conclusions

Thus, in order for an optimal functioning of the authorities and public services vital to the organization of the company, the need for legal regulation of the organization and functioning of the public administration under the rule of law derives from the nature of the object of this activity.

No doubt that public administration is a truly interesting topic dedicated especially to scientific research for the importance it shows in the proper functioning of vital public authorities and services.

Research object not only for jurists, but also for economists, historians, sociologists, philosophers, political scientists and even anthropologists, public administration has as main purpose the realisation of political values as a form of expression of the general interests of society, values that are materialised in law.

Therefore, the phenomenon of administration was thus approached in a monodisciplinary way by each of the specializations and the image provided could not comprehend the complexity and nuance of the mechanisms, institutions and structures involved in the functioning of administration.

It is the state itself that must accurately determine the limits of its powers in the form of the law, as it does with regard to liberties, but it is not appropriate to act more than it is within its legal competence.

In this regard, the renowned theorist in administrative sciences, prof. univ. dr. Ioan Alexandru remarks the essential property of the state governed by law, which results from the application of the principle of legality in the activity of public administration which, together with the organized division of state power into three components, aims to guarantee the citizen's freedom from the direct State's intervention.[16]

Consequently, the result of the legal normative activity is represented by the multiplicity and variety of activities and forms of organisation of the public administration system.

An important way to achieve the organisation and functioning of the public administration system that provides an objective criterion for assessing the conduct of persons performing public administration is the legal norm.

If we consider the law execution, the public administration system is the instrument with which the law is realised. In order to meet this mission, the public administration, seen as an activity and as an organisation system, must also be subject to the law.

In this way, the principle of legality of public administration activity is outlined, as a fundamental principle. Unlike the 1991 Constitution, the text of the Constitution revised in 2003 dedicates its superset position as a general principle, placing it at the top of the legal norms pyramid: "*generating constitutional supralegality*"[17]

Thus, law is thus a necessary and binding dimension for the public administration.

The principle of legality is also expressly stated in the "*Code of Good Administrative Behaviour*" adopted by the European Parliament on September 6th, 2001).

As a result, it is imperative that it be interpreted dynamically in the sense of the obligation of public administration authorities to act to enforce the law and to take the necessary measures, including coercive measures, in order to restore the violated legal order.

This explanation derives from the very purpose of the public administration that of being in the service of the general interests of society expressed in law.

In the Romanian legal system with all the opposite opinions supported in the specialised literature we must recognise the thesis of the plurality of norms applicable to the administration of administrative, private law or other branches of public law.

A comparison of European systems highlights two "*types*" of law applicable to the administration in the European space, namely the Anglo-Saxon system (which does not recognise the existence of administrative law as a separate branch of common law, so the administration is subject to common law rules (common-law), as well as administrative disputes settled by common law courts) and the francophone system (present in most European states, based on the recognition of exorbitant law for the state administration, respectively administrative law, with the recognition of the existence of separate administrative jurisdictions common law courts structured in a system headed by a supreme administrative court)

It is important for defining the sphere of administration and the distinction between the public administration made by the state structures respectively by the local authorities and the administrative activity carried out by the other state bodies (public authorities): Parliament, courts, Constitutional Court.

SOME FEATURES OF THE NEW PUBLIC MANAGEMENT

Florina POPA*

Abstract

The profound changes experienced by the public administration in the last twenty years, which are closely correlated with the economic and social phenomena, were based on the particularities of the New Public Management, an event of great significance for the practice of public administration, both in industrially developed countries and in the developing ones.

The new concept is underlying on the transfer to the public sector, of management techniques, proper to the private sector, thus producing a move in the operating methods of public sector organizations, element which contributes to reducing divergences between the two sectors.

Characteristic of the New Public Management, is the interaction of the reform procedures, which aim at diminishing the governmental costs, by orienting towards privatization and the competition stimulation in the offer of services.

By the introduction of market processes aims to increase accountability, efficiency regarding services provided and attention paid to consumer satisfaction.

The study tries to present the characteristic elements of the New Public Management, as it appears from the opinions of some specialists and directions of action in implementing reforms, reflected in the emphasis on different coordinating elements, such as: managerialism, disaggregation, competition, performance stimulation, contracting, dissociation, fragmentation of authority and responsibility.

The aim is to highlight the aspects wherethrough the change leads to the penetration of modern management processes, in public administration and the transfer of emphasis from the old form of public organization and provision of public services (based on bureaucratic principles, planning, centralization, direct control and autonomy), towards a market-oriented public service management.

Keywords: *New Public Management, characteristics, directions, reform.*

JEL Classification H11; H44; H83; L33

1. Introduction

One of the events of great significance for the practice of public administration, in the last twenty years, both in industrially developed and in developing countries (Calogero, 2010 pp. 30-54) is the penetration, on a global scale, of the principles of the New Public Management, consequence of the great changes, in world plan, result of the internationalization of the production and the free movement of the capitals, including, the contribution of the computer science revolution. (Androniceanu & Șandor, 2006).

The new concept transfers to the public sector, the management techniques, own to the private sector (Amar & Berthier, 2007), which means a move in the methods of operation of the public sector organizations, attenuating the distinction between the two sectors; the decision-making power of public managers increases, the guidance through rules of procedure transmitted from the center relaxes. (Kalimullah, Ashraf, Nour, 2012)

The process of New Public Management is based on the orientation towards market economy principles and an increased efficiency of public administration, against the background of changes which can lead to an improvement in the use of public resources and an increase in the quality of public services (Świrska Anna, 2014).

The framework of the paper follows the particularities and directions of manifestation of the New Public Management, whose interaction can lead to the achievement of the reform objectives.

There are briefly presented, the main characteristic elements of the phenomenon, as well as the way in which they have been approached by various theorists, in the specialized literature.

2. Features of the New Public Management

The profound changes experienced by the public administration, in the last twenty years, have been closely correlated with the economic and social phenomena, a process that can be followed from several perspectives (Calogero, 2010):

a) *managerial perspective*, by focusing public systems towards the use of new principles and instruments in the process of organizational, managerial and information system change;

b) *political perspective*, through which the public sector is directed towards new forms of legitimation;

c) *legal perspective* through which the public

* Senior Researcher III, PhD, Institute of National Economy, Romanian Academy (e-mail: florinapopa289@gmail.com).

sector is oriented towards the introduction of a new legal framework, which should correspond to the new conditions generated by the socio-economic changes in the society.

This reform process is based on the particularities of the New Public Management, as observed by various theorists.

Characteristical, in the case of the New Public Management, is the interaction of the reform procedures, which aim at reducing the governmental costs, by orienting towards privatization and incentive the competition in the offer of services.

The speciality literature refers to *two basic principles* of the New Public Management: the managerialism and market orientation, each with characteristic features.

Managerialism emphasizes the administration authority of managers, the exercise of an effective control of work techniques and, according to Pollit (1993, 2-3)[1] *is characterized* by: increasing efficiency; use of advanced technologies; emphasis on increasing labour productivity, implementing participatory, professional management; managers' freedom to lead.

It, also, seeks to reduce bureaucracy, considered, also, by Weber, as a danger to parliamentary democracy. (Nesbitt 1976)[2].

The principle of ***market orientation*** is based on the indirect control, on the need for adequate managerial motivation (incentives, commitments) and refers to *characteristics* such as: increasing quality; emphasis on devolution, delegation; orientation towards market principles, contracts achievement, competition, measurement of performance dimensions, control fulfillment.

The introduction of market processes means increasing accountability, efficiency concerning services delivery and attention to consumer satisfaction.

Thus, the managerial principle aim at control and correct the growth adjustment of bureaucracy, without rejecting it;

The second principle emphasizes on the market mechanisms and discipline, it forms into an alternative to a hierarchical structure of bureaucratic model.

Thus, by the various market techniques adopted for the purpose of reconsidering the state bureaucracy, based on the business organizations, move from hierarchical authority to contracts, tender procedures and market discipline.

The use of private sector tools in public administration does not assume removing bureaucracy, but only eliminating some elements of it that prove inopportune or unproductive for public administration.

Also, characteristical for the New Public Management is the separation of the political segment from that of management, politicians having the role of decision-making on major managerial objectives and not that to care about the current operational activities.

An approach in which the emphasis is on the business side of public management, called by Van Helden (1994, 11) "making use of business economics principles"[3], is characterized by improving efficiency and effectiveness in the fulfillment of public service, by using market tools, results-based management, decentralization of responsibility.

For Pollit and Bouckaert (2004, 6)[4], the public management reform ensures the fulfillment of several objectives, whereof:

- saving public expenses;
- increasing the quality of public services;
- increasing the efficiency of governmental actions;
- favorable perspective concerning the effectiveness of the implemented policies.

A number of features of the New Public Management have been identified by specialists, in several ***theories and school of thought of public administration***, as seen below (Gruening, 2001):

Budget cuts - expenditure constraints - necessary in the event of scarce financial resources.

Privatization - rational administrative structures - include the theory of public choice, the neo-Austrian school and the theory of property rights, but also in the field of rational management (Drucker, 1968)[5].

The separation of the provision of services from their production is based on the Ostroms' studies on the model of a polycentric administrative system and Drucker[6].

Contracting highlights aspects of a rational and human resources-oriented management. It has as elements of influence, the economics of transaction costs and the theory of public choice (for example, Niskanen)[7].

Taxes applied to consumers are identified, in the opinions of scientists who have studied the theory of public choice, in the elements of consumer marketing (rational management). In the marketing studies there are aspects related to the client concept, whose elements, such as one-stop shops or management of cases, derive from the organic management and the New Public Administration.

Competition is encountered in the *theory of public choice*. It is the result of organic management models, when it has effects of stimulating and motivating departments within an organization (internal

[7] Gernod Gruening, 2001, pag. 16, quotes Niskanen.

competition). Gives managers, flexibility in management decisions.

The separation of politics from administration is present in the progressive thinking and classical public administration, in political analysis but also in some branches of public management.

Decentralization appears in neoclassical thinking, the theory of public choice, the economics of transaction costs and the New Public Administration and its successors.

Responsibility for obtaining performance, present in the school of classical thought, of public organizations, neoclassical public administration, political analysis, rational public management, but also in techniques for performance measurement and accounting. It may also contain elements of reform in the *financial management and performance auditing*, with a focus on rational public management that takes over elements from the private sector.

Strategic planning and management styles that have undergone changes highlight aspects of bureaucratic and rational public management, the emphasis being on the difference between the transition from bureaucratic management to the rational one and from he rational management to that of human resources. These elements are also found in the principal-agent theory.

Legal budgetary constraints are constitutional formulations of public choice theoreticians (Buchanan)[8].

Improved regulation is found in the theory of property rights and the theory of public election regulation (especially, Stigler, 1971 and the Chicago school)[9].

The rationalization of jurisdictions and the streamline of administrative structures can be found in classical administrative theory and progressive thinking, and will be used by followers of neoclassical theory, political analysis and rational public management.

Democratization and increased citizen participation are identified in the New Public Administration and its subsequent approaches.

The OECD Report (OECD, 1998)[10] points out the following ***features*** of the New Public Management:

- *Focus on results* translated by: efficiency and effectiveness in delivering quality services and obtaining real benefits by users;
- *Decentralized management*, whereby to ensure a correspondence between authority and responsibility, wherewith the allocation of resources and the provision of services to be achieved closer to the delivery point;
- *Greater customer orientation*, meeting preferences by forming a competitive framework between the public sector and the private sector;
- *Greater possibilities for cost efficiency* in the delivery of public services and public regulations, use of market techniques (for example: user fees, vouchers, sale of property rights);
- *Responsibility for achieving results* and risks-taking, through risk management.

Calogero M. (2010) groups a number of ***essential features*** of the New Public Management, into three important classes (Osborne and Gaebler, 1993, p. 277)[11]:

- Restoring the borders between the state and the market through privatization and outsourcing.
- Restructuring the public sector, at macro level, by delegating state functions to lower organizational levels (also called institutional decentralization).
- Restatement of the operational rules by which the public sector exercises its functions and achieves the proposed purpose. This side, in turn, includes other elements:
  - making relations between the public sector and the private sector, more concrete, through formal privatization, respectively, the transformation of the state economic bodies into joint-stock companies.
  - functioning of public administration activities, based on some market techniques;
  - competition within the public sector;
  - devolution of functions and competencies from the central level, to the lower organizational levels, within each entity in the public sector (internal decentralization);
  - reforming public administration, by the transition from the traditional bureaucratic model (with formal structure) to the managerial one which requires the efficient administration of public resources (Matei, 2009b, p. 146)[12];
  - deregulation of the functioning of economic and social systems;
  - re-defining the roles and rights of citizens.

The New Public Management transfers the emphasis on traditional public administration to public management (Larbi, G. A., 1999)[13], determining the orientation towards managerialism. Thus, the old form of public organization and provision of public services, based on bureaucratic principles, planning, centralization, direct control and autonomy, is replaced by a market-oriented public service management.

3. Directions of action of the New Public Management

The New Public Management can be considered as an overall change, oriented towards convergence, towards new modes of governance, in a limited variety, in each model, the component variables interacting, respectively (Calogero, 2010):

- specific components that are found in each model, having a certain order of priorities;
- speed of reform propagation;
- the internal and external environment that determines the conditions for achieving the modernization process;
- the form of approach chosen for each model.

According to H. Wollmann[14], the orientation is towards giving up the Weberian approach of the organization of public administration, considered rigid and the implementation of the rules of managerial reform (Świrska, 2014).

The New Public Management paradigm suggests reducing the size of the government and its role, removing bureaucracy, decentralization, privatization, adopting market principles in public service delivery, emphasis on accountability and performance. There are principles that oppose the characteristics of traditional administration regarding the conditions of employment and promotion, their indeterminate nature, excessive bureaucracy, traditional form of accountability, unfavorable elements for achieving performance (Hughes, 2003)[15].

The implementation of the reforms of the New Public Management is supported by a series of practices, expression and consequence of its characteristics, as they were signaled and argued in a series of works of some authors.

➢ The main directions of the New Public Management resulting from managerialism are decentralization, deconcentration and reconsideration of the size of public services (Mellon, 1993; Hood, 1991, Ferlie et. al., 1996)[16]

In the context of decentralization, the tendency to eliminate bureaucracy in the provision of public services (Ingraham, 1996: 255)[17] leads to increase in managerial and economic-financial autonomy.

Among the elements that belong to decentralization, related to the New Public Management, are important (Androniceanu, 2007):

- *Reconsideration of traditional public bureaucracies* of large dimensions, in the form of executive agencies (Pollit, 1994; Pollit and Summa, 1997; Kanter, 1989)[18]. This involves managerial autonomy and skills in developing some contractual relationships with central departments and other agencies, outside the traditional hierarchy. Thus, this create a move away of governement, from public services, as well as a flexibility in the exercise of human resource allocation management and an increase of responsibility in achieving results.
- *Budgeting and financial control* involves the creation of executive agencies, respectively, budget centers or payment units. Managers have the freedom to manage income freely and the responsibility to control their achievement (Kaul, 1997; Walsh, 1995)[19].
- *Organizational division* refers to the replacement of vertically integrated hierarchies with flat organizational structures, considered efficient (Ferlie et. al., 1996; Pollit, 1994)[20].
- *The reorganization* allow for a decentralized public management, through reorganization, rationalization and restructuring of the public sector, so that public services ensure an increase in the degree of satisfaction of customer requirements, from the perspective of quality, price.
- *Distinction between the processes of services fulfillment and that of their delivery ones*. It consists in the delimitation the production of public services - in which the direct supplier intervenes - and the payment of their supply system, through the intermediate provider.

➢ According to the opinions of Dunleavy et al. (2006)[21], the New Public Management *reform directions* emphasize disaggregation, competition, performance stimulation. In this context, Lane (2000)[22] insists on the form of *contracting*, different from the one practiced in the traditional administration. Contracts are short-term, their objectives are in line with market activity, favour the competition and market

mechanisms penetration, a situation distinct from that of the public sector, where contracts are long-term.

➢ Hood (1991)[23] indicates seven *directions of action*, in the implementation of the New Public Management reform.

− ***Professional management*** In the exercise of their activity, the attributions of the managers are distinct from those of the civil servants.

Managers:

− have the authority in decision-making and responsibility for results achievement;

− are invested in function, by the authorities, ensuring the achievement of a managerial program, with objectives and indicators;

− are accountable to the authority that appointed them and ensure the transparent nature of information to citizens, in order to carry out policies.

Civil servants - exercise their function, but they cannot have opinions or decision-making power for the policies they promote.

− ***Establishment of some performance indicators, with clear standards***. The indicators refer to the implementation of programs and the measurement of results, taking into account of standards that establish the minimum or maximum levels to be obtained.

− ***Control of results***, ***foremost and less of procedures***. Agencies can decide on the budget and human resources, with an emphasis on measuring results.

− ***Dismantling the public service and creating specialized agencies*** It refers to the fragmentation of some large departments within the ministries, into small dimensions agencies:

− have leading autonomy, having their own budget within the department;

− may have contractual relations with the hierarchical authority, in the delivery of services.

➢ According to the OECD Report (2002)[24], under contractual relations with the guardianship authority, their accountability is contractual and not administrative.

− ***Introducing competition in the public sector*** Under the conditions of specialized agencies and skilled labor, contracting favours competition achievement, as the government can select the most cost-effective options. Competitions between agencies concerning service delivery and, also, on the labor market, in employee promotion are stimulated. Thus, the market forces regulate the quality, quantity and price of services offered, based on competition.

− ***Management arrangements specific to private management*** Involves the practice, in the classical administration, of organization activities of work, according to the methods of the private sector: negotiating employment contracts, at hiring staff, evaluating results, as well as remuneration depending on performance.

− ***Saving the use of resources*** The optimal use of resources implies the orientation towards the fulfillment of the objectives, so that the expenses to be motivated by the benefits brought.

➢ Other ways of reform, through the New Public Management, according to the OECD Report (1993)[25]:

− Dissociation, fragmentation of authority and responsibility at the local level, as a result of decentralization; the advantages lie in the possibility of reducing expenses, of a better knowledge of citizens' requirements and, respectively, setting targets, dependent on their preferences.

− Privatization of large public enterprises (national companies, autonomous companies), to increase the efficiency of their activity.

➢ Other authors have grouped the directions of action of the New Public Management, in categories of functions, as presented in the table below (Table 1):

Table 1 Grouping, by functions, the directions of action of the New Public Management

Function	Directions for action
Strategic	⇒ Management of results ⇒ Strategic planning ⇒ Privatization of public enterprises, outsourcing of activities ⇒ Achievement of public-private partnerships ⇒ Implementation the separation of political function from the administrative ones ⇒ Deconcentration/decentralization ⇒ Use of information and communication technology ⇒ Removal of bureaucracy
Finance	⇒ Deficit reduction ⇒ Budgeting based on programs

[23] Hood (1991) quted in *Noul Management Public – Premize*, https://www.scritub.com/management/Noul-Management-Public-Premise3274217.php.

[24] Raportul OECD (2002), quoted in *Noul Management Public – Premize*, https://www.scritub.com/management/Noul-Management-Public-Premise3274217.php.

[25] Raportul OECD (1993) quoted in *Noul Management Public – Premize*, https://www.scritub.com/management/Noul-Management-Public-Premise3274217.php.

	⇒ Greater transparency in accounting
Marketing	⇒ Marketing development, in the public sector (markets, polls, consultations) ⇒ Use of information and communication technology
Human resources	⇒ Reducing staff ⇒ Accountability, but also the motivation of officials ⇒ Increasing participation, through employee initiatives

Source: Amar Anne and Berthier Ludovic (2007), p. 4, "Le Nouveau Management Public: Avantages et Limites (The New Public Management: Advantages and Limits)", *Gestion et Management Publics*, vol.5, Décembre quotes Laufer et Burlaud, 1980 ; Hood, 1991 ; Pollitt et Bouckaert, 2000 ; Gruening, 2001.

The diagram above shows that the New Public Management is transdisciplinary, manifesting itself, simultaneously, through the four functions (strategic, finance, marketing and human resources).

The process of the New Public Management determines the state to decide on the role and missions it has, respectively, those that it has to ensure, directly, those that can be delegated or transferred to private agencies or enterprises, as well as those that can be organized in partnership with the private sector (Amar & Berthier, 2007).

4. Conclusions

The new current of thinking meant a new form of approach to administration and public management, an attempt to change and move from the bureaucratic traditions, of hierarchical organization, to fostering of new practices of management, adapted to the requirements of the market economy, with an emphasis on competition, delegation, performance.

There is, thus, a shift in the operating methods of public sector organizations; another form of relationship among government, public service and citizen is created.

The formula of the New Public Management suggests the reduction of the dimension of government and its role, removing bureaucracy, the decentralization, privatization, the adoption of market principles in public service delivery, emphasis on responsibility and performance (Kalimullah, Ashraf, Nour, 2012).

The purpose of the changes is for the methods and techniques adopted, to generate the reform of public sector organizations, increase their competitiveness and efficiency, in the use of resources and the provision of services. (Katsamunska, 2012)

THE LABOR MARKET DURING THE MEDICAL CRISIS

Carmen RADU[*]
Liviu RADU[**]

Abstract

This article aims to analyze the current situation in the light of the way of managing human resources under crisis conditions, on the one hand, and of the way of adapting labor resources to the new conditions, on the other hand.

The national and European welfare depends on the way people adapt themselves or are helped to adapt to the economic and social environment imposed by the new living conditions. We find ourselves in the midst of a crisis imposed by the pandemic that broke out in December 2019 and unfortunately, far from being resolved too soon, given the emergence of new mutations of the virus. Given this socio-economic situation, we intend to sum-up the way in which human resources have been affected and changed and how they have succeeded or not in adapting to the new working conditions.

We will consider the analysis of the evolution of the government policies on the wage system, the conditions of compensation during the non-working period, the health system and the way the reforms in industry, education and health are taken over.

Keywords: *human resource management, structural reform, health system, social security, public policies.*

1. Introduction

The health crisis caused by the COVID-19 pandemic and the impact suffered by a sudden and almost generalized deterioration of the macroeconomic context and the business environment, have severely[1] affected the extremely fragile balance of the global labor market. It can be said that the enablers of supply and demand of labor have undergone unexpected mutations and transformations.

Abolition of global value added chains, total or partial closure of international trade flows and borders, temporary bans on economic activity in most sectors, hygiene and social distancing rules, restriction of the right to leave home, except in well-defined situations, bans on leaving localities and in some cases even quarantine of localities, punctual opening of air and ground transportation lanes for seasonal work and offers that sometimes came unexpectedly from EU Member States, etc. are just some of the factors with significant influences.

These factors have affected, especially in Romania, all members of the society, not only those active with legal forms on the labor market or operating in a "gray" area of it, but also important segments of the population dependent on them.

The Romanian labor market which is not limited only to the processes specific to employee turnover, has also particular features, in addition to the general features of market employment condition. The peculiarities lie, on the one hand, in the structure of the economy and, on the other hand, in the level of its development. In this background, two important aspects emerge, respectively:

- high share of unpaid activities, directly on a contractual basis, respectively of family workers
- high share of wage labor without written and registered labor contracts, namely informal and untaxed wage labor.

Statistics show that these categories of employed persons, along with self-employed workers, are the categories most vulnerable to the crisis, but also the categories often neglected in public strategies and policies to mitigate the effects of the health crisis. In what concerns social services, the opinions expressed by Robert Palacios and David Robalino can also be take into account and by analyzing the ways to reduce labor market distortions[2], who argue that the integration of the social benefits and social services systems is becoming more important given future characteristics of labor market, where jobs will be maintained by requiring a low level of qualification and even subsistence.

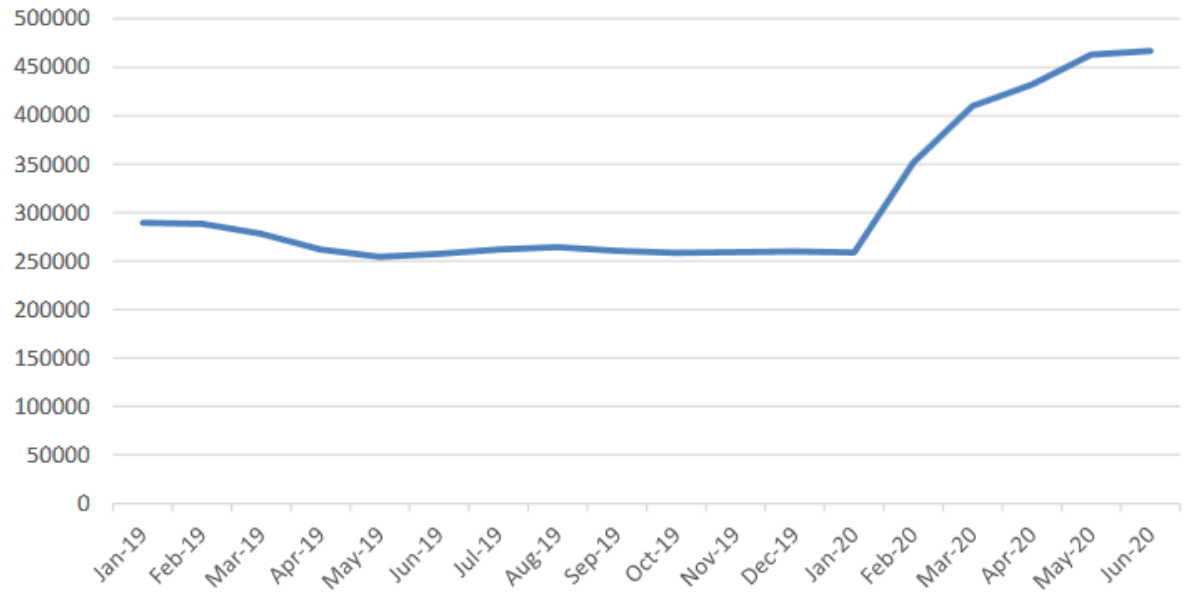
2. The reaction of international bodies and national governments to health crisis. The first lockdown (February – May 2020)

A study of the International Labor Organization shows that concerns are mounting about the disproportionate impacts of COVID-19 on more vulnerable groups, persons with informal jobs, those[3] in occupations and industries most affected. Furthermore, it should also be noted that the classic form of employment, respectively wage labor within companies, entails a variety and complexity that require appropriate approaches to each category.

Furthermore[4], recent conclusions of the European Commission on the impact of Covid19 on the labor market highlight a series of aspects that could also be identified in Romania. Among these, we mention that the following are important from the perspective of future developments on the Romanian labor market:

- it is difficult to make long-term forecasts, especially in terms of adverse externalities on the labor market, due to the fact that the prolongation of the pandemic will exacerbate the shortage of the medical staff;
- the already precarious employment will be increased, especially for the areas of activity with high risk of labor contagion. On the other hand, the space for promoting policies to mitigate adverse effects will be narrowed, especially due to insufficient financial resources.

Chart 1: The evolution of the unemployment index in Romania – January 2019 – June 2020



Source: https://ro.gigroup.com/wp-content/uploads/sites/12/2020/09/Impactul-Covid-19-pe-piata-muncii.pdf

As we can see in the previous chart, if in January 2019 the number of unemployed was less than 300,000 persons, representing 3.32%, it can be ascertained that in June 2020, the number of unemployed increased substantially under the pandemic conditions, by reaching almost 500,000, respectively a percentage of 5.2%.

Throughout 2019, the increase of the unemployment is almost linear, starting from January 2020, a steep increase is recorded in January – March.

Two important aspects[5] are highlighted by the European Commission in this stage analysis, namely: on the one hand, the risk of increasing development/relaunch divergences between Member States if national policy responses are not sufficiently coordinated or if there is no strong common response at EU level, respectively an incomplete recovery in one country would spread to all the other countries and would die out the regional economic crisis; on the other hand, the pandemic period could trigger more drastic and lasting changes in global value chains and international cooperation, which would adversely affect the labor market especially of open economies, less developed and heavily dependent on the international trade, such as Romania.

Table 1 Worldwide impact of health crisis on areas of activity

IMPACT	low	medium - low	medium	medium - high	high
ACTIVITIES	health and social services	agriculture	constructions	art and entertainment	accommodation and food services
	education	breeding	financial activities	recreational activities	real estate and commercial activities
	public administration and defense	fishing	insurances	transport	manufacturing and retail trade
	public services	forestry	mining	communications	means of transport repairs

Source: Organizaţia mondială a muncii, apud – https://ro.gigroup.com/wp-content/uploads/sites/12/2020/09/Impactul-Covid-19-pe-piata-muncii.pdf

According to the International Labor Organization (ILO)[6], the isolation measures that were to be adopted as a result of the emergence of Covid-19 already affected almost 81% of the global labor force, respectively 2,700 mio workers. Notwithstanding, the impact varies greatly depending on different sectors of activity. If we take a look at the report prepared by the International Labor Organization (ILO), the impact of Covid-19 crisis is estimated to be low in the sectors of health, public administration and defense, education and public services; low – medium in agriculture, breeding, fishing and forestry; and medium-high in constructions, finance and insurance activities, as well as in mining. On the contrary, the sectors where the impact will have a high level will be those in connection with arts, entertainment, recreation and transport; while the sectors that will see dramatic declines will be those that include accommodation and food services; real estate activities, administrative and commercial activities; manufacturing industries, retail trade, as well as those dedicated to vehicle repair.

In general terms, this crisis has shown us the importance of the digital transformation and the actual need of all those companies that have not started the digitization processes to start them as soon as possible. The labor world is immersed in a process of irreparable change where the experts of digital marketing, online training, data analysis or experts in cybersecurity and in various areas of health can find a wide range of possibilities. For many others, the time to reinvent themselves has come. In fact, according to the competence forecasts of the European Center for the Development of Vocational Training, in sectors with medium-high and high impact of the coronavirus on the economic activity, between one fifth and a quarter of new jobs expected to be created until 2030 bear the risk of being automated.

According to the data of the International Labor Organization Observatory, young people have been more affected by COVID-19 crisis, by suffering its consequences in several areas: the interruption of the educational or vocational training program, due to the loss of jobs and, consequently, of income and greater difficulties in finding a job. Specifically, as reflected in ILO statistics, a total of 178 mio of young workers worldwide, in proportion, more than four out of ten young people employed worldwide, have worked in the sectors most affected by the crisis. On the other hand, both technical and vocational education and on-the-job training have been severely affected, especially in what concerns younger population. According to a recent joint survey conducted by ILO, UNESCO and the World Bank, approximately 98% of the technical and vocational training centers have partially or completely closed their centers. Although there are some programs that have been able to continue online, there are many others that, either due to lack of resources or impossibility, given the high practical content, it has not been possible to continue their work. A new global survey conducted by ILO together with several partners of the Global Initiative on Decent Jobs for Youth, shows that more than one in six young people interviewed have stopped working due to the employment crisis caused by COVID-19. For youths who kept their jobs, their working hours decreased by 23%.

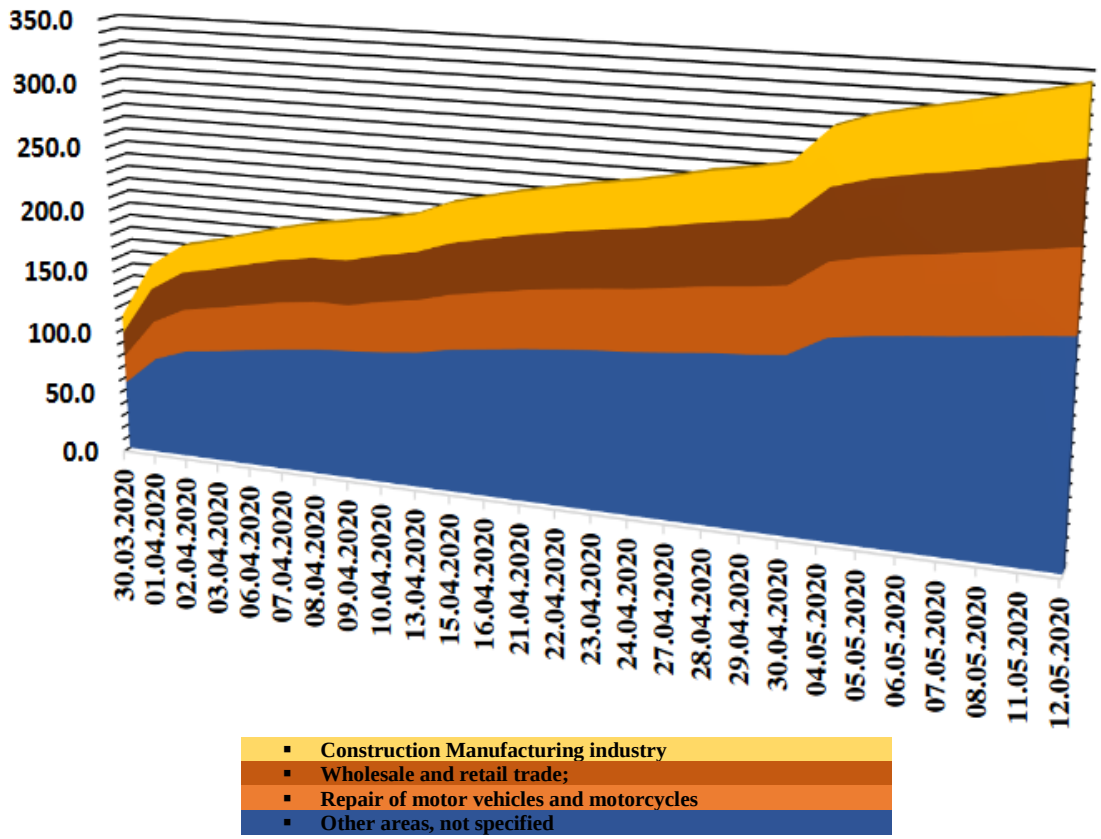
The organizations and professionals face constant changes that require new ways of thinking and acting. In an ever-changing future, the agility seems to be the key to success. But it is important to wonder what agility means for a company? It is not enough to use certain agile techniques or methodologies, the real confrontation goes much further: it entails giving continuous value to the customer, in addition to empowering people to work more collaboratively, efficiently and in a more stable environment. Placing people at the center, making them real managers of change. This implies the need to change the way of

[6] https://ro.gigroup.com/wp-content/uploads/sites/12/2020/09/Impactul-Covid-19-pe-piata-muncii.pdf

thinking within corporate culture. In this background, temporary work companies and service outsourcing companies are real drivers of the economy, as they facilitate the flexibility needed by the organizations which have seen their scenario changed overnight.

According to the analysis performed by ILO, at the international level, the most affected activities were accommodation and food services, while according to the analysis performed by the Ministry of Labor and Social Protection[7], the most affected activities in Romania, between March – May 2020 were construction and manufacturing.

Chart 2: The distribution of terminated labor contracts per sectors of activity, in Romania 30.03.2020 – 12.05.2020 thousands of employment contracts



Source: https://mpra.ub.uni-muenchen.de/101676/1/MPRA_paper_101676.pdf

3. National measures to control and prevent the effects of the pandemic

All the states of the world[8], followed quickly enough by Romania, adopted budgetary, political and liquidity measures to increase the capacity to respond the adverse effects entailed by the pandemic. The main concern was to keep the income of the population at a certain threshold that would not allow a drastic decrease in living standards.

By means of Law Decree no. 18/2020, Italy approved social depreciation measures to compensate income reduced as a result of the downturn in economic activity.

Germany launches the largest package of economic recovery measures, aimed mainly at supporting enterprises. Furthermore, a separate aid fund has also been set up for medium-sized enterprises and self-employed workers.

In Belgium, self-employed workers who can demonstrate that their activity was affected during the pandemic by having their income reduced, they can claim a reduction of the taxes to be paid and can benefit from payment deferral or exemption of social security contributions.

In the US, the aid program includes funds for households, loans for SMEs and large companies. Obviously, in addition to these, substantial funds have been allocated in the health sector. Furthermore, the amount of $ 1,200 was granted to each person earning

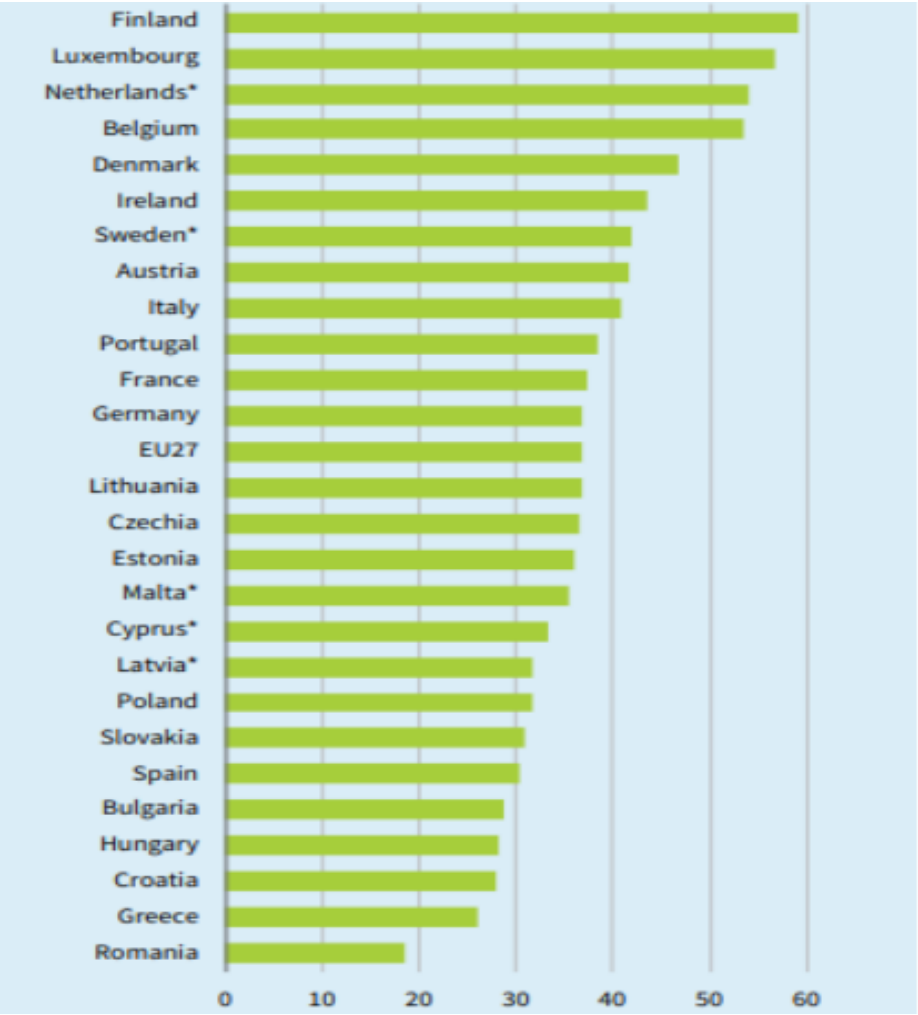
[7] http://mmuncii.ro/j33/index.php/ro/comunicare/comunicate-de-presa/5951-situatia-contractelor-individuale-de-munca-suspendate-incetate,-la-data-de-20-mai-2020.

[8] Labor market vulnerabilities under the COVID-19 impact in Romania, Luminița Chivu and George Georgescu June 2020 MPRA Munich Personal ReEcArchive.

less than $ 7,500 per year. Unemployment benefits are increased by $ 600 per week. In France, 100% of the technical unemployment benefits are paid by the state, and payments for social security contributions and taxes were deferred from payment.

In Spain, a guaranteed minimum income is introduced to compensate for lost income.

Chart 3: Proportion of workers who started teleworking as a result of Covid – 19 by country (%)



Source: https://www.eurofound.europa.eu/publications/report/2020/living-working-and-covid-19

In our country, the way to support technical unemployment both for employees with labor contracts and for liberal professions and self-employed persons was established by means of GEO 30/2020. Furthermore, certain monthly expenses were rescheduled/deferred, mainly those for utilities, such as reduction/cancellation/exemption of budgetary obligations. The Government has adopted the measure of granting tax breaks for those who pay taxes within a certain period of time.

Globally speaking, in relation to the number of active employees on March 30th, 2020, namely 5,569.6 thousand persons, between March 30th, 2020 and up to date, under the impact of the crisis, there is a dramatic increase in the number of terminated and suspended labor contracts. As we have already pointed out, areas such as manufacturing, wholesale and retail trade, construction, vehicle repair and hospitality industry are constantly among the activities with the greatest number of suspended labor contracts, with all the activities related to them both upstream and downstream. Those who have gone into unemployment are constantly suffering from serious financial insecurity, thus entailing increased social protection measures[9].

In Romania, there are 1.5 mio employees without labor contracts. Many of them work either for natural persons or carry out daily work. This category also includes work under the table, undeclared and untaxed work. The lack of labor contracts means that these persons cannot benefit from technical unemployment. In 2017, in Romania, there were 7 million persons at risk of poverty and social exclusion, but after the impact of the pandemic their number increased

[9] Eurofound, Living, working and COVID-19 First findings, April2020.

dramatically. Among those affected, the largest share is represented by young people aged between 25 and 49, namely exactly those who could work. An alternative to the termination or suspension of the labor contracts is represented by the work from home or telework.

Work from home[10], long considered an advantage in the benefit packages of top employees, is starting to gain ground within more and more companies the business of which allows this. But for the employees who, due to the specific of business, cannot work remotely, the impact of the pandemic has added an excess of stress due to health risks. On the other hand, the work from home brings into question the impact on labor productivity, from the perspective of the employer, respectively on the employees' motivation and general well-being. Furthermore, even those who have benefited from this possibility have considered that, over time, labor productivity decreases substantially. On the other hand, the work from home raises a series of challenges.

Eurofound Report "Living, working and Covid – 19" published in April 2020 states that 37% of human resources in the European Union worked from home during the period with the most drastic restrictions in the health crisis (chart 3). On this background, Romania had a percentage of 30% activity from home – below the European average, being very far from the leaders of work from home (Nordic countries – 60% and Germany, France or Italy). This fact indicates that Romania is not well prepared entering the digital era.

Table 2 Flexible working hours and supportive work from home for parents

How will you properly manage workforce planning to continue work during the pandemic[11]?	By flexible working hours and/or work from home	79 %
	By granting leave to less busy employees during this period	38 %
	By alternative leave of employees with children	25 %
	By communicating in advance, for a longer period, the days of leave to be requested by employees	21 %
	By financial incentives to remain totally and / or partially in activity	11 %

Source: https://www.pwc.ro/en/PeopleandOrganisation/Raport-HR-Barometru_Martie-2020.pdf

Along with this, the closure of schools and the relocation of classes into the online environment has added extra emotional and logistics pressure for employees in families with children. The work-family balance was strongly marked by the most common form of challenge, working from home. For employees without children, the lack of social interaction, imposed by the telework, represented the second common challenge. The employers consider and try to compensate for the psychological effects of work transformation by moments of online socialization, well-being and mindfulness programs. Obviously, the great fear of employees is related to the decrease of income due to the severe economic downturn. As the entertainment related fields and HoReCa field substantially reduced the activity and the number of employees, production, logistics and retail jobs began to expand. However, it is wrong to look at the labor market only from the perspective of big cities. For large companies, the process of transferring activities in the digital area is one of the strategic objectives in banks, financial services, FMGC (Fast Moving Consumer Goods), logistics. For these, the location in areas close to the cities but affected by the lack of staff, the pandemic can add extra opportunity by the possibility of getting out of the localization bubble and widening the pool of candidates, already over-requested in big cities. Therefore, companies can expand their recruitment area in small and medium-sized cities. Companies such as IT, BPO or call-center can hire candidates located outside their usual area. Therefore, for employees in small urban area, there may be the opportunity to access large companies, for which it was necessary to change their address to big cities.

At the same time, small and medium-sized companies, the financial flows and domestic processes of which are not as organized as in case of large companies, try to survive by having the advantage of flexibility, but the disadvantage of the employees' lack of experience adds extra pressure on existing employees. In rural areas, the pandemic has rather generated modifications in the field of logistics, due to the need to change transport flows to and from work. The changes in the workflows of companies, caused by digitalization, which is often forced, along with the emotional pressure of health risks already have a strong impact on employees' motivation. On this background, many people working in a certain field are seriously considering changing jobs after a year of pandemic.

[10] Market study conducted by Happy Recruiter.com through Dora, the recruitment robot, on a national sample of over 2300 persons.

[11] HR Barometru – PwC Study (March 23rd -26th 2020), based on data from 91 companies in Romania. The scope was to provide up-to-date data on the impact of COVID-19 virus on human resource management policies.

4. Conclusions

A peculiarity of Eastern European countries, including Romania, is represented by the massive influx of emigrants returning to their countries of origin.

After the outbreak of the pandemic and up to date, workers who went to work in Western countries tend to return home. The austerity measures imposed in developed European countries discourage the desire of those working in the respective countries. In Romania alone, over one million people returned in the first months of 2020[12]. Many of these persons return permanently, not wanting to leave for a long time. If the Romanian authorities succeeded in managing this wave of unemployed people, by directing them to the labor market, we could reduce quantitative and qualitative gaps in human resources. The sectors that require less skilled labor force, such as agriculture or food industry, could absorb the exodus of migrants. Otherwise, there will be great tensions on the labor market with severe economic and social impact.

Alongside these issues, the existing employees faced the obligation to comply with hygiene measures and social distancing, change of work regime (telework) and worst of all, termination or suspension of a large number of individual labor contracts.

In Romania, in addition to the affected employees, the labor market faces three more categories of issues:

- the high share of activities which are not directly paid, namely family workers;
- high share of wage labor without registered labor contracts, namely informal and untaxed wage labor;
- self-employed workers.

These categories severely affected by the crisis, are often neglected by public strategies and policies within human resources.

The persons who have gone to work abroad and returned to the country along with disadvantaged persons are categories extremely exposed to the current crisis. Furthermore, in Romania, as in case of other East-European states, low-skilled persons are not found in state aid schemes. This shock on the labor market will cause resonance waves in all sectors of the national economy. Romania is threatened by the decrease of the country rating granted by the international agencies. A potential transition to the junk category (not recommended for investments) would lead to a sudden and significant increase in the costs of financing the budget deficit and refinancing public debt.

Notwithstanding, according to the study of the Romanian Academy from the first part of the health crisis called „Punct de vedere: România în și după pandemie" (Point of view: Romania in and after the pandemic), considers a series of economic and social recovery measures[13]. These measures focus mainly on the following issues:

- reconsideration of the economic and social role of the state and of the public-private partnership. During the pandemic, it has been demonstrated that the appropriate government intervention can mitigate the adverse effects of the crisis;
- mindful investigation of the issued related to population migration and alarming decrease in the number of jobs in certain geographical areas;
- ensuring the necessary premises for the relaunch of the economy starting with the improvement of the population health condition;
- mindful capitalization of all opportunities granted by the European Union for the economic and social development of the country in the medium and long term;
- commissioning of the national strategy for sustainable development by 2030 starting from the reduction of social inequity and extreme poverty;
- set up a governmental commission for the analysis of the way of managing the bank capital, intended to cover the interest rate, the facilities for the grace period and the repayment of loans, interest subsidy, etc.

These measures emerge on the background of an optimistic situation expected by the European Commission which, in 2020-2021 winter economic forecasts[14] published on 11.02.2021, projects the following:

- the euro area economy will grow by 3.8% in both 2021 and 2022. The forecast projects that the EU economy will grow by 3.7% in 2021 and 3.9% in 2022;
- the euro area and EU economies are expected to reach their pre-crisis levels of output earlier than anticipated in the Autumn 2020 Economic Forecast, largely because of the stronger than expected growth momentum projected in the second half of 2021 and in 2022.

At the time of documenting this material, the world is facing the third pandemic wave. Notwithstanding, the European Commission considers that, after an economic contraction imposed by measures to limit the spread of the virus, the economic growth is to be resumed in summer and accelerated as national vaccination programs advance. The improvement of the world economy perspectives which comes to support the economic recovery is also expected. The economic impact of the pandemic remains uneven from one EU Member State to another, which means that the pace of recovery also varies significantly. In respect of the above, the European Commission has activated, for the first time, the general derogation clause of the Stability and Growth Pact, as part of its strategy to respond quickly to the epidemic

caused by coronavirus. This measure allows national governments to provide a better support to their own economies, as budgetary regulations have been much relaxed. On this background, on 30.03.2021, the European Commission adopted a communication providing EU Member States with general guidance on budgetary policy for the following period. The derogation clause proposed by the European Union is extended until 2023.

SECTORAL POLICIES IN THE POST-COVID-19 PERIOD

Emilia STOICA*
Liviu RADU**

Abstract

National economies, but also the global economy as a whole, face major challenges caused primarily by the effects of the corona pandemic, to which are added factors that stimulate destabilizing trends in the value chain in the international economy: a new industrial revolution in the digital age; accentuation of nationalism and, implicitly, of protectionism; the urgent need to protect the natural environment, etc.

In a such unstable economic and social situation, the policies and programs developed and implemented by public authorities are crucial both for economic development and for improving the quality of life.

Public interventions of any kind: in the field of public finances; monetary policy; those aimed at investments; technical and technological progress, etc. will have to consider, on the one hand, the increase of the added value in the productive sectors of the national economy that present comparative advantage and, on the other hand, given equally important, to ensure the material, human, capital resources for this development, simultaneously with the appropriate satisfaction of life needs - food, health, education, services, etc. - of the population.

In this sense, the institutional sectoral structure of the national economy has always been, but especially in the present period, a major importance for policy makers, and sectoral prioritization in public policy interventions is a constant concern of the utmost importance for economic and social resilience of any country.

Keywords: *COVID 19 virus, pandemic, economic challenges, economic policies, economic crisis.*

1. Introduction

In each country, the coronavirus epidemic has highlighted weaknesses, sometimes large, in the economy and social life. The consequences of the spread of Covid-19 have manifested themselves not only in the unprepared health field - both in terms of providing adequate drugs and / or vaccines, but also in equipping medical centers with the necessary equipment - to solve the diseases.

All aspects of economic activity: production, distribution and trade, services, etc. - but also of social life: employment, education, social security, etc. - were affected due to the need to limit physical contacts, lockdown, complete cessation of activities.

The role of public authorities in overcoming the consequences of the health crisis and resuming the upward trend of economic growth is crucial, both for coordinating all activities and actors involved, and as the main participant in financing the planned programs.

Economic policies, both at macro, mezzo and micro level, will focus on two time horizons: one operational, respectively in the short term and the second in the medium and long term. Thus, in operational terms, public authorities will seek to eliminate the consequences of the pandemic, and in the medium and even long term will be developed and implemented strategies, plans and programs that lead to economic growth and social development, in conditions of protection and recovery of the natural environment - in a word, sustainable development.

At the macroeconomic level, a accommodative monetary policy is considered in the first place - such as lower active interest rates for individuals and enterprises, a lower minimum required reserve ratio (RMO), etc. - to stimulate domestic credit and, due to it, consumption and productive activity - the most important factors of economic and social development.

The second fundamental instrument of macroeconomic policy - namely fiscal policy - will play a major role in the post-crisis period. In this sense, the entire fiscal system: legislation, administration, control will have to exert less pressure on taxpayers (but not less vigilant), but at the same time increase the accuracy of the implementation of existing regulations, so as to significantly improve the functions of public finances - allocative and redistributive of public revenues - of the respective system.

Budgetary policy will need to be pro-active, with the main goal comprising two priority areas:

- health protection of the population, support of jobs and incomes of the population, prevention of discrimination and exclusion;
- public investments in priority economic and social infrastructure, through subsidies and other financial instruments addressed to specific economic-social and / or institutional sectors (according to the System of Accounts or National Accounts (SNA) , developed by the United Nations Organization (UN)

and which presents, for each state, the synthesis of the market economy).

It is necessary to specify the notion of sector. In the general sense, by economic or social sector we mean a specific field of activity, for example in the economy: industry, agriculture, construction, transport, tourism, etc., and in the social sectors: health, education, standard of living, etc.

In SNA, where we find the notion of institutional sector, the state of economic development of a country is described by statistical indicators of economic and / or social nature related to well-specified segments:

- the real economy sector (SQS - Companies and Qvasi-Companies), comprising all resident economic agents that achieve added value through productive activity;
- the "Households" sector, through which are registered both the incomes and the expenses made by all the resident families;
- the "Administration" sector, with its subdivisions "Public Administration" and "Private Administration". Very interesting for the analysis of the economic and financial governance being the incomes, the expenses and, obviously, the balance between them, as well as the modalities of covering a possible negative balance, in fact the public debt;
- the financial sector comprising credit institutions, insurance companies, securities exchanges, non-banking financial institutions, their primary activity consisting in collecting temporarily free cash of economic agents and redistributing them to fund seekers, be they individuals, enterprises or public institutions;
- the "Rest of the World" sector presents the commercial and financial relations of the national economy with private and public non-residents.

2. Public policies dedicated to the economic sectors

Public policies, after conducting a diagnostic analysis of the economic situation, based on both statistical information related to economic and social sectors and those provided by the SNA develop proposals for intervention in specific areas, specifying their goals and priorities for the chosen time horizon.

The sectorial policies constitute the individualization of the objectives included in the macroeconomic policy for each economic-social sector, highlighting the contribution of each field of activity to the fulfillment of the global objectives.

The concretization of the public policy for each economic or social sector takes into account the specificity of each field of activity, its weight in the added value at national level, as well as the technical and technological evolutions that must be accessed and implemented to face the exigencies imposed by the international competitive environment. .

The epidemic caused by coronavirus has spread worldwide, and its consequences have been felt not only in the field of health, but also in all sectors of activity, because limiting the spread of the disease has imposed unprecedented isolation measures. The so-called lockdown involved the complete closure of some activities - such as tourism and restaurants, bars, etc. - or partial, especially in industry, construction, transport, etc., which meant a decrease or even a total decrease in income from wages, with dramatic consequences for many people.

In this situation, public authorities are obliged to adopt measures to remove the consequences of the pandemic and, at the same time, to develop and implement appropriate policies to restore economic and social life to the pre-crisis situation and resume growth in all sectors of the national economy.

The impact of the health crisis on the entire economic and social life is wide, and to measure it with the most acceptable degree of accuracy it is necessary to develop studies based on credible statistical information and address the economic and social sectors that make up the national economy in a state. Thus, according to the specifics of each country, the areas that are subject to sectoral economic policies can be:

- energy - production, distribution and consumption - which can ensure the economic independence of a state;
- industry, with its sub-branches: extractive, machine building and light industry, the food industry, these being the ones that bring the highest net added value;
- constructions, a sector in which a large number of people are employed, many of them having a lower qualification;
- road, rail, sea and air transport, which is a vital sector for the economy of each country;
- services, whose importance is constantly growing, as technology and the adoption of the digital economy;
- agriculture, which provides vital products for the population, etc.

To the policies dedicated to the economic sectors are added the sectorial policies in the social fields: health, education, social protection, etc. which are, especially because of the current crisis, in the attention of all public authorities.

In the post-pandemic period, government authorities - which have a key role both in implementing the so-called resilience program, i.e. to counteract the shocks that the community feels in all aspects of economic and social life and return to the situation before the pandemic, and for elaboration and implementation of the macroeconomic growth policy - faces several challenges:

- rapid technical and technological advance;
- correlating the opening of international commercial markets with investment activity, as well as with labor markets - creating jobs and adjusting their

characteristics to the specifics of their services and locations;

- adapting education systems and programs to the needs of the labor market and to the imperatives of local development;
- stimulating the penetration of information and communication technologies (ICT) in the sphere of production and services, favoring research and development (R&D) activities in all fields;
- the increasing globalization of services and activities of manufacturing industries.

The share of services in the national GDP signifies the structural transformations of the national economy specific to a post-industrial period. Although the net added value resulting from services is lower than in productive activities, the competition between service companies, amplified by the expansion of globalization, determines to a large extent the widespread introduction of ITC, the immediate consequence being the increase of labor productivity.

3. Economic sectors of the national economy

3.1. The influence of the sectoral structure on the economic performance before the pandemic

Analyzing the sectoral structure of national economies, the statistical information provided by the World Bank showed at the end of 2019 - ie before the global health crisis - the preponderance of services, measured as added value in national GDP, but with large differences between countries.

The situation differs from one country to another, but a common denominator can be found between some of them and it usually refers to the level of economic development. The World Bank classifies the countries of the world into four categories, using as a criterion the macroeconomic indicator Gross National Income (GNI) per capita per year[1]:

- Low income economies: GNI / head up to USD 1,036;
- Low to middle income economies: GNI / head over $ 1,036, but less than $ 4,045;
- Upper income economies: GNI / head over USD 1,045, but less than USD 12,535;
- High-income savings: over $ 12,535.

Sectoral structure of economies before the pandemic

	Gross domestic product (GDP)		Agriculture		Industry		Manufacturing		Services, value added	
	$ billions / % in GDP World		% of GDP country		% of GDP country		% of GDP country		% of GDP country	
	2010	2019	2010	2019	2010	2019	2010	2019	2010	2019

Note: According to World Bank definitions, the information in the table refers to:

- GDP at purchaser's prices is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products;
- Agriculture includes cultivation of crops and livestock production, forestry and fishing;
- Industry includes mining, manufacturing (also reported as a separate subgroup), construction, electricity, water, and gas;
- Services include value added in wholesale and retail trade (including hotels and restaurants), transport; government, financial, professional and personal services such as education, health care, and real estate services, imputed bank service charges, import duties etc.;
- Value added (as is defined in the International Standard Industrial Classification (ISIC), revision 3 or 4) is the net output of a sector after adding up all outputs and subtracting intermediate inputs.

Sources: https://databank.worldbank.org/source/world-development-indicators http://www.worldbank.org/

[1] https://blogs.worldbank.org/fr/opendata/nouvelle-classification-des-pays-en-fonction-de-leur-revenu-2020-2021

The table presented above shows the sectoral structure of the national economy depending on the labor productivity that is performed - as a weighted average - in each macrosector. This structure greatly influences the performance of the respective economy - performance measured by the indicator of the share of sectoral GDP in the cumulated GDP at the level of the respective country - but it is also an important instrument of economic policy and strategy.

Developed countries make the most of GDP in the services sector, otherwise politicians have said that these countries have entered a post-industrial period, when many manufacturing activities - which use a larger number of jobs, but they are even more polluting - they have been delegated to corporations in less developed countries.

The middle-income countries - lower or upper - get their macroeconomic added value from productive activities - industry or manufactoring - and in order to recover from the crisis Covid-19 must adopt policies of resilience and relaunch of both sectors with the greatest potential, as well as those considered strategic for the economic and social development of the country.

Although included in these broad economic categories, the behavior of communities is greatly influenced by many other factors, among which with an important share the social and historical ones, including such relations with other countries closer or farther away.

3.2. Sectoral factors of economic growth in high and upper middle income countries

The most important growth factors that developed countries - such as the United States, Western Europe, Japan, and Asian dragons, including China - have introduced into the growth policies they have implemented in the modern era have been, in addition to the accumulation of physical capital, of even greater importance, technical, technological and organizational innovations.

Particular attention was also paid to the possibility of increasing labor productivity, so that a corporate profit rate high enough to allow productive activities to be maintained - in the industrial, construction, transport, energy, etc. sectors. - to face the competition, in the conditions of the salary increase, imperative absolutely necessary to use another lever of macroeconomic growth, respectively the internal consumption.

	Gross domestic product (GDP)		Agriculture		Industry		Manufacturing		Services, value added	
	$ billions / % in GDP World		% of GDP country		% of GDP country		% of GDP country		% of GDP country

Sources: https://databank.worldbank.org/source/world-development-indicators

Developed countries, such as the United States, the United Kingdom, Germany and other Western European countries, account for more than 60% of their GDP in the services sector - they are considered to have entered the so-called post-industrial era -, but even this proportion highlights vulnerabilities that were perceived more pronounced in the conditions of the pandemic, which imposed the lockdown and disruption of many commercial networks. Consequently, these states are rethinking their sectoral structure of the economy in order to reduce their dependence on supply, as well as the conditions imposed by relocation, especially to South-East Asia.

United States of America

The reverse of this behavior has been felt in the United States, which is facing a large current account deficit due to imports that significantly exceed exports.

Foreign trade indicators in USA	2015	2016	2017	2018	2019
Imports of goods and services (% in GDP)	15,3	14,6	15,0	15,3	14,7
Exports of goods and services (% in GDP)	12,4	11,9	12,1	12,2	11,7

Sources: https://import-export.societegenerale.fr/fr/fiche-pays, Source : OMC - Organisation Mondiale du Commerce; Banque Mondiale , Janvier 2021

Although the former Trump administration and the current Biden administration have initiated and continue a policy of reducing dependence on productive activities or import consumption - mainly from China, the great competitor to the world leader, but also from other trading partners: Canada, Mexico, European Union - this action is greatly slowed by the sectoral structure of the US economy.

Breakdown of economic activity by sector in USA	**Agriculture**	**Industry**	**Services**
Employment by sector (in% of total employment)	1,3	19,7	79,0
Value added (in% of GDP)	0,9	18,2	77,4
Added value (annual growth in%)	-5,5	1,8	2,1

Sources: https://import-export.societegenerale.fr/fr/fiche-pays , Source: Banque Mondiale , Janvier 2021

The country with the strongest economy in the world has an unbalanced sectoral structure: agriculture, although one of the best in the world, has such a small share in both employment and contribution to GDP that it can not ensure food consumption of the population. Also, the manufacturing industry has been largely relocated to other geographical areas - generally in search of cheap labor - favoring multinationals, but not host states, so that national income does not benefit from an increase in industrial activity in an equivalent proportion.

Growth indicators in the USA	**2018**	**2019**	**2020 (e)**	**2021 (e)**	**2022 (e)**
GDP (annual growth in%, constant price)	3,0	2,2e	-4,3	5,1	2,5
Balance of current transactions (as% of GDP)	-2,2	-2,2	-2,1	-2,1	-2,1

Sources:https://import-export.societegenerale.fr/fr/fiche-pays, Source : FMI - World Economic Outlook Database - Janvier 2021

Consequently, the macroeconomic forecasts for the next two years[2] - note that they are developed at the end of 2020, but in the meantime, the third wave COVID-19 has hit several countries, including the US, which requires their adjustment or, in better case, the lag - maintain a current account deficit and, implicitly, the need to cover it, which negatively affects the upward trend of GDP.

Egypt

By comparison, Egypt, which is in the group of Upper Middle Income countries, has a much larger agricultural sector in terms of national GDP - Egypt has a millennial tradition in this field - but productivity here is low and the population employed in Agriculture is more numerous than in developed countries.

Breakdown of economic activity by sector in Egipt	**Agriculture**	**Industry**	**Services**
Employment by sector (in% of total employment)	23,3	28,2	48,6
Value added (in% of GDP)	11,0	35,6	50,5
Added value (annual growth in%)	3,1	6,4	5,0

Sources: https://import-export.societegenerale.fr/fr/fiche-pays , Source : Banque Mondiale , Janvier 2021

In addition, the manufacturing sector, even in terms of food processing, is heavily dependent on imports[3]. Also, in the field of hydrocarbons, exports have decreased in the last two years, with Egypt's energy balance becoming negative.

Foreign trade indicators in Egypt	**2015**	**2016**	**2017**	**2018**	**2019**
Imports of goods and services (in% of GDP)	21,7	19,9	29,3	29,4	n/a
Exports of goods and services (in% of GDP)	13,2	10,3	15,8	18,9	n/a

Thus, the value of Egyptian exports is constantly lower than that of imports, although the quality of Egyptian products is well appreciated in foreign markets, and exported services, which come mainly from tourism, are appreciated worldwide.

Growth indicators in Egipt	2018	2019	2020 (e)	2021 (e)	2022 (e)
GDP (annual growth in%, constant price)	5,3	5,6e	3,5	2,8	5,5
Current account balance (in% of GDP)	-2,4	-3,6	-3,2	-4,2	-2,9

Consequently, although the IMF forecasts that the Egyptian economy will show a positive trend in 2020, despite the pandemic, the foreign trade balance will continue to be weak, amid declining exports at a slower pace than declining imports. This situation can be explained also by the sectoral structure of the real economy (creating added value), the manufacturing sector being predominant in the industry - the exported products incorporating technical and technological progress in a modest proportion -, to which is added the agricultural sector, from which products with a low or even zero degree of processing are exported.

Romania

Romania is one of the categorized developing countries, even if according to The Atlas Method, by the World Bank it is classified, starting with 2019 in the High-income group category, with GNI per capita of US $ 12,630 - its strategic sectors being the energy, IT, transport, tourism, but mining and agriculture, although neglected and with a very low yield, have a great potential and have a comparative advantage that should not be ignored in future strategies and development policies.

To these domains that are part of the Institutional sector Companies and Qvasi-Societies of the National Accounts System are added the social sectors, mainly: the fields of health, education and research & development (R&D), so that even the sectors with competitive potential to increase their contribution to macroeconomic development.

A special place is occupied by agriculture, which is the economic sector of special importance. The added value of agriculture has a very small share in the GDP of developed countries and a slightly higher share of middle income, but this sector is the one that provides food to the population, and government authorities in all states are responsible for providing it both in terms of quantitative view, as well as in terms of quality and safety food.

Countries that benefit from advantages in this sector - whether favored by geography or have created, such as the Netherlands, an agricultural product industry - improve their current account balances by exporting agricultural products and / or food.

Consequently, agriculture - as a strategic economic sector - must be given special importance (perhaps the greatest) in the development policies created and implemented at national level.

3.3. Germany's sectoral structure - the main factor of economic performance

In Europe and beyond, the way the German economy is run and evolves is an example to follow regardless of the situation, but even more so in a period as difficult as the post-Covid-19 one. According to the billion-dollar GDP macroeconomic indicator, Germany is the third largest economy in the world, although its population is much smaller than that of other countries, such as China or India, which have the largest population, which shows that the performance of the German economy, as measured by the GDP per capita indicator, is undeniably much higher.

	Gross domestic product				Population		
	2010		2019		2021		
	Position in the world	$ billions	Position in the world	$ billions	Position in the world	Number of inhabitants	% of the world's population
World	-	66.113,10	-	87.697,50	-	7.850.000.000	100%
United States	1	14.992,10	1	21.374,40	3	331.352.000	4,13%
China	2	6.087,20	2	14.342,90	1	1.407.130.000	17,5%
Germany	3	3.396,40	3	3.845,60	19	83.190.556	1,04%

Source: World Bank national accounts data, and OECD National Accounts data files;
https://ro.wikipedia.org/wiki/Lista_%C8%9B%C4%83rilor_dup%C4%83_popula%C8%9Bie

Germany's strong economic position in the world can be explained by several strengths that it created and maintained over the years after World War II:

- the importance they attached to industrial development, both in terms of volume and especially in terms of product quality, so that the "made in Germany" brand is highly sought after abroad and the added value incorporated by them is among the highest in the world;
- due to the quality of industrial products, Germany has allowed itself to have an economy with a high degree of openness, so as to benefit from the comparative advantages provided by the gradual reduction of trade protectionism between the countries of the world. Germany is currently the third largest country in the world in terms of the volume of foreign trade, both in terms of exports and imports, and its current account is always in surplus, which gives it a favorable financial position compared to trading partners;

Ranking of the world's leading exporters and importers of goods in 2017as a percentage of the total world

Exports		Imports	
China	12,8 %	**United States**	13,4 %
United States	8,7 %	**China**	10,2 %
Germany	*8,2 %*	**Germany**	6,5 %
Japan	3,9 %	**Japan**	3,7 %
Netherlands	3,7 %	**Great Britain**	3,6 %
South Korea	3,2 %	**France**	3,5 %
Hong Kong	3,1 %	**Hong Kong**	3,3 %
France	3,0 %	**Netherlands**	3,2 %
Italy	2,9 %	**Italy**	3,2 %
Great Britain	2,5 %	**South Korea**	2,7 %

Source: O.M.C.

- industrial performance, as well as from other sectors, was achieved through carefully designed programs to support the development of SMEs first and, after they have gained momentum, of medium and large enterprises that have managed to show their potential both in internal competitive environment, as well as internationally;
- the organization of the productive process - the importance of the approach has been highlighted since the beginning of the twentieth century by the American F.W. Taylor - proposed as a high-performance development solution the concentration of activities with the same characteristics or objectives, in the so-called "clusters", in which to stimulate the implementation of new technologies, digitization, etc. In Germany, dedicated economic centers have been conceived and put into operation, which are a strong asset for the development of, for example, car construction (Stuttgart), the chemical industry (Rhin-Neckar), etc .;
- in order to support performers in a competitive environment, it is necessary for this environment to be known in all its facets and, in order to raise awareness of the level of confrontation, Germany has become one of the major active organizers of trade fairs, exhibitions and international exhibitions, as well as industrial service promotions in Europe and around the world;
- economic development cannot be achieved ignoring the importance of the social aspect. Germany has a very low level of unemployment, the lowest since 1990, the year of the reunification of the two German states, primarily due to the implementation of the reform introduced by Chancellor Schroder's administration on the labor market, social protection system and tax system, through which more competitive wage costs could be applied;
- the careful and responsible management of the public finances, which allowed the diminution of the budget deficit and of the public debt, in the conditions of maintaining some sectorial policies that would support the activity in the respective sector in the sense pursued by the public policy in the field. In this sense, the energy sector is one with important reform problems, as Germany is, in proportion, one of the largest energy consuming countries. Public authorities, both federal and especially state and local, are actively involved, including financially, in reducing the production of energy from fossil and nuclear resources and replacing them with green energy - renewable and non - polluting.

4. Sectoral resilience and growth policies

The health crisis has affected - and continues to affect - many communities, both centrally and territorially: regions, departments, urban and rural localities, albeit in a different way.

The economic impact varies depending on the intensity of the pandemic in the respective geographical area, as well as the extent to which it is involved in the value chains established by globalization, including sectoral specialization - a relevant example is tourism

and catering: restaurants, bars, etc., which suffered huge losses due to the pandemic.

Tourism presented in 2020 the lowest volume of activity ever recorded[4], for example the arrival of tourists in dedicated locations decreased by 74%, and revenue losses from international transport services amounted to over 1.3 trillion USD in 2020, but the decline has not yet ended due to the persistence of the health crisis and the consequent maintenance of restrictive measures.

Given the recent forecasts (March 2021) regarding the end of the pandemic, experts in the field estimate that it will be possible to reach the global level of tourism revenues achieved in 2019 only in 2024. In the meantime, however, this sector, which had marked a very high dynamic before Covid-19, it will face the decrease of jobs and the corresponding decrease of incomes due to the need to respect the restrictions of physical distance, the reduction of the daily periods of operation, etc.

Public authorities at all administrative levels are responsible for maintaining economic and social life within acceptable limits, but as most democratic states have now massively decentralized social services to the public, the legal obligation to provide them to the population lies largely with territorial public authorities, often being shared as a responsibility with central / federal public authorities.

The category of decentralized public services includes almost entirely utilities: water, sewerage, district heating, sanitation, basic administrative services, etc., but also those of a social nature: health, education, protection of vulnerable persons, as well as public transport, order and public security etc.

Although many decentralized public services are financed exclusively by tariffs, their support requires significant public funds - from territorial public budgets - which must be provided, despite the substantial decrease in tax revenues due to the pandemic, which need to be scheduled upstream compared to the operationalization of the sectoral policy instruments considered.

In order to help enterprises - the basic cell of economic activity in any country - the approaches of public authorities responsible for monitoring economic and financial performance at the national level have several solutions in mind:

- guaranteeing the treasury loans that a company in the category of SMEs – i.e. those with relatively low resilience - has contracted or wants to contract them to withstand the effects of the health crisis;
- subsidizing the partial unemployment / technical unemployment caused by the pandemic;
- subsidizing the expenses in order to bear the effects of the sanitary crisis;
- subsidizing maintenance / administration expenses: rent, energy bills, water, etc. of commercial premises;
- total or partial coverage of expenses for the endowment and implementation of digital communication, etc.

The measures taken by the public authorities to stop the spread of the influenza virus have disrupted productive and commercial activities, with immediate consequences on employment and, implicitly, on the income of the population.

The direct impact on domestic demand in all countries of the world has led to a significant decrease in the volume of foreign trade, the entire supply chain being disrupted.

To counter the shock of the health crisis, governments have adopted monetary and / or public spending policies to protect the population - both from virus infection and from deteriorating living conditions due to declining incomes - as well as economic activity as a whole, through various state aid schemes, subsidies, etc.

However, these measures have significantly degraded national public finances, with most countries in the world registering in 2020 much larger budget deficits than in previous years.

In the European Union, a series of rules were imposed by the treaties signed and, consequently, accepted by all Member States to maintain financial stability. Thus, the consolidated Treaty of Lisbon (2007) established the conditions and actions to be taken with regard to deficits considered excessive according to European Union rules[5]:

- the public budget deficit must be within a maximum of 3% of GDP;
- public debt must be below the 60% of GDP limit.

Currently, at the beginning of 2021, regarding the public policies adopted in all European states, they imply two distinct directions, depending on the expected effect:

- short-term interventions, in order to maintain the level of health and quality of life within acceptable parameters;
- medium and long term interventions, in order to protect the existing assets and to boost the resumption of economic activity and to support the pace of development.

The macroeconomic instruments that public authorities have at their disposal in contemporary democratic economies can be divided into two broad categories:

- monetary policies, which can generally be implemented by the monetary authority of each state - or group of independent states, such as the Eurozone;
- budgetary policies, which refer to the measures promoted and implemented regarding both public expenditures and those related to taxes and

[4] https://www.unwto.org/en/

[5] https://eur-lex.europa.eu/summary/glossary/

duties levied on residents and / or non-residents who obtain income on the national territory.

As for monetary policies, they act at the macro level, they are generally not directed towards a certain economic sector of activity.

For the post-pandemic period, actions are planned to influence economic activity:

- decrease of the reference interest rate, which will spread through commercial banks and investments on the active rate practiced on loans to individuals and legal entities, thus stimulating both current operating activity and investment at the macroeconomic level;
- the so-called QE (quantitative easing) instrument, which means the purchase by the central bank - a policy known as "open market" - of government bonds issued for the financial coverage of public debt. Following this operation, the central bank will cause an increase in the liquidity held by banks and, as a consequence, a decrease in the active interest rate granted by them. Also, the interest rate on financing / refinancing the public debt will decrease, which means a lower public debt service, respectively lower public expenditures at national and / or local level.

The approach to budgetary policy is different. Thus, the tax policy and fees Keynesian interventionist type recommends in times of recession - such as the post-Covid-19 period - the reduction of the tax burden, but as the concrete situation this year imposes increased public funds to support economic and social life, it is it is necessary to think of alternative solutions.

In this regard, the public authorities will set priorities for the current year, 2021, as well as for the future. Increased attention to demand - such as the increase in the guaranteed minimum income by law, as decided in the UK - will make this macroeconomic indicator the main factor in the country's development, at least this year.

If, on the contrary, the national public authorities decide to stimulate supply, as the main priority for the future economic development of the country, ie financial interventions will be mainly aimed at supporting investments - of any kind: rehabilitation, modernization, expansion, new investments - in sectors considered by of vital importance at national level, they will receive the largest amounts as budget allocations, in the form of budget appropriations and / or commitment appropriations[6].

5. Conclusions

Analyzing the economic and social situation before the pandemic, as well as the strong impact it produces, state governments propose for their countries models of resilience and resumption of growth considerably different from the models presented and implemented previously. In this sense, it is considered that the State's intervention - both as a public service provider and as the main financier - must be strong, at least in the next few years.

Economic and social developments and the need for public authorities to counteract or at least reduce the effects of the pandemic on the lives of the population require major changes in these conditions, given the macroeconomic policies, but also, especially at the sectoral level, which must be implemented to overcome the impact of the health crisis and be able to restart economic activity and increase employment.

As the public finance situation is not expected to improve significantly in 2021 due to successive waves of epidemics, EU policymakers have proposed maintaining a lax approach to public spending and implementing macroeconomic and sectoral support measures through a Next Generation EU financial instrument.

The economic policies considered include all economic and social sectors, prioritizing them according to the importance that each one represents for the respective country, but also taking into account, at the same time, the targets identified in the development strategies. Thus, among the targeted sectors will not be missing the industrial ones specific to each country: extractive, manufacturing, high processing; energy, including renewable energy; agriculture, forestry, fishing and food industry; constructions, etc., and to all these are added the social sectors - of equal or even greater importance.

When creating development policies for economic sectors, especially industrial, agricultural, etc., that are considered strategic, the governments of states that introduce a series of measures to eliminate the effects of the pandemic and resumption of growth must take into account a number of situations generated by the health crisis, but also the whole economic situation before the crisis, its challenges not yet being solved. Among other things, it is about the revaluation of supply chains and the rethinking of the interdependencies between the states of the world in an increasingly extended and also contested globalization. Some examples of magnitude:

- the separation of Great Britain from the European Union (BREXIT);
- American Trump policy against economic competition exercised by China, but also by other geographical areas of the world, such as the European Union, Canada, etc., a policy that seems to be continued by the Biden administration;
- the fierce technological competition in the top fields, such as artificial intelligence, 5G, semiconductors, etc.

[6] According to the Romanian legislation (Law no. 500 of 2002, consolidated, regarding public finances), the multiannual legal commitments include the maximum amounts that can be budgeted in the years for which the commitment is concluded. The budget credit represents the maximum amount that can be ordered and paid in the current budget year for the legal commitments contracted in the respective year and / or in the previous years.

It is predicted that the new American geopolitics and the Chinese response to it will affect investment and, consequently, medium and long-term economic growth in both major states, as well as in other countries that are in close economic and financial relations with them, such as for example, many South-East Asian states.

Thus, for the post-Covid-19 period, the industrial policies elaborated by the national public authorities, especially for the fields considered strategic will take into account the characteristics of a complicated economic-social, given and political conjuncture:

- the need to strengthen the role of the state in the national economy, both in terms of adopting the regulatory framework in all aspects of domestic economic and social life and international relations, and as a provider of public services in most areas: economic, health, education, social protection, protection environment, but also economic and financial control, population security, etc .;
- significant changes in the geopolitics of the world's regions, affecting material and financial supply chains, including relations between and even within companies - mainly in the case of multinationals, which in many situations, such as the US, are facing the requirement of the authorities to relocate;
- the requirements expressed by all media: scientific, economic, domestic and international social, regarding the need to improve environmental conditions.

Regulations proposed by international courts and adopted, in part for the most part, by many countries around the world, require access to clean technologies, which are generally expensive.
